### OSPF for Routed Access

With Cisco IOS Release 12.2(55)SE, the IP Base image supports OSPF for routed access. The IP services image is required if you need multiple OSPFv2 and OSPFv3 instances without route restrictions. Additionally, the IP services image is required to enable the multi-VRF-CE feature.

OSPF for Routed Access is specifically designed so that you can extend Layer 3 routing capabilities to the wiring closet.

**Note**

OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a combined total of 1000 dynamically learned routes. The IP Base image provides OSPF for routed access.

However, these restrictions are not enforced in this release.

With the typical topology (hub and spoke) in a campus environment, where the wiring closets (spokes) are connected to the distribution switch (hub) that forwards all nonlocal traffic to the distribution layer, the wiring closet Device need not hold a complete routing table. A best practice design, where the distribution Device...
sends a default route to the wiring closet Device to reach interarea and external routes (OSPF stub or totally stub area configuration) should be used when OSPF for Routed Access is used in the wiring closet.

For more details, see the “High Availability Campus Network Design—Routed Access Layer using EIGRP or OSPF” document.

**OSPF Nonstop Forwarding**

The Device or switch stack supports two levels of nonstop forwarding (NSF):

- OSPF NSF Awareness, on page 1020
- OSPF NSF Capability, on page 1020

**OSPF NSF Awareness**

When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router crashing and the backup RP taking over, or while the primary RP is manually reloaded for a non-disruptive software upgrade.

This feature cannot be disabled.

**OSPF NSF Capability**

supports the OSPFv2 NSF IETF format in addition to the OSPFv2 NSF Cisco format that is supported in earlier releases. For information about this feature, see: NSF—OSPF (RFC 3623 OSPF Graceful Restart).

The also supports OSPF NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change.

**Note**

OSPF NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers non-NSF aware neighbors on a network segment, it disables NSF capabilities for that segment. Other network segments where all devices are NSF-aware or NSF-capable continue to provide NSF capabilities.

Use the nsf OSPF routing configuration command to enable OSPF NSF routing. Use the show ip ospf privileged EXEC command to verify that it is enabled.

For more information, see Cisco Nonstop Forwarding:

**Configuring Basic OSPF Parameters**

To enable OSPF, create an OSPF routing process, specify the range of IP addresses to associate with the routing process, and assign area IDs to be associated with that range.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

| Step 2 | router ospf process-id  
| Example: | Switch(config)# router ospf 15 |

### Purpose
Enables OSPF routing, and enter router configuration mode. The process ID is an internally used identification parameter that is locally assigned and can be any positive integer. Each OSPF routing process has a unique value.

**Note** OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a maximum number of 1000 dynamically learned routes.

| Step 3 | network address wildcard-mask area area-id  
| Example: | Switch(config)# network 10.1.1.1 255.240.0.0 area 20 |

### Purpose
Define an interface on which OSPF runs and the area ID for that interface. You can use the wildcard-mask to use a single command to define one or more multiple interfaces to be associated with a specific OSPF area. The area ID can be a decimal value or an IP address.

| Step 4 | end  
| Example: | Switch(config)# end |

### Purpose
Returns to privileged EXEC mode.

| Step 5 | show ip protocols  
| Example: | Switch# show ip protocols |

### Purpose
Verifies your entries.

| Step 6 | copy running-config startup-config  
| Example: | Switch# copy running-config startup-config |

### Purpose
(Optional) Saves your entries in the configuration file.

---

**Example: Configuring Basic OSPF Parameters**

This example shows how to configure an OSPF routing process and assign it a process number of 109:

```
Switch(config)# router ospf 109
Switch(config-router)# network 131.108.0.0 255.255.255.0 area 24
```

**Configuring OSPF Interfaces**

You can use the `ip ospf` interface configuration commands to modify interface-specific OSPF parameters. You are not required to modify any of these parameters, but some interface parameters (hello interval, dead interval, and authentication key) must be consistent across all routers in an attached network. If you modify these parameters, be sure all routers in the network have compatible values.
The `ip ospf` interface configuration commands are all optional.

### Procedure

<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code></td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip ospf cost</code></td>
<td>(Optional) Explicitly specifies the cost of sending a packet on the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip ospf 8</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip ospf retransmit-interval seconds</code></td>
<td>(Optional) Specifies the number of seconds between link state advertisement transmissions. The range is 1 to 65535 seconds. The default is 5 seconds.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip ospf transmit-interval 10</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>ip ospf transmit-delay seconds</code></td>
<td>(Optional) Sets the estimated number of seconds to wait before sending a link state update packet. The range is 1 to 65535 seconds. The default is 1 second.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip ospf transmit-delay 2</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>ip ospf priority number</code></td>
<td>(Optional) Sets priority to help find the OSPF designated router for a network. The range is from 0 to 255. The default is 1.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip ospf priority 5</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td><code>ip ospf hello-interval seconds</code></td>
<td>(Optional) Sets the number of seconds between hello packets sent on an OSPF interface. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip ospf hello-interval 12</td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td><code>ip ospf dead-interval seconds</code></td>
<td>(Optional) Sets the number of seconds after the last device hello packet was seen before its neighbors declare the OSPF router to be down. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 4 times the hello interval.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip ospf dead-interval 8</td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>show ip ospf interface [interface-name]</code></td>
<td>Displays OSPF-related interface information.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show ip ospf interface</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>show ip ospf neighbor detail</code></td>
<td>Displays NSF awareness status of neighbor switch. The output matches one of these examples:</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| `Switch# show ip ospf neighbor detail` | `Options is 0x52`  
  
  *LLS Options is 0x1 (LR)*  
  
  When both of these lines appear, the neighbor switch is NSF aware.  
  
  *Options is 0x42*—This means the neighbor switch is not NSF aware. |
| **Step 15**       |         |
| `copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
| **Example:**      |         |
| `Switch# copy running-config startup-config` | |
OSPF Area Parameters

You can optionally configure several OSPF area parameters. These parameters include authentication for password-based protection against unauthorized access to an area, stub areas, and not-so-stubby-areas (NSSAs). Stub areas are areas into which information on external routes is not sent. Instead, the area border router (ABR) generates a default external route into the stub area for destinations outside the autonomous system (AS). An NSSA does not flood all LSAs from the core into the area, but can import AS external routes within the area by redistribution.

Route summarization is the consolidation of advertised addresses into a single summary route to be advertised by other areas. If network numbers are contiguous, you can use the **area range** router configuration command to configure the ABR to advertise a summary route that covers all networks in the range.

<td></td>
</tr>
</tbody>
</table>
| 6    | area area-id nssa [no-redistribution] [default-information-originate] [no-summary] | (Optional) Defines an area as a not-so-stubby-area. Every router within the same area must agree that the area is NSSA. Select one of these keywords:  
  - **no-redistribution**—Select when the router is an NSSA ABR and you want the redistribute command to import routes into normal areas, but not into the NSSA.  
  - **default-information-originate**—Select on an ABR to allow importing type 7 LSAs into the NSSA.  
  - **no-redistribution**—Select to not send summary LSAs into the NSSA. |
|      | Example: Switch(config-router)# area 1 nssa default-information-originate | |
| 7    | area area-id range address mask | (Optional) Specifies an address range for which a single route is advertised. Use this command only with area border routers. |
|      | Example: Switch(config-router)# area 1 range 255.240.0.0 | |
| 8    | end | Returns to privileged EXEC mode. |
|      | Example: Switch(config)# end | |
| 9    | show ip ospf [process-id] | Displays information about the OSPF routing process in general or for a specific process ID to verify configuration. |
|      | Example: Switch# show ip ospf | |
| 10   | show ip ospf [process-id [area-id]] database | Displays lists of information related to the OSPF database for a specific router. |
|      | Example: Switch# show ip ospf database | |
| 11   | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
|      | Example: Switch# copy running-config startup-config | |
Other OSPF Parameters

You can optionally configure other OSPF parameters in router configuration mode.

- Route summarization: When redistributing routes from other protocols. Each route is advertised individually in an external LSA. To help decrease the size of the OSPF link state database, you can use the `summary-address` router configuration command to advertise a single router for all the redistributed routes included in a specified network address and mask.

- Virtual links: In OSPF, all areas must be connected to a backbone area. You can establish a virtual link in case of a backbone-continuity break by configuring two Area Border Routers as endpoints of a virtual link. Configuration information includes the identity of the other virtual endpoint (the other ABR) and the nonbackbone link that the two routers have in common (the transit area). Virtual links cannot be configured through a stub area.

- Default route: When you specifically configure redistribution of routes into an OSPF routing domain, the route automatically becomes an autonomous system boundary router (ASBR). You can force the ASBR to generate a default route into the OSPF routing domain.

- Domain Name Server (DNS) names for use in all OSPF `show` privileged EXEC command displays makes it easier to identify a router than displaying it by router ID or neighbor ID.

- Default Metrics: OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The metric is calculated as `ref-bw` divided by bandwidth, where `ref` is 10 by default, and bandwidth (`bw`) is specified by the `bandwidth` interface configuration command. For multiple links with high bandwidth, you can specify a larger number to differentiate the cost on those links.

- Administrative distance is a rating of the trustworthiness of a routing information source, an integer between 0 and 255, with a higher value meaning a lower trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. OSPF uses three different administrative distances: routes within an area (interarea), routes to another area (interarea), and routes from another routing domain learned through redistribution (external). You can change any of the distance values.

- Passive interfaces: Because interfaces between two devices on an Ethernet represent only one network segment, to prevent OSPF from sending hello packets for the sending interface, you must configure the sending device to be a passive interface. Both devices can identify each other through the hello packet for the receiving interface.

- Route calculation timers: You can configure the delay time between when OSPF receives a topology change and when it starts the shortest path first (SPF) calculation and the hold time between two SPF calculations.

- Log neighbor changes: You can configure the router to send a syslog message when an OSPF neighbor state changes, providing a high-level view of changes in the router.

| Switch(config)# default-information originate metric 100 metric-type 1           |                                                                                                                                          |
| Step 6                                                                           | **ip ospf name-lookup**                                                                                                                                                                         |
| Example:                                                                         | (Optional) Configures DNS name lookup. The default is disabled.  
| Switch(config)# ip ospf name-lookup                                              |                                                                                                                                          |
| Step 7                                                                           | **ip auto-cost reference-bandwidth** `ref-bw`                                                                                                                                                     |
| Example:                                                                         | (Optional) Specifies an address range for which a single route will be advertised. Use this command only with area border routers.  
| Switch(config)# ip auto-cost reference-bandwidth 5                               |                                                                                                                                          |
| Step 8                                                                           | **distance ospf** `[[inter-area dist1] [inter-area dist2] [external dist3]]`                                                                                                                                 |
| Example:                                                                         | (Optional) Changes the OSPF distance values. The default distance for each type of route is 110. The range is 1 to 255.  
| Switch(config)# distance ospf inter-area 150                                     |                                                                                                                                          |
### Command or Action

#### Step 9
**passive-interface** *type number*

**Example:**
```
Switch(config)# passive-interface gigabitethernet 1/0/6
```

(Optional) Suppresses the sending of hello packets through the specified interface.

#### Step 10
**timers throttle spf** *spf-delay spf-holdtime spf-wait*

**Example:**
```
Switch(config)# timers throttle spf 200 100 100
```

(Optional) Configures route calculation timers.
- *spf-delay*—Delay between receiving a change to SPF calculation. The range is from 1 to 600000 in milliseconds.
- *spf-holdtime*—Delay between first and second SPF calculation. The range is from 1 to 600000 in milliseconds.
- *spf-wait*—Maximum wait time in milliseconds for SPF calculations. The range is from 1 to 600000 in milliseconds.

#### Step 11
**ospf log-adj-changes**

**Example:**
```
Switch(config)# ospf log-adj-changes
```

(Optional) Sends syslog message when a neighbor state changes.

#### Step 12
**end**

**Example:**
```
Switch(config)# end
```

Returns to privileged EXEC mode.

#### Step 13
**show ip ospf** [process-id [area-id]] **database**

**Example:**
```
Switch# show ip ospf database
```

Displays lists of information related to the OSPF database for a specific router.

#### Step 14
**copy running-config startup-config**

**Example:**
```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

### LSA Group Pacing

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, check-summing, and aging functions for more efficient router use. This feature is enabled by default with a 4-minute default pacing interval, and you will not usually need to modify this parameter. The optimum group pacing interval is inversely proportional to the number of LSAs the router is refreshing, check-summing, and aging. For example, if you have approximately 10,000 LSAs in the database, decreasing the pacing interval
would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

**Changing LSA Group Pacing**

**Procedure**

<table>

</tr>
</tbody>
</table>

**Loopback Interfaces**

OSPF uses the highest IP address configured on the interfaces as its router ID. If this interface is down or removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces. If a loopback interface is configured with an IP address, OSPF uses this IP address as its router ID, even if other interfaces have higher IP addresses. Because loopback interfaces never fail, this provides
greater stability. OSPF automatically prefers a loopback interface over other interfaces, and it chooses the highest IP address among all loopback interfaces.

**Configuring a Loopback Interface**

**Procedure**

Information About EIGRP

Enhanced IGRP (EIGRP) is a Cisco proprietary enhanced version of the IGRP. EIGRP uses the same distance vector algorithm and distance information as IGRP; however, the convergence properties and the operating efficiency of EIGRP are significantly improved.

The convergence technology employs an algorithm referred to as the Diffusing Update Algorithm (DUAL), which guarantees loop-free operation at every instant throughout a route computation and allows all devices involved in a topology change to synchronize at the same time. Routers that are not affected by topology changes are not involved in recomputations.

IP EIGRP provides increased network width. With RIP, the largest possible width of your network is 15 hops. Because the EIGRP metric is large enough to support thousands of hops, the only barrier to expanding the network is the transport-layer hop counter. EIGRP increments the transport control field only when an IP packet has traversed 15 routers and the next hop to the destination was learned through EIGRP. When a RIP route is used as the next hop to the destination, the transport control field is incremented as usual.
EIGRP Features

EIGRP offers these features:

• Fast convergence.
• Incremental updates when the state of a destination changes, instead of sending the entire contents of the routing table, minimizing the bandwidth required for EIGRP packets.
• Less CPU usage because full update packets need not be processed each time they are received.
• Protocol-independent neighbor discovery mechanism to learn about neighboring routers.
• Variable-length subnet masks (VLSMs).
• Arbitrary route summarization.
• EIGRP scales to large networks.

EIGRP Components

EIGRP has these four basic components:

• Neighbor discovery and recovery is the process that routers use to dynamically learn of other routers on their directly attached networks. Routers must also discover when their neighbors become unreachable or inoperative. Neighbor discovery and recovery is achieved with low overhead by periodically sending small hello packets. As long as hello packets are received, the Cisco IOS software can learn that a neighbor is alive and functioning. When this status is determined, the neighboring routers can exchange routing information.
• The reliable transport protocol is responsible for guaranteed, ordered delivery of EIGRP packets to all neighbors. It supports intermixed transmission of multicast and unicast packets. Some EIGRP packets must be sent reliably, and others need not be. For efficiency, reliability is provided only when necessary. For example, on a multiaccess network that has multicast capabilities (such as Ethernet), it is not necessary to send hellos reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello with an indication in the packet informing the receivers that the packet need not be acknowledged. Other types of packets (such as updates) require acknowledgment, which is shown in the packet. The reliable transport has a provision to send multicast packets quickly when there are unacknowledged packets pending. Doing so helps ensure that convergence time remains low in the presence of varying speed links.
• The DUAL finite state machine embodies the decision process for all route computations. It tracks all routes advertised by all neighbors. DUAL uses the distance information (known as a metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination that is guaranteed not to be part of a routing loop. When there are no feasible successors, but there are neighbors advertising the destination, a recomputation must occur. This is the process whereby a new successor is determined. The amount of time it takes to recompute the route affects the convergence time. Recomputation is processor-intensive; it is advantageous to avoid recomputation if it is not necessary. When a topology change occurs, DUAL tests for feasible successors. If there are feasible successors, it uses any it finds to avoid unnecessary recomputation.
• The protocol-dependent modules are responsible for network layer protocol-specific tasks. An example is the IP EIGRP module, which is responsible for sending and receiving EIGRP packets that are
encapsulated in IP. It is also responsible for parsing EIGRP packets and informing DUAL of the new information received. EIGRP asks DUAL to make routing decisions, but the results are stored in the IP routing table. EIGRP is also responsible for redistributing routes learned by other IP routing protocols.

**Note** To enable EIGRP, the Device or stack master must be running the

# How to Configure EIGRP

To create an EIGRP routing process, you must enable EIGRP and associate networks. EIGRP sends updates to the interfaces in the specified networks. If you do not specify an interface network, it is not advertised in any EIGRP update.

**Note** If you have routers on your network that are configured for IGRP, and you want to change to EIGRP, you must designate transition routers that have both IGRP and EIGRP configured. In these cases, perform Steps 1 through 3 in the next section and also see the “Configuring Split Horizon” section. You must use the same AS number for routes to be automatically redistributed.

# Default EIGRP Configuration

### EIGRP Nonstop Forwarding

The Device stack supports two levels of EIGRP nonstop forwarding:

- EIGRP NSF Awareness
- EIGRP NSF Capability

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
</table>
| Distance                       | Internal distance: 90.  
                                  | External distance: 170. |
| EIGRP log-neighbor changes     | Disabled. No adjacency changes logged. |
| IP authentication key-chain    | No authentication provided. |
| IP authentication mode         | No authentication provided. |
| IP bandwidth-percent           | 50 percent. |
| IP hello interval              | For low-speed nonbroadcast multiaccess (NBMA) networks: 60 seconds; all other networks: 5 seconds. |
| IP hold-time                   | For low-speed NBMA networks: 180 seconds; all other networks: 15 seconds. |
| IP split-horizon               | Enabled. |
| IP summary address             | No summary aggregate addresses are predefined. |
| Metric weights                 | tos: 0; k1 and k3: 1; k2, k4, and k5: 0 |
| Network                        | None specified. |
| Nonstop Forwarding (NSF) Awareness | Enabled for IPv4 on switches running the Allows Layer 3 switches to continue forwarding packets from a neighboring NSF-capable router during hardware or software changes. |
| NSF capability                 | Disabled. |
| Note                           | The Device supports EIGRP NSF-capable routing for IPv4. |
| Offset-list                    | Disabled. |
| Router EIGRP                   | Disabled. |
| Set metric                    | No metric set in the route map. |
| Traffic-share                  | Distributed proportionately to the ratios of the metrics. |
| Variance                       | 1 (equal-cost load-balancing). |
EIGRP NSF Awareness

The supports EIGRP NSF Awareness for IPv4. When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade. This feature cannot be disabled.

EIGRP NSF Capability

The supports EIGRP Cisco NSF routing to speed up convergence and to eliminate traffic loss after a stack master change.

The also supports EIGRP NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When an EIGRP NSF-capable stack master restarts or a new stack master starts up and NSF restarts, the Device has no neighbors, and the topology table is empty. The Device must bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables without interrupting the traffic directed toward the Device stack. EIGRP peer routers maintain the routes learned from the new stack master and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the new stack master uses a new Restart (RS) bit in the EIGRP packet header to show the restart. When the neighbor receives this, it synchronizes the stack in its peer list and maintains the adjacency with the stack. The neighbor then sends its topology table to the stack master with the RS bit set to show that it is NSF-aware and is aiding the new stack master.

If at least one of the stack peer neighbors is NSF-aware, the stack master receives updates and rebuilds its database. Each NSF-aware neighbor sends an end of table (EOT) marker in the last update packet to mark the end of the table content. The stack master recognizes the convergence when it receives the EOT marker, and it then begins sending updates. When the stack master has received all EOT markers from its neighbors or when the NSF converge timer expires, EIGRP notifies the routing information database (RIB) of convergence and floods its topology table to all NSF-aware peers.

**Configuring Basic EIGRP Parameters**

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> router eigrp autonomous-system</td>
<td>Enables an EIGRP routing process, and enter router configuration mode. The AS number identifies the routes to other EIGRP routers and is used to tag routing information.</td>
</tr>
<tr>
<td>Example: Switch(config)# router eigrp 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> nsf</td>
<td>(Optional) Enables EIGRP NSF. Enter this command on the stack master and on all of its peers.</td>
</tr>
<tr>
<td>Example: Switch(config)# nsf</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| **Step 4** | `network network-number` | Associate networks with an EIGRP routing process. EIGRP sends updates to the interfaces in the specified networks.  
Example:  
Switch(config)# network 192.168.0.0 |
| **Step 5** | `eigrp log-neighbor-changes` | (Optional) Enables logging of EIGRP neighbor changes to monitor routing system stability.  
Example:  
Switch(config)# eigrp log-neighbor-changes |
| **Step 6** | `metric weights tos k1 k2 k3 k4 k5` | (Optional) Adjust the EIGRP metric. Although the defaults have been carefully set to provide excellent operation in most networks, you can adjust them.  
Caution: Setting metrics is complex and is not recommended without guidance from an experienced network designer.  
Example:  
Switch(config)# metric weights 0 2 0 2 0 0 |
| **Step 7** | `offset-list [access-list number | name] [in | out] offset [type number]` | (Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through EIGRP. You can limit the offset list with an access list or an interface.  
Example:  
Switch(config)# offset-list 21 out 10 |
| **Step 8** | `auto-summary` | (Optional) Enables automatic summarization of subnet routes into network-level routes.  
Example:  
Switch(config)# auto-summary |
| **Step 9** | `ip summary-address eigrp autonomous-system-number address mask` | (Optional) Configures a summary aggregate.  
Example:  
Switch(config)# ip summary-address eigrp 1 192.168.0.0 255.255.0.0 |
| **Step 10** | `end` | Returns to privileged EXEC mode.  
Example:  
Switch(config)# end |
| **Step 11** | `show ip protocols` | Verifies your entries.  
For NSF awareness, the output shows:  
*** IP Routing is NSF aware *** EIGRP NSF enabled  
Example:  
Switch# show ip protocols |
### Configuring EIGRP Interfaces

Other optional EIGRP parameters can be configured on an interface basis.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip bandwidth-percent eigrp percent</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) Configures the percentage of bandwidth that can be used by EIGRP on an interface. The default is 50 percent.</td>
</tr>
<tr>
<td>Switch(config-if)# ip bandwidth-percent eigrp 60</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip summary-address eigrp autonomous-system-number address mask</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) Configures a summary aggregate address for a specified interface (not usually necessary if auto-summary is enabled).</td>
</tr>
<tr>
<td>Switch(config-if)# ip summary-address eigrp 109 192.161.0.0 255.255.0.0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ip hello-interval eigrp autonomous-system-number seconds</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) Change the hello time interval for an EIGRP routing process. The range is 1 to 65535 seconds. The default is 60 seconds for low-speed NBMA networks and 5 seconds for all other networks.</td>
</tr>
<tr>
<td>Switch(config-if)# ip hello-interval eigrp 109 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>ip hold-time eigrp autonomous-system-number seconds</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) Change the hold time interval for an EIGRP routing process. The range is 1 to 65535 seconds. The default is 180 seconds for low-speed NBMA networks and 15 seconds for all other networks.</td>
</tr>
</tbody>
</table>
### Configuring EIGRP Route Authentication

EIGRP route authentication provides MD5 authentication of routing updates from the EIGRP routing protocol to prevent the introduction of unauthorized or false routing messages from unapproved sources.

## EIGRP Stub Routing

The EIGRP stub routing feature reduces resource utilization by moving routed traffic closer to the end user. 

### Note

The device uses EIGRP stub routing at the access layer to eliminate the need for other types of routing advertisements.

In a network using EIGRP stub routing, the only allowable route for IP traffic to the user is through a device that is configured with EIGRP stub routing. The device sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote routers to use EIGRP and to configure only the device as a stub. Only specified routes are propagated from the device. The device responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In the figure given below, device B is configured as an EIGRP stub router. Devices A and C are connected to the rest of the WAN. Device B advertises connected, static, redistribution, and summary routes to Device A and C. Device B does not advertise any routes learned from Device A (and the reverse).
Monitoring and Maintaining EIGRP

You can delete neighbors from the neighbor table. You can also display various EIGRP routing statistics. The table given below lists the privileged EXEC commands for deleting neighbors and displaying statistics.

Information About BGP

The Border Gateway Protocol (BGP) is an exterior gateway protocol used to set up an interdomain routing system that guarantees the loop-free exchange of routing information between autonomous systems. Autonomous systems are made up of routers that operate under the same administration and that run Interior Gateway Protocols (IGPs), such as RIP or OSPF, within their boundaries and that interconnect by using an Exterior Gateway Protocol (EGP). BGP Version 4 is the standard EGP for interdomain routing in the Internet. The protocol is defined in RFCs 1163, 1267, and 1771.
BGP Network Topology

Routers that belong to the same autonomous system (AS) and that exchange BGP updates run internal BGP (IBGP), and routers that belong to different autonomous systems and that exchange BGP updates run external BGP (EBGP). Most configuration commands are the same for configuring EBGP and IBGP. The difference is that the routing updates are exchanged either between autonomous systems (EBGP) or within an AS (IBGP). The figure given below shows a network that is running both EBGP and IBGP.

Figure 89: EBGP, IBGP, and Multiple Autonomous Systems

Before exchanging information with an external AS, BGP ensures that networks within the AS can be reached by defining internal BGP peering among routers within the AS and by redistributing BGP routing information to IGPss that run within the AS, such as IGRP and OSPF.

Routers that run a BGP routing process are often referred to as BGP speakers. BGP uses the Transmission Control Protocol (TCP) as its transport protocol (specifically port 179). Two BGP speakers that have a TCP connection to each other for exchanging routing information are known as peers or neighbors. In the above figure, Routers A and B are EBGP peers, as are Routers B and C and Routers C and D. The routing information is a series of AS numbers that describe the full path to the destination network. BGP uses this information to construct a loop-free map of autonomous systems.

The network has these characteristics:

- Routers A and B are running EBGP, and Routers B and C are running IBGP. Note that the EBGP peers are directly connected and that the IBGP peers are not. As long as there is an IGP running that allows the two neighbors to reach one another, IBGP peers do not have to be directly connected.

- All BGP speakers within an AS must establish a peer relationship with each other. That is, the BGP speakers within an AS must be fully meshed logically. BGP4 provides two techniques that reduce the requirement for a logical full mesh: confederations and route reflectors.

- AS 200 is a transit AS for AS 100 and AS 300—that is, AS 200 is used to transfer packets between AS 100 and AS 300.

BGP peers initially exchange their full BGP routing tables and then send only incremental updates. BGP peers also exchange keepalive messages (to ensure that the connection is up) and notification messages (in response to errors or special conditions).

In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (the autonomous system path), and a list of other path attributes. The primary function of a BGP
system is to exchange network reachability information, including information about the list of AS paths, with other BGP systems. This information can be used to determine AS connectivity, to prune routing loops, and to enforce AS-level policy decisions.

A router or Device running Cisco IOS does not select or use an IBGP route unless it has a route available to the next-hop router and it has received synchronization from an IGP (unless IGP synchronization is disabled). When multiple routes are available, BGP bases its path selection on attribute values. See the “Configuring BGP Decision Attributes” section for information about BGP attributes.

BGP Version 4 supports classless interdomain routing (CIDR) so you can reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes.

### How to Configure BGP

#### Default BGP Configuration

The table given below shows the basic default BGP configuration.

*Table 111: Default BGP Configuration*

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>

</tr>
<tr>
<td>NSF Awareness</td>
<td>Disabled. If enabled, allows Layer 3 switches to continue forwarding packets from a neighboring NSF-capable router during hardware or software changes.</td>
</tr>
</tbody>
</table>
Nonstop Forwarding Awareness

The BGP NSF Awareness feature is supported for IPv4 in the . To enable this feature with BGP routing, you need to enable Graceful Restart. When the neighboring router is NSF-capable, and this feature is enabled, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

Information About BGP Routing

To enable BGP routing, you establish a BGP routing process and define the local network. Because BGP must completely recognize the relationships with its neighbors, you must also specify a BGP neighbor.

BGP supports two kinds of neighbors: internal and external. Internal neighbors are in the same AS; external neighbors are in different autonomous systems. External neighbors are usually adjacent to each other and share a subnet, but internal neighbors can be anywhere in the same AS.

The switch supports the use of private AS numbers, usually assigned by service providers and given to systems whose routes are not advertised to external neighbors. The private AS numbers are from 64512 to 65535. You can configure external neighbors to remove private AS numbers from the AS path by using the neighbor remove-private-as router configuration command. Then when an update is passed to an external neighbor, if the AS path includes private AS numbers, these numbers are dropped.

If your AS will be passing traffic through it from another AS to a third AS, it is important to be consistent about the routes it advertises. If BGP advertised a route before all routers in the network had learned about the route through the IGP, the AS might receive traffic that some routers could not yet route. To prevent this from happening, BGP must wait until the IGP has propagated information across the AS so that BGP is synchronized with the IGP. Synchronization is enabled by default. If your AS does not pass traffic from one AS to another AS, or if all routers in your autonomous systems are running BGP, you can disable synchronization, which allows your network to carry fewer routes in the IGP and allows BGP to converge more quickly.

<table>

**Example: Configuring BGP on Routers**

These examples show how to configure BGP on the routers in the figure below,
Figure 90: EBGP, IBGP, and Multiple Autonomous Systems

Router A:

Switch(config)# router bgp 100
Switch(config-router)# neighbor 129.213.1.1 remote-as 200

Router B:

Switch(config)# router bgp 200
Switch(config-router)# neighbor 129.213.1.2 remote-as 100
Switch(config-router)# neighbor 175.220.1.2 remote-as 200

Router C:

Switch(config)# router bgp 200
Switch(config-router)# neighbor 175.220.212.1 remote-as 200
Switch(config-router)# neighbor 192.208.10.1 remote-as 300

Router D:

Switch(config)# router bgp 300
Switch(config-router)# neighbor 192.208.10.2 remote-as 200

To verify that BGP peers are running, use the show ip bgp neighbors privileged EXEC command. This is the output of this command on Router A:

Switch# show ip bgp neighbors

BGP neighbor is 129.213.1.1, remote AS 200, external link
BGP version 4, remote router ID 175.220.212.1
BGP state = established, table version = 3, up for 0:10:59
Last read 0:00:29, hold time is 180, keepalive interval is 60 seconds
Minimum time between advertisement runs is 30 seconds
Received 2828 messages, 0 notifications, 0 in queue
Sent 2826 messages, 0 notifications, 0 in queue
Connections established 11; dropped 10

Anything other than state = established means that the peers are not running. The remote router ID is the highest IP address on that router (or the highest loopback interface). Each time the table is updated with new information, the table version number increments. A table version number that continually increments means that a route is flapping, causing continual routing updates.
For exterior protocols, a reference to an IP network from the network router configuration command controls only which networks are advertised. This is in contrast to Interior Gateway Protocols (IGPs), such as EIGRP, which also use the network command to specify where to send updates.

Routing Policy Changes

Routing policies for a peer include all the configurations that might affect inbound or outbound routing table updates. When you have defined two routers as BGP neighbors, they form a BGP connection and exchange routing information. If you later change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you must reset the BGP sessions so that the configuration changes take effect.

There are two types of reset, hard reset and soft reset. Cisco IOS Releases 12.1 and later support a soft reset without any prior configuration. To use a soft reset without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session. A soft reset allows the dynamic exchange of route refresh requests and routing information between BGP routers and the subsequent re-advertisement of the respective outbound routing table.

- When soft reset generates inbound updates from a neighbor, it is called dynamic inbound soft reset.
- When soft reset sends a set of updates to a neighbor, it is called outbound soft reset.

A soft inbound reset causes the new inbound policy to take effect. A soft outbound reset causes the new local outbound policy to take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy can also take effect.

The table given below lists the advantages and disadvantages hard reset and soft reset.

Table 112: Advantages and Disadvantages of Hard and Soft Resets

<table>
<thead>
<tr>
<th>Type of Reset</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hard reset</td>
<td>No memory overhead</td>
<td>The prefixes in the BGP, IP, and FIB tables provided by the neighbor are lost. Not recommended.</td>

Managing Routing Policy Changes

To learn if a BGP peer supports the route refresh capability and to reset the BGP session:
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** show ip bgp neighbors | Displays whether a neighbor supports the route refresh capability. When supported, this message appears for the router:  
Received route refresh capability from peer. |
| **Step 2** clear ip bgp[* | address | peer-group-name] | Resets the routing table on the specified connection.  
- Enter an asterisk (*) to specify that all connections be reset.  
- Enter an IP address to specify the connection to be reset.  
- Enter a peer group name to reset the peer group. |
| **Step 3** clear ip bgp[* | address | peer-group-name] | soft out | (Optional) Performs an outbound soft reset to reset the inbound routing table on the specified connection. Use this command if route refresh is supported.  
- Enter an asterisk (*) to specify that all connections be reset.  
- Enter an IP address to specify the connection to be reset.  
- Enter a peer group name to reset the peer group. |
| **Step 4** show ip bgp | Verifies the reset by checking information about the routing table and about BGP neighbors. |
| **Step 5** show ip bgp neighbors | Verifies the reset by checking information about the routing table and about BGP neighbors. |

### BGP Decision Attributes

When a BGP speaker receives updates from multiple autonomous systems that describe different paths to the same destination, it must choose the single best path for reaching that destination. When chosen, the selected path is entered into the BGP routing table and propagated to its neighbors. The decision is based on the value of attributes that the update contains and other BGP-configurable factors.

When a BGP peer learns two EBGP paths for a prefix from a neighboring AS, it chooses the best path and inserts that path in the IP routing table. If BGP multipath support is enabled and the EBGP paths are learned from the same neighboring autonomous systems, instead of a single best path, multiple paths are installed in the IP routing table. Then, during packet switching, per-packet or per-destination load-balancing is performed.
among the multiple paths. The **maximum-paths** router configuration command controls the number of paths allowed.

These factors summarize the order in which BGP evaluates the attributes for choosing the best path:

1. If the path specifies a next hop that is inaccessible, drop the update. The BGP next-hop attribute, automatically determined by the software, is the IP address of the next hop that is going to be used to reach a destination. For EBGP, this is usually the IP address of the neighbor specified by the `neighbor remote-as router` configuration command. You can disable next-hop processing by using route maps or the `neighbor next-hop-self` router configuration command.

2. Prefer the path with the largest weight (a Cisco proprietary parameter). The weight attribute is local to the router and not propagated in routing updates. By default, the weight attribute is 32768 for paths that the router originates and zero for other paths. Routes with the largest weight are preferred. You can use access lists, route maps, or the `neighbor weight` router configuration command to set weights.

3. Prefer the route with the highest local preference. Local preference is part of the routing update and exchanged among routers in the same AS. The default value of the local preference attribute is 100. You can set local preference by using the `bgp default local-preference` router configuration command or by using a route map.

4. Prefer the route that was originated by BGP running on the local router.

5. Prefer the route with the shortest AS path.

6. Prefer the route with the lowest origin type. An interior route or IGP is lower than a route learned by EGP, and an EGP-learned route is lower than one of unknown origin or learned in another way.

7. Prefer the route with the lowest multi -exit discriminator (MED) metric attribute if the neighboring AS is the same for all routes considered. You can configure the MED by using route maps or by using the `default-metric` router configuration command. When an update is sent to an IBGP peer, the MED is included.

8. Prefer the external (EBGP) path over the internal (IBGP) path.

9. Prefer the route that can be reached through the closest IGP neighbor (the lowest IGP metric). This means that the router will prefer the shortest internal path within the AS to reach the destination (the shortest path to the BGP next-hop).

10. If the following conditions are all true, insert the route for this path into the IP routing table:
    - Both the best route and this route are external.
    - Both the best route and this route are from the same neighboring autonomous system.
    - Maximum-paths is enabled.

11. If multipath is not enabled, prefer the route with the lowest IP address value for the BGP router ID. The router ID is usually the highest IP address on the router or the loopback (virtual) address, but might be implementation-specific.

</tbody>
</table>
Route Maps

Within BGP, route maps can be used to control and to modify routing information and to define the conditions by which routes are redistributed between routing domains. Each route map has a name that identifies the route map (map tag) and an optional sequence number.

Configuring BGP Filtering with Route Maps

</tbody>
</table>
BGP Filtering

You can filter BGP advertisements by using AS-path filters, such as the `as-path access-list` global configuration command and the `neighbor filter-list` router configuration command. You can also use access lists with the `neighbor distribute-list` router configuration command. Distribute-list filters are applied to network numbers. See the “Controlling Advertising and Processing in Routing Updates” section for information about the `distribute-list` command.

You can use route maps on a per-neighbor basis to filter updates and to modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates. On both inbound and outbound updates, matching is supported based on AS path, community, and network numbers. Autonomous system path matching requires the `match as-path access-list` route-map command, community based matching requires the `match community-list` route-map command, and network-based matching requires the `ip access-list` global configuration command.

### Configuring BGP Filtering by Neighbor

#### Procedure

<td>Switch(config)# router bgp 109</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`neighbor {ip-address</td>
<td>peer-group name} distribute-list {access-list-number</td>
</tr>
<tr>
<td>Note</td>
<td>You can also use the <code>neighbor prefix-list</code> router configuration command to filter updates, but you cannot use both commands to configure the same BGP peer.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# neighbor 172.16.4.1 distribute-list 39 in</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>`neighbor {ip-address</td>
<td>peer-group name} route-map map-tag {in</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# neighbor 172.16.70.24 route-map internal-map in</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

Switch(config)# end

<table>
<thead>
<tr>
<th><strong>Step 6</strong></th>
<th><strong>show ip bgp neighbors</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# show ip bgp neighbors</td>
</tr>
</tbody>
</table>

Verifies the configuration.

<table>
<thead>
<tr>
<th><strong>Step 7</strong></th>
<th><strong>copy running-config startup-config</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

---

### Configuring BGP Filtering by Access Lists and Neighbors

Another method of filtering is to specify an access list filter on both incoming and outbound updates, based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. To use this method, define an autonomous system path access list, and apply it to updates to and from particular neighbors.

#### Procedure

<table>
<thead>
<tr>
<th><strong>Command or Action</strong></th>
<th><strong>Purpose</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** ip as-path access-list access-list-number {permit | deny} as-regular-expressions | Defines a BGP-related access list. |
| **Example:** Switch(config)# ip as-path access-list 1 deny _65535_ |

| **Step 3** router bgp autonomous-system | Enters BGP router configuration mode. |
| **Example:** Switch(config)# router bgp 110 |

| **Step 4** neighbor {ip-address | peer-group name} filter-list {access-list-number | name} {in | out | weight weight} | Establishes a BGP filter based on an access list. |
| **Example:** Switch(config-router)# neighbor 172.16.1.1 filter-list 1 out |
### Prefix List for BGP Filtering

You can use prefix lists as an alternative to access lists in many BGP route filtering commands, including the `neighbor distribute-list` router configuration command. The advantages of using prefix lists include performance improvements in loading and lookup of large lists, incremental update support, easier CLI configuration, and greater flexibility.

Filtering by a prefix list involves matching the prefixes of routes with those listed in the prefix list, as when matching access lists. When there is a match, the route is used. Whether a prefix is permitted or denied is based upon these rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries in a prefix list.
- When multiple entries of a prefix list match a given prefix, the sequence number of a prefix list entry identifies the entry with the lowest sequence number.

By default, sequence numbers are generated automatically and incremented in units of five. If you disable the automatic generation of sequence numbers, you must specify the sequence number for each entry. You can specify sequence values in any increment. If you specify increments of one, you cannot insert additional entries into the list; if you choose very large increments, you might run out of values.

### Configuring Prefix Lists for BGP Filtering

You do not need to specify a sequence number when removing a configuration entry. **Show** commands include the sequence numbers in their output.

Before using a prefix list in a command, you must set up the prefix list.
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
| **Step 2** | `ip prefix-list list-name [seq seq-value] deny | permit network/len [ge ge-value] [le le-value]` | Creates a prefix list with an optional sequence number to `deny` or `permit` access for matching conditions. You must enter at least one `permit` or `deny` clause.  
  - `network/len` is the network number and length (in bits) of the network mask.  
  - (Optional) `ge` and `le` values specify the range of the prefix length to be matched. The specified `ge-value` and `le-value` must satisfy this condition: `len < ge-value < le-value < 32` |
| **Example:** | `Switch(config)# ip prefix-list BLUE permit 172.16.1.0/24` | |
| **Step 3** | `ip prefix-list list-name seq seq-value deny | permit network/len [ge ge-value] [le le-value]` | (Optional) Adds an entry to a prefix list, and assign a sequence number to the entry. |
| **Example:** | `Switch(config)# ip prefix-list BLUE seq 10 permit 172.24.1.0/24` | |
| **Step 4** | `end` | Returns to privileged EXEC mode. |
| **Example:** | `Switch(config)# end` | |
| **Step 5** | `show ip prefix list [detail | summary] name [network/len] [seq seq-num] [longer] [first-match]` | Verifies the configuration by displaying information about a prefix list or prefix list entries. |
| **Example:** | `Switch# show ip prefix list summary test` | |
| **Step 6** | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
| **Example:** | `Switch# copy running-config startup-config` | |

## BGP Community Filtering

One way that BGP controls the distribution of routing information based on the value of the COMMUNITIES attribute. The attribute is a way to groups destinations into communities and to apply routing decisions based on environments.
on the communities. This method simplifies configuration of a BGP speaker to control distribution of routing information.

A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities. AS administrators can define to which communities a destination belongs. By default, all destinations belong to the general Internet community. The community is identified by the COMMUNITIES attribute, an optional, transitive, global attribute in the numerical range from 1 to 4294967200. These are some predefined, well-known communities:

- internet—Advertise this route to the Internet community. All routers belong to it.
- no-export—Do not advertise this route to EBGP peers.
- no-advertise—Do not advertise this route to any peer (internal or external).
- local-as—Do not advertise this route to peers outside the local autonomous system.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. A BGP speaker can set, append, or modify the community of a route when learning, advertising, or redistributing routes. When routes are aggregated, the resulting aggregate has a COMMUNITIES attribute that contains all communities from all the initial routes.

You can use community lists to create groups of communities to use in a match clause of a route map. As with an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

**Configuring BGP Community Filtering**

By default, no COMMUNITIES attribute is sent to a neighbor. You can specify that the COMMUNITIES attribute be sent to the neighbor at an IP address by using the `neighbor send-community` router configuration command.

**SUMMARY STEPS**

1. configure terminal
2. ip community-list community-list-number {permit | deny} community-number
3. router bgp autonomous-system
4. neighbor {ip-address | peer-group name} send-community
5. set comm-list list-num delete
6. exit
7. ip bgp-community new-format
8. end
9. show ip bgp community
10. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Creates a community list, and assigns it a number.</td>
</tr>
</tbody>
</table>
| **Step 2** ip community-list community-list-number {permit | deny} community-number | • The `community-list-number` is an integer from 1 to 99 that identifies one or more permit or deny groups of communities.  
• The `community-number` is the number configured by a `set community` route-map configuration command. |
| **Example:** Switch(config)# ip community-list 1 permit 50000:10 | |
| **Step 3** router bgp autonomous-system | Enters BGP router configuration mode. |
| **Example:** Switch(config)# router bgp 108 | |
| **Step 4** neighbor {ip-address | peer-group name} send-community | Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address. |
| **Example:** Switch(config-router)# neighbor 172.16.70.23 send-community | |
| **Step 5** set comm-list list-num delete | (Optional) Removes communities from the community attribute of an inbound or outbound update that match a standard or extended community list specified by a route map. |
| **Example:** Switch(config-router)# set comm-list 500 delete | |
| **Step 6** exit | Returns to global configuration mode. |
| **Example:** Switch(config-router)# end | |
| **Step 7** ip bgp-community new-format | (Optional) Displays and parses BGP communities in the format AA:NN. A BGP community is displayed in a two-part format 2 bytes long. The Cisco default community format is in the format NNAA. In the most recent RFC for BGP, a community takes the form AA:NN, where the first part is the AS number and the second part is a 2-byte number. |
| **Example:** Switch(config)# ip bgp-community new format | |
| **Step 8** end | Returns to privileged EXEC mode. |
| **Example:** Switch(config)# end | |
### BGP Neighbors and Peer Groups

Often many BGP neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and to make updating more efficient. When you have configured many peers, we recommend this approach.

To configure a BGP peer group, you create the peer group, assign options to the peer group, and add neighbors as peer group members. You configure the peer group by using the `neighbor` router configuration commands. By default, peer group members inherit all the configuration options of the peer group, including the remote-as (if configured), version, update-source, out-route-map, out-filter-list, out-dist-list, minimum-advertisement-interval, and next-hop-self. All peer group members also inherit changes made to the peer group. Members can also be configured to override the options that do not affect outbound updates.

### Configuring BGP Neighbors and Peer Groups

To assign configuration options to an individual neighbor, specify any of these router configuration commands by using the neighbor IP address. To assign the options to a peer group, specify any of the commands by using the peer group name. You can disable a BGP peer or peer group without removing all the configuration information by using the `neighbor shutdown` router configuration command.

</tbody>
</table>
| 18   | `neighbor {ip-address | peer-group-name} timers keepalive holdtime` | (Optional) Sets timers for the neighbor or peer group.  
  - The keepalive interval is the time within which keepalive messages are sent to peers. The range is 1 to 4294967295 seconds; the default is 60. |
### Aggregate Routes

Classless interdomain routing (CIDR) enables you to create aggregate routes (or supernets) to minimize the size of routing tables. You can configure aggregate routes in BGP either by redistributing an aggregate route into BGP or by creating an aggregate entry in the BGP routing table. An aggregate address is added to the BGP table when there is at least one more specific entry in the BGP table.

<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>aggregate-address address mask suppress-map map-name</code></td>
<td>(Optional) Suppresses selected, more specific routes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 suppress-map map1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>aggregate-address address mask advertise-map map-name</code></td>
<td>(Optional) Generates an aggregate based on conditions specified by the route map.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 advertise-map map2</code></td>
<td></td>
</tr>
</tbody>
</table>
Routing Domain Confederations

One way to reduce the IBGP mesh is to divide an autonomous system into multiple subautonomous systems and to group them into a single confederation that appears as a single autonomous system. Each autonomous system is fully meshed within itself and has a few connections to other autonomous systems in the same confederation. Even though the peers in different autonomous systems have EBGP sessions, they exchange routing information as if they were IBGP peers. Specifically, the next hop, MED, and local preference information is preserved. You can then use a single IGP for all of the autonomous systems.

Configuring Routing Domain Confederations

You must specify a confederation identifier that acts as the autonomous system number for the group of autonomous systems.

Procedure

</table>

**BGP Route Reflectors**

BGP requires that all of the IBGP speakers be fully meshed. When a router receives a route from an external neighbor, it must advertise it to all internal neighbors. To prevent a routing information loop, all IBPG speakers must be connected. The internal neighbors do not send routes learned from internal neighbors to other internal neighbors.
With route reflectors, all IBGP speakers need not be fully meshed because another method is used to pass learned routes to neighbors. When you configure an internal BGP peer to be a route reflector, it is responsible for passing IBGP learned routes to a set of IBGP neighbors. The internal peers of the route reflector are divided into two groups: client peers and nonclient peers (all the other routers in the autonomous system). A route reflector reflects routes between these two groups. The route reflector and its client peers form a cluster. The nonclient peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with IBGP speakers outside their cluster.

When the route reflector receives an advertised route, it takes one of these actions, depending on the neighbor:

- A route from an external BGP speaker is advertised to all clients and nonclient peers.
- A route from a nonclient peer is advertised to all clients.
- A route from a client is advertised to all clients and nonclient peers. Hence, the clients need not be fully meshed.

Usually a cluster of clients have a single route reflector, and the cluster is identified by the route reflector router ID. To increase redundancy and to avoid a single point of failure, a cluster might have more than one route reflector. In this case, all route reflectors in the cluster must be configured with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster. All the route reflectors serving a cluster should be fully meshed and should have identical sets of client and nonclient peers.

## Configuring BGP Route Reflectors

### Procedure

<table>
<thead>
<tr>
<th>Step</th>

### Route Dampening

Route flap dampening is a BGP feature designed to minimize the propagation of flapping routes across an internetwork. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, and so on. When route dampening is enabled, a numeric penalty value is assigned to a route when it flaps. When a route’s accumulated penalties reach a configurable limit, BGP suppresses advertisements of the route, even if the route is running. The reuse limit is a configurable value that is compared with the penalty. If the penalty is less than the reuse limit, a suppressed route that is up is advertised again.

Dampening is not applied to routes that are learned by IBGP. This policy prevents the IBGP peers from having a higher penalty for routes external to the AS.

### Configuring Route Dampening

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Enters global configuration mode.</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| Step 2 | `router bgp autonomous-system`  
Example:  
Switch(config)# router bgp 100 | Enters BGP router configuration mode. |
| Step 3 | `bgp dampening`  
Example:  
Switch(config-router)# bgp dampening | Enables BGP route dampening. |
| Step 4 | `bgp dampening half-life reuse suppress max-suppress [route-map map]`  
Example:  
Switch(config-router)# bgp dampening 30 1500 10000 120 | (Optional) Changes the default values of route dampening factors. |
| Step 5 | `end`  
Example:  
Switch(config)# end | Returns to privileged EXEC mode. |
| Step 6 | `show ip bgp flap-statistics [{regexp regexp} | {filter-list list} | {address mask [longer-prefix]}]`  
Example:  
Switch# show ip bgp flap-statistics | (Optional) Monitors the flaps of all paths that are flapping. The statistics are deleted when the route is not suppressed and is stable. |
| Step 7 | `show ip bgp dampened-paths`  
Example:  
Switch# show ip bgp dampened-paths | (Optional) Displays the dampened routes, including the time remaining before they are suppressed. |
| Step 8 | `clear ip bgp flap-statistics [{regexp regexp} | {filter-list list} | {address mask [longer-prefix]}]`  
Example:  
Switch# clear ip bgp flap-statistics | (Optional) Clears BGP flap statistics to make it less likely that a route will be dampened. |
| Step 9 | `clear ip bgp dampening`  
Example:  
Switch# clear ip bgp dampening | (Optional) Clears route dampening information, and unsuppress the suppressed routes. |
| Step 10 | `copy running-config startup-config`  
Example: | (Optional) Saves your entries in the configuration file. |
More BGP Information

Monitoring and Maintaining BGP

You can remove all contents of a particular cache, table, or database. This might be necessary when the contents of the particular structure have become or are suspected to be invalid.

You can display specific statistics, such as the contents of BGP routing tables, caches, and databases. You can use the information to get resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device’s packets are taking through the network.

The table given below lists the privileged EXEC commands for clearing and displaying BGP.

**Table 113: IP BGP Clear and Show Commands**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear ip bgp address</code></td>
<td>Resets a particular BGP connection.</td>
</tr>
<tr>
<td><code>clear ip bgp *</code></td>
<td>Resets all BGP connections.</td>
</tr>
<tr>
<td><code>clear ip bgp peer-group tag</code></td>
<td>Removes all members of a BGP peer group.</td>
</tr>
<tr>
<td><code>show ip bgp prefix</code></td>
<td>Displays peer groups and peers not in peer groups to which the prefix has been advertised. Also displays prefix attributes such as the next hop and the local prefix.</td>
</tr>
<tr>
<td><code>show ip bgp cidr-only</code></td>
<td>Displays all BGP routes that contain subnet and supernet network masks.</td>
</tr>
<tr>
<td><code>show ip bgp community [community-number] [exact]</code></td>
<td>Displays routes that belong to the specified communities.</td>

### Information About ISO CLNS Routing

#### Connectionless Routing

The International Organization for Standardization (ISO) Connectionless Network Service (CLNS) protocol is a standard for the network layer of the Open System Interconnection (OSI) model. Addresses in the ISO network architecture are referred to as network service access point (NSAP) addresses and network entity titles (NETs). Each node in an OSI network has one or more NETs. In addition, each node has many NSAP addresses.

When you enable connectionless routing on the Device by using the `clns routing` global configuration command, the Device makes only forwarding decisions, with no routing-related functionality. For dynamic routing, you must also enable a routing protocol. The Device supports the Intermediate System-to-Intermediate System (IS-IS) dynamic routing protocol that is based on the OSI routing protocol for ISO CLNS networks.

When dynamically routing, you use IS-IS. This routing protocol supports the concept of areas. Within an area, all routers know how to reach all the system IDs. Between areas, routers know how to reach the proper area. IS-IS supports two levels of routing: station routing (within an area) and area routing (between areas).

The key difference between the ISO IGRP and IS-IS NSAP addressing schemes is in the definition of area addresses. Both use the system ID for Level 1 routing (routing within an area). However, they differ in the way addresses are specified for area routing. An ISO IGRP NSAP address includes three separate fields for routing: the domain, area, and system ID. An IS-IS address includes two fields: a single continuous area field (comprising the domain and area fields) and the system ID.
How to Configure ISO CLNS Routing

Information About IS-IS Routing

Integrated Intermediate System-to-Intermediate System (IS-IS) is an ISO dynamic routing protocol (described in ISO 105890). To enable IS-IS you should create an IS-IS routing process and assign it to a specific interface, rather than to a network. You can specify more than one IS-IS routing process per Layer 3 device by using the multiarea IS-IS configuration syntax. You should then configure the parameters for each instance of the IS-IS routing process.

Small IS-IS networks are built as a single area that includes all the devices in the network. As the network grows larger, the network reorganizes itself into a backbone area made up of all the connected set of Level 2 devices still connected to their local areas. Within a local area, devices know how to reach all system IDs. Between areas, devices know how to reach the backbone, and the backbone devices know how to reach other areas.

Devices establish Level 1 adjacencies to perform routing within a local area (station routing). Devices establish Level 2 adjacencies to perform routing between Level 1 areas (area routing).

A single Cisco device can participate in routing in up to 29 areas and can perform Level 2 routing in the backbone. In general, each routing process corresponds to an area. By default, the first instance of the routing process that is configured performs both Level 1 and Level 2 routing. You can configure additional device instances, which are automatically treated as Level 1 areas. You must configure the parameters for each instance of the IS-IS routing process individually.

For IS-IS multiarea routing, you can configure only one process to perform Level 2 routing, although you can define up to 29 Level 1 areas for each Cisco unit. If Level 2 routing is configured on any process, all additional processes are automatically configured as Level 1. You can configure this process to perform Level 1 routing at the same time. If Level 2 routing is not desired for a device instance, remove the Level 2 capability using the `is-type` command in global configuration mode. Use the `is-type` command also to configure a different device instance as a Level 2 device.

</tr>
</tbody>
</table>

**Nonstop Forwarding Awareness**

The integrated IS-IS Nonstop Forwarding (NSF) Awareness feature is supported for IPv4G. The feature allows customer premises equipment (CPE) devices that are NSF-aware to help NSF-capable devices perform nonstop forwarding of packets. The local device is not necessarily performing NSF, but its NSF awareness capability...
Enables the integrity and accuracy of the routing database and the link-state database on the neighboring NSF-capable device to be maintained during the switchover process.

The integrated IS-IS Nonstop Forwarding (NSF) Awareness feature is automatically enabled and requires no configuration.

Enabling IS-IS Routing

To enable IS-IS, you specify a name and network entity title (NET) for each routing process. You then enable IS-IS routing on the interface and specify the area for each instance of the routing process.

### Procedure

Switch# show isis database detail

**Step 11**  
`copy running-config startup-config`  
*Example:*  
Switch# copy running-config startup-config

---

### Example: Configuring IS-IS Routing

This example shows how to configure three routers to run conventional IS-IS as an IP routing protocol. In conventional IS-IS, all routers act as Level 1 and Level 2 routers (by default).

**Router A:**

