Preface

This preface describes the audience, organization and conventions of the *Cisco Nexus 5000 Series NX-OS Fundamentals Configuration Guide*. It also provides information on how to obtain related documentation.

- Audience, page xi
- Document Organization, page xi
- Document Conventions, page xii
- Related Documentation for Nexus 7000 Series NX-OS Software, page xiii
- Obtaining Documentation and Submitting a Service Request, page xiv

Audience

This publication is for experienced users who configure and maintain Cisco NX-OS devices.

Document Organization

This document is organized into the following chapters:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New and Changed Information, page 1</td>
<td>Describes the new and changed information for the new Cisco NX-OS software release.</td>
</tr>
<tr>
<td>Overview, page 3</td>
<td>Provides an overview of the features included in the Cisco NX-OS software.</td>
</tr>
<tr>
<td>Using the Cisco NX-OS Setup Utility, page 17</td>
<td>Provides a flowchart for setting up the Cisco NX-OS software.</td>
</tr>
<tr>
<td>Understanding the Command-Line Interface, page 25</td>
<td>Describes the command line interface including command modes, special characters, and keystrokes.</td>
</tr>
</tbody>
</table>
### Document Conventions

Command descriptions use the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold</strong></td>
<td>Bold text indicates the commands and keywords that you enter literally as shown.</td>
</tr>
<tr>
<td><em>Italic</em></td>
<td>Italic text indicates arguments for which the user supplies the values.</td>
</tr>
<tr>
<td>[x]</td>
<td>Square brackets enclose an optional element (keyword or argument).</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
<tr>
<td>[x {y</td>
<td>z}]</td>
</tr>
<tr>
<td><code>variable</code></td>
<td>Indicates a variable for which you supply values, in context where italics cannot be used.</td>
</tr>
<tr>
<td><code>string</code></td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
</tbody>
</table>

Screen examples use the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>screen font</code></td>
<td>Terminal sessions and information the switch displays are in screen font.</td>
</tr>
</tbody>
</table>
This document uses the following conventions:

- **Note**: Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

- **Caution**: Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

## Related Documentation for Nexus 7000 Series NX-OS Software

Cisco NX-OS documentation is available at the following URL:

The documentation set for the Cisco NX-OS software includes the following documents:

**Release Notes**
- Cisco Nexus 7000 Series NX-OS Release Notes, Release 4.2

**Cisco NX-OS Configuration Guides**
- Cisco Nexus 7000 Series NX-OS Virtual Device Context Quick Start, Release 4.2
- Cisco Nexus 7000 Series NX-OS Fundamentals Configuration Guide, Release 4.2
- Cisco Nexus 7000 Series NX-OS Interfaces Configuration Guide, Release 4.2
- Cisco Nexus 7000 Series NX-OS Layer 2 Switching Configuration Guide, Release 4.2
- Cisco Nexus 7000 Series NX-OS Quality of Service Configuration Guide, Release 4.2
- Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide, Release 4.2
- Cisco Nexus 7000 Series NX-OS Multicast Routing Configuration Guide, Release 4.2
- Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What's New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
New and Changed Information

This chapter provides release-specific information for each new and changed feature in the Cisco Nexus 7000 Series NX-OS Fundamentals Configuration Guide, Release 4.2. The latest version of this document is available at the following Cisco website:

- New and Changed Information, page 1

New and Changed Information

To check for additional information about Cisco NX-OS Release 4.2, see the Cisco Nexus 7000 Series NX-OS Release Notes, Release 4.2 available at the following Cisco website:

This table summarizes the new and changed features for the Cisco Nexus 7000 Series NX-OS Fundamentals Configuration Guide, Release 4.2, and tells you where they are documented.

Table 1: New and Changed Features for Release 4.2

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Changed in Release</th>
<th>Where Documented</th>
</tr>
</thead>
<tbody>
<tr>
<td>diff utility</td>
<td>Allows comparison of command outputs.</td>
<td>4.2(1)</td>
<td>Understanding the Command-Line Interface, page 25</td>
</tr>
<tr>

<td>Allows sending commands directly to a module from the supervisor module session.</td>
<td>4.2(1)</td>
<td>Understanding the Command-Line Interface, page 25</td>
</tr>
<tr>
<td>Command history</td>
<td>Provides changes to the <code>show cli history</code> command.</td>
<td>4.2(1)</td>
<td>Understanding the Command-Line Interface, page 25</td>
</tr>
<tr>
<td>Command modes</td>
<td>Allows saving and restoring of command modes.</td>
<td>4.2(1)</td>
<td>Understanding the Command-Line Interface, page 25</td>
</tr>
<tr>
<td>Confirmation prompts</td>
<td>Allows enabling and disabling for command confirmation prompts.</td>
<td>4.2(1)</td>
<td>Understanding the Command-Line Interface, page 25</td>
</tr>
<tr>
<td>Terminal colors</td>
<td>Allowed changes to the colors used for CLI elements in the terminal display.</td>
<td>4.2(1)</td>
<td>Understanding the Command-Line Interface, page 25</td>
</tr>
<tr>
<td><code>show</code> command output redirection</td>
<td>You can change the format of the <code>show</code> command output when you redirect it to a file. The format can be ASCII or zipped.</td>
<td>4.2(1)</td>
<td>Using the Device File Systems, Directories, and Files, page 81</td>
</tr>
</tbody>
</table>
Overview

This chapter provides an overview of the Cisco NX-OS software.

- Software Compatibility, page 3
- Serviceability, page 5
- Manageability, page 6
- Traffic Routing, Forwarding, and Management, page 7
- Quality of Service, page 9
- Network Security, page 9
- Licensing, page 10
- Supported Standards, page 10

Software Compatibility

The Cisco NX-OS software interoperates with Cisco products that run any variant of the Cisco IOS software. The Cisco NX-OS software also interoperates with any networking operating system that conforms to the IEEE and RFC compliance standards.

Common Software Throughout the Data Center

The Cisco NX-OS software provides a unified operating system that is designed to run all areas of the data center network including the LAN and Layer 4 through Layer 7 network services.
This figure shows an overview of the Cisco NX-OS software in the data center.

*Figure 1: Cisco NX-OS in a Data Center*
Modular Software Design

The Cisco NX-OS software supports distributed multithreaded processing on symmetric multiprocessors (SMPs), multi-core CPUs, and distributed data module processors. The Cisco NX-OS software offloads computationally intensive tasks, such as hardware table programming, to dedicated processors distributed across the data modules. The modular processes are created on demand, each in a separate protected memory space. Processes are started and system resources are allocated only when you enable a feature. A real-time preemptive scheduler helps to ensure the timely processing of critical functions.

Virtual Device Contexts

The Cisco NX-OS software can segment system and hardware resources into virtual contexts that emulate virtual devices. Each virtual device context (VDC) has its own software processes, dedicated hardware resources (interfaces), and an independent management environment. With VDCs, you can consolidate separate networks onto a common infrastructure, which maintain the administrative boundary separation and fault isolation characteristics of physically separate networks, and provide many of the operational cost benefits of a single infrastructure. For more information, see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2.

Serviceability

The Cisco NX-OS software has serviceability functions that allow the device to respond to network trends and events. These features help you with network planning and improving response times.

Switched Port Analyzer

The Switched Port Analyzer (SPAN) feature allows you to analyze all traffic between ports (called the SPAN source ports) by nonintrusively directing the SPAN session traffic to a SPAN destination port that has an external analyzer attached to it. For more information about SPAN, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

Ethanalyzer

Ethanalyzer is a Cisco NX-OS protocol analyzer tool based on the Wireshark (formerly Ethereal) open source code. Ethanalyzer is a command-line version of Wireshark for capturing and decoding packets. You can use Ethanalyzer to troubleshoot your network and analyze the control-plane traffic. For more information about Ethanalyzer, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

Call Home

The Call Home feature continuously monitors hardware and software components to provide e-mail-based notification of critical system events. A versatile range of message formats is available for optimal compatibility with pager services, standard e-mail, and XML-based automated parsing applications. It offers alert grouping capabilities and customizable destination profiles. You can use this feature, for example, to directly page a network support engineer, send an e-mail message to a network operations center (NOC), and employ Cisco.
Online Diagnostics

Cisco generic online diagnostics (GOLD) verify that hardware and internal data paths are operating as designed. Boot-time diagnostics, continuous monitoring, and on-demand and scheduled tests are part of the Cisco GOLD feature set. GOLD allows rapid fault isolation and continuous system monitoring. For information about configuring GOLD, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

Embedded Event Manager

Cisco Embedded Event Manager (EEM) is a device and system management feature that helps you to customize behavior based on network events as they happen. For information about configuring EEM, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

NetFlow

Manageability

This section describes the manageability features in the Cisco NX-OS software.

Simple Network Management Protocol

The Cisco NX-OS software is compliant with Simple Network Management Protocol (SNMP) version 1, version 2, and version 3. A large number of MIBs is supported. For more information about SNMP, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

Configuration Verification and Rollback

The Cisco NX-OS software allows you to verify the consistency of a configuration and the availability of necessary hardware resources prior to committing the configuration. You can preconfigure a device and apply the verified configuration at a later time. Configurations also include checkpoints that allow you to roll back to a known good configuration as needed. For more information about rollback, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.
Role-Based Access Control

With role-based access control (RBAC), you can limit access to device operations by assigning roles to users. You can customize access and restrict it to the users who require it. For more information about RBAC, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

Connectivity Management Processor

The Cisco NX-OS software supports the use of a Connectivity Management Processor (CMP) for remote platform management. The CMP provides an out-of-band access channel to the Cisco NX-OS console. For more information about CMP, see the Cisco Nexus 7000 Series Connectivity Management Processor Configuration Guide.

Cisco NX-OS Device Configuration Methods

You can configure devices using the CLI from a Secure Shell (SSH) session or a Telnet session. SSH provides a secure connection to the device. The CLI configuration guides and command references are organized by feature. For more information, see the Cisco NX-OS configuration guides and the Cisco NX-OS command references. For more information on SSH and Talent, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

You can also configure devices using the XML management interface, which is a programmatic method based on the NETCONF protocol that complements the CLI. For more information, see the Cisco NX-OS XML Management Interface User Guide, Release 4.2.

Traffic Routing, Forwarding, and Management

This section describes the traffic routing, forwarding, and management features supported by the Cisco NX-OS software.

Ethernet Switching

The Cisco NX-OS software supports high-density, high-performance Ethernet systems and provides the following Ethernet switching features:

- IEEE 802.1D-2004 Rapid and Multiple Spanning Tree Protocols (802.1w and 802.1s)
- IEEE 802.1Q VLANs and trunks
- 16,000-subscriber VLANs
- IEEE 802.3ad link aggregation
- Private VLANs
- Cross-chassis private VLANs
- Unidirectional Link Detection (UDLD) in aggressive and standard modes

For more information, see the Cisco Nexus 7000 Series NX-OS Interfaces Configuration Guide, Release 4.2 and the Cisco Nexus 7000 Series NX-OS Layer 2 Switching Configuration Guide, Release 4.2.
IP Routing

The Cisco NX-OS software supports IP version 4 (IPv4) and IP version 6 (IPv6) and the following routing protocols:

- Open Shortest Path First (OSPF) Protocol Versions 2 (IPv4) and 3 (IPv6)
- Border Gateway Protocol (BGP)
- Enhanced Interior Gateway Routing Protocol (EIGRP)
- Routing Information Protocol Version 2 (RIPv2)

The Cisco NX-OS software implementations of these protocols are fully compliant with the latest standards and include 4-byte autonomous system numbers (ASNs) and incremental shortest path first (SPF). All unicast protocols support Non-Stop Forwarding Graceful Restart (NSF-GR). All protocols support all interface types, including Ethernet interfaces, VLAN interfaces, subinterfaces, port channels, tunnel interfaces, and loopback interfaces.

For more information, see the Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide, Release 4.2.

IP Services

The following IP services are available in the Cisco NX-OS software:

- Virtual Routing and Forwarding (VRF)
- Dynamic Host Configuration Protocol (DHCP) Helper
- Hot-Standby Routing Protocol (HSRP)
- Gateway Load Balancing Protocol (GLBP)
- Enhanced Object Tracking
- Policy-Based Routing (PBR)
- Unicast Graceful Restart for all protocols in IPv4 Unicast Graceful Restart for OPSFv3 in IPv6

For more information, see the Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide, Release 4.2.

IP Multicast

The Cisco NX-OS software includes the following multicast protocols and functions:

- Protocol Independent Multicast (PIM) Version 2 (PIMv2)
- Source Specific Multicast (SSM)
- PIM sparse mode (Any-Source Multicast [ASM] for IPv4 and IPv6)
The Cisco NX-OS software does not support PIM dense mode.

- Bidirectional Protocol Independent Multicast (Bidir PIM)
- Anycast rendezvous point (Anycast-RP)
- Multicast NSF for IPv4 and IPv6
- RP-Discovery using bootstrap router (BSR) (Auto-RP and static)
- Internet Group Management Protocol (IGMP) Versions 1, 2, and 3 router role
- IGMPv2 host mode
- IGMP snooping
- Multicast Listener Discovery (MLD) Protocol Version 2 (for IPv6)
- Multicast Source Discovery Protocol (MSDP) (for IPv4 only)

For more information, see the Cisco Nexus 7000 Series NX-OS Multicast Routing Command Reference, Release 4.2.

Quality of Service

The Cisco NX-OS software supports quality of service (QoS) functions for classification, marking, queuing, policing, and scheduling. Modular QoS CLI (MQC) supports all QoS features. You can use MQC to provide uniform configurations across various Cisco platforms. For more information, see the Cisco Nexus 7000 Series NX-OS Quality of Service Configuration Guide, Release 4.2.

Network Security

This section describes the network security features support by the Cisco NX-OS software.

Cisco TrustSec

Cisco TrustSec security provides data confidentiality and integrity and supports standard IEEE 802.1AE link-layer cryptography with 128-bit Advanced Encryption Standard (AES) cryptography. Link-layer cryptography guarantees end-to-end data privacy while allowing the insertion of security service devices along the encrypted path. Cisco TrustSec uses security group access control lists (SGACLs), which are based on security group tags instead of IP addresses. SGACLs enable policies that are more concise and easier to manage due to their topology independence. For more information, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

Additional Network Security Features

In addition to Cisco TrustSec, the Cisco NX-OS software includes the following security features:

- Data path intrusion detection system (IDS) for protocol conformance checks
- Control Plane Policing (CoPP)
- Message-digest algorithm 5 (MD5) routing protocol authentication
- Cisco-integrated security features, including Dynamic Address Resolution Protocol (ARP) inspection (DAI), DHCP snooping, and IP Source Guard
- Authentication, authorization, and accounting (AAA)
- RADIUS and TACACS+
- SSH Protocol Version 2
- SNMPv3
- Port security
- IEEE 802.1X authentication
- Layer 2 Cisco Network Admission Control (NAC) LAN port IP
- Policies based on MAC and IPv4 addresses supported by named ACLs (port-based ACLs [PACLs], VLAN-based ACLs [VACLs], and router-based ACLs [RACLs])
- Traffic storm control (unicast, multicast, and broadcast)
- Unicast Reverse Path Forwarding (Unicast RPF)

For more information, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

**Licensing**

The Cisco NX-OS software licensing feature allows you to access premium features on the device after you install the appropriate license for that feature. Any feature not included in a license package is bundled with the Cisco NX-OS software and is provided to you at no extra charge.

