

Vcenter Plugin

VMware Vcenter plugin allows you to monitor the Cisco Unified Computing System™ (Cisco UCS®), Cisco Nexus, and Cisco MDS 9000 Family platforms through Cisco Prime DCNM.

The Cisco Prime DCNM plug-in for VMware Vcenter adds a multihop view and monitoring of Ethernet and Fibre Channel Cisco Nexus and Cisco MDS 9000 Family topologies. The increased visibility into virtualized infrastructure helps network administrators locate performance anomalies that may cause service degradation. It also aids to eliminate virtual computing and networking as a root cause of the problem.

This Appendix contains the following sections:

- [Associating Vcenter with the Datasource, page D-1](#)
- [Registering Vcenter plugin, page D-1](#)
- [Triggering the plugin, page D-2](#)
- [Removing the plugin, page D-2](#)

Associating Vcenter with the Datasource

To associate the Vcenter with the datasource, Cisco DCNM must discover the LAN and SAN devices.

Navigate to **Admin > Data Source > Fabric** to check if the LAN/SAN devices are discovered on the Cisco DCNM Web Client. In the **Admin > Data Sources > VMWare** block, click + to add the Vcenter to the datasource.

Registering Vcenter plugin

To register the Vcenter plugin, run the RegisterPlugin script. Enter the Vcenter IP address, Vcenter username, Vcenter password, and complete URL of the DCNM server. The plugin configuration file is stored in the DCNM server.

Example:

```
RegisterPlugin.bat -add 172.22.29.87 admin nbv123 https://dcnm-san-001:443
```

Triggering the plugin

When user clicks on the menu, it will show the login page first, and then will launch an internal browser which will show the host dashboard.

Removing the plugin

To remove the Vcenter plugin, run the RegisterPlugin script. Enter the Vcenter IP address, Vcenter username, Vcenter password, and complete URL of the DCNM server. The plugin configuration file is located in the DCNM server.