```
Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000a.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-if)# interface gigabitethernet1/0/2
Switch(config-if)# ip router isis
```
Switch(config-if)# clns router isis
Switch(config-router)# exit

Router B:

Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000b.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit

Router C:

Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000c.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit

IS-IS Global Parameters

The following are the optional IS-IS global parameters that you can configure:

- You can force a default route into an IS-IS routing domain by configuring a default route that is controlled by a route map. You can also specify the other filtering options that are configurable under a route map.

- You can configure the device to ignore IS-IS link-state packets (LSPs) that are received with internal checksum errors, or to purge corrupted LSPs, and cause the initiator of the LSP to regenerate it.

- You can assign passwords to areas and domains.

- You can create aggregate addresses that are represented in the routing table by a summary address (based on route summarization). Routes learned from other routing protocols can also be summarized. The metric used to advertise the summary is the smallest metric of all the specific routes.

- You can set an overload bit.

- You can configure the LSP refresh interval and the maximum time that an LSP can remain in the device database without a refresh.

- You can set the throttling timers for LSP generation, shortest path first computation, and partial route computation.

- You can configure the device to generate a log message when an IS-IS adjacency changes state (Up or Down).
- If a link in the network has a maximum transmission unit (MTU) size of less than 1500 bytes, you can lower the LSP MTU so that routing still occurs.
- You can use the **partition avoidance** command to prevent an area from becoming partitioned when full connectivity is lost among a Level 1-2 border device, adjacent Level 1 devices, and end hosts.

## Configuring IS-IS Global Parameters

</tbody>
</table>
| **Step 8**

**set-overload-bit [on-startup {seconds | wait-for-bgp}]**

**Example:**

```
Switch(config-router)# set-overload-bit on-startup wait-for-bgp
```

(Optional) Sets an overload bit to allow other routers to ignore the router in their shortest path first (SPF) calculations if the router is having problems.

- **on-startup**—Sets the overload bit only on startup. If `on-startup` is not specified, the overload bit is set immediately and remains set until you enter the `no set-overload-bit` command. If `on-startup` is specified, you must either enter number of seconds or enter `wait-for-bgp`.

- **seconds**—When the `on-startup` keyword is configured, it causes the overload bit to be set when the system is started and remains set for the specified number of seconds. The range is from 5 to 86400 seconds.

- **wait-for-bgp**—When the `on-startup` keyword is configured, it causes the overload bit to be set when the system is started and remains set until BGP has converged. If BGP does not signal the IS-IS that it is converged, the IS-IS will turn off the overload bit after 10 minutes.

| **Step 9**

**lsp-refresh-interval seconds**

**Example:**

```
Switch(config-router)# lsp-refresh-interval 1080
```

(Optional) Sets an LSP refresh interval, in seconds. The range is from 1 to 65535 seconds. The default is to send LSP refreshes every 900 seconds (15 minutes).

| **Step 10**

**max-lsp-lifetime seconds**

**Example:**

```
Switch(config-router)# max-lsp-lifetime 1000
```

(Optional) Sets the maximum time that LSP packets remain in the router database without being refreshed. The range is from 1 to 65535 seconds. The default is 1200 seconds (20 minutes). After the specified time interval, the LSP packet is deleted.

| **Step 11**

**lsp-gen-interval [level-1 | level-2] lsp-max-wait [lsp-initial-wait lsp-second-wait]**

**Example:**

```
Switch(config-router)# lsp-gen-interval level-2 2 50 100
```

(Optional) Sets the IS-IS LSP generation throttling timers:

- **lsp-max-wait**—Maximum interval (in seconds) between two consecutive occurrences of an LSP being generated. The range is from 1 to 120; the default is 5.

- **lsp-initial-wait**—Initial LSP generation delay (in milliseconds). The range is from 1 to 10000; the default is 50.

- **lsp-second-wait**—Hold time between the first and second LSP generation (in milliseconds). The range is from 1 to 10000; the default is 5000.
<table>

- *prc-initial-wait*—Initial PRC calculation delay (in milliseconds) after a topology change. The range is from 1 to 10,000; the default is 2000.  
- *prc-second-wait*—Hold time between the first and second PRC calculation (in milliseconds). The range is from 1 to 10,000; the default is 5000. |
| **Example:**                                                                    |                                                                            |
| `Switch(config-router)# prc-interval 5 10 20`                                    |                                                                            |
| **Step 14**                                                                     | (Optional) Sets the router to log IS-IS adjacency state changes. Enter all to include all changes generated by events that are not related to the IS-IS hellos, including End System-to-Intermediate System PDUs and link state packets (LSPs). |
| `log-adjacency-changes [all]`                                                    |                                                                            |
| **Example:**                                                                    |                                                                            |
| `Switch(config-router)# log-adjacency-changes all`                              |                                                                            |
| **Step 15**                                                                     | (Optional) Specifies the maximum LSP packet size, in bytes. The range is from 128 to 4352; the default is 1497 bytes. |
| `lsp-mtu size`                                                                  | Note  If a link in the network has a reduced MTU size, you must change the LSP MTU size on all the devices in the network. |
| **Example:**                                                                    |                                                                            |
| `Switch(config-router)# lsp mtu 1560`                                           |                                                                            |
| **Step 16**                                                                     | (Optional) Causes an IS-IS Level 1-2 border router to stop advertising the Level 1 area prefix into the Level 2 backbone when full connectivity is lost among the border router, all adjacent level 1 routers, and end hosts. |
| `partition avoidance`                                                           |                                                                            |
| **Example:**                                                                    |                                                                            |
| `Switch(config-router)# partition avoidance`                                     |                                                                            |
| **Step 17**                                                                     | Returns to privileged EXEC mode.                                                            |
| `end`                                                                           |                                                                            |
| **Example:**                                                                    |                                                                            |
| `Switch(config)# end`                                                           |                                                                            |
IS-IS Interface Parameters

You can optionally configure certain interface-specific IS-IS parameters independently from other attached devices. However, if you change default values such as multipliers and time intervals, it makes sense to also change them on multiple devices and interfaces. Most of the interface parameters can be configured for level 1, level 2, or both.

The following are the interface-level parameters that you can configure:

- The default metric on the interface that is used as a value for the IS-IS metric and assigned when quality of service (QoS) routing is not performed.

- The hello interval (length of time between hello packets sent on the interface) or the default hello packet multiplier used on the interface to determine the hold time sent in IS-IS hello packets. The hold time determines how long a neighbor waits for another hello packet before declaring the neighbor down. This determines how quickly a failed link or neighbor is detected so that routes can be recalculated. Change the hello multiplier in circumstances where hello packets are lost frequently and IS-IS adjacencies are failing unnecessarily. You can raise the hello multiplier and lower the hello interval correspondingly to make the hello protocol more reliable, without increasing the time required to detect a link failure.

- Other time intervals:
  - Complete sequence number PDU (CSNP) interval—CSNPs are sent by the designated device to maintain database synchronization.
  - Retransmission interval—This is the time between retransmission of IS-IS LSPs for point-to-point links.
  - IS-IS LSP retransmission throttle interval—This is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs are resent on point-to-point links. This interval is different from the retransmission interval, which is the time between successive retransmissions of the same LSP.

- Designated device-election priority, which allows you to reduce the number of adjacencies required on a multiaccess network, which in turn reduces the amount of routing protocol traffic and the size of the topology database.

- The interface circuit type, which is the type of adjacency required for neighbors on the specified interface.

- Password authentication for the interface.

Configuring IS-IS Interface Parameters

To configure IS-IS interface-specific parameters, perform this procedure:
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `configure terminal`  
**Example:**  
Switch# `configure terminal` | Enters global configuration mode. |
| Step 2 | `interface interface-id`  
**Example:**  
Switch(config)# `interface gigabitethernet 1/0/1` | Specifies the interface to be configured and enter interface configuration mode. If the interface is not already configured as a Layer 3 interface, enter the **no switchport** command to configure the interface in Layer 3 mode. |
| Step 3 | `isis metric default-metric [level-1 | level-2]`  
**Example:**  
Switch(config-if)# `isis metric 15` | (Optional) Configures the metric (or cost) for the specified interface. The range is from 0 to 63; the default is 10. If no level is entered, the default is to apply to both Level 1 and Level 2 routers. |
| Step 4 | `isis hello-interval {seconds | minimal} [level-1 | level-2]`  
**Example:**  
Switch(config-if)# `isis hello-interval minimal` | (Optional) Specifies the length of time between the hello packets sent by the switch. By default, a value that is three times the hello interval *seconds* is advertised as the *holdtime* in the hello packets sent. With smaller hello intervals, topological changes are detected faster, but there is more routing traffic.  
- **minimal**—Causes the system to compute the hello interval based on the hello multiplier so that the resulting hold time is 1 second.  
- **seconds**—Range is from 1 to 65535; the default is 10 seconds. |
| Step 5 | `isis hello-multiplier multiplier [level-1 | level-2]`  
**Example:**  
Switch(config-if)# `isis hello-multiplier 5` | (Optional) Specifies the number of IS-IS hello packets a neighbor must miss before the device should declare the adjacency as down. The range is from 3 to 1000; the default is 3.  
**Note** Using a smaller hello multiplier causes fast convergence, but might result in routing instability. |
| Step 6 | `isis csnp-interval seconds [level-1 | level-2]`  
**Example:**  
Switch(config-if)# `isis csnp-interval 15` | (Optional) Configures the IS-IS complete sequence number PDU (CSNP) interval for the interface. The range is from 0 to 65535; the default is 10 seconds. |
| Step 7 | `isis retransmit-interval seconds`  
**Example:**  
Switch(config-if)# `isis retransmit-interval 7` | (Optional) Configures the number of seconds between the retransmission of IS-IS LSPs for point-to-point links. Specify an integer that is greater than the expected round-trip delay between any two routers on the network. The range is from 0 to 65535; the default is 5 seconds. |
<table>

Monitoring and Maintaining ISO IGRP and IS-IS

You can remove all contents of a CLNS cache or remove information for a particular neighbor or route. You can display specific CLNS or IS-IS statistics, such as the contents of routing tables, caches, and databases. You can also display information about specific interfaces, filters, or neighbors.

The following table lists the privileged EXEC commands for clearing and displaying ISO CLNS and IS-IS routing.

Table 115: ISO CLNS and IS-IS Clear and Show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear clns cache</td>
<td>Clears and reinitializes the CLNS routing cache.</td>
</tr>
<tr>
<td>clear clns es-neighbors</td>
<td>Removes end system (ES) neighbor information from the adjacency database.</td>
</tr>
<tr>
<td>clear clns is-neighbors</td>
<td>Removes intermediate system (IS) neighbor information from the adjacency database.</td>

**Information About Multi-VRF CE**

Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service-provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table, called a VPN routing/forwarding (VRF) table.

The switch supports multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices (multi-VRF CE) when it is running the Multi-VRF CE allows a service provider to support two or more VPNs with overlapping IP addresses.

---

**Note**
The switch does not use Multiprotocol Label Switching (MPLS) to support VPNs.

**Understanding Multi-VRF CE**

Multi-VRF CE is a feature that allows a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. Multi-VRF CE uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but an interface cannot belong to more than one VRF at any time.

---

**Note**
Multi-VRF CE interfaces must be Layer 3 interfaces.

Multi-VRF CE includes these devices:
• Customer edge (CE) devices provide customers access to the service-provider network over a data link to one or more provider edge routers. The CE device advertises the site’s local routes to the router and learns the remote VPN routes from it. A switch can be a CE.

• Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv2, OSPF, or EIGRP. The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service-provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CEs, a PE router exchanges VPN routing information with other PE routers by using internal BGP (IBGP).

• Provider routers or core routers are any routers in the service provider network that do not attach to CE devices.

With multi-VRF CE, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. Multi-VRF CE extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

Network Topology

The figure shows a configuration using switches as multiple virtual CEs. This scenario is suited for customers who have low bandwidth requirements for their VPN service, for example, small companies. In this case, multi-VRF CE support is required in the switches. Because multi-VRF CE is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.

*Figure 91: Switches Acting as Multiple Virtual CEs*

When the CE switch receives a command to add a Layer 3 interface to a VRF, it sets up the appropriate mapping between the VLAN ID and the policy label (PL) in multi-VRF-CE-related data structures and adds the VLAN ID and PL to the VLAN database.

When multi-VRF CE is configured, the Layer 3 forwarding table is conceptually partitioned into two sections:

- The multi-VRF CE routing section contains the routes from different VPNs.
- The global routing section contains routes to non-VPN networks, such as the Internet.
VLAN IDs from different VRFs are mapped into different policy labels, which are used to distinguish the VRFs during processing. For each new VPN route learned, the Layer 3 setup function retrieves the policy label by using the VLAN ID of the ingress port and inserts the policy label and new route to the multi-VRF CE routing section. If the packet is received from a routed port, the port internal VLAN ID number is used; if the packet is received from an SVI, the VLAN number is used.

Packet-Forwarding Process

This is the packet-forwarding process in a multi-VRF-CE-enabled network:

- When the switch receives a packet from a VPN, the switch looks up the routing table based on the input policy label number. When a route is found, the switch forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. Then it performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input policy label to look up the correct VPN routing table. If a route is found, it forwards the packet within the VPN.

Network Components

To configure VRF, you create a VRF table and specify the Layer 3 interface associated with the VRF. Then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the provider’s backbone. The multi-VRF CE network has three major components:

- VPN route target communities—lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- VPN forwarding—transports all traffic between all VPN community members across a VPN service-provider network.

VRF-Aware Services

IP services can be configured on global interfaces, and these services run within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-Aware services are implemented in platform-independent modules. VRF means multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.
How to Configure Multi-VRF CE

Default Multi-VRF CE Configuration

Table 116: Default VRF Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF</td>
<td>Disabled. No VRFs are defined.</td>
</tr>
<tr>
<td>Maps</td>
<td>No import maps, export maps, or route maps are defined.</td>
</tr>
<tr>
<td>VRF maximum routes</td>
<td>Fast Ethernet switches: 8000 Gigabit Ethernet switches: 12000.</td>
</tr>
<tr>
<td>Forwarding table</td>
<td>The default for an interface is the global routing table.</td>
</tr>
</tbody>
</table>
Multi-VRF CE Configuration Guidelines

To use multi-VRF CE, you must have the enabled on your switch.

- A switch with multi-VRF CE is shared by multiple customers, and each customer has its own routing table.
- Because customers use different VRF tables, the same IP addresses can be reused. Overlapped IP addresses are allowed in different VPNs.
- Multi-VRF CE lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. Each customer has its own VLAN.
- Multi-VRF CE does not support all MPLS-VRF functionality. It does not support label exchange, LDP adjacency, or labeled packets.
- For the PE router, there is no difference between using multi-VRF CE or using multiple CEs. In Figure 41-6, multiple virtual Layer 3 interfaces are connected to the multi-VRF CE device.
- The switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. The SVIs can be connected through an access port or a trunk port.
- A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer’s VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- The switch supports one global network and up to 256 VRFs.
- Most routing protocols (BGP, OSPF, RIP, and static routing) can be used between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  - BGP does not require multiple algorithms to communicate with multiple CEs.
  - BGP is designed for passing routing information between systems run by different administrations.
  - BGP makes it easy to pass attributes of the routes to the CE.
- Multi-VRF CE does not affect the packet switching rate.
- VPN multicast is not supported.
- You can enable VRF on a private VLAN, and the reverse.
- You cannot enable VRF when policy-based routing (PBR) is enabled on an interface, and the reverse.
- You cannot enable VRF when Web Cache Communication Protocol (WCCP) is enabled on an interface, and the reverse.

Configuring VRFs

Perform the following steps:
## Configuring VRFs

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip routing</code></td>
<td>Enables IP routing.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# <code>ip routing</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip vrf vrf-name</code></td>
<td>Names the VRF, and enter VRF configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# <code>ip vrf vpn1</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>rd route-distinguisher</code></td>
<td>Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-vrf)# <code>rd 100:2</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>`route-target {export</td>
<td>import</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-vrf)# <code>route-target both 100:2</code></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>import map route-map</code></td>
<td>(Optional) Associates a route map with the VRF.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-vrf)# <code>import map importmap1</code></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td><code>interface interface-id</code></td>
<td>Specifies the Layer 3 interface to be associated with the VRF, and enter interface configuration mode. The interface can be a routed port or SVI.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-vrf)# <code>interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td><code>ip vrf forwarding vrf-name</code></td>
<td>Associates the VRF with the Layer 3 interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# <code>ip vrf forwarding vpn1</code></td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>When <code>ip vrf forwarding</code> is enabled in the Management Interface, the access point does not join.</td>
<td></td>
</tr>
<tr>
<td>Step 9</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Configuring VRF-Aware Services

These services are VRF-Aware:

- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP

Configuring VRF-Aware Services for ARP

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>show ip arp vrf vrf-name</td>
</tr>
</tbody>
</table>

Example:

Switch# show ip arp vrf vpn1

Displays the ARP table in the specified VRF.
## Configuring VRF-Aware Services for Ping

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> ping vrf vrf-name ip-host</td>
<td>Displays the ARP table in the specified VRF.</td>
</tr>
</tbody>
</table>

**Example:**

Switch# ping vrf vpnl ip-host

## Configuring VRF-Aware Services for SNMP

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

Switch# configure terminal

**Step 2** snmp-server trap authentication vrf | Enables SNMP traps for packets on a VRF. |

**Example:**

Switch(config)# snmp-server trap authentication vrf

**Step 3** snmp-server engineID remote host vrf vpn-instance engine-id string | Configures a name for the remote SNMP engine on a switch. |

**Example:**

Switch(config)# snmp-server engineID remote 172.16.20.3 vrf vpnl 8000009030000B064EFE100

**Step 4** snmp-server host host vrf vpn-instance traps community | Specifies the recipient of an SNMP trap operation and specifies the VRF table to be used for sending SNMP traps. |

**Example:**

Switch(config)# snmp-server host 172.16.20.3 vrf vpnl traps comaccess

**Step 5** snmp-server host host vrf vpn-instance informs community | Specifies the recipient of an SNMP inform operation and specifies the VRF table to be used for sending SNMP informs. |

**Example:**

Switch(config)# snmp-server host 172.16.20.3 vrf vpnl informs comaccess
### Configuring VRF-Aware Services for HSRP

HSRP support for VRFs ensures that HSRP virtual IP addresses are added to the correct IP routing table.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface interface-id</code></td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>no switchport</code></td>
<td>Removes the interface from Layer 2 configuration mode if it is a physical interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# <code>no switchport</code></td>
<td></td>

<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring VRF-Aware Services for uRPF

uRPF can be configured on an interface assigned to a VRF, and source lookup is done in the VRF table.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>no switchport</td>
<td>Removes the interface from Layer 2 configuration mode if it is a physical interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# no switchport</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>ip vrf forwarding vrf-name</td>
<td>Configures VRF on the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip vrf forwarding vpn2</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>ip address ip-address</td>
<td>Enters the IP address for the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip address 10.1.5.1</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring VRF-Aware RADIUS

To configure VRF-Aware RADIUS, you must first enable AAA on a RADIUS server. The switch supports the `ip vrf forwarding vrf-name` server-group configuration and the `ip radius source-interface` global configuration commands, as described in the Per VRF AAA Feature Guide.

### Configuring VRF-Aware Services for Syslog

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> logging on</td>
<td>Enables or temporarily disables logging of storage router event message.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging on</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> logging host <em>ip-address</em> vrf <em>vrf-name</em></td>
<td>Specifies the host address of the syslog server where logging messages are to be sent.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging host 10.10.1.0 vrf vpn1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> logging buffered <em>logging buffered size debugging</em></td>
<td>Logs messages to an internal buffer.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging buffered critical 6000 debugging</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> logging trap debugging</td>
<td>Limits the logging messages sent to the syslog server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring VRF-Aware Services for Traceroute

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# logging trap debugging</code></td>
<td>Provides detailed logging messages.</td>
</tr>
</tbody>
</table>

**Step 6**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>logging facility facility</code></td>
<td>Sends system logging messages to a logging facility.</td>
</tr>
<tr>
<td>Example: <code>Switch(config)# logging facility user</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 7**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Switch(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

### Configuring VRF-Aware Services for FTP and TFTP

So that FTP and TFTP are VRF-aware, you must configure some FTP/TFTP CLIs. For example, if you want to use a VRF table that is attached to an interface, say E1/0, you need to configure the `ip tftp source-interface E1/0` or the `ip ftp source-interface E1/0` command to inform TFTP or FTP server to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. That is, you can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>

**Step 1**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip ftp source-interface interface-type interface-number</code></td>
<td>Specifies the source IP address for FTP connections.</td>
</tr>
<tr>
<td>Example: <code>Switch(config)# ip ftp source-interface gigabitethernet 1/0/2</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Multicast VRFs

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)#end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><strong>ip tftp source-interface interface-type interface-number</strong></td>
<td>Specifies the source IP address for TFTP connections.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# ip tftp source-interface gigabitethernet 1/0/2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>-------</td>
<td>-------------------</td>
</tr>
<tr>
<td>4</td>
<td>rd route-distinguisher</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config-vrf)# rd 100:2</td>

</tr>
<tr>
<td>11</td>
<td>ip pim sparse-dense mode</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config-if)# ip pim sparse-dense mode</td>
</tr>
<tr>
<td>12</td>
<td>end</td>
</tr>
</tbody>
</table>
### Configuring a VPN Routing Session

Routing within the VPN can be configured with any supported routing protocol (RIP, OSPF, EIGRP, or BGP) or with static routing. The configuration shown here is for OSPF, but the process is the same for other protocols.

**Note**
To configure an EIGRP routing process to run within a VRF instance, you must configure an autonomous-system number by entering the `autonomous-system autonomous-system-number` address-family configuration mode command.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enters global configuration mode.</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td>Enables OSPF routing, specifies a VPN forwarding table, and enter router configuration mode.</td>
<td><code>router ospf process-id vrf vrf-name</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# router ospf 1 vrf vpn1</code></td>
</tr>
<tr>
<td>(Optional) Logs changes in the adjacency state. This is the default state.</td>
<td><code>log-adjacency-changes</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-router)# log-adjacency-changes</code></td>
</tr>
<tr>
<td>Sets the switch to redistribute information from the BGP network to the OSPF network.</td>
<td><code>redistribute bgp autonomous-system-number subnets</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-router)# redistribute bgp autonomous-system-number subnets</code></td>
</tr>
</tbody>
</table>
### Configuring BGP PE to CE Routing Sessions

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> router bgp autonomous-system-number</td>
<td>Configures the BGP routing process with the AS number passed to other BGP routers, and enter router configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> network network-number mask network-mask</td>
<td>Specifies a network and mask to announce using BGP.</td>
</tr>
</tbody>
</table>

**Command or Action**

```
Switch(config-router)# redistribute bgp 10 subnets
```

**Step 5** network network-number area area-id

**Example:**

```
Switch(config-router)# network 1 area 2
```

**Purpose**

- Defines a network address and mask on which OSPF runs and the area ID for that network address.

**Step 6**

```
Switch(config-router)# end
```

**Purpose**

- Returns to privileged EXEC mode.

**Step 7**

```
Switch(config-router)# network 1 area 2
```

**Purpose**

- Verifies the configuration of the OSPF network.

**Step 8**

```
Switch(config-router)# end
```

**Purpose**

- (Optional) Saves your entries in the configuration file.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> redistribute ospf process-id match internal</td>
<td>Sets the switch to redistribute OSPF internal routes.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# redistribute ospf 1 match internal</td>
</tr>
<tr>
<td><strong>Step 5</strong> network network-number area area-id</td>
<td>Defines a network address and mask on which OSPF runs and the area ID for that network address.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# network 5 area 2</td>
</tr>
<tr>
<td><strong>Step 6</strong> address-family ipv4 vrf vrf-name</td>
<td>Defines BGP parameters for PE to CE routing sessions, and enter VRF address-family mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# address-family ipv4 vrf vpn1</td>
</tr>
<tr>
<td><strong>Step 7</strong> neighbor address remote-as as-number</td>
<td>Defines a BGP session between PE and CE routers.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# neighbor 10.1.1.2 remote-as 2</td>
</tr>
<tr>
<td><strong>Step 8</strong> neighbor address activate</td>
<td>Activates the advertisement of the IPv4 address family.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# neighbor 10.2.1.1 activate</td>
</tr>
<tr>
<td><strong>Step 9</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# end</td>
</tr>
<tr>
<td><strong>Step 10</strong> show ip bgp [ipv4] [neighbors]</td>
<td>Verifies BGP configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# show ip bgp ipv4 neighbors</td>
</tr>
<tr>
<td><strong>Step 11</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>
Multi-VRF CE Configuration Example

OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The examples following the illustration show how to configure a switch as CE Switch A, and the VRF configuration for customer switches D and F. Commands for configuring CE Switch C and the other customer switches are not included but would be similar.

Figure 92: Multi-VRF CE Configuration Example

On Switch A, enable routing and configure VRF.

```
Switch(config)# configure terminal
Switch(config)# ip routing
Switch(config)# ip vrf v11
Switch(config-vrf)# rd 800:1
Switch(config-vrf)# route-target export 800:1
Switch(config-vrf)# route-target import 800:1
Switch(config-vrf)# exit
Switch(config)# ip vrf v12
Switch(config-vrf)# rd 800:2
Switch(config-vrf)# route-target export 800:2
Switch(config-vrf)# route-target import 800:2
Switch(config-vrf)# exit
```

Configure the loopback and physical interfaces on Switch A. Gigabit Ethernet port 1 is a trunk connection to the PE. Gigabit Ethernet ports 8 and 11 connect to VPNs:

```
Switch(config)# interface loopback1
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 8.8.1.8 255.255.255.0
Switch(config-if)# exit
```
Switch(config)# interface loopback2
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 8.8.2.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface gigabitethernet1/0/5
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/8
Switch(config-if)# switchport access vlan 208
Switch(config-if)# no ip address
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Configure the VLANs used on Switch A. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for the VPNs that include Switch F and Switch D, respectively:

Switch(config)# interface vlan10
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 38.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface vlan20
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 83.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface vlan118
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 118.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface vlan208
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 208.0.0.8 255.255.255.0
Switch(config-if)# exit

Configure OSPF routing in VPN1 and VPN2.

Switch(config)# router ospf 1 vrf vl1
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
Switch(config)# router ospf 2 vrf vl2
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit

Configure BGP for CE to PE routing.

Switch(config)# router bgp 800
Switch(config-router)# address-family ipv4 vrf vl12
Switch(config-router-af)# redistribute ospf 2 match internal
Switch(config-router-af)# neighbor 83.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 83.0.0.3 activate
Switch(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Switch(config-router-af)# exit
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 208.0.0.20 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

Switch F belongs to VPN 2. Configure the connection to Switch A by using these commands.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface vlan118
Switch(config-if)# ip address 118.0.0.11 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

When used on switch B (the PE router), these commands configure only the connections to the CE device, Switch A.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Router(config-vrf)# route-target export 100:2
Router(config-vrf)# route-target import 100:2
Router(config-vrf)# exit
Router(config)# ip cef
Router(config)# interface Loopback1
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 3.3.1.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Loopback2
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 3.3.2.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface gigabitethernet1/1/0.10
Router(config-if)# encapsulation dot1q 10
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 38.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface gigabitethernet1/1/0.20
Router(config-if)# encapsulation dot1q 20
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 83.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# router bgp 100
Router(config-router)# address-family ipv4 vrf v2
Router(config-router-af)# neighbor 83.0.0.8 remote-as 800
Router(config-router-af)# neighbor 83.0.0.8 activate
Router(config-router-af)# network 3.3.2.0 mask 255.255.255.0
Router(config-router-af)# exit
Router(config-router)# address-family ipv4 vrf v1
Router(config-router-af)# neighbor 38.0.0.8 remote-as 800
Router(config-router-af)# neighbor 38.0.0.8 activate
Router(config-router-af)# network 3.3.1.0 mask 255.255.255.0
Router(config-router-af)# end

Monitoring Multi-VRF CE

Table 117: Commands for Displaying Multi-VRF CE Information

<table>
<thead>
<tr>
<th>Command</th>

Configuring Unicast Reverse Path Forwarding

The unicast reverse path forwarding (unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.
Protocol-Independent Features

This section describes IP routing protocol-independent features that are available on switches running the feature set.

Distributed Cisco Express Forwarding

Information About Cisco Express Forwarding

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology used to optimize network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. CEF is less CPU-intensive than fast switching route caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. In dynamic networks, fast switching cache entries are frequently invalidated because of routing changes, which can cause traffic to be process switched using the routing table, instead of fast switched using the route cache. CEF and dCEF use the Forwarding Information Base (FIB) lookup table to perform destination-based switching of IP packets.

The two main components in CEF and dCEF are the distributed FIB and the distributed adjacency tables.

- The FIB is similar to a routing table or information base and maintains a mirror image of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table. Because the FIB contains all known routes that exist in the routing table, CEF eliminates route cache maintenance, is more efficient for switching traffic, and is not affected by traffic patterns.

- Nodes in the network are said to be adjacent if they can reach each other with a single hop across a link layer. CEF uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Because the switch or switch stack uses Application Specific Integrated Circuits (ASICs) to achieve Gigabit-speed line rate IP traffic, CEF or dCEF forwarding applies only to the software-forwarding path, that is, traffic that is forwarded by the CPU.

How to Configure Cisco Express Forwarding

CEF or distributed CEF is enabled globally by default. If for some reason it is disabled, you can re-enable it by using the `ip cef` or `ip cef distributed` global configuration command.

The default configuration is CEF or dCEF enabled on all Layer 3 interfaces. Entering the `no ip route-cache cef` interface configuration command disables CEF for traffic that is being forwarded by software. This command does not affect the hardware forwarding path. Disabling CEF and using the `debug ip packet detail` privileged EXEC command can be useful to debug software-forwarded traffic. To enable CEF on an interface for the software-forwarding path, use the `ip route-cache cef` interface configuration command.
Although the `no ip route-cache cef` interface configuration command to disable CEF on an interface is visible in the CLI, we strongly recommend that you do not disable CEF or dCEF on interfaces except for debugging purposes.

To enable CEF or dCEF globally and on an interface for software-forwarded traffic if it has been disabled:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>

</tr>
</tbody>
</table>
### Number of Equal-Cost Routing Paths

**Information About Equal-Cost Routing Paths**

When a router has two or more routes to the same network with the same metrics, these routes can be thought of as having an equal cost. The term parallel path is another way to see occurrences of equal-cost routes in a routing table. If a router has two or more equal-cost paths to a network, it can use them concurrently. Parallel paths provide redundancy in case of a circuit failure and also enable a router to load balance packets over the available paths for more efficient use of available bandwidth. Equal-cost routes are supported across switches in a stack.

Even though the router automatically learns about and configures equal-cost routes, you can control the maximum number of parallel paths supported by an IP routing protocol in its routing table. Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.

**How to Configure Equal-Cost Routing Paths**

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

### Table: Command or Action and Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 9</strong> show cef linecard [slot-number] [detail]</td>
<td>(Optional) Displays CEF-related interface information on a switch by stack member for all switches in the stack or for the specified switch. (Optional) For <code>slot-number</code>, enter the stack member switch number.</td>
</tr>
<tr>
<td>Example: Switch# show cef linecard 5 detail</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> show cef interface [interface-id]</td>
<td>Displays detailed CEF information for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>Example: Switch# show cef interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> show adjacency</td>
<td>Displays CEF adjacency table information.</td>
</tr>
<tr>
<td>Example: Switch# show adjacency</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters router configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

```
router {rip | ospf | eigrp}
```

**Example:**

```
Switch(config)# router eigrp
```

Sets the maximum number of parallel paths for the protocol routing table. The range is from 1 to 16; the default is 4 for most IP routing protocols, but only 1 for BGP.

**Step 3**

```
maximum-paths maximum
```

**Example:**

```
Switch(config-router)# maximum-paths 2
```

Returns to privileged EXEC mode.

**Step 4**

```
end
```

**Example:**

```
Switch(config-router)# end
```

Verifies the setting in the Maximum path field.

**Step 5**

```
show ip protocols
```

**Example:**

```
Switch# show ip protocols
```

(Optional) Saves your entries in the configuration file.

**Static Unicast Routes**

**Information About Static Unicast Routes**

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

The switch retains static routes until you remove them. However, you can override static routes with dynamic routing information by assigning administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 41-16. If you want a static route to be overridden by information from a dynamic routing protocol, set the administrative distance of the static route higher than that of the dynamic protocol.

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Default Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected interface</td>
<td>0</td>
</tr>
<tr>
<td>Static route</td>
<td>1</td>
</tr>
</tbody>
</table>
Configuring Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Follow these steps to configure a static route:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ip route prefix mask {address</td>
<td>interface} {distance}</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip route prefix mask gigabitethernet 1/0/4</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>show ip route</td>
<td>Displays the current state of the routing table to verify the configuration.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# show ip route</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

Use the no ip route prefix mask {address|interface} global configuration command to remove a static route. The device retains static routes until you remove them.

Default Routes and Networks

Information About Default Routes and Networks

A router might not be able to learn the routes to all other networks. To provide complete routing capability, you can use some routers as smart routers and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be dynamically learned or can be configured in the individual routers. Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then forwarded to other routers.

If a router has a directly connected interface to the specified default network, the dynamic routing protocols running on that device generate a default route. In RIP, it advertises the pseudonetwork 0.0.0.0.

A router that is generating the default for a network also might need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.

When default information is passed through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In IGRP networks, there might be several candidate networks for the system default. Cisco routers use administrative distance and metric information to set the default route or the gateway of last resort.

If dynamic default information is not being passed to the system, candidates for the default route are specified with the ip default-network global configuration command. If this network appears in the routing table from any source, it is flagged as a possible choice for the default route. If the router has no interface on the default network, but does have a path to it, the network is considered as a possible candidate, and the gateway to the best default path becomes the gateway of last resort.
How to Configure Default Routes and Networks

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

Route Maps to Redistribute Routing Information

Information About Route Maps

The switch can run multiple routing protocols simultaneously, and it can redistribute information from one routing protocol to another. Redistributing information from one routing protocol to another applies to all supported IP-based routing protocols.

You can also conditionally control the redistribution of routes between routing domains by defining enhanced packet filters or route maps between the two domains. The `match` and `set` route-map configuration commands define the condition portion of a route map. The `match` command specifies that a criterion must be matched. The `set` command specifies an action to be taken if the routing update meets the conditions defined by the `match` command. Although redistribution is a protocol-independent feature, some of the `match` and `set` route-map configuration commands are specific to a particular protocol.

One or more `match` commands and one or more `set` commands follow a `route-map` command. If there are no `match` commands, everything matches. If there are no `set` commands, nothing is done, other than the match. Therefore, you need at least one `match` or `set` command.
A route map with no set route-map configuration commands is sent to the CPU, which causes high CPU utilization.

You can also identify route-map statements as permit or deny. If the statement is marked as a deny, the packets meeting the match criteria are sent back through the normal forwarding channels (destination-based routing). If the statement is marked as permit, set clauses are applied to packets meeting the match criteria. Packets that do not meet the match criteria are forwarded through the normal routing channel.

### How to Configure a Route Map

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one match route-map configuration command and one set route-map configuration command.

The keywords are the same as defined in the procedure to control the route distribution.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2: route-map map-tag [permit</td>
<td>deny] [sequence number]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# route-map rip-to-ospf permit 4</td>
<td>map-tag—A meaningful name for the route map. The redistribute router configuration command uses this name to reference this route map. Multiple route maps might share the same map tag name.</td>
</tr>
<tr>
<td>(Optional) If permit is specified and the match criteria are met for this route map, the route is redistributed as controlled by the set actions. If deny is specified, the route is not redistributed.</td>
<td></td>
</tr>
<tr>
<td>sequence number (Optional)— Number that indicates the position a new route map is to have in the list of route maps already configured with the same name.</td>
<td></td>
</tr>
<tr>
<td>Step 3: match as-path path-list-number</td>
<td>Matches a BGP AS path access list.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-route-map)#match as-path 10</td>
<td></td>
</tr>
<tr>
<td>Step 4: match community-list community-list-number [exact]</td>
<td>Matches a BGP community list.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Switch(config-route-map)# match community-list 150</td>
<td>Matches a standard access list by specifying the name or number. It can be an integer from 1 to 199.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Matches the specified route metric. The <code>metric-value</code> can be an EIGRP metric with a specified value from 0 to 4294967295.</td>
</tr>
<tr>
<td>`match ip address {access-list-number</td>
<td>access-list-name} [...access-list-number</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Matches the specified tag value in a list of one or more route tag values. Each can be an integer from 0 to 4294967295.</td>
</tr>
<tr>
<td><code>match tag tag value [...tag-value]</code></td>
<td>Matches the specified next hop route out one of the specified interfaces.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Matches the address specified by the specified advertised access lists.</td>
</tr>
<tr>
<td>`match ip next-hop {access-list-number</td>
<td>access-list-name} [...access-list-number</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>• <code>local</code>—Locally generated BGP routes.</td>
</tr>
<tr>
<td><code>match metric metric-value</code></td>
<td>• <code>internal</code>—OSPF intra-area and interarea routes or EIGRP internal routes.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>• <code>external</code>—OSPF external routes (Type 1 or Type 2) or EIGRP external routes.</td>
</tr>
<tr>
<td><code>match interface type number [...type-number]</code></td>
<td>Example: Switch(config-route-map)# match route-type local</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Example: Switch(config-route-map)# match route-type internal</td>
</tr>
<tr>
<td>`match ip route-source {access-list-number</td>
<td>access-list-name} [...access-list-number</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Example: Switch(config-route-map)# match route-type type-1</td>
</tr>
<tr>
<td><code>match tag tag value [...tag-value]</code></td>
<td>Example: Switch(config-route-map)# match route-type type-2</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><strong>set dampening half-life reuse suppress max-suppress-time</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Sets BGP route dampening factors.</td>
</tr>
<tr>
<td>Switch(config-route-map)# set dampening 30 1500 10000 120</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td><strong>set local-preference value</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Assigns a value to a local BGP path.</td>
</tr>
<tr>
<td>Switch(config-route-map)# set local-preference 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td>**set origin {igp</td>
</tr>
<tr>
<td>Example:</td>
<td>Sets the BGP origin code.</td>
</tr>
<tr>
<td>Switch(config-route-map)#set origin igp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td>**set as-path {tag</td>
</tr>
<tr>
<td>Example:</td>
<td>Modifies the BGP autonomous system path.</td>
</tr>
<tr>
<td>Switch(config-route-map)# set as-path tag</td>
<td></td>
</tr>
<tr>
<td><strong>Step 16</strong></td>
<td>**set level {level-1</td>
</tr>
<tr>
<td>Example:</td>
<td>Sets the level for routes that are advertised into the specified area of the routing domain. The stub-area and backbone are OSPF NSSA and backbone areas.</td>

**How to Control Route Distribution**

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one **match** route-map configuration command and one **set** route-map configuration command.

**Note**

The keywords are the same as defined in the procedure to configure the route map for redistribution.
The metrics of one routing protocol do not necessarily translate into the metrics of another. For example, the RIP metric is a hop count, and the IGRP metric is a combination of five qualities. In these situations, an artificial metric is assigned to the redistributed route. Uncontrolled exchanging of routing information between different routing protocols can create routing loops and seriously degrade network operation.

If you have not defined a default redistribution metric that replaces metric conversion, some automatic metric translations occur between routing protocols:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- Any protocol can redistribute other routing protocols if a default mode is in effect.

**Policy-Based Routing**

**Information About Policy-Based Routing**

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

- Identity of a particular end system
- Application
- Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

- Route map statement marked as permit is processed as follows:
  - A match command can match on length or multiple ACLs. A route map statement can contain multiple match commands. Logical or algorithm function is performed across all the match commands to reach a permit or deny decision.

  For example:
  ```
  match length A B
  match ip address acl1 acl2
  match ip address acl3
  ```
  A packet is permitted if it is permitted by match length A B or acl1 or acl2 or acl3
  - If the decision reached is permit, then the action specified by the set command is applied on the packet.
• If the decision reached is deny, then the PBR action (specified in the set command) is not applied.
  Instead the processing logic moves forward to look at the next route-map statement in the sequence
  (the statement with the next higher sequence number). If no next statement exists, PBR processing
  terminates, and the packet is routed using the default IP routing table.

• For PBR, route-map statements marked as deny are not supported.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify
match criteria based on an application, a protocol type, or an end station. The process proceeds through the
route map until a match is found. If no match is found, normal destination-based routing occurs. There is an
implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop
router in the path.

How to Configure PBR

• To use PBR, you must have the feature set enabled on the switch or stack master.

• Multicast traffic is not policy-routed. PBR applies to only to unicast traffic.

• You can enable PBR on a routed port or an SVI.

• The switch supports PBR based on match length.

• You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot
  apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do
  so, the command is rejected. When a policy route map is applied to a physical interface, that interface
  cannot become a member of an EtherChannel.

• You can define a maximum of 128 IP policy route maps on the switch or switch stack.

• You can define a maximum of 512 access control entries (ACEs) for PBR on the switch or switch stack.

• When configuring match criteria in a route map, follow these guidelines:
  • Do not match ACLs that permit packets destined for a local address. PBR would forward these
    packets, which could cause ping or Telnet failure or route protocol flapping.

• VRF and PBR are mutually exclusive on a switch interface. You cannot enable VRF when PBR is enabled
  on an interface. The reverse is also true, you cannot enable PBR when VRF is enabled on an interface.

• The number of hardware entries used by PBR depends on the route map itself, the ACLs used, and the
  order of the ACLs and route-map entries.

• PBR based on TOS, DSCP and IP Precedence are not supported.

• Set interface, set default next-hop and set default interface are not supported.

• **ip next-hop recursive** and **ip next-hop verify availability** features are not available and the next-hop
  should be directly connected.

• Policy-maps with no set actions are supported. Matching packets are routed normally.

• Policy-maps with no match clauses are supported. Set actions are applied to all packets.
By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.

### Procedure

## Filtering Routing Information

You can filter routing protocol information by performing the tasks described in this section.

**Note**

When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

### Setting Passive Interfaces

To prevent other routers on a local network from dynamically learning about routes, you can use the `passive-interface` router configuration command to keep routing update messages from being sent through a router interface. When you use this command in the OSPF protocol, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface.

In networks with many interfaces, to avoid having to manually set them as passive, you can set all interfaces to be passive by default by using the `passive-interface default` router configuration command and manually setting interfaces where adjacencies are desired.

Use a network monitoring privileged EXEC command such as `show ip ospf interface` to verify the interfaces that you enabled as passive, or use the `show ip interface` privileged EXEC command to verify the interfaces that you enabled as active.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  - `configure terminal`
  - **Example:**
    
    ```
    Switch# configure terminal
    ```
  | Enters global configuration mode. |
| **Step 2**
  - `router { rip | ospf | eigrp}`
  - **Example:**
    
    ```
    Switch(config)# router ospf
    ```
  | Enters router configuration mode. |
| **Step 3**
  - `passive-interface interface-id`
  - **Example:**
    
    ```
    Switch(config-router)# passive-interface gigabitethernet 1/0/1
    ```
  | Suppresses sending routing updates through the specified Layer 3 interface. |
| **Step 4**
  - `passive-interface default`
  - **Example:**
    
    ```
    Switch(config-router)# passive-interface default
    ```
  | (Optional) Sets all interfaces as passive by default. |
| **Step 5**
  - `no passive-interface interface type`
  - **Example:**
    
    ```
    Switch(config-router)# no passive-interface g1/0/1
    ```
  | (Optional) Activates only those interfaces that need to have adjacencies sent. |
### Command or Action

<table>

<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

---

### Controlling Advertising and Processing in Routing Updates

You can use the `distribute-list` router configuration command with access control lists to suppress routes from being advertised in routing updates and to prevent other routers from learning one or more routes. When used in OSPF, this feature applies to only external routes, and you cannot specify an interface name.

You can also use a `distribute-list` router configuration command to avoid processing certain routes listed in incoming updates. (This feature does not apply to OSPF.)

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| 2    | router { rip | eigrp} | Enters router configuration mode. |
| **Example:** | Switch(config)# router eigrp 10 |

| 3    | distribute-list {access-list-number| access-list-name} out [interface-name | routing process | autonomous-system-number] | Permits or denies routes from being advertised in routing updates, depending upon the action listed in the access list. |
| **Example:** | Switch(config-router)# distribute 120 out gigabitethernet 1/0/7 |
Filtering Sources of Routing Information

Because some routing information might be more accurate than others, you can use filtering to prioritize information coming from different sources. An administrative distance is a rating of the trustworthiness of a routing information source, such as a router or group of routers. In a large network, some routing protocols can be more reliable than others. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router always picks the route whose routing protocol has the lowest administrative distance.

Because each network has its own requirements, there are no general guidelines for assigning administrative distances.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>

<td>Switch(config)# router eigrp 10</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>distance weight {ip-address {ip-address mask}} [ip access list]</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-router)# distance 50 10.1.5.1</td>
</tr>
</tbody>
</table>
## Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for EIGRP and RIP Version 2.

### Prerequisites

Before you manage authentication keys, you must enable authentication. See the appropriate protocol section to see how to enable authentication for that protocol. To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the `key number` key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

### How to Configure Authentication Keys

You can configure multiple keys with life times. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know these lifetimes.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

Configuring Policy-Based Routing (PBR)

- Policy-Based Routing, on page 1129

Policy-Based Routing

Information About Policy-Based Routing

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

- Identity of a particular end system
- Application
- Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

- Route map statement marked as permit is processed as follows:
  - A match command can match on length or multiple ACLs. A route map statement can contain multiple match commands. Logical or algorithm function is performed across all the match commands to reach a permit or deny decision.

For example:

```
match length A B
match ip address acl1 acl2
match ip address acl3
```
A packet is permitted if it is permitted by match length A B or acl1 or acl2 or acl3

• If the decision reached is permit, then the action specified by the set command is applied on the packet.
• If the decision reached is deny, then the PBR action (specified in the set command) is not applied. Instead the processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.

• For PBR, route-map statements marked as deny are not supported.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify match criteria based on an application, a protocol type, or an end station. The process proceeds through the route map until a match is found. If no match is found, normal destination-based routing occurs. There is an implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop router in the path.

**How to Configure PBR**

• To use PBR, you must have the feature set enabled on the switch or stack master.
• Multicast traffic is not policy-routed. PBR applies to only to unicast traffic.
• You can enable PBR on a routed port or an SVI.
• The switch supports PBR based on match length.
• You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do so, the command is rejected. When a policy route map is applied to a physical interface, that interface cannot become a member of an EtherChannel.
• You can define a maximum of 128 IP policy route maps on the switch or switch stack.
• You can define a maximum of 512 access control entries (ACEs) for PBR on the switch or switch stack.
• When configuring match criteria in a route map, follow these guidelines:
  • Do not match ACLs that permit packets destined for a local address. PBR would forward these packets, which could cause ping or Telnet failure or route protocol flapping.
• VRF and PBR are mutually exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when VRF is enabled on an interface.
• The number of hardware entries used by PBR depends on the route map itself, the ACLs used, and the order of the ACLs and route-map entries.
• PBR based on TOS, DSCP and IP Precedence are not supported.
• Set interface, set default next-hop and set default interface are not supported.
• **ip next-hop recursive** and **ip next-hop verify availability** features are not available and the next-hop should be directly connected.
• Policy-maps with no set actions are supported. Matching packets are routed normally.
- Policy-maps with no match clauses are supported. Set actions are applied to all packets.

By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>

<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> set ip next-hop verify-availability [next-hop-address sequence track object]</td>
<td>Configures the route map to verify the reachability of the tracked object.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-route-map)# set ip next-hop verify-availability 95.1.1.2 track 100</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This command is not supported on IPv6 and VRF.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> exit</td>
<td>Returns to global configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-route-map)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the interface to be configured.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> ip policy route-map map-tag</td>
<td>Enables PBR on a Layer 3 interface, and identify the route map to use. You can configure only one route map on an interface. However, you can have multiple route map entries with different sequence numbers. These entries are evaluated in the order of sequence number until the first match. If there is no match, packets are routed as usual.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# ip policy route-map pbr-map</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> ip route-cache policy</td>
<td>(Optional) Enables fast-switching PBR. You must enable PBR before enabling fast-switching PBR.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# ip route-cache policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> exit</td>
<td>Returns to global configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> ip local policy route-map map-tag</td>
<td>(Optional) Enables local PBR to perform policy-based routing on packets originating at the switch. This applies to packets generated by the switch, and not to incoming packets.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip local policy route-map local-pbr</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> show route-map [map-name]</td>
<td>(Optional) Displays all the route maps configured or only the one specified to verify configuration.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# show route-map</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong> show ip policy</td>
<td>(Optional) Displays policy route maps attached to the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# show ip policy</td>
<td></td>
</tr>

<td>Cisco IOS Release 15.2(6)E2</td>
<td>Policy-based routing is used to configure a defined policy for traffic flows.</td>
</tr>
</tbody>
</table>

---

**Purpose**

Command or Action | Purpose
------------------|-------------------------------------------------|
**Step 16** show ip local policy | (Optional) Displays whether or not local policy routing is enabled and, if so, the route map being used.

**Example:**