You must purchase and install a license for each device.

---

**Note**

With the exception of the Cisco TrustSec feature, you can enable a feature without installing its license. The Cisco NX-OS software gives you a grace period that allows you to try a feature before purchasing its license. You must install the Advanced Services license package to enable the Cisco TrustSec feature.

For detailed information about Cisco NX-OS software licensing, see the *Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2*.

For information about troubleshooting licensing issues, see the *Cisco Nexus 7000 Series NX-OS Troubleshooting Guide, Release 4.x*.

**Supported Standards**

This table lists the IEEE compliance standards.
### Table 2: IEEE Compliance Standards

CHAPTER 3

Using the Cisco NX-OS Setup Utility

This chapter describes how to set up the basic Cisco NX-OS configuration after you have installed the hardware.

This chapter includes the following sections:

- Information About the Cisco NX-OS Setup Utility, page 17
- Prerequisites for the Setup Utility, page 19
- Setting Up Your Cisco NX-OS Device, page 19
- Additional References for the Setup Utility, page 24

Information About the Cisco NX-OS Setup Utility

The Cisco NX-OS setup utility is an interactive command-line interface (CLI) mode that guides you through a basic (also called a startup) configuration of the system. The setup utility allows you to configure only enough connectivity for system management.

The setup utility allows you to build an initial configuration file using the System Configuration Dialog. The setup starts automatically when a device has no configuration file in NVRAM. The dialog guides you through initial configuration. After the file is created, you can use the CLI to perform additional configuration.

You can press Ctrl-C at any prompt to skip the remaining configuration options and proceed with what you have configured up to that point, except for the administrator password. If you want to skip answers to any questions, press Enter. If a default answer is not available (for example, the device hostname), the device uses what was previously configured and skips to the next question.
This figure shows how to enter and exit the setup script.

**Figure 2: Setup Script Flow**

You use the setup utility mainly for configuring the system initially, when no configuration is present. However, you can use the setup utility at any time for basic device configuration. The setup utility keeps the configured values when you skip steps in the script. For example, if you have already configured the mgmt0 interface, the setup utility does not change that configuration if you skip that step. However, if there is a default value for the step, the setup utility changes to the configuration using that default, not the configured value. Be sure to carefully check the configuration changes before you save the configuration.

**Note**

Be sure to configure the IPv4 route, the default network IPv4 address, and the default gateway IPv4 address to enable SNMP access. If you enable IPv4 routing, the device uses the IPv4 route and the default network IPv4 address. If IPv4 routing is disabled, the device uses the default gateway IPv4 address.
Prerequisites for the Setup Utility

The setup utility has the following prerequisites:

- Have a password strategy for your network environment.
- Connect the console port on the supervisor module to the network. If you have dual supervisor modules, connect the console ports on both supervisor modules to the network.
- Connect the Ethernet management port on the supervisor module to the network. If you have dual supervisor modules, connect the Ethernet management ports on both supervisor modules to the network.
- Enable the licensing grace period, if applicable. For detailed information about licensing, see the Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2.

Setting Up Your Cisco NX-OS Device

To configure basic management of the Cisco NX-OS device using the setup utility, follow these steps:

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Power on the device.</th>
</tr>
</thead>
</table>
| Step 2 | Enable or disable password-strength checking.  
|       | A strong password has the following characteristics:  
|       | • At least eight characters long  
|       | • Does not contain many consecutive characters (such as "abcd")  
|       | • Does not contain many repeating characters (such as "aaabbb")  
|       | • Does not contain dictionary words  
|       | • Does not contain proper names  
|       | • Contains both uppercase and lowercase characters  
|       | • Contains numbers |

Example:

```
---- System Admin Account Setup ----
Do you want to enforce secure password standard (yes/no) [y]: y
```

| Step 3 | Enter the new password for the administrator. |
Note If a password is trivial (such as a short, easy-to-decipher password), your password configuration is rejected. Passwords are case sensitive. Be sure to configure a strong password that has at least eight characters, both uppercase and lowercase letters, and numbers.

Example:

Enter the password for "admin": <password>

Confirm the password for "admin": <password>

---- Basic System Configuration Dialog VDC: 1 ----

This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

Please register Cisco Nexus7000 Family devices promptly with your supplier. Failure to register may affect response times for initial service calls. Nexus7000 devices must be registered to receive entitled support services.

Press Enter at anytime to skip a dialog. Use ctrl-c at anytime to skip the remaining dialogs.

Step 4 Enter the setup mode by entering yes.

Example:

Would you like to enter the basic configuration dialog (yes/no): yes

Step 5 Create additional accounts by entering yes (no is the default).

Example:

Create another login account (yes/no) [n]: yes

a) Enter the user login ID.

Example:

Enter the User login Id : user_login

b) Enter the user password.

Example:

Enter the password for "user1": user_password
Confirm the password for "user1": user_password

c) Enter the default user role.

Example:

Enter the user role (network-operator|network-admin|vdc-operator|vdc-admin) [network-operator]: default_user_role

For information on the default user roles, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

Step 6 Configure an SNMP community string by entering yes.
Example:
Configure read-only SNMP community string (yes/no) [n]: yes
SNMP community string : snmp_community_string

For information on SNMP, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

Step 7 Enter a name for the device (the default name is switch).

Example:
Enter the switch name: switch_name

Step 8 Enable the license grace period by entering yes.
Note Enabling the grace period allows users to test licensed features, except for Cisco TrustSec, which requires an Advanced Services license. The grace period is 120 days and starts when you first configure a licensed feature and stops when all features for a license are disabled. Once the grace period expires, you must purchase the license to access the licensed features. For more information about licenses, see the Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2.

Example:
Enable license grace period? (yes/no) [n]: yes

Step 9 Configure out-of-band management by entering yes. You can then enter the mgmt0 IPv4 address and subnet mask.
Note You can only configure IPv4 address in the setup utility. For information on configuring IPv6, see the Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide, Release 4.2.

Example:
Continue with Out-of-band (mgmt0) management configuration? [yes/no]: yes
Mgmt0 IPv4 address: mgmt0_ip_address
Mgmt0 IPv4 netmask: mgmt0_subnet_mask

Step 10 Configure the IPv4 default gateway (recommended) by entering yes. You can then enter its IP address.

Example:
Configure the default-gateway: (yes/no) [y]: yes
IPV4 address of the default-gateway: default_gateway

Step 11 Configure advanced IP options such as the static routes, default network, DNS, and domain name by entering yes.

Example:
Configure Advanced IP options (yes/no)? [n]: yes

Step 12 Configure a static route (recommended) by entering yes. You can then enter its destination prefix, destination prefix mask, and next hop IP address.
Example:

Configure static route: (yes/no) [y]: yes
Destination prefix: dest_prefix
Destination prefix mask: dest_mask
Next hop ip address: next_hop_address

Step 13 Configure the default network (recommended) by entering yes. You can then enter its IPv4 address.

Note The default network IPv4 address is the same as the destination prefix in the static route configuration.

Example:

Configure the default network: (yes/no) [y]: yes
Default network IP address [dest_prefix]: dest_prefix

Step 14 Configure the DNS IPv4 address by entering yes. You can then enter the address.

Example:

Configure the DNS IP address? (yes/no) [y]: yes
DNS IP address: ipv4_address

Step 15 Configure the default domain name by entering yes. You can then enter the name.

Example:

Configure the DNS IP address? (yes/no) [y]: yes
DNS IP address: ipv4_address

Step 16 Enable the Telnet service by entering yes.

Example:

Enable the telnet service? (yes/no) [y]: yes

Step 17 Enable the SSH service by entering yes. You can then enter the key type and number of key bits. For more information, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

Example:

Enable the ssh service? (yes/no) [y]: yes
Type of ssh key you would like to generate (dsa/rsa) : key_type
Number of key bits <768-2048> : number_of_bits

Step 18 Configure the NTP server by entering yes. You can then enter its IP address. For more information, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

Example:

Configure NTP server? (yes/no) [n]: yes
NTP server IP address: ntp_server_IP_address

Step 19 Specify a default interface layer (L2 or L3).
Example:
Configure default interface layer (L3/L2) [L3]: \textit{interface\_layer}

**Step 20** Enter the default switchport interface state (shutdown or no shutdown). A shutdown interface is in an administratively down state. For more information, see the \textit{Cisco Nexus 7000 Series NX-OS Interfaces Configuration Guide, Release 4.2}.

Example:
Configure default switchport interface state (shut/noshut) [shut]: \textit{default\_state}

**Step 21** Enter the best practices profile for control plane policing (CoPP). For more information, see the \textit{Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2}.

Example:
Configure best practices CoPP profile (strict/m moderate/lenient/none) [strict]: \textit{policy}

**Step 22** Configure CMP for the current supervisor, and then enter the IP address, netmask, and default gateway IP by entering yes. For more information, see the \textit{Cisco Nexus 7000 Series Connectivity Management Processor Configuration Guide}.

Example:
Configure CMP processor on current sup (slot 5)? (yes/no) [y]: \textbf{yes}
cmp-mgmt IPv4 address : \textit{IP\_address}
cmp-mgmt IPv4 netmask : \textit{net\_mask}
IPv4 address of the default gateway : \textit{default\_gateway}

**Step 23** Configure CMP for the redundant supervisor by entering yes. You can then enter the IP address, netmask, and default gateway IP.

Example:
Configure CMP processor on standby sup (slot 5)? (yes/no) [y]: \textbf{yes}
cmp-mgmt IPv4 address : \textit{IP\_address}
cmp-mgmt IPv4 netmask : \textit{net\_mask}
IPv4 address of the default gateway : \textit{default\_gateway}

The system now summarizes the complete configuration and asks if you want to edit it.

**Step 24** Continue to the next step by entering no. If you enter yes, the setup utility returns to the beginning of the setup and repeats each step.

Example:
Would you like to edit the configuration? (yes/no) [y]: \textbf{yes}

**Step 25** Use and save this configuration by entering yes. If you do not save the configuration at this point, none of your changes are part of the configuration the next time the device reboots. Enter yes to save the new configuration. This ensures that the boot variables for the kickstart and system images are also automatically configured.
Example:

Use this configuration and save it? (yes/no) [y]: yes

Caution If you do not save the configuration at this point, none of your changes are part of the configuration the next time that the device reboots. Enter yes to save the new configuration to ensure that the boot variables for the kickstart and system images are also automatically configured.

Additional References for the Setup Utility

This section includes additional information related to using the setup utility.

Understanding the Command-Line Interface

This chapter describes the Cisco NX-OS software command-line interface (CLI).

This chapter includes the following sections:

- Information About the CLI Prompt, page 26
- Command Modes, page 26
- Special Characters, page 31
- Keystroke Shortcuts, page 31
- Abbreviating Commands, page 34
- Completing a Partial Command Name, page 34
- Identifying Your Location in the Command Hierarchy, page 35
- Using the no Form of a Command, page 35
- Configuring CLI Variables, page 36
- Command Aliases, page 38
- Command Scripts, page 39
- Context-Sensitive Help, page 41
- Understanding Regular Expressions, page 42
- Searching and Filtering show Command Output, page 44
- Searching and Filtering from the --More-- Prompt, page 49
- Using the Command History, page 50
- Enabling or Disabling the CLI Confirmation Prompts, page 52
- Setting CLI Display Colors, page 52
- Sending Commands to Modules, page 53
- BIOS Loader Prompt, page 54
- Examples Using the CLI, page 54
- Additional References for the CLI, page 56
Information About the CLI Prompt

Once you have successfully accessed the device, the CLI prompt displays in the terminal window of your console port or remote workstation as shown in the following example:

```
User Access Verification
login: admin
Password:<password>
Cisco Nexus Operating System (NX-OS) Software
TAC support: http://www.cisco.com/tac
Copyright (c) 2002-2009, Cisco Systems, Inc. All rights reserved.
The copyrights to certain works contained in this software are owned by other third parties and used and distributed under license. Certain components of this software are licensed under the GNU General Public License (GPL) version 2.0 or the GNU Lesser General Public License (LGPL) Version 2.1. A copy of each such license is available at http://www.opensource.org/licenses/gpl-2.0.php and http://www.opensource.org/licenses/lgpl-2.1.php
switch#
```

You can change the default device hostname.

From the CLI prompt, you can do the following:

- Use CLI commands for configuring features
- Access the command history
- Use command parsing functions

Command Modes

This section describes command modes in the Cisco NX-OS CLI.

EXEC Command Mode

When you first log in, the Cisco NX-OS software places you in EXEC mode. The commands available in EXEC mode include the show commands that display the device status and configuration information, the clear commands, and other commands that perform actions that you do not save in the device configuration.

Global Configuration Command Mode

Global configuration mode provides access to the broadest range of commands. The term indicates characteristics or features that affect the device as a whole. You can enter commands in global configuration mode to configure your device globally, or to enter more specific configuration modes to configure specific elements such as interfaces or protocols.
Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

Example:

switch# configure terminal
switch(config)#

Note: The CLI prompt changes to indicate that you are in global configuration mode.

Interface Configuration Command Mode

One example of a specific configuration mode that you enter from global configuration mode is interface configuration mode. To configure interfaces on your device, you must specify the interface and enter interface configuration mode.

You must enable many features on a per-interface basis. Interface configuration commands modify the operation of the interfaces on the device, such as Ethernet interfaces or management interfaces (mgmt 0).

For more information about configuring interfaces, see the Cisco Nexus 7000 Series NX-OS Interfaces Configuration Guide, Release 4.2 and the Cisco Nexus 7000 Series NX-OS Interfaces Command Reference, Release 4.2.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

Example:

switch# configure terminal
switch(config)#

Step 2

interface type number

Example:

switch(config)# interface ethernet 2/2
switch(config-if)#

Note: The CLI prompt changes to indicate that you are in interface configuration mode.

Subinterface Configuration Command Mode

From global configuration mode, you can access a configuration submode for configuring VLAN interfaces called subinterfaces. In subinterface configuration mode, you can configure multiple virtual interfaces on a single physical interface. Subinterfaces appear to a protocol as distinct physical interfaces.

Subinterfaces also allow multiple encapsulations for a protocol on a single interface. For example, you can configure IEEE 802.1Q encapsulation to associate a subinterface with a VLAN.

