Configuring MPLS Static Label Binding

This chapter describes how to configure Multiprotocol Label Switching (MPLS) static label binding on Cisco NX-OS devices.

This chapter includes the following sections:

• Finding Feature Information, page 9-1
• Information About MPLS Static Label Binding, page 9-1
• Licensing Requirements for MPLS Static Label Binding, page 9-3
• Prerequisites for MPLS Static Label Binding, page 9-3
• Guidelines and Limitations for MPLS Static Label Binding, page 9-4
• Default Settings for MPLS Static Label Binding, page 9-4
• Configuring MPLS Static Label Binding, page 9-4
• Verifying the MPLS Static Label Binding Configuration, page 9-7
• Configuration Examples for MPLS Static Label Binding, page 9-8
• Additional References for MPLS Static Label Binding, page 9-10
• Feature History for MPLS Static Label Binding, page 9-11

Finding Feature Information

Your software release might not support all the features documented in this module. For the latest caveats and feature information, see the Bug Search Tool at https://tools.cisco.com/bugsearch/ and the release notes for your software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the "New and Changed Information" chapter or the Feature History table below.

Information About MPLS Static Label Binding

The MPLS static label binding feature enables you to configure:

• MPLS static labels to be used in the core of the MPLS network instead of dynamic labels. Because these labels are exchanged by LDP, they are not VRF-aware as LDP runs only the default VRF on Cisco NX-OS.
Information About MPLS Static Label Binding

- MPLS virtual private network (VPN) static labels to be used at the edge of an MPLS VPN. These labels are VRF-aware because they correspond to a prefix in a particular VRF.

Note: Cisco NX-OS does not support the allocation of aggregate MPLS VPN static labels on a per-VRF basis.

The following topics provide information about MPLS static labels:

- Overview of MPLS Static Labels and LDP VRF-Aware Static Labels, page 9-3
- Labels Reserved for Static Assignment, page 9-3
Overview of MPLS Static Labels and LDP VRF-Aware Static Labels

Label switch routers (LSRs) dynamically learn the labels that they should use to label-switch packets by using the following label distribution protocols:

- Label Distribution Protocol (LDP), which is the Internet Engineering Task Force (IETF) standard used to bind labels to network addresses
- Resource Reservation Protocol (RSVP), which is used to distribute labels for traffic engineering (TE)
- Border Gateway Protocol (BGP), which is used to distribute labels for MPLS VPNs

The LSR installs the dynamically learned label into its label forwarding information base (LFIB).

You can configure static labels for the following purposes:

- To bind labels to IPv4 prefixes to support MPLS hop-by-hop forwarding through neighbor routers that do not implement LDP label distribution. MPLS static labels allow you to configure entries in the MPLS forwarding table and assign label values to forwarding equivalence classes (FECs) that are learned by IGP. You can manually configure an LSP without setting up an LDP session between the endpoints.
- To statically bind a VRF-aware label on a provider edge (PE) router to a customer network prefix (VPN IPv4 prefix). You can use VRF-aware static labels with non-default VRF tables so that you can use the labels at the VPN edge. VRF-aware static labels are advertised by VPNv4 BGP in the backbone.

Labels Reserved for Static Assignment

Before you can manually assign labels, you must reserve a range of labels to be used for the manual assignment. Reserving the labels ensures that the labels are not dynamically assigned.

Licensing Requirements for MPLS Static Label Binding

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>MPLS static label binding requires an MPLS license. For a complete explanation of the Cisco NX-OS licensing scheme and how to obtain and apply licenses, see the <em>Cisco NX-OS Licensing Guide</em>.</td>
</tr>
</tbody>
</table>

Prerequisites for MPLS Static Label Binding

MPLS static label binding has the following prerequisites:

- You must enable MPLS LDP.
Guidelines and Limitations for MPLS Static Label Binding

MPLS static label binding has the following configuration guidelines and limitations:

- Static local labels preempt dynamically allocated labels.
- Configuring static local labels for connected routes is not supported.
- LDP-learned remote labels are preferred over locally configured outgoing labels.
- Static outgoing labels should match the next-hop’s incoming labels.
- VRF is not supported for static outgoing labels.
- LDP is not supported in non-default VRFs.

Default Settings for MPLS Static Label Binding

Table 9-1 lists the default settings for MPLS static label binding parameters.