```plaintext
Switch# show ip local policy
```
Configuring EIGRP Stub Routing

• EIGRP Stub Routing, on page 1135

EIGRP Stub Routing

The EIGRP stub routing feature improves network stability, reduces resource utilization, and simplifies the stub device configuration.

Stub routing is commonly used in hub-and-spoke network topologies. In a hub-and-spoke network, one or more end (stub) networks are connected to a remote device (the spoke) that is connected to one or more distribution devices (the hub). The remote device is adjacent to one or more distribution devices. The only route for IP traffic to reach the remote device is through a distribution device. This type of configuration is commonly used in WAN topologies, where the distribution device is directly connected to a WAN. The distribution device can be connected to many remote devices, which is often the case. In a hub-and-spoke topology, the remote device must forward all nonlocal traffic to a distribution device, so it becomes unnecessary for the remote device to have a complete routing table. Generally, the distribution device need not send anything more than a default route to the remote device.

When using the EIGRP stub routing feature, you need to configure the distribution and remote devices to use EIGRP and configure only the remote device as a stub. Only specified routes are propagated from the remote (stub) device. The stub device responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” A device that is configured as a stub will send a special peer information packet to all neighboring devices to report its status as a stub device.
Any neighbor that receives a packet informing it of the stub status will not query the stub device for any routes, and a device that has a stub peer will not query that peer. The stub device will depend on the distribution device to send proper updates to all peers.

The figure below shows a simple hub-and-spoke network.

![Figure 93: Simple Hub-and-Spoke Network](image)

The stub routing feature by itself does not prevent routes from being advertised to the remote device. In the above example, the remote device can access the corporate network and the Internet only through the distribution device. Having a complete route table on the remote device would serve no functional purpose because the path to the corporate network and the Internet would always be through the distribution device. The large route table would only reduce the amount of memory required by the remote device. Bandwidth and memory can be conserved by summarizing and filtering routes in the distribution device. The remote device need not receive routes that have been learned from other networks because the remote device must send all nonlocal traffic, regardless of the destination, to the distribution device. If a true stub network is desired, the distribution device should be configured to send only a default route to the remote device. The EIGRP stub routing feature does not automatically enable summarization on distribution devices. In most cases, the network administrator will need to configure summarization on distribution devices.

**Note**

When configuring the distribution device to send only a default route to the remote device, you must use the `ip classless` command on the remote device. By default, the `ip classless` command is enabled in all Cisco images that support the EIGRP stub routing feature.

Without the EIGRP stub routing feature, even after routes that are sent from the distribution device to the remote device have been filtered or summarized, a problem might occur. If a route is lost somewhere in the corporate network, EIGRP could send a query to the distribution device, which in turn would send a query to the remote device, even if routes are being summarized. If there is a communication problem (over the WAN link) between the distribution device and the remote device, an EIGRP stuck inactive (SIA) condition could occur and cause instability elsewhere in the network. The EIGRP stub routing feature allows a network administrator to prevent queries from being sent to the remote device.

**Dual-Homed Remote Topology**

In addition to a simple hub-and-spoke network, where a remote device is connected to a single distribution device, the remote device can be dual-homed to two or more distribution devices. This configuration adds redundancy and introduces unique issues, and the stub feature helps to address some of these issues.
A dual-homed remote device will have two or more distribution (hub) devices. However, the principles of stub routing are the same as they are with a hub-and-spoke topology. The figure below shows a common dual-homed remote topology with one remote device: however, 100 or more devices could be connected on the same interfaces on distribution Device 1 and distribution Device 2. The remote device will use the best route to reach its destination. If distribution Device 1 experiences a failure, the remote device can still use distribution Device 2 to reach the corporate network.

**Figure 94: Simple Dual-Homed Remote Topology**

The figure above shows a simple dual-homed remote topology with one remote device and two distribution devices. Both distribution devices maintain routes to the corporate network and stub network 10.1.1.0/24.

Dual-homed routing can introduce instability into an EIGRP network. In the figure below, distribution Device 1 is directly connected to network 10.3.1.0/24. If summarization or filtering is applied on distribution Device 1, the device will advertise network 10.3.1.0/24 to all of its directly connected EIGRP neighbors (distribution Device 2 and the remote device).

**Figure 95: Dual-Homed Remote Topology with Distribution Device 1 Connected to Two Networks**

The figure above shows a simple dual-homed remote topology, where distribution Device 1 is connected to both network 10.3.1.0/24 and network 10.2.1.0/24.

If the 10.2.1.0/24 link between distribution Device 1 and distribution Device 2 fails, the lowest cost path to network 10.3.1.0/24 from distribution Device 2 will be through the remote device (see the figure below). This route is not desirable because the traffic that was previously traveling across the corporate network 10.2.1.0/24 would now be sent across a much lower bandwidth connection. The overutilization of the lower bandwidth WAN connection can cause many problems that might affect the entire corporate network. The use of the
lower bandwidth route that passes through the remote device may cause WAN EIGRP distribution devices to be dropped. Serial lines on distribution and remote devices may also be dropped, and EIGRP SIA errors on the distribution and core devices can occur.

*Figure 96: Dual-Homed Remote Topology with a Failed Route to a Distribution Device*

It is not desirable for traffic from distribution Device 2 to travel through any remote device to reach network 10.3.1.0/24. Backup routes can be used if links are sized to manage the load. However, most networks, of the type shown in the figure above, have remote devices located at remote offices with relatively slow links. To ensure that traffic from distribution devices are not routed through a remote device, you can configure route summarization on the distribution device and the remote device.

It is typically undesirable for traffic from a distribution device to use a remote device as a transit path. A typical connection from a distribution device to a remote device would have much less bandwidth than a connection at the network core. Attempting to use a remote device with a limited bandwidth connection as a transit path would generally produce excessive congestion at the remote device. The EIGRP stub routing feature can prevent this problem by preventing the remote device from advertising core routes back to the distribution devices. In the above example, routes learned by the remote device from distribution Device 1 will not be advertised to distribution Device 2. Therefore, distribution Device 2 will not use the remote device as a transit for traffic destined to the network core.

The EIGRP stub routing feature provides network stability. If the network is not stable, this feature prevents EIGRP queries from being sent over limited bandwidth links to nontransit devices. Instead, distribution devices to which the stub device is connected answer queries on behalf of the stub device. This feature greatly reduces the chance of further network instability due to congested or problematic WAN links. The EIGRP stub routing feature also simplifies the configuration and maintenance of hub-and-spoke networks. When stub routing is enabled in dual-homed remote configurations, it is no longer necessary to configure filtering on remote devices to prevent those devices from appearing as transit paths to hub devices.

*Caution*

The EIGRP stub routing feature should be used only on stub devices. A stub device is defined as a device connected to the network core or distribution layer through which core transit traffic should not flow. A stub device should not have any EIGRP neighbors other than distribution devices. Ignoring this restriction will cause undesirable behavior.
Multiaccess interfaces such as ATM, Gigabit Ethernet, Frame Relay, ISDN PRI, and X.25 are supported by the EIGRP stub routing feature only when all devices on that interface, except the hub, are configured as stub devices.

### How to Configure EIGRP Stub Routing

**Configuring the EIGRP Stub Routing Autonomous System Configuration**

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router eigrp autonomous-system-number
4. network ip-address [wildcard-mask]
5. eigrp stub [receive-only] [leak-map name] [connected] [static] [summary] [redistributed]
6. end
7. show ip eigrp neighbors [interface-type | as-number | static | detail]

**DETAILED STEPS**

Configuration Examples for EIGRP Stub Routing

Example: EIGRP Stub Routing—Autonomous System Configuration

A device that is configured as a stub with the `eigrp stub` command shares connected and summary routing information with all neighbor devices by default. The following six keywords can be used with the `eigrp stub` command to modify this behavior:

- `connected`
- `leak-map`
- `receive-only`
- `redistributed`
- `static`
- `summary`

This section provides configuration examples for all forms of the `eigrp stub` command for an EIGRP autonomous system configuration.

Example: `eigrp stub` Command

In the following example, the `eigrp stub` command is used to configure the device as a stub that advertises connected and summary routes:

```
Device(config)# router eigrp 1
Device(config-router)# network 10.0.0.0
Device(config-router)# eigrp stub
```

Example: `eigrp stub connected static` Command

In the following example, the `eigrp stub` command is used with the `connected` and `static` keywords to configure the device as a stub that advertises connected and static routes (sending summary routes will not be permitted):

```
Device(config)# router eigrp 1
Device(config-router)# network 10.0.0.0
Device(config-router)# eigrp stub connected static
```

Example: `eigrp stub leak-map` Command

In the following example, the `eigrp stub` command is issued with the `leak-map name` keyword-argument pair to configure the device to reference a leak map that identifies routes that would have been suppressed:

```
Device(config)# router eigrp 1
Device(config-router)# network 10.0.0.0
Device(config-router)# eigrp stub leak-map map1
```
Example: eigrp stub receive-only Command

In the following example, the `eigrp stub receive-only` command is issued to configure the device as a receive-only neighbor (connected, summary, and static routes will not be sent):

```
Device(config)# router eigrp 1
Device(config-router)# network 10.0.0.0
Device(config-router)# eigrp stub receive-only
```

Example: eigrp stub redistributed Command

In the following example, the `eigrp stub redistributed` command is issued to configure the device to advertise other protocols and autonomous systems:

```
Device(config)# router eigrp 1
Device(config-router)# network 10.0.0.0
Device(config-router)# eigrp stub redistributed
```

Example: EIGRP Stub Routing—Named Configuration

A device that is configured as a stub with the `eigrp stub` command shares connected and summary routing information with all neighbor devices by default. The following six keywords can be used with the `eigrp stub` command to modify this behavior:

- `connected`
- `leak-map`
- `receive-only`
- `redistributed`
- `static`
- `summary`

This section provides configuration examples for all forms of the `eigrp stub` command for an EIGRP named configuration.

Example: eigrp stub Command

In the following example, the `eigrp stub` command is used to configure the device as a stub that advertises connected and summary routes:

```
Device(config)# router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# eigrp stub
```
Example: eigrp stub connected static Command

In the following named configuration example, the eigrp stub command is issued with the connected and static keywords to configure the device as a stub that advertises connected and static routes (sending summary routes will not be permitted):

```
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# eigrp stub connected static
```

Example: eigrp stub leak-map Command

In the following named configuration example, the eigrp stub command is issued with the leak-map name keyword-argument pair to configure the device to reference a leak map that identifies routes that would normally have been suppressed:

```
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# eigrp stub leak-map map1
```

Example: eigrp stub receive-only Command

In the following named configuration example, the eigrp stub command is issued with the receive-only keyword to configure the device as a receive-only neighbor (connected, summary, and static routes will not be sent):

```
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# eigrp stub receive-only
```

Example: eigrp stub redistributed Command

In the following named configuration example, the eigrp stub command is issued with the redistributed keyword to configure the device to advertise other protocols and autonomous systems:

```
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# eigrp stub redistributed
```

**Feature Information for EIGRP Stub Routing**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
The EIGRP Stub Routing feature improves network stability, reduces resource utilization, and simplifies stub router configuration. Stub routing is commonly used in a hub-and-spoke network topology. In a hub-and-spoke network, one or more end (stub) networks are connected to a remote router (the spoke) that is connected to one or more distribution routers (the hub). The remote router is adjacent only to one or more distribution routers.

Security Features Overview

The security features are as follows:

- IPv6 First Hop Security—A suite of security features to be applied at the first hop switch to protect against vulnerabilities inherent in IPv6 networks. These include, Binding Integrity Guard (Binding Table), Router Advertisement Guard (RA Guard), DHCP Guard, IPv6 Neighbor Discovery Inspection (ND Guard).

- Web Authentication—Allows a supplicant (client) that does not support IEEE 802.1x functionality to be authenticated using a web browser.

- Local Web Authentication Banner—A custom banner or an image file displayed at a web authentication login screen.

- IEEE 802.1x Authentication with ACLs and the RADIUS Filter-Id Attribute

- Password-protected access (read-only and read-write access) to management interfaces (device manager, Network Assistant, and the CLI) for protection against unauthorized configuration changes

- Multilevel security for a choice of security level, notification, and resulting actions

- Static MAC addressing for ensuring security

- Protected port option for restricting the forwarding of traffic to designated ports on the same switch

- Port security option for limiting and identifying MAC addresses of the stations allowed to access the port

- VLAN aware port security option to shut down the VLAN on the port when a violation occurs, instead of shutting down the entire port.

- Port security aging to set the aging time for secure addresses on a port.

- Protocol storm protection to control the rate of incoming protocol traffic to a switch by dropping packets that exceed a specified ingress rate.

- BPDU guard for shutting down a Port Fast-configured port when an invalid configuration occurs.
- Standard and extended IP access control lists (ACLs) for defining inbound security policies on Layer 2 interfaces (port ACLs).
- Extended MAC access control lists for defining security policies in the inbound direction on Layer 2 interfaces.
- Source and destination MAC-based ACLs for filtering non-IP traffic.
- DHCP snooping to filter untrusted DHCP messages between untrusted hosts and DHCP servers.
- IP source guard to restrict traffic on nonrouted interfaces by filtering traffic based on the DHCP snooping database and IP source bindings.
- Dynamic ARP inspection to prevent malicious attacks on the switch by not relaying invalid ARP requests and responses to other ports in the same VLAN.
- IEEE 802.1x port-based authentication to prevent unauthorized devices (clients) from gaining access to the network. These 802.1x features are supported:
  - Support for single-host, multi-host, multi-auth, and multi-domain-auth modes.
  - Multidomain authentication (MDA) to allow both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), to independently authenticate on the same IEEE 802.1x-enabled switch port.
  - Dynamic voice virtual LAN (VLAN) for MDA to allow a dynamic voice VLAN on an MDA-enabled port.
  - VLAN assignment for restricting 802.1x-authenticated users to a specified VLAN.
  - Support for VLAN assignment on a port configured for multi-auth mode. The RADIUS server assigns a VLAN to the first host to authenticate on the port, and subsequent hosts use the same VLAN. Voice VLAN assignment is supported for one IP phone.
  - Port security for controlling access to 802.1x ports.
  - Voice VLAN to permit a Cisco IP Phone to access the voice VLAN regardless of the authorized or unauthorized state of the port.
  - IP phone detection enhancement to detect and recognize a Cisco IP phone.
  - Guest VLAN to provide limited services to non-802.1x-compliant users.
  - Restricted VLAN to provide limited services to users who are 802.1x compliant, but do not have the credentials to authenticate via the standard 802.1x processes.
  - 802.1x accounting to track network usage.
  - 802.1x with wake-on-LAN to allow dormant PCs to be powered on based on the receipt of a specific Ethernet frame.
  - 802.1x readiness check to determine the readiness of connected end hosts before configuring IEEE 802.1x on the switch.
  - Voice aware 802.1x security to apply traffic violation actions only on the VLAN on which a security violation occurs.
  - MAC authentication bypass (MAB) to authorize clients based on the client MAC address.
• Network Admission Control (NAC) Layer 2 802.1x validation of the antivirus condition or posture of endpoint systems or clients before granting the devices network access.

**Note**  
NAC is not supported on LanLite images.

• Network Edge Access Topology (NEAT) with 802.1X switch supplicant, host authorization with CISP, and auto enablement to authenticate a switch outside a wiring closet as a supplicant to another switch.

**Note**  
NEAT is not supported on LanLite images.

• IEEE 802.1x with open access to allow a host to access the network before being authenticated.

**Note**  
This feature is not supported on LanLite images.

• IEEE 802.1x authentication with downloadable ACLs and redirect URLs to allow per-user ACL downloads from a Cisco Secure ACS server to an authenticated switch.

• Support for dynamic creation or attachment of an auth-default ACL on a port that has no configured static ACLs.

**Note**  
This feature is not supported on LanLite images.

• Flexible-authentication sequencing to configure the order of the authentication methods that a port tries when authenticating a new host.

• Multiple-user authentication to allow more than one host to authenticate on an 802.1x-enabled port.

• TACACS+, a proprietary feature for managing network security through a TACACS server for both IPv4 and IPv6.

• RADIUS for verifying the identity of, granting access to, and tracking the actions of remote users through authentication, authorization, and accounting (AAA) services for both IPv4 and IPv6.

• Enhancements to RADIUS, TACACS+, and SSH to function over IPv6.

• Secure Socket Layer (SSL) Version 3.0 support for the HTTP 1.1 server authentication, encryption, and message integrity and HTTP client authentication to allow secure HTTP communications (requires the cryptographic version of the software).

• IEEE 802.1x Authentication with ACLs and the RADIUS Filter-Id Attribute.

• Support for IP source guard on static hosts.

• RADIUS Change of Authorization (CoA) to change the attributes of a certain session after it is authenticated. When there is a change in policy for a user or user group in AAA, administrators can send
the RADIUS CoA packets from the AAA server, such as Cisco Identity Services Engine, or Cisco Secure ACS to reinitialize authentication, and apply to the new policies.

• IEEE 802.1x User Distribution to allow deployments with multiple VLANs (for a group of users) to improve scalability of the network by load balancing users across different VLANs. Authorized users are assigned to the least populated VLAN in the group, assigned by RADIUS server.

  Note This feature is not supported on LanLite images.

• Support for critical VLAN—multi-host/multi-auth enabled ports are placed in a critical VLAN in order to permit access to critical resources if AAA server becomes unreachable.

  Note This feature is not supported on LanLite images.

• Support for Network Edge Access Topology (NEAT) to change the port host mode and to apply a standard port configuration on the authenticator switch port.

• VLAN-ID based MAC authentication to use the combined VLAN and MAC address information for user authentication to prevent network access from unauthorized VLANs.

• MAC move to allow hosts (including the hosts connected behind an IP phone) to move across ports within the same switch without any restrictions to enable mobility. With MAC move, the switch treats the reappearance of the same MAC address on another port in the same way as a completely new MAC address.

• Support for 3DES and AES with version 3 of the Simple Network Management Protocol (SNMPv3). This release adds support for the 168-bit Triple Data Encryption Standard (3DES) and the 128-bit, 192-bit, and 256-bit Advanced Encryption Standard (AES) encryption algorithms to SNMPv3.

• Support for Cisco TrustSec SXP protocol. This feature is not supported on LanLite images.
CHAPTER 52

Preventing Unauthorized Access

- Finding Feature Information, on page 1153
- Preventing Unauthorized Access, on page 1153

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Preventing Unauthorized Access

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.

- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

- If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.
• You can also enable the login enhancements feature, which logs both failed and unsuccessful login attempts. Login enhancements can also be configured to block future login attempts after a set number of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements documentation.
CHAPTER 53

Controlling Switch Access with Passwords and Privilege Levels

- Finding Feature Information, on page 1155
- Restrictions for Controlling Switch Access with Passwords and Privileges, on page 1155
- Information About Passwords and Privilege Levels, on page 1156
- How to Control Switch Access with Passwords and Privilege Levels, on page 1158
- Monitoring Switch Access, on page 1168
- Configuration Examples for Setting Passwords and Privilege Levels, on page 1169

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Controlling Switch Access with Passwords and Privileges

The following are the restrictions for controlling switch access with passwords and privileges:

- Disabling password recovery will not work if you have set the switch to boot up manually by using the boot manual global configuration command. This command produces the boot loader prompt (switch:) after the switch is power cycled.
Information About Passwords and Privilege Levels

Default Password and Privilege Level Configuration

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

Table 122: Default Password and Privilege Levels

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.</td>
</tr>
<tr>
<td>Line password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>

Additional Password Security

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the `enable password` or `enable secret` global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the `enable secret` command because it uses an improved encryption algorithm.

If you configure the `enable secret` command, it takes precedence over the `enable password` command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.
If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the `service password-recovery` global configuration command.

**Terminal Line Telnet Configuration**

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line.

**Username and Password Pairs**

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

**Privilege Levels**

Cisco devices use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privilege levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

**Privilege Levels on Lines**

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the `clear line` command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the `configure` command, you can assign it level 3 security and distribute that password to a more restricted group of users.

**Command Privilege Levels**

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the `show ip traffic` command to level 15, the `show` commands and `show ip` commands are automatically set to privilege level 15 unless you set them individually to different levels.
### How to Control Switch Access with Passwords and Privilege Levels

#### Setting or Changing a Static Enable Password

The enable password controls access to the privileged EXEC mode. Follow these steps to set or change a static enable password:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. enable password password
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
Example:  
Switch> enable |
| Step 2 | configure terminal | Enters global configuration mode.  
Example:  
Switch# configure terminal |
| Step 3 | enable password password | Defines a new password or changes an existing password for access to privileged EXEC mode.  
By default, no password is defined.  
For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this:  
1. Enter abc.  
2. Enter Ctrl-v.  
Example:  
Switch(config)# enable password secret321 |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3. Enter <code>?123</code>.</td>
</tr>
<tr>
<td></td>
<td>When the system prompts you to enter the enable password, you need not</td>
</tr>
<tr>
<td></td>
<td>precede the question mark with the Ctrl-v; you can simply enter abc?123</td>
</tr>
<tr>
<td></td>
<td>at the password prompt.</td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# show running-config</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Protecting Enable and Enable Secret Passwords with Encryption

Follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. Use one of the following:
   - `enable password [level level] {password encryption-type encrypted-password}`
   - `enable secret [level level] {password encryption-type encrypted-password}`
4. `service password-encryption`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Enters global configuration mode. |
| configure terminal | |
| Example: | |
| Switch# configure terminal | |

<table>
<thead>
<tr>
<th><strong>Step 3</strong></th>
<th>Use one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• enable password [level level] {password encryption-type encrypted-password}</td>
<td>• Defines a new password or changes an existing password for access to privileged EXEC mode.</td>
</tr>
<tr>
<td>• enable secret [level level] {password encryption-type encrypted-password}</td>
<td>• Defines a secret password, which is saved using a nonreversible encryption method.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# enable password example102</td>
<td>• (Optional) For level, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# enable secret level 1 password secret123sample</td>
<td>• For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
</tbody>
</table>

### Note
- If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method.

| **Step 4** | (Optional) Encrypts the password when the password is defined or when the configuration is written. |
| service password-encryption | Encryption prevents the password from being readable in the configuration file. |
| Example: | |
| Switch(config)# service password-encryption | |
### Disabling Password Recovery

Follow these steps to disable password recovery to protect the security of your switch:

**Before you begin**

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `system disable password recovery switch {all | <1-9>}`
4. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
`enable`
Example:
`Switch> enable` | Enables privileged EXEC mode.
- Enter your password if prompted. |
| **Step 5**
`end`
Example:
`Switch(config)# end` | Returns to privileged EXEC mode. |
| **Step 6**
`show running-config`
Example:
`Switch# show running-config` | Verifies your entries. |
| **Step 7**
`copy running-config startup-config`
Example:
`Switch# copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
### Step 2
Configure terminal

**Example:**

```plaintext
Switch# configure terminal
```

**Purpose:**
Enters global configuration mode.

### Step 3
System disable password recovery switch {all | <1-9>}

**Example:**

```plaintext
Switch(config)# system disable password recovery switch all
```

**Purpose:**
Disables password recovery.

- `all` - Sets the configuration on switches in stack.
- `<1-9>` - Sets the configuration on the Switch Number selected.

This setting is saved in an area of the flash memory that is accessible by the boot loader and the Cisco IOS image, but it is not part of the file system and is not accessible by any user.

### Step 4
End

**Example:**

```plaintext
Switch(config)# end
```

**Purpose:**
Returns to privileged EXEC mode.

---

**What to do next**

To remove `disable password recovery`, use the `no system disable password recovery switch all` global configuration command.

---

### Setting a Telnet Password for a Terminal Line

Beginning in user EXEC mode, follow these steps to set a Telnet password for the connected terminal line:

**Before you begin**

- Attach a PC or workstation with emulation software to the switch console port, or attach a PC to the Ethernet management port.
- The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `line vty 0 15`
4. `password password`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  * enable
  * Example:
    * Switch> enable
| Purpose
  * Note: If a password is required for access to privileged EXEC mode, you will be prompted for it.
  * Enter privileged EXEC mode. |
| **Step 2**
  * configure terminal
  * Example:
    * Switch# configure terminal |
| Enter global configuration mode. |
| **Step 3**
  * line vty 0 15
  * Example:
    * Switch(config)# line vty 0 15 |
| Configures the number of Telnet sessions (lines), and enters line configuration mode.
  * There are 16 possible sessions on a command-capable Switch. The 0 and 15 mean that you are configuring all 16 possible Telnet sessions. |
| **Step 4**
  * password *password*
  * Example:
    * Switch(config-line)# password abcxyz543 |
| Sets a Telnet password for the line or lines.
  * For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined. |
| **Step 5**
  * end
  * Example:
    * Switch(config-line)# end |
| Returns to privileged EXEC mode. |
| **Step 6**
  * show running-config
  * Example:
    * Switch# show running-config |
| Verifies your entries. |
| **Step 7**
  * copy running-config startup-config
  * Example:
    * Switch# copy running-config startup-config |
| (Optional) Saves your entries in the configuration file. |

### Configuring Username and Password Pairs

Follow these steps to configure username and password pairs:
### SUMMARY STEPS

1. enable
2. configure terminal
3. `username name [privilege level] {password encryption-type password}`
4. Use one of the following:
   - `line console 0`
   - `line vty 0 15`
5. login local
6. end
7. show running-config
8. copy running-config startup-config

### DETAILED STEPS

<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>username name [privilege level] {password encryption-type password}</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# username adamsample privilege 1 password secret456&lt;br&gt;Switch(config)# username 111111111111 mac attribute</td>
</tr>
</tbody>
</table>

Sets the username, privilege level, and password for each user.<br>**Purpose**
- For `name`, specify the user ID as one word or the MAC address. Spaces and quotation marks are not allowed.<br>- You can configure a maximum of 12000 clients each, for both username and MAC filter.<br>- (Optional) For `level`, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.<br>- For `encryption-type`, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.<br>- For `password`, specify the password the user must enter to gain access to the Switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the `username` command.
### Setting the Privilege Level for a Command

Follow these steps to set the privilege level for a command:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `privilege mode level level command`
4. `enable password level level password`
5. `end`
6. `copy running-config startup-config`

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 4    | Use one of the following:  
      - `line console 0`
      - `line vty 0 15`
   | Enters line configuration mode, and configures the console port (line 0) or the VTY lines (line 0 to 15). |
|      | **Example:**  
      - `Switch(config)# line console 0`
      - `Switch(config)# line vty 15`  |
| 5    | `login local`  
   | Enables local password checking at login time. Authentication is based on the username specified in Step 3. |
|      | **Example:**  
      - `Switch(config-line)# login local`  |
| 6    | `end`  
   | Returns to privileged EXEC mode. |
|      | **Example:**  
      - `Switch(config)# end`  |
| 7    | `show running-config`  
   | Verifies your entries. |
|      | **Example:**  
      - `Switch# show running-config`  |
| 8    | `copy running-config startup-config`  
   | (Optional) Saves your entries in the configuration file. |
|      | **Example:**  
      - `Switch# copy running-config startup-config` |

Configuration Examples for Setting Passwords and Privilege Levels

Example: Setting or Changing a Static Enable Password

This example shows how to change the enable password to 1lu2c3k4y5. The password is not encrypted and provides access to level 15 (traditional privileged EXEC mode access):

Switch(config)# enable password 1lu2c3k4y5

Example: Protecting Enable and Enable Secret Passwords with Encryption

This example shows how to configure the encrypted password $1$FaD0$Xyti5Rkls3LoyxzS8 for privilege level 2:

Switch(config)# enable secret level 2 5 $1$FaD0$Xyti5Rkls3LoyxzS8

Example: Setting a Telnet Password for a Terminal Line

This example shows how to set the Telnet password to let45me67in89:

Switch(config)# line vty 10
Switch(config-line)# password let45me67in89

Example: Setting the Privilege Level for a Command

This example shows how to set the configure command to privilege level 14 and define SecretPswd14 as the password users must enter to use level 14 commands:

Switch(config)# privilege exec level 14 configure
Switch(config)# enable password level 14 SecretPswd14
Example: Setting the Privilege Level for a Command
Configuring TACACS+

• Finding Feature Information, on page 1171
• Prerequisites for TACACS+, on page 1171
• Information About TACACS+, on page 1172
• How to Configure Switch Access with TACACS+, on page 1176
• Monitoring TACACS+, on page 1183

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for TACACS+

The following are the prerequisites for set up and configuration of switch access with TACACS+ (must be performed in the order presented):

1. Configure the switches with the TACACS+ server addresses.
2. Set an authentication key.
3. Configure the key from Step 2 on the TACACS+ servers.
4. Enable authentication, authorization, and accounting (AAA).
5. Create a login authentication method list.
6. Apply the list to the terminal lines.
7. Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:
• You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.

• We recommend a redundant connection between a switch stack and the TACACS+ server. This is to help ensure that the TACACS+ server remains accessible in case one of the connected stack members is removed from the switch stack.

• You need a system running the TACACS+ daemon software to use TACACS+ on your switch.

• To use TACACS+, it must be enabled.

• Authorization must be enabled on the switch to be used.

• Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

• To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the `aaa new-model` command.

• At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting.

• The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

• Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.

• Use the local database if authentication was not performed by using TACACS+.

## Information About TACACS+

### TACACS+ and Switch Access

This section describes TACACS+. TACACS+ provides detailed accounting information and flexible administrative control over the authentication and authorization processes. It is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

### TACACS+ Overview

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—individually. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.
The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers.

**Figure 97: Typical TACACS+ Network Configuration**

TACACS+, administered through the AAA security services, can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.

  The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocmds, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

**TACACS+ Operation**

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:
1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:

- ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.

- REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.

- ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.

- CONTINUE—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:

- Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services

- Connection parameters, including the host or client IP address, access list, and user timeouts

### Method List

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

If a method list is configured under VTY lines, the corresponding method list must be added to AAA. The following example shows how to configure a method list under a VTY line:

```
Device# configure terminal
Device(config)# line vty 0 4
Device(config)# authorization commands 15 auth1
```

The following example shows how to configure a method list in AAA:

```
Device# configure terminal
Device(config)# aaa new-model
```
Device(config)# aaa authorization commands 15 auth1 group tacacs+

If no method list is configured under VTY lines, the default method list must be added to AAA. The following example shows a VTY configuration without a method list:

Device# configure terminal
Device(config)# line vty 0 4

The following example shows how to configure the default method list:

Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authorization commands 15 default group tacacs+

**TACACS+ Configuration Options**

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

**TACACS+ Login Authentication**

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**TACACS+ Authorization for Privileged EXEC Access and Network Services**

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

**TACACS+ Accounting**

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

**Default TACACS+ Configuration**

TACACS+ and AAA are disabled by default.
To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

---

**Note**

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

---

## How to Configure Switch Access with TACACS+

This section describes how to configure your switch to support TACACS+.

### Identifying the TACACS+ Server Host and Setting the Authentication Key

Follow these steps to identify the TACACS+ server host and set the authentication key:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `tacacs-server host hostname`
4. `aaa new-model`
5. `aaa group server tacacs+ group-name`
6. `server ip-address`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
`Example:`  
Switch> `enable`  
• Enter your password if prompted. |
| Step 2 | `configure terminal` | Enters global configuration mode.  
`Example:`  
Switch# `configure terminal` |
| Step 3 | `tacacs-server host hostname` | Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.  
`Example:` |
## Configuring TACACS+ Login Authentication

Follow these steps to configure TACACS+ login authentication:

### Before you begin

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# tacacs-server host yourserver</td>
<td>For <code>hostname</code>, specify the name or IP address of the host.</td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example: Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> aaa group server tacacs+ group-name</td>
<td>(Optional) Defines the AAA server-group with a group name.</td>
</tr>
<tr>
<td>Example: Switch(config)# aaa group server tacacs+ your_server_group</td>
<td>This command puts the Switch in a server group subconfiguration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> server ip-address</td>
<td>(Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group. Each server in the group must be previously defined in Step 3.</td>
</tr>
<tr>
<td>Example: Switch(config)# server 10.1.2.3</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
To secure the access for HTTP access by using AAA methods, you must configure the `ip http authentication` command. Configuring AAA authentication does not secure the access for HTTP access by using AAA methods.

For more information about the `ip http authentication` command, see the Cisco IOS Security Command Reference, Release 12.4.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login {default | list-name} method1 [method2...]`
5. `line [console | tty | vty] line-number [ending-line-number]`
6. `login authentication {default | list-name}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| **Example:**
  Switch> enable | • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**
  Switch# configure terminal | |
| **Step 3** aaa new-model | Enables AAA. |
| **Example:**
  Switch(config)# aaa new-model | |
| **Step 4** aaa authentication login {default | list-name} method1 [method2...]
  **Example:**
  Switch(config)# aaa authentication login default tacacs+ local
  **Example:**
  Switch(config)# aaa authentication login list-name method1 [method2...] |
  Creates a login authentication method list. |
  • To create a default list that is used when a named list is not specified in the `login authentication` command, use the **default** keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports. |
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command/Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>`line [console</td>
<td>tty</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# line 2 4</code></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>`login authentication {default</td>
<td>list-name}`</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-line)# login authentication default</code></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

You can use the `aaa authorization` global configuration command with the `tacacs+` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

#### Note

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa authorization network tacacs+`
4. `aaa authorization exec tacacs+`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 8** `show running-config`   | Verifies your entries.                                                 |
| Example:                           |                                                                         |
| `Switch# show running-config`      |                                                                         |

| **Step 9** `copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
| Example:                           |                                                                         |
| `Switch# copy running-config startup-config` |                                                                         |

### Starting TACACS+ Accounting

Follow these steps to start TACACS+ Accounting:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa accounting network start-stop tacacs+`
4. `aaa accounting exec start-stop tacacs+`
5. `end`
6. show running-config
7. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

What to do next

To establish a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

Establishing a Session with a Router if the AAA Server is Unreachable

To establishing a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

Monitoring TACACS+

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring RADIUS

This section lists the prerequisites for controlling Switch access with RADIUS.

General:

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- Use the `aaa new-model` global configuration command to enable AAA.
- Use the `aaa authentication` global configuration command to define method lists for RADIUS authentication.
- Use `line` and `interface` commands to enable the defined method lists to be used.
• At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.

• You should have access to and should configure a RADIUS server before configuring RADIUS features on your Switch.

• The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

• To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

For RADIUS operation:

• Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

Restrictions for Configuring RADIUS

This topic covers restrictions for controlling Switch access with RADIUS.

General:

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

• Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.

• Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.

• Networks using a variety of services. RADIUS generally binds a user to one service model.

Information about RADIUS

RADIUS and Switch Access

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.
RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validates users and to grant access to network resources.

- Networks already using RADIUS. You can add a Cisco Switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.

- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, “Configuring IEEE 802.1x Port-Based Authentication.”

- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

RADIUS Operation

When a user attempts to log in and authenticate to a Switch that is access controlled by a RADIUS server, these events occur:
1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
   - ACCEPT—The user is authenticated.
   - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   - CHALLENGE—A challenge requires additional data from the user.
   - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

### RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst support the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

The supports these per-session CoA requests:

- Session reauthentication
- Session termination
- Session termination with port shutdown
- Session termination with port bounce
This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst. However, some basic configuration is required for the following attributes:

- Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.
- Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

- CoA acknowledgement (ACK) [CoA-ACK]
- CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.

The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.

Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

This table shows the IETF attributes are supported for this feature.

CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect-negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.
The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

CoA ACK Response Code

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

CoA NAK Response Code

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use show commands to verify a successful CoA.

CoA Request Commands

<table>

</tr>
<tr>
<td>Disable host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=disable-host-port&quot;</td>
</tr>
</tbody>
</table>

10 All CoA commands must include the session identifier between the and the CoA client.

Session Reauthentication

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: Cisco:Avpair="subscriber:command=reauthenticate" and one or more session identification attributes.
The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

**Session Termination**

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

**CoA Disconnect-Request**

This command is a standard Disconnect-Request. If the session cannot be located, the switch returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch terminates the session. After the session has been completely removed, the switch returns a Disconnect-ACK.

If the switch fails-over to a standby switch before returning a Disconnect-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the “Session Context Not Found” error-code attribute.

**CoA Request: Disable Host Port**

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network access on the port, re-enable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

Cisco:Avpair="subscriber:command=disable-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.
If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

**Note**
A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

**CoA Request: Bounce-Port**

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

**Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

**RADIUS Server Host**

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP...
port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

**RADIUS Login Authentication**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**AAA Server Groups**

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order in which they are configured.)
AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

```plaintext
protocol : attribute sep value *
```

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco’s “multiple named IP address pools” feature to be activated during IP authorization (during PPP’s Internet Protocol Control Protocol (IPCP) address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an “*”, the AV pair “ip:addr-pool=first” becomes optional. Note that any AV pair can be made optional:

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

Attribute 26 contains the following three elements:

- Type
The figure below shows the packet format for a VSA encapsulated “behind” attribute 26.

**Figure 99: VSA Encapsulated Behind Attribute 26**

It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor’s definition of that attribute.

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).

**Table 129: Vendor-Specific Attributes Table Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>All attributes listed in the following table are extensions of IETF attribute 26.</td>
</tr>
<tr>
<td>Vendor-Specific Command Codes</td>
<td>A defined code used to identify a particular vendor. Code 9 defines Cisco VSAs, 311 defines Microsoft VSAs, and 529 defines Ascend VSAs.</td>
</tr>
<tr>
<td>Sub-Type Number</td>
<td>The attribute ID number. This number is much like the ID numbers of IETF attributes, except it is a “second layer” ID number encapsulated behind attribute 26.</td>
</tr>
<tr>
<td>Attribute</td>
<td>The ASCII string name of the attribute.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the attribute.</td>
</tr>
</tbody>
</table>

**Table 130: Vendor-Specific RADIUS IETF Attributes**

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MS-CHAP Attributes</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-----------------</td>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>26</td>
<td>311</td>
<td>1</td>
<td>MSCHAP-Response</td>
<td>Contains the response value provided by a PPP MS-CHAP user in response to the challenge. It is only used in Access-Request packets. This attribute is identical to the PPP CHAP Identifier. (RFC 2548)</td>
</tr>
<tr>
<td>26</td>
<td>311</td>
<td>11</td>
<td>MSCHAP-Challenge</td>
<td>Contains the challenge sent by a network access server to an MS-CHAP user. It can be used in both Access-Request and Access-Challenge packets. (RFC 2548)</td>
</tr>
</tbody>
</table>

**VPDN Attributes**

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>l2tp-cm-local-window-size</td>
<td>Specifies the maximum receive window size for L2TP control messages. This value is advertised to the peer during tunnel establishment.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>l2tp-drop-out-of-order</td>
<td>Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>l2tp-hello-interval</td>
<td>Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>l2tp-hidden-avp</td>
<td>When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden.</td>
</tr>
</tbody>
</table>
### Vendor-Specific RADIUS Attributes

<table>
<thead>
<tr>

<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>12tp-nosession-timeout</td>
<td>Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>tunnel-tos-reflect</td>
<td>Copies the IP ToS field from the IP header of each payload packet to the IP header of the tunnel packet for packets entering the tunnel at the LNS.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>12tp-tunnel-authen</td>
<td>If this attribute is set, it performs L2TP tunnel authentication.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>12tp-tunnel-password</td>
<td>Shared secret used for L2TP tunnel authentication and AVP hiding.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>12tp-udp-checksum</td>
<td>This is an authorization attribute and defines whether L2TP should perform UDP checksums for data packets. Valid values are “yes” and “no.” The default is no.</td>
</tr>
</tbody>
</table>

### Store and Forward Fax Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>3</td>
<td>Fax-Account-Id-Origin</td>
<td>Indicates the account ID origin as defined by system administrator for the <code>mnoip aaa receive-id</code> or the <code>mnoip aaa send-id</code> commands.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>4</td>
<td>Fax-Msg-Id=</td>
<td>Indicates a unique fax message identification number assigned by Store and Forward Fax.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>5</td>
<td>Fax-Pages</td>
<td>Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-----------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>6</td>
<td>Fax-Coverpage-Flag</td>
<td>Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>7</td>
<td>Fax-Modem-Time</td>
<td>Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>8</td>
<td>Fax-Connect-Speed</td>
<td>Indicates the modem speed at which this fax-mail was initially transmitted or received. Possible values are 1200, 4800, 9600, and 14400.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>9</td>
<td>Fax-Recipient-Count</td>
<td>Indicates the number of recipients for this fax transmission. Until e-mail servers support Session mode, the number should be 1.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>10</td>
<td>Fax-Process-Abort-Flag</td>
<td>Indicates that the fax session was aborted or successful. True means that the session was aborted; false means that the session was successful.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>11</td>
<td>Fax-Dsn-Address</td>
<td>Indicates the address to which DSNs will be sent.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>----------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>12</td>
<td>Fax-Dsn-Flag</td>
<td>Indicates whether or not DSN has been enabled. True indicates that DSN has been enabled; false means that DSN has not been enabled.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>13</td>
<td>Fax-Mdn-Address</td>
<td>Indicates the address to which MDNs will be sent.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>14</td>
<td>Fax-Mdn-Flag</td>
<td>Indicates whether or not message delivery notification (MDN) has been enabled. True indicates that MDN had been enabled; false means that MDN had not been enabled.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>15</td>
<td>Fax-Auth-Status</td>
<td>Indicates whether or not authentication for this fax session was successful. Possible values for this field are success, failed, bypassed, or unknown.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>16</td>
<td>Email-Server-Address</td>
<td>Indicates the IP address of the e-mail server handling the on-ramp fix-mail message.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>17</td>
<td>Email-Server-Ack-Flag</td>
<td>Indicates that the on-ramp gateway has received a positive acknowledgment from the e-mail server accepting the fax-mail message.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>18</td>
<td>Gateway-Id</td>
<td>Indicates the name of the gateway that processed the fax session. The name appears in the following format: hostname.domain-name.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>19</td>
<td>Call-Type</td>
<td>Describes the type of fax activity: fax receive or fax send.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>----------------</td>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>20</td>
<td>Port-Used</td>
<td>Indicates the slot/port number of the Cisco AS5300 used to either transmit or receive this fax-mail.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>21</td>
<td>Abort-Cause</td>
<td>If the fax session aborts, indicates the system component that signaled the abort. Examples of system components that could trigger an abort are FAP (Fax Application Process), TIFF (the TIFF reader or the TIFF writer), fax-mail client, fax-mail server, ESMTP client, or ESMTP server.</td>
</tr>
</tbody>
</table>

**H323 Attributes**

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>23</td>
<td>Remote-Gateway-ID</td>
<td>Indicates the IP address of the remote gateway.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(h323-remote-address)</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>24</td>
<td>Connection-ID</td>
<td>Identifies the conference ID.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(h323-conf-id)</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>25</td>
<td>Setup-Time</td>
<td>Indicates the setup time for this connection in Coordinated Universal Time (UTC) formerly known as Greenwich Mean Time (GMT) and Zulu time.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(h323-setup-time)</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>26</td>
<td>Call-Origin</td>
<td>Indicates the origin of the call relative to the gateway. Possible values are originating and terminating (answer).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(h323-call-origin)</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>27</td>
<td>Call-Type</td>
<td>Indicates call leg type. Possible values are telephony and VoIP.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(h323-call-type)</td>
<td></td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>28</td>
<td>Connect-Time</td>
<td>Indicates the connection time for this call leg in UTC.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(h323-connect-time)</td>
<td></td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-----------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>29</td>
<td>Disconnect-Time (h323-disconnect-time)</td>
<td>Indicates the time this call leg was disconnected in UTC.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>30</td>
<td>Disconnect-Cause (h323-disconnect-cause)</td>
<td>Specifies the reason a connection was taken offline per Q.931 specification.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>31</td>
<td>Voice-Quality (h323-voice-quality)</td>
<td>Specifies the impairment factor (ICPIF) affecting voice quality for a call.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>33</td>
<td>Gateway-ID (h323-gw-id)</td>
<td>Indicates the name of the underlying gateway.</td>
</tr>
</tbody>
</table>

**Large Scale Dialout Attributes**

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>callback-dialstring</td>
<td>Defines a dialing string to be used for callback.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>data-service</td>
<td>No description available.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>dial-number</td>
<td>Defines the number to dial.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>force-56</td>
<td>Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>map-class</td>
<td>Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-auth</td>
<td>Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.</td>
</tr>
</tbody>
</table>
To apply for PAP, do not configure the `ppp pap send-name password` command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-name</td>
<td>PPP name authentication. Initially, it performed the functions now provided by both the send-name and remote-name attributes. Because the remote-name attribute has been added, the send-name attribute is restricted to its current behavior.</td>
</tr>
</tbody>
</table>
### Vendor-Specific RADIUS Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-secret</td>
<td>PPP password authentication. The vendor-specific attributes (VSAs) “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both “preauth:send-name” and “preauth:send-secret” will be used in the response packet.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>remote-name</td>
<td>Provides the name of the remote host for use in large-scale dial-out. Dialer checks that the large-scale dial-out remote name matches the authenticated name, to protect against accidental user RADIUS misconfiguration. (For example, dialing a valid phone number but connecting to the wrong device.)</td>
</tr>
</tbody>
</table>

**Miscellaneous Attributes**
<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>2</td>
<td>Cisco-NAS-Port</td>
<td>Specifies additional vendor specific attribute (VSA) information for NAS-Port accounting. To specify additional NAS-Port information in the form an Attribute-Value Pair (AVPair) string, use the <code>radius-server vsa send</code> global configuration command. <strong>Note</strong> This VSA is typically used in Accounting, but may also be used in Authentication (Access-Request) packets.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>min-links</td>
<td>Sets the minimum number of links for MLP.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>proxyacl#&lt;n&gt;</td>
<td>Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces.</td>
</tr>
</tbody>
</table>
## Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius server` global configuration commands.

### How to Configure RADIUS

#### Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the Switch, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`.

You can configure the switch to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the Switch and the key string to be shared by both the server and the Switch. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>spi</td>
<td>Carries the authentication information needed by the home agent to authenticate a mobile node during registration. The information is in the same syntax as the <code>ip mobile secure host &lt;addr&gt;</code> configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range.</td>
</tr>
</tbody>
</table>
**Before you begin**

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>Step 2 <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3 `radius-server host {hostname</td>
<td>ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]`</td>
</tr>
<tr>
<td>Example: <code>Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1</code></td>
<td>• (Optional) For <code>auth-port port-number</code>, specify the UDP destination port for authentication requests.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>acct-port port-number</code>, specify the UDP destination port for accounting requests.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>timeout seconds</code>, specify the time interval that the Switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the <code>radius-server timeout</code> global configuration command setting. If no timeout is set with the <code>radius-server host</code> command, the setting of the <code>radius-server timeout</code> command is used.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>retransmit retries</code>, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The</td>
</tr>
</tbody>
</table>
### Configuring RADIUS Login Authentication

Follow these steps to configure RADIUS login authentication:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>range</strong> is 1 to 1000. If no retransmit value is set with the <code>radius-server host</code> command, the setting of the <code>radius-server retransmit</code> global configuration command is used.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <code>key string</code>, specify the authentication and encryption key used between the Switch and the RADIUS daemon running on the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <code>radius-server host</code> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td>To configure the Switch to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure that each UDP port number is different. The Switch software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Before you begin

To secure the device for HTTP access by using AAA methods, you must configure the device with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the device for HTTP access by using AAA methods.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login {default | list-name} method1 [method2...]
5. `line [console | tty | vty] line-number [ending-line-number]
6. `login authentication {default | list-name}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | |
| `Switch# configure terminal` | |

| **Step 3** aaa new-model | Enables AAA. |
| **Example:** | |
| `Switch(config)# aaa new-model` | |

| **Step 4** aaa authentication login {default | list-name} method1 [method2...]
<p>| <strong>Example:</strong> | Creates a login authentication method list. |
| <code>Switch(config)# aaa authentication login default local</code> | • To create a default list that is used when a named list is not specified in the <code>login authentication</code> command, use the default keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports. |
| | • For list-name, specify a character string to name the list you are creating. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• For method1..., specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails. Select one of these methods:</td>
<td></td>
</tr>
<tr>
<td>• enable—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the <code>enable password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• group radius—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td>• line—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <code>password password</code> line configuration command.</td>
<td></td>
</tr>
<tr>
<td>• local—Use the local username database for authentication. You must enter username information in the database. Use the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• local-case—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• none—Do not use any authentication for login.</td>
<td></td>
</tr>
</tbody>
</table>

| Step 5 | line [console | tty | vty] line-number [ending-line-number] | Enters line configuration mode, and configure the lines to which you want to apply the authentication list. |
|--------|----------------------------------------|--------------------------------------------------|
| Example: | Switch(config)# line 1 4 |

| Step 6 | login authentication {default | list-name} | Applies the authentication list to a line or set of lines. |
|--------|----------------------------------------|--------------------------------------------------|
| Example: | Switch(config)# login authentication default |

<table>
<thead>
<tr>
<th>Step 7</th>
<th>end</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Defining AAA Server Groups

You use the `server` group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional `auth-port` and `acct-port` keywords.

Follow these steps to define AAA server groups:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius server name`
4. `address {ipv4 | ipv6} {ip-address | hostname} auth-port port-number acct-port port-number`
5. `key string`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

Configuring RADIUS Authorization for User Privileged Access and Network Services

Note
Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user privileged access and network services:

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa authorization network radius
4. aaa authorization exec radius
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>

</tr>
</tbody>
</table>
### Starting RADIUS Accounting

Follow these steps to start RADIUS accounting:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa accounting network start-stop radius`
4. `aaa accounting exec start-stop radius`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---

What to do next

You can use the `aaa authorization` global configuration command with the `radius` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.
### Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

#### SUMMARY STEPS

1. configure terminal

<table>
<thead>
<tr>
<th>Command or Action</th>

### Configuring the Device to Use Vendor-Specific RADIUS Attributes

Follow these steps to configure the device to use vendor-specific RADIUS attributes:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `radius-server vsa send [accounting | authentication]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
`enable`
**Example:**
`Switch> enable`
| Enables privileged EXEC mode.
* Enter your password if prompted. |
| **Step 2**
`configure terminal`
**Example:**
`Switch# configure terminal`
| Enters global configuration mode. |
| **Step 3**
`radius-server vsa send [accounting | authentication]`
**Example:**
| Enables the device to recognize and use VSAs as defined by RADIUS IETF attribute 26. |
### Configuring the Device for Vendor-Proprietary RADIUS Server Communication

Follow these steps to configure the device to use vendor-proprietary RADIUS server communication:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. radius-server host [hostname | ip-address] non-standard
4. radius-server key string
5. end
6. show running-config
7. copy running-config startup-config

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config)# radius-server vsa send accounting` | • (Optional) Use the `accounting` keyword to limit the set of recognized vendor-specific attributes to only accounting attributes.  
• (Optional) Use the `authentication` keyword to limit the set of recognized vendor-specific attributes to only authentication attributes.  
If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used. |

**Step 4**

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 5**

**Example:**

```
Switch# show running-config
```

Verifies your entries.

**Step 6**

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

For detailed information about the fields in these displays, see the command reference for this release.
Configuration Examples for Controlling Switch Access with RADIUS

Examples: Identifying the RADIUS Server Host

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```
Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
```

This example shows how to configure host1 as the RADIUS server and to use the default ports for both authentication and accounting:

```
Switch(config)# radius-server host host1
```

Example: Using Two Different RADIUS Group Servers

In this example, the switch is configured to recognize two different RADIUS group servers (group1 and group2). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes

For example, this AV pair activates Cisco’s multiple named ip address pools feature during IP authorization (during PPP IPCP address assignment):

```
cisco-avpair= “ip:addr-pool=first”
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= “shell:priv-lvl=15”
```

This example shows how to specify an authorized VLAN in the RADIUS server database:
This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

- `cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
- `cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
- `cisco-avpair= "mac:inacl#3=deny any any decnet-iv"

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

- `cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"

**Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication**

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of `rad124` between the switch and the server:

```
Switch(config)# radius-server host 172.20.30.15 nonstandard
Switch(config)# radius-server key rad124
```
Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Configuring Kerberos

- Finding Feature Information, on page 1227
- Prerequisites for Controlling Switch Access with Kerberos, on page 1227
- Information about Kerberos, on page 1228
- How to Configure Kerberos, on page 1231
- Monitoring the Kerberos Configuration, on page 1231

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

- So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.

- A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

When you add or create entries for the hosts and users, follow these guidelines:

- The Kerberos principal name must be in all lowercase characters.
- The Kerberos instance name must be in all lowercase characters.
- The Kerberos realm name must be in all uppercase characters.
Information about Kerberos

This section provides Kerberos information.

Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

Note

In the Kerberos configuration examples, the trusted third party can be any switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the key distribution center (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

Note

A Kerberos server can be any switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called single logon. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

Kerberos supports these network services:

- Telnet
- rlogin
- rsh
This table lists the common Kerberos-related terms and definitions.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.</td>
</tr>
<tr>
<td>Authorization</td>
<td>A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.</td>
</tr>
<tr>
<td>Credential</td>
<td>A general term that refers to authentication tickets, such as TGTs\textsuperscript{11} and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.</td>
</tr>
<tr>
<td>Instance</td>
<td>An authorization level label for Kerberos principals. Most Kerberos principals are of the form user@REALM (for example, <a href="mailto:smith@EXAMPLE.COM">smith@EXAMPLE.COM</a>). A Kerberos principal with a Kerberos instance has the form user/instance@REALM (for example, smith/admin@EXAMPLE.COM). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so. Note: The Kerberos principal and instance names must be in all lowercase characters.</td>
</tr>
<tr>
<td>KDC\textsuperscript{12}</td>
<td>Key distribution center that consists of a Kerberos server and database program that is running on a network host.</td>
</tr>
<tr>
<td>Kerberized</td>
<td>A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.</td>
</tr>
<tr>
<td>Kerberos realm</td>
<td>A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service. Note: The Kerberos realm name must be in all uppercase characters.</td>
</tr>
<tr>
<td>Kerberos server</td>
<td>A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services.</td>
</tr>
<tr>
<td>KEYTAB\textsuperscript{13}</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB\textsuperscript{14}.</td>
</tr>
<tr>
<td>Principal</td>
<td>Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server. Note: The Kerberos principal name must be in all lowercase characters.</td>
</tr>
</tbody>
</table>
**Term** | **Definition**
--- | ---
Service credential | A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.
SRVTAB | A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.
TGT | Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC.

Kerberos Operation

A Kerberos server can be a device that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a device as a Kerberos server, remote users must follow these steps:

**Authenticating to a Boundary Switch**

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
   - If the decryption is successful, the user is authenticated to the switch.
   - If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.
Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a KDC and obtain a TGT from the KDC to access network services.

For instructions about how to authenticate to a KDC, see the “Obtaining a TGT from a KDC” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a TGT must now authenticate to the network services in a Kerberos realm.

For instructions about how to authenticate to a network service, see the “Authenticating to Network Services” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

How to Configure Kerberos

To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the following commands:

- `show running-config`
- `show kerberos creds`: Lists the credentials in a current user’s credentials cache.
- `clear kerberos creds`: Destroys all credentials in a current user’s credentials cache, including those forwarded.
Configuring Local Authentication and Authorization

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login default local`
5. `aaa authorization exec default local`
6. `aaa authorization network default local`
7. `username name [privilege level] {password encryption-type password}`
8. `end`
9. `show running-config`
10. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

</table>
Monitoring Local Authentication and Authorization

To display Local Authentication and Authorization configuration, use the `show running-config` privileged EXEC command.
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.

- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

- SCP relies on SSH for security.

- SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.

- A user must have appropriate authorization to use SCP.
A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the `copy` command. An authorized administrator can also do this from a workstation.

The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.

Configure a hostname and host domain for your device by using the `hostname` and `ip domain-name` commands in global configuration mode.

### Restrictions for Configuring Secure Shell

The following are restrictions for configuring the device for secure shell.