For more information about configuring subinterfaces, see the Cisco Nexus 7000 Series NX-OS Interfaces Configuration Guide, Release 4.2.
For more information about subinterface commands, see the Cisco Nexus 7000 Series NX-OS Interfaces Command Reference, Release 4.2.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><code>switch(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface type number.subint</code></td>
<td>Specifies the VLAN interface to be configured.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch(config)# interface ethernet 2/2.1</code></td>
<td></td>
</tr>
<tr>
<td><code>switch(config-subif)#</code></td>
<td>The CLI places you into a subinterface configuration mode for the specified VLAN interface.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The CLI prompt changes to indicate that you are in global configuration mode.</td>
</tr>
</tbody>
</table>

**Saving and Restoring a Command Mode**

The Cisco NX-OS software allows you to save current command mode, configure a feature, and then restore the previous command mode. The **pop** command saves the command mode and the **push** command restores the command mode.

The following example shows how to save and restore a command mode:

```
switch# configure terminal
switch(config)# event manager applet test
switch(config-applet)# push
switch(config-applet)# configure terminal
switch(config)# username testuser password newtest
switch(config)# pop
switch(config-applet)#
```

**Exiting a Configuration Command Mode**

To exit from any configuration command mode, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exit</code></td>
<td>Exits from the current configuration command mode and returns to the previous configuration command mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch(config-if)# exit</code></td>
<td></td>
</tr>
<tr>
<td><code>switch(config)#</code></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Exits from the current configuration command mode and returns to EXEC mode.</td>
</tr>
</tbody>
</table>
Purpose

Example:
switch(config-if)# end
switch#

Exitsthe current configuration command mode and
returns to EXEC mode.

Ctrl-Z

Example:
switch(config-if)# ^z
switch(config)#

Exits the current configuration command mode and
returns to EXEC mode.

Caution If you use Ctrl-Z at the end of a command
line in which a valid command has been
typed, the CLI adds the command to the
running configuration file. We
recommend that you exit a configuration
mode using the exit or end command.

Command Mode Summary

This table summarizes information about the main command modes.
### Table 4: Command Mode Summary

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXEC</td>
<td>From the login prompt, enter your username and password.</td>

Keystroke Shortcuts

This table lists command key combinations that can be used in both EXEC and configuration modes.

Table 6: Keystroke Shortcuts

<table>
<thead>
<tr>
<th>Keystokes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-A</td>
<td>Moves the cursor to the beginning of the line.</td>
</tr>
<tr>
<td>Ctrl-B</td>
<td>Moves the cursor one character to the left. When you enter a command that extends beyond a single line, you can press the Left Arrow or Ctrl-B keys repeatedly to scroll back toward the system prompt and verify the beginning of the command entry, or you can press the Ctrl-A key combination.</td>
</tr>
<tr>
<td>Ctrl-C</td>
<td>Cancels the command and returns to the command prompt.</td>
</tr>
<tr>
<td><strong>Keystrokes</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>---------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td>Deletes the character at the cursor.</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>Moves the cursor to the end of the line.</td>
</tr>
<tr>
<td>Ctrl-F</td>
<td>Moves the cursor one character to the right.</td>
</tr>
<tr>
<td>Ctrl-G</td>
<td>Exits to the previous command mode without removing the command string.</td>
</tr>
<tr>
<td>Ctrl-K</td>
<td>Deletes all characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Ctrl-L</td>
<td>Redisplays the current command line.</td>
</tr>
<tr>
<td>Ctrl-N</td>
<td>Displays the next command in the command history.</td>
</tr>
<tr>
<td>Ctrl-O</td>
<td>Clears the terminal screen.</td>
</tr>
<tr>
<td>Ctrl-P</td>
<td>Displays the previous command in the command history.</td>
</tr>
<tr>
<td>Ctrl-R</td>
<td>Redisplays the current command line.</td>
</tr>
<tr>
<td>Ctrl-T</td>
<td>Transposes the character to the left of the cursor with the character located to the right of the cursor.</td>
</tr>
<tr>
<td>Ctrl-U</td>
<td>Deletes all characters from the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-V</td>
<td>Removes any special meaning for the following keystroke. For example, press Ctrl-V before entering a question mark (?) in a regular expression.</td>
</tr>
<tr>
<td>Ctrl-W</td>
<td>Deletes the word to the left of the cursor.</td>
</tr>
<tr>
<td>Ctrl-X, H</td>
<td>Lists the history of commands you have entered. When using this key combination, press and release the Ctrl and X keys together before pressing H.</td>
</tr>
<tr>
<td>Ctrl-Y</td>
<td>Recalls the most recent entry in the buffer (press keys simultaneously).</td>
</tr>
<tr>
<td>Ctrl-Z</td>
<td>Ends a configuration session, and returns you to EXEC mode. When used at the end of a command line in which a valid command has been typed, the resulting configuration is first added to the running configuration file.</td>
</tr>
<tr>
<td>Keystrokes</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Up arrow key</td>
<td>Displays the previous command in the command history.</td>
</tr>
<tr>
<td>Down arrow key</td>
<td>Displays the next command in the command history.</td>
</tr>
<tr>
<td>Right arrow key</td>
<td>Moves your cursor through the command history, either forward or backward, to locate a command string.</td>
</tr>
<tr>
<td>Left arrow key</td>
<td>Displays a list of available commands.</td>
</tr>
<tr>
<td>?</td>
<td>Completes the word for you after entering the first characters of the word, and then pressing the Tab key. All options that match are presented.</td>
</tr>
<tr>
<td>Tab</td>
<td>Use tabs to complete the following items:</td>
</tr>
<tr>
<td></td>
<td>• Command names</td>
</tr>
<tr>
<td></td>
<td>• Scheme names in the file system</td>
</tr>
<tr>
<td></td>
<td>• Server names in the file system</td>
</tr>
<tr>
<td></td>
<td>• Filenames in the file system</td>

</tr>
<tr>
<td></td>
<td>callhome class-map clock cts</td>
</tr>
<tr>
<td></td>
<td>cdp cli control-plane</td>
</tr>
<tr>
<td></td>
<td>switch(config)# cl&lt;Tab&gt;</td>
</tr>
<tr>
<td></td>
<td>class-map cli clock</td>
</tr>
<tr>
<td></td>
<td>switch(config)# cla&lt;Tab&gt;</td>
</tr>
<tr>
<td></td>
<td>switch(config)# class-map</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# cd bootflash:&lt;Tab&gt;</td>
</tr>
<tr>
<td></td>
<td>bootflash: bootflash://sup-1/</td>
</tr>
<tr>
<td></td>
<td>bootflash:// sup-2/</td>
</tr>
<tr>
<td></td>
<td>bootflash://module-5/</td>
</tr>
<tr>
<td></td>
<td>bootflash://sup-active/</td>
</tr>
<tr>
<td></td>
<td>bootflash://module-6/ bootflash://sup-local/</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# cd bootflash://mo&lt;Tab&gt;</td>
</tr>
<tr>
<td></td>
<td>bootflash://module-5/</td>
</tr>
<tr>
<td></td>
<td>bootflash://module-6/cv</td>
</tr>
</tbody>
</table>
|              | switch# cd bootflash://module-
Abbreviating Commands

You can abbreviate commands and keywords by entering the first few characters of a command. The abbreviation must include sufficient characters to make it unique from other commands or keywords. If you are having trouble entering a command, check the system prompt and enter the question mark (?) for a list of available commands. You might be in the wrong command mode or using incorrect syntax.

This table lists examples of command abbreviations.

<table>
<thead>
<tr>
<th>Command</th>
<th>Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>conf t</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>copy run start</td>
</tr>
<tr>
<td>interface ethernet 1/2</td>
<td>int e 1/2</td>
</tr>
<tr>
<td>show running-config</td>
<td>sh run</td>
</tr>
</tbody>
</table>

Completing a Partial Command Name

If you cannot remember a complete command name, or if you want to reduce the amount of typing you have to perform, enter the first few letters of the command, then press the Tab key. The command line parser will complete the command if the string entered is unique to the command mode. If your keyboard does not have a Tab key, press Ctrl-I instead.

The CLI recognizes a command once you have entered enough characters to make the command unique. For example, if you enter conf in EXEC mode, the CLI will be able to associate your entry with the configure command, because only the configure command begins with conf.

In the following example the CLI recognizes the unique string for conf in EXEC mode when you press the Tab key:

```
switch# conf<Tab>
switch# configure
```

When you use the command completion feature the CLI displays the full command name. The CLI does not execute the command until you press the Return or Enter key. This allows you can modify the command if the full command was not what you intended by the abbreviation. If you enter a set of characters that could indicate more than one command, a list of matching commands displays.

For example, entering co<Tab> lists all commands available in EXEC mode beginning with "co":

```
switch# co<Tab>
configure copy
switch# co
```

Note that the characters you entered appear at the prompt again to allow you to complete the command entry.
Identifying Your Location in the Command Hierarchy

Some features have a configuration submode hierarchy nested more than one level. In these cases, you can display information about your present working context (PWC).

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 where detail</td>
<td>Displays the PWC.</td>
</tr>
</tbody>
</table>

Example:

```
switch# configure terminal
switch(config)# interface mgmt0
switch(config-if)# where detail
mode: conf
    interface mgmt0
username: admin
vdc: switch
routing-context vrf: default
```

Using the no Form of a Command

Almost every configuration command has a \texttt{no} form that can be used to disable a feature, revert to a default value, or remove a configuration. The Cisco NX-OS command reference publications describe the function of the \texttt{no} form of the command whenever a \texttt{no} form is available.

This example shows how to disable a feature:

```
switch# configure terminal
switch(config)# feature tacacs+
switch(config)# no feature tacacs+
```

This example shows how to revert to the default value for a feature:

```
switch# configure terminal
switch(config)# banner motd #Welcome to the switch#
switch(config)# show banner motd
Welcome to the switch

switch(config)# no banner motd
switch(config)# show banner motd
User Access Verification
```

This example shows how to remove the configuration for a feature:

```
switch# configure terminal
switch(config)# radius-server host 10.10.2.2
switch(config)# show radius-server
retransmission count:0
timeout value:1
deadtime value:1
total number of servers:1

following RADIUS servers are configured:
    10.10.1.1:
        available for authentication on port:1812
        available for accounting on port:1813
    10.10.2.2:
```
available for authentication on port:1812
available for accounting on port:1813

switch(config)# no radius-server host 10.10.2.2
switch(config)# show radius-server
retransmission count:0
timeout value:1
deadtime value:1
total number of servers:1

following RADIUS servers are configured:
  10.10.1.1:
    available for authentication on port:1812
    available for accounting on port:1813

This example shows how to use the no form of a command in EXEC mode:

switch# cli var name testinterface ethernet1/2
switch# show cli variables
SWITCHNAME="switch"
TIMESTAMP="2009-05-12-13.43.13"
testinterface="ethernet1/2"

switch# cli no var name testinterface
switch# show cli variables
SWITCHNAME="switch"
TIMESTAMP="2009-05-12-13.43.13"

### Configuring CLI Variables

This section describes CLI variables in the Cisco NX-OS CLI.

### About CLI Variables

The Cisco NX-OS software supports the definition and use of variables in CLI commands. You can refer to CLI variables in the following ways:

- Entered directly on the command line.
- Passed to a script initiated using the run-script command. The variables defined in the parent shell are available for use in the child run-script command process.

CLI variables have the following characteristics:

- Cannot have nested references through another variable
- Can persist across switch reloads or exist only for the current session

Cisco NX-OS supports one predefined variable: TIMESTAMP. This variable refers to the current time when the command executes in the format YYYY-MM-DD-HH.MM.SS.

---

**Note**

The TIMESTAMP variable name is case sensitive. All letters must be uppercase.
Configuring CLI Session-Only Variables

You can define CLI session variables to persist only for the duration of your CLI session. These variables are useful for scripts that you execute periodically. You can reference the variable by enclosing the name in parentheses and preceding it with a dollar sign ($), for example $(variable-name).

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>cli var name variable-name variable-text</td>
<td>Configures the CLI session variable. The variable-name argument is alphanumeric, case sensitive, and has a maximum length of 31 characters. The variable-text argument is alphanumeric, case sensitive, can contain spaces, and has a maximum length of 200 characters.</td>
</tr>
<tr>
<td>Example: switch# cli var name testinterface ethernet 2/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>show cli variables</td>
<td>(Optional) Displays the CLI variable configuration.</td>
</tr>
<tr>
<td>Example: switch# show cli variables</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Persistent CLI Variables

You can configure CLI variables that persist across CLI sessions and device reloads.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>switch(config)#</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>cli var name variable-name variable-text</td>
<td>Configures the CLI persistent variable. The variable name is case-sensitive alphanumeric string and must begin with an alphabetic character. The maximum length is 31 characters.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch(config)# cli var name testinterface ethernet 2/1</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch(config)# exit</td>
</tr>
<tr>
<td></td>
<td>switch#</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>show cli variables</td>
<td>(Optional) Displays the CLI variable configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# show cli variables</td>
</tr>
</tbody>
</table>
Purpose

Step 5  copy running-config startup-config

(Optional)
Copies the running configuration to the startup configuration.

Example:
switch(config)# copy running-config
startup-config

Command Aliases

This section provides information about command aliases.

About Command Aliases

You can define command aliases to replace frequently used commands. The command aliases can represent all or part of the command syntax.

Command alias support has the following characteristics:

• Command aliases are global for all user sessions.
• Command aliases persist across reboots if you save them to the startup configuration.
• Command alias translation always takes precedence over any keyword in any configuration mode or submode.
• Command alias configuration takes effect for other user sessions immediately.
• The Cisco NX-OS software provides one default alias, alias, which is the equivalent to the show cli alias command that displays all user-defined aliases.
• You cannot delete or change the default command alias alias.
• You can nest aliases to a maximum depth of 1. One command alias can refer to another command alias that must refer to a valid command, not to another command alias.
• A command alias always replaces the first command keyword on the command line.
• You can define command aliases for commands in any command mode.
• If you reference a CLI variable in a command alias, the current value of the variable appears in the alias, not the variable reference.
• You can use command aliases for show command searching and filtering.