Table 9-1  Default MPLS Static Label Binding Parameters

Configuring MPLS Static Label Binding

This section includes the following topics:

- Reserving Labels to Use for MPLS Static Labels and LDP VRF-Aware Static Labels, page 9-4
- Configuring MPLS Static Labels in the MPLS VPN Provider Core, page 9-5
- Configuring MPLS LDP VRF-Aware Static Labels at the Edge of the VPN, page 9-6

Reserving Labels to Use for MPLS Static Labels and LDP VRF-Aware Static Labels

You can reserve the labels that are to be statically assigned so that they are not dynamically assigned.

Prerequisites

Ensure that you are in the correct VDC (or use the switchto vdc command).

Ensure that MPLS LDP is enabled.

SUMMARY STEPS

1. configure terminal
2. mpls label range min-value max-value [static min-static-value max-static-value]
3. (Optional) `show mpls label range`
4. (Optional) `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> mpls label range min-value max-value [static min-static-value max-static-value]</td>
<td>Reserved a range of labels for static label assignment. For Cisco NX-OS releases prior to 6.1, the range for the minimum and maximum values is from 16 to 492286. Beginning with Cisco NX-OS Release 6.1, the range is from 16 to 471804.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config)# mpls label range 200 100000 static 16 199</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> show mpls label range</td>
<td>(Optional) Displays information about the range of values for local labels, including those labels that are available for static assignments.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>switch(config)# show mpls label range</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config)# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring MPLS Static Labels in the MPLS VPN Provider Core

You can configure MPLS static labels in order to configure entries in the MPLS forwarding table and assign label values to FECs learned by routing protocols or static routes. You can manually configure an LSP without setting up LDP sessions between the endpoints.

**Note**

In MPLS VPN networks, you can use static labels only in the MPLS VPN provider core.

**Prerequisites**

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

Ensure that MPLS LDP is enabled on each LSR.

**SUMMARY STEPS**

1. `configure terminal`
2. `mpls ldp configuration`
3. `mpls static binding ipv4 prefix mask {label | input label | output nexthop {explicit-null | implicit-null | label}}`
4. (Optional) `show mpls static binding ipv4`
5. (Optional) `copy running-config startup-config`
Chapter 9      Configuring MPLS Static Label Binding

Configuring MPLS Static Label Binding

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
</tbody>
</table>
| Example: | `switch# configure terminal`  
 `switch(config)#` | |
| Step 2 | `mpls ldp configuration` | Enters LDP configuration mode. |
| Example: | `switch(config)# mpls ldp configuration`  
 `switch(config-ldp)#` | |
| Step 3 | `mpls static binding ipv4 prefix mask`  
 `{label | input label | output nexthop`  
 `{explicit-null | implicit-null | label}}` | Specifies the static binding of labels to IPv4 prefixes.  
 Specified bindings are installed automatically in the  
 MPLS forwarding table as routing demands. |
| Example: | `switch(config-ldp)# mpls static binding`  
 `ipv4 10.2.2.0 255.255.255.255 input 17` | |
| Step 4 | `show mpls static binding ipv4` | (Optional) Displays the configured static labels. |
| Example: | `switch(config-ldp)# show mpls static`  
 `binding ipv4` | |
| Step 5 | `copy running-config startup-config` | (Optional) Copies the running configuration to the  
 startup configuration. |
| Example: | `switch(config-ldp)# copy running-config`  
 `startup-config` | |

Configuring MPLS LDP VRF-Aware Static Labels at the Edge of the VPN

You can statically bind a VRF-aware label on a PE router to a customer network prefix (VPN IPv4  
prefix). You can use VRF-aware static labels with non-default VRF tables so the labels can be used at  
the VPN edge.

Prerequisites

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

Ensure that MPLS LDP is enabled on each LSR.

Ensure that MPLS VPN is configured.

Ensure that the provider network has MPLS LDP installed and running.