- The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
- SSH supports only the execution-shell application.
- The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- The device supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
- When using SCP, you cannot enter the password into the `copy` command. You must enter the password when prompted.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.
- The `-l` keyword and userid `{number} {ip-address}` delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.
- To authenticate clients with freeradius over RADSEC, you should generate an RSA key longer than 1024 bit. Use the `crypto key generate rsa general-keys exportable label label-name` command to achieve this.

### Information About Configuring Secure Shell

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

### SSH and Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.
SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

Note

The SSH client functionality is available only when the SSH server is enabled.

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

SSH Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.
- If the SSH server is running on a stack master and the stack master fails, the new stack master uses the RSA key pair generated by the previous stack master.
- If you get CLI error messages after entering the `crypto key generate rsa` global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the `crypto key generate rsa` command.
- When generating the RSA key pair, the message No host name specified might appear. If it does, you must configure a hostname by using the `hostname` global configuration command.
- When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the `ip domain-name` global configuration command.
- When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.
Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note

When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Secure Copy Protocol

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the device can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

How to Configure SSH

Setting Up the Switch to Run SSH

Follow the procedure given below to set up your Switch to run SSH:

Before you begin

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

SUMMARY STEPS

1. enable
2. configure terminal
3. hostname hostname
4. ip domain-name domain_name
5. crypto key generate rsa
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code>&lt;br&gt;Example: <code>Switch&gt; enable</code></td>
<td>Enables privileged EXEC mode.  * Enter your password if prompted.</td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code>&lt;br&gt;Example: <code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td><code>hostname hostname</code>&lt;br&gt;Example: <code>Switch(config)# hostname your_hostname</code></td>
<td>Configures a hostname and IP domain name for your Switch.  <strong>Note</strong> Follow this procedure only if you are configuring the Switch as an SSH server.</td>
</tr>
<tr>
<td>4</td>
<td><code>ip domain-name domain_name</code>&lt;br&gt;Example: <code>Switch(config)# ip domain-name your_domain</code></td>
<td>Configures a host domain for your Switch.</td>
</tr>
<tr>
<td>5</td>
<td><code>crypto key generate rsa</code>&lt;br&gt;Example: <code>Switch(config)# crypto key generate rsa</code></td>
<td>Enables the SSH server for local and remote authentication on the Switch and generates an RSA key pair. Generating an RSA key pair for the Switch automatically enables SSH.  <strong>Note</strong> Follow this procedure only if you are configuring the Switch as an SSH server.</td>
</tr>
<tr>
<td>6</td>
<td><code>end</code>&lt;br&gt;Example: <code>Switch(config)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring the SSH Server

Follow the procedure given below to configure the SSH server:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>2.</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3.</td>
<td>ip ssh version [1</td>
<td>Use one or both of the following:</td>
</tr>
<tr>
<td></td>
<td>2]</td>
<td>• line vty line_number[ ending_line_number]</td>
</tr>
<tr>
<td>4.</td>
<td>ip ssh {timeout seconds</td>
<td>• transport input ssh</td>

Configuring SSH File Transfer Protocol

Secure Shell (SSH) includes support for SSH File Transfer Protocol (SFTP), which is a new standard file transfer protocol introduced in SSHv2. This feature provides a secure and authenticated method for copying device configuration or device image files.

- Prerequisites for SSH File Transfer Protocol, on page 1245
- Restrictions for SSH File Transfer Protocol, on page 1245
- Information About SSH File Transfer Protocol, on page 1245
- How to Configure SSH File Transfer Protocol, on page 1246
- Example: Configuring SSH File Transfer Protocol, on page 1247
- Additional References, on page 1248
- Feature Information for SSH File Transfer Protocol, on page 1248

Prerequisites for SSH File Transfer Protocol

- SSH must be enabled.
- The `ip ssh source-interface interface-type interface-number` command must be configured.

Restrictions for SSH File Transfer Protocol

- The SFTP server is not supported.
- SFTP boot is not supported.
- The `sftp` option in the `install add` command is not supported.

Information About SSH File Transfer Protocol

The SFTP client functionality is provided as part of the SSH component and is always enabled on the corresponding device. Therefore, any SFTP server user with the appropriate permission can copy files to and from the device.

An SFTP client is VRF-aware; you can configure the secure FTP client to use the virtual routing and forwarding (VRF) associated with a particular source interface during connection attempts.
How to Configure SSH File Transfer Protocol

The following sections provide information about the various tasks that comprise an SFTP configuration.

Configuring SFTP

Perform the following steps:

Before you begin

To configure a Cisco device for SFTP client-side functionality, the `ip ssh source-interface interface-type interface-number` command must be configured first.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip ssh source-interface interface-type interface-number
4. exit
5. show running-config
6. debug ip sftp

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password, if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip ssh source-interface</td>
<td>Defines the source IP for the SSH session.</td>
</tr>
<tr>
<td><strong>interface-type interface-number</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip ssh source-interface</td>
<td></td>
</tr>
<tr>
<td>GigabitEthernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>
Perform an SFTP Copy Operation

SFTP copy takes the IP or hostname of the corresponding server if Domain Name System (DNS) is configured. To perform SFTP copy operations, use the following commands in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Device# `copy ios-file-system:file sftp://user:pwd@server-ip//filepath`  
Or  
Device# `copy ios-file-system: sftp:`  
Device# `copy sftp://user:pwd@server-ip //filepath ios-file-system:file`  
Or  
Device# `copy sftp: ios-file-system:` | Copies a file from the local Cisco IOS file system to the server.  
Specify the username, password, IP address, and filepath of the server.  
Copies the file from the server to the local Cisco IOS file system.  
Specify the username, password, IP address, and filepath of the server. |

Example: Configuring SSH File Transfer Protocol

The following example shows how to configure the client-side functionality of SFTP:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh source-interface gigabitethernet 1/0/1
Device(config)# exit
```

X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature uses public key algorithm (PKI) for server and user authentication, and allows the Secure Shell (SSH) protocol to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

This module describes how to configure server and user certificate profiles for a digital certificate.

• Finding Feature Information, on page 1249
• Prerequisites for X.509v3 Certificates for SSH Authentication, on page 1249
• Restrictions for X.509v3 Certificates for SSH Authentication, on page 1250
• Information About X.509v3 Certificates for SSH Authentication, on page 1250
• How to Configure X.509v3 Certificates for SSH Authentication, on page 1251
• Verifying the Server and User Authentication Using Digital Certificates, on page 1254
• Configuration Examples for X.509v3 Certificates for SSH Authentication, on page 1259
• Additional References for X.509v3 Certificates for SSH Authentication, on page 1259
• Feature Information for X.509v3 Certificates for SSH Authentication, on page 1260

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature replaces the `ip ssh server authenticate user` command with the `ip ssh server algorithm authentication` command. Configure the `default ip ssh server authenticate user` command to remove the `ip ssh server authenticate user` command from the configuration. The IOS secure shell (SSH) server will start using the `ip ssh server algorithm authentication` command.

When you configure the `ip ssh server authenticate user` command, the following message is displayed:
Warning

SSH command accepted; but this CLI will be deprecated soon. Please move to new CLI `ip ssh server algorithm authentication`. Please configure the “default ip ssh server authenticate user” to make the CLI ineffective.

Restrictions for X.509v3 Certificates for SSH Authentication

- The X.509v3 Certificates for SSH Authentication feature implementation is applicable only on the Cisco IOS Secure Shell (SSH) server side.
- The Cisco IOS SSH server supports only the x509v3-ssh-rsa algorithm-based certificate for server and user authentication.

Information About X.509v3 Certificates for SSH Authentication

X.509v3 Certificates for SSH Authentication Overview

The Secure Shell (SSH) protocol provides a secure remote access connection to network devices. The communication between the client and server is encrypted.

There are two SSH protocols that use public key cryptography for authentication. The Transport Layer Protocol, uses a digital signature algorithm (called the public key algorithm) to authenticate the server to the client. And the User Authentication Protocol uses a digital signature to authenticate (public key authentication) the client to the server.

The validity of the authentication depends upon the strength of the linkage between the public signing key and the identity of the signer. Digital certificates, such as those in X.509 Version 3 (X.509v3), are used to provide identity management. X.509v3 uses a chain of signatures by a trusted root certification authority and intermediate certificate authorities to bind a public signing key to a specific digital identity. This implementation allows the use of a public key algorithm for server and user authentication, and allows SSH to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

Server and User Authentication Using X.509v3

For server authentication, the Secure shell (SSH) server sends its own certificate to the SSH client for verification. This server certificate is associated with the trustpoint configured in the server certificate profile (ssh-server-cert-profile-server configuration mode).

For user authentication, the SSH client sends the user's certificate to the IOS SSH server for verification. The SSH server validates the incoming user certificate using public key infrastructure (PKI) trustpoints configured in the server certificate profile (ssh-server-cert-profile-user configuration mode).

By default, certificate-based authentication is enabled for server and user at the IOS SSH server end.
OCSP Response Stapling

The Online Certificate Status Protocol (OCSP) enables applications to determine the (revocation) state of an identified certificate. This protocol specifies the data that needs to be exchanged between an application checking the status of a certificate and the server providing that status. An OCSP client issues a status request to an OCSP responder and suspends acceptance of the certificate until a response is received. An OCSP response at a minimum consists of a responseStatus field that indicates the processing status of the a request.

For the public key algorithms, the key format consists of a sequence of one or more X.509v3 certificates followed by a sequence of zero or more OCSP responses.

The X.509v3 Certificate for SSH Authentication feature uses OCSP Response Stapling. By using OCSP response stapling, a device obtains the revocation information of its own certificate by contacting the OCSP server and then stapling the result along with its certificates and sending the information to the peer rather than having the peer contact the OCSP responder.

How to Configure X.509v3 Certificates for SSH Authentication

Configuring Digital Certificates for Server Authentication

SUMMARY STEPS

1. enable
2. configure terminal
3. ip ssh server algorithm hostkey [x509v3-ssh-rsa [ssh-rsa] [ssh-rsa [x509v3-ssh-rsa]]]
4. ip ssh server certificate profile
5. server
6. trustpoint sign PKI-trustpoint-name
7. ocsrp-response include
8. end
9. line vty line_number [ending_line_number]
10. transport input ssh

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Example: Switch# configure terminal</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 3    | `ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}` | Defines the order of host key algorithms. Only the configured algorithm is negotiated with the Secure Shell (SSH) client. **Note** The IOS SSH server must have at least one configured host key algorithm:  
  - `x509v3-ssh-rsa`—certificate-based authentication  
  - `ssh-rsa`—public key-based authentication |
| Example: | Switch(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa | |
| 4    | `ip ssh server certificate profile` | Configures server and user certificate profiles and enters SSH certificate profile configuration mode. |
| Example: | Switch(config)# ip ssh server certificate profile | |
| 5    | server | Configures server certificate profile and enters SSH server certificate profile server configuration mode.  
  - The server profile is used to send out the certificate of the server to the SSH client during server authentication. |
| Example: | Switch(ssh-server-cert-profile)# server | |
| 6    | trustpoint sign `PKI-trustpoint-name` | Attaches the public key infrastructure (PKI) trustpoint to the server certificate profile.  
  - The SSH server uses the certificate associated with this PKI trustpoint for server authentication. |
| Example: | Switch(ssh-server-cert-profile-server)# trustpoint sign trust1 | |
| 7    | ocsp-response include | (Optional) Sends the Online Certificate Status Protocol (OCSP) response or OCSP stapling along with the server certificate.  
  - **Note** By default, no OCSP response is sent along with the server certificate. |
| Example: | Switch(ssh-server-cert-profile-server)# ocsp-response include | |
| 8    | end | Exits SSH server certificate profile server configuration mode and returns to privileged EXEC mode. |
| Example: | Switch(ssh-server-cert-profile-server)# end | |
| 9    | line vty line_number `[ending_line_number]` | Enters line configuration mode to configure the virtual terminal line settings. For line_number and ending_line_number, specify a pair of lines. The range is 0 to 15. |
| Example: | Switch(config)# line vty line_number [ending_line_number] | |
| 10   | transport input ssh | Specifies that the Switch prevent non-SSH Telnet connections. This limits the router to only SSH connections. |
| Example: | Switch(config-line)# transport input ssh | |
Configuring Digital Certificates for User Authentication

SUMMARY STEPS

1. enable
2. configure terminal
3. ip ssh server algorithm authentication {publickey | keyboard | password}
4. ip ssh server algorithm publickey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}
5. ip ssh server certificate profile
6. user
7. trustpoint verify PKI-trustpoint-name
8. ocsp-response required
9. end
10. line vty line_number [ending_line_number]
11. transport input ssh

### Verifying the Server and User Authentication Using Digital Certificates

**SUMMARY STEPS**

1. **enable**
2. **show ip ssh**
3. debug ip ssh detail
4. show log
5. debug ip packet
6. show log

DETAILED STEPS

Step 1  enable

Enables privileged EXEC mode.
  • Enter your password if prompted.

Example:

Device> enable

Step 2  show ip ssh

Displays the currently configured authentication methods. To confirm the use of certificate-based authentication, ensure that the x509v3-ssh-rsa algorithm is the configured host key algorithm.

Example:

Device# show ip ssh

SSH Enabled - version 1.99
Authentication methods:publickey,keyboard-interactive,password
Authentication Publickey Algorithms:x509v3-ssh-rsa,ssh-rsa
Hostkey Algorithms:x509v3-ssh-rsa,ssh-rsa
Authentication timeout: 120 secs; Authentication retries: 3
Minimum expected Diffie Hellman key size : 1024 bits

Step 3  debug ip ssh detail

Turns on debugging messages for SSH details.

Example:

Device# debug ip ssh detail
ssh detail messages debugging is on

Step 4  show log

Shows the debug message log.

Example:

Device# show log

Syslog logging: enabled (0 messages dropped, 9 messages rate-limited, 0 flushes, 0 overruns, xml disabled, filtering disabled)

Configuration Examples for X.509v3 Certificates for SSH Authentication

Example: Configuring Digital Certificates for Server Authentication

Switch> enable
Switch# configure terminal
Switch(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa
Switch(config)# ip ssh server certificate profile
Switch(ssh-server-cert-profile)# server
Switch(ssh-server-cert-profile-server)# trustpoint sign trust1
Switch(ssh-server-cert-profile-server)# exit

Example: Configuring Digital Certificate for User Authentication

Switch> enable
Switch# configure terminal
Switch(config)# ip ssh server algorithm authentication publickey
Switch(config)# ip ssh server algorithm publickey x509v3-ssh-rsa
Switch(config)# ip ssh server certificate profile
Switch(ssh-server-cert-profile)# user
Switch(ssh-server-cert-profile-user)# trustpoint verify trust2
Switch(ssh-server-cert-profile-user)# end

Feature Information for X.509v3 Certificates for SSH Authentication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Secure Socket Layer HTTP

- Finding Feature Information, on page 1263
- Information about Secure Sockets Layer (SSL) HTTP, on page 1263
- How to Configure Secure HTTP Servers and Clients, on page 1266
- Monitoring Secure HTTP Server and Client Status, on page 1273

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about Secure Sockets Layer (SSL) HTTP

Secure HTTP Servers and Clients Overview

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with https:// instead of http://.

Note

SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.
The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as trustpoints.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.
- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

Note

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

When a new certificate is enrolled, the new configuration change is not applied to the HTTPS server until the server is restarted. You can restart the server using either the CLI or by physical reboot. On restarting the server, the switch starts using the new certificate.

If a self-signed certificate has been generated, this information is included in the output of the show running-config privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.

Switch# show running-config
Building configuration...
<output truncated>
crypto pki trustpoint TP=self-signed-3080755072
    enrollment selfsigned
    subject-name cn=IOS-Self-Signed-Certificate-3080755072
    revocation-check none
    rsa-keypair TP=self-signed-3080755072

crypto ca certificate chain TP-self-signed-3080755072
certificate self-signed 01
  3082029F 30820200 A0030201 02020101 300D0609 2A864886 F70D0101 04050030
  59312F30 2D060355 04031326 494F532D 53656C66 2D536967 6E65642D 43657274
  30330301 30303030 35395A17 0D323030 31303130 30303030 305A3059 312F302D
<output truncated>

You can remove this self-signed certificate by disabling the secure HTTP server and entering the no crypto pki trustpoint TP-self-signed-30890755072 global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

The values that follow TP self-signed depend on the serial number of the device.

You can use an optional command (ip http secure-client-auth) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

CipherSuites

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL_RSA_WITH_DES_CBC_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. SSL_RSA_WITH_DES_CBC_SHA—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest
2. SSL_RSA_WITH_NULL_SHA key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
3. SSL_RSA_WITH_NULL_MD5 key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).
4. SSL_RSA_WITH_RC4_128_MD5—RSA key exchange with RC4 128-bit encryption and MD5 for message digest
5. SSL_RSA_WITH_RC4_128_SHA—RSA key exchange with RC4 128-bit encryption and SHA for message digest
6. SSL_RSA_WITH_3DES_EDE_CBC_SHA—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest
7. SSL_RSA_WITH_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).

8. SSL_RSA_WITH_AES_256_CBC_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

9. SSL_RSA_WITH_DHE_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).

10. SSL_RSA_WITH_DHE_AES_256_CBC_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

---

**Note**

The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

**Default SSL Configuration**

The standard HTTP server is enabled.

SSL is enabled.

No CA trustpoints are configured.

No self-signed certificates are generated.

**SSL Configuration Guidelines**

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.

**How to Configure Secure HTTP Servers and Clients**

**Configuring a CA Trustpoint**

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:
### SUMMARY STEPS

1. configure terminal
2. hostname hostname
3. ip domain-name domain-name
4. crypto key generate rsa
5. crypto ca trustpoint name
6. enrollment url url
7. enrollment http-proxy host-name port-number
8. crl query url
9. primary name
10. exit
11. crypto ca authentication name
12. crypto ca enroll name
13. end

### DETAILED STEPS

<table>

</tbody>
</table>
Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter https://URL, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

https://209.165.129:1026
or

https://host.domain.com:1026

The existing ip http access-class access-list-number command for specifying the access-list (Only IPv4 ACLs) is going to be deprecated. You can still use this command to specify an access list to allow access to the HTTP server. Two new commands have been introduced to enable support for specifying IPv4 and IPv6 ACLs. These are ip http access-class ipv4 access-list-name | access-list-number for specifying IPv4 ACLs and ip http access-class ipv6 access-list-name for specifying IPv6 ACLs. We recommend using the new CLI to avoid receiving warning messages.

Note the following considerations for specifying access-lists:

- If you specify an access-list that does not exist, the configuration takes place but you receive the below warning message:

  ACL being attached does not exist, please configure it

- If you use the ip http access-class command for specifying an access-list for the HTTP server, the below warning message appears:

  This CLI will be deprecated soon, Please use new CLI ip http access-class ipv4/ipv6 <access-list-name> | <access-list-number>

- If you use ip http access-class ipv4 access-list-name | access-list-number or ip http access-class ipv6 access-list-name, and an access-list was already configured using ip http access-class, the below warning message appears:

  Removing ip http access-class <access-list-number>

ip http access-class access-list-number and ip http access-class ipv4 access-list-name | access-list-number share the same functionality. Each command overrides the configuration of the previous command. The
following combinations between the configuration of the two commands explain the effect on the running configuration:

- If \texttt{ip http access-class access-list-number} is already configured and you try to configure using \texttt{ip http access-class ipv4 access-list-number} command, the configuration of \texttt{ip http access-class access-list-number} will be removed and the configuration of \texttt{ip http access-class ipv4 access-list-number} will be added to the running configuration.

- If \texttt{ip http access-class access-list-number} is already configured and you try to configure using \texttt{ip http access-class ipv4 access-list-name} command, the configuration of \texttt{ip http access-class access-list-number} will be removed and the configuration of \texttt{ip http access-class ipv4 access-list-name} will be added to the running configuration.

- If \texttt{ip http access-class ipv4 access-list-number} is already configured and you try to configure using \texttt{ip http access-class access-list-name}, the configuration of \texttt{ip http access-class ipv4 access-list-number} will be removed from configuration and the configuration of \texttt{ip http access-class access-list-name} will be added to the running configuration.

- If \texttt{ip http access-class ipv4 access-list-name} is already configured and you try to configure using \texttt{ip http access-class access-list-number}, the configuration of \texttt{ip http access-class ipv4 access-list-name} will be removed from the configuration and the configuration of \texttt{ip http access-class access-list-number} will be added to the running configuration.

**SUMMARY STEPS**

1. \texttt{show ip http server status}
2. \texttt{configure terminal}
3. \texttt{ip http secure-server}
4. \texttt{ip http secure-port port-number}
5. \texttt{ip http secure-ciphersuite \{ [3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha] \}}
6. \texttt{ip http secure-client-auth}
7. \texttt{ip http secure-trustpoint name}
8. \texttt{ip http path path-name}
9. \texttt{ip http access-class access-list-number}
10. \texttt{ip http access-class \{ ipv4 \{access-list-number | access-list-name\} | ipv6 \{access-list-name\} \}}
11. \texttt{ip http max-connections value}
12. \texttt{ip http timeout-policy idle seconds life seconds requests value}
13. \texttt{end}

**DETAILED STEPS**

<tr>
<td>Step 10</td>
<td>`ip http access-class { ipv4 {access-list-number</td>
<td>access-list-name}</td>
</tr>
<tr>
<td>Step 11</td>
<td><code>ip http max-connections value</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Switch(config)# ip http max-connections 4</code></td>
<td>(Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. We recommend that the value be at least 10 and not less. This is required for the UI to function as expected.</td>
</tr>
<tr>
<td>Step 12</td>
<td><code>ip http timeout-policy idle seconds life seconds requests requests</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Switch(config)# ip http timeout-policy idle 120 life 240 requests 1</code></td>
<td>(Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances:&lt;br&gt;- <strong>idle</strong>—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes).&lt;br&gt;- <strong>life</strong>—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds.&lt;br&gt;- <strong>requests</strong>—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1.</td>
</tr>
<tr>
<td>Step 13</td>
<td><code>end</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Switch(config)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

**Before you begin**

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.
SUMMARY STEPS

1. configure terminal
2. ip http client secure-trustpoint name
3. ip http client secure-ciphersuite {3des-ede-cbc-sha [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
4. end

CHAPTER 62

Certification Authority Interoperability

This chapter describes how to configure certification authority (CA) interoperability, which is provided in support of the IPSec protocol. CA interoperability permits Cisco IOS devices and CAs to communicate so that your Cisco IOS device can obtain and use digital certificates from the CA. Although IPSec can be implemented in your network without the use of a CA, using a CA provides manageability and scalability for IPSec.

- Prerequisites For Certification Authority, on page 1275
- Restrictions for Certification Authority, on page 1275
- Information About Certification Authority, on page 1276
- How to Configure Certification Authority, on page 1279
- Monitoring and Maintaining Certification Authority, on page 1286

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites For Certification Authority

You need to have a certification authority (CA) available to your network before you configure this interoperability feature. The CA must support the Public Key Infrastructure (PKI) protocol, and the Simple Certificate Enrollment Protocol (SCEP).

Restrictions for Certification Authority

When configuring your CA, the following restrictions apply:
- This feature should be configured only when you also configure both IPsec and Internet Key Exchange (IKE) in your network.
- The Cisco IOS software does not support CA server public keys greater than 2048 bits.

Information About Certification Authority

CA Supported Standards

Without certification authority (CA) interoperability, Cisco IOS devices could not use CAs when deploying IPsec. CAs provide a manageable, scalable solution for IPsec networks.

Cisco supports the following standards with this feature:

- **IPSec**—IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer; it uses Internet Key Exchange to handle negotiation of protocols and algorithms based on local policy, and to generate the encryption and authentication keys to be used by IPsec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

- **Internet Key Exchange (IKE)**—A hybrid protocol that implements Oakley and Skeme key exchanges inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with the IPSec protocol. IKE provides authentication of the IPSec peers, negotiates IPSec keys, and negotiates IPSec security associations.

- **Public-Key Cryptography Standard #7 (PKCS #7)**—A standard from RSA Data Security, Inc., used to encrypt and sign certificate enrollment messages.

- **Public-Key Cryptography Standard #10 (PKCS #10)**—A standard syntax from RSA Data Security, Inc. for certificate requests.

- **RSA Keys**—RSA is the public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. RSA keys come in pairs: one public key and one private key.

- **X.509v3 certificates**—Certificate support that allows the IPSec-protected network to scale by providing the equivalent of a digital ID card to each device. When two devices wish to communicate, they exchange digital certificates to prove their identity (thus removing the need to manually exchange public keys with each peer or to manually specify a shared key at each peer). These certificates are obtained from a CA. X.509 is part of the X.500 standard of the ITU.

Purpose of CAs

Certificate authorities (CAs) are responsible for managing certificate requests and issuing certificates to participating IPSec network devices. These services provide centralized key management for the participating devices.

CAs simplify the administration of IPSec network devices. You can use a CA with a network containing multiple IPSec-compliant devices such as routers.

Digital signatures, enabled by public key cryptography, provide a means of digitally authenticating devices and individual users. In public key cryptography, such as the RSA encryption system, each user has a key pair containing both a public and a private key. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other. In simple terms, a signature is formed when data is encrypted with a user's private key. The receiver verifies the signature by decrypting the message with the sender's public
The fact that the message could be decrypted using the sender's public key indicates that the holder of the private key, the sender, must have created the message. This process relies on the receiver's having a copy of the sender's public key and knowing with a high degree of certainty that it really does belong to the sender and not to someone pretending to be the sender.

Digital certificates provide the link. A digital certificate contains information to identify a user or device, such as the name, serial number, company, department, or IP address. It also contains a copy of the entity's public key. The certificate is itself signed by a certification authority (CA), a third party that is explicitly trusted by the receiver to validate identities and to create digital certificates.

In order to validate the signature of the CA, the receiver must first know the CA's public key. Normally this process is handled out-of-band or through an operation done at installation. For instance, most web browsers are configured with the public keys of several CAs by default. The Internet Key Exchange (IKE), an essential component of IPSec, can use digital signatures to scalably authenticate peer devices before setting up security associations.

Without digital signatures, one must manually exchange either public keys or secrets between each pair of devices that use IPSec to protect communications between them. Without certificates, every new device added to the network requires a configuration change on every other device with which it communicates securely. With digital certificates, each device is enrolled with a certification authority. When two devices wish to communicate, they exchange certificates and digitally sign data to authenticate each other. When a new device is added to the network, one simply enrolls that device with a CA, and none of the other devices needs modification. When the new device attempts an IPSec connection, certificates are automatically exchanged and the device can be authenticated.

### Implementing IPsec Without CAs

Without a CA, if you want to enable IPsec services (such as encryption) between two Cisco devices, you must first ensure that each device has the key of the other device (such as an RSA public key or a shared key). This requirement means that you must manually perform one of the following operations:

- At each device, enter the RSA public key of the other device.
- At each device, specify a shared key to be used by both device.

In the above illustration, each device uses the key of the other device to authenticate the identity of the other device; this authentication always occurs when IPSec traffic is exchanged between the two devices.

If you have multiple Cisco devices in a mesh topology and wish to exchange IPsec traffic passing among all of those devices, you must first configure shared keys or RSA public keys among all of those devices.

Every time a new device is added to the IPsec network, you must configure keys between the new device and each of the existing devices. (In Figure 34, four additional two-part key configurations would be required to add a single encrypting device to the network.)

Consequently, the more devices there are that require IPsec services, the more involved the key administration becomes. This approach does not scale well for larger, more complex encrypting networks.

### Implementing IPsec With CAs

With a CA, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA, requesting a certificate for the device. When this has been accomplished, each participating device can dynamically authenticate all the other participating devices. This process is illustrated in the illustration.
To add a new IPsec device to the network, you need only configure that new device to request a certificate from the CA, instead of making multiple key configurations with all the other existing IPsec devices.

**Implementing IPsec with Multiple Root CAs**

With multiple root CAs, you no longer have to enroll a device with the CA that issued a certificate to a peer. Instead, you configure a device with multiple CAs that it trusts. Thus, a device can use a configured CA (a trusted root) to verify certificates offered by a peer that were not issued by the same CA defined in the identity of the device.

Configuring multiple CAs allows two or more devices enrolled under different domains (different CAs) to verify the identity of each other when using IKE to set up IPsec tunnels.

Through Simple Certificate Enrollment Protocol (SCEP), each device is configured with a CA (the enrollment CA). The CA issues a certificate to the device that is signed with the private key of the CA. To verify the certificates of peers in the same domain, the device is also configured with the root certificate of the enrollment CA.

To verify the certificate of a peer from a different domain, the root certificate of the enrollment CA in the domain of the peer must be configured securely in the device.

During Internet Key Exchange (IKE) phase one signature verification, the initiator will send the responder a list of its CA certificates. The responder should send the certificate issued by one of the CAs in the list. If the certificate is verified, the device saves the public key contained in the certificate on its public key ring.

With multiple root CAs, VPN users can establish trust in one domain and easily and securely distribute it to other domains. Thus, the required private communication channel between entities authenticated under different domains can occur.

**How CA Certificates Are Used by IPsec Devices**

When two IPsec devices want to exchange IPsec-protected traffic passing between them, they must first authenticate each other—otherwise, IPsec protection cannot occur. The authentication is done with IKE.

Without a CA, a device authenticates itself to the remote device using either RSA-encrypted nonces or preshared keys. Both methods require that keys must have been previously configured between the two devices.

With a CA, a device authenticates itself to the remote device by sending a certificate to the remote device and performing some public key cryptography. Each device must send its own unique certificate that was issued and validated by the CA. This process works because the certificate of each device encapsulates the public key of the device, each certificate is authenticated by the CA, and all participating devices recognize the CA as an authenticating authority. This scheme is called IKE with an RSA signature.

Your device can continue sending its own certificate for multiple IPsec sessions, and to multiple IPsec peers until the certificate expires. When its certificate expires, the device administrator must obtain a new one from the CA.

CAs can also revoke certificates for devices that will no longer participate in IPsec. Revoked certificates are not recognized as valid by other IPsec devices. Revoked certificates are listed in a certificate revocation list (CRL), which each peer may check before accepting a certificate from another peer.
Registration Authorities

Some CAs have a registration authority (RA) as part of their implementation. An RA is essentially a server that acts as a proxy for the CA so that CA functions can continue when the CA is offline.

Some of the configuration tasks described in this document differ slightly, depending on whether your CA supports an RA.

How to Configure Certification Authority

Managing NVRAM Memory Usage

Certificates and certificate revocation lists (CRLs) are used by your device when a CA is used. Normally certain certificates and all CRLs are stored locally in the NVRAM of the device, and each certificate and CRL uses a moderate amount of memory.

The following certificates are normally stored at your device:

- Certificate of your device
- Certificate of the CA
- Root certificates obtained from CA servers (all root certificates are saved in RAM after the device has been initialized)
- Two registration authority (RA) certificates (only if the CA supports an RA)

CRLs are normally stored at your device according to the following conditions:

- If your CA does not support an RA, only one CRL gets stored in the device.
- If your CA supports an RA, multiple CRLs can be stored in the device.

In some cases, storing these certificates and CRLs locally will not present any difficulty. In other cases, memory might become a problem—particularly if the CA supports an RA and a large number of CRLs have to be stored on the device. If the NVRAM is too small to store root certificates, only the fingerprint of the root certificate is saved.

To save NVRAM space, specify that certificates and CRLs should not be stored locally, but should be retrieved from the CA when needed. This alternative will save NVRAM space but could result in a slight performance impact. To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode.

If you do not enable query mode now, you can do it later even if certificates and CRLs have already been stored on the device. In this case, when you enable query mode, the stored certificates and CRLs are deleted from the device after you save the configuration. (If you copy the configuration to a TFTP site prior to enabling query mode, you can save any stored certificates and CRLs at the TFTP site.)

Before disabling query mode, perform the `copy system:running-config nvram:startup-config` command to save all current certificates and CRLs to NVRAM. Otherwise they could be lost during a reboot.

To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode by using the following command in global configuration mode:

```bash
enable query mode
```

Query mode may affect availability if the CA is down.
### Configuring the Device Host Name and IP Domain Name

You must configure the host name and IP domain name of a device if this has not already been done. This is required because the device assigns a fully qualified domain name (FQDN) to the keys and certificates used by IPSec, and the FQDN is based on the host name and IP domain name assigned to the device. For example, a certificate named "device20.example.com" is based on a device host name of "device20" and a device IP domain name of "example.com".

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `hostname name`
4. `ip domain-name name`
5. `end`

<tr>
<td><strong>Step 5</strong> <code>root tftp server-hostname filename</code></td>
<td>Obtains the certification authority (CA) certificate via TFTP.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(ca-trustpoint)# root tftp server1 file1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>enrollment http-proxy hostname port-number</code></td>
<td>Accesses the certification authority (CA) by HTTP through the proxy server.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(ca-trustpoint)# enrollment http-proxy host2 8080</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>end</code></td>
<td>Exits CA trustpoint configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(ca-trustpoint)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

### Authenticating the CA

The device must authenticate the certification authority (CA). It does this by obtaining the self-signed certificate of the CA, which contains the public key of the CA. Because the certificate of the CA is self-signed (the CA signs its own certificate) the public key of the CA should be manually authenticated by contacting the CA administrator to compare the fingerprint of the CA certificate when you perform this step.

Perform the following task to get the public key of the CA:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto pki authenticate name`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
### Requesting Signed Certificates

You must obtain a signed certificate from the certification authority (CA) for each of the RSA key pairs on your device. If you generated general-purpose RSA keys, your device has only one RSA key pair and needs only one certificate. If you previously generated special-usage RSA keys, your device has two RSA key pairs and needs two certificates.

Perform the following task to request signed certificates from the CA:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki enroll number
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto pki enroll number</td>
<td>Obtains certificates for your device from the CA.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# crypto pki enroll myca</td>
<td></td>
</tr>
</tbody>
</table>
What to do next

Saving Your Configuration

Always remember to save your work when you make configuration changes.

Use the `copy system:running-config nvram:startup-config` command to save your configuration. This command includes saving RSA keys to private NVRAM. RSA keys are not saved with your configuration when you use a `copy system:running-config rcp:` or `copy system:running-config tftp:` command.

---

### Monitoring and Maintaining Certification Authority

#### Requesting a Certificate Revocation List

You can request a certificate revocation list (CRL) only if the certification authority (CA) does not support a registration authority (RA). The following task applies only when the CA does not support an RA.

When a device receives a certificate from a peer, your device will download a CRL from the CA. The device then checks the CRL to make sure the certificate that the peer sent has not been revoked. (If the certificate appears on the CRL, the device will not accept the certificate and will not authenticate the peer.)

A CRL can be reused with subsequent certificates until the CRL expires if query mode is off. If the device receives a peer's certificate after the applicable CRL has expired, the device will download the new CRL.

If the device has a CRL that has not yet expired, but you suspect that the contents of the CRL are out of date, you can request that the latest CRL be downloaded immediately to replace the old CRL.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto pki crl request name`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

---

---
Querying a Certification Revocation List

You can query a certificate revocation list (CRL) only when you configure your device with a trusted root. When your device receives a certificate from a peer from another domain (with a different CA), the CRL downloaded from the CA of the device will not include certificate information about the peer. Therefore, you should check the CRL published by the configured root with the LDAP URL to ensure that the certificate of the peer has not been revoked.

If you would like CRL of the root certificate to be queried when the device reboots, you must enter the `crl query` command.

Perform the following task to query the CRL published by the configured root with the LDAP URL:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint name**
4. **crl query ldap://url:[port]**
5. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>

<tr>
<td><strong>Step 3</strong> crypto key zeroize rsa</td>
<td>Deletes all Rivest, Shamir, and Adelman (RSA) keys from your device.</td>
</tr>
<tr>
<td>[key-pair-label]</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# crypto key zeroize rsa</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
What to do next

After you delete RSA keys from the device, you should also complete the following two additional tasks:

- Ask the CA administrator to revoke the device certificates at the CA; you must supply the challenge password that you created when you originally obtained the device certificates with the `crypto pki enroll` command.
- Manually remove the device certificates from the device configuration.

Deleting Public Keys for a Peer

Under certain circumstances you may want to delete RSA public keys of peer devices from your device configuration. For example, if you no longer trust the integrity of the public key of a peer, you should delete the key.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto key pubkey-chain rsa`
4. `no named key key-name [encryption | signature]`
5. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto key pubkey-chain rsa</td>
<td>Enters public key chain configuration mode, so that you can manually specify other devices’ RSA public keys.</td>
</tr>
<tr>
<td>Example: Device(config)# crypto key pubkey-chain rsa</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> no named key key-name [encryption</td>
<td>signature]</td>
</tr>
<tr>
<td>Example: Device(config-pubkey-c)# no named-key otherpeer.example.com</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits public key configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config-pubkey)# end</td>
<td></td>
</tr>
</tbody>
</table>
Deleting Certificates from the Configuration

If the need arises, you can delete certificates that are saved in your device. Your device saves its own certificates, the certificate of the CA, and any RA certificates.

To delete the CA's certificate, you must remove the entire CA identity, which also removes all certificates associated with the CA—your router's certificate, the CA certificate, and any RA certificates.

SUMMARY STEPS

1. enable
2. show crypto pki certificates
3. configure terminal
4. crypto pki certificate chain name
5. no certificate certificate-serial-number
6. exit
7. no crypto pki import name certificate
8. exit

| **Step 6**
  show crypto pki trustpoints  
  **Example:**
  Device# show crypto pki certificates | Displays trustpoints that are configured on a device. |
Access Control List Overview

Access lists filter network traffic by controlling the forwarding or blocking of packets at the interface of a device. A device examines each packet to determine whether to forward or drop that packet, based on the criteria specified in access lists.

The criteria that can be specified in an access list include the source address of the traffic, the destination address of the traffic, and the upper-layer protocol.

Note

Some users might successfully evade basic access lists because these lists require no authentication.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Access Control Lists

Definition of an Access List

An access list is a sequential list consisting of at least one permit statement and possibly one or more deny statements. In the case of IP access lists, the statements can apply to IP addresses, upper-layer IP protocols, or other fields in IP packets. The access list is identified and referenced by a name or a number. Access list acts as a packet filter, filtering packets based on the criteria defined in the access list.
An access list may be configured, but it does not take effect until the access list is either applied to an interface, a virtual terminal line (vty), or referenced by some command that accepts an access list. Multiple commands can reference the same access list.

The following configuration example shows how to create an IP access list named branchoffices. The ACL is applied to serial interface 0 on incoming packets. No sources other than those on the networks specified by each source address and mask pair can access this interface. The destinations for packets coming from sources on network 172.20.7.0 are unrestricted. The destination for packets coming from sources on network 172.29.2.0 must be 172.25.5.4.

```
ip access-list extended branchoffices
10 permit 172.20.7.0 0.0.0.3 any
20 permit 172.29.2.0 0.0.0.255 host 172.25.5.4
! interface serial 0
   ip access-group branchoffices in
```

## Functions of an Access Control List

There are many reasons to configure access lists; for example, to restrict contents of routing updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide security for your network, which is the focus of this module.

Use access lists to provide a basic level of security for accessing your network. If you do not configure access lists on your device, all packets passing through the device are allowed access to all parts of your network.

Access lists can allow a host to access a part of your network and prevent another host from accessing the same area. In the figure below, Host A is allowed to access the Human Resources network, but Host B is prevented from accessing the Human Resources network.

You can also use access lists to define the type of traffic that is forwarded or blocked at device interfaces. For example, you can permit e-mail traffic to be routed but at the same time block all Telnet traffic.

## Purpose of IP Access Lists

Access lists perform packet filtering to control which packets move through the network and where. Such control can help limit network traffic and restrict the access of users and devices to the network. Access lists have many uses, and therefore many commands accept a reference to an access list in their command syntax. Access lists can be used to do the following:

- Filter incoming packets on an interface.
- Filter outgoing packets on an interface.
- Restrict the contents of routing updates.
- Limit debug output based on an address or protocol.
- Control virtual terminal line access.
- Identify or classify traffic for advanced features, such as congestion avoidance, congestion management, and priority and custom queuing.
- Trigger dial-on-demand routing (DDR) calls.
Reasons to Configure ACLs

There are many reasons to configure access lists; for example, you can use access lists to restrict contents of switching updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide a basic level of security for your network by controlling access to it. If you do not configure access lists on your device, all packets passing through the device could be allowed onto all parts of your network.

An access list can allow one host to access a part of your network and prevent another host from accessing the same area. For example, by applying an appropriate access list to interfaces of a device, Host A is allowed to access the human resources network and Host B is prevented from accessing the human resources network.

You can use access lists on a device that is positioned between two parts of your network, to control traffic entering or exiting a specific part of your internal network.

To provide some security benefits of access lists, you should at least configure access lists on border devices—devices located at the edges of your networks. Such an access list provides a basic buffer from the outside network or from a less controlled area of your own network into a more sensitive area of your network.

On these border devices, you should configure access lists for each network protocol configured on the device interfaces. You can configure access lists so that inbound traffic or outbound traffic or both are filtered on an interface.

Access lists are defined on a per-protocol basis. In other words, you should define access lists for every protocol enabled on an interface if you want to control traffic flow for that protocol.

Software Processing of an Access List

The following general steps describe how the an access list is processed when it is applied to an interface, a vty, or referenced by any command. These steps apply to an access list that has 13 or fewer access list entries.

- The software receives an IP packet and tests parts of each packet being filtered against the conditions in the access list, one condition (permit or deny statement) at a time. For example, the software tests the source and destination addresses of the packet against the source and destination addresses in a permit or deny statement.

- If a packet does not match an access list statement, the packet is then tested against the next statement in the list.

- If a packet and an access list statement match, the rest of the statements in the list are skipped and the packet is permitted or denied as specified in the matched statement. The first entry that the packet matches determines whether the software permits or denies the packet. That is, after the first match, no subsequent entries are considered.

- If the access list denies a packet, the software discards the packet and returns an Internet Control Message Protocol (ICMP) Host Unreachable message.

- If no conditions match, the software drops the packet. This is because each access list ends with an unwritten, implicit deny statement. That is, if the packet has not been permitted by the time it was tested against each statement, it is denied.

An access list with more than 13 entries is processed using a trie-based lookup algorithm. This process will happen automatically; it does not need to be configured.
Access List Rules

The following rules apply to access control lists (ACLs):

- Only one access list per interface, per protocol, and per direction is allowed.
- An access list must contain at least one permit statement or all packets are denied entry into the network.
- The order in which access list conditions or match criteria are configured is important. While deciding whether to forward or block a packet, Cisco software tests the packet against each criteria statement in the order in which these statements are created. After a match is found, no more criteria statements are checked. The same permit or deny statements specified in a different order can result in a packet being passed under one circumstance and denied in another circumstance.
- If an access list is referenced by a name, but the access list does not exist, all packets pass. An interface or command with an empty access list applied to it permits all traffic into the network.
- Standard access lists and extended access lists cannot have the same name.
- Inbound access lists process packets before packets are sent to an outbound interface. Inbound access lists that have filtering criteria that deny packet access to a network saves the overhead of a route lookup. Packets that are permitted access to a network based on the configured filtering criteria are processed for routing. For inbound access lists, when you configure a permit statement, packets are processed after they are received, and when you configure a deny statement, packets are discarded.
- Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed by the outbound access list. For outbound access lists, when you configure a permit statement, packets are sent to the output buffer, and when you configure a deny statement, packets are discarded.
- An access list can control traffic arriving at a device or leaving a device, but not traffic originating at a device.

Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient access lists.

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit deny statement that follows could cause you immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one permit statement; otherwise, all packets are denied and no traffic passes.
- Because the software stops testing conditions after it encounters the first match (to either a permit or deny statement), you will reduce processing time and resources if you put the statements that packets are most likely to match at the beginning of the access list. Place more frequently occurring conditions before less frequent conditions.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.
• Use the statement `permit any any` if you want to allow all other packets not already denied. Using the statement `permit any any` in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry `permit any any` because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify `permit any any`, all traffic not already denied will get through.

• Although all access lists end with an implicit `deny` statement, we recommend use of an explicit `deny` statement (for example, `deny ip any any`). On most platforms, you can display the count of packets denied by issuing the `show access-list` command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit `deny` statements are counted, which is why the explicit `deny` statement will yield more complete data for you.

• While you are creating an access list or after it is created, you might want to delete an entry.
  - You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
  - You can delete an entry from a named access list. Use the `no permit` or `no deny` command to delete the appropriate entry.

• In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the `remark` command.

• If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the `log` keyword with the corresponding `deny` statement so that the packets denied from that source are logged for you.

• This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

### IP Packet Fields You Can Filter to Control Access

You can use an extended access list to filter on any of the following fields in an IP packet. Source address and destination address are the two most frequently specified fields on which to base an access list:

- **Source address**—Specifies a source address to control packets coming from certain networking devices or hosts.
- **Destination address**—Specifies a destination address to control packets being sent to certain networking devices or hosts.
- **Protocol**—Specifies an IP protocol indicated by the keyword `eigrp`, `gre`, `icmp`, `igmp`, `ip`, `ipinip`, `nos`, `ospf`, `tcp`, or `udp`, or indicated by an integer in the range from 0 to 255 (representing an Internet protocol). If you specify a transport layer protocol (`icmp`, `igmp`, `tcp`, or `udp`), the command has a specific syntax.
  - **Ports and non-contiguous ports**—Specifies TCP or UDP ports by a port name or port number. The port numbers can be noncontiguous port numbers. Port numbers can be useful to filter Telnet traffic or HTTP traffic, for example.
  - **TCP flags**— Specifies that packets match any flag or all flags set in TCP packets. Filtering on specific TCP flags can help prevent false synchronization packets.
- **IP options**—Specifies IP options; one reason to filter on IP options is to prevent routers from being saturated with spurious packets containing them.
Source and Destination Addresses

Source and destination address fields in an IP packet are two typical fields on which to base an access list. Specify source addresses to control the packets being sent from certain networking devices or hosts. Specify destination addresses to control the packets being sent to certain networking devices or hosts.

Wildcard Mask for Addresses in an Access List

Address filtering uses wildcard masking to indicate to the software whether to check or ignore corresponding IP address bits when comparing the address bits in an access list entry to a packet being submitted to the access list. By carefully setting wildcard masks, you can specify one or more IP addresses for permit or deny tests.

Wildcard masking for IP address bits uses the number 1 and the number 0 to specify how the software treats the corresponding IP address bits. A wildcard mask is sometimes referred to as an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet (network) mask.

- A wildcard mask bit 0 means check the corresponding bit value; they must match.
- A wildcard mask bit 1 means ignore that corresponding bit value; they need not match.

If you do not supply a wildcard mask with a source or destination address in an access list statement, the software assumes an implicit wildcard mask of 0.0.0.0, meaning all values must match.

Unlike subnet masks, which require contiguous bits indicating network and subnet to be ones, wildcard masks allow noncontiguous bits in the mask.

The table below shows examples of IP addresses and masks from an access list, along with the corresponding addresses that are considered a match.

Table 138: Sample IP Addresses, Wildcard Masks, and Match Results

<table>
<thead>
<tr>
<th>Address</th>
<th>Wildcard Mask</th>
<th>Match Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>255.255.255.255</td>
<td>All addresses will match the access list conditions.</td>

<td>Matches any even-numbered network in the range of 10.1.2.0 to 10.1.254.0</td>
</tr>
</tbody>
</table>

Access List Sequence Numbers

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within
an access list. If you wanted to insert an entry in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When you add a new entry, you specify the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

**ACL Supported Types**

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).

- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

**Supported ACLs**

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply port ACLs to a Layer 2 interface in each direction to each access list type — IPv4 and MAC.

- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).

**ACL Precedence**

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.

- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.

- When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

### Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface in inbound direction. The following access lists are supported:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

Figure 101: Using ACLs to Control Traffic in a Network

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.
You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

**Router ACLs**

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

**Access Control Entries**

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies *permit* or *deny* and a set of conditions the packet must satisfy in order to match the ACE. The meaning of *permit* or *deny* depends on the context in which the ACL is used.

**ACEs and Fragmented and Unfragmented Traffic**

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.

**Note**

For TCP ACEs with L4 Ops, the fragmented packets will be dropped per RFC 1858.
• Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:

Switch(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Switch(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Switch(config)# access-list 102 permit tcp any host 10.1.1.2
Switch(config)# access-list 102 deny tcp any any

Note

In the first and second ACEs in the examples, the eq keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

• Packet A is a TCP packet from host 10.2.2.2, port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

• Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit). Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

• Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.
IPv4 ACLs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring IPv4 Access Control Lists

General Network Security

The following are restrictions for configuring network security with ACLs:

- Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name.

- A standard ACL and an extended ACL cannot have the same name.

- Though visible in the command-line help strings, appletalk is not supported as a matching condition for the deny and permit MAC access-list configuration mode commands.

- ACL wildcard is not supported in downstream client policy.
IPv4 ACL Network Interfaces

The following restrictions apply to IPv4 ACLs to network interfaces:

- When controlling access to an interface, you can use a named or numbered ACL.
- If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.
- You do not have to enable routing to apply ACLs to Layer 2 interfaces.

MAC ACLs on a Layer 2 Interface

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

Note

The `mac access-group` interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

IP Access List Entry Sequence Numbering

- This feature does not support dynamic, reflexive, or firewall access lists.

Information about Network Security with ACLs

This chapter describes how to configure network security on the switch by using access control lists (ACLs), which in commands and tables are also referred to as access lists.

Cisco TrustSec and ACLs

Catalyst 3850 switches running the IP base or IP services feature set also support Cisco TrustSec Security Group Tag (SCT) Exchange Protocol (SXP). This feature supports security group access control lists (SGACLs), which define ACL policies for a group of devices instead of an IP address. The SXP control protocol allows tagging packets with SCTs without a hardware upgrade, and runs between access layer devices at the Cisco TrustSec domain edge and distribution layer devices within the Cisco TrustSec domain. Catalyst 3850 switches operate as access layer switches in the Cisco TrustSec network.

The sections on SXP define the capabilities supported on the Catalyst 3850 switches.
ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic.

Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies permit or deny and a set of conditions the packet must satisfy in order to match the ACE. The meaning of permit or deny depends on the context in which the ACL is used.

ACL Supported Types

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

Supported ACLs

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply port ACLs to a Layer 2 interface in each direction to each access list type — IPv4 and MAC.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).

ACL Precedence

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:
Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface in inbound direction. The following access lists are supported:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

Figure 102: Using ACLs to Control Traffic in a Network

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but
prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the
inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

---

**Note**

You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

---

**Router ACLs**

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.
VLAN Maps

VLAN ACLs or VLAN maps are used to control network traffic within a VLAN. You can apply VLAN maps to all packets that are bridged within a VLAN in the switch or switch stack. VACLs are strictly for security packet filtering and for redirecting traffic to specific physical interfaces. VACLs are not defined by direction (ingress or egress).

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

**Figure 103: Using VLAN Maps to Control Traffic**

This figure shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

ACEs and Fragmented and Unfragmented Traffic

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.

**Note**

For TCP ACEs with L4 Ops, the fragmented packets will be dropped per RFC 1858.

- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:
Switch(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Switch(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Switch(config)# access-list 102 permit tcp any host 10.1.1.2
Switch(config)# access-list 102 deny tcp any any

In the first and second ACEs in the examples, the \texttt{eq} keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2, port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

**Standard and Extended IPv4 ACLs**

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.
IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.
- ACL logging for port ACLs and VLAN maps

Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.

This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

Table 139: Access List Numbers

<table>
<thead>
<tr>
<th>Access List Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>
<td>IP standard access list</td>
<td>Yes</td>
</tr>
<tr>
<td>100–199</td>
<td>IP extended access list</td>
<td>Yes</td>
</tr>
<tr>
<td>200–299</td>
<td>Protocol type-code access list</td>
<td>No</td>
</tr>
<tr>
<td>300–399</td>
<td>DECnet access list</td>
<td>No</td>

<tr>
<td>1200–1299</td>
<td>IPX summary address access list</td>
<td>No</td>
</tr>
<tr>
<td>1300–1999</td>
<td>IP standard access list (expanded range)</td>
<td>Yes</td>
</tr>
</tbody>
</table>
In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

### Numbered Standard IPv4 ACLs

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

The switch always rewrites the order of standard access lists so that entries with host matches and entries with matches having a don’t care mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero don’t care masks. Therefore, in show command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to VLANs, to terminal lines, or to interfaces.

### Numbered Extended IPv4 ACLs

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

**Note**

ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

These IP protocols are supported:

- Authentication Header Protocol (ahp)
- Encapsulation Security Payload (esp)
- Enhanced Interior Gateway Routing Protocol (eigrp)
- generic routing encapsulation (gre)
- Internet Control Message Protocol (icmp)
- Internet Group Management Protocol (igmp)
• any Interior Protocol (ip)
• IP in IP tunneling (ipinip)
• KA9Q NOS-compatible IP over IP tunneling (nos)
• Open Shortest Path First routing (ospf)
• Payload Compression Protocol (pcp)
• Protocol-Independent Multicast (pim)
• Transmission Control Protocol (tcp)
• User Datagram Protocol (udp)

Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

Note

The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines before configuring named ACLs:

• Numbered ACLs are also available.
• A standard ACL and an extended ACL cannot have the same name.
• You can use standard or extended ACLs (named or numbered) in VLAN maps.

ACL Logging

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the `logging console` commands controlling the syslog messages.

Note

ACL logging is only supported for RACL.

Note

Because routing is done in hardware and logging is done in software, if a large number of packets match a permit or deny ACE containing a log keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.
The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

**Note**
The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

**Smart Logging**
When smart logging is enabled on the switch and an ACL configured with smart logging is attached to a Layer 2 interface (port ACL), the contents of packets denied or permitted because of the ACL are also sent to a specified NetFlow collector.

**Hardware and Software Treatment of IP ACLs**
ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

**Note**
If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.

For router ACLs, other factors can cause packets to be sent to the CPU:
- Using the `log` keyword
- Generating ICMP unreachable messages

When traffic flows are both logged and forwarded, forwarding is done by hardware, but logging must be done by software. Because of the difference in packet handling capacity between hardware and software, if the sum of all flows being logged (both permitted flows and denied flows) is of great enough bandwidth, not all of the packets that are forwarded can be logged.

When you enter the `show ip access-lists` privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Router ACLs function as follows:
- The hardware controls permit and deny actions of standard and extended ACLs (input and output) for security access control.
- If `log` has not been specified, the flows that match a `deny` statement in a security ACL are dropped by the hardware if `ip unreachable` is disabled. The flows matching a `permit` statement are switched in hardware.
- Adding the `log` keyword to an ACE in a router ACL causes a copy of the packet to be sent to the CPU for logging only. If the ACE is a `permit` statement, the packet is still switched and routed in hardware.
VLAN Map Configuration Guidelines

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.
- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.
- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.
- Logging is not supported for VLAN maps.
- When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.
- If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

VLAN Maps with Router ACLs

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.

If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

Note

When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.

If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

VLAN Maps and Router ACL Configuration Guidelines

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.
If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.
- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:
  
  
  permit... permit... permit... deny ip any any
  
or
  deny... deny... deny... permit ip any any

- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.
- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use don't care bits in the IP address, whenever possible.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

VACL Logging

When you configure VACL logging, syslog messages are generated for denied IP packets under these circumstances:

- When the first matching packet is received.
- For any matching packets received within the last 5 minutes.
- If the threshold is reached before the 5-minute interval.

Log messages are generated on a per-flow basis. A flow is defined as packets with the same IP addresses and Layer 4 (UDP or TCP) port numbers. If a flow does not receive any packets in the 5-minute interval, that flow is removed from the cache. When a syslog message is generated, the timer and packet counter are reset.

VACL logging restrictions:

- Only denied IP packets are logged.
- Packets that require logging on the outbound port ACLs are not logged if they are denied by a VACL.

Time Ranges for ACLs

You can selectively apply extended ACLs based on the time of day and the week by using the `time-range` global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect.
for example, during a specified time period or on specified days of the week. The \texttt{time-range} keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).

- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

\begin{footnotesize}
\begin{itemize}
  \item The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.
\end{itemize}
\end{footnotesize}

\section*{IPv4 ACL Interface Considerations}

When you apply the \texttt{ip access-group} interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the \texttt{ip icmp rate-limit unreachable} global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

\section*{How to Configure ACLs}

\section*{Configuring IPv4 ACLs}

Follow the procedure given below to use IP ACLs on the switch:
SUMMARY STEPS

1. Create an ACL by specifying an access list number or name and the access conditions.
2. Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

DETAILED STEPS

Step 1
Create an ACL by specifying an access list number or name and the access conditions.

Step 2
Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

Creating a Numbered Standard ACL (CLI)

Follow the procedure given below to create a numbered standard ACL:

SUMMARY STEPS

1. enable
2. configure terminal
3. access-list access-list-number {deny | permit} source source-wildcard [log]
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| enable
| Example:
| Switch> enable |
| Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2**
| configure terminal
| Example:
| Switch# configure terminal |
| Enters global configuration mode. |
| **Step 3**
| access-list access-list-number {deny | permit} source source-wildcard [log]
| Example:
| Switch(config)# access-list 2 deny your_host |
| Defines a standard IPv4 access list by using a source address and wildcard.
The access-list-number is a decimal number from 1 to 99 or 1300 to 1999.
Enter deny or permit to specify whether to deny or permit access if conditions are matched. |
Creating a Numbered Extended ACL (CLI)

Follow the procedure given below to create a numbered extended ACL:

SUMMARY STEPS

1. configure terminal
2. access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]
3. `access-list` `access-list-number` {`deny` | `permit`} `tcp` `source` `source-wildcard` [operator port] `destination` `destination-wildcard` [established] [precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp] [flag]

4. `access-list` `access-list-number` {`deny` | `permit`} `udp` `source` `source-wildcard` [operator port] `destination` `destination-wildcard` [precedence precedence] [tos tos] [fragments] [log [log-input]] [time-range time-range-name] [dscp dscp]

5. `access-list` `access-list-number` {`deny` | `permit`} `icmp` `source` `source-wildcard` `destination` `destination-wildcard` [precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp]

6. `access-list` `access-list-number` {`deny` | `permit`} `igmp` `source` `source-wildcard` `destination` `destination-wildcard` [precedence precedence] [tos tos] [fragments] [log [log-input]] [time-range time-range-name] [dscp dscp]

7. end

### DETAILED STEPS

</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

Define an extended IPv4 access list and the access conditions.

The `access-list-number` is a decimal number from 100 to 199 or 2000 to 2699.

Enter `deny` or `permit` to specify whether to deny or permit the packet if conditions are matched.

For `protocol`, enter the name or number of an IP protocol:
- `ahp`
- `eigrp`
- `esp`
- `gre`
- `icmp`
- `igmp`
- `igp`
- `ip`
- `ipinip`
- `nos`
- `ospf`
- `pcp`
- `pim`
- `tcp`
- `udp`
- or an integer in the range 0 to 255 representing an IP protocol number.

To match any Internet protocol (including ICMP, TCP, and UDP), use the keyword `ip`.

**Note**

This step includes options for most IP protocols.

For additional specific parameters for TCP, UDP, ICMP, and IGMP, see the following steps.

The `source` is the number of the network or host from which the packet is sent.

The `source-wildcard` applies wildcard bits to the source.

The `destination` is the network or host number to which the packet is sent.

The `destination-wildcard` applies wildcard bits to the destination.
### Command or Action

<table>
<thead>
<tr>
<th>Source, source-wildcard, destination, and destination-wildcard can be specified as:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The 32-bit quantity in dotted-decimal format.</td>
</tr>
<tr>
<td>• The keyword <strong>any</strong> for 0.0.0.0 255.255.255.255 (any host).</td>
</tr>
<tr>
<td>• The keyword <strong>host</strong> for a single host 0.0.0.0.</td>
</tr>
</tbody>
</table>

The other keywords are optional and have these meanings:

- **precedence**—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: **routine** (0), **priority** (1), **immediate** (2), **flash** (3), **flash-override** (4), **critical** (5), **internet** (6), **network** (7).
- **fragments**—Enter to check non-initial fragments.
- **tos**—Enter to match by type of service level, specified by a number from 0 to 15 or a name: **normal** (0), **max-reliability** (2), **max-throughput** (4), **min-delay** (8).
- **log**—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or **log-input** to include the input interface in the log entry.
- **time-range**—Specify the time-range name.
- **dscp**—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values.

**Note** Your controller must support the ability to:

- Mark DCSP
- Mark UP
- Map DSCP and UP

For more information on **DSCP-to-UP Mapping**, see:

**Note** If you enter a **dscp** value, you cannot enter **tos** or **precedence**. You can enter both a **tos** and a **precedence** value with no **dscp**.

---

**Security**

Creating a Numbered Extended ACL (CLI)
### Command or Action

**Step 3**