Defining Command Aliases

You can define command aliases for commonly used commands.
Configuring Command Aliases for a User Session

You can create a command alias for the current user session which is not available to any other user on the Cisco NX-OS device. You can also save the command alias for future use by the current user account.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch# configure terminal
switch(config)#
```

| Step 2 | `cli alias name alias-name alias-text` | Configures the command alias. The alias name is an alphanumeric string that is not case sensitive and must begin with an alphabetic character. The maximum length is 30 characters. |

**Example:**
```
switch(config)# cli alias name ethint interface ethernet
```

| Step 3 | `exit` | Exits global configuration mode. |

**Example:**
```
switch(config)# exit
switch#
```

| Step 4 | `alias` | (Optional) Displays the command alias configuration. |

**Example:**
```
switch# alias
```

| Step 5 | `copy running-config startup-config` | (Optional) Copies the running configuration to the startup configuration. |

**Example:**
```
switch# copy running-config startup-config
```

Command Scripts

This section describes how you can create scripts of commands to perform multiple tasks.
Running a Command Script

You can create a list of commands in a file and execute them from the CLI. You can use CLI variables in the command script.

**Note**
You cannot create the script files at the CLI prompt. You can create the script file on a remote device and copy it to the bootflash:, slot0:, or volatile: directory on the Cisco NX-OS device.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> run-script [bootflash:</td>
<td>slot0:</td>
</tr>
</tbody>
</table>

**Example:**
switch# run-script testfile

Echoing Information to the Terminal

You can echo information to the terminal, which is particularly useful from a command script. You can reference CLI variables and use formatting options in the echoed text.

This table lists the formatting options that you can insert in the text.

**Table 8: Formatting Options for the echo Command**

<table>
<thead>
<tr>
<th>Formatting Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\b</td>
<td>Inserts back spaces.</td>
</tr>
<tr>
<td>\c</td>
<td>Removes the new line character at the end of the text string.</td>
</tr>
<tr>
<td>\f</td>
<td>Inserts a form feed character.</td>
</tr>
<tr>
<td>\n</td>
<td>Inserts a new line character.</td>
</tr>
<tr>
<td>\r</td>
<td>Returns to the beginning of the text line.</td>
</tr>
<tr>
<td>\t</td>
<td>Inserts a horizontal tab character.</td>
</tr>
<tr>
<td>\v</td>
<td>Inserts a vertical tab character.</td>
</tr>
<tr>
<td>\</td>
<td>Displays a backslash character.</td>
</tr>
<tr>
<td>\nnn</td>
<td>Displays the corresponding ASCII octal character.</td>
</tr>
</tbody>
</table>
Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>echo [backslash-interpret] [text]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>switch# echo This is a test. This is a test.</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>The backslash-interpret keyword indicates that the text string contains formatting options. The text argument is alphanumeric, case sensitive, and can contain blanks. The maximum length is 200 characters. The default is a blank line.</td>
</tr>
</tbody>
</table>

Delaying Command Action

You can delay a command action for a period of time, which is particularly useful within a command script.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>sleep seconds</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>switch# sleep 30</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Causes a delay for a number of seconds. The range is from 0 to 2147483647.</td>
</tr>
</tbody>
</table>

Context-Sensitive Help

The Cisco NX-OS software provides context-sensitive help in the CLI. You can use a question mark (?) at any point in a command to list the valid input options.

CLI uses the caret (^) symbol to isolate input errors. The ^ symbol appears at the point in the command string where you have entered an incorrect command, keyword, or argument.

This table shows example outputs of context sensitive help.

Table 9: Context-Sensitive Help Example

<table>
<thead>
<tr>
<th>Example Outputs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch# clock ?</td>
<td></td>
</tr>
<tr>
<td>set HH:MM:SS Current Time</td>
<td></td>
</tr>
<tr>
<td>switch# clock</td>
<td></td>
</tr>
<tr>
<td>Displays the command syntax for the clock command in EXEC mode. The switch output shows that the set keyword is required for using the clock command.</td>
<td></td>
</tr>
<tr>
<td>switch# clock set ?</td>
<td></td>
</tr>
<tr>
<td>WORD HH:MM:SS Current Time</td>
<td></td>
</tr>
<tr>
<td>switch# clock set</td>
<td></td>
</tr>
<tr>
<td>Displays the command syntax for setting the time. The help output shows that the current time is required for setting the clock and how to format the time.</td>
<td></td>
</tr>
<tr>
<td>switch# clock set 13:32:00&lt;CR&gt;</td>
<td></td>
</tr>
<tr>
<td>% Incomplete command</td>
<td></td>
</tr>
<tr>
<td>switch#</td>
<td></td>
</tr>
<tr>
<td>Adds the current time.</td>
<td></td>
</tr>
</tbody>
</table>
Example Outputs | Description
---|---
switch# <Ctrl-P>
switch# clock set 13:32:00 | The CLI indicates the command is incomplete.
switch# clock set 13:32:00 | Displays the previous command that you entered.
switch# clock set 13:32:00 ?  
<1-31> Day of the month  
switch# clock set 13:32:00 | Displays the additional arguments for the clock set command.
switch# clock set 13:32:00 18 ?  
April Month of the year  
August Month of the year  
December Month of the year  
February Month of the year  
January Month of the year  
July Month of the year  
June Month of the year  
March Month of the year  
May Month of the year  
November Month of the year  
October Month of the year  
September Month of the year  
switch# clock set 13:32:00 18 | Displays the additional arguments for the clock set command.
switch# clock set 13:32:00 18 April 08<CR>  
% Invalid input detected at '^' marker. | Adds the date to the clock setting. The CLI indicates an error with the caret symbol (^) at 08.
switch# clock set 13:32:00 18 April ?  
<2000-2030> Enter the year (no abbreviation)  
switch# clock set 13:32:00 18 April | Displays the correct arguments for the year.
switch# clock set 13:32:00 18 April 2008<CR> switch# | Enters the correct syntax for the clock set command.

Understanding Regular Expressions

The Cisco NX-OS software supports regular expressions for searching and filtering in CLI output, such as the show commands. Regular expressions are case sensitive and allow for complex matching requirements.

Special Characters

You can also use other keyboard characters (such as ! or ~) as single-character patterns, but certain keyboard characters have special meanings when used in regular expressions.

This table lists the keyboard characters that have special meanings.

**Table 10: Special Characters with Special Meaning**

<table>
<thead>
<tr>
<th>Character</th>
<th>Special Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any single character, including white space.</td>
</tr>
</tbody>
</table>
**Multiple-Character Patterns**

You can also specify a pattern that contains multiple characters by joining letters, digits, or keyboard characters that do not have special meanings. For example, a4% is a multiple-character regular expression.

With multiple-character patterns, the order is important. The regular expression a4% matches the character a followed by a 4 followed by a percent sign (%). If the string does not have a4%, in that order, pattern matching fails. The multiple-character regular expression a. (the character a followed by a period) uses the special meaning of the period character to match the letter a followed by any single character. With this example, the strings ab, a!, or a2 are all valid matches for the regular expression.

You can remove the special meaning of a special character by inserting a backslash before it. For example, when the expression a\. is used in the command syntax, only the string a.w will be matched.

**Anchoring**

You can match a regular expression pattern against the beginning or the end of the string by anchoring these regular expressions to a portion of the string using the special characters.

This table lists the special characters that you can use for anchoring.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
</tbody>
</table>
For example, the regular expression `^con` matches any string that starts with con, and `$sole` matches any string that ends with sole.

The `^` symbol can also be used to indicate the logical function "not" when used in a bracketed range. For example, the expression `[^abcd]` indicates a range that matches any single letter, as long as it is not a, b, c, or d.

## Searching and Filtering show Command Output

Often, the output from `show` commands can be lengthy and cumbersome. The Cisco NX-OS software provides the means to search and filter the output so that you can easily locate information. The searching and filtering options follow a pipe character (`|`) at the end of the `show` command. You can display the options using the CLI context-sensitive help facility:

```
switch# show running-config | ?
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cut</td>
<td>Print selected parts of lines.</td>
</tr>
<tr>
<td>diff</td>
<td>Show difference between current and previous invocation (creates temp files: remove them with 'diff-clean' command and dont use it on commands with big outputs, like 'show tech')!</td>
</tr>
<tr>
<td>egrep</td>
<td>Egrep - print lines matching a pattern</td>
</tr>
<tr>
<td>grep</td>
<td>Grep - print lines matching a pattern</td>
</tr>
<tr>
<td>head</td>
<td>Display first lines</td>
</tr>
<tr>
<td>human</td>
<td>Output in human format (if permanently set to xml, else it will turn on xml for next command)</td>
</tr>
<tr>
<td>last</td>
<td>Display last lines</td>
</tr>
<tr>
<td>less</td>
<td>Filter for paging</td>
</tr>
<tr>
<td>no-more</td>
<td>Turn-off pagination for command output</td>
</tr>
<tr>
<td>sed</td>
<td>Stream Editor</td>
</tr>
<tr>
<td>sort</td>
<td>Stream Sorter</td>
</tr>
<tr>
<td>tr</td>
<td>Translate, squeeze, and/or delete characters</td>
</tr>
<tr>
<td>uniq</td>
<td>Discard all but one of successive identical lines</td>
</tr>
<tr>
<td>vsh</td>
<td>The shell than understands cli command</td>
</tr>
<tr>
<td>wc</td>
<td>Count words, lines, characters</td>
</tr>
<tr>
<td>xml</td>
<td>Output in xml format (according to .xsd definitions)</td>
</tr>
<tr>
<td>begin</td>
<td>Start displaying at the line that contains the text that matches the search string. The search string is case sensitive.</td>
</tr>
<tr>
<td>end</td>
<td>End with the line that matches</td>
</tr>
<tr>
<td>exclude</td>
<td>Exclude lines that match</td>
</tr>
<tr>
<td>include</td>
<td>Include lines that match</td>
</tr>
</tbody>
</table>

## Filtering and Searching Keywords

The Cisco NX-OS CLI provides a set of keywords that you can use with the `show` commands to search and filter the command output.

This table lists the keywords for filtering and searching the CLI output.

<table>
<thead>
<tr>
<th>Table 12: Filtering and Searching Keywords</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Keyword Syntax</strong></td>
</tr>
<tr>
<td><strong>begin</strong></td>
</tr>
<tr>
<td>Example:</td>
</tr>
</tbody>
</table>

The `^` symbol can also be used to indicate the logical function "not" when used in a bracketed range. For example, the expression `[^abcd]` indicates a range that matches any single letter, as long as it is not a, b, c, or d.
<table>
<thead>
<tr>
<th><strong>Keyword Syntax</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
</table>
| count             | Displays the number of lines in the command output.  
Example:  
```
show running-config | count
```
| cut [-d *character*] [-b | -c | -f | -s] | Displays only the part of the output lines. You can display a number of bytes (-b), characters (-c), fields (-f), or fields (-f). You can also use the -d keyword to define a field delimiter other than the tag character default. The -s keyword suppress the display of line not containing the delimiter.  
Example:  
```
show file testoutput | cut -b 1-10
```
| end *string*      | Displays all lines up to the last occurrence of the search string.  
Example:  
```
show running-config | end interface
```
| exclude *string*  | Displays all lines that do not include the search string. The search string is case sensitive.  
Example:  
```
show interface brief | exclude down
```
| head [lines lines] | Displays the beginning of the output for the number of lines specified. The default number of lines is 10.  
Example:  
```
show logging logfile | head lines 50
```
| human             | Displays the output in normal format if you have previously set the output format to XML using the **terminal output xml** command.  
Example:  
```
show version | human
```
| include *string*  | Displays all lines that include the search string. The search string is case sensitive.  
Example:  
```
show interface brief | include up
```
| last [lines]      | Displays the end of the output for the number of lines specified. The default number of lines is 10.  
Example:  
```
show logging logfile | last lines 50
```
| no-more           | Displays all the output without stopping at the end of the screen with the —More— prompt.  
Example:  
```
show interface brief | no-more
```
| wc [bytes | lines | words] | Displays counts of characters, lines, or words. The default is to display the number of lines, words, and characters.  
Example:  
```
show file testoutput | wc bytes
```
| xml               | Displays the output in XML format.  
Example:  
```
show version | xml
```
diff Utility

You can compare the output from a `show` command with the output from the previous invocation of that command.

Caution

Do not use the diff utility for `show` commands that have very long output, such as the `show tech-support` command.

The diff utility syntax is as follows:

```
```

This table describes the keywords for the diff utility.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--left-column</code></td>
<td>Prints only the left column of the two common lines in side-by-side format.</td>
</tr>
<tr>
<td><code>-B</code></td>
<td>Ignores the changes that only insert or delete blank lines.</td>
</tr>
<tr>
<td><code>-I</code></td>
<td>Ignores the changes that only insert or delete lines that match the regular expression.</td>
</tr>
<tr>
<td><code>-W columns</code></td>
<td>Specifies the output column width for the side-by-side format. The range is from 0 to 4294967295.</td>
</tr>
<tr>
<td><code>-b</code></td>
<td>Ignores the changes in the amount of white space. The default is to display the white space differences.</td>
</tr>
<tr>
<td><code>-c lines</code></td>
<td>Sets the number of lines of context displayed. The default number of lines is 3. The range is from 0 to 4294967295.</td>
</tr>
<tr>
<td><code>-i</code></td>
<td>Ignores uppercase and lowercase differences. The default is to report the uppercase and lowercase differences.</td>
</tr>
<tr>
<td><code>-q</code></td>
<td>Indicates whether the files differ but does not display the details of the differences. The default is to display the differences.</td>
</tr>
<tr>
<td><code>-s</code></td>
<td>Indicates whether the two outputs are the same. The default is no indication when the outputs are the same.</td>
</tr>
<tr>
<td><code>-y</code></td>
<td>Uses the side-by-side format for the output differences. The default is to display the old output lines first, followed by the current output lines.</td>
</tr>
<tr>
<td><code>again</code></td>
<td>Does not create new output file: use old ones, just change display options or add more filters.</td>
</tr>
</tbody>
</table>
The Cisco NX-OS software creates temporary files for the most current output for a `show` command for all current and previous users sessions. You can remove these temporary files using the `diff-clean` command.

`diff-clean [all-sessions | all-users]`

By default, the `diff-clean` command removes the temporary files for the current user's active session. The `all-sessions` keyword removes temporary files for all past and present sessions for the current user. The `all-users` keyword removes temporary files for all past and present sessions for the all users.

### grep and egrep Utilities

You can use the Global Regular Expression Print (`grep`) and Extended grep (`egrep`) command-line utilities to filter the `show` command output.

The `grep` and `egrep` syntax is as follows:

```
{grep | egrep} [count] [ignore-case] [invert-match] [line-exp] [line-number] [next lines] [prev lines] [word-exp] expression
```

This table lists the `grep` and `egrep` parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>count</code></td>
<td>Displays only the total count of matched lines.</td>
</tr>
<tr>
<td><code>ignore-case</code></td>
<td>Specifies to ignore the case difference in matched lines.</td>
</tr>
<tr>
<td><code>invert-match</code></td>
<td>Displays lines that do not match the expression.</td>
</tr>
<tr>
<td><code>line-exp</code></td>
<td>Displays only lines that match a complete line.</td>
</tr>
<tr>
<td><code>line-number</code></td>
<td>Specifies to display the line number before each matched line.</td>
</tr>
<tr>
<td><code>next lines</code></td>
<td>Specifies the number of lines to display after a matched line. The default is 0. The range is from 1 to 999.</td>
</tr>
<tr>
<td><code>prev lines</code></td>
<td>Specifies the number of lines to display before a matched line. The default is 0. The range is from 1 to 999.</td>
</tr>
<tr>
<td><code>word-exp</code></td>
<td>Displays only lines that match a complete word.</td>
</tr>
</tbody>
</table>
### less Utility

You can use the less utility to display the contents of the `show` command output one screen at a time. You can enter less commands at the : prompt. To display all less commands you can use, enter h at the : prompt.