SUMMARY STEPS

1. `configure terminal`
2. `mpls ldp configuration`
3. `mpls static binding ipv4 vrf vrf_name prefix mask {input label | label}`
4. (Optional) `show mpls static binding ipv4 vrf vrf_name`
5. (Optional) `show running-config vrf vrf_name`
6. (Optional) `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>

<tr>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>switch(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> mpls ldp configuration</td>
<td>Enters LDP configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config)# mpls ldp configuration</td>
<td></td>
</tr>
<tr>
<td>switch(config-ldp)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> mpls static binding ipv4 vrf vrf_name prefix mask {input label</td>
<td>label}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config-ldp)# mpls static binding ipv4 vrf vrf1 10.2.0.0 255.255.0.0 input 17</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> show mpls static binding ipv4 vrf vrf_name</td>
<td>(Optional) Displays the configured MPLS static bindings.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config-ldp)# show mpls static binding ipv4 vrf vrf1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config vrf vrf_name</td>
<td>(Optional) Displays the VRF running configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config-ldp)# show running-config vrf vrf1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>switch(config-ldp)# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Verifying the MPLS Static Label Binding Configuration**

To display the MPLS static label binding configuration, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mpls label range</td>
<td>Displays information about the range of values for local labels, including those labels that are available for static assignments.</td>
</tr>
<tr>
<td>show mpls ldp bindings</td>
<td>Displays the MPLS LDP label information base (LIB).</td>
</tr>
<tr>
<td>show mpls static binding</td>
<td>Displays the configured static label bindings.</td>
</tr>
</tbody>
</table>
Chapter 9      Configuring MPLS Static Label Binding

Configuration Examples for MPLS Static Label Binding

This section provides configuration examples for MPLS static label binding and includes the following topics:

- Examples: Reserving Labels to Use for MPLS Static Labels and MPLS LDP VRF-Aware Static Labels, page 9-8
- Examples: Configuring MPLS Static Labels in the MPLS VPN Provider Core, page 9-8
- Examples: Configuring MPLS LDP VRF-Aware Static Labels at the VPN Edge, page 9-10

Examples: Reserving Labels to Use for MPLS Static Labels and MPLS LDP VRF-Aware Static Labels

The following example shows how to reserve a generic range of labels from 200 to 100000 and configure a static label range of 16 to 199:

```
switch(config)# mpls label range 200 100000 static 16 199
```

In this example, the output from the `show mpls label range` command displays the new label range:

```
switch# show mpls label range
Downstream Generic label region: Min/Max label: 200/100000
Range for static labels: Min/Max/Number: 16/199
```

Examples: Configuring MPLS Static Labels in the MPLS VPN Provider Core

The following example shows how to configure input and output labels for several prefixes:

```
switch(config)# mpls ldp configuration
switch(config-ldp)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55
switch(config-ldp)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.0.0.66 167
switch(config-ldp)# mpls static binding ipv4 10.0.0.0 255.0.0.0 input 17
switch(config-ldp)# mpls static binding ipv4 10.66.0.0 255.255.0.0 output 10.13.0.8 explicit-null
```

The `show mpls static binding ipv4` command displays the configured static labels:

```
switch# show mpls static binding ipv4
10.0.0.0/8: (vrf: default) Incoming label: 55
   Outgoing labels:
       10.0.0.66   167
10.66.0.0/16: (vrf: default) Incoming label: 17
```

For detailed information about the fields in the output from these commands, see the *Cisco Nexus 7000 Series NX-OS MPLS Command Reference*. 

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mpls switching</td>
<td>Displays the MPLS label switching database.</td>
</tr>
<tr>
<td>show running-config vrf vrf_name</td>
<td>Displays the VRF running configuration.</td>
</tr>
</tbody>
</table>
Outgoing labels:
10.13.0.8.0
Examples: Configuring MPLS LDP VRF-Aware Static Labels at the VPN Edge

The following example shows how to configure static label bindings and input (local) labels for various prefixes:

```plaintext
switch(config)# mpls ldp configuration
switch(config-ldp)# mpls static binding ipv4 vrf vpn100 10.0.0.0 255.0.0.0 55
switch(config-ldp)# mpls static binding ipv4 vrf vpn100 10.66.0.0 255.255.0.0 input 17
```

In the following output, the `show mpls static binding ipv4 vrf` command displays the configured VRF-aware static bindings:

```plaintext
switch# show mpls static binding ipv4 vrf vpn100
10.0.0.0/8: (vrf: vpn100)  Incoming label: 55
   Outgoing labels:  None
10.66.0.0/16: (vrf: vpn100)  Incoming label: 17
   Outgoing labels:  None
```