```
access-list access-list-number {deny | permit} tcp source source-wildcard [operator port] destination destination-wildcard [operator port] [established] [precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp] [flag]
```

**Example:**

```bash
Switch(config)# access-list 101 permit tcp any any eq 500
```

**Purpose**

Defines an extended TCP access list and the access conditions.

The parameters are the same as those described for an extended IPv4 ACL, with these exceptions:

- **established**—Enter to match an established connection. This has the same function as matching on the **ack** or **rst** flag.

- **flag**—Enter one of these flags to match by the specified TCP header bits: **ack** (acknowledge), **fin** (finish), **psh** (push), **rst** (reset), **syn** (synchronize), or **urg** (urgent).

---

**Step 4**

```
access-list access-list-number {deny | permit} udp source source-wildcard [operator port] destination destination-wildcard [operator port] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]
```

**Example:**

```bash
Switch(config)# access-list 101 permit udp any any eq 100
```

**Purpose**

(Optional) Defines an extended UDP access list and the access conditions.

The UDP parameters are the same as those described for TCP except that the [operator [port]] port number or name must be a UDP port number or name, and the **flag** and **established** keywords are not valid for UDP.

---

**Step 5**

```
access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [icmp-type | [icmp-type icmp-code] | [icmp-message]] [precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp]
```

**Example:**

```bash
Switch(config)# access-list 101 permit icmp any any 200
```

**Purpose**

Defines an extended ICMP access list and the access conditions.

The ICMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:

- **icmp-type**—Enter to filter by ICMP message type, a number from 0 to 255.

- **icmp-code**—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.
Creating Named Standard ACLs

Follow the procedure given below to create a standard ACL using names:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip access-list standard name
4. Use one of the following:
   - deny {source [source-wildcard] | host source | any} [log]
   - permit {source [source-wildcard] | host source | any} [log]
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>icmp-message</code>—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name.</td>
</tr>
</tbody>
</table>

### Step 6

```
access-list access-list-number {deny | permit} igmp source source-wildcard destination destination-wildcard [igmp-type] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]
```

**Example:**

```
Switch(config)# access-list 101 permit igmp any any 14
```

### Step 7

```
end
```

**Example:**

```
Switch(config)# end
```

The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.

`igmp-type`—To match IGMP message type, enter a number from 0 to 15, or enter the message name: `dvmrp`, `host-query`, `host-report`, `pim`, or `trace`. 
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2** | configure terminal  
Example: Switch# configure terminal | Enters global configuration mode. |
| **Step 3** | ip access-list standard *name*  
Example: Switch(config)# ip access-list standard 20 | Defines a standard IPv4 access list using a name, and enter access-list configuration mode.  
The name can be a number from 1 to 99. |
| **Step 4** | Use one of the following:  
• deny {source [source-wildcard] | host source | any} [log]  
• permit {source [source-wildcard] | host source | any} [log]  
Example: Switch(config-std-nacl)# deny 192.168.0.0 0.0.255.255 255.255.0.0 0.0.255.255  
or  
Switch(config-std-nacl)# permit 10.108.0.0 0.0.0.0 255.255.255.0 0.0.0.0 | In access-list configuration mode, specify one or more conditions denied or permitted to decide if the packet is forwarded or dropped.  
• host source—A source and source wildcard of source 0.0.0.0.  
• any—A source and source wildcard of 0.0.0.0 255.255.255.255. |
| **Step 5** | end  
Example: Switch(config-std-nacl)# end | Returns to privileged EXEC mode. |
| **Step 6** | show running-config  
Example: Switch# show running-config | Verifies your entries. |
| **Step 7** | copy running-config startup-config  
Example: Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
Creating Extended Named ACLs

Follow the procedure given below to create an extended ACL using names:

SUMMARY STEPS

1. enable
2. configure terminal
3. ip access-list extended name
4. {deny | permit} protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]
5. end
6. show running-config
7. copy running-config startup-config

<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use **no permit** and **no deny** access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

**What to do next**

After creating a named ACL, you can apply it to interfaces or to VLANs.

### Configuring Time Ranges for ACLs

Follow these steps to configure a time-range parameter for an ACL:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **time-range** *time-range-name*
4. Use one of the following:
   - **absolute** `[start time date] [end time date]`
   - **periodic** `day-of-the-week hh:mm to [day-of-the-week] hh:mm`
   - **periodic** `weekdays | weekend | daily` `hh:mm to hh:mm`
5. **end**
6. **show running-config**
### 7. copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | ```
enable
```  
**Example:**  
```Switch(config)# enable
``` | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | ```
configure terminal
```  
**Example:**  
```Switch# configure terminal
``` | Enters global configuration mode. |
| Step 3 | ```
time-range time-range-name
```  
**Example:**  
```Switch(config)# time-range workhours
``` | Assigns a meaningful name (for example, *workhours*) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter. |
| Step 4 | Use one of the following:  
- ```
absolute [start time date] [end time date]
```  
**Example:**  
```Switch(config-time-range)# absolute start 00:00 1 Jan 2006 end 23:59 1 Jan 2006
```  
**or**  
```Switch(config-time-range)# periodic weekdays 8:00 to 12:00
``` | Specifies when the function it will be applied to is operational.  
- You can use only one *absolute* statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.  
- You can enter multiple *periodic* statements. For example, you could configure different hours for weekdays and weekends.  
See the example configurations. |
| Step 5 | ```
end
```  
**Example:**  
```Switch(config)# end
``` | Returns to privileged EXEC mode. |
| Step 6 | ```
show running-config
```  
**Example:** | Verifies your entries. |
### Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. line [console | vty] line-number
4. access-class access-list-number {in | out}
5. end
6. show running-config
7. copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  
  enable
  
  Example:
  
  Switch(config)# enable | Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2**
  
  configure terminal
  
  Example:
  
  Switch# configure terminal | Enters global configuration mode. |
Applying an IPv4 ACL to an Interface (CLI)

This section describes how to apply IPv4 ACLs to network interfaces. Beginning in privileged EXEC mode, follow the procedure given below to control access to an interface:

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. ip access-group {access-list-number | name} {in | out}
4. end

Applying an IPv4 ACL to an Interface (CLI)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

**Creating Named MAC Extended ACLs**

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Follow these steps to create a named MAC extended ACL:
**SUMMARY STEPS**

1. enable
2. configure terminal
3. mac access-list extended name
4. {deny | permit} {any | host source MAC address | source MAC address mask} {any | host destination MAC address | destination MAC address mask} {type mask | lsap lsap mask | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp | 0-65535} [cos cos]
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>mac access-list extended name</td>
<td>Defines an extended MAC access list using a name.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# mac access-list extended mac1</td>
<td></td>
</tr>
</tbody>
</table>
| 4 | {deny | permit} {any | host source MAC address | source MAC address mask} {any | host destination MAC address | destination MAC address mask} {type mask | lsap lsap mask | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp | 0-65535} [cos cos] | In extended MAC access-list configuration mode, specifies to permit or deny any source MAC address, a source MAC address with a mask, or a specific host source MAC address and any destination MAC address, destination MAC address with a mask, or a specific destination MAC address. (Optional) You can also enter these options:  
  - type mask—An arbitrary EtherType number of a packet with Ethernet II or SNAP encapsulation in decimal, hexadecimal, or octal with optional mask of don’t care bits applied to the EtherType before testing for a match.  
  - lsap lsap mask—An LSAP number of a packet with IEEE 802.2 encapsulation in decimal, hexadecimal, or octal with optional mask of don’t care bits.  
<pre><code> | Example: Switch(config-ext-macl)# deny any any decnet-iv | |
</code></pre>
<p>|     | or | |
|     | Switch(config-ext-macl)# permit any any | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• cos</td>
<td>cos</td>
</tr>
</tbody>
</table>

### Step 5
**Example:**
```
Switch(config-ext-macl)# end
```

Returns to privileged EXEC mode.

### Step 6
**Example:**
```
Switch# show running-config
```

Verifies your entries.

### Step 7
**Example:**
```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

<tr>
<td><strong>Step 6</strong></td>
<td><strong>show mac access-group [interface interface-id]</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show mac access-group interface gigabitethernet1/0/2</code></td>
<td>Displays the MAC access list applied to the interface or all Layer 2 interfaces.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an
undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.

### Configuring VLAN Maps

Follow the procedure given below to create a VLAN map and apply it to one or more VLANs:

**Before you begin**

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.

**SUMMARY STEPS**

1. `vlan access-map name [number]`
2. `match {ip | mac} address {name | number} [name | number]`
3. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):
   - `• action { forward }

     Switch(config-access-map)# action forward`
   - `• action { drop }

     Switch(config-access-map)# action drop`
4. `vlan filter mapname vlan-list list`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match. Entering this command changes to access-map configuration mode.</td>
</tr>
<tr>
<td><strong>vlan access-map name [number]</strong> Example: Switch(config)# vlan access-map map_1 20</td>
<td>Create a VLAN map with the name map_1 and assign it a number of 20.</td>
</tr>
</tbody>
</table>
Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

**SUMMARY STEPS**

1. configure terminal
2. vlan access-map name [number]
3. match {ip | mac} address {name | number} [name | number]
4. action {drop | forward}
5. end
6. show running-config

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>match {ip</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-access-map)# match ip address ip2</td>
</tr>
<tr>
<td></td>
<td>Match the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note that packets are only matched against access lists of the correct protocol type. IP packets are matched against standard or extended IP access lists. Non-IP packets are only matched against named MAC extended access lists.</td>
</tr>
<tr>
<td>Note</td>
<td>If the VLAN map is configured with a match clause for a type of packet (IP or MAC) and the map action is drop, all packets that match the type are dropped. If the VLAN map has no match clause, and the configured action is drop, all IP and Layer 2 packets are dropped.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):</td>
</tr>
<tr>
<td></td>
<td>• action { forward}</td>
</tr>
<tr>
<td></td>
<td>Switch(config-access-map)# action forward</td>
</tr>
<tr>
<td></td>
<td>• action { drop}</td>
</tr>
<tr>
<td></td>
<td>Switch(config-access-map)# action drop</td>
</tr>
<tr>
<td></td>
<td>Sets the action for the map entry.</td>
</tr>
<tr>
<td>Step 4</td>
<td>vlan filter mapname vlan-list list</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# vlan filter map 1 vlan-list 20-22</td>
</tr>
<tr>
<td></td>
<td>Applies the VLAN map to one or more VLAN IDs.</td>
</tr>
<tr>
<td></td>
<td>The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional.</td>
</tr>
</tbody>
</table>
7. **copy running-config startup-config**

### DETAILED STEPS

</table>
Applying a VLAN Map to a VLAN

To apply a VLAN map to one or more VLANs, perform these steps.

**SUMMARY STEPS**

1. configure terminal
2. vlan filter mapname vlan-list list
3. end
4. show running-config
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

### Configuring VACL Logging

Beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. configure terminal
2. vlan access-map name [number]
3. action drop log
4. exit
5. vlan access-log {maxflow max_number | threshold pkt_count}
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>vlan access-map name [number]</td>
<td>Creates a VLAN map. Give it a name and optionally a number. The number is the sequence number of the entry within the map. The sequence number range is from 0 to 65535. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. Specifying the map name and optionally a number enters the access-map configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# vlan access-map gandymede 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>action drop log</td>
<td>Sets the VLAN access map to drop and log IP packets.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**  
`Switch(config-access-map)# action drop log`

**Step 4**  
**exit**  
**Example:**  
`Switch(config-access-map)# exit`

**Step 5**  
**vlan access-log** `{maxflow max_number | threshold pkt_count}`

**Example:**  
`Switch(config)# vlan access-log threshold 4000`

**Step 6**  
**end**  
**Example:**  
`Switch(config)# end`

---

### Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the `ip access-group` interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

**Table 140: Commands for Displaying Access Lists and Access Groups**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show access-lists [number</td>
<td>name]`</td>
</tr>
</tbody>
</table>
### Command and Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ip access-lists [number</td>
<td>name]`</td>
</tr>
<tr>
<td><code>show ip interface interface-id</code></td>
<td>Displays detailed configuration and status of an interface. If IP is enabled on the interface and ACLs have been applied by using the <code>ip access-group</code> interface configuration command, the access groups are included in the display.</td>
</tr>
<tr>
<td><code>show running-config [interface interface-id]</code></td>
<td>Displays the contents of the configuration file for the switch or the specified interface, including all configured MAC and IP access lists and which access groups are applied to an interface.</td>
</tr>
<tr>
<td><code>show mac access-group [interface interface-id]</code></td>
<td>Displays MAC access lists applied to all Layer 2 interfaces or the specified Layer 2 interface.</td>
</tr>
</tbody>
</table>

## Configuration Examples for ACLs

### Examples: Using Time Ranges with ACLs

This example shows how to verify after you configure time ranges for `workhours` and to configure January 1, 2006, as a company holiday.

Switch# `show time-range`  
time-range entry: new_year_day_2003 (inactive)  
  absolute start 00:00 01 January 2006 end 23:59 01 January 2006  
time-range entry: workhours (inactive)  
  periodic weekdays 8:00 to 12:00  
  periodic weekdays 13:00 to 17:00

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

Switch(config)# `access-list 188 deny tcp any any time-range new_year_day_2006`  
Switch(config)# `access-list 188 permit tcp any any time-range workhours`  
Switch(config)# `end`  
Switch# `show access-lists`  
Extended IP access list 188  
  10 deny tcp any any time-range new_year_day_2006 (inactive)  
  20 permit tcp any any time-range workhours (inactive)

This example uses named ACLs to permit and deny the same traffic.

Switch(config)# `ip access-list extended deny_access`  
Switch(config-ext-nacl)# `deny tcp any any time-range new_year_day_2006`
Switch(config-ext-nacl)# exit
Switch(config)# ip access-list extended may_access
Switch(config-ext-nacl)# permit tcp any any time-range workhours
Switch(config-ext-nacl)# end
Switch# show ip access-lists
Extended IP access list lpipe_defalut
  10 permit ip any any
Extended IP access list deny_access
  10 deny tcp any any time-range new_year_day_2006 (inactive)
Extended IP access list may_access
  10 permit tcp any any time-range workhours (inactive)

Examples: Including Comments in ACLs

You can use the remark keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the access-list access-list number remark remark global configuration command. To remove the remark, use the no form of this command.

In this example, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith through
Switch(config)# access-list 1 deny 171.69.3.13

For an entry in a named IP ACL, use the remark access-list configuration command. To remove the remark, use the no form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet

Examples: Troubleshooting ACLs

If this ACL manager message appears and [chars] is the access-list name,

ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]

The switch has insufficient resources to create a hardware representation of the ACL. The resources include hardware memory and label space but not CPU memory. A lack of available logical operation units or
specialized hardware resources causes this problem. Logical operation units are needed for a TCP flag match or a test other than **eq** (**ne**, **gt**, **lt**, or **range**) on TCP, UDP, or SCTP port numbers.

Use one of these workarounds:

- Modify the ACL configuration to use fewer resources.
- Rename the ACL with a name or number that alphanumerically precedes the ACL names or numbers.

To determine the specialized hardware resources, enter the `show platform layer4 acl` map privileged EXEC command. If the switch does not have available resources, the output shows that index 0 to index 15 are not available.

For more information about configuring ACLs with insufficient resources, see CSCsq63926 in the Bug Toolkit.

For example, if you apply this ACL to an interface:

```plaintext
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
permit tcp source source-wildcard destination destination-wildcard
```

And if this message appears:

```
ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The flag-related operators are not available. To avoid this issue,

- Move the fourth ACE before the first ACE by using **ip access-list resequence** global configuration command:

```plaintext
permit tcp source source-wildcard destination destination-wildcard
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```

or

- Rename the ACL with a name or number that alphanumerically precedes the other ACLs (for example, rename ACL 79 to ACL 1).

You can now apply the first ACE in the ACL to the interface. The switch allocates the ACE to available mapping bits in the Opselect index and then allocates flag-related operators to use the same bits in the hardware memory.

### IPv4 ACL Configuration Examples

This section provides examples of configuring and applying IPv4 ACLs. For detailed information about compiling ACLs, see the *Cisco IOS Security Configuration Guide, Release 12.4* and to the Configuring IP Services” section in the “IP Addressing and Services” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*. 
ACLs in a Small Networked Office

Figure 104: Using Router ACLs to Control Traffic

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing confidential payroll data. All users can access Server A, but Server B has restricted access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

Examples: ACLs in a Small Networked Office

This example uses a standard ACL to filter traffic coming into Server B from a port, permitting traffic only from Accounting’s source addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic coming out of routed Port 1 from the specified source address.

```
Switch(config)# access-list 6 permit 172.20.128.64 0.0.0.31
Switch(config)# end
Switch# how access-lists
Standard IP access list 6
   10 permit 172.20.128.64, wildcard bits 0.0.0.31
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 6 out
```

This example uses an extended ACL to filter traffic coming from Server B into a port, permitting traffic from any source address (in this case Server B) to only the Accounting destination addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic going into routed Port 1, permitting it to go only to the specified
destination addresses. Note that with extended ACLs, you must enter the protocol (IP) before the source and destination information.

Switch(config)# access-list 106 permit ip any 172.20.128.64 0.0.0.31
Switch(config)# end
Switch# show access-lists
Extended IP access list 106
  10 permit ip any 172.20.128.64 0.0.0.31
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 106 in

Example: Numbered ACLs

In this example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 10.0.0.0 subnets. The ACL is applied to packets entering a port.

Switch(config)# access-list 2 permit 10.48.0.3
Switch(config)# access-list 2 deny 10.48.0.0 0.0.255.255
Switch(config)# access-list 2 permit 10.0.0.0 0.255.255.255
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip access-group 2 in

Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip access-group 102 in

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 102 in

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The `established` keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.

Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 102 in

Examples: Named ACLs

Creating named standard and extended ACLs

This example creates a standard ACL named `internet_filter` and an extended ACL named `marketing_group`. The `internet_filter` ACL allows all traffic from the source address 1.2.3.4.

Switch(config)# ip access-list standard Internet_filter
Switch(config-ext-nacl)# permit 1.2.3.4
Switch(config-ext-nacl)# exit

The `marketing_group` ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

Switch(config)# ip access-list extended marketing_group
Switch(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Switch(config-ext-nacl)# deny tcp any any
Switch(config-ext-nacl)# permit icmp any any
Switch(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Switch(config-ext-nacl)# deny ip any any log
Switch(config-ext-nacl)# exit

The `Internet_filter` ACL is applied to outgoing traffic and the `marketing_group` ACL is applied to incoming traffic on a Layer 3 port.

Switch(config)# interface gigabitethernet3/0/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 2.0.5.1 255.255.255.0
Switch(config-if)# ip access-group Internet_filter out
Switch(config-if)# ip access-group marketing_group in

Deleting individual ACEs from named ACLs

This example shows how you can delete individual ACEs from the named access list `border-list`.

Switch(config)# ip access-list extended border-list
Switch(config-ext-nacl)# no permit ip host 10.1.1.3 any

Examples: Time Range Applied to an IP ACL
This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

Switch(config)# time-range no-http
Switch(config)# periodic weekdays 8:00 to 18:00
! Switch(config)# time-range udp-yes
Switch(config)# periodic weekend 12:00 to 20:00
! Switch(config)# ip access-list extended strict
Switch(config-ext-nacl)# deny tcp any any eq www time-range no-http
Switch(config-ext-nacl)# permit udp any any time-range udp-yes
!
Switch(config-ext-nacl)# exit
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip access-group strict in

Examples: Configuring Commented IP ACL Entries
In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith workstation through
Switch(config)# access-list 1 deny 171.69.3.13

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

Switch(config)# access-list 100 remark Do not allow Winter to browse the web
Switch(config)# access-list 100 deny host 171.69.3.85 any eq www
Switch(config)# access-list 100 remark Do not allow Smith to browse the web
Switch(config)# access-list 100 deny host 171.69.3.13 any eq www

In this example of a named ACL, the Jones subnet is not allowed access:

Switch(config)# ip access-list standard prevention
Switch(config-std-nacl)# remark Do not allow Jones subnet through
Switch(config-std-nacl)# deny 171.69.0.0 0.0.255.255

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet
Examples: ACL Logging

Two variations of logging are supported on ACLs. The log keyword sends an informational logging message to the console about the packet that matches the entry; the log-input keyword includes the input interface in the log entry.

In this example, standard named access list stan1 denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the log keyword.

```console
Switch(config)# ip access-list standard stan1
Switch(config-standard-nacl)# deny 10.1.1.0 0.0.0.255 log
Switch(config-standard-nacl)# permit any log
Switch(config-standard-nacl)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group stan1 in
Switch(config-if)# end
Switch(config)#
```

This example is a named extended access list ext1 that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.

```console
Switch(config)# ip access-list extended ext1
Switch(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Switch(config-ext-nacl)# deny udp any any log
Switch(config-ext-nacl)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip access-group ext1 in
Switch(config-if)#
```

This is an example of a log for an extended ACL:

```console
01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1 packet
01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7 packets
01:26:12:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255 (0), 1 packet
01:31:33:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255 (0), 8 packets
```

Note that all logging entries for IP ACLs start with %SEC-6-IPACCESSLOG with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the log-input keyword is entered:
Configuration Examples for ACLs and VLAN Maps

Example: Creating an ACL and a VLAN Map to Deny a Packet

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the ip1 ACL (TCP packets) would be dropped. You first create the ip1 ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

Switch(config)# ip access-list extended ip1
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 10
Switch(config-access-map)# match ip address ip1
Switch(config-access-map)# action drop

Example: Creating an ACL and a VLAN Map to Permit a Packet

This example shows how to create a VLAN map to permit a packet. ACL ip2 permits UDP packets and any packets that match the ip2 ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

Switch(config)# ip access-list extended ip2
Switch(config-ext-nacl)# permit udp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 20
Switch(config-access-map)# match ip address ip2
Switch(config-access-map)# action forward

Example: Default Action of Dropping IP Packets and Forwarding MAC Packets

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists igmp-match and tcp-match, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
• Forward all non-IP packets

Switch(config)# access-list 101 permit udp any any
Switch(config)# ip access-list extended igmp-match
Switch(config-ext-nacl)# permit igmp any any

Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map drop-ip-default 10
Switch(config-access-map)# match ip address 101
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 20
Switch(config-access-map)# match ip address igmp-match
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 30
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward

Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists good-hosts and good-protocols, the map will have the following results:

• Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
• Forward MAC packets with decnet-iv or vines-ip protocols
• Drop all other non-IP packets
• Forward all IP packets

Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists tcp-match and good-hosts from Examples 2 and 3, the map will have the following results:

• Forward all TCP packets
• Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
• Drop all other IP packets
• Drop all other MAC packets

Switch(config)# vlan access-map drop-all-default 10
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-all-default 20
Switch(config-access-map)# match mac address good-hosts
Switch(config-access-map)# action forward
Configuration Examples for Using VLAN Maps in Your Network

Example: Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point, Switch A.

If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list `http` that permits (matches) any TCP traffic on the HTTP port.

```bash
Switch(config)# ip access-list extended http
Switch(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Switch(config-ext-nacl)# exit
```

Next, create VLAN access map `map2` so that traffic that matches the `http` access list is dropped and all other IP traffic is forwarded.

```bash
Switch(config)# vlan access-map map2 10
Switch(config-access-map)# match ip address http
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# ip access-list extended match_all
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map2 20
Switch(config-access-map)# match ip address match_all
```
Example: Restricting Access to a Server on Another VLAN

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map SERVER1 that denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map SERVER1 to VLAN 10.

Define the IP ACL that will match the correct packets.

```
Switch(config)# ip access-list extended SERVER1_ACL
Switch(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Switch(config-ext-nacl)# exit
```

Define a VLAN map using this ACL that will drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

```
Switch(config)# vlan access-map SERVER1_MAP
Switch(config-access-map)# match ip address SERVER1_ACL
Switch(config-access-map)# action drop
Switch(config)# vlan access-map SERVER1_MAP 20
```
Switch(config-access-map)# action forward
Switch(config-access-map)# exit

Apply the VLAN map to VLAN 10.

Switch(config)# vlan filter SERVER1_MAP vlan-list 10

**Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs**

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet’s path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

**Example: ACLs and Switched Packets**

*Figure 107: Applying ACLs on Switched Packets*

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.

**Example: ACLs and Bridged Packets**

*Figure 108: Applying ACLs on Bridged Packets*

This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.
Example: ACLs and Routed Packets

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN
Example: ACLs and Multicast Packets

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.

Feature Information for IPv4 Access Control Lists

<table>
<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS Release 15.2(3)E</td>
<td>IPv4 Access Control Lists perform packet filtering to control which packets move through the network and where. Such control provides security by helping to limit network traffic, restrict the access of users and devices to the network, and prevent traffic from leaving a network. This feature was introduced.</td>
</tr>
<tr>
<td>Cisco IOS 15.2(2)E</td>
<td>The Named ACL Support for Noncontiguous Ports on an Access Control Entry feature allows you to specify noncontiguous ports in a single access control entry, which greatly reduces the number of entries required in an access control list when several entries have the same source address, destination address, and protocol, but differ only in the ports.</td>
</tr>
</tbody>
</table>
The IP Access List Entry Sequence Numbering feature helps users to apply sequence numbers to permit or deny statements and also reorder, add, or remove such statements from a named IP access list. This feature makes revising IP access lists much easier. Prior to this feature, users could add access list entries to the end of an access list only; therefore needing to add statements anywhere except the end required reconfiguring the access list entirely.

The following commands were introduced or modified: `deny (IP)`, `ip access-list resequence deny (IP)`, `permit (IP)`.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

IPv6 ACLs Overview

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similar to how you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running IP base and LAN base feature sets.

A switch supports three types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.

- IPv6 port ACLs are supported on outbound and inbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.
• VLAN ACLs or VLAN maps access-control all packets in a VLAN. You can use VLAN maps to filter traffic between devices in the same VLAN. ACL VLAN maps are applied on L2 VLANs. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv6. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets entering the VLAN are checked against the VLAN map.

The switch supports VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

Interactions with Other Features and Switches

• If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

• If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.

• You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

• You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.

• If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.

Restrictions for IPv6 ACLs

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

• The switch does not support matching on these keywords: routing header, and undetermined-transport.

• The switch does not support reflexive ACLs (the reflect keyword).

• This release supports port ACLs, router ACLs and VLAN ACLs (VLAN maps) for IPv6.

• Output router ACLs and input port ACLs for IPv6 are supported only on switch stacks. Switches support only control plane (incoming) IPv6 ACLs.

• The switch does not apply MAC-based ACLs on IPv6 frames.

• When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
• If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:
• Fragmented frames (the fragments keyword as in IPv4) are supported
• The same statistics supported in IPv4 are supported for IPv6 ACLs.
• If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
• Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.
• Logging is supported for router ACLs, but not for port ACLs.
• The switch supports IPv6 address-matching for a full range of prefix-lengths.

Default Configuration for IPv6 ACLs

The default IPv6 ACL configuration is as follows:

Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any nd-na sequence 40
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100

Configuring IPv6 ACLs

To filter IPv6 traffic, perform this procedure:

SUMMARY STEPS

1. enable
2. configure terminal
3. ipv6 access-list list-name
4. {deny | permit} protocol {source-ipv6-prefix/prefix-length | any} host source-ipv6-address { [operator [port-number]]} {destination-ipv6-prefix/prefix-length | any} host destination-ipv6-address { [operator [port-number]]} [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]
5. {deny | permit} tcp {source-ipv6-prefix/prefix-length | any} host source-ipv6-address { [operator [port-number]]} {destination-ipv6-prefix/prefix-length | any} host destination-ipv6-address { [operator [port-number]]} [ack] [dscp value] [established] [fin] [log] [log-input] [neq [port | protocol]] [psh] [range [port | protocol]] [rst] [routing] [sequence value] [syn] [time-range name] [urg]
### 6. {deny | permit} udp `{source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] `{destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port | protocol}] [routing] [sequence value] [time-range name]`

### 7. {deny | permit} icmp `{source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] `{destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type] [icmp-code] [icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name]`

### 8. end

### 9. show ipv6 access-list

### 10. show running-config

### 11. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ipv6 access-list list-name</code></td>
<td>Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ipv6 access-list example_acl_list</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `{deny</td>
<td>permit} protocol `{source-ipv6-prefix/prefix-length</td>
</tr>
<tr>
<td></td>
<td>• For protocol, enter the name or number of an IP: ahp, esp, icmp, ipv6, pcp, step, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.</td>
</tr>
<tr>
<td></td>
<td>• The source-ipv6-prefix/prefix-length or destination-ipv6-prefix/prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).</td>
</tr>
<tr>
<td></td>
<td>• Enter any as an abbreviation for the IPv6 prefix ::/0.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>• For <strong>host</strong> source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are <strong>lt</strong> (less than), <strong>gt</strong> (greater than), <strong>eq</strong> (equal), <strong>neq</strong> (not equal), and <strong>range</strong>. If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/prefix-length argument, it must match the destination port.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) The <strong>port-number</strong> is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is ipv6.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter log to cause a logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter routing to specify that IPv6 packets be routed.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4,294,967,295.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Define a TCP access list and the access conditions.</td>
</tr>
</tbody>
</table>

```bash
{deny | permit} tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length |}
```

• **icmp-type**: Enter to filter by ICMP message type, a number from 0 to 255.  
• **icmp-code**: Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.  
• **icmp-message**: Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type
Attaching an IPv6 ACL to an Interface

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.

Follow these steps to control access to an interface.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. no switchport
5. ipv6 address ipv6-address
6. ipv6 traffic-filter access-list-name {in | out}
7. end
8. show running-config
9. copy running-config startup-config

DETAILED STEPS

<table>

</tr>
</tbody>
</table>
Purpose

Command or Action | Purpose
---|---
Step 2 configure terminal | Enters global configuration mode.
Example:
Switch# configure terminal

Step 3 interface interface-id | Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode.

Step 4 no switchport | If applying a router ACL, this changes the interface from Layer 2 mode (the default) to Layer 3 mode.

Step 5 ipv6 address ipv6-address | Configure an IPv6 address on a Layer 3 interface (for router ACLs).

Step 6 ipv6 traffic-filter access-list-name {in | out} | Apply the access list to incoming or outgoing traffic on the interface.
Note The out keyword is not supported for Layer 2 interfaces (port ACLs).

Step 7 end | Returns to privileged EXEC mode.
Example:
Switch(config)# end

Step 8 show running-config | Verifies your entries.
Example:
Switch# show running-config

Step 9 copy running-config startup-config | (Optional) Saves your entries in the configuration file.
Example:
Switch# copy running-config startup-config

Monitoring IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:
### Table 141: show ACL commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show access-lists</td>
<td>Displays all access lists configured on the switch.</td>
</tr>
<tr>
<td>show ipv6 access-list [access-list-name]</td>
<td>Displays all configured IPv6 access lists or the access list specified by name.</td>
</tr>
<tr>
<td>show vlan access-map [map-name]</td>
<td>Displays VLAN access map configuration.</td>
</tr>
<tr>
<td>show vlan filter [access-map access-map</td>
<td>vlan vlan-id]</td>
</tr>
</tbody>
</table>

This is an example of the output from the `show access-lists` privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch # show access-lists
Extended IP access list hello
  10 permit ip any any
IPv6 access list ipv6
  permit ipv6 any any sequence 10
```

This is an example of the output from the `show ipv6 access-list` privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
  permit tcp any any eq bgp (8 matches) sequence 10
  permit tcp any any eq telnet (15 matches) sequence 20
  permit udp any any sequence 30
IPv6 access list outbound
  deny udp any any sequence 10
  deny tcp any any eq telnet sequence 20
```

This is an example of the output from the `show vlan access-map` privileged EXEC command. The output shows VLAN access map information.

```
Switch# show vlan access-map
Vlan access-map "m1" 10
  Match clauses:
    ipv6 address: ip2
  Action: drop
```
Configuring DHCP

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About DHCP

DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator. The switch can act as a DHCP server.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.
DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCPRELEASE or DHCPDECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.
When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allow-untrusted` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

Normally, it is not desirable to broadcast packets to wireless clients. So, DHCP snooping replaces destination broadcast MAC address (ffff.ffff.ffff) with unicast MAC address for DHCP packets that are going from server to wireless clients. The unicast MAC address is retrieved from CHADDR field in the DHCP payload. This processing is applied for server to client packets such as DHCP OFFER, DHCP ACK, and DHCP NACK messages. The `ip dhcp snooping wireless bootp-broadcast enable` can be used to revert this behavior. When the wireless BOOTP broadcast is enabled, the broadcast DHCP packets from server are forwarded to wireless clients without changing the destination MAC address.

**Option-82 Data Insertion**

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

*Figure 111: DHCP Relay Agent in a Metropolitan Ethernet Network*

When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
• When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. You can configure the remote ID and circuit ID.

• If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.

• The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

• The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

• The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, *Suboption Packet Formats*):

• Circuit-ID suboption fields
  • Suboption type
  • Length of the suboption type
  • Circuit-ID type
  • Length of the circuit-ID type

• Remote-ID suboption fields
  • Suboption type
  • Length of the suboption type
  • Remote-ID type
  • Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet1/0/25, and so forth.

The illustration, *Suboption Packet Formats*, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option global configuration command. 
The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- **Circuit-ID suboption fields**
  - The circuit-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

- **Remote-ID suboption fields**
  - The remote-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.
Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is
updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
... 
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1dbdb223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 584a38f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

• The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.

• An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).

• The interface in the entry no longer exists on the system.

• The interface is a routed interface or a DHCP snooping-trusted interface.
# How to Configure DHCP Features

## Default DHCP Snooping Configuration

**Table 142: Default DHCP Configuration**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>

<td>Enabled in Cisco IOS software, requires configuration.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This feature is operational only when a destination is configured.</td>
</tr>
</tbody>
</table>

\(^{15}\) The switch responds to DHCP requests only if it is configured as a DHCP server.

\(^{16}\) The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.

\(^{17}\) Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.
DHCP Snooping Configuration Guidelines

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust interface` configuration command.

- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.

- You can display DHCP snooping statistics by entering the `show ip dhcp snooping statistics` user EXEC command, and you can clear the snooping statistics counters by entering the `clear ip dhcp snooping statistics` privileged EXEC command.

Configuring the DHCP Server

The switch can act as a DHCP server.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.4.

Configuring the DHCP Relay Agent

Follow these steps to enable the DHCP relay agent on the switch:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. service dhcp
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>service dhcp</td>
<td>Enables the DHCP server and relay agent on your switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>By default, this feature is enabled.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# service dhcp</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

Example:

Switch(config)# end

**Step 5**

Example:

Switch# show running-config

**Step 6**

Example:

Switch# copy running-config startup-config

What to do next

- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy

### Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the `ip helper-address address` interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the `ip helper-address` command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface vlan vlan-id
4. ip address ip-address subnet-mask
5. ip helper-address address
6. end
7. Use one of the following:
   - interface range port-range
   - interface interface-id
8. `switchport mode access`
9. `switchport access vlan vlan-id`
10. `end`
11. `show running-config`
12. `copy running-config startup-config`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
   - `enable`
   - **Example:**
     ```
     Switch> enable
     ```
   - Enables privileged EXEC mode.
     - Enter your password if prompted.
| **Step 2**
   - `configure terminal`
   - **Example:**
     ```
     Switch# configure terminal
     ```
   - Enters global configuration mode.
| **Step 3**
   - `interface vlan vlan-id`
   - **Example:**
     ```
     Switch(config)# interface vlan 1
     ```
   - Creates a switch virtual interface by entering a VLAN ID, and enter interface configuration mode.
| **Step 4**
   - `ip address ip-address subnet-mask`
   - **Example:**
     ```
     Switch(config-if)# ip address 192.108.1.27 255.255.255.0
     ```
   - Configures the interface with an IP address and an IP subnet.
| **Step 5**
   - `ip helper-address address`
   - **Example:**
     ```
     Switch(config-if)# ip helper-address 172.16.1.2
     ```
   - Specifies the DHCP packet forwarding address.
The helper address can be a specific DHCP server address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables other servers to respond to DHCP requests. If you have multiple servers, you can configure one helper address for each server.
| **Step 6**
   - `end`
   - **Example:**
     ```
     Switch(config-if)# end
     ```
   - Returns to global configuration mode.
| **Step 7**
   - Use one of the following:
     - `interface range port-range`
     - `interface interface-id`
   - Configures multiple physical ports that are connected to the DHCP clients, and enter interface range configuration mode.
### Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

- You must globally enable DHCP snooping on the switch.
- Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
- If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.
- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.
- For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.
• You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.

• To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.

• The following prerequisites apply to DHCP snooping binding database configuration:
  • You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.
  • Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
  • For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.
  • To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).
  • If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

• Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.

• If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.

• If a switch port is connected to a DHCP server, configure a port as trusted by entering the **ip dhcp snooping trust interface** configuration command.

• If a switch port is connected to a DHCP client, configure a port as untrusted by entering the **no ip dhcp snooping trust** interface configuration command.

---

**Enabling DHCP Snooping and Option 82**

Follow these steps to enable DHCP snooping on the switch:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip dhcp snooping
4. ip dhcp snooping vlan vlan-range
5. ip dhcp snooping information option
6. ip dhcp snooping information option format remote-id [string ASCII-string | hostname]
7. ip dhcp snooping information option allow-untrusted
8. interface interface-id
9. ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string

<td>ip dhcp snooping information option format remote-id [string ASCII-string</td>
<td>You can configure the remote ID as:</td>
</tr>
<tr>
<td></td>
<td>hostname]</td>
</tr>
</tbody>
</table>
## Enabling DHCP Snooping and Option 82

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| `Switch(config)# ip dhcp snooping information option format remote-id string asciistring2` | - String of up to 63 ASCII characters (no spaces)  
- Configured hostname for the switch  
*Note* If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration. |
| **Step 7**        |         |
| `ip dhcp snooping information option allow-untrusted` | (Optional) If the switch is an aggregation switch connected to an edge switch, this command enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch.  
The default setting is disabled.  
*Note* Enter this command only on aggregation switches that are connected to trusted devices. |
| **Step 8**        |         |
| `interface interface-id` | Specifies the interface to be configured, and enter interface configuration mode. |
| **Example:**      |         |
| `Switch(config)# interface gigabitethernet2/0/1` |         |
| **Step 9**        |         |
| `ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string` | (Optional) Configures the circuit-ID suboption for the specified interface.  
Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format `vlan-mod-port`.  
You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces).  
(Optional) Use the `override` keyword when you do not want the circuit-ID suboption inserted in TLV format to define subscriber information. |
| **Example:**      |         |
| `Switch(config-if)# ip dhcp snooping vlan 1 information option format-type circuit-id override string override2` |         |
| **Step 10**       |         |
| `ip dhcp snooping trust` | (Optional) Configures the interface as trusted or untrusted.  
Use the `no` keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted. |
| **Example:**      |         |
| `Switch(config-if)# ip dhcp snooping trust` |         |
| **Step 11**       |         |
| `ip dhcp snooping limit rate rate` | (Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured.  
*Note* We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN with DHCP snooping. |
| **Example:**      |         |
| `Switch(config-if)# ip dhcp snooping limit rate 100` |         |
### Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

### Monitoring DHCP Snooping Information

<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
show ip dhcp snooping database
Display the DHCP snooping binding database status and statistics.

show ip dhcp snooping statistics
Display the DHCP snooping statistics in summary or detail form.

show ip source binding
Display the dynamically and statically configured bindings.

If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.

### Configuring DHCP Server Port-Based Address Allocation

#### Information About Configuring DHCP Server Port-Based Address Allocation

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.

When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier option in the DHCP packet. Clients that do not include the client identifier option are identified by the client hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

#### Default Port-Based Address Allocation Configuration

By default, DHCP server port-based address allocation is disabled.

#### Port-Based Address Allocation Configuration Guidelines

- By default, DHCP server port-based address allocation is disabled.
To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the reserved-only DHCP pool configuration command.

### Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. ip dhcp snooping database {flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password[@]]@]hostname [host-ip]/[directory] image-name.tar | rcp://user@host/filename} | tftp://host/filename
4. ip dhcp snooping database timeout seconds
5. ip dhcp snooping database write-delay seconds
6. end
7. ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds
8. show ip dhcp snooping database [detail]
9. show running-config
10. copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
</tr>
<tr>
<td>Enables privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | configure terminal |
| Example: | Switch# configure terminal |
| Enters global configuration mode. |

<p>| <strong>Step 3</strong> | ip dhcp snooping database {flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password[@]]@]hostname [host-ip]/[directory] image-name.tar | rcp://user@host/filename} | tftp://host/filename |
| Example: | Switch(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2 |
| Specifies the URL for the database agent or the binding file by using one of these forms: |  |
| • flash[number]:/filename | (Optional) Use the number parameter to specify the stack member number of the stack master. The range for number is 1 to 9. |
| • ftp://user:password@host/filename |  |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip dhcp snooping database timeout seconds</td>
<td>Specifies (in seconds) how long to wait for the database transfer process to finish before stopping the process. The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip dhcp snooping database timeout 300</td>
<td></td>
</tr>
<tr>
<td>ip dhcp snooping database write-delay seconds</td>
<td>Specifies the duration for which the transfer should be delayed after the binding database changes. The range is from 15 to 86400 seconds. The default is 300 seconds (5 minutes).</td>
</tr>
<tr>
<td>Example: Switch(config)# ip dhcp snooping database write-delay 15</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>ip dhcp snooping binding mac-address vlan vlan-id ip-address interface-id interface-id expiry seconds</td>
<td>(Optional) Adds binding entries to the DHCP snooping binding database. The vlan-id range is from 1 to 4904. The seconds range is from 1 to 4294967295. Enter this command for each entry that you add. Use this command when you are testing or debugging the switch.</td>
</tr>
<tr>
<td>Example: Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gi1/1 expiry 1000</td>
<td></td>
</tr>
<tr>
<td>show ip dhcp snooping database [detail]</td>
<td>Displays the status and statistics of the DHCP snooping binding database agent.</td>

<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Enabling DHCP Server Port-Based Address Allocation

Follow these steps to globally enable port-based address allocation and to automatically generate a subscriber identifier on an interface.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip dhcp use subscriber-id client-id
4. ip dhcp subscriber-id interface-name
5. interface interface-id
6. ip dhcp server use subscriber-id client-id
7. end
8. show running-config
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>

<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet1/0/1</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 6**

*ip dhcp server use subscriber-id client-id*

**Example:**

Switch(config-if)# ip dhcp server use subscriber-id client-id

**Purpose:** Configures the DHCP server to use the subscriber identifier as the client identifier on all incoming DHCP messages on the interface.

**Step 7**

*end*

**Example:**

Switch(config)# end

**Purpose:** Returns to privileged EXEC mode.

**Step 8**

*show running-config*

**Example:**

Switch# show running-config

**Purpose:** Verifies your entries.

**Step 9**

*copy running-config startup-config*

**Example:**

Switch# copy running-config startup-config

**Purpose:** (Optional) Saves your entries in the configuration file.

### What to do next

After enabling DHCP port-based address allocation on the switch, use the `ip dhcp pool` global configuration command to preassign IP addresses and to associate them to clients.

Monitoring DHCP Server Port-Based Address Allocation
Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- Finding Feature Information, on page 1387
- Information About IP Source Guard, on page 1387
- How to Configure IP Source Guard, on page 1389
- Monitoring IP Source Guard, on page 1393

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IP Source Guard

IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address in the binding table is allowed, all other traffic is denied.
The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

**IP Source Guard for Static Hosts**

**Note**

Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the `show ip device tracking all` EXEC command, the IP device tracking table displays the entries as ACTIVE.

**Note**

Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.
IP Source Guard Configuration Guidelines

- You can configure static IP bindings only on nonrouted ports. If you enter the `ip source binding mac-address vlan vlan-id ip-address interface interface-id` global configuration command on a routed interface, this error message appears:

  Static IP source binding can only be configured on switch port.

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.

- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

  Note: If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

- You can enable this feature when 802.1x port-based authentication is enabled.

- When you configure IP source guard smart logging, packets with a source address other than the specified address or an address learned by DHCP are denied, and the packet contents are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled.

- In a switch stack, if IP source guard is configured on a stack member interface and you remove the the configuration of that switch by entering the `no switch stack-member-number provision` global configuration command, the interface static bindings are removed from the binding table, but they are not removed from the running configuration. If you again provision the switch by entering the `switch stack-member-number provision` command, the binding is restored.

  To remove the binding from the running configuration, you must disable IP source guard before entering the `no switch provision` command. The configuration is also removed if the switch reloads while the interface is removed from the binding table.

How to Configure IP Source Guard

Enabling IP Source Guard

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. ip verify source [mac-check ]
5. exit
6. ip source binding mac-address vlan vlan-id ip-address interface interface-id
7. end
### Enabling IP Source Guard

8. `show running-config`
9. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable`  
**Example:**  
`Switch> enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** | `configure terminal`  
**Example:**  
`Switch# configure terminal` | Enters global configuration mode. |
| **Step 3** | `interface interface-id`  
**Example:**  
`Switch(config)# interface gigabitethernet 1/0/1` | Specifies the interface to be configured, and enters interface configuration mode. |
| **Step 4** | `ip verify source [mac-check ]`  
**Example:**  
`Switch(config-if)# ip verify source` | Enables IP source guard with source IP address filtering.  
(Optional) `mac-check`—Enables IP Source Guard with source IP address and MAC address filtering. |
| **Step 5** | `exit`  
**Example:**  
`Switch(config-if)# exit` | Returns to global configuration mode. |
| **Step 6** | `ip source binding mac-address vlan vlan-id ip-address interface interface-id`  
**Example:**  
`Switch(config)# ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1` | Adds a static IP source binding.  
Enter this command for each static binding. |
| **Step 7** | `end`  
**Example:**  
`Switch(config)# end` | Returns to privileged EXEC mode. |
### Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port

You must configure the `ip device tracking maximum limit-number interface` configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip device tracking`
4. `interface interface-id`
5. `switchport mode access`
6. `switchport access vlan vlan-id`
7. `ip verify source[tracking] [mac-check]`
8. `ip device tracking maximum number`
9. `end`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.

- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.
Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

**Note** Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.

If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none` interface configuration command to make the rate unlimited. A high-rate limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.

When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.
Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

![Figure 114: ARP Cache Poisoning](image)

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic man-in-the-middle attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets
Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan vlan-range` global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the `arp access-list acl-name` global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate {[src-mac] [dst-mac] [ip]}` global configuration command.

### Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `ip arp inspection trust interface` configuration command.

⚠️ **Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.
Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

**Rate Limiting of ARP Packets**

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.
The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command.

Default Dynamic ARP Inspection Configuration

<tr>
<td>Rate limit of incoming ARP packets</td>
<td>The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second. The rate is unlimited on all trusted interfaces. The burst interval is 1 second.</td>
</tr>
<tr>
<td>ARP ACLs for non-DHCP environments</td>
<td>No ARP ACLs are defined.</td>
</tr>
<tr>
<td>Validation checks</td>
<td>No checks are performed.</td>
</tr>
</tbody>
</table>
Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the ip arp inspection filter vlan global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. arp access-list acl-name
4. permit ip host sender-ip mac host sender-mac
5. exit
6. ip arp inspection filter arp-acl-name vlan vlan-range [static]
7. interface interface-id
8. no ip arp inspection trust
9. end
10. Use the following show commands:

<tr>
<td>6.</td>
<td>ip arp inspection filter arp-acl-name vlan vlan-range [static]</td>
<td>Applies ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.</td>
</tr>
<tr>
<td></td>
<td>• For arp-acl-name, specify the name of the ACL created in Step 2.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For vlan-range, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• (Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.

arp packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them.

**Step 7** | interface interface-id
--- | ---
Specifies Switch A interface that is connected to Switch B, and enters the interface configuration mode.

**Step 8** | no ip arp inspection trust
--- | ---
Configures Switch A interface that is connected to Switch B as untrusted.

By default, all interfaces are untrusted. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the `ip arp inspection vlan logging` global configuration command.

**Step 9** | end
--- | ---
Returns to privileged EXEC mode.

**Step 10** | Use the following show commands:
--- | ---
- show arp access-list acl-name
- show ip arp inspection vlan vlan-range
- show ip arp inspection interfaces

Verifies your entries.

**Step 11** | show running-config
--- | ---
Example:

```
Switch# show running-config
```

Verifies your entries.

**Step 12** | copy running-config startup-config
--- | ---
Example:

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.
Configuring Dynamic ARP Inspection in DHCP Environments

Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

SUMMARY STEPS

1. enable
2. show cdp neighbors

## Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

**Note**

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the **no ip arp inspection limit** interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface interface-id**
4. **ip arp inspection limit {rate pps [burst interval seconds] | none}**
5. **exit**
6. Use the following commands:
   - **errdisable detect cause arp-inspection**
- `errdisable recovery cause arp-inspection`
- `errdisable recovery interval interval`

7. `exit`
8. Use the following show commands:
   - `show ip arp inspection interfaces`
   - `show errdisable recovery`

9. `show running-config`
10. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

  **Example:**  
  `Switch# copy running-config startup-config`  
  (Optional) Saves your entries in the configuration file. |

### Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

### SUMMARY STEPS

1. `enable`  
2. `configure terminal`  
3. `ip arp inspection validate [src-mac] [dst-mac] [ip]`  
4. `exit`  
5. `show ip arp inspection vlan vlan-range`  
6. `show running-config`  
7. `copy running-config startup-config`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip arp inspection validate {src-mac} {dst-mac} {ip}</td>
<td>Performs a specific check on incoming ARP packets. By default, no checks are performed.</td>
</tr>
<tr>
<td></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td>• For src-mac, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td></td>
<td>• For dst-mac, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td></td>
<td>• For ip, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses.</td>
</tr>
<tr>
<td></td>
<td>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show ip arp inspection vlan vlan-range</td>
<td>Verifies your settings.</td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>

</tbody>
</table>
Monitoring DAI

To monitor DAI, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection statistics</td>
<td>Clears dynamic ARP inspection statistics.</td>
</tr>
<tr>
<td>show ip arp inspection statistics [vlan vlan-range]</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
</tbody>
</table>

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
<tr>
<td>show ip arp inspection interfaces [interface-id]</td>
<td>Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>show ip arp inspection vlan vlan-range</code></td>
<td>Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
</tbody>
</table>
Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term *switch* refers to a standalone switch or a switch stack.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About 802.1x Port-Based Authentication

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

**Note**

TACACS is not supported with 802.1x authentication.
Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

**Port-Based Authentication Process**

To configure IEEE 802.1X port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.
- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.
- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.
- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

---

**Note**

Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.
This figure shows the authentication process.

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during re-authentication. The actions are Initialize and ReAuthenticate. When the Initialize action is set (the attribute value is DEFAULT), the 802.1x session ends, and connectivity is lost during re-authentication. When the ReAuthenticate action is set (the attribute value is RADIUS-Request), the session is not affected during re-authentication.

- You manually re-authenticate the client by entering the `dot1x re-authenticate interface interface-id` privileged EXEC command.
Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the `authentication port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.

**Figure 117: Message Exchange**

This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.

![Message Exchange Diagram](diagram)

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the
client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

Figure 118: Message Exchange During MAC Authentication Bypass

This figure shows the message exchange during MAC authentication bypass.

18 Supported in Cisco IOS Release 12.2(50)SE and later.
19 For clients that do not support 802.1x authentication.

**Per-User ACLs and Filter-Ids**

---

**Note**
You can only set any as the source in the ACL.

---

**Note**
For any ACL configured for multiple-host mode, the source portion of statement must be any. (For example, `permit icmp any host 10.10.1.1`.)

---

**Note**
Using role-based ACLs as Filter-Id is not recommended.

You must specify any in the source ports of any defined ACL. Otherwise, the ACL cannot be applied and authorization fails. Single host is the only exception to support backward compatibility.

More than one host can be authenticated on MDA-enabled and multi-auth ports. The ACL policy applied for one host does not affect the traffic of another host. If only one host is authenticated on a multi-host port, and the other hosts gain network access without authentication, the ACL policy for the first host can be applied to the other connected hosts by specifying any in the source address.
Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the **authentication host-mode**, **authentication violation**, and **authentication timer** interface configuration commands.

802.1x-specific commands begin with the **dot1x** keyword. For example, the **authentication port-control auto** interface configuration command enables authentication on an interface.

To disable dot1x on a switch, remove the configuration globally by using the **no dot1x system-auth-control**, and also remove it from all configured interfaces.

**Note**

If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

The **authentication manager** commands provide the same functionality as earlier 802.1x commands.

When filtering out verbose system messages generated by the authentication manager, the filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The **no authentication logging verbose** global configuration command filters verbose messages from the authentication manager.
- The **no dot1x logging verbose** global configuration command filters 802.1x authentication verbose messages.
- The **no mab logging verbose** global configuration command filters MAC authentication bypass (MAB) verbose messages.

### Ports in Authorized and Unauthorized States

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the **unauthorized** state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the **authorized** state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

**Note**

CDP bypass is not supported and may cause a port to go into err-disabled state.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the

</tr>
</tbody>
</table>
client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the `authentication port-control` interface configuration command and these keywords:

- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.

- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.

- **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

**802.1x Host Mode**

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients.

In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

**Figure 119: Multiple Host Mode Example**
For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

The switch supports multidomain authentication (MDA), which allows both a data device and a voice device, such as an IP Phone (Cisco or non-Cisco), to connect to the same switch port.

**802.1x Multiple Authentication Mode**

Multiple-authentication (multiauth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multiauth port.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
- The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.
- After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.
- You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.
- The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

**Multi-auth Per User VLAN assignment**

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.

The number of hosts per multi-auth port is 8, however there can be more hosts.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

**Scenario one**
When a hub is connected to an access port, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behaviour is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 sends untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

**Scenario two**

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

**Scenario three**

When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).

---

**Note**

The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

---

**Limitation in Multi-auth Per User VLAN assignment**

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs**: Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.

- **IPv6 control packets**: In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assign incorrect IPv6 address to itself. Such a host is unable to get access to the network.

  The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports. The packet is replicated for each client in multi-auth
port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

- **IP multicast**: Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANs join the multicast group. When two hosts in different VLANs join a multicast group (on the same multi-auth port), two copies of each multicast packet are sent out from that port.

### MAC Move

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port. MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on that port.) When a MAC address moves from one port to another, the switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port. The MAC move feature applies to both voice and data hosts.

**Note**

In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.

### MAC Replace

The MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

**Note**

This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the `authentication violation` interface configuration command with the `replace` keyword, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
- The authentication manager replaces the MAC address of the current data host on the port with the new MAC address.
- The authentication manager initiates the authentication process for the new MAC address.
- If the authentication manager determines that the new host is a voice host, the original voice host is removed.
If a port is in open authentication mode, any new MAC address is immediately added to the MAC address table.

802.1x Accounting

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor this activity on 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- START—sent when a new user session starts
- INTERIM—sent during an existing session for updates
- STOP—sent when a session terminates

You can view the AV pairs that are being sent by the switch by entering the `debug radius accounting` privileged EXEC command. For more information about this command, see the Cisco IOS Debug Command Reference, Release 12.4.

This table lists the AV pairs and when they are sent are sent by the switch.

<table>
<thead>
<tr>
<th>Attribute Number</th>
<th>AV Pair Name</th>
<th>START</th>
<th>INTERIM</th>
<th>STOP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute[1]</td>
<td>User-Name</td>
<td>Always</td>
<td>Always</td>
<td>Always</td>
</tr>
<tr>
<td>Attribute[4]</td>
<td>NAS-IP-Address</td>
<td>Always</td>
<td>Always</td>
<td>Always</td>
</tr>
<tr>
<td>Attribute[5]</td>
<td>NAS-Port</td>
<td>Always</td>
<td>Always</td>
<td>Always</td>
</tr>

<td>Never</td>
<td>Sometimes²⁰</td>
<td>Sometimes</td>
</tr>
<tr>
<td>Attribute[25]</td>
<td>Class</td>
<td>Always</td>
<td>Always</td>
<td>Always</td>
</tr>
</tbody>
</table>

²⁰Sometimes means the attribute is only sent on some occasions, not always.
The Framed-IP-Address AV pair is sent when a valid static IP address is configured or when a Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.

802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.

Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.
802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode in Cisco IOS Release 12.2(37)SE. In Cisco IOS Release 12.2(40)SE and later, when a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.

- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

  Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).

- If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.

- If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.

- Enabling port security does not impact the RADIUS server-assigned VLAN behavior.

- If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.

- If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

  - If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, then authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.

  - If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.
If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

- If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.
- If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  - [64] Tunnel-Type = VLAN
  - [65] Tunnel-Medium-Type = 802
  - [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID
  - [83] Tunnel-Preference

Attribute [64] must contain the value VLAN (type 13). Attribute [65] must contain the value 802 (type 6). Attribute [81] specifies the VLAN name or VLAN ID assigned to the IEEE 802.1x-authenticated user.

### 802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port, to which a port ACL is applied, are filtered by the port ACL. Incoming routed packets received on other ports are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration conflicts, you should carefully plan the user profiles stored on the RADIUS server.
RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes (VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs used for per-user ACLs are in acl#<n> for the ingress direction and outacl#<n> for the egress direction. MAC ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server. When the definitions are passed from the RADIUS server, they are created by using the extended naming convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the switch. The attribute contains the ACL number followed by .in for ingress filtering or .out for egress filtering. If the RADIUS server does not allow the .in or .out syntax, the access list is applied to the outbound ACL by default. The user is marked unauthorized if the Filter-Id sent from the RADIUS server is not configured on the device. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported only for IP ACLs numbered in the range of 1 to 199 (IP standard ACLs) and 1300 to 2699 (IP extended ACLs).

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

You must meet the following prerequisites to configure per-user ACLs:

- Enable AAA authentication.
- Enable AAA authorization by using the network keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication.
- Configure the user profile and VSAs on the RADIUS server.
- Configure the 802.1x port for single-host mode.

### 802.1x Authentication with Downloadable ACLs and Redirect URLs

**Note**
IPv6 does not support Redirect URLs.

You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication or MAC authentication bypass of the host. You can also download ACLs during web authentication.

**Note**
A downloadable ACL is also referred to as a dACL.

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode, the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.

If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.
The limit for dACL with stacking is 64 ACEs per dACL per port. The limit without stacking is the number of available TCAM entries which varies based on the other ACL features that are active.

If there is no static ACL on a port, a dynamic auth-default ACL is created, and policies are enforced before dACLs are downloaded and applied.

The auth-default-ACL does not appear in the running configuration.

The auth-default ACL is created when at least one host with an authorization policy is detected on the port. The auth-default ACL is removed from the port when the last authenticated session ends. You can configure the auth-default ACL for IPv4 by using the **ip access-list extended auth-default-acl** command in global configuration mode. For IPv6, use the **ipv6 access-list extended auth-default-acl** command in the global configuration mode.

The auth-default-ACL does not support Cisco Discovery Protocol bypass in the single host mode. You must configure a static ACL on the interface to support Cisco Discovery Protocol bypass.

The 802.1x and MAB authentication methods support two authentication modes, **open** and **closed**. If there is no static ACL on a port in **closed** authentication mode:

- An auth-default-ACL is created.
- The auth-default-ACL allows only DHCP traffic until policies are enforced.
- When the first host authenticates, the authorization policy is applied without IP address insertion.
- When a second host is detected, the policies for the first host are refreshed, and policies for the first and subsequent sessions are enforced with IP address insertion.

If there is no static ACL on a port in **open** authentication mode:

- An auth-default-ACL-OPEN is created and allows all traffic.
- Policies are enforced with IP address insertion to prevent security breaches.
- Web authentication is subject to the auth-default-ACL-OPEN.

To control access for hosts with no authorization policy, you can configure a directive. The supported values for the directive are **open** and **default**. When you configure the **open** directive, all traffic is allowed. The **default** directive subjects traffic to the access provided by the port. You can configure the directive either in the user profile on the AAA server or on the switch. To configure the directive on the AAA server, use the **authz-directive =<open/default>** global command. To configure the directive on the switch, use the **epm access-control open** global configuration command.

The default value of the directive is **default**.
If a host falls back to web authentication on a port without a configured ACL:

- If the port is in open authentication mode, the auth-default-ACL-OPEN is created.
- If the port is in closed authentication mode, the auth-default-ACL is created.

The access control entries (ACEs) in the fallback ACL are converted to per-user entries. If the configured fallback profile does not include a fallback ACL, the host is subject to the auth-default-ACL associated with the port.

**Note**

If you use a custom logo with web authentication and it is stored on an external server, the port ACL must allow access to the external server before authentication. You must either configure a static port ACL or change the auth-default-ACL to provide appropriate access to the external server.

---

**Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL**

The switch uses these *cisco-av-pair* VSAs:

- url-redirect is the HTTP or HTTPS URL.
- url-redirect-acl is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the end point. The switch then forwards the client web browser to the specified redirect address. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.

**Note**

- Traffic that matches a permit ACE in the ACL is redirected.
- Define the URL redirect ACL and the default port ACL on the switch.

---

If a redirect URL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

This section describes the ACS server switchover or failover behavior:

The first authorization request is sent to the primary ACS server; after the time out period set by the tacacs-server timeout command ends, the request is switched-over to the secondary server for authorization. After the first authorization request, all succeeding requests are sent to the secondary ACS server. After the switchover, if the secondary server is not available, attempts are made to reach the server and after the timeout period, authorization requests are then sent to the primary ACS server. If both servers are down, authorization requests are sent to the next ACS server in the list, after the configured timeout period ends, sent to the next server, and so on. If none of the servers are reachable, the user receives an authorization failed message.

---

**Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs**

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS cisco-av-pair vendor-specific attributes (VSAs). This pair specifies the names of the downloadable...
ACLs on the Cisco Secure ACS with the #ACL#-IP-name-number attribute for IPv4 and #ACL#-.in.ipv6 attribute for IPv6.

- The name is the ACL name.
- The number is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

### VLAN ID-Based MAC Authentication

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

### 802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:

- Enter the authentication event no-response action authorize vlan vlan-id interface configuration command to allow access to the guest VLAN.
• Enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command to restart the port.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.

---

**Note**

If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

Any number of 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes.

You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports MAC authentication bypass. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

---

### 802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN (also referred to as an `authentication failed VLAN`) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN. These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

---

**Note**

You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count increments when the RADIUS server replies with either an `EAP failure` or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.
Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a link down or EAP logoff event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the link down or EAP logoff event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports. You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as critical authentication or the AAA fail policy, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated. You can configure the switch to connect those hosts to critical ports.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the critical VLAN. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the critical-authentication state, which is a special case of the authentication state.

**Note**

If critical authentication is configured on interface, then vlan used for critical authorization (critical vlan) should be active on the switch. If the critical vlan is inactive (or) down, critical authentication session will keep trying to enable inactive vlan and fail repeatedly. This can lead to large amount of memory holding.

Inaccessible Authentication Bypass Support on Multiple-Authentication Ports

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on multiple-authentication (multiauth) ports, use the authentication event server dead action reinitialize vlan vlan-id command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.
Inaccessible Authentication Bypass Authentication Results

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.

- If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.

- If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

Inaccessible Authentication Bypass Feature Interactions

Inaccessible authentication bypass interacts with these features:

- Guest VLAN—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 8021.x port, the features interact as follows:
  - If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
  - If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
  - If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.
  - If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.

- Restricted VLAN—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.

- 802.1x accounting—Accounting is not affected if the RADIUS servers are unavailable.

- Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.

- Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.

- Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.
802.1x Critical Voice VLAN

When an IP phone connected to a port is authenticated by the Cisco Identity Services Engine (ISE), the phone is put into the voice domain. If the ISE is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

**Note**

Dynamic assignment of critical voice VLAN is not supported with nested service templates. It causes the device to switch between VLANs continuously in a loop.

You can enter the `authentication event server dead action authorize voice` interface configuration command to configure the critical voice VLAN feature. When the ISE does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through Cisco Discovery Protocol (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the `switchport voice vlan vlan-id` interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

802.1x User Distribution

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.

- Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.

- Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured by using the switch CLI. If the VLAN group name is found, the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.
The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups.

**802.1x User Distribution Configuration Guidelines**

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

**IEEE 802.1x Authentication with Voice VLAN Ports**

A voice VLAN port is a special access port associated with two VLAN identifiers:

- **VVID** to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- **PVID** to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone.
If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the switch for up to 30 seconds.

IEEE 802.1x Authentication with Port Security

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

IEEE 802.1x Authentication with Wake-on-LAN

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the magic packet. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

If PortFast is not enabled on the port, the port is forced to the bidirectional state.

When you configure a port as unidirectional by using the authentication control-direction in interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.

When you configure a port as bidirectional by using the authentication control-direction both interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

IEEE 802.1x Authentication with MAC Authentication Bypass

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.

If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and
password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured. This process works for most client devices; however, it does not work for clients that use an alternate MAC address format. You can configure how MAB authentication is performed for clients with MAC addresses that deviate from the standard format or where the RADIUS configuration requires the user name and password to differ.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant and uses 802.1x authentication (not MAC authentication bypass) to authorize the interface. EAPOL history is cleared if the interface link status goes down.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is DEFAULT.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]) and if the Termination-Action RADIUS attribute (Attribute [29]) action is Initialize (the attribute value is DEFAULT), the MAC authentication bypass session ends, and connectivity is lost during re-authentication. If MAC authentication bypass is enabled and the IEEE 802.1x authentication times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—You can enable MAC authentication bypass only if 802.1x authentication is enabled on the port.
- Guest VLAN—If a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.
- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.
- Port security
- Voice VLAN
- Private VLAN—You can assign a client to a private VLAN.
- Network Edge Access Topology (NEAT)—MAB and NEAT are mutually exclusive. You cannot enable MAB when NEAT is enabled on an interface, and you should not enable NEAT when MAB is enabled on an interface.

Cisco IOS Release 12.2(55)SE and later supports filtering of verbose MAB system messages.
Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or posture of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.
- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the `DEFAULT` or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.
- Set the list of VLAN number or name or VLAN group name as the value of the Tunnel Group Private ID (Attribute[81]) and the preference for the VLAN number or name or VLAN group name as the value of the Tunnel Preference (Attribute[83]). If you do not configure the Tunnel Preference, the first Tunnel Group Private ID (Attribute[81]) attribute is picked up from the list.
- View the NAC posture token, which shows the posture of the client, by using the `show authentication` privileged EXEC command.
- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. The IEEE 802.1X Flexible Authentication feature supports three authentication methods:

- `dot1X`—IEEE 802.1X authentication is a Layer 2 authentication method.
- `mab`—MAC-Authentication Bypass is a Layer 2 authentication method.
- `webauth`—Web authentication is a Layer 3 authentication method.

Using this feature, you can control which ports use which authentication methods, and you can control the failover sequencing of methods on those ports. For example, MAC authentication bypass and 802.1x can be the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

The IEEE 802.1X Flexible Authentication feature supports the following host modes:

- `multi-auth`—Multiauthentication allows one authentication on a voice VLAN and multiple authentications on the data VLAN.
- `multi-domain`—Multidomain authentication allows two authentications: one on the voice VLAN and one on the data VLAN.
**Open1x Authentication**

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

- **Single-host mode with open authentication**– Only one user is allowed network access before and after authentication.
- **MDA mode with open authentication**– Only one user in the voice domain and one user in the data domain are allowed.
- **Multiple-hosts mode with open authentication**– Any host can access the network.
- **Multiple-authentication mode with open authentication**– Similar to MDA, except multiple hosts can be authenticated.

**Note**

If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the `authentication open` interface configuration command, the port will grant access to the host irrespective of the `authentication port-control` interface configuration command.

**Multidomain Authentication**

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

**Note**

For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Follow these guidelines for configuring MDA:

- You must configure a switch port for MDA.
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.
- Voice VLAN assignment on an MDA-enabled port is supported Cisco IOS Release 12.2(40)SE and later.
- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of `device-traffic-class=voice`. Without this value, the switch treats the voice device as a data device.
- The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.
• If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.

• Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.

• A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.

• MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.

• When a data or a voice device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.

• If more than five devices are detected on the data VLAN or more than one voice device is detected on the voice VLAN while a port is unauthorized, the port is error disabled.

• When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.

• Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.

• Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.

• If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.

• We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

### Limiting Login for Users

The Limiting Login feature helps Network administrators to limit the login attempt of users to a network. When a user fails to successfully login to a network within a configurable number of attempts within a configurable time limit, the user can be blocked. This feature is enabled only for local users and not for remote users. You need to configure the `aaa authentication rejected` command in global configuration mode to enable this feature.

### 802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms). This allows any type of device to authenticate on the port.

• 802.1x switch supplicant: You can configure a switch to act as a supplicant to another switch by using the 802.1x supplicant feature. This configuration is helpful in a scenario, where, for example, a switch...
is outside a wiring closet and is connected to an upstream switch through a trunk port. A switch configured with the 802.1x switch supplicant feature authenticates with the upstream switch for secure connectivity. Once the supplicant switch authenticates successfully the port mode changes from access to trunk in an authenticator switch. In a supplicant switch you must manually configure trunk when enabling CISP.

- If the access VLAN is configured on the authenticator switch, it becomes the native VLAN for the trunk port after successful authentication.

In the default state, when you connect a supplicant switch to an authenticator switch that has BPDU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the `dot1x supplicant controlled transient` global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the `no dot1x supplicant controlled transient` global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the `dot1x supplicant controlled transient` command on a supplicant switch when BPDU guard is enabled on the authenticator switch with the `spanning-tree bpduguard enable` interface configuration command.

**Note**

If you globally enable BPDU guard on the authenticator switch by using the `spanning-tree portfast bpduguard default` global configuration command, entering the `dot1x supplicant controlled transient` command does not prevent the BPDU violation.

You can enable MDA or multiauth mode on the authenticator switch interface that connects to one more supplicant switches. Multihost mode is not supported on the authenticator switch interface.

When you reboot an authenticator switch with single-host mode enabled on the interface, the interface may move to err-disabled state before authentication. To recover from err-disabled state, flap the authenticator port to activate the interface again and initiate authentication.

Use the `dot1x supplicant force-multicast` global configuration command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

- Host Authorization: Ensures that only traffic from authorized hosts (connecting to the switch with supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting to the supplicant switch to the authenticator switch.

- Auto enablement: Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs coming from supplicant switches. Configure the `cisco-av-pair` as `device-traffic-class=switch` at the ISE. (You can configure this under the `group` or the `user` settings.)
**Figure 120: Authenticator and Supplicant Switch using CISP**

<p>| | | |</p>
<table>

<td></td>
</tr>
</tbody>
</table>

**Note**  
The `switchport nonnegotiate` command is not supported on supplicant and authenticator switches with NEAT. This command should not be configured at the supplicant side of the topology. If configured on the authenticator side, the internal macros will automatically remove this command from the port.

**Voice Aware 802.1x Security**

**Note**  
To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

**Common Session ID**

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.

The session ID includes:

- The IP address of the Network Access Device (NAD)
A monotonically increasing unique 32 bit integer
The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 160000050000000B288508E5:

Switch# show authentication sessions
Interface  MAC Address  Method  Domain  Status  Session ID
Fa4/0/4    0000.0000.0203  mab     DATA   Authz Success  160000050000000B288508E5

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 160000050000000B288508E5:

1w0d: %AUTHMGR-5-START: Starting 'mab' for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %MAB-5-SUCCESS: Authentication successful for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %AUTHMGR-7-RESULT: Authentication result 'success' from 'mab' for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5

The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

How to Configure 802.1x Port-Based Authentication

Default 802.1x Authentication Configuration

802.1x Authentication Configuration Guidelines

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.

- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

- Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

- When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

- After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x
authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (authentication timer inactivity and authentication timer reauthentication) interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.

• When configuring the inaccessible authentication bypass feature, follow these guidelines:

  • The feature is supported on 802.1x port in single-host mode and multihosts mode.
  
  • If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.

  • If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.

  • You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.

  • If the CTS links are in Critical Authentication mode and the master reloads, the policy where SGT was configured on a device will not be available on the new master. This is because the internal bindings will not be synced to the standby switch in a 3750-X switch stack.

  • You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

  • When wireless guest clients obtains IP from foreign client VLAN instead of anchor client VLAN, you should use the ip dhcp required command under the WLAN configuration to force clients to issue a new DHCP request. This prevents the clients from getting an incorrect IP at anchor.

  • If the wired guest clients fail to get IP address after a Cisco WLC (foreign) reload, perform a shut/no shut on the ports used by the clients to reconnect them.

**MAC Authentication Bypass**

These are the MAC authentication bypass configuration guidelines:

• Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.

• If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.

• If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.

• If the port is in the authorized state, the port remains in this state until re-authorization occurs.

• You can configure a timeout period for hosts that are connected by MAC authentication bypass but are inactive. The range is 1 to 65535 seconds.
Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an 802.1x-enabled port:

• In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.

• In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.

• In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

Configuring 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as dot1x force-unauthorized.

Follow these steps to enable the 802.1x readiness check on the switch:

Before you begin

Follow these guidelines to enable the readiness check on the switch:

• The readiness check is typically used before 802.1x is enabled on the switch.

• If you use the dot1x test eapol-capable privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.

• When you configure the dot1x test eapol-capable command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.

• When you configure the dot1x test eapol-capable command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.

• The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

SUMMARY STEPS

1. enable
2. configure terminal
3. dot1x test eapol-capable [interface interface-id]
4. dot1x test timeout timeout
### Configuring 802.1x Readiness Check

5. `end`
6. `show running-config`
7. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Enters global configuration mode. |
| `configure terminal` | |
| Example: | |
| `Switch# configure terminal` | |

| **Step 3** | Enables the 802.1x readiness check on the switch. |
| `dot1x test eapol-capable [interface interface-id]` | (Optional) For `interface-id` specify the port on which to check for IEEE 802.1x readiness. |
| **Example:** | |
| `Switch# dot1x test eapol-capable interface gigabitethernet1/0/13 DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable` | Note: If you omit the optional `interface` keyword, all interfaces on the switch are tested. |

| **Step 4** | (Optional) Configures the timeout used to wait for EAPOL response. The range is from 1 to 65535 seconds. The default is 10 seconds. |
| `dot1x test timeout timeout` | |

| **Step 5** | Returns to privileged EXEC mode. |
| `end` | |
| Example: | |
| `Switch(config)# end` | |

| **Step 6** | Verifies your entries. |
| `show running-config` | |
| Example: | |
| `Switch# show running-config` | |

| **Step 7** | (Optional) Saves your entries in the configuration file. |
| `copy running-config startup-config` | |
| Example: | |
| `Switch# copy running-config startup-config` | |
Configuring Voice Aware 802.1x Security

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature on the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

- You enable voice aware 802.1x security by entering the `errdisable detect cause security-violation shutdown vlan` global configuration command. You disable voice aware 802.1x security by entering the `no` version of this command. This command applies to all 802.1x-configured ports in the switch.

  **Note** If you do not include the `shutdown vlan` keywords, the entire port is shut down when it enters the error-disabled state.

- If you use the `errdisable recovery cause security-violation` global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the `shutdown` and `no shutdown` interface configuration commands.

- You can re-enable individual VLANs by using the `clear errdisable interface interface-id vlan [vlan-list]` privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

**SUMMARY STEPS**

1. `configure terminal`
2. `errdisable detect cause security-violation shutdown vlan`
3. `errdisable recovery cause security-violation`
4. `clear errdisable interface interface-id vlan [vlan-list]`
5. Enter the following:
   - `shutdown`
   - `no shutdown`
6. `end`
7. `show errdisable detect`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>errdisable detect cause security-violation shutdown vlan</code></td>
<td>Shut down any VLAN on which a security violation error occurs.</td>
</tr>
</tbody>
</table>
### Configuring 802.1x Violation Modes

You can configure an 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

- a device connects to an 802.1x-enabled port
- the maximum number of allowed about devices have been authenticated on the port

Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:

### Example

This example shows how to configure the switch to shut down any VLAN on which a security violation error occurs:

```
Switch(config)# errdisable detect cause security-violation shutdown vlan
```

This example shows how to re-enable all VLANs that were error disabled on port Gigabit Ethernet 40/2.

```
Switch# clear errdisable interface gigabitethernet40/2 vlan
```

You can verify your settings by entering the `show errdisable detect` privileged EXEC command.
SUMMARY STEPS

1. `configure terminal`
2. `aaa new-model`
3. `aaa authentication dot1x {default} method1`
4. `interface interface-id`
5. `switchport mode access`
6. `authentication violation {shutdown | restrict | protect | replace}`
7. `end`

DETAILED STEPS

<table>
<thead>
<tr>

</table>
Configuring 802.1x Authentication

To allow per-user ACLs or VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the 802.1x AAA process:

**Before you begin**

To configure 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

**SUMMARY STEPS**

1. A user connects to a port on the switch.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The switch sends a start message to an accounting server.
5. Re-authentication is performed, as necessary.
6. The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.
7. The user disconnects from the port.
8. The switch sends a stop message to the accounting server.

**DETAILED STEPS**

### Configuring 802.1x Port-Based Authentication

Beginning in privileged EXEC mode, follow these steps to configure 802.1x port-based authentication:

**SUMMARY STEPS**

1. configure terminal
2. aaa new-model
3. aaa authentication dot1x {default} method1
4. dot1x system-auth-control
5. aaa authorization network {default} group radius
6. radius-server host ip-address
7. radius-server key string
8. interface interface-id
9. switchport mode access
10. authentication port-control auto
11. dot1x pae authenticator
12. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
* Example:  
Switch# configure terminal |
| **Step 2** | aaa new-model  
* Example:  
Switch(config)# aaa new-model |
| **Step 3** | aaa authentication dot1x {default} method1  
* Example:  
| Creates an 802.1x authentication method list. |
**Command or Action** | **Purpose**
--- | ---
Switch(config)# aaa authentication dot1x default
group radius | To create a default list that is used when a named list is not specified in the `authentication` command, use the `default` keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.
For method 1, enter the `group radius` keywords to use the list of all RADIUS servers for authentication.

**Note** Though other keywords are visible in the command-line help string, only the `group radius` keywords are supported.

**Step 4** dot1x system-auth-control

*Example:*
Switch(config)# dot1x system-auth-control

**Step 5** aaa authorization network {default} group radius

*Example:*
Switch(config)# aaa authorization network default
group radius

(Optional) Configures the switch to use user-RADIUS authorization for all network-related service requests, such as per-user ACLs or VLAN assignment.

**Step 6** radius-server host `ip-address`

*Example:*
Switch(config)# radius-server host 124.2.2.12

(Optional) Specifies the IP address of the RADIUS server.

**Step 7** radius-server key `string`

*Example:*
Switch(config)# radius-server key abc1234

(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.

**Step 8** interface `interface-id`

*Example:*
Switch(config)# interface gigabitethernet1/0/2

Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.

**Step 9** switchport mode access

*Example:*
Switch(config-if)# switchport mode access

(Optional) Sets the port to access mode only if you configured the RADIUS server in Step 6 and Step 7.
### Purpose

Command or Action

<table>
<thead>
<tr>
<th>Step 10</th>
<th>authentication port-control auto</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>authentication port-control auto</td>
</tr>
</tbody>
</table>

**Step 10**

Enables 802.1x authentication on the port.

### Example:

Step 10

```
Switch(config-if)# authentication port-control auto
```

### Purpose

Sets the interface Port Access Entity to act only as an authenticator and ignore messages meant for a supplicant.

### Example:

Step 11

```
Switch(config-if)# dot1x pae authenticator
```

### Summary

#### Steps

1. enable
2. configure terminal
3. radius-server host {hostname | ip-address} auth-port port-number key string
4. end

#### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---

### Configuring the Switch-to-RADIUS-Server Communication

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius-server host` global configuration command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, `radius-server retransmit`, and `radius-server key` global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

#### Before you begin

You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

#### Summary Steps

1. enable
2. configure terminal
3. radius-server host {hostname | ip-address} auth-port port-number key string
4. end

#### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> radius-server host {hostname</td>
<td>ip-address} auth-port port-number key string</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# radius-server host 125.5.5.43 auth-port 1645 key rad123</td>
<td>For hostname</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For auth-port port-number, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>If you want to use multiple RADIUS servers, re-enter this command.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the authentication port-control interface configuration command set to auto. Use the multi-domain keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.
**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `authentication host-mode [multi-auth | multi-domain | multi-host | single-host]`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Specifies the port to which multiple hosts are indirectly attached, and enter interface configuration mode. |
| interface interface-id | |
| Example: | |
| Switch(config)# interface gigabitethernet2/0/1 | |

| **Step 3** | Allows multiple hosts (clients) on an 802.1x-authorized port. |
| authentication host-mode [multi-auth | multi-domain | multi-host | single-host] | |
| Example: | |
| Switch(config-if)# authentication host-mode multi-host | |

The keywords have these meanings:

- **multi-auth**—Allow multiple authenticated clients on both the voice VLAN and data VLAN.

  **Note** The **multi-auth** keyword is only available with the `authentication host-mode` command.

- **multi-host**—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated.

- **multi-domain**—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port.

  **Note** You must configure the voice VLAN for the IP phone when the host mode is set to **multi-domain**.

Make sure that the **authentication port-control** interface configuration command is set to **auto** for the specified interface.

| **Step 4** | Returns to privileged EXEC mode. |
| end | |
| Example: | |
Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

**SUMMARY STEPS**

1. **configure terminal**
2. **interface interface-id**
3. **authentication periodic**
4. **authentication timer {{[inactivity | reauthenticate | restart | unauthorized]} {value}}**
5. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>interface interface-id</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td><strong>authentication periodic</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# authentication periodic</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Sets the number of seconds between re-authentication attempts.</td>
</tr>
<tr>
<td>**authentication timer {{[inactivity</td>
<td>reauthenticate</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The default value is 3600 seconds. To change the value of the reauthentication timer or to have the switch use a RADIUS-provided session timeout, enter the <strong>authentication timer reauthenticate</strong> command.</td>
</tr>
<tr>
<td></td>
<td>The <strong>authentication timer</strong> keywords have these meanings:</td>
</tr>
</tbody>
</table>
Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The **authentication timer restart** interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `authentication timer restart seconds`
4. `end`
5. `show authentication sessions interface interface-id`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-if)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2** interface interface-id  
**Example:**  
Switch(config)# interface gigabitethernet2/0/1 | Specifies the port to be configured, and enter interface configuration mode. |
| **Step 3** authentication timer restart seconds  
**Example:**  
Switch(config-if)# authentication timer restart 30 | Sets the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client.  
The range is 1 to 65535 seconds; the default is 60. |
| **Step 4** end  
**Example:**  
Switch(config-if)# end | Returns to privileged EXEC mode. |
| **Step 5** show authentication sessions interface interface-id  
**Example:**  
Switch# show authentication sessions interface gigabitethernet2/0/1 | Verifies your entries. |
| **Step 6** copy running-config startup-config  
**Example:**  
Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

### Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. `interface interface-id`
3. `authentication timer reauthenticate seconds`
4. `end`
5. `show authentication sessions interface interface-id`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>

<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td>Example: <code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `dot1x max-reauth-req count`
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode access
4. dot1x max-req count
5. end

DETAILED STEPS

### Enabling MAC Replace

MAC replace allows a host to replace an authenticated host on a port.

Beginning in privileged EXEC mode, follow these steps to enable MAC replace on an interface. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication violation {protect | replace | restrict | shutdown}
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>

### Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

**Note**

In Cisco IOS XE Denali 16.3.x and Cisco IOS XE Everest 16.6.x, periodic AAA accounting updates are not supported. The switch does not send periodic interim accounting records to the accounting server. Periodic AAA accounting updates are available in Cisco IOS XE Fuji 16.9.x and later releases.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

*Accounting message %s for session %s failed to receive Accounting Response.*

When the stop message is not sent successfully, this message appears:

*00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.*
You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`  
2. `interface interface-id`  
3. `aaa accounting dot1x default start-stop group radius`  
4. `aaa accounting system default start-stop group radius`  
5. `end`  
6. `show running-config`  
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
`configure terminal`  
Example:  
Switch# config terminal | Enters global configuration mode. |
| **Step 2**  
`interface interface-id`  
Example:  
Switch(config)# interface gigabitethernet1/0/3 | Specifies the port to be configured, and enter interface configuration mode. |
| **Step 3**  
`aaa accounting dot1x default start-stop group radius`  
Example:  
Switch(config-if)# aaa accounting dot1x default start-stop group radius | Enables 802.1x accounting using the list of all RADIUS servers. |
| **Step 4**  
`aaa accounting system default start-stop group radius`  
Example:  
Switch(config-if)# aaa accounting system default start-stop group radius | (Optional) Enables system accounting (using the list of all RADIUS servers) and generates system accounting reload event messages when the switch reloads. |
### Configuring a Guest VLAN

When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

#### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication event no-response action authorize vlan vlan-id`
5. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> authentication event fail action authorize vlan vlan-id</td>
<td>Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# authentication event fail action authorize vlan 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Number of Authentication Attempts on a Restricted VLAN

You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the `authentication event retry retry count` interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
6. `authentication event retry retry count`
7. `end`

**DETAILED STEPS**

<table>

</tbody>
</table>
| Step 3 | Use one of the following:  
   - `switchport mode access`
   - `switchport mode private-vlan host`
| | Example: `Switch(config-if)# switchport mode access` | • Sets the port to access mode.  
• Configures the Layer 2 port as a private-VLAN host port. |
| Step 4 | `authentication port-control auto` | Enables 802.1x authentication on the port. |
| | Example: | |
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.</td>
</tr>
</tbody>
</table>

**Step 5**

**authentication event fail action authorize vlan vlan-id**

**Example:**

```
Switch(config-if)# authentication event fail action authorize vlan 8
```

**Step 6**

**authentication event retry retry count**

**Example:**

```
Switch(config-if)# authentication event retry 2
```

**Step 7**

**end**

**Example:**

```
Switch(config-if)# end
```

---

**Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN**

Beginning in privileged EXEC mode, follow these steps to configure critical voice VLAN on a port and enable the inaccessible authentication bypass feature.

**SUMMARY STEPS**

1. configure terminal
2. aaa new-model
3. radius-server dead-criteria {time seconds } [tries number]
4. radius-serverdeadtimeminutes
5. radius-server host ip-address address [acct-port udp-port] [auth-port udp-port] [testusername name [idle-time time] [ignore-acct-port] [ignore auth-port]] [key string]
6. dot1x critical {eapol | recovery delay milliseconds}
7. interface interface-id
8. authentication event server dead action {authorize | reinitialize} vlan vlan-id
9. switchport voice vlan vlan-id
10. authentication event server dead action authorize voice
11. show authentication interface interface-id
12. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example: Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> radius-server dead-criteria {time seconds} [tries number]</td>
<td>Sets the conditions that determine when a RADIUS server is considered unavailable or down (dead).</td>
</tr>
</tbody>
</table>
| Example: Switch(config)# radius-server dead-criteria time 20 tries 10 | • time — 1 to 120 seconds. The switch dynamically determines a default seconds value between 10 and 60.  
  • number — 1 to 100 tries. The switch dynamically determines a default tries number between 10 and 100. |
| **Step 4** radius-server dead-time minutes | (Optional) Sets the number of minutes during which a RADIUS server is not sent requests. The range is from 0 to 1440 minutes (24 hours). The default is 0 minutes. |
| Example: Switch(config)# radius-server dead-time 60 | |
| **Step 5** radius-server host ip-address address [acct-port udp-port] [auth-port udp-port] [testusername name] [idle-time time] [ignore-acct-port] [ignore auth-port] [key string] | (Optional) Configure the RADIUS server parameters by using these keywords: |
| Example: Switch(config)# radius-server host 1.1.1.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234 | • acct-port udp-port — Specify the UDP port for the RADIUS accounting server. The range for the UDP port number is from 0 to 65536. The default is 1646.  
  • auth-port udp-port — Specify the UDP port for the RADIUS authentication server. The range for the UDP port number is from 0 to 65536. The default is 1645.  
  **Note** You should configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.  
  • test username name — Enable automated testing of the RADIUS server status, and specify the username to be used. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• idle-time time—Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes. The default is 60 minutes (1 hour).</td>
<td></td>
</tr>
<tr>
<td>• ignore-acct-port—Disable testing on the RADIUS-server accounting port.</td>
<td></td>
</tr>
<tr>
<td>• ignore-auth-port—Disable testing on the RADIUS-server authentication port.</td>
<td></td>
</tr>
<tr>
<td>• For keystring, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server. Note Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</td>
<td></td>
</tr>
<tr>
<td>You can also configure the authentication and encryption key by using the radius-server key {0string</td>
<td>7string</td>
</tr>
</tbody>
</table>

### Step 6

**dot1x critical {eapol | recovery delay milliseconds}**

**Example:**

```
Switch(config)# dot1x critical eapol
(config)# dot1x critical recovery delay 2000
```

(Optional) Configure the parameters for inaccessible authentication bypass:

- • **eapol**—Specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port.

- • **recovery delay milliseconds**—Set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The range is from 1 to 10000 milliseconds. The default is 1000 milliseconds (a port can be re-initialized every second).

### Step 7

**interface interface-id**

**Example:**

```
Switch(config)# interface gigabitethernet 1/0/1
```

Specify the port to be configured, and enter interface configuration mode.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 8     | `authentication event server dead action {authorize | reinitialize} vlan vlan-id` | Use these keywords to move hosts on the port if the RADIUS server is unreachable:  
  • `authorize`—Move any new hosts trying to authenticate to the user-specified critical VLAN.  
  • `reinitialize`—Move all authorized hosts on the port to the user-specified critical VLAN. |
| 9     | `switchport voice vlan vlan-id` | Specifies the voice VLAN for the port. The voice VLAN cannot be the same as the critical data VLAN configured in Step 6. |
| 10    | `authentication event server dead action authorize voice` | Configures critical voice VLAN to move data traffic on the port to the voice VLAN if the RADIUS server is unreachable. |
| 11    | `show authentication interface interface-id` | (Optional) Verify your entries. |
| 12    | `copy running-config startup-config` | (Optional) Verify your entries. |

**Example**

To return to the RADIUS server default settings, use the `no radius-server dead-criteria`, the `no radius-server deadtime`, and the `no radius-server host` global configuration commands. To disable inaccessible authentication bypass, use the `no authentication event server dead action` interface configuration command. To disable critical voice VLAN, use the `no authentication event server dead action authorize voice` interface configuration command.

**Example of Configuring Inaccessible Authentication Bypass**

This example shows how to configure the inaccessible authentication bypass feature:
Configuring 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication control-direction {both | in}
4. end
5. show authentication sessions interface interface-id
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet2/0/3</td>
<td></td>
</tr>
<tr>
<td>Step 3 authentication control-direction {both</td>
<td>in}</td>
</tr>
<tr>
<td>Example: Switch(config-if)# authentication control-direction both</td>
<td></td>
</tr>
</tbody>
</table>

- **both**—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional.
### Configuring MAC Authentication Bypass

Beginning in privileged EXEC mode, follow these steps to enable MAC authentication bypass. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication port-control auto
4. mab [eap]
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Formatting a MAC Authentication Bypass Username and Password

Use the optional **mab request format** command to format the MAB username and password in a style accepted by the authentication server. The username and password are usually the MAC address of the client. Some authentication server configurations require the password to be different from the username.

Beginning in privileged EXEC mode, follow these steps to format MAC authentication bypass username and passwords.

#### SUMMARY STEPS

1. configure terminal
2. mab request format attribute 1 groupsize \{1 | 2 | 4 | 12\} [separator \{- | : | .\} [lowercase | uppercase]]
3. mab request format attribute2 \{0 | 7\} text
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>`mab request format attribute 1 groupsize {1</td>
<td>2</td>
</tr>
</tbody>
</table>
| Example: | Switch(config)# mab request format attribute 1 groupsize 12 | 1—Sets the username format of the 12 hex digits of the MAC address.  
| | | group size—The number of hex nibbles to concatenate before insertion of a separator. A valid group size must be either 1, 2, 4, or 12.  
| | | separator—The character that separates the hex nibbles according to group size. A valid separator must be either a hyphen, colon, or period. No separator is used for a group size of 12.  
| | | `{lowercase | uppercase}`—Specifies if nonnumeric hex nibbles should be in lowercase or uppercase. |
| Step 3 | `mab request format attribute2 {0 | 7} text` | 2—Specifies a custom (nondefault) value for the User-Password attribute in MAB-generated Access-Request packets. |
| Example: | Switch(config)# mab request format attribute 2 7 A02f44E18B12 | 0—Specifies a cleartext password to follow.  
| | | 7—Specifies an encrypted password to follow.  
| | | `text`—Specifies the password to be used in the User-Password attribute.  
| | | **Note** When you send configuration information in e-mail, remove type 7 password information. The `show tech-support` command removes this information from its output by default. |
| Step 4 | `end` | Returns to privileged EXEC mode. |
| Example: | Switch(config)# end | |

---

**Configuring 802.1x User Distribution**

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

### SUMMARY STEPS

1. `configure terminal`  
2. `vlan group vlan-group-name vlan-list vlan-list`  
3. `end`  
4. `no vlan group vlan-group-name vlan-list vlan-list`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>

| **Step 2** | **Purpose** |
| vlan group vlan-group-name vlan-list | Configures a VLAN group, and maps a single VLAN or a range of VLANs to it. |
| Example: | Switch(config)# vlan group eng-dept vlan-list 10 |

| **Step 3** | **Purpose** |
| end | Returns to privileged EXEC mode. |
| Example: | Switch(config)# end |

| **Step 4** | **Purpose** |
| no vlan group vlan-group-name vlan-list | Clears the VLAN group configuration or elements of the VLAN group configuration. |
| Example: | Switch(config)# no vlan group eng-dept vlan-list 10 |

Example of Configuring VLAN Groups

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```
Switch(config)# vlan group eng-dept vlan-list 10
```

```
Switch(config)# show vlan group group-name eng-dept
Group Name                      Vlans Mapped
-------------------            --------------
eng-dept                  10

Switch(config)# show dot1x vlan-group all
Group Name                      Vlans Mapped
-------------------            --------------
eng-dept                  10
hr-dept                  20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:

```
Switch(config)# vlan group eng-dept vlan-list 30
Switch(config)# show vlan group eng-dept
Group Name                      Vlans Mapped
-------------------            --------------
eng-dept                  30
```
This example shows how to remove a VLAN from a VLAN group:

```
Switch# no vlan group eng-dept vlan-list 10
```

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:

```
Switch(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.
```

```
Switch(config)# show vlan group group-name eng-dept
```

This example shows how to clear all the VLAN groups:

```
Switch(config)# no vlan group end-dept vlan-list all
Switch(config)# show vlan-group all
```

For more information about these commands, see the Cisco IOS Security Command Reference.

---

**Configuring NAC Layer 2 802.1x Validation**

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication event no-response action authorize vlan vlan-id
5. authentication periodic
6. authentication timer reauthenticate
7. end
8. show authentication sessions interface interface-id
9. copy running-config startup-config

<td>Device(config)# aaa authentication login default local</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>aaa authentication rejected n in m ban x</code></td>
<td>Configures the time period for which an user is blocked, if the user fails to successfully login within the specified time and login attempts.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
|        | Device(config)# aaa authentication rejected 3 in 20 ban 300 | • \(n\)—Specifies the number of times a user can try to login.  
  • \(m\)—Specifies the number of seconds within which an user can try to login. |
Configuring an Authenticator Switch with NEAT

Configuring this feature requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

- The authenticator switch interface configuration must be restored to access mode by explicitly flapping it if a line card is removed and inserted in the chassis when CISP or NEAT session is active.
- The `cisco-av-pairs` must be configured as `device-traffic-class=switch` on the ISE, which sets the interface as a trunk after the supplicant is successfully authenticated.

Beginning in privileged EXEC mode, follow these steps to configure a switch as an authenticator:

**SUMMARY STEPS**

1. configure terminal
2. cisp enable
3. interface interface-id
4. `switchport mode access`
5. `authentication port-control auto`
6. `dot1x pae authenticator`
7. `spanning-tree portfast`
8. `end`
9. `show running-config interface interface-id`
10. `copy running-config startup-config`

### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal&lt;br&gt;<strong>Example:</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> cisp enable&lt;br&gt;<strong>Example:</strong> Switch(config)# cisp enable</td>
<td>Enables CISP.</td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id&lt;br&gt;<strong>Example:</strong> Switch(config)# interface gigabitethernet 2/0/1</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> switchport mode access&lt;br&gt;<strong>Example:</strong> Switch(config-if)# switchport mode access</td>
<td>Sets the port mode to <code>access</code>.</td>
</tr>
<tr>
<td><strong>Step 5</strong> authentication port-control auto&lt;br&gt;<strong>Example:</strong> Switch(config-if)# authentication port-control auto</td>
<td>Sets the port-authentication mode to auto.</td>
</tr>
<tr>
<td><strong>Step 6</strong> dot1x pae authenticator&lt;br&gt;<strong>Example:</strong> Switch(config-if)# dot1x pae authenticator</td>
<td>Configures the interface as a port access entity (PAE) authenticator.</td>
</tr>
</tbody>
</table>
### Configuring a Supplicant Switch with NEAT

Beginning in privileged EXEC mode, follow these steps to configure a switch as a supplicant:

#### SUMMARY STEPS

1. configure terminal
2. cisp enable
3. dot1x credentials profile
4. username suppswitch
5. password password
6. dot1x supplicant force-multicast
7. interface interface-id
8. switchport trunk encapsulation dot1q
9. switchport mode trunk
10. dot1x pae supplicant
11. dot1x credentials profile-name
12. end
13. show running-config interface interface-id

### Step 7

**spanning-tree portfast**

**Example:**

```
Switch(config-if)# spanning-tree portfast trunk
```

**Purpose:** Enables Port Fast on an access port connected to a single workstation or server.

### Step 8

**end**

**Example:**

```
Switch(config-if)# end
```

**Purpose:** Returns to privileged EXEC mode.

### Step 9

**show running-config interface interface-id**

**Example:**

```
Switch# show running-config interface gigabitethernet 2/0/1
```

**Purpose:** Verifies your configuration.

### Step 10

**copy running-config startup-config**

**Example:**