### sed Utility

You can use the Stream Editor (sed) utility to filter and manipulate the `show` command output as follows:

```
sed command
```

The `command` argument contains sed utility commands.

### sort Utility

You can use the sort utility to filter `show` command output.

The sort utility syntax is as follows:

```
```

This table describes the sort utility parameters.

#### Table 15: sort Utility Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-M</code></td>
<td>Sorts by month.</td>
</tr>
<tr>
<td><code>-b</code></td>
<td>Ignores leading blanks (space characters). The default sort includes the leading blanks.</td>
</tr>
<tr>
<td><code>-d</code></td>
<td>Sorts by comparing only blanks and alphanumeric characters. The default sort includes all characters.</td>
</tr>
<tr>
<td><code>-f</code></td>
<td>Folds lowercase characters into uppercase characters.</td>
</tr>
<tr>
<td><code>-g</code></td>
<td>Sorts by comparing a general numeric value.</td>
</tr>
<tr>
<td><code>-i</code></td>
<td>Sorts only using printable characters. The default sort includes nonprintable characters.</td>
</tr>
<tr>
<td><code>-k field-number,char-position][ordering</code></td>
<td>Sorts according to a key value. There is no default key value.</td>
</tr>
<tr>
<td><code>-n</code></td>
<td>Sorts according to a numeric string value.</td>
</tr>
</tbody>
</table>
### Table 16: --More-- Prompt Commands

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[lines]&lt;space&gt;</td>
<td>Displays output lines for either the specified number of lines or the current screen size.</td>
</tr>
<tr>
<td>[lines]z</td>
<td>Displays output lines for either the specified number of lines or the current screen size. If you use the lines argument, that value becomes the new default screen size.</td>
</tr>
<tr>
<td>[lines]&lt;return&gt;</td>
<td>Displays output lines for either the specified number of lines or the current default number of lines. The initial default is 1 line. If you use the optional lines argument, that value becomes the new default number of lines to display for this command.</td>
</tr>
<tr>
<td>[lines]d or [lines]Ctrl+shift+D</td>
<td>Scrolls through output lines for either the specified number of lines or the current default number of lines. The initial default is 11 lines. If you use the optional lines argument, that value becomes the new default number of lines to display for this command.</td>
</tr>
<tr>
<td>q or Q or Ctrl-C</td>
<td>Exits the --More-- prompt.</td>
</tr>
<tr>
<td>[lines]s</td>
<td>Skips forward in the output for either the specified number of lines or the current default number of lines and displays a screen of lines. The default is 1 line.</td>
</tr>
<tr>
<td>[lines]f</td>
<td>Skips forward in the output for either the specified number of screens or the current default number of screens.</td>
</tr>
<tr>
<td>Commands</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>screens and displays a screen of lines. The default is 1 screen.</td>
<td></td>
</tr>
<tr>
<td>=</td>
<td>Displays the current line number.</td>
</tr>
<tr>
<td>[count]/expression</td>
<td>Skips to the line that matches the regular expression and displays a screen of output lines. Use the optional count argument to search for lines with multiple occurrences of the expression. This command sets the current regular expression that you can use in other commands.</td>
</tr>
<tr>
<td>[count]n</td>
<td>Skips to the next line that matches the current regular expression and displays a screen of output lines. Use the optional count argument to skip past matches.</td>
</tr>
<tr>
<td>!</td>
<td>![shell-cmd]</td>
</tr>
<tr>
<td>.</td>
<td>Repeats the previous command.</td>
</tr>
</tbody>
</table>

### Using the Command History

The Cisco NX-OS software CLI allows you to access the command history for the current user session. You can recall and reissue commands, with or without modification. You can also clear the command history.

### Recalling a Command

You can recall a command in the command history to optionally modify and enter again.

This example shows how to recall a command and reenter it:

```plaintext
switch(config)# show cli history
0 11:04:07 configure terminal
1 11:04:28 show interface ethernet 2/24
2 11:04:39 interface ethernet 2/24
3 11:05:13 no shutdown
4 11:05:19 exit
5 11:05:25 show cli history
switch(config)# !1
switch(config)# show interface ethernet 2/24
```

You can also use the Ctrl-P and Ctrl-N keystroke shortcuts to recall commands.

### Controlling CLI History Recall

You can control the commands that you recall from the CLI history using the Ctrl-P and Ctrl-N keystroke shortcuts. By default, the Cisco NX-OS software recalls all commands from the current command mode and higher command modes. For example, if you are working in global configuration mode, the command recall
keystroke shortcuts recall both EXEC mode and global configuration mode commands. Using the terminal history no-exec-in-config command, you can avoid recalling EXEC mode commands when you are in a configuration mode.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>[no] terminal history</td>
<td></td>
</tr>
<tr>
<td>no-exec-in-config</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch# terminal history</td>
<td></td>
</tr>
<tr>
<td>no-exec-in-config</td>
<td>Configures the CLI history to remove the EXEC commands when you use the recall keystroke shortcuts in a configuration mode. The default recalls EXEC commands. You can revert to the default using the no form of the command.</td>
</tr>
</tbody>
</table>

**Configuring the CLI Edit Mode**

You can recall commands from the CLI history using the Ctrl-P and Ctrl-N keystroke shortcuts and edit them before reissuing them. The default edit mode is emacs. You can change the edit mode to vi.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>[no] terminal edit-mode vi [persist]</td>
<td>Changes the CLI edit mode to vi for the user session. The persist keyword makes the setting persistent across sessions for the current username. Use the no to revert to using emacs.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch# terminal edit-mode vi</td>
<td></td>
</tr>
</tbody>
</table>

**Displaying the Command History**

You can display the command history using the show cli history command.

The show cli history command has the following syntax:

```
show cli history [lines] [config-only | exec-only | this-mode-only] [unformatted]
```

By default, the number of lines displayed is 12 and the output includes the command number and timestamp. The example shows how to display default number of lines of the command history:

```
switch# show cli history
```

The example shows how to display 20 lines of the command history:

```
switch# show cli history 20
```

The example shows how to display only the configuration commands in the command history:

```
switch(config)# show cli history config-only
```
The example shows how to display only the EXEC commands in the command history:

```
switch(config)# show cli history exec-only
```

The example shows how to display only the commands in the command history for the current command mode:

```
switch(config-if)# show cli history this-mode-only
```

The example shows how to display only the commands in the command history without the command number and timestamp:

```
switch(config)# show cli history unformatted
```

### Enabling or Disabling the CLI Confirmation Prompts

For many features, the Cisco NX-OS software displays prompts on the CLI that ask for confirmation before continuing. You can enable or disable these prompts. The default is enabled.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>[no] terminal dont-ask [persist]</td>
<td>Disables the CLI confirmation prompt. The <strong>persist</strong> keyword makes the setting persistent across sessions for the current username. The default is enabled. Use the <strong>no</strong> form of the command to enable the CLI confirmation prompts.</td>
</tr>
</tbody>
</table>

**Example:**

```
switch# terminal dont-ask
```

### Setting CLI Display Colors

You can change the CLI colors to display as follows:

- The prompt displays in green if the previous command succeeded.
- The prompt displays in red if the previous command failed.
- The user input displays in blue.
- The command output displays in the default color.

The default colors are those sent by the terminal emulator software.
### Sending Commands to Modules

You can send commands directly to modules from the supervisor module session using the `slot` command. The `slot` has the following syntax:

```
slot slot-number [quoted] command-string
```

By default, the keyword and arguments in the `command-string` argument are space-separated. To send more than one command to a module, separate the commands with a space character, a semicolon character (;), and a space character.

The `quoted` keyword indicates that the command string begins and ends with double quotation marks ("."). Use this keyword when you want to redirect the module command output to a filtering utility, such as `diff`, that is only supported on the supervisor module session.

The following example shows how to display and filter module information:

```
switch# slot 2 show version | grep lc
```

The following example shows how to filter module information on the supervisor module session:

```
switch# slot 2 quoted "show version" | diff
switch# slot 4 quoted "show version" | diff -c
```

```diff
*** /volatile/vsh_diff_1_root_8430_slot__quoted_show_version.old Wed Apr 29 20:10:41 2009
--- - Wed Apr 29 20:10:41 2009
**************
*** 1,5 ****

Hardware
  bootflash: 0 blocks (block size 512b)
```
BIOS Loader Prompt

When the supervisor modules power up, a specialized BIOS image automatically loads and tries to locate a valid kickstart image for booting the system. If a valid kickstart image is not found, the following BIOS loader prompt displays:

```
loader>
```

For information on how to load the Cisco NX-OS software from the loader> prompt, see the Cisco Nexus 7000 Series NX-OS Troubleshooting Guide, Release 4.x.

Examples Using the CLI

This section includes examples of using the CLI.

Defining Command Aliases

This example shows how to define command aliases:

```
cli alias name ethint interface ethernet
cli alias name shintbr show interface brief
cli alias name shintupbr shintbr | include up | include ethernet
```

This example shows how to use a command alias:

```
switch# configure terminal
switch(config)# ethint 2/3
switch(config-if)#
```

Using CLI Session Variables

You can reference a variable using the syntax `$(variable-name)`. This example shows how to reference a user-defined CLI session variable:

```
switch# show interface $(testinterface)
Ethernet2/1 is down (Administratively down)
Hardware is 10/100/1000 Ethernet, address is 0000.0000.0000 (bia 0019.076c.4dac)
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA
auto-duplex, auto-speed
Beacon is turned off
Auto-Negotiation is turned on
Input flow-control is off, output flow-control is off
Auto-mdix is turned on
Switchport monitor is off
Last clearing of "show interface" counters never
5 minute input rate 0 bytes/sec, 0 packets/sec
5 minute output rate 0 bytes/sec, 0 packets/sec
L3 in Switched:
  ucast: 0 pkts, 0 bytes - mcast: 0 pkts, 0 bytes
L3 out Switched:
Using the System-Defined Timestamp Variable

This example uses $\textit{TIMESTAMP}$ when redirecting \texttt{show} command output to a file:

```
switch# \texttt{show running-config > rcfg.$(TIMESTAMP)}
Preparing to copy....done
switch# \texttt{dir}
    12667    May 01 12:27:59 2008 rcfg.2008-05-01-12.27.59
```

Running a Command Script

This example displays the CLI commands specified in the script file:

```
switch# \texttt{show file testfile}
configure terminal
interface ethernet 2/1
no shutdown
end
show interface ethernet 2/1
```

This example displays the \texttt{run-script} command execution output:

```
switch# \texttt{run-script testfile}
`\texttt{configure terminal}`
`\texttt{interface ethernet 2/1}`
`\texttt{no shutdown}`
`end`
`\texttt{show interface ethernet 2/1}`
```
Ethernet2/1 is down (Link not connected)
Hardware is 10/100/1000 Ethernet, address is 0019.076c.4dac (bia 0019.076c.4dac)
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA
Port mode is trunk
auto-duplex, auto-speed
Beacon is turned off
Auto-Negotiation is turned on
Input flow-control is off, output flow-control is off
Auto-mdix is turned on
Switchport monitor is off
Last clearing of "show interface" counters 1d26.2uh
5 minute input rate 0 bytes/sec, 0 packets/sec
5 minute output rate 0 bytes/sec, 0 packets/sec
Rx
0 input packets 0 unicast packets 0 multicast packets
0 broadcast packets 0 jumbo packets 0 storm suppression packets
0 bytes
Tx
0 output packets 0 multicast packets
0 broadcast packets 0 jumbo packets
0 bytes
0 input error 0 short frame 0 watchdog
0 no buffer 0 runt 0 CRC 0 ecc
0 overrun 0 underrun 0 ignored 0 bad etype drop
0 bad proto drop 0 if down drop 0 input with dribble
0 input discard
0 output error 0 collision 0 deferred
0 late collision 0 lost carrier 0 no carrier
0 babble
0 Rx pause 0 Tx pause 0 reset

This chapter describes how to manage the terminal settings and sessions on a Cisco NX-OS device. This chapter includes the following sections:

- Information About Terminal Settings and Sessions, page 59
- Licensing Requirements for Terminal Settings and Sessions, page 61
- Configuring the Console Port, page 61
- Configuring the COM1 Port, page 63
- Configuring Virtual Terminals, page 64
- Configuring Modem Connections, page 66
- Clearing Terminal Sessions, page 70
- Displaying Terminal and Session Information, page 71
- Default Settings for File System Parameters, page 71
- Additional References for Terminal Settings and Sessions, page 71

Information About Terminal Settings and Sessions

This section includes information about terminal settings and sessions.

Terminal Session Settings

The Cisco NX-OS software features allow you to manage the following characteristics of terminals:

- **Terminal type**: Name used by Telnet when communicating with remote hosts
- **Length**: Number of lines of command output displayed before pausing
- **Width**: Number of characters displayed before wrapping the line
- **Inactive session timeout**: Number of minutes that a session remains inactive before the device terminates it
**Console Port**

The console port is an asynchronous serial port that allows you to connect to the device for initial configuration through a standard RS-232 port with an RJ-45 connector. Any device connected to this port must be capable of asynchronous transmission. You can configure the following parameters for the console port:

- **Data bits**: Specifies the number of bits in an 8-bit byte that is used for data.
- **Inactive session timeout**: Specifies the number of minutes a session can be inactive before it is terminated.
- **Parity**: Specifies the odd or even parity for error detection.
- **Speed**: Specifies the transmission speed for the connection.
- **Stop bits**: Specifies the stop bits for an asynchronous line.

Configure your terminal emulator with 9600 baud, 8 data bits, 1 stop bit, and no parity.

**COM1 Port**

A COM1 port is an RS-232 port with a DB-9 interface that enables you to connect to an external serial communication device such as a modem. You can configure the following parameters for the COM1 port:

- **Data bits**: Specifies the number of bits in an 8-bit byte that is used for data.
- **Hardware flowcontrol**: Enables the flow-control hardware.
- **Parity**: Specifies the odd or even parity for error detection.
- **Speed**: Specifies the transmission speed for the connection.
- **Stop bits**: Specifies the stop bits for an asynchronous line.

Configure your terminal emulator with 9600 baud, 8 data bits, 1 stop bit, and no parity.

**Virtual Terminals**

You can use virtual terminal lines to connect to your Cisco NX-OS device. Secure Shell (SSH) and Telnet create virtual terminal sessions. You can configure an inactive session timeout and a maximum sessions limit for virtual terminals.

**Modem Support**

You can connect a modem to the COM1 or console ports on the supervisor module. The following modems were tested on devices running the Cisco NX-OS software:

- Hayes Accura V.92 ([http://www.hayesmicro.com/Products/accura-prod-v92.htm](http://www.hayesmicro.com/Products/accura-prod-v92.htm))
Do not connect a modem when the device is booting. Only connect the modem when the device is powered-up.

The Cisco NX-OS software has the default initialization string (ATE0Q1&D2&C1S0=1\015) to detect connected modems. The default string is defined as follows:

- **AT**: Attention
- **E0 (required)**: No echo
- **Q1**: Result code on
- **&D2**: Normal data terminal ready (DTR) option
- **&C1**: Enable tracking the state of the data carrier
- **S0=1**: Pick up after one ring
- **\015 (required)**: Carriage return in octal

**Virtualization Support for Configuration Files**

Except for removing the configuration for a missing module, the configuration file operations are local to the virtual device context (VDC). You can remove the missing module configuration only from the default VDC. For more information on VDCs, see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2.

**Licensing Requirements for Terminal Settings and Sessions**

The following table shows the licensing requirements for this feature:

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>Terminal setting configuration requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2.</td>
</tr>
</tbody>
</table>

**Configuring the Console Port**

You can set the following characteristics for the console port:

- Data bits
- Inactive session timeout
- Parity
Before You Begin
Log in to the console port.
Ensure that you are in the default VDC.

Procedure

<table>

### Configuring the COM1 Port

You can set the following characteristics for the COM1 port:

- Data bits
- Flow control on the hardware
- Parity
- Speed
- Stop bits

**Before You Begin**

Log in to the console port or COM1 port.

Ensure that you are in the default VDC.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# configure terminal</code></td>
</tr>
<tr>
<td></td>
<td><code>switch(config)#</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>line com1</strong></td>
</tr>
<tr>
<td></td>
<td>Enters COM1 configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# line com1</code></td>
</tr>
<tr>
<td></td>
<td><code>switch(config-com1)#</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>databits bits</strong></td>
</tr>
<tr>
<td></td>
<td>Configures the number of data bits per byte. The range is from 5 to 8. The default is 8.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch(config-com1)# databits 7</code></td>
</tr>
</tbody>
</table>
### Configuring Virtual Terminals

This section describes how to configure virtual terminals on Cisco NX-OS devices.

### Configuring the Inactive Session Timeout

You can configure a timeout for inactive virtual terminal sessions on a Cisco NX-OS device.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>flowcontrol hardware</td>
<td>Enables flow control on the hardware. The default is enabled.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch(config-com1)# flowcontrol hardware</td>
<td>Use the no flowcontrol hardware command to disable flow control on the hardware.</td>
</tr>
</tbody>
</table>

| Step 5          | parity {even | none | odd} | Configures the parity. The default is none. |
| Example:        | switch(config-com1)# parity even | |

| Step 6          | speed {300 | 1200 | 2400 | 4800 | 9600 | 38400 | 57600 | 115200} | Configures the transmit and receive speed. The default is 9600. |
| Example:        | switch(config-com1)# speed 115200 | |

| Step 7          | stopbits {1 | 2} | Configures the stop bits. The default is 1. |
| Example:        | switch(config-com1)# stopbits 2 | |

| Step 8          | exit | Exits COM1 configuration mode. |
| Example:        | switch(config-com1)# exit switch(config)# | |

| Step 9          | show line com1 | (Optional) Displays the COM1 port settings. |
| Example:        | switch(config)# show line com1 | |

| Step 10         | copy running-config startup-config | (Optional) Copies the running configuration to the startup configuration. |
| Example:        | switch(config)# copy running-config startup-config | |
### Configuring Virtual Terminals

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# configure terminal</code>&lt;br&gt;<code>switch(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>line vty</code></td>
<td>Enters line configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# line vty</code>&lt;br&gt;<code>switch(config-line)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>exec-timeout minutes</code></td>
<td>Configures the inactive session timeout for the VDC. The range is from 0 to 525600 minutes (8760 hours). A value of 0 minutes disables the timeout. The default value is 0.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch(config-line)# exec-timeout 30</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>exit</code></td>
<td>Exits line configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch(config-line)# exit</code>&lt;br&gt;<code>switch(config)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>`show running-config all</td>
<td>begin vty`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>`switch(config)# show running-config all</td>
<td>begin vty`</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch(config)# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Configuring the Session Limit

You can limit the number of virtual terminal sessions on your Cisco NX-OS device.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# configure terminal</code>&lt;br&gt;<code>switch(config)#</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Modem Connections

You can connect a modem to either the COM1 port or the console port.

We recommend that you use the COM1 port to connect the modem.

### Enabling a Modem Connection

You must enable the modem connection on the port before you can use the modem.

#### Before You Begin

- Log in to the console port.
- Ensure that you are in the default VDC.

---

#### Command or Action | Purpose
--- | ---
**Step 2** | line vty

Example:
```
switch# line vty
switch(config-line)#
```

Enters line configuration mode.

**Step 3** | session-limit sessions

Example:
```
switch(config-line)# session-limit 10
```

Configures the maximum number of virtual sessions for the Cisco NX-OS device. The range is from 1 to 64. The default is 32.

**Step 4** | exit

Example:
```
switch(config-line)# exit
switch(config)#
```

Exits line configuration mode.

**Step 5** | show running-config all | being vty

Example:
```
switch(config)# show running-config all
| begin vty
```

(Optional) Displays the virtual terminal configuration.

**Step 6** | copy running-config startup-config

Example:
```
switch(config)# copy running-config startup-config
```

(Optional) Copies the running configuration to the startup configuration.
## Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch# configure terminal
switch(config)#
```

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter one of the following commands:</td>
<td></td>
<td>Enters COM1 configuration mode or console configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>line com1</td>
<td>Enters COM1 configuration mode.</td>
</tr>
<tr>
<td>line console</td>
<td>Enters console configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch# line com1
switch(config-com1)#
```

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>modem in</td>
<td>Enables modem input on the COM1 or console port.</td>

</tbody>
</table>

**Example:**
```
switch(config-com1)# modem in
```

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>exit</td>
<td>Exits COM1 or console configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch(config-com1)# exit
switch(config)#
```

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show line</td>
<td>(Optional) Displays the console and COM1 settings.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch(config)# show line
```

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch(config)# copy running-config startup-config
```

### Downloading the Default Initialization String

The Cisco NX-OS software provides a default initialization string that you can download for connecting with the modem. The default initialization string is ATE0Q1&D2&C1S0=1\015.

**Before You Begin**

Log in to the console port.
Ensure that you are in the default VDC.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Enter one of the following commands:</td>
<td></td>
</tr>
<tr>
<td><strong>Option</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>line com1</td>
<td>Enters COM1 configuration mode.</td>
</tr>
<tr>
<td>line console</td>
<td>Enters console configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# line com1</td>
<td></td>
</tr>
<tr>
<td>switch(config-com1)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> modem init-string default</td>
<td>Writes the default initialization string to the modem.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config-com1)# modem init-string default</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits COM1 or console configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config-com1)# exit</td>
<td></td>
</tr>
<tr>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show line</td>
<td>(Optional) Displays the COM1 and console settings.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config)# show line</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config)# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring and Downloading a User-Specified Initialization String**

You can configure and download your own initialization when the default initialization string is not compatible with your modem.
Before You Begin
Log in to the console port.
Ensure that you are in the default VDC.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Enter one of the following commands:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>line com1</td>
<td>Enters COM1 configuration mode.</td>
</tr>
<tr>
<td></td>
<td>line console</td>
<td>Enters console configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch# line com1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config-com1)#</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>modem set-string user-input string</td>
<td>Sets the user-specified initialization string for the COM1 or console port. The initialization string is alphanumeric and case sensitive, can contain special characters, and has a maximum of 100 characters.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config-com1)# modem set-string user-input ATE0Q1&amp;D2&amp;C1S0=3\015</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>You must first set the user-input string before initializing the string.</td>
</tr>
<tr>
<td>Step 4</td>
<td>modem init-string user-input</td>
<td>Writes the user-specified initialization string to the modem connected to the COM1 or console port.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config-com1)# modem init-string user-input</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>exit</td>
<td>Exits COM1 or console configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config-com1)# exit</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>show line</td>
<td>(Optional) Displays the COM1 and console settings.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)# show line</td>
<td></td>
</tr>
</tbody>
</table>
Initializing a Modem for a Powered-Up Cisco NX-OS Device

If you connect a modem to a powered-up physical device, you must initialize the modem before you can use it.

Before You Begin

After waiting until the Cisco NX-OS device has completed the boot sequence and the system image is running, connect the modem to either the COM1 port or the console port on the device.

Enable the modem connection on the port.

Ensure that you are in the default VDC.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7: copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>

Example:

```
switch(config)# copy running-config startup-config
```

Clearing Terminal Sessions

You can clear terminal sessions on the Cisco NX-OS device.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: show users</td>
<td>(Optional) Displays the user sessions on the device.</td>
</tr>
</tbody>
</table>

Example:

```
switch# show users
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2: clear line name</td>
<td>Clears a terminal session on a specific line. The line name is case sensitive.</td>
</tr>
</tbody>
</table>

Example:

```
switch# clear line pts/0
```
### Displaying Terminal and Session Information

To display terminal and session information, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show terminal</td>
<td>Displays terminal settings.</td>
</tr>
<tr>
<td>show line</td>
<td>Displays the COM1 and console ports settings.</td>
</tr>
<tr>
<td>show users</td>
<td>Displays virtual terminal sessions.</td>
</tr>
<tr>
<td>show running-config [all]</td>
<td>Displays the user account configuration in the running configuration. The all keyword displays the default values for the user accounts.</td>
</tr>
</tbody>
</table>

For detailed information about the fields in the output from these commands, see the Cisco Nexus 7000 Series NX-OS Fundamentals Command Reference, Release 4.2.

### Default Settings for File System Parameters

This table lists the default settings for the file system parameters.

**Table 18: Default File System Settings**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default filesystem</td>
<td>bootflash:</td>
</tr>
</tbody>
</table>

### Additional References for Terminal Settings and Sessions

This section includes additional references for terminal settings and sessions on NX-OS devices.

Basic Device Management

This chapter describes how to perform basic management tasks on the Cisco NX-OS device. This chapter includes the following sections:

- Information About Basic Device Management, page 73
- Licensing Requirements for Basic Device Management, page 74
- Changing the Device Hostname, page 75
- Configuring the MOTD Banner, page 75
- Configuring the Time Zone, page 76
- Configuring Summer Time (Daylight Saving Time), page 77
- Manually Setting the Device Clock, page 78
- Managing Users, page 79
- Verifying the Device Configuration, page 79
- Default Settings for Basic Device Parameters, page 80
- Additional References for Basic Device Management, page 80
- Feature History for Basic Device Management, page 80

Information About Basic Device Management

This section provides information about basic device management.

Device Hostname

You can change the device hostname displayed in the command prompt from the default (switch) to another character string. When you give the device a unique hostname, you can easily identify the device from the command-line interface (CLI) prompt.
**Message-of-the-Day Banner**

The message-of-the-day (MOTD) banner displays before the user login prompt on the device. This message can contain any information that you want to display for users of the device.

**Device Clock**

If you do not synchronize your device with a valid outside timing mechanism, such as an NTP clock source, you can manually set the clock time when your device boots. For information about NTP, see the Cisco Nexus 7000 Series NX-OS System Management Configuration Guide, Release 4.2.

**Time Zone and Summer Time (Daylight Saving Time)**

You can configure the time zone and summer time (daylight saving time) setting for your device. These values offset the clock time from Coordinated Universal Time (UTC). UTC is International Atomic Time (TAI) with leap seconds added periodically to compensate for the Earth's slowing rotation. UTC was formerly called Greenwich Mean Time (GMT).

**User Sessions**

You can display the active user session on your device. You can also send messages to the user sessions. For more information about managing user sessions and accounts, see the Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.2.

**Virtualization Support for Basic Device Management**

Basic device management is local to the virtual device context (VDC). For more information on VDCs, see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2.

**Licensing Requirements for Basic Device Management**

The following table shows the licensing requirements for this feature:

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>Basic device management requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2.</td>
</tr>
</tbody>
</table>
Changing the Device Hostname

You can change the device hostname displayed in the command prompt from the default (switch) to another character string.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>switch(config)#</td>
</tr>
<tr>
<td>2</td>
<td>hostname name</td>
<td>Changes the device hostname. The name argument is alphanumeric, case sensitive, and has a length of 32 characters. The default is switch.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>switch(config)# hostname Engineering2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Engineering2(config)#</td>
</tr>
<tr>
<td>3</td>
<td>switchname name</td>
<td>Changes the device hostname. The default is switch.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>switch# switchname Engineering2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Engineering2(config)#</td>
</tr>
<tr>
<td>4</td>
<td>exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Engineering2(config)# exit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Engineering2#</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Engineering2# copy running-config</td>
</tr>
<tr>
<td></td>
<td></td>
<td>startup-config</td>
</tr>
</tbody>
</table>

Configuring the MOTD Banner

You can configure the MOTD to display before the login prompt on the terminal when a user logs in. The MOTD banner has the following characteristics:

- Maximum of 80 characters per line
- Maximum of 40 lines
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>banner motd delimiting-character message delimiting-character</td>
<td>Configures the MOTD banner. Do not use the delimiting-character in the message text.</td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>Do not use &quot; or % as a delimiting character.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)# banner motd #Welcome to the Switch#</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)# exit</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch#</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>show banner motd</td>
<td>(Optional) Displays the configured MOTD banner.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch# show banner motd</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

## Configuring the Time Zone

You can configure the time zone to offset the device clock time from UTC.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>clock timezone zone-name offset-hours offset-minutes</td>
<td>Configures the time zone. The zone-name argument is a 3-character string for the time zone acronym (for example, PST or EST). The offset-hours</td>
</tr>
</tbody>
</table>
### Configuring Summer Time (Daylight Saving Time)

You can configure when summer time, or daylight saving time, is in effect for the device and the offset in minutes.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# configure terminal &lt;br&gt; switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>clock summer-time zone-name &lt;br&gt; start-week start-day start-month start-time &lt;br&gt; end-week end-day end-month end-time &lt;br&gt; offset-minutes</td>
<td>Configures summer time or daylight saving time. The zone-name argument is a three character string for the time zone acronym (for example, PST and EST). The values for the start-day and end-day arguments are Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and Sunday. The values for the start-month and end-month arguments are January, February, March, April, May, June, July, August, September, October, November, and December. The value for the start-time and end-time arguments are in the format hh:mm.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch(config)# clock summer-time &lt;br&gt; PDT &lt;br&gt; 1 Sunday March 02:00 1 Sunday November 02:00 60</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Exits global configuration mode.</td>
<td></td>
</tr>
<tr>
<td>show clock detail</td>
<td>(Optional) Displays the configured MOTD banner.</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
<td></td>
</tr>
</tbody>
</table>

**Manually Setting the Device Clock**

You can set the clock manually if your device cannot access a remote time source.

**Before You Begin**

Configure the time zone.

**Procedure**

<table>
<thead>
<tr>

Managing Users

You can display information about users logged into the device and send messages to those users.

Displaying Information about the User Sessions

You can display information about the user session on the device.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>show users</strong></td>
<td>Displays the user sessions.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# show users</td>
<td></td>
</tr>
</tbody>
</table>

Sending a Message to Users

You can send a message to active users currently using the device CLI.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>show users</strong></td>
<td>(Optional) Displays the active user sessions.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# show users</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Sends a message to all active users or to a specific user. The message can be up to 80 alphanumeric characters and is case sensitive.</td>
</tr>
<tr>
<td><strong>send [session line] message-text</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# send Reloading the device is 10 minutes!</td>
<td></td>
</tr>
</tbody>
</table>

Verifying the Device Configuration

To verify the device configuration, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show running-config</td>
<td>Displays the running configuration.</td>
</tr>
<tr>
<td>show startup-config</td>
<td>Displays the startup configuration.</td>
</tr>
</tbody>
</table>
For detailed information about the fields in the output from these commands, see the Cisco Nexus 7000 Series NX-OS Fundamentals Command Reference, Release 4.2.

Default Settings for Basic Device Parameters

This table lists the default settings for basic device parameters.

Information About theDevice File Systems, Directories, and Files

This section describes file systems, directories, and files on the Cisco NX-OS device.

File Systems

The syntax for specifying a local file system is `filesystem[/modules/]`. This table describes file systems that you can reference on your device.
### Table 21: File System Syntax Components

<table>
<thead>
<tr>
<th>File System Name</th>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bootflash</td>
<td>sup-active</td>
<td>Internal CompactFlash memory located on the active supervisor module used for storing image files, configuration files, and other miscellaneous files. The initial default directory is bootflash.</td>
</tr>
<tr>
<td></td>
<td>sup-local</td>
<td></td>
</tr>
<tr>
<td></td>
<td>sup-standby</td>
<td>Internal CompactFlash memory located on the standby supervisor module used for storing image files, configuration files, and other miscellaneous files.</td>
</tr>
<tr>
<td></td>
<td>sup-remote</td>
<td></td>
</tr>
<tr>
<td>slot0</td>
<td>—</td>
<td>External CompactFlash memory installed in a supervisor module used for storing system images, configuration files, and other miscellaneous files.</td>
</tr>
<tr>
<td>volatile</td>
<td>—</td>
<td>Volatile random-access memory (VRAM) located on a supervisor module used for temporary or pending changes.</td>
</tr>
<tr>
<td>nvram</td>
<td>—</td>
<td>Nonvolatile random-access memory (NVRAM) located on a supervisor module used for storing the startup-configuration file.</td>
</tr>
<tr>
<td>log</td>
<td>—</td>
<td>Memory on the active supervisor that stores logging file statistics.</td>
</tr>
<tr>
<td>system</td>
<td>—</td>
<td>Memory on a supervisor module used for storing the running-configuration file.</td>
</tr>
<tr>
<td>debug</td>
<td>—</td>
<td>Memory on a supervisor module used for debug logs.</td>
</tr>
<tr>
<td>usb1</td>
<td>—</td>
<td>External USB flash memory installed in a supervisor module used for storing image files, configuration files, and other miscellaneous files.</td>
</tr>
<tr>
<td>usb2</td>
<td>—</td>
<td>External USB flash memory installed in a supervisor module hold.</td>
</tr>
</tbody>
</table>
Directories

You can create directories on bootflash: and external flash memory (slot0:, usb1:, and usb2:). You can navigate through these directories and use them for files.

Files

You create and access files on bootflash: volatile:, slot0:, usb1:, and usb2: file systems. You can only access files on the system: file systems. You can use the debug: file system for debug log files specified in the `debug logfile` command. You can also download files, such as system image files, from remote servers using FTP, Secure Copy (SCP), Secure Shell FTP (SFTP), and TFTP.

Virtualization Support for File Systems

Most file system, directory, and file configuration and operations are local to the virtual device context (VDC). One exception is formatting an external Flash device, which you must perform from the default VDC. For more information on VDCs, see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2.

Licensing Requirements for File Systems, Directories, and Files

The following table shows the licensing requirements for this feature:

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>Using the file systems, directories, and files requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2.</td>
</tr>
</tbody>
</table>

Formatting External Flash Devices

You can format an external flash device to erase the contents from the default VDC and restore it to its factory-shipped state.
For information on recovering corrupted bootflash using formatting, see the Cisco Nexus 7000 Series NX-OS Troubleshooting Guide, Release 4.x.

**Before You Begin**

Ensure you are in the default VDC.

Insert the external flash device in the active supervisor module.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> dir {slot0:</td>
<td>usb1:</td>
</tr>
<tr>
<td>Example: switch# dir slot0:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> format {slot0:</td>
<td>usb1:</td>
</tr>
<tr>
<td>Example: switch# format slot0:</td>
<td></td>
</tr>
</tbody>
</table>

**Working with Directories**

This section describes how to work with directories on the Cisco NX-OS device.

**Identifying the Current Directory**

You can display the directory name of your current directory.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> pwd</td>
<td>Displays the name of your current directory.</td>
</tr>
<tr>
<td>Example: switch# pwd</td>
<td></td>
</tr>
</tbody>
</table>

**Changing the Current Directory**

You can change the current directory for file system operations. The initial default directory is bootflash:
Creating a Directory

You can create directories in the bootflash: and flash device file systems.

<table>
<thead>
<tr>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Creating a Directory

<table>
<thead>
<tr>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Displaying Directory Contents

You can display the contents of a directory.
Deleting a Directory

You can remove directories from the file systems on your device.

Before You Begin

Ensure that the directory is empty before you try to delete it.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>pwd</code></td>
<td>(Optional) Displays the name of your current default directory.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>switch# pwd</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| `dir [filesystem://[/module[/directory]]]` | (Optional) Displays the contents of the current directory. The file system, module, and directory names are case sensitive. If the directory is not empty, you must delete all the files before you can delete the directory. |
| Example:          |         |
| `switch# dir bootflash:test` |         |

| **Step 3**        |         |
| `rmdir [filesystem://[/module[/directory]]]` | Deletes a directory. The file system and directory name are case sensitive. |
| Example:          |         |
| `switch# mkdir test` |         |

Related Topics

- Deleting a Directory, page 94

Accessing Directories on the Standby Supervisor Module

You can access all file systems on the standby supervisor module (remote) from a session on the active supervisor module. This feature is useful when copying files to the active supervisor modules requires similar files to exist on the standby supervisor module. To access the file systems on the standby supervisor module from a session on the active supervisor module, you specify the standby supervisor module in the path to the file using either `filesystem://sup-remote/` or `filesystem://sup-standby/`.  

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>`dir [directory</td>
<td>filesystem://[/module[/directory]]]`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>switch# dir bootflash:test</code></td>
<td></td>
</tr>
</tbody>
</table>
Working with Files

This section describes how to work with files on the Cisco NX-OS device.

Moving Files

You can move a file from one directory to another directory.

⚠️ Caution

If a file with the same name already exists in the destination directory, that file is overwritten by the moved file.

You can use the move command to rename a file by moving the file within the same directory.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>(Optional) Displays the name of your current default directory.</td>
</tr>
<tr>
<td><code>pwd</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch# pwd</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>(Optional) Displays the contents of the current directory. The file system and directory name are case sensitive.</td>
</tr>
<tr>
<td><code>dir [filesystem://module/][directory]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch# dir bootflash</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Moves a file. The file system, module, and directory names are case sensitive. The target-filename argument is alphanumeric, case sensitive, and has a maximum of 64 characters. If the target-filename argument is not specified, the filename defaults to the source-filename argument value.</td>
</tr>
<tr>
<td>`move [filesystem://module/][directory/][directory/]</td>
<td>directory/][source-filename</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>switch# move test old_tests/test1</td>
<td></td>
</tr>
</tbody>
</table>

Copying Files

You can make copies of files, either within the same directory or on another directory.

📝 Note

Use the dir command to ensure that enough space is available in the target file system. If enough space is not available, use the delete command to remove unneeded files.
## Deleting Files

You can delete a file from a directory.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>dir [filesystem://module/][directory]</code></td>
<td>(Optional) Displays the contents of the current directory. The file system and directory name are case sensitive.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# dir bootflash</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>delete [filesystem://module/][directory/]filename</code></td>
<td>Deletes a file. The file system, module, and directory names are case sensitive. The <code>source-filename</code> argument is case sensitive.</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# move test old_tests/test1</td>
</tr>
<tr>
<td>Caution</td>
<td>If you specify a directory, the <code>delete</code> command deletes the entire directory and all its contents.</td>
</tr>
</tbody>
</table>

## Displaying File Contents

You can display the contents of a file.
Displaying File Checksums

You can display checksums to check the file integrity.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>show file [filesystem://module/][directory/][filename] {cksum</td>
<td>md5sum}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# show file bootflash:test-results</td>
<td></td>
</tr>
</tbody>
</table>

Compressing and Uncompressing Files

You can compress and uncompress files on your Cisco NX-OS device using Lempel-Ziv 1977 (LZ77) coding.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>dir [filesystem://module/][directory]]</td>
<td>(Optional) Displays the contents of the current directory. The file system and directory name are case sensitive.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# dir bootflash</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>gzip [filesystem://module/][directory/][filename]</td>
<td>Compresses a file. After the file is compressed, it has a .gz prefix.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# gzip show_tech</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>gunzip [filesystem://module/][directory/][filename].gz</td>
<td>Uncompresses a file. The file to uncompress must have the .gz prefix. After the file is uncompressed, it does not have the .gz prefix.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# gunzip show_tech.gz</td>
<td></td>
</tr>
</tbody>
</table>
Displaying the Last Lines in a File

You can display the last lines of a file.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>tail [filesystem://module/][directory/][filename [lines]]</strong></td>
</tr>
</tbody>
</table>

Example:
switch# tail ospf-gr.conf

Redirecting show Command Output to a File

You can redirect `show` command output to a file on bootflash:, slot0:, volatile:, or on a remote server. You can also specify the format for the command output.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>**terminal redirection-mode {ascii</td>
</tr>
</tbody>
</table>

Example:
switch# terminal redirection-mode zipped

**Step 2** | **show-command > [filesystem://module/][directory] || [directory /]][filename** | Redirects the output from a `show` command to a file. |

Example:
switch# show tech-support > bootflash:techinfo

Finding Files

You can find the files in the current working directory and its subdirectories that have names that begin with a specific character string.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>pwd</strong></td>
</tr>
</tbody>
</table>

Example:
switch# pwd
### Creating an Archive Files

You can create an archive file and add files to it. You can specify the following compression types:

- bzip2
- gzip
- Uncompressed

The default is gzip.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>**tar create {bootflash:</td>
</tr>
<tr>
<td>volatile:}archive-filename [absolute] [bz2-compress] [gz-compress] [remove] [uncompressed] [verbose] filename-list</td>
<td>The <em>absolute</em> keyword specifies that the leading backslash characters () should not be removed from the names of the files added to the archive file. By default, the leading backslash characters are removed.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>switch# tar create bootflash:config-archive gz-compress bootflash:config-file</strong></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Appending Files to an Archive File

You can append files to an existing archive file on your Cisco NX-OS device.

**Before You Begin**

You have created an archive file on your Cisco NX-OS device.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 tar append</td>
<td>Creates an archive file and adds files to it. The archive filename is not case sensitive.</td>
</tr>
<tr>
<td>bootflash:</td>
<td>The <code>absolute</code> keyword specifies that the leading backslash characters () should not be removed from the names of the files added to the archive file. By default, the leading backslash characters are removed.</td>
</tr>
<tr>
<td>volatile:archive-filename</td>
<td>The <code>remove</code> keyword specifies that the Cisco NX-OS software should delete the files from the filesystem after adding them to the archive. By default, the files are not deleted.</td>
</tr>
<tr>
<td>[absolute]</td>
<td>The <code>verbose</code> keyword specifies that the Cisco NX-OS software should list the files as they are added to the archive. By default, the files are listed as they are added.</td>
</tr>
<tr>
<td>[remove]</td>
<td>filename-list</td>
</tr>
</tbody>
</table>

## Extracting Files from an Archive File

You can extract files to an existing archive file on your Cisco NX-OS device.

**Before You Begin**

You have created an archive file on your Cisco NX-OS device.
Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> tar extract {bootflash:</td>
<td>Creates an archive file and adds files to it. The archive filename is not case sensitive.</td>
</tr>
<tr>
<td>volatile:}archive-filename</td>
<td>The <strong>keep-old</strong> keyword indicates that the Cisco NX-OS software should not overwrite files with the same name as the files being extracted.</td>
</tr>
<tr>
<td>[keep-old] [screen] [to {bootflash:</td>
<td>The <strong>screen</strong> keyword specifies that the Cisco NX-OS software should display the contents of the extracted files to the terminal screen.</td>
</tr>
<tr>
<td>volatile:}{directory-name]} [verbose]</td>
<td>The <strong>to</strong> keyword specifies the target filesystem. You can include a directory name. The directory name is alphanumeric, case sensitive, and has a maximum length of 240 characters.</td>
</tr>
<tr>
<td>Example: switch# tar extract bootflash:config-archive.tar.gz</td>
<td>The <strong>verbose</strong> keyword specifies that the Cisco NX-OS software should display the names of the files as they are extracted.</td>
</tr>
</tbody>
</table>

Displaying the Filenames in an Archive File

You can display the names of the files in an archive files using the **tar list** command.

**tar list** {bootflash: | **archive-filename** |

The archive filename is not case sensitive.