```
Switch# copy running-config startup-config
```

**Purpose:** (Optional) Saves your entries in the configuration file.

**Note:** Saving changes to the configuration file will mean that the authenticator interface will continue to be in trunk mode after reload. If you want the authenticator interface to remain as an access port, do not save your changes to the configuration file.
14. `copy running-config startup-config`
15. Configuring NEAT with Auto Smartports Macros

### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>

<tr>
<td><code>Switch(config-if)# switchport trunk encapsulation dot1q</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Step 9** switchport mode trunk  
*Example:*  
`Switch(config-if)# switchport mode trunk` | Configures the interface as a VLAN trunk port. |
| **Step 10** dot1x pae supplicant  
*Example:*  
`Switch(config-if)# dot1x pae supplicant` | Configures the interface as a port access entity (PAE) supplicant. |
| **Step 11** dot1x credentials *profile-name*  
*Example:*  
`Switch(config-if)# dot1x credentials test` | Attaches the 802.1x credentials profile to the interface. |
| **Step 12** end  
*Example:*  
`Switch(config-if)# end` | Returns to privileged EXEC mode. |
| **Step 13** show running-config interface *interface-id*  
*Example:*  
`Switch# show running-config interface gigabitethernet1/0/1` | Verifies your configuration. |
| **Step 14** copy running-config startup-config  
*Example:*  
`Switch# copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
| **Step 15** Configuring NEAT with Auto Smartports Macros | You can also use an Auto Smartports user-defined macro instead of the switch VSA to configure the authenticator switch. For more information, see the *Auto Smartports Configuration Guide* for this release. |
Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the `show ip access-list` privileged EXEC command to display the downloaded ACLs on the port.

**Configuring Downloadable ACLs**

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

### SUMMARY STEPS

1. configure terminal
2. ip device tracking
3. aaa new-model
4. aaa authorization network default local group radius
5. radius-server vsa send authentication
6. interface interface-id
7. ip access-group acl-id in
8. show running-config interface interface-id
9. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| **Example:**  
  Switch# configure terminal | |
| **Step 2** ip device tracking | Sets the ip device tracking table. |
| **Example:**  
  Switch(config)# ip device tracking | |
| **Step 3** aaa new-model | Enables AAA. |
| **Example:**  
  Switch(config)# aaa new-model | |
### Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. configure terminal
2. access-list access-list-number { deny | permit } { hostname | any | host } log
3. interface interface-id
4. ip access-group acl-id in

### Command or Action | Purpose |
<table>

<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>access-list access-list-number { deny</td>
<td>permit } { hostname</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>The access-list-number is a decimal number from 1 to 99 or 1300 to 1999.</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# access-list 1 deny any log</td>
<td>Enter deny or permit to specify whether to deny or permit access if conditions are matched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The source is the source address of the network or host that sends a packet, such as this:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• hostname: The 32-bit quantity in dotted-decimal format.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• any: The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0.255.255.255.255. You do not need to enter a source-wildcard value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• host: The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Optional) Applies the source-wildcard wildcard bits to the source.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet2/0/2</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>ip access-group acl-id in</td>
<td>Configures the default ACL on the port in the input direction.</td>

<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip access-group default_acl in</td>
<td>The acl-id is an access list name or number.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

**exit**

**Example:**

Switch(config-if)# exit

Returns to global configuration mode.

**Step 6**

**aaa new-model**

**Example:**

Switch(config)# aaa new-model

Enables AAA.

**Step 7**

**aaa authorization network default group radius**

**Example:**

Switch(config)# aaa authorization network default group radius

Sets the authorization method to local. To remove the authorization method, use the `no aaa authorization network default group radius` command.

**Step 8**

**ip device tracking**

**Example:**

Switch(config)# ip device tracking

Enables the IP device tracking table. To disable the IP device tracking table, use the `no ip device tracking` global configuration commands.

**Step 9**

**ip device tracking probe [count | interval | use-svi]**

**Example:**

Switch(config)# ip device tracking probe count

(Optional) Configures the IP device tracking table:

- **count count**—Sets the number of times that the switch sends the ARP probe. The range is from 1 to 5. The default is 3.
- **interval interval**—Sets the number of seconds that the switch waits for a response before resending the ARP probe. The range is from 30 to 300 seconds. The default is 30 seconds.
- **use-svi**—Uses the switch virtual interface (SVI) IP address as source of ARP probes.

**Step 10**

**radius-server vsa send authentication**

**Example:**

Switch(config)# radius-server vsa send authentication

Configures the network access server to recognize and use vendor-specific attributes.

**Note** The downloadable ACL must be operational.
Configuring VLAN ID-based MAC Authentication

Beginning in privileged EXEC mode, follow these steps:

**SUMMARY STEPS**

1. configure terminal
2. mab request format attribute 32 vlan access-vlan
3. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring Flexible Authentication Ordering**

The examples used in the instructions below changes the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.
Before changing the default order and priority of these authentication methods, however, you should understand the potential consequences of those changes. See http://www.cisco.com/en/US/prod/collateral/iosswrel/ps6537/ps6866/ps6638/application_note_c27-573287_ps6638_Products_White_Paper.html for details.

Beginning in privileged EXEC mode, follow these steps:

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication order [ dot1x | mab ] | {webauth}
5. authentication priority [ dot1x | mab ] | {webauth}
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Example: <code>Switch# configure terminal</code></td>

### Resetting the 802.1x Authentication Configuration to the Default Values

Beginning in privileged EXEC mode, follow these steps to reset the 802.1x authentication configuration to the default values. This procedure is optional.

#### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `dot1x default`
4. `end`

#### DETAILED STEPS

Configuring MACsec Encryption

• Finding Feature Information, on page 1503
• Information About MACsec Encryption, on page 1503
• Configuring MKA and MACsec, on page 1510
• Configuring MACsec MKA using PSK, on page 1513
• Configuring MACsec MKA using EAP-TLS, on page 1515
• Configuring Cisco TrustSec MACsec, on page 1529
• Configuration Examples for Configuring MACsec Encryption, on page 1534

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About MACsec Encryption

This chapter describes how to configure Media Access Control Security (MACsec) encryption on the Catalyst switches. MACsec is the IEEE 802.1AE standard for authenticating and encrypting packets between two MACsec-capable devices. The switch also supports MACsec link layer switch-to-switch security by using Cisco TrustSec Network Device Admission Control (NDAC) and the Security Association Protocol (SAP) key exchange. Link layer security can include both packet authentication between switches and MACsec encryption between switches (encryption is optional).

Note

MACsec is not supported on switches running the NPE or the LAN base image.

All downlink ports on the switch can run Cisco TrustSec MACsec link layer switch-to-switch security.
Table 153: MACsec Support on Switch Ports

<table>
<thead>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Cisco TrustSec and Cisco SAP are meant only for switch-to-switch links and are not supported on switch ports connected to end hosts, such as PCs or IP phones. Cisco NDAC and SAP are mutually exclusive with Network Edge Access Topology (NEAT), which is used for compact switches to extend security outside the wiring closet.

### Media Access Control Security and MACsec Key Agreement

MACsec, defined in 802.1AE, provides MAC-layer encryption over wired networks by using out-of-band methods for encryption keying. The MACsec Key Agreement (MKA) Protocol provides the required session keys and manages the required encryption keys. MKA and MACsec are implemented after successful authentication using the 802.1x Extensible Authentication Protocol (EAP-TLS) or Pre Shared Key (PSK) framework.

A switch using MACsec accepts either MACsec or non-MACsec frames, depending on the policy associated with the MKA peer. MACsec frames are encrypted and protected with an integrity check value (ICV). When the switch receives frames from the MKA peer, it decrypts them and calculates the correct ICV by using session keys provided by MKA. The switch compares that ICV to the ICV within the frame. If they are not identical, the frame is dropped. The switch also encrypts and adds an ICV to any frames sent over the secured port (the access point used to provide the secure MAC service to a MKA peer) using the current session key.

The MKA Protocol manages the encryption keys used by the underlying MACsec protocol. The basic requirements of MKA are defined in 802.1x-REV. The MKA Protocol extends 802.1x to allow peer discovery with confirmation of mutual authentication and sharing of MACsec secret keys to protect data exchanged by the peers.

The EAP framework implements MKA as a newly defined EAP-over-LAN (EAPOL) packet. EAP authentication produces a master session key (MSK) shared by both partners in the data exchange. Entering the EAP session ID generates a secure connectivity association key name (CKN). The switch acts as the authenticator for both uplink and downlink; and acts as the key server for downlink. It generates a random secure association key (SAK), which is sent to the client partner. The client is never a key server and can only interact with a single MKA entity, the key server. After key derivation and generation, the switch sends periodic transports to the partner at a default interval of 2 seconds.

The packet body in an EAPOL Protocol Data Unit (PDU) is referred to as a MACsec Key Agreement PDU (MKPDU). MKA sessions and participants are deleted when the MKA lifetime (6 seconds) passes with no MKPDU received from a participant. For example, if a MKA peer disconnects, the participant on the switch continues to operate MKA until 6 seconds have elapsed after the last MKPDU is received from the MKA peer.

#### Note

Integrity check value (ICV) indicator in MKPDU is optional. ICV is not optional when the traffic is encrypted.

EAPOL Announcements indicate the use of the type of keying material. The announcements can be used to announce the capability of the supplicant as well as the authenticator. Based on the capability of each side, the largest common denominator of the keying material could be used.
Prior to Cisco IOS XE Fuji 16.8.1a, should-secure was supported for MKA and SAP. With should-secure enabled, if the peer is configured for MACsec, the data traffic is encrypted, otherwise it is sent in clear text. Starting with Cisco IOS XE Fuji 16.8.1a, must-secure support is enabled on both the ingress and the egress. Must-secure is supported for MKA and SAP. With must-secure enabled, only EAPoL traffic will not be encrypted. The rest of the traffic will be encrypted. Unencrypted packets are dropped.

**Note**

Must-secure mode is enabled by default.

**MKA Policies**

To enable MKA on an interface, a defined MKA policy should be applied to the interface. Removing the MKA policy disables MKA on that interface. You can configure these options:

- Policy name, not to exceed 16 ASCII characters.
- Confidentiality (encryption) offset of 0, 30, or 50 bytes for each physical interface
- Replay protection. You can configure MACsec window size, as defined by the number of out-of-order frames that are accepted. This value is used while installing the security associations in the MACsec. A value of 0 means that frames are accepted only in the correct order.

**Virtual Ports**

You use virtual ports for multiple secured connectivity associations on a single physical port. Each connectivity association (pair) represents a virtual port, with a maximum of two virtual ports per physical port. Only one of the two virtual ports can be part of a data VLAN; the other must externally tag its packets for the voice VLAN. You cannot simultaneously host secured and unsecured sessions in the same VLAN on the same port. Because of this limitation, 802.1x multiple authentication mode is not supported.

The exception to this limitation is in multiple-host mode when the first MACsec supplicant is successfully authenticated and connected to a hub that is connected to the switch. A non-MACsec host connected to the hub can send traffic without authentication because it is in multiple-host mode. We do not recommend using multi-host mode because after the first successful client, authentication is not required for other clients.

Virtual ports represent an arbitrary identifier for a connectivity association and have no meaning outside the MKA Protocol. A virtual port corresponds to a separate logical port ID. Valid port IDs for a virtual port are 0x0002 to 0xFFFF. Each virtual port receives a unique secure channel identifier (SCI) based on the MAC address of the physical interface concatenated with a 16-bit port ID.

**MACsec and Stacking**

A (Catalyst 3560cx) Switch stack master running MACsec maintains the configuration files that show which ports on a member switch support MACsec. The stack master performs these functions:

- Processes secure channel and secure association creation and deletion
- Sends secure association service requests to the stack members.
- Processes packet number and replay-window information from local or remote ports and notifies the key management protocol.
- Sends MACsec initialization requests with the globally configured options to new switches that are added to the stack.
- Sends any per-port configuration to the member switches.
A member switch performs these functions:

- Processes MACsec initialization requests from the stack master.
- Processes MACsec service requests sent by the stack master.
- Sends information about local ports to the stack master.

In case of a stack master changeover, all secured sessions are brought down and then reestablished. The authentication manager recognizes any secured sessions and initiates teardown of these sessions.

**Note**

If you are using 1G SFP modules for inter switch connection, change system MTU to 1550 byte to ensure support of MACsec overhead.

## MACsec, MKA and 802.1x Host Modes

You can use MACsec and the MKA Protocol with 802.1x single-host mode or Multi Domain Authentication (MDA) mode. Multiple authentication mode is not supported.

### Single-Host Mode

The figure shows how a single EAP authenticated session is secured by MACsec by using MKA

![Figure 121: MACsec in Single-Host Mode with a Secured Data Session](image)

### MKA Statistics

Some MKA counters are aggregated globally, while others are updated both globally and per session. You can also obtain information about the status of MKA sessions.

This is an example of the `show mka statistics` command output:

```
Switch# show mka statistics
MKA Global Statistics
-----------------------
MKA Session Totals

Pairwise CAKs Derived..... 32
Pairwise CAK Rekeys........ 31
Group CAKs Generated....... 0
Group CAKs Received........ 0

SA Statistics
```
Information About MACsec MKA using EAP-TLS

MACsec MKA is supported on switch-to-switch links. Using IEEE 802.1X Port-based Authentication with Extensible Authentication Protocol (EAP-TLS), you can configure MACsec MKA between device uplink ports. EAP-TLS allows mutual authentication and obtains an MSK (master session key) from which the connectivity association key (CAK) is derived for MKA operations. Device certificates are carried, using EAP-TLS, for authentication to the AAA server.

Prerequisites for MACsec MKA using EAP-TLS

- Ensure that you have a Certificate Authority (CA) server configured for your network.
- Generate a CA certificate.
• Ensure that you have configured Cisco Identity Services Engine (ISE) Release 2.0.

• Ensure that both the participating devices, the CA server, and Cisco Identity Services Engine (ISE) are synchronized using Network Time Protocol (NTP). If time is not synchronized on all your devices, certificates will not be validated.

• Ensure that 802.1x authentication and AAA are configured on your device.

Limitations for MACsec MKA using EAP-TLS

• MKA is not supported on port-channels.

• MKA is not supported with High Availability and local authentication.

• MKA/EAPTLS is not supported for promiscuous PVLAN Primary port.

• While configuring MACsec MKA using EAP-TLS, MACsec secure channels encrypt counters does not increment before first Rekey.

Cisco TrustSec Overview

The table below lists the TrustSec features to be eventually implemented on TrustSec-enabled Cisco switches. Successive general availability releases of TrustSec will expand the number of switches supported and the number of TrustSec features supported per switch.

<table>
<thead>
<tr>
<th>Cisco TrustSec Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1AE Tagging (MACsec)</td>
<td>Protocol for IEEE 802.1AE-based wire-rate hop-to-hop Layer 2 encryption.</td>
</tr>
<tr>
<td></td>
<td>Between MACsec-capable devices, packets are encrypted on egress from the transmitting device, decrypted on ingress to the receiving device, and in the clear within the devices.</td>
</tr>
<tr>
<td></td>
<td>This feature is only available between TrustSec hardware-capable devices.</td>
</tr>
<tr>
<td>Endpoint Admission Control (EAC)</td>
<td>EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).</td>
</tr>
</tbody>
</table>
Cisco TrustSec Feature | Description
---|---
Network Device Admission Control (NDAC) | NDAC is an authentication process where each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC utilizes an authentication framework based on IEEE 802.1X port-based authentication and uses EAP-FAST as its EAP method. Successful authentication and authorization in NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.

Security Association Protocol (SAP) | After NDAC authentication, the Security Association Protocol (SAP) automatically negotiates keys and the cipher suite for subsequent MACSec link encryption between TrustSec peers. SAP is defined in IEEE 802.11i.

Security Group Tag (SGT) | An SGT is a 16-bit single label indicating the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet.

SGT Exchange Protocol (SXP) | Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a sourceIP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.

When both ends of a link support 802.1AE MACsec, SAP negotiation occurs. An EAPOL-key exchange occurs between the supplicant and the authenticator to negotiate a cipher suite, exchange security parameters, and manage keys. Successful completion of these tasks results in the establishment of a security association (SA).

Depending on your software version and licensing and link hardware support, SAP negotiation can use one of these modes of operation:

- Galois Counter Mode (GCM)—authentication and encryption
- GCM authentication (GMAC)—GCM authentication, no encryption
- No Encapsulation—no encapsulation (clear text)
- Null—encapsulation, no authentication or encryption
Configuring MKA and MACsec

Default MACsec MKA Configuration

MACsec is disabled. No MKA policies are configured.

Configuring an MKA Policy

**SUMMARY STEPS**

1. configure terminal
2. mka policy *policy name*
3. confidentiality-offset *Offset value*
4. replay-protection window-size *frames*
5. end
6. show mka policy

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> mka policy <em>policy name</em></td>
<td>Identify an MKA policy, and enter MKA policy configuration mode. The maximum policy name length is 16 characters.</td>
</tr>
<tr>
<td><strong>Step 3</strong> confidentiality-offset <em>Offset value</em></td>
<td>Set the Confidentiality (encryption) offset for each physical interface</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Offset Value can be 0, 30 or 50. If you are using Anyconnect on the client, it is recommended to use Offset 0.</td>
</tr>
<tr>
<td><strong>Step 4</strong> replay-protection window-size <em>frames</em></td>
<td>Enable replay protection, and configure the window size in number of frames. The range is from 0 to 4294967295. The default window size is 0. Entering a window size of 0 is not the same as entering the <strong>no replay-protection command</strong>. Configuring a window size of 0 uses replay protection with a strict ordering of frames. Entering <strong>no replay-protection</strong> turns off MACsec replay-protection.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> show mka policy</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>
Example

This example configures the MKA policy relay-policy:

```
Switch(config)# mka policy replay-policy
Switch(config-mka-policy)# confidentiality-offset 0
Switch(config-mka-policy)# replay-protection window-size 300
Switch(config-mka-policy)# end
```

Configuring MACsec on an Interface

Follow these steps to configure MACsec on an interface with one MACsec session for voice and one for data:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. switchport access vlan vlan-id
5. switchport mode access
6. macsec
7. authentication event linksec fail action authorize vlan vlan-id
8. authentication host-mode multi-domain
9. authentication linksec policy must-secure
10. authentication port-control auto
11. authentication periodic
12. authentication timer reauthenticate
13. authentication violation protect
14. mka policy policy name
15. dot1x pae authenticator
16. spanning-tree portfast
17. end
18. show authentication session interface interface-id
19. show authentication session interface interface-id details
20. show macsec interface interface-id
21. show mka sessions
22. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
| Step 2 | configure terminal  
Example:  
Switch# configure terminal | Enters global configuration mode. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>interface interface-id</td>
<td>Identify the MACsec interface, and enter interface configuration mode. The interface must be a physical interface.</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport access vlan vlan-id</td>
<td>Configure the access VLAN for the port.</td>
</tr>
<tr>
<td>Step 5</td>
<td>switchport mode access</td>
<td>Configure the interface as an access port.</td>
</tr>
<tr>
<td>Step 6</td>
<td>macsec</td>
<td>Enable 802.1ae MACsec on the interface.</td>
</tr>
<tr>
<td>Step 7</td>
<td>authentication event linksec fail action authorize vlan vlan-id</td>
<td>(Optional) Specify that the switch processes authentication link-security failures resulting from unrecognized user credentials by authorizing a restricted VLAN on the port after a failed authentication attempt.</td>
</tr>
<tr>
<td>Step 8</td>
<td>authentication host-mode multi-domain</td>
<td>Configure authentication manager mode on the port to allow both a host and a voice device to be authenticated on the 802.1x-authorized port. If not configured, the default host mode is single.</td>
</tr>
<tr>
<td>Step 9</td>
<td>authentication linksec policy must-secure</td>
<td>Set the LinkSec security policy to secure the session with MACsec if the peer is available. If not set, the default is <em>should secure</em>.</td>
</tr>
<tr>
<td>Step 10</td>
<td>authentication port-control auto</td>
<td>Enable 802.1x authentication on the port. The port changes to the authorized or unauthorized state based on the authentication exchange between the switch and the client.</td>
</tr>
<tr>
<td>Step 11</td>
<td>authentication periodic</td>
<td>Enable or Disable Reauthentication for this port.</td>
</tr>
<tr>
<td>Step 12</td>
<td>authentication timer reauthenticate</td>
<td>Enter a value between 1 and 65535. Obtains re-authentication timeout value from the server.</td>
</tr>
<tr>
<td>Step 13</td>
<td>authentication violation protect</td>
<td>Configure the port to drop unexpected incoming MAC addresses when a new device connects to a port or when a device connects to a port after the maximum number of devices are connected to that port. If not configured, the default is to shut down the port.</td>
</tr>
<tr>
<td>Step 14</td>
<td>mka policy policy name</td>
<td>Apply an existing MKA protocol policy to the interface, and enable MKA on the interface. If no MKA policy was configured (by entering the <em>mka policy</em> global configuration command), you must apply the MKA default policy to the interface by entering the <em>mka default-policy</em> interface configuration command.</td>

### Configuring MACsec MKA using PSK

**SUMMARY STEPS**

1. configure terminal
2. key chain key-chain-name macsec
3. key hex-string
4. key-string { [0|6|7] pwd-string | pwd-string }
5. lifetime local [start timestamp [hh:mm:ss | day | month | year] [duration seconds | end timestamp [hh:mm:ss | day | month | year]]
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 key chain  key-chain-name macsec</td>
<td>Configures a key chain and enters the key chain configuration mode.</td>
</tr>
<tr>
<td>Step 3 key hex-string</td>
<td>Configures a unique identifier for each key in the keychain and enters the keychain's key configuration mode. <strong>Note</strong> For 128-bit encryption, use 32 hex digit key-string.</td>
</tr>
<tr>
<td>Step 4 key-string { [0</td>
<td>6</td>
</tr>
<tr>
<td>Step 5 lifetime local [start timestamp {hh::mm::ss</td>
<td>day</td>
</tr>
</tbody>
</table>

### Example

Following is an indicative example:

```
Switch(config)# Key chain keychain1 macsec
Switch(config-key-chain)# key 1000
Switch(config-keychain-key)# cryptographic-algorithm gcm-aes-128
Switch(config-keychain-key)# key-string 12345678901234567890123456789012
Switch(config-keychain-key)# lifetime local 12:12:00 July 28 2016 12:19:00 July 28 2016
Switch(config-keychain-key)# end
```

### Configuring MACsec MKA on an Interface using PSK

#### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. macsec network-link
4. mka policy policy-name
5. mka pre-shared-key key-chain key-chain name
6. macsec replay-protection window-size frame number
7. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>--------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>3</td>
<td>macsec network-link</td>
</tr>
<tr>
<td>4</td>
<td>mka policy policy-name</td>
</tr>
<tr>
<td>5</td>
<td>mka pre-shared-key key-chain key-chain name</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>macsec replay-protection window-size frame number</td>
</tr>
<tr>
<td>7</td>
<td>end</td>
</tr>
</tbody>
</table>

**Example**

Following is an indicative example:

```
Switch(config)# interface GigabitEthernet 0/0/0
Switch(config-if)# mka policy mka_policy
Switch(config-if)# mka pre-shared-key key-chain key-chain-name
Switch(config-if)# macsec replay-protection window-size 10
Switch(config-if)# end
```

**What to do next**

It is not recommended to change the MKA policy on an interface with MKA PSK configured when the session is running. However, if a change is required, you must reconfigure the policy as follows:

1. Disable the existing session by removing macsec network-link configuration on each of the participating node using the `no macsec network-link` command
2. Configure the MKA policy on the interface on each of the participating node using the `mka policy policy-name` command.
3. Enable the new session on each of the participating node by using the `macsec network-link` command.

**Configuring MACsec MKA using EAP-TLS**

To configure MACsec with MKA on point-to-point links, perform these tasks:

- Configure Certificate Enrollment
  - Generate Key Pairs
  - Configure SCEP Enrollment
- Configure Certificates Manually
Remote Authentication

Generating Key Pairs

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> crypto key generate rsa label <em>label-name</em> general-keys modulus <em>size</em></td>
<td>Generates a RSA key pair for signing and encryption. You can also assign a label to each key pair using the label keyword. The label is referenced by the trustpoint that uses the key pair. If you do not assign a label, the key pair is automatically labeled &lt;Default-RSA-Key&gt;. If you do not use additional keywords this command generates one general purpose RSA key pair. If the modulus is not specified, the default key modulus of 1024 is used. You can specify other modulus sizes with the modulus keyword.</td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> show authentication session interface <em>interface-id</em></td>
<td>Verifies the authorized session security status.</td>
</tr>
<tr>
<td><strong>Step 5</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Configuring Enrollment using SCEP

Simple Certificate Enrollment Protocol (SCEP) is a Cisco-developed enrollment protocol that uses HTTP to communicate with the certificate authority (CA) or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> crypto pki trustpoint <em>server name</em></td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> enrollment url <em>url name pem</em></td>
<td>Specifies the URL of the CA on which your device should send certificate requests.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
 | An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1:1::1]:80. The pem keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request.

**Step 4** | `rsakeypair label` | Specifies which key pair to associate with the certificate.  
**Note** The `rsakeypair` name must match the trust-point name.

**Step 5** | `serial-number none` | The `none` keyword specifies that a serial number will not be included in the certificate request.

**Step 6** | `ip-address none` | The `none` keyword specifies that no IP address should be included in the certificate request.

**Step 7** | `revocation-check crl` | Specifies CRL as the method to ensure that the certificate of a peer has not been revoked.

**Step 8** | `auto-enroll percent regenerate` | Enables auto-enrollment, allowing the client to automatically request a rollover certificate from the CA.  
If auto-enrollment is not enabled, the client must be manually re-enrolled in your PKI upon certificate expiration.  
By default, only the Domain Name System (DNS) name of the device is included in the certificate.  
Use the `percent` argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached.  
Use the `regenerate` keyword to generate a new key for the certificate even if a named key already exists.  
If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: “! RSA key pair associated with trustpoint is exportable.”  
It is recommended that a new key pair be generated for security reasons.

**Step 9** | `crypto pki authenticate name` | Retrieves the CA certificate and authenticates it.

**Step 10** | `exit` | Exits global configuration mode.

**Step 11** | `show crypto pki certificate trustpoint name` | Displays information about the certificate for the trust point.
Configuring Enrollment Manually

If your CA does not support SCEP or if a network connection between the router and CA is not possible. Perform the following task to set up manual certificate enrollment:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>crypto pki trustpoint server name</td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>enrollment url url name pem</td>
<td>Specifies the URL of the CA on which your device should send certificate requests. An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1::1]:80. The pem keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>rsakeypair label</td>
<td>Specifies which key pair to associate with the certificate.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>serial-number none</td>
<td>The <em>none</em> keyword specifies that a serial number will not be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>ip-address none</td>
<td>The <em>none</em> keyword specifies that no IP address should be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>revocation-check crl</td>
<td>Specifies CRL as the method to ensure that the certificate of a peer has not been revoked.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>exit</td>
<td>Exits Global Configuration mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>crypto pki authenticate name</td>
<td>Retrieves the CA certificate and authenticates it.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>crypto pki enroll name</td>
<td>Generates certificate request and displays the request for copying and pasting into the certificate server. Enter enrollment information when you are prompted. For example, specify whether to include the device FQDN and IP address in the certificate request. You are also given the choice about displaying the certificate request to the console terminal. The base-64 encoded certificate with or without PEM headers as requested is displayed.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>crypto pki import name certificate</td>
<td>Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate. The device attempts to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from “.req” to “.crt”.</td>
</tr>
</tbody>
</table>
PurposeCommand or Action | Purpose
--- | ---
 | usage key certificates, the extensions ‘‘-sign.crt’’ and ‘‘-encr.crt’’ are used.
The device parses the received files, verifies the certificates, and inserts the certificates into the internal certificate database on the switch.

**Note** Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two key pairs generated.

| Step 12 | exit | Exits global configuration mode.
| Step 13 | show crypto pki certificate trustpoint name | Displays information about the certificate for the trust point.
| Step 14 | copy running-config startup-config | (Optional) Saves your entries in the configuration file.

### Enabling 802.1x Authentication and Configuring AAA

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
  * Enter your password if prompted.  
| Step 2 | configure terminal | Enters global configuration mode.  
| Step 3 | aaa new-model | Enables AAA.  
| Step 4 | dot1x system-auth-control | Enables 802.1X on your device.  
| Step 5 | radius server name | Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.  
| Step 6 | address ip-address auth-port port-number acct-port port-number | Configures the IPv4 address for the RADIUS server accounting and authentication parameters.  
| Step 7 | automate-tester username username | Enables the automated testing feature for the RADIUS server.  
  With this practice, the device sends periodic test authentication messages to the RADIUS server. It looks for a RADIUS response from the server. A success
### Configuring EAP-TLS Profile and 802.1x Credentials

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Step 3** eap profile *profile-name* | Configures EAP profile and enters EAP profile configuration mode. |
| **Step 4** method tls | Enables EAP-TLS method on the device. |
| **Step 5** pki-trustpoint *name* | Sets the default PKI trustpoint. |
| **Step 6** exit | Returns to global configuration mode. |
| **Step 7** dot1x credentials *profile-name* | Configures 802.1x credentials profile and enters dot1x credentials configuration mode. |
| **Step 8** username *username* | Sets the authentication user ID. |
| **Step 9** pki-trustpoint *name* | Sets the default PKI trustpoint. |
### Applying the 802.1x MACsec MKA Configuration on Interfaces

To apply MACsec MKA using EAP-TLS to interfaces, perform the following task:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Identifies the MACsec interface, and enter interface configuration mode. The interface must be a physical interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong> macsec network-link</td>
<td>Enables MACsec on the interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong> authentication periodic</td>
<td>Enables reauthentication for this port.</td>
</tr>
<tr>
<td><strong>Step 5</strong> authentication timer reauthenticate interval</td>
<td>Sets the reauthentication interval.</td>
</tr>
<tr>
<td><strong>Step 6</strong> access-session host-mode multi-domain</td>
<td>Allows hosts to gain access to the interface.</td>
</tr>
<tr>
<td><strong>Step 7</strong> access-session closed</td>
<td>Prevents preauthentication access on the interface.</td>
</tr>
<tr>
<td><strong>Step 8</strong> access-session port-control auto</td>
<td>Sets the authorization state of a port.</td>
</tr>
<tr>
<td><strong>Step 9</strong> dot1x pae both</td>
<td>Configures the port as an 802.1X port access entity (PAE) supplicant and authenticator.</td>
</tr>
<tr>
<td><strong>Step 10</strong> dot1x credentials profile</td>
<td>Assigns a 802.1x credentials profile to the interface.</td>
</tr>
<tr>
<td><strong>Step 11</strong> dot1x supplicant eap profile name</td>
<td>Assigns the EAP-TLS profile to the interface.</td>
</tr>
<tr>
<td><strong>Step 12</strong> service-policy type control subscriber control-policy name</td>
<td>Applies a subscriber control policy to the interface.</td>
</tr>
<tr>
<td><strong>Step 13</strong> exit</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 14</strong> show macsec interface</td>
<td>Displays MACsec details for the interface.</td>
</tr>
<tr>
<td><strong>Step 15</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Local Authentication

Configuring the EAP Credentials using Local Authentication

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** | configure terminal | Eneters global configuration mode. |
| **Step 3** | aaa new-model | Enables AAA. |
| **Step 4** | aaa local authentication default authorization default | Sets the default local authentication and default local authorization method. |
| **Step 5** | aaa authentication dot1x default local | Sets the default local username authentication list for IEEE 802.1x. |
| **Step 6** | aaa authorization network default local | Sets an authorization method list for local user. |
| **Step 7** | aaa authorization credential-download default local | Sets an authorization method list for use of local credentials. |
| **Step 8** | exit | Returns to privileged EXEC mode. |

Configuring the Local EAP-TLS Authentication and Authorization Profile

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** | configure terminal | Eneters global configuration mode. |
| **Step 3** | aaa new-model | Enables AAA. |
| **Step 4** | dot1x credentials *profile-name* | Configures the dot1x credentials profile and enters dot1x credentials configuration mode. |
| **Step 5** | username *name* password *password* | Sets the authentication user ID and password. |
| **Step 6** | exit | Returns to global configuration mode. |
| **Step 7** | aaa attribute list *list-name* | (Optional) Sets the AAA attribute list definition and enters attribute list configuration mode. |
| **Step 8** | aaa attribute type linksec-policy must-secure | (Optional) Specifies the AAA attribute type. |
### Command or Action | Purpose
--- | ---
**Step 9** | exit
Returns to global configuration mode.
**Step 10** | username *name aaa attribute list name* *(Optional) Specifies the AAA attribute list for the user ID.*
**Step 11** | end
Returns to privileged EXEC mode.

## Configuring Enrollment using SCEP

Simple Certificate Enrollment Protocol (SCEP) is a Cisco-developed enrollment protocol that uses HTTP to communicate with the certificate authority (CA) or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable Enables privileged EXEC mode. - Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto pki trustpoint <em>servername</em> Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>enrollment url <em>url name pem</em> Specifies the URL of the CA on which your device should send certificate requests. An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1:1::1]:80. The pem keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>rsakeypair <em>label</em> Specifies which key pair to associate with the certificate. <strong>Note</strong> The rsakeypair name must match the trust-point name.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>serial-number none The <em>none</em> keyword specifies that a serial number will not be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>ip-address none The <em>none</em> keyword specifies that no IP address should be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>revocation-check crl Specifies CRL as the method to ensure that the certificate of a peer has not been revoked.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>auto-enroll <em>percent regenerate</em> Enables auto-enrollment, allowing the client to automatically request a rollover certificate from the CA.</td>
</tr>
</tbody>
</table>
If auto-enrollment is not enabled, the client must be manually re-enrolled in your PKI upon certificate expiration.

By default, only the Domain Name System (DNS) name of the device is included in the certificate.

Use the percent argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached.

Use the regenerate keyword to generate a new key for the certificate even if a named key already exists.

If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: “RSA key pair associated with trustpoint is exportable.”

It is recommended that a new key pair be generated for security reasons.

### Configuring Enrollment Manually

If your CA does not support SCEP or if a network connection between the router and CA is not possible. Perform the following task to set up manual certificate enrollment:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>configuration terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>crypto pki trustpoint server name</td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td>enrollment url url name pem</td>
<td>Specifies the URL of the CA on which your device should send certificate requests. An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1:1::1]:80.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 5</strong> rsakeypair <em>label</em></td>
<td>Specifies which key pair to associate with the certificate.</td>
</tr>
<tr>
<td><strong>Step 6</strong> serial-number none</td>
<td>The <em>none</em> keyword specifies that a serial number will not be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 7</strong> ip-address none</td>
<td>The <em>none</em> keyword specifies that no IP address should be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 8</strong> revocation-check crl</td>
<td>Specifies CRL as the method to ensure that the certificate of a peer has not been revoked.</td>
</tr>
<tr>
<td><strong>Step 9</strong> exit</td>
<td>Exits Global Configuration mode.</td>
</tr>
<tr>
<td><strong>Step 10</strong> crypto pki authenticate <em>name</em></td>
<td>Retrieves the CA certificate and authenticates it.</td>
</tr>
<tr>
<td><strong>Step 11</strong> crypto pki enroll <em>name</em></td>
<td>Generates certificate request and displays the request for copying and pasting into the certificate server. Enter enrollment information when you are prompted. For example, specify whether to include the device FQDN and IP address in the certificate request. You are also given the choice about displaying the certificate request to the console terminal. The base-64 encoded certificate with or without PEM headers as requested is displayed.</td>
</tr>
<tr>
<td><strong>Step 12</strong> crypto pki import <em>name</em> <em>certificate</em></td>
<td>Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate. The device attempts to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from “.req” to “.crt”. For usage key certificates, the extensions “-sign.crt” and “-encr.crt” are used. The device parses the received files, verifies the certificates, and inserts the certificates into the internal certificate database on the switch. Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two key pairs generated.</td>
</tr>
<tr>
<td><strong>Step 13</strong> exit</td>
<td>Exits Global Configuration mode.</td>
</tr>
</tbody>
</table>
### Configuring EAP-TLS Profile and 802.1x Credentials

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>• Enteryourpasswordifprompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> eap profile <em>profile-name</em></td>
<td>Configures EAP profile and enters EAP profile configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> method tls</td>
<td>Enables EAP-TLS method on the device.</td>
</tr>
<tr>
<td><strong>Step 5</strong> pki-trustpoint <em>name</em></td>
<td>Sets the default PKI trustpoint.</td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> dot1x credentials <em>profile-name</em></td>
<td>Configures 802.1x credentials profile and enters dot1x credentials configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> username <em>username</em></td>
<td>Sets the authentication user ID.</td>
</tr>
<tr>
<td><strong>Step 9</strong> pki-trustpoint <em>name</em></td>
<td>Sets the default PKI trustpoint.</td>
</tr>
<tr>
<td><strong>Step 10</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Applying the 802.1x MKA MACsec Configuration on Interfaces

To apply MKA MACsec using EAP-TLS to interfaces, perform the following task:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>• Enteryourpasswordifprompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> interface <em>interface-id</em></td>
<td>Identifies the MACsec interface, and enter interface configuration mode. The interface must be a physical interface.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Step 4  macsec</td>
<td>Enables MACsec on the interface.</td>
</tr>
<tr>
<td>Step 5  authentication periodic</td>
<td>Enables reauthentication for this port.</td>
</tr>
<tr>
<td>Step 6  authentication timer reauthenticate interval</td>
<td>Sets the reauthentication interval.</td>
</tr>
<tr>
<td>Step 7  access-session host-mode multi-domain</td>
<td>Allows hosts to gain access to the interface.</td>
</tr>
<tr>
<td>Step 8  access-session closed</td>
<td>Prevents preauthentication access on the interface.</td>
</tr>
<tr>
<td>Step 9  access-session port-control auto</td>
<td>Sets the authorization state of a port.</td>
</tr>
<tr>
<td>Step 10 dot1x pae both</td>
<td>Configures the port as an 802.1X port access entity (PAE) supplicant and authenticator.</td>
</tr>
<tr>
<td>Step 11 dot1x credentials profile</td>
<td>Assigns a 802.1x credentials profile to the interface.</td>
</tr>
<tr>
<td>Step 12 dot1x authenticator eap profile name</td>
<td>Assigns the EAP-TLS authenticator profile to the interface.</td>
</tr>
<tr>
<td>Step 13 dot1x supplicant eap profile name</td>
<td>Assigns the EAP-TLS supplicant profile to the interface.</td>
</tr>
<tr>
<td>Step 14 service-policy type control subscriber control-policy name</td>
<td>Applies a subscriber control policy to the interface.</td>
</tr>
<tr>
<td>Step 15 exit</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 16 show macsec interface</td>
<td>Displays MACsec details for the interface.</td>
</tr>
<tr>
<td>Step 17 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Verifying MACsec MKA using EAP-TLS**

Use the following `show` commands to verify the configuration of MACsec MKA using EAP-TLS. Given below are the sample outputs of the `show` commands.

The `show mka sessions` command displays a summary of active MACsec Key Agreement (MKA) Protocol sessions.

```
Device# show mka sessions

Total MKA Sessions....... 1
  Secured Sessions... 1
  Pending Sessions... 0

Interface Local-TxSCI Policy-Name Inherited Key-Server
Port-ID Peer-RxSCI MACsec-Peers Status CKN

Te0/1/3 74a2.e625.4413/0013 *DEFAULT POLICY* NO YES
19 74a2.e625.4c22/0012 1 Secured
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)
The `show macsec status interface interface-id` command displays MACsec status information for the given interface.

Device# show macsec status interface te0/1/2

Capabilities:
- Cipher: GCM-AES-128
- Cipher: GCM-AES-256
- Confidentiality Offset: 0
- Replay Window: 64
- Delay Protect Enable: FALSE
- Access Control: must-secure

Transmit SC:
- SCI: 74A2E6254C220012
- Transmitting: TRUE

Transmit SA:
- Next PN: 412
- Delay Protect AN/nextPN: 99/0

Receive SC:
- SCI: 74A2E62544130013
- Receiving: TRUE

Receive SA:
- Next PN: 64
- AN: 0
- Delay Protect AN/LPN: 0/0

The `show access-session interface interface-id details` command displays detailed information about the access session for the given interface.

Device# show access-session interface te1/0/1 details

Interface: TenGigabitEthernet1/0/1
- IIF-ID: 0x17298FCD
- MAC Address: f8a5.c592.13e4

Configuring Cisco TrustSec MACsec

Configuring Cisco TrustSec Credentials on the Switch

To enable Cisco TrustSec features, you must create Cisco TrustSec credentials on the switch to use in other TrustSec configurations. Beginning in privilege EXEC mode, follow these steps to configure Cisco TrustSec credentials.

**SUMMARY STEPS**

1. `cts credentials id device-id password cts-password`
2. `show cts credentials`
3. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `cts credentials id device-id password cts-password` | Specifies the Cisco TrustSec credentials for this switch to use when authenticating with other Cisco TrustSec devices with EAP-FAST.  
  - `id` — Specifies a Cisco TrustSec device ID for the switch. The device-id argument has a maximum length of 32 characters and is case sensitive  
  - `password cts-password` — Specifies the Cisco TrustSec password for the device. |
|       | **Example:**  
Switch# `cts credentials id trustsec password mypassword` | |
| Step 2 | `show cts credentials` | (Optional) Displays Cisco TrustSec credentials configured on the switch. |
|       | **Example:**  
Switch# `show cts credentials` | |
| Step 3 | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
|       | **Example:**  
Switch# `copy running-config startup-config` | |

**Example**

To delete the Cisco TrustSec credentials, enter the `clear cts credentials` privileged EXEC command.

This example shows how to create Cisco TrustSec credentials.

`Switch# cts credentials id trustsec password mypassword`

CTS device ID and password have been inserted in the local keystore. Please make sure that the same ID and password are configured in the server database.
Switch# show cts credentials
CTS password is defined in keystore, device-id = trustsec

What to do next

Before you configure Cisco TrustSec MACsec authentication, you should configure Cisco TrustSec seed and non-seed devices. For 802.1x mode, you must configure at least one seed device, that device closest to the access control system (ACS). See this section in the Cisco TrustSec Configuration Guide: http://www.cisco.com/en/US/docs/switches/lan/trustsec/configuration/guide/ident-conn_config.html

Configuring Cisco TrustSec Switch-to-Switch Link Security in 802.1x Mode

Before you begin

You enable Cisco TrustSec link layer switch-to-switch security on an interface that connects to another Cisco TrustSec device. When configuring Cisco TrustSec in 802.1x mode on an interface, follow these guidelines:

• To use 802.1x mode, you must globally enable 802.1x on each device. For more information 802.1x, see the Configuring IEEE 802.1x Port-Based Authentication chapter.

• If you select GCM as the SAP operating mode, you must have a MACsec encryption software license from Cisco. MACsec is supported on Catalyst 3560cx universal IP base and IP services licenses. It is not supported with the NPE license or with a LAN base service image.

  If you select GCM without the required license, the interface is forced to a link-down state.

Beginning in privilege EXEC mode, follow these steps to configure Cisco TrustSec switch-to-switch link layer security with 802.1x:

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. cts dot1x
4. sap mode-list mode1 [ mode2 [ mode3 [ mode4 ] ] ]
5. no propagate sgt
6. exit
7. end
8. show cts interface [ interface-id ] [ brief | summary ]
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><em>Note</em></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

#### Command or Action

<table>
<thead>
<tr>
<th>Example:</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# interface tengigabitethernet 1/1/2</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 3

**cts dotlx**

**Example:**

Switch(config-if)# cts dotlx

**ConfigurestheinterfacetoperformNDACauthentication.**

#### Step 4

**sap mode-listmode1 [mode2 [mode3 [mode4]]]]**

**Example:**

Switch(config-if-cts-dotlx)# sap mode-list gcm-encrypt null no-encap

**Optional** Configures the SAP operation mode on the interface. The interface negotiates with the peer for a mutually acceptable mode. Enter the acceptable modes in your order of preference.

**Choices for mode are:**

- **gcm-encrypt**—Authentication and encryption

  **Note** Select this mode for MACsec authentication and encryption if your software license supports MACsec encryption.

- **gmac**—Authentication, no encryption

- **no-encap**—No encapsulation

- **null**—Encapsulation, no authentication or encryption

  **Note** If the interface is not capable of data link encryption, no-encap is the default and the only available SAP operating mode. SGT is not supported.

  **Note** Although visible in the CLI help, the timer reauthentication and propagate sgt keywords are not supported.

#### Step 5

**no propagate sgt**

**Example:**

Switch(config-if-cts-dotlx)# no propagate sgt

**The switch (Catalyst 3560cx) does not support SGT tagging. This command disables propagation of SGT tag on the CTS link. It is mandatory that for the peer switch also to have "no propagate sgt" configured for the traffic to flow properly over the CTS link.**

#### Step 6

**exit**

**Example:**

Switch(config-if-cts-dotlx)# exit

**Exits Cisco TrustSec 802.1x interface configuration mode.**

#### Step 7

**end**

**Example:**

Switch(config-if)# end

**Returns to privileged EXEC mode.**
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong> show cts interface [interface-id</td>
<td>brief</td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to enable Cisco TrustSec authentication in 802.1x mode on an interface using GCM as the preferred SAP mode:

```
Switch# configure terminal
Switch(config)# interface tengigabitethernet 1/1/2
Switch(config-if)# cts dot1x
Switch(config-if-cts-dot1x)# sap mode-list gcm-encrypt null no-encap
Switch(config-if-cts-dot1x)# no propagate sgt
Switch(config-if-cts-dot1x)# exit
Switch(config-if)# end
```

**Configuring Cisco TrustSec Switch-to-Switch Link Security in Manual Mode**

**Before you begin**

When manually configuring Cisco TrustSec on an interface, consider these usage guidelines and restrictions:

- If no SAP parameters are defined, Cisco TrustSec encapsulation or encryption is not performed.
- If you select GCM as the SAP operating mode, you must have a MACsec Encryption software license from Cisco. If you select GCM without the required license, the interface is forced to a link-down state.
- These protection levels are supported when you configure SAP pairwise master key (sap pmk):
  - SAP is not configured—no protection.
  - sap mode-list gcm-encrypt gmac no-encap—protection desirable but not mandatory.
  - sap mode-list gcm-encrypt gmac—confidentiality preferred and integrity required. The protection is selected by the supplicant according to supplicant preference.
  - sap mode-list gmac—integrity only.
  - sap mode-list gcm-encrypt—confidentiality required.
  - sap mode-list gmac gcm-encrypt—integrity required and preferred, confidentiality optional.

Beginning in privileged EXEC mode, follow these steps to manually configure Cisco TrustSec on an interface to another Cisco TrustSec device:
### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `cts manual`
4. `sap pmk key [mode-list mode1 [mode2 [mode3 [mode4]]]]`
5. `no propagate sgt`
6. `exit`
7. `end`
8. `show cts interface [interface-id | brief | summary]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example: Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# <code>interface tengigabitethernet 1/1/2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters Cisco TrustSec manual configuration mode.</td>
</tr>
<tr>
<td><code>cts manual</code></td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config-if)# <code>cts manual</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Configures the SAP pairwise master key (PMK) and operation mode. SAP is disabled by default in Cisco TrustSec manual mode.</td>
</tr>
<tr>
<td><code>sap pmk key [mode-list mode1 [mode2 [mode3 [mode4]]]]</code></td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config-if-cts-manual)# <code>sap pmk 1234abcdef mode-list gcm-encrypt null no-encap</code></td>
<td></td>
</tr>
</tbody>
</table>

The SAP operation mode options:

- `gcm-encrypt`—Authentication and encryption
  
  **Note** Select this mode for MACsec authentication and encryption if your software license supports MACsec encryption.

- `gmac`—Authentication, no encryption

- `no-encap`—No encapsulation

- `null`—Encapsulation, no authentication or encryption
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 5** | no propagate sgt
**Example:**
Switch(config-if-cts-manual)# no propagate sgt |
| **Step 6** | exit
**Example:**
Switch(config-if-cts-manual)# exit |
| **Step 7** | end
**Example:**
Switch(config-if)# end |
| **Step 8** | show cts interface [interface-id | brief | summary] |

#### Note
If the interface is not capable of data link encryption, **no-encap** is the default and the only available SAP operating mode. SGT is not supported.

Use the **no** form of this command when the peer is incapable of processing a SGT. The **no propagate sgt** command prevents the interface from transmitting the SGT to the peer.

Exits Cisco TrustSec 802.1x interface configuration mode.

Returns to privileged EXEC mode.

(Optional) Verify the configuration by displaying TrustSec-related interface characteristics.

---

### Example

This example shows how to configure Cisco TrustSec authentication in manual mode on an interface:

```
Switch# configure terminal
Switch(config)# interface tengigabitethernet 1/1/2
Switch(config-if)# cts manual
Switch(config-if-cts-manual)# sap pmk 1234abcd ef mode-list gcm-encrypt null no-encap
Switch(config-if-cts-manual)# no propagate sgt
Switch(config-if-cts-manual)# exit
Switch(config-if)# end
```

---

### Configuration Examples for Configuring MACsec Encryption

#### Example: Configuring MACsec on an Interface

Configuring MACsec on an Interface

```
Switch(config)# interface GigabitEthernet1/0/25
Switch(config-if)# switchport access vlan 10
Switch(config-if)# switchport mode access
Switch(config-if)# macsec
Switch(config-if)# authentication event linksec fail action authorize vlan 2
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# authentication linksec policy must-secure
```
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication periodic
Switch(config-if)# authentication timer reauthenticate
Switch(config-if)# authentication violation protect
Switch(config-if)# mka policy replay-policy

Cisco TrustSec Switch-to-Switch Link Security Configuration Example

This example shows the configuration necessary for a seed and non-seed device for Cisco TrustSec switch-to-switch security. You must configure the AAA and RADIUS for link security. In this example, ACS-1 through ACS-3 can be any server names and cts-radius is the Cisco TrustSec server.