```
switch# tar list bootflash:config-archive.tar.gz
config-file
new-config
```

Examples of Using the File System

This section includes example of using the file system on the Cisco NX-OS device.

Accessing Directories on Standby Supervisor Modules

This example shows how to list the files on the standby supervisor module:

```
switch# dir bootflash://sup-remote
12198912 Aug 27 16:29:18 2003 m9500-sf1ek9-kickstart-mzg.1.3.0.39a.bin
1864931 Apr 29 12:41:59 2003 dplug2
12288 Apr 18 20:23:11 2003 lost+found/
12097024 Nov 21 16:34:18 2003 m9500-sf1ek9-kickstart-mz.1.3.1.1.bin
41574014 Nov 21 16:34:47 2003 m9500-sf1ek9-mz.1.3.1.1.bin

Usage for bootflash://sup-remote
67747169 bytes used
116812447 bytes free
184559616 bytes total
```
This example shows how to delete a file on the standby supervisor module:

```
switch# delete bootflash://sup-remote/aOldConfig.txt
```

### Moving Files

This example shows how to move a file on an external flash device:

```
switch# move slot0:samplefile slot0:mystorage/samplefile
```

This example shows how to move a file in the default file system:

```
switch# move samplefile mystorage/samplefile
```

### Copying Files

This example shows how to copy the file called samplefile from the root directory of the slot0: file system to the mystorage directory:

```
switch# copy slot0:samplefile slot0:mystorage/samplefile
```

This example shows how to copy a file from the current directory level:

```
switch# copy samplefile mystorage/samplefile
```

This example shows how to copy a file from the active supervisor module bootflash to the standby supervisor module bootflash:

```
switch# copy bootflash:system_image bootflash://sup-2/system_image
```

This example shows how to overwrite the contents of an existing configuration in NVRAM:

```
switch# copy nvram: snapshot-config nvram:startup-config
```

Warning: this command is going to overwrite your current startup-config:

Do you wish to continue? [y/n] [y] y

You can also use the `copy` command to upload and download files from the slot0: or bootflash: file system to or from a FTP, TFTP, SFTP, or SCP server.

### Deleting a Directory

You can remove directories from the file systems on your device.

**Before You Begin**

Ensure that the directory is empty before you try to delete it.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>pwd</code></td>
<td>(Optional) Displays the name of your current default directory.</td>
</tr>
<tr>
<td></td>
<td><code>switch# pwd</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>dir filesystem :[/module/]directory</code></td>
<td>Displays the contents of the current directory. The file system, module, and directory names are case sensitive. If the directory is not empty, you must delete all the files before you can delete the directory.</td>
</tr>
<tr>
<td></td>
<td><code>switch# dir bootflash:test</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>rmdir filesystem :[/module/]directory</code></td>
<td>Deletes a directory. The file system and directory name are case sensitive.</td>
</tr>
<tr>
<td></td>
<td><code>switch# mkdir test</code></td>
<td></td>
</tr>
</tbody>
</table>

**Related Topics**

### Displaying File Contents

This example displays the contents of a file on an external flash device:

```
switch# show file slot0:test
configure terminal
interface ethernet 1/1
no shutdown
end
show interface ethernet 1/1
```

This example displays the contents of a file residing in the current directory:

```
switch# show file myfile
```

### Displaying File Checksums

This example shows how to display the checksum of a file:

```
switch# show file bootflash:trunks2.cfg cksum
583547619
```

This example shows how to display the MD5 checksum of a file:

```
switch# show file bootflash:trunks2.cfg md5sum
3b94707198aabc6cf46459de10c9281c
```
Compressing and Uncompressing Files

This example shows how to compress a file:

```
switch# dir
   1525859 Jul 04 00:51:03 2003 Samplefile
...
switch# gzip volatile:Samplefile
switch# dir
   266069 Jul 04 00:51:03 2003 Samplefile.gz
...
```

This example shows how to uncompress a compressed file:

```
switch# dir
   266069 Jul 04 00:51:03 2003 Samplefile.gz
...
switch# gunzip samplefile
switch# dir
   1525859 Jul 04 00:51:03 2003 Samplefile
...
```

Redirecting show Command Output

This example shows how to direct the output to a file on the bootflash: file system:

```
switch# show interface > bootflash:switch1-intf.cfg
```

This example shows how to direct the output to a file on external flash memory:

```
switch# show interface > slot0:switch-intf.cfg
```

This example shows how to direct the output to a file on a TFTP server:

```
switch# show interface > tftp://10.10.1.1/home/configs/switch-intf.cfg
Preparing to copy...done
```

This example directs the output of the show tech-support command to a file:

```
switch# show tech-support > Samplefile
Building Configuration ...
switch# dir
   1525859 Jul 04 00:51:03 2003 Samplefile
Usage for volatile://
   1527808 bytes used
   19443712 bytes free
   20971520 bytes total
```

Finding Files

This example shows how to find a file in the current default directory:

```
switch# find smm_shm.cfg
/usr/bin/find: ./lost+found: Permission denied
./smm_shm.cfg
./newer-fs/isan/etc/routing-sw/smm_shm.cfg
```
Default Settings for File System Parameters

This table lists the default settings for the file system parameters.

CHAPTER 8

Working with Configuration Files

This chapter describes how to work with configuration files on the Cisco NX-OS device.

This chapter includes the following sections:

- Information About Configuration Files, page 99
- Licensing Requirements for Configuration Files, page 100
- Managing Configuration Files, page 100
- Verifying the Device Configuration, page 109
- Examples of Working with Configuration Files, page 109
- Additional References for Configuration Files, page 110
- Feature History for Configuration Files, page 110

Information About Configuration Files

Configuration files contain the Cisco NX-OS software commands used to configure the features on a Cisco NX-OS device. Commands are parsed (translated and executed) by the Cisco NX-OS software when the system is booted (from the startup-config file) or when you enter commands at the CLI in a configuration mode.

To change the startup configuration file, you can either save the running-configuration file to the startup configuration using the `copy running-config startup-config` command or copy a configuration file from a file server to the startup configuration.

Types of Configuration Files

The Cisco NX-OS software has two types of configuration files, running configuration and startup configuration. The device uses the startup configuration (startup-config) during device startup to configure the software features. The running configuration (running-config) contains the current changes that you make to the startup-configuration file. The two configuration files can be different. You may want to change the device configuration for a short time period rather than permanently. In this case, you would change the running configuration by using commands in global configuration mode but not save the changes to the startup configuration.
To change the running configuration, use the `configure terminal` command to enter global configuration mode. As you use the Cisco NX-OS configuration modes, commands generally are executed immediately and are saved to the running configuration file either immediately after you enter them or when you exit a configuration mode.

To change the startup-configuration file, you can either save the running configuration file to the startup configuration or download a configuration file from a file server to the startup configuration.

**Related Topics**
- Saving the Running Configuration to the Startup Configuration, page 100
- Downloading the Startup Configuration From a Remote Server, page 102

**Virtualization Support for Configuration Files**

Except for removing the configuration for a missing module, the configuration file operations are local to the virtual device context (VDC). You can remove the missing module configuration only from the default VDC. For more information on VDCs, see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2.

**Licensing Requirements for Configuration Files**

The following table shows the licensing requirements for this feature:

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>Configuration files require no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <em>Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.2</em>.</td>
</tr>
</tbody>
</table>

**Managing Configuration Files**

This section describes how to manage configuration files.

**Saving the Running Configuration to the Startup Configuration**

You can save the running configuration to the startup configuration to save your changes for the next time you that reload the device.

For information on saving the running configuration for all VDCs on the physical device, see the *Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.2*. 
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>show running-config</code></td>
<td>(Optional) Displays the running configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# show running-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>copy running-config startup-config</code></td>
<td>Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Copying a Configuration File to a Remote Server

You can copy a configuration file stored in the internal memory to a remote server as a backup or to use for configuring other Cisco NX-OS devices.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>copy running-config scheme://server[/url[/filename]]</code></td>
<td>Copies the running-configuration file to a remote server. For the <code>scheme</code> argument, you can enter <code>tftp:</code>, <code>ftp:</code>, <code>scp:</code>, or <code>sftp:</code>. The <code>server</code> argument is the address or name of the remote server, and the <code>url</code> argument is the path to the source file on the remote server. The <code>server</code>, <code>url</code>, and <code>filename</code> arguments are case sensitive.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# copy running-config tftp://10.10.1.1/sw1-run-config.bak</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>copy startup-config scheme://server[/url[/filename]]</code></td>
<td>Copies the startup-configuration file to a remote server. For the <code>scheme</code> argument, you can enter <code>tftp:</code>, <code>ftp:</code>, <code>scp:</code>, or <code>sftp:</code>. The <code>server</code> argument is the address or name of the remote server, and the <code>url</code> argument is the path to the source file on the remote server. The <code>server</code>, <code>url</code>, and <code>filename</code> arguments are case sensitive.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# copy startup-config tftp://10.10.1.1/sw1-start-config.bak</code></td>
<td></td>
</tr>
</tbody>
</table>

### Downloading the Running Configuration From a Remote Server

You can configure your Cisco NX-OS device by using configuration files that you created on another Cisco NX-OS device and uploaded to a remote server. You then download the file from the remote server to your device using TFTP, FTP, Secure Copy (SCP), or Secure Shell FTP (SFTP) to the running configuration.

#### Before You Begin

Ensure that the configuration file that you want to download is in the correct directory on the remote server.
Ensure that the permissions on the file are set correctly. Permissions on the file should be set to world-read. Ensure that your Cisco NX-OS device has a route to the remote server. The Cisco NX-OS device and the remote server must be in the same subnetwork if you do not have a router or a default gateway to route traffic between subnets.

Check connectivity to the remote server using the `ping` or `ping6` command.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>copy scheme://server[/url]/filename running-config</code></td>
<td>Downloads the running-configuration file from a remote server. For the <code>scheme</code> argument, you can enter <code>tftp</code>, <code>ftp</code>, <code>scp</code>, or <code>sftp</code>. The <code>server</code> argument is the address or name of the remote server, and the <code>url</code> argument is the path to the source file on the remote server. The <code>server</code>, <code>url</code>, and <code>filename</code> arguments are case sensitive. Example: <code>switch# copy tftp://10.10.1.1/my-config running-config</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>show running-config</code></td>
<td>(Optional) Displays the running configuration. Example: <code>switch# show running-config</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration. Example: <code>switch# copy running-config startup-config</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show startup-config</code></td>
<td>(Optional) Displays the startup configuration. Example: <code>switch# show startup-config</code></td>
</tr>
</tbody>
</table>

### Downloading the Startup Configuration From a Remote Server

You can configure your Cisco NX-OS device by using configuration files that you created on another Cisco NX-OS device and uploaded to a remote server. You then download the file from the remote server to your device using TFTP, FTP, Secure Copy (SCP), or Secure Shell FTP (SFTP) to the startup configuration.

**Caution**

This procedure disrupts all traffic on the Cisco NX-OS device.

**Before You Begin**

Log in to a session on the console port.
Ensure that the configuration file you that want to download is in the correct directory on the remote server. Ensure that the permissions on the file are set correctly. Permissions on the file should be set to world-read. Ensure that your Cisco NX-OS device has a route to the remote server. The Cisco NX-OS device and the remote server must be in the same subnetwork if you do not have a router or a default gateway to route traffic between subnets.

Check connectivity to the remote server using the ping or ping6 command.

**Procedure**

Copying the Running Configuration From an External Flash Memory Device

You can configure your Cisco NX-OS device by copying configuration files created on another Cisco NX-OS device and saved to an external flash memory device.

**Before You Begin**

Insert the external flash memory device into the active supervisor module.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>

**Step 1**
- Command: `dir slot0: | usb1: | usb2:]:[directory]`
- Example: `switch# dir slot0:`
  - (Optional) Displays the files on the external flash memory device.

**Step 2**
- Command: `copy slot0: | usb1: | usb2:]:[directory]filename running-config`
- Example: `switch# copy slot0:dsn-config.cfg running-config`
  - Copies the running configuration from an external flash memory device. The `filename` argument is case sensitive.

**Step 3**
- Command: `show running-config`
- Example: `switch# show running-config`
  - (Optional) Displays the running configuration.

**Step 4**
- Command: `copy running-config startup-config`
- Example: `switch# copy running-config startup-config`
  - (Optional) Copies the running configuration to the startup configuration.

**Step 5**
- Command: `show startup-config`
- Example: `switch# show startup-config`
  - (Optional) Displays the startup configuration.

### Copying the Startup Configuration From an External Flash Memory Device

You can recover the startup configuration on your Cisco NX-OS device by downloading a new startup configuration file saved on an external flash memory device.

**Before You Begin**
Insert the external flash memory device into the active supervisor module.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>

**Step 1**
- Command: `dir slot0: | usb1: | usb2:]:[directory]`
  - (Optional) Displays the files on the external flash memory device.
### Managing Configuration Files

#### Copying Configuration Files to an Internal File System

You can copy configuration files to the internal memory as a backup for later use.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>copy running-config [filesystem:] [directory/] [directory/] filename</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>switch# copy running-config bootflash:sw1-run-config.bak</td>
</tr>
<tr>
<td></td>
<td>Copies the running-configuration file to a remote server. The filesystem, directory, and filename arguments are case sensitive.</td>
</tr>
</tbody>
</table>

| **Step 2** | **copy startup-config [filesystem:] [directory/] [directory/] filename** |
| **Example:** | switch# copy startup-config bootflash:sw1-start-config.bak |
| | Copies the startup-configuration file to a remote server. The filesystem, directory, and filename arguments are case sensitive. |

- Copying Files, page 87

#### Rolling Back to a Previous Configuration

Problems, such as memory corruption, can occur that make it necessary for you to recover your configuration from a backed up version.
Each time that you enter a `copy running-config startup-config` command, a binary file is created and the ASCII file is updated. A valid binary configuration file reduces the overall boot time significantly. A binary file cannot be uploaded, but its contents can be used to overwrite the existing startup configuration. The `write erase` command clears the binary file.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>write erase</td>
</tr>
</tbody>
</table>
| Example: &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&n...
Erasing a Configuration

You can erase the configuration on your device to return to the factory defaults. You can erase the following configuration files saved in the persistent memory on the device:

- Startup
- Boot
- Debug

**Note**

The `write erase` command erases the entire startup configuration, except for the following:

- Boot variable definitions
- The IPv4 configuration on the mgmt0 interface, including the following:
  - Address
  - Subnet mask
  - Route address in the management VRF

To remove the boot variable definitions and the IPv4 configuration on the mgmt0 interface, use the `write erase boot` command.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> write erase [boot</td>
<td>debug]</td>
</tr>
</tbody>
</table>

#### Example:

```
switch# write erase
Warning: This command will erase the startup-configuration.
Do you wish to proceed anyway? (y/n) [n] y
```

### Verifying the Device Configuration

To verify the device configuration, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Displays the running configuration.</td>
</tr>
<tr>
<td><code>show startup-config</code></td>
<td>Displays the startup configuration.</td>
</tr>
</tbody>
</table>

For detailed information about the fields in the output from these commands, see the Cisco Nexus 7000 Series NX-OS Fundamentals Command Reference, Release 4.2.

### Examples of Working with Configuration Files

This section includes examples of working with configuration files.

#### Copying Configuration Files

This example shows how to overwrite the contents of an existing configuration in NVRAM:

```
switch# copy nvram:snapshot-config nvram:startup-config
Warning: this command is going to overwrite your current startup-config.
Do you wish to continue? [y/n] [y] y
```

This example shows how to copy a running configuration to the bootflash: file system:

```
switch# copy system:running-config bootflash:my-config
```

### Backing Up Configuration Files

This example shows how to create a snapshot of the startup configuration in a predefined location on the device (binary file):

```
switch# copy startup-config nvram:snapshot-config
```
This example shows how to back up the startup configuration to the bootflash: filesystem (ASCII file):

```
switch# copy startup-config bootflash:my-config
```

This example shows how to back up the startup configuration to the TFTP server (ASCII file):

```
switch# copy startup-config tftp://172.16.10.100/my-config
```

This example shows how to back up the running configuration to the bootflash: filesystem (ASCII file):

```
switch# copy running-config bootflash:my-config
```

### Rolling Back to a Previous Configuration

To roll back your configuration to a snapshot copy of a previously saved configuration, you need to perform the following steps:

1. Clear the current running image with the `write erase` command.
2. Restart the device with the `reload` command.
3. Copy the previously saved configuration file to the running configuration with the `copy configuration_file running-configuration` command.
4. Copy the running configuration to the start-up configuration with the `copy running-config startup-config` command.