Seed Device Configuration:

```
Switch(config)# aaa new-model
Switch(config)# radius server ACS-1
Switch(config-radius-server)# address ipv4 10.5.120.12 auth-port 1812 acct-port 1813
Switch(config-radius-server)# pac key cisco123
Switch(config-radius-server)# exit
Switch(config)# radius server ACS-2
Switch(config-radius-server)# address ipv4 10.5.120.14 auth-port 1812 acct-port 1813
Switch(config-radius-server)# pac key cisco123
Switch(config-radius-server)# exit
Switch(config)# radius server ACS-3
Switch(config-radius-server)# address ipv4 10.5.120.15 auth-port 1812 acct-port 1813
Switch(config-radius-server)# pac key cisco123
Switch(config-radius-server)# exit
Switch(config)# aaa group server radius cts-radius
Switch(config-sg-radius)# server name ACS-1
Switch(config-sg-radius)# server name ACS-2
Switch(config-sg-radius)# server name ACS-3
Switch(config-sg-radius)# exit
Switch(config)# aaa authentication login default none
Switch(config)# aaa authentication dot1x default group cts-radius
Switch(config)# aaa authorization network cts-radius group cts-radius
Switch(config)# aaa session-id common
Switch(config)# cts authorization list cts-radius
Switch(config)# dot1x system-auth-control
Switch(config)# interface gi1/1/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# cts dot1x
Switch(config-if-cts-dot1x)# sap mode-list gcm-encrypt gmac
Switch(config-if-cts-dot1x)# no propagate sgt
Switch(config-if-cts-dot1x)# exit

CHAPTER 71

Web-Based Authentication

This chapter describes how to configure web-based authentication on the device. It contains these sections:

• Finding Feature Information, on page 1541
• Web-Based Authentication Overview, on page 1541
• How to Configure Web-Based Authentication, on page 1550
• Verifying Web-Based Authentication Status, on page 1564

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Web-Based Authentication Overview

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.

Note

HTTPS traffic interception for central web authentication redirect is not supported.
You should use global parameter-map (for method-type, custom, and redirect) only for using the same web authentication methods like consent, web consent, and webauth, for all the clients and SSIDs. This ensures that all the clients have the same web-authentication method.

If the requirement is to use Consent for one SSID and Web-authentication for another SSID, then you should use two named parameter-maps. You should configure Consent in first parameter-map and configure webauth in second parameter-map.

The traceback that you receive when webauth client tries to do authentication does not have any performance or behavioral impact. It happens rarely when the context for which FFM replied back to EPM for ACL application is already dequeued (possibly due to timer expiry) and the session becomes ‘unauthorized’.

Based on where the web pages are hosted, the local web authentication can be categorized as follows:

- **Internal**—The internal default HTML pages (Login, Success, Fail, and Expire) in the controller are used during the local web authentication.
- **Customized**—The customized web pages (Login, Success, Fail, and Expire) are downloaded onto the controller and used during the local web authentication.
- **External**—The customized web pages are hosted on the external web server instead of using the in-built or custom web pages.

Based on the various web authentication pages, the types of web authentication are as follows:

- **Webauth**—This is a basic web authentication. Herein, the controller presents a policy page with the user name and password. You need to enter the correct credentials to access the network.
- **Consent or web-passsthrough**—Herein, the controller presents a policy page with the Accept or Deny buttons. You need to click the Accept button to access the network.
- **Webconsent**—This is a combination of webauth and consent web authentication types. Herein, the controller presents a policy page with Accept or Deny buttons along with username or password. You need to enter the correct credentials and click the Accept button to access the network.

**Device Roles**

With web-based authentication, the devices in the network have these specific roles:

- **Client**—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with Java Script enabled.

- **Authentication server**—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.

- **Switch**—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.
**Host Detection**

The switch maintains an IP device tracking table to store information about detected hosts.

---

**Note**

By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- ARP based trigger—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.
- Dynamic ARP inspection
- DHCP snooping—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.

**Session Creation**

When web-based authentication detects a new host, it creates a session as follows:

- Reviews the exception list.
  
  If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.

- Reviews for authorization bypass
  
  If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.

  If the server response is access accepted, authorization is bypassed for this host. The session is established.

- Sets up the HTTP intercept ACL
  
  If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.
Authentication Process

When you enable web-based authentication, these events occur:

• The user initiates an HTTP session.

• The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.

• If the authentication succeeds, the switch downloads and activates the user’s access policy from the authentication server. The login success page is sent to the user.

• If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.

• If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.

• The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.

• The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface.

• The feature applies the downloaded timeout or the locally configured session timeout.

• If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.

• If the terminate action is default, the session is dismantled, and the applied policy is removed.

Local Web Authentication Banner

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.

The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

• Authentication Successful

• Authentication Failed

• Authentication Expired

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:

• Legacy mode—Use the `ip admission auth-proxy-banner http` global configuration command.

• New-style mode—Use the `parameter-map type weauth global banner` global configuration command.

The default banner `Cisco Systems` and `Switch host-name Authentication` appear on the Login Page. `Cisco Systems` appears on the authentication result pop-up page.
The banner can be customized as follows:

- Add a message, such as switch, router, or company name to the banner:
  - Legacy mode—Use the `ip admission auth-proxy-banner http banner-text` global configuration command.
  - New-style mode—Use the `parameter-map type webauth global banner` global configuration command.

- Add a logo or text file to the banner:
  - Legacy mode—Use the `ip admission auth-proxy-banner http file-path` global configuration command.
  - New-style mode—Use the `parameter-map type webauth global banner` global configuration command.
If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.
Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

- **Login**—Your credentials are requested.
- **Success**—The login was successful.
- **Fail**—The login failed.
- **Expire**—The login session has expired because of excessive login failures.

Guidelines

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the *login*, *success*, *failure*, and *expire* web pages.
- On the banner page, you can specify text in the login page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, http://www.cisco.com). An incomplete URL might cause *page not found* or similar errors on a web browser.
- If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).
- The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.
- If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.
- Configured web pages can be copied to the switch boot flash or flash.
- The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).
- You must configure all four pages.
- The banner page has no effect if it is configured with the web page.
- All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use `web_auth_<filename>` as the file name.
- The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.
When configuring customized authentication proxy web pages, follow these guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.

- The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.

- Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.

- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.

- To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.

- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.

- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.

- To remove the specification of a custom file, use the **no** form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as **uname** and **pwd**.

- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.
Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

• If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.

• If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.

• To remove the specification of a redirection URL, use the no form of the command.

• If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, http://) followed by the URL information. If only the URL is given without http://, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

Web-based Authentication Interactions with Other Features

Port Security

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.

LAN Port IP

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated by using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated, and posture is validated again.

Gateway IP

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

ACLs

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.
Context-Based Access Control

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

EtherChannel

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

How to Configure Web-Based Authentication

Default Web-Based Authentication Configuration

The following table shows the default web-based authentication configuration.

Table 154: Default Web-based Authentication Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>

</tr>
<tr>
<td>Inactivity timeout</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Web-Based Authentication Configuration Guidelines and Restrictions

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- External web authentication, where the switch redirects a client to a particular host or web server for displaying login message, is not supported.
- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must enable SISF-Based device tracking to use web-based authentication. By default, SISF-Based device tracking is disabled on a switch.
You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.

Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.

Web-based authentication does not support VLAN assignment as a downloadable-host policy.

Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.

Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.

Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:

- Host name
- Host IP address
- Host name and specific UDP port numbers
- IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

When you configure the RADIUS server parameters:

- Specify the key string on a separate command line.
- For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
- When you specify the key string, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
- You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the radius-server host global configuration command. If you want to configure these options on a per-server basis, use the radius-server timeout, radius-server transmit, and the radius-server key global configuration commands.

You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.
Configuring the Authentication Rule and Interfaces

Follow these steps to configure the authentication rule and interfaces:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip admission name name proxy http`
4. `interface type slot/port`
5. `ip access-group name`
6. `ip admission name`
7. `exit`
8. `ip device tracking`
9. `end`
10. `show ip admission status`
11. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission name name proxy http</td>
<td>Configures an authentication rule for web-based authorization.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip admission name webauth1 proxy http</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> interface type slot/port</td>
<td>Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication.</td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet 1/0/1</td>
<td>type can be fastethernet, gigabit ethernet, or tengigabitethernet.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip access-group name</td>
<td>Applies the default ACL.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config-if)# ip access-group webauthag</code></td>
<td>Configures an authentication rule for web-based authorization for the interface.</td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>ip admission name</code></td>
<td>Configures an authentication rule for web-based authorization for the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# ip admission name</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>exit</code></td>
<td>Returns to configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>ip device tracking</code></td>
<td>Enables the IP device tracking table.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# ip device tracking</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> <code>show ip admission status</code></td>
<td>Displays the configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# show ip admission</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Configuring AAA Authentication

#### SUMMARY STEPS

1. `aaa new-model`
2. `aaa authentication login default group {tacacs+ | radius}`
3. `aaa authorization auth-proxy default group {tacacs+ | radius}`
4. `tacacs-server host {hostname | ip_address}`
5. `tacacs-server key {key-data}`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** aaa new-model  
  Example:  
  Switch(config)# aaa new-model | Enables AAA functionality. |
| **Step 2** aaa authentication login default group {tacacs+ | radius}  
  Example:  
  Switch(config)# aaa authentication login default group tacacs+ | Defines the list of authentication methods at login.  
  named_authentication_list refers to any name that is not greater than 31 characters.  
  AAA_group_name refers to the server group name. You need to define the server-group server_name at the beginning itself. |
| **Step 3** aaa authorization auth-proxy default group {tacacs+ | radius}  
  Example:  
  Switch(config)# aaa authorization auth-proxy default group tacacs+ | Creates an authorization method list for web-based authorization. |
| **Step 4** tacacs-server host {hostname | ip_address}  
  Example:  
  Switch(config)# tacacs-server host 10.1.1.1 | Specifies an AAA server. |
| **Step 5** tacacs-server key {key-data}  
  Example:  
  Switch(config)# tacacs-server key | Configures the authorization and encryption key used between the switch and the TACACS server. |

### Configuring Switch-to-RADIUS-Server Communication

Follow these steps to configure the RADIUS server parameters:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip radius source-interface vlan vlan interface number`
4. `radius-server host {hostname | ip-address} test username username`
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt;</code> <code>enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| `configure terminal` |   |   |
| Example:           |   |   |
| `Switch# configure terminal` |   |   |

| **Step 3**        | Specifies that the RADIUS packets have the IP address of the indicated interface. |
| `ip radius source-interface vlan vlan interface number` |   |   |
| Example:          |   |   |
| `Switch(config)# ip radius source-interface vlan 80` |   |   |

| **Step 4**        | Specifies the host name or IP address of the remote RADIUS server. |
| `radius-server host {hostname | ip-address} test username username` |   |   |
| Example:          |   |   |
| `Switch(config)# radius-server host 172.120.39.46 test username user1` |   |   |

| **Step 5**        | Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. |
| `radius-server key string` |   |   |
| Example:          |   |   |
| `Switch(config)# radius-server key rad123` |   |   |

| **Step 6**        | Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive. The range of `num-tries` is 1 to 100. |
| `radius-server dead-criteria tries num-tries` |   |   |
| Example:          |   |   |
| `Switch(config)# radius-server dead-criteria tries 30` |   |   |
Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the Switch. You can enable the server for either HTTP or HTTPS.

*Note*

The Apple pseudo-browser will not open if you configure only the `ip http secure-server` command. You should also configure the `ip http server` command.

Follow the procedure given below to enable the server for either HTTP or HTTPS:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip http server`
4. `ip http secure-server`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>ip http server</code></td>
<td>Enables the HTTP server. The web-based authentication feature uses the</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>HTTP server to communicate with the hosts for user authentication.</td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# ip http server</code></td>
<td></td>
</tr>
</tbody>
</table>
### Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the Switch default HTML pages during web-based authentication.

Follow these steps to specify the use of your custom authentication proxy web pages:

#### Before you begin

Store your custom HTML files on the Switch flash memory.

#### SUMMARY STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>2.</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3.</td>
<td>ip admission proxy http login page file device:login-filename</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>ip admission proxy http success page file device:success-filename</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>ip admission proxy http failure page file device:fail-filename</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td>ip admission proxy http login expired page file device:expired-filename</td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

#### DETAILED STEPS

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip admission proxy http login page file device:login-filename</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip admission proxy http login page file disk1:login.htm</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip admission proxy http success page file device:success-filename</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip admission proxy http success page file disk1:success.htm</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ip admission proxy http failure page file device:fail-filename</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip admission proxy http fail page file disk1:fail.htm</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>ip admission proxy http login expired page file device:expired-filename</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip admission proxy http login expired page file disk1:expired.htm</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

## Specifying a Redirection URL for Successful Login

Follow these steps to specify a URL to which the user is redirected after authentication, effectively replacing the internal Success HTML page:

### SUMMARY STEPS

1. **enable**

---

**Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)**
2. configure terminal
3. ip admission proxy http success redirect url-string
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies a URL for redirection of the user in place of the default login success page.</td>
</tr>
<tr>
<td>ip admission proxy http success redirect url-string</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip admission proxy http success redirect <a href="http://www.example.com">www.example.com</a></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring Web-Based Authentication Parameters**

Follow these steps to configure the maximum number of failed login attempts before the client is placed in a watch list for a waiting period:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip admission max-login-attempts number
4. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

Device> enable

### Purpose

- Enter your password if prompted.

### Step 2

**command terminal**

**Example:**

Device# configure terminal

### Purpose

Enters global configuration mode.

### Step 3

**ip admission max-login-attempts** *number*

**Example:**

Device(config)# ip admission max-login-attempts 10

### Purpose

Sets the maximum number of failed login attempts. The range is 1 to 2147483647 attempts. The default is 5.

### Step 4

**exit**

**Example:**

Device# exit

### Purpose

Exits global configuration mode and returns to privileged EXEC mode.

---

### Configuring a Web-Based Authentication Local Banner

Follow these steps to configure a local banner on a switch that has web authentication configured.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip admission auth-proxy-banner http [banner-text | file-path]
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch&gt; enable</td>
<td>* Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission auth-proxy-banner http [banner-text</td>
<td>banner-text or file-path]</td>
</tr>
<tr>
<td>Example: Switch(config)# ip admission auth-proxy-banner http C My Switch C</td>
<td>(Optional) Create a custom banner by entering C banner-text C (where C is a delimiting character), or file-path that indicates a file (for example, a logo or text file) that appears in the banner.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Web-Based Authentication without SVI

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client without creating an IP address in the routing table. These steps are optional.

### SUMMARY STEPS

1. enable
2. configure terminal
3. parameter-map type webauth global
4. l2-webauth-enabled
5. end
6. show running-config
7. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> parameter-map type webauth global</td>
<td>Creates a parameter map and enters parameter-map webauth configuration mode. The specific configuration commands supported for a global parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the parameter-map-name argument.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch (config)# parameter-map type webauth global</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> l2-webauth-enabled</td>
<td>Enables the web-based authentication without SVI feature</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch (config-params-parameter-map)# l2-webauth-enabled</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Web-Based Authentication with VRF Aware

You configure the web-based authentication with VRF aware to redirect the HTML login page to the client. These steps are optional.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `parameter-map type webauth global`
4. `webauth-vrf-aware`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
* Enter your password if prompted. |
| Example: | Switch> `enable` |
| Step 2 | `configure terminal` | Enters global configuration mode. |
| Example: | Switch# `configure terminal` |
| Step 3 | `parameter-map type webauth global` | Creates a parameter map and enters parameter-map webauth configuration mode. The specific configuration commands supported for a global parameter map defined with the `global` keyword differ from the commands supported for a named parameter map defined with the `parameter-map-name` argument. |
| Example: | Switch (config)# `parameter-map type webauth global` |
| Step 4 | `webauth-vrf-aware` | Enables the web-based authentication VRF aware feature on SVI. |
| Example: | Switch (config-params-parameter-map)# `webauth-vrf-aware` |
| Step 5 | `end` | Returns to privileged EXEC mode. |
| Example: | Switch(config)# `end` |
| Step 6 | `show running-config` | Verifies your entries. |
| Example: | Switch# `show running-config` |
Removing Web-Based Authentication Cache Entries

Follow these steps to remove web-based authentication cache entries:

**SUMMARY STEPS**

1. `enable`
2. `clear ip auth-proxy cache { * | host ip address }`
3. `clear ip admission cache { * | host ip address }`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  `enable`
  Example:
  ```
  Switch> enable
  ```
  Enables privileged EXEC mode.
  • Enter your password if prompted.

| **Step 2**
  `clear ip auth-proxy cache { * | host ip address }`
  Example:
  ```
  Switch# clear ip auth-proxy cache 192.168.4.5
  ```
  Delete authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.

| **Step 3**
  `clear ip admission cache { * | host ip address }`
  Example:
  ```
  Switch# clear ip admission cache 192.168.4.5
  ```
  Delete authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.

**Verifying Web-Based Authentication Status**

Use the commands in this topic to display the web-based authentication settings for all interfaces or for specific ports.
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show authentication sessions method webauth</code></td>
<td>Displays the web-based authentication settings for all interfaces for fastethernet, gigabitethernet, or tengigabitethernet</td>
</tr>
<tr>
<td><code>show wireless client mac-address a.a.a detail</code></td>
<td>Displays the session specific wireless information and wireless states.</td>
</tr>
<tr>
<td><code>show authentication sessions interface type slot/port[details]</code></td>
<td>Displays the web-based authentication settings for the specified interface for fastethernet, gigabitethernet, or tengigabitethernet. In Session Aware Networking mode, use the <code>show access-session interface</code> command.</td>
</tr>
</tbody>
</table>
Verifying Web-Based Authentication Status
Auto Identity

The Auto Identity feature provides a set of built-in policies at global configuration and interface configuration modes. This feature is available only in Class-Based Policy Language (CPL) control policy-equivalent new-style mode. To convert all the relevant authentication commands to their CPL control policy-equivalents, use the `authentication convert-to new-style` command.

This module describes the feature and explains how to configure it.

- Finding Feature Information, on page 1567
- Information About Auto Identity, on page 1567
- How to Configure Auto Identity, on page 1571
- Configuration Examples for Auto Identity, on page 1573
- Verifying Auto Identity, on page 1574
- Feature Information for Auto Identity, on page 1577

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Auto Identity

Auto Identity Overview

The Cisco Identity-Based Networking Services (IBNS) solution provides a policy and identity-based framework in which edge devices can deliver flexible and scalable services to subscribers. IBNS allows the concurrent operation of IEEE 802.1x (dot1x), MAC authentication bypass (MAB), and web authentication methods, making it possible to invoke multiple authentication methods in parallel, on a single subscriber session. These authentication methods, dot1x, authentication, authorization, and accounting (AAA), and RADIUS are available in global configuration and interface configuration modes.
The Auto Identity feature uses the Cisco Common Classification Policy Language-based configuration that significantly reduces the number of commands used to configure both authentication methods and interface-level commands. The Auto Identity feature provides a set of built-in policies that are based on policy maps, class maps, parameter maps, and interface templates.

In global configuration mode, the **source template AI_GLOBAL_CONFIG_TEMPLATE** command enables the Auto Identity feature. In interface configuration mode, configure the **AI_MONITOR_MODE**, **AI_LOW_IMPACT_MODE**, or **AI_CLOSED_MODE** interface templates to enable the feature on interfaces.

You can configure multiple templates; however, you must bind multiple templates together using the **merge** command. If you do not bind the templates, the last configured template is used. While binding templates, if the same command is repeated in two templates with different arguments, the last configured command is used.

---

**Note**
You can also enable user-defined templates that are configured using the **template name** command in global configuration mode.

Use the **show template interface** or **show template global** commands to display information about built-in templates. Built-in templates can be edited. Built-in template information is displayed in the output of the **show running-config** command, if the template is edited. If you delete an edited built-in template, the built-in template reverts to the default and is not deleted from the configuration. However, if you delete a user-defined template, it is deleted from the configuration.

---

**Note**
Before you delete a template, ensure that it is not attached to a device.

### Auto Identity Global Template

To enable the global template, configure the **source template template-name** command.

---

**Note**
You must configure the RADIUS server commands, because these are not automatically configured when the global template is enabled.

The following example shows how to enable the global template:

```
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 172.20.254.4 auth-port 1645 acct-port 1646
Switch(config-radius-server)# key cisco
Switch(config-radius-server)# end
```

The **AI_GLOBAL_CONFIG_TEMPLATE** automatically configures the following commands:

- `dot1x system-auth-control`
- `aaa new-model`
- `aaa authentication dot1x default group radius`
- `aaa authorization network default group radius`
- `aaa authorization auth-proxy default group radius`
- `aaa accounting identity default start-stop group radius`
- `aaa accounting system default start-stop group radius`
Auto Identity Interface Templates

The following interface templates are available in the Auto Identity feature:

- **AI_MONITOR_MODE**—Passively monitors sessions that have authentication in open mode.
- **AI_LOW_IMPACT_MODE**—Similar to monitor mode, but with a configured static policy such as a port access control list (PACL).
- **AI_CLOSED_MODE**—Secure mode in which data traffic is not allowed into the network, until authentication is complete. This mode is the default.

The following commands are inbuilt in the **AI_MONITOR_MODE**:

```
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_LOW_IMPACT_MODE**:

```
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
ip access-group AI_PORT_ACL in
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_CLOSED_MODE**:

```
switchport mode access
access-session closed
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

Auto Identity Built-in Policies

The following five built-in policies are available in the Auto Identity feature:

- **AI_DOT1X_MAB_AUTH**—Enables flexible authentication with dot1x, and then MAC Address Bypass (MAB).
- **AI_DOT1X_MAB_POLICIES**—Enables flexible authentication with dot1x, and then MAB. Applies critical VLAN in case the Authentication, Authorization, and Accounting (AAA) server is not reachable.
- **AI_DOT1X_MAB_WEBAUTH**—Enables flexible authentication with dot1x, MAB, and then web authentication.
Auto Identity Class Maps Templates

The following built-in class maps are supported by the Auto Identity feature:

- **AI_NRH**—Specifies that the nonresponsive host (NRH) authentication method is enabled.
- **AI_WEBAUTH_METHOD**—Specifies that the web authentication method is enabled.
- **AI_WEBAUTH_FAILED**—Specifies that the web authentication method failed to authenticate.
- **AI_WEBAUTH_NO_RESP**—Specifies that the web authentication client failed to respond.
- **AI_DOT1X_METHOD**—Specifies that the dot1x method is enabled.
- **AI_DOT1X_FAILED**—Specifies that the dot1x method failed to authenticate.
- **AI_DOT1X_NO_RESP**—Specifies that the dot1x client failed to respond.
- **AI_DOT1X_TIMEOUT**—Specifies that the dot1x client stopped responding after the initial acknowledge (ACK) request.
- **AI_MAB_METHOD**—Specifies that the MAC Authentication Bypass (MAB) method is enabled.
- **AI_MAB_FAILED**—Specifies that the MAB method failed to authenticate.
- **AI_AAA_SVR_DOWN_AUTHD_HOST**—Specifies that the Authentication, Authorization, and Accounting (AAA) server is down, and the client is in authorized state.
- **AI_AAA_SVR_DOWN_UNAUTHD_HOST**—Specifies that the AAA server is down, and the client is in unauthorized state.
- **AI_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is applied.
- **AI_NOT_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is not applied.
- **AI_METHOD_DOT1XDEVICE_PHONE**—Specifies that the method is dot1x and the device type is IP phone.
- **AIDEVICE_PHONE**—Specifies that the device type is IP phone.

Auto Identity Parameter Maps

The following built-in parameter map templates are supported by the Auto Identity feature:

- **AI_NRH_PMAP**—Starts nonresponsive host (NRH) authentication.
- **AI_WEBAUTH_PMAP**—Starts web authentication.

Auto Identity Service Templates

Service templates are available inside built-in policy maps. The following built-in service templates are supported by the Auto Identity feature:

- **AI_INACTIVE_TIMER**—Template to start the inactivity timer.
- **AI_CRITICAL_ACL**—Dummy template; users can configure this template as per their requirements.
How to Configure Auto Identity

Configuring Auto Identity Globally

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `sourcetemplate {AI_GLOBAL_CONFIG_TEMPLATE | template-name}`
4. `aaa new-model`
5. `radius server name`
6. `address ipv4 {hostname | ipv4-address}`
7. `key ipv4 {0 string | 7 string} string`
8. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode. Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td>Switch&gt; enable</td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| `configure terminal` | *Example:* Switch# configure terminal |

| **Step 3**        | Configures an auto identity template. Specifies the name for the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode. Configures the IPv4 address for the RADIUS server accounting and authentication parameters. |
| `sourcetemplate {AI_GLOBAL_CONFIG_TEMPLATE | template-name}` | • *AI_GLOBAL_CONFIG_TEMPLATE* is a built-in template. **Note** This command is not a part of the global template, and you must configure it. |
| *Example:*        | Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE |

| **Step 4**        | Enables the authentication, authorization, and accounting (AAA) access control mode. |
| `aaa new-model`   | *Example:* Switch(config)# aaa new-model |

| **Step 5**        | Specifies the name for the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode. |
| `radius server name` | *Example:* Switch(config)# radius server ISE |

| **Step 6**        | Configures the IPv4 address for the RADIUS server accounting and authentication parameters. |
| `address ipv4 {hostname | ipv4-address}` | *Note* This command is not a part of the global template, and you must configure it. |
| *Example:*        | Switch(config-radius-server)# address ipv4 10.1.1.1 |
### Configuring Auto Identity at an Interface Level

When you configure two interface templates, you must configure the `merge` keyword. If you do not, the last configured template is used.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type number
4. source template `{AI_CLOSED_MODE | AI_LOW_IMPACT_MODE | AI_MONITOR_MODE | template-name} [merge]`
5. source template `{AI_CLOSED_MODE | AI_LOW_IMPACT_MODE | AI_MONITOR_MODE | template-name} [merge]`
6. switchport access vlan vlan-id
7. switchport voice vlan vlan-id
8. Repeat Steps 4, 6, and 7 on all interfaces that must have the Auto Identity feature configured.
9. end

</tr>
<tr>
<td></td>
<td>cisco</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

This command is not a part of the global template, and you must configure it.
### Command or Action

**Step 4**
```
source template {AI_CLOSED_MODE | AI_LOW_IMPACT_MODE | AI_MONITOR_MODE | template-name} [merge]
```
**Example:**
```
Switch(config-if)# source template AI_CLOSED_MODE
```

**Purpose:** Configures a source template for the interface.

**Step 5**
```
source template {AI_CLOSED_MODE | AI_LOW_IMPACT_MODE | AI_MONITOR_MODE | template-name} [merge]
```
**Example:**
```
Switch(config-if)# source template AI_MONITOR_MODE merge
```

(Optional) Configures a source template for the interface and merges this template with the previously configured template

- When you configure two templates, if you do not configure the `merge` keyword, the last configured template is used.

**Step 6**
```
switchport access vlan vlan-id
```
**Example:**
```
Switch(config-if)# switchport access vlan 100
```

Sets the VLAN when the interface is in access mode.

**Step 7**
```
switchport voice vlan vlan-id
```
**Example:**
```
Switch(config-if)# switchport voice vlan 101
```

Configures a voice VLAN on a multiple VLAN access port.

**Step 8**
Repeat Steps 4, 6, and 7 on all interfaces that must have the Auto Identity feature configured.

---

**Step 9**
```
end
```
**Example:**
```
Switch(config-if)# end
```

Exits interface configuration mode and returns to privileged EXEC mode.

## Configuration Examples for Auto Identity

### Example: Configuring Auto Identity Globally

Switch> `enable`
Switch# `configure terminal`
Switch(config)# `source template AI_GLOBAL_CONFIG_TEMPLATE`
Switch(config)# `aaa new-model`
Switch(config)# `radius server ISE`
Switch(config-radius-server)# `address ipv4 10.1.1.1`
Switch(config-radius-server)# `key ipv4 cisco`
Switch(config-radius-server)# `end`
Example: Configuring Auto Identity at an Interface Level

Switch> enable
Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# source template AI_CLOSED_MODE
Switch(config-if)# source template AI_MONITOR_MODE merge
Switch(config-if)# switchport access vlan 100
Switch(config-if)# switchport voice vlan 101
Switch(config-if)# end

Verifying Auto Identity

Step 1    enable

Example:
Switch> enable
Enables Privileged EXEC mode.

   • Enter your password if prompted.

Step 2    show template interface source built-in all

Displays all the configured built-in interface templates.

Example:
Switch# show template interface source built-in all

Template Name : AI_CLOSED_MODE
Modified : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session closed
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
!
Template Name : AI_LOW_IMPACT_MODE
Modified : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
ip access-group AI_PORT_ACL in
!
Template Name : AI_MONITOR_MODE
Modified : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session port-control auto
Step 3  
show template global source built-in all

Displays all the configured global built-in templates.

Example:
Switch# show template global source built-in all

Global Template Name : AI_GLOBAL_CONFIG_TEMPLATE
Modified : No
Global Template Definition : global
dot1x system-auth-control
aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include

Step 4  
show derived-config | include aaa | radius-server

Displays the composite results of all the configuration commands that apply to an interface, including commands that come from sources such as static templates, dynamic templates, dialer interfaces, and authentication, authorization, and accounting (AAA) per-user attributes.

Example:
Switch# show derived-config | inc aaa| radius-server

aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
aaa session-id common
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
radius-server host 10.25.18.42 key cisco

Step 5  
show derived-config | interface type-number

Displays the composite results of all configuration for an interface.

Example:
Switch# show derived-config | interface gigabitethernet2/0/6

Building configuration...
Step 6  show access-session | interface interface-type-number details

Displays the policies applied to an interface.

Example:
Switch# show access-session interface gigabitethernet2/0/6 details

Interface: GigabitEthernet2/0/6
  MAC Address: c025.5c43.be00
  IPv6 Address: Unknown
  IPv4 Address: Unknown
  User-Name: CP-9971-SEPC0255C43BE00
  Device-type: Cisco-IP-Phone-9971
  Status: Authorized
  Domain: VOICE
  Oper host mode: multi-auth
  Oper control dir: both
  Session timeout: N/A
  Common Session ID: 091A1C5B00000017002003EE
  Acct Session ID: 0x00000005
  Handle: 0xBB00000B
  Current Policy: AI_DOT1X_MAB_POLICIES

Local Policies:

Server Policies:
  Vlan Group: Vlan: 100
  Security Policy: Must Not Secure
  Security Status: Link Unsecure

Method status list:
  Method     State
  dot1x      Authc Success

Step 7  show running-config interface type-number

Displays the contents of the current running configuration file or the configuration for an interface.

Example:
Switch# show running-config interface gigabitethernet2/0/6

Building configuration...

Current configuration : 214 bytes
! interface GigabitEthernet2/0/6
  switchport mode access
  switchport voice vlan 100
  access-session port-control auto
  spanning-tree portfast edge
  service-policy type control subscriber AI_NEXTGEN_AUTHBYPASS
end

Step 8  show lldp neighbor

Displays information about one or all neighboring devices discovered using the Link Layer Discovery Protocol (LLDP).

Example:

Switch# show lldp neighbor

Capability codes:
  (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
  (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other

Feature Information for Auto Identity

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 156: Feature Information for Auto Identity

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Auto Identity  | Cisco IOS Release 15.2(4)E | The Auto Identity feature provides a set of built-in policies at the global configuration and interface configuration modes. This feature is available only in the Class-Based Policy Language (CPL) control policy-equivalent new-style mode. In Cisco IOS Release 15.2(4)E, this feature was implemented on Cisco Catalyst 2960–X Series Switches, Catalyst 3750–X Series Switches, and Cisco Catalyst 4500E Supervisor Engine 7-E. The following commands was introduced or modified: source-template.
Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.
When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

**Traffic Patterns**

*Figure 127: Broadcast Storm Control Example*

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the `storm-control` interface configuration commands to set the threshold value for each traffic type.
How to Configure Storm Control

Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

Note

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

**Before you begin**

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

<tr>
<td></td>
<td>Specifies the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>**storm-control {broadcast</td>
</tr>
<tr>
<td></td>
<td>Configures broadcast, multicast, or unicast storm control. By default, storm control is disabled. &lt;br&gt;The keywords have these meanings:&lt;br&gt;- For <strong>level</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00. &lt;br&gt;- (Optional) For <strong>level-low</strong>, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00. &lt;br&gt;If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked. &lt;br&gt;- For <strong>bps bps</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0. &lt;br&gt;- (Optional) For <strong>bps-low</strong>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0. &lt;br&gt;- For <strong>pps pps</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) For <code>pps-low</code>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is <strong>0.0 to 10000000000.0</strong>.</td>
<td></td>
</tr>
<tr>
<td>For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

**storm-control action** `{shutdown | trap}`

*Example:*

Switch(config-if)# storm-control action trap

Specifies the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.

- Select the `shutdown` keyword to error-disable the port during a storm.
- Select the `trap` keyword to generate an SNMP trap when a storm is detected.

### Step 6

**end**

*Example:*

Switch(config-if)# end

Returns to privileged EXEC mode.

### Step 7

**show storm-control** `[interface-id] [broadcast | multicast | unicast]`

*Example:*

Switch# show storm-control gigabitethernet1/0/1 unicast

Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, details for all traffic types (broadcast, multicast and unicast) are displayed.

### Step 8

**copy running-config startup-config**

*Example:*

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

## Configuring Small-Frame Arrival Rate

Incoming VLAN-tagged packets smaller than 67 bytes are considered small frames. They are forwarded by the switch, but they do not cause the switch storm-control counters to increment.

You globally enable the small-frame arrival feature on the switch and then configure the small-frame threshold for packets on each interface. Packets smaller than the minimum size and arriving at a specified rate (the threshold) are dropped since the port is error disabled.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **errdisable detect cause small-frame**
4. `errdisablerecoveryinterval interval`
5. `errdisablerecoverycause small-frame`
6. `interface interface-id`
7. `small-frameviolation-rate pps`
8. `end`
9. `show interfaces interface-id`
10. `show running-config`
11. `copy running-config startup-config`

### Information About Protected Ports

#### Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control
traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

**Default Protected Port Configuration**

The default is to have no protected ports defined.

**Protected Ports Guidelines**

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

**How to Configure Protected Ports**

**Configuring a Protected Port**

**Before you begin**

Protected ports are not pre-defined. This is the task to configure one.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. switchport protected
5. end
6. show interfaces interface-id switchport
7. show running-config
8. copy running-config startup-config

Monitoring Protected Ports

**Table 157: Commands for Displaying Protected Port Settings**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces [interface-id] switchport</code></td>
<td>Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.</td>
</tr>
</tbody>
</table>

**Where to Go Next**

- Information About Port Blocking

**Information About Port Blocking**

**Port Blocking**

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

**Note**

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

**How to Configure Port Blocking**

**Blocking Flooded Traffic on an Interface**

**Before you begin**

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport block multicast`
5. `switchport block unicast`
6. `end`
7. `show interfaces interface-id switchport`
8. `show running-config`
9. `copy running-config startup-config`

---

**Prerequisites for Port Security**

*Note*  
If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

---

**Restrictions for Port Security**

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.
Information About Port Security

Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:

- Static secure MAC addresses—These are manually configured by using the `switchport port-security mac-address mac-address` interface configuration command, stored in the address table, and added to the switch running configuration.

- Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.

- Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

Security Violations

It is a security violation when one of these situations occurs:
• The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.

• An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

• Running diagnostic tests with port security enabled.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

• protect—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

Note

We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

• restrict—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

• shutdown—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command, or you can manually re-enable it by entering the shutdown and no shutdown interface configuration commands. This is the default mode.

• shutdown vlan—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.

This table shows the violation mode and the actions taken when you configure an interface for port security.

Table 159: Security Violation Mode Actions

<table>
<thead>
<tr>
<th>Violation Mode</th>
<th>Traffic is forwarded</th>
<th>Sends SNMP trap</th>
<th>Sends syslog message</th>

<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.

The switch returns an error message if you manually configure an address that would cause a security violation.

Shuts down only the VLAN on which the violation occurred.

**Port Security Aging**

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

- **Absolute**—The secure addresses on the port are deleted after the specified aging time.
- **Inactivity**—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

**Default Port Security Configuration**

<table>
<thead>
<tr>

</tr>
<tr>
<td>Port security aging</td>
<td>Disabled. Aging time is 0. &lt;br&gt;Static aging is disabled. &lt;br&gt;Type is absolute.</td>
</tr>
</tbody>
</table>

**Port Security Configuration Guidelines**

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.

- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

  **Note**  
  Voice VLAN is only supported on access ports and not on trunk ports, even though the configuration is allowed.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP
phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.

- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the `switchport voice` and `switchport priority extend` interface configuration commands has no effect.

When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

- The switch does not support port security aging of sticky secure MAC addresses.

This table summarizes port security compatibility with other port-based features.

\(^{24}\) DTP=Dynamic Trunking Protocol

\(^{25}\) A port configured with the `switchport mode dynamic` interface configuration command.
A VLAN Query Protocol (VQP) port configured with the `switchport access vlan dynamic` interface configuration command.

You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.

### Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

### How to Configure Port Security

#### Enabling and Configuring Port Security

**Before you begin**

This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode {access | trunk}`
5. `switchport voice vlan vlan-id`
6. `switchport port-security`
7. `switchport port-security [maximum value {vlan {vlan-list | {access | voice}}}]`
8. `switchport port-security violation {protect | restrict | shutdown | shutdown vlan}`
9. `switchport port-security [mac-address mac-address {vlan {vlan-id | {access | voice}}}]`
10. `switchport port-security mac-address sticky`
11. `switchport port-security mac-address sticky [mac-address | vlan {vlan-id | {access | voice}}]`
12. `end`
13. `show port-security`
14. `show running-config`
15. `copy running-config startup-config`

Enabling and Configuring Port Security Aging

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport port-security aging {static | time time | type {absolute | inactivity}}
5. end
6. show port-security [interface interface-id] [address]
7. show running-config
8. copy running-config startup-config

DETAILED STEPS

<td></td>
</tr>
<tr>
<td></td>
<td>Enter <strong>static</strong> to enable aging for statically configured secure addresses on this port.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For <strong>time</strong>, specifies the aging time for this port. The valid range is from 0 to 1440 minutes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For <strong>type</strong>, select one of these keywords:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>absolute</strong>—Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified lapses and are removed from the secure address list.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>inactivity</strong>—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source addresses for the specified time period.</td>
<td></td>
</tr>
</tbody>
</table>

| Step 5 | end | Returns to privileged EXEC mode. |
|        | **Example:** | |
|        | Switch(config)# end | |

| Step 6 | show port-security [interface interface-id] [address] | Verifies your entries. |
|        | **Example:** | |
|        | Switch# show port-security interface gigabitethernet 1/0/1 | |

| Step 7 | show running-config | Verifies your entries. |
|        | **Example:** | |
|        | Switch# show running-config | |

| Step 8 | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
|        | **Example:** | |
|        | Switch# copy running-config startup-config | |
Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 50
Switch(config-if)# switchport port-security mac-address sticky

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

Switch(config)# interface gigabitethernet 1/0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

Switch(config)# interface tengigabitethernet 1/0/1
Switch(config-if)# switchport access vlan 21
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 22
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 20
Switch(config-if)# switchport port-security violation restrict
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security mac-address 0000.0000.0002
Switch(config-if)# switchport port-security mac-address 0000.0000.0003
Switch(config-if)# switchport port-security mac-address 0000.0000.0001 vlan voice
Switch(config-if)# switchport port-security mac-address 0000.0000.0004 vlan voice
Switch(config-if)# switchport port-security maximum 10 vlan access
Switch(config-if)# switchport port-security maximum 10 vlan voice

Information About Protocol Storm Protection

Protocol Storm Protection

When a switch is flooded with Address Resolution Protocol (ARP) or control packets, high CPU utilization can cause the CPU to overload. These issues can occur:

- Routing protocol can flap because the protocol control packets are not received, and neighboring adjacencies are dropped.
- Spanning Tree Protocol (STP) reconverges because the STP bridge protocol data unit (BPDU) cannot be sent or received.
Using protocol storm protection, you can control the rate at which control packets are sent to the switch by specifying the upper threshold for the packet flow rate. The supported protocols are ARP, ARP snooping, Dynamic Host Configuration Protocol (DHCP) v4, DHCP snooping, Internet Group Management Protocol (IGMP), and IGMP snooping.

When the packet rate exceeds the defined threshold, the switch drops all traffic arriving on the specified virtual port for 30 seconds. The packet rate is measured again, and protocol storm protection is again applied if necessary.

For further protection, you can manually error disable the virtual port, blocking all incoming traffic on the virtual port. You can manually enable the virtual port or set a time interval for automatic re-enabling of the virtual port.

**Note**

Excess packets are dropped on no more than two virtual ports.

Virtual port error disabling is not supported for EtherChannel and Flexlink interfaces.

## Default Protocol Storm Protection Configuration

Protocol storm protection is disabled by default. When it is enabled, auto-recovery of the virtual port is disabled by default.

## How to Configure Protocol Storm Protection

### Enabling Protocol Storm Protection

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `psp {arp | dhcp | igmp} pps value`
4. `errdisable detect cause psp`
5. `errdisable recovery interval time`
6. `end`
7. `show psp config {arp | dhcp | igmp}`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for First Hop Security in IPv6

• You have configured the necessary IPv6 enabled SDM template.
• You should be familiar with the IPv6 neighbor discovery feature.
Restrictions for First Hop Security in IPv6

- The following restrictions apply when applying FHS policies to EtherChannel interfaces (Port Channels):
  - A physical port with an FHS policy attached cannot join an EtherChannel group.
  - An FHS policy cannot be attached to a physical port when it is a member of an EtherChannel group.

- By default, a snooping policy has a security-level of guard. When such a snooping policy is configured on an access switch, external IPv6 Router Advertisement (RA) or Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server packets are blocked, even though the uplink port facing the router or DHCP server/relay is configured as a trusted port. To allow IPv6 RA or DHCPv6 server messages, do the following:
  - Apply an IPv6 RA-guard policy (for RA) or IPv6 DHCP-guard policy (for DHCP server messages) on the uplink port.
  - Configure a snooping policy with a lower security-level, for example glean or inspect. However; configuring a lower security level is not recommended with such a snooping policy, because benefits of First Hop security features are not effective.

Information about First Hop Security in IPv6

First Hop Security in IPv6 (FHS IPv6) is a set of IPv6 security features, the policies of which can be attached to a physical interface, or a VLAN. An IPv6 software policy database service stores and accesses these policies. When a policy is configured or modified, the attributes of the policy are stored or updated in the software policy database, then applied as was specified. The following IPv6 policies are currently supported:

- IPv6 FHS Binding Table Content—A database table of IPv6 neighbors connected to the switch is created from information sources such as Neighbor Discovery (ND) protocol snooping. This database, or binding, table is used by various IPv6 guard features (such as IPv6 ND Inspection) to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.
- IPv6 Neighbor Discovery Inspection—IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database and IPv6 neighbor discovery messages that do not conform are dropped. An ND message is considered trustworthy if its IPv6-to-Media Access Control (MAC) mapping is verifiable.
  This feature mitigates some of the inherent vulnerabilities of the ND mechanism, such as attacks on DAD, address resolution, router discovery, and the neighbor cache.
- IPv6 Router Advertisement Guard—The IPv6 Router Advertisement (RA) guard feature enables the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network switch platform. RAs are used by routers to announce themselves on the link. The RA Guard feature analyzes the RAs and filters out bogus RAs sent by unauthorized routers. In host mode, all router
advertisement and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. Once the Layer 2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

- IPv6 DHCP Guard—The IPv6 DHCP Guard feature blocks reply and advertisement messages that come from unauthorized DHCPv6 servers and relay agents. IPv6 DHCP guard can prevent forged messages from being entered in the binding table and block DHCPv6 server messages when they are received on ports that are not explicitly configured as facing a DHCPv6 server or DHCP relay. To use this feature, configure a policy and attach it to an interface or a VLAN. To debug DHCP guard packets, use the `debug ipv6 snooping dhcp-guard` privileged EXEC command.

- IPv6 Source Guard—Like IPv4 Source Guard, IPv6 Source Guard validates the source address or prefix to prevent source address spoofing.

A source guard programs the hardware to allow or deny traffic based on source or destination addresses. It deals exclusively with data packet traffic.

To debug source-guard packets, use the `debug ipv6 snooping source-guard` privileged EXEC command.

The following restrictions apply:

- An FHS policy cannot be attached to an physical port when it is a member of an EtherChannel group.

- When IPv6 source guard is enabled on a switch port, NDP or DHCP snooping must be enabled on the interface to which the switch port belongs. Otherwise, all data traffic from this port will be blocked.

- An IPv6 source guard policy cannot be attached to a VLAN. It is supported only at the interface level.

- When you configure IPv4 and IPv6 source guard together on an interface, it is recommended to use `ip verify source mac-check` instead of `ip verify source`. IPv4 connectivity on a given port might break due to two different filtering rules set — one for IPv4 (IP-filter) and the other for IPv6 (IP-MAC filter).

- You cannot use IPv6 Source Guard and Prefix Guard together. When you attach the policy to an interface, it should be "validate address" or "validate prefix" but not both.

- PVLAN and Source/Prefix Guard cannot be applied together.

For more information on IPv6 Source Guard, see the IPv6 Source Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

- IPv6 Prefix Guard—The IPv6 prefix guard feature works within the IPv6 source guard feature, to enable the device to deny traffic originated from non-topologically correct addresses. IPv6 prefix guard is often used when IPv6 prefixes are delegated to devices (for example, home gateways) using DHCP prefix delegation. The feature discovers ranges of addresses assigned to the link and blocks any traffic sourced with an address outside this range.

For more information on IPv6 Prefix Guard, see the IPv6 Prefix Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

- IPv6 Destination Guard—The IPv6 destination guard feature works with IPv6 neighbor discovery to ensure that the device performs address resolution only for those addresses that are known to be active
on the link. It relies on the address glean functionality to populate all destinations active on the link into the binding table and then blocks resolutions before they happen when the destination is not found in the binding table.

For more information about IPv6 Destination Guard, see the IPv6 Destination Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

• IPv6 Neighbor Discovery Multicast Suppress — The IPv6 Neighbor Discovery multicast suppress feature is an IPv6 snooping feature that runs on a switch or a wireless controller and is used to reduce the amount of control traffic necessary for proper link operations.

• DHCPv6 Relay — Lightweight DHCPv6 Relay Agent — The DHCPv6 Relay — Lightweight DHCPv6 Relay Agent feature allows relay agent information to be inserted by an access node that performs a link-layer bridging (non-routing) function. Lightweight DHCPv6 Relay Agent (LDRA) functionality can be implemented in existing access nodes, such as DSL access multiplexers (DSLAMs) and Ethernet switches, that do not support IPv6 control or routing functions. LDRA is used to insert relay-agent options in DHCP version 6 (DHCPv6) message exchanges primarily to identify client-facing interfaces. LDRA functionality can be enabled on an interface and on a VLAN.

Note
If an LDRA device is directly connected to a client, the interface must have the pool configuration to fetch the specific subnet or link information at the server side. In this case, if the LDRA device is present in different subnets or links, the server may not be able to fetch the correct subnet. You can now configure the pool name in the interface so as to choose the proper subnet or link for the client.

For more information about DHCPv6 Relay, See the DHCPv6 Relay — Lightweight DHCPv6 Relay Agent section of the IP Addressing: DHCP Configuration Guide, Cisco IOS Release 15.1SG.

How to Configure an IPv6 Snooping Policy

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Snooping Policy:

SUMMARY STEPS

1. configure terminal
2. ipv6 snooping policy policy-name
3. { [default] | [device-role { node | switch }] } | [limit address-count value ] | [no] | [protocol { dhcp | ndp } ] | [security-level { glean | guard | inspect }] } | [tracking { disable | stale-lifetime { seconds | infinite } | enable | reachable-lifetime { seconds | infinite } } ] | [trusted-port ]
4. end
5. show ipv6 snooping policy policy-name

DETAILED STEPS

<table>
<thead>
<tr>

**Example:**

Switch(config-ip6-snooping)# security-level inspect

**Example:**

Switch(config-ip6-snooping)# trusted-port
How to Attach an IPv6 Snooping Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an interface or VLAN:

**SUMMARY STEPS**

1. `configure terminal`
2. `interface Interface_type stack/module/port`
3. `switchport`
4. `ipv6 snooping [attach-policy policy_name [ vlan vlan_id | add vlan_ids | exceptvlan_ids | none | remove vlan_ids | vlan vlan_id | add vlan_ids | exceptvlan_ids | none | remove vlan_ids | all ]] | vlan vlan_id | add vlan_ids | exceptvlan_ids | none | remove vlan_ids | all ]`
5. `do show running-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface Interface_type stack/module/port</td>
<td>Specifies an interface type and identifier; enters the interface configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet 1/1/4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switchport</td>
<td>Enters the Switchport mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

Switch(config-if)# switchport

### Purpose

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the switchport interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration. The command prompt displays as (config-if)# in Switchport configuration mode.

### Note

Attaches a custom IPv6 snooping policy to the interface or the specified VLANs on the interface. To attach the default policy to the interface, use the `ipv6 snooping` command without the `attach-policy` keyword. To attach the default policy to VLANs on the interface, use the `ipv6 snooping vlan` command. The default policy is, security-level `guard`, device-role `node`, protocol `ndp` and `dhcp`.

### Step 4

<table>
<thead>
<tr>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6 snooping [attach-policy policy_name [ vlan {vlan_id</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config-if)# ipv6 snooping

or

Switch(config-if)# ipv6 snooping attach-policy example_policy

or

Switch(config-if)# ipv6 snooping vlan 111,112

or

Switch(config-if)# ipv6 snooping attach-policy example_policy vlan 111,112

### Step 5

<table>
<thead>
<tr>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>do show running-config</td>
</tr>
</tbody>
</table>

**Example:**

Switch#(config-if)# do show running-config

Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.

---

**How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface**

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an EtherChannel interface or VLAN:
### How to Attach an IPv6 Snooping Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping Policy to VLANs across multiple interfaces:

#### SUMMARY STEPS

1. `configure terminal`
2. `vlan configuration vlan_list`
3. `ipv6 snooping [attach-policy policy_name]`

### Procedure

<table>

## How to Configure the IPv6 Binding Table Content

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

### SUMMARY STEPS

1. **configure terminal**
2. [no] ipv6 neighbor binding [vlan vlan-id ]ipv6-address interface interface_type stack/module/port hw_address [reachable-lifetimevalue [seconds | default | infinite]] | [tracking] [default | disable] [reachable-lifetimevalue [seconds | default | infinite]] | [enable [reachable-lifetimevalue [seconds | default | infinite]] | [retry-interval [seconds | default | infinite] ] ]
3. [no] ipv6 neighbor binding max-entries number [mac-limit number | port-limit number [mac-limit number]] | vlan-limit number [mac-limit number | port-limit number mac-limitnumber ] ] ]
4. ipv6 neighbor binding logging
5. exit
6. show ipv6 neighbor binding
How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

**SUMMARY STEPS**

1. configure terminal
2. [no] ipv6 nd inspection policy policy-name
3. device-role \{host | monitor | router | switch\}
4. drop-unsecure
5. limit address-count value
6. sec-level minimum value
7. tracking \{enable \{reachable-lifetime \{value | infinite\}\} | disable \{stale-lifetime \{value | infinite\}\}\}
8. trusted-port
9. validate source-mac
10. no \{device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac\}
11. default \{device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac\}
12. do show ipv6 nd inspection policy policy_name

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal&lt;br&gt;Example: Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>[no]ipv6 nd inspection policy policy-name&lt;br&gt;Example: Switch(config)# ipv6 nd inspection policy example_policy</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>device-role {host</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>drop-unsecure&lt;br&gt;Example: Switch(config-nd-inspection)# drop-unsecure</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>limit address-count value&lt;br&gt;Example: Switch(config-nd-inspection)# limit address-count 1000</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>sec-level minimum value&lt;br&gt;Example: Switch(config-nd-inspection)# limit address-count 1000</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>tracking {enable {reachable-lifetime {value</td>
</tr>
</tbody>
</table>

Enter the global configuration mode.

Specifies the ND inspection policy name and enters ND Inspection Policy configuration mode.

Specifies the role of the device attached to the port. The default is host.

Drops messages with no or invalid options or an invalid signature.

Enter 1–10,000.

Specifies the minimum security level parameter value when Cryptographically Generated Address (CGA) options are used.

Overrides the default tracking policy on a port.
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures a port to become a trusted port.</td>
</tr>
<tr>
<td>Checks the source media access control (MAC) address against the link-layer address.</td>
</tr>
<tr>
<td>Remove the current configuration of a parameter with the no form of the command.</td>
</tr>
<tr>
<td>Restores configuration to the default values.</td>
</tr>
<tr>
<td>Verifies the ND Inspection Configuration without exiting ND inspection configuration mode.</td>
</tr>
</tbody>
</table>

### How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to an interface or VLANs on an interface:

**SUMMARY STEPS**

1. `configure terminal`
2. `interface Interface_type stack/module/port`
3. `ipv6 nd inspection [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]`
4. `do show running-config`
## Detailed Steps

<table>

### How to Attach an IPv6 Neighbor Discovery Inspection Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to VLANs across multiple interfaces:

### SUMMARY STEPS

1. configure terminal
2. `vlan configuration vlan_list`
3. `ipv6 nd inspection [attach-policy policy_name]`
4. `do show running-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
configure terminal  
Example:  
Switch# configure terminal | Enters the global configuration mode. |
| **Step 2**  
`vlan configuration vlan_list`  
Example:  
Switch(config)# vlan configuration 334 | Specifies the VLANs to which the IPv6 Snooping policy will be attached; enters the VLAN interface configuration mode. |
| **Step 3**  
`ipv6 nd inspection [attach-policy policy_name]`  
Example:  
Switch(config-vlan-config)#ipv6 nd inspection  
attach-policy example_policy | Attaches the IPv6 Neighbor Discovery policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the `attach-policy` option is not used. The default policy is, device-role host, no drop-unsecure, limit address-count disabled, sec-level minimum is disabled, tracking is disabled, no trusted-port, no validate source-mac. |
| **Step 4**  
do show running-config  
Example:  
Switch#(config-if)# do show running-config | Confirms that the policy is attached to the specified VLANs without exiting the configuration mode. |

**How to Configure an IPv6 Router Advertisement Guard Policy**

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 Router Advertisement policy:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no]ipv6 nd raguard policy policy-name`
3. `[no]device-role {host | monitor | router | switch}`
4. `[no]hop-limit {maximum | minimum} value`
5. `[no]managed-config-flag {off | on}`
6. `[no]match [ipv6 access-list list | ra prefix-list list]`
7. `[no]other-config-flag {on | off}`
8. `[no]router-preference maximum {high | medium | low}`
9. `[no]trusted-port`
10. `default {device-role | hop-limit {maximum | minimum} | managed-config-flag | match [ipv6 access-list | ra prefix-list ] | other-config-flag | router-preference maximum | trusted-port}`
11. `do show ipv6 nd raguard policy policy_name`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>[no]ipv6 nd raguard policy policy-name</td>
<td>Specifies the RA Guard policy name and enters RA Guard Policy configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# ipv6 nd raguard policy example_policy</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>[no]device-role {host</td>
<td>monitor</td>

How to Configure an IPv6 DHCP Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 DHCP (DHCPv6) Guard policy:

**SUMMARY STEPS**

1. configure terminal
2. [no]ipv6 dhcp guard policy policy-name
3. [no]device-role {client | server}
4. [no] match server access-list ipv6-access-list-name
5. [no] match reply prefix-list ipv6-prefix-list-name
6. [no] preference { max limit | min limit }
7. [no] trusted-port
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>[no]ipv6 dhcp guard policy <em>policy-name</em></td>
<td>Specifies the DHCPv6 Guard policy name and enters DHCPv6 Guard Policy configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ipv6 dhcp guard policy example_policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>[no]device-role {client</td>
<td>server}</td>
</tr>
</tbody>
</table>
| **Example:** | Switch(config-dhcp-guard)# device-role server | - client—Default value, specifies that the attached device is a client. Server messages are dropped on this port.  
- server—Specifies that the attached device is a DHCPv6 server. Server messages are allowed on this port. |
| **Step 4** | [no] match server access-list *ipv6-access-list-name* | (Optional). Enables verification that the advertised DHCPv6 server or relay address is from an authorized server access list (The destination address in the access list is 'any'). If not configured, this check will be bypassed. An empty access list is treated as a permit. |
| **Example:** | ;;Assume a preconfigured IPv6 Access List as follows:  
Switch(config)# ipv6 access-list my_acls  
Switch(config-ipv6-acl)# permit host FE80::A8BB:CCFF:FE01:F700 any  
Switch(config-dhcp-guard)# match server access-list my_acls | |
| **Step 5** | [no] match reply prefix-list *ipv6-prefix-list-name* | (Optional) Enables verification of the advertised prefixes in DHCPv6 reply messages from the configured authorized prefix list. If not configured, this check will be bypassed. An empty prefix list is treated as a permit. |
| **Example:** | ;;Assume a preconfigured IPv6 prefix list as follows:  
Switch(config)# ipv6 prefix-list my_prefix permit 2001:0DB8::/64 le 128  
Switch(config-dhcp-guard)# match reply prefix-list my_prefix | |
How to Configure an IPv6 DHCP Guard Policy

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>[no] preference { max limit</td>
<td>min limit }</td>
</tr>
<tr>
<td>7</td>
<td>[no] trusted-port</td>
<td>(Optional) <strong>trusted-port</strong>—Sets the port to a trusted mode. No further policing takes place on the port. <strong>Note</strong> If you configure a trusted port then the device-role option is not available.</td>
</tr>
<tr>
<td>8</td>
<td>default { device-role</td>
<td>trusted-port }</td>
</tr>
<tr>
<td>9</td>
<td>do show ipv6 dhcp guard policy policy_name</td>
<td>(Optional) Displays the configuration of the IPv6 DHCP guard policy without leaving the configuration submode. Omitting the <strong>policy_name</strong> variable displays all DHCPv6 policies.</td>
</tr>
</tbody>
</table>

### Example of DHCPv6 Guard Configuration

```bash
enable
configure terminal
ipv6 access-list acl1
  permit host FE80::A8BB:CCFF:FE01:F700 any
ipv6 prefix-list abc permit 2001:0DB8::/64 le 128
ipv6 dhcp guard policy poll
device-role server
  match server access-list acl1
  match reply prefix-list abc
  preference min 0
  preference max 255
  trusted-port
interface GigabitEthernet 0/2/0
  switchport
  ipv6 dhcp guard attach-policy poll vlan add 1
  vlan 1
  ipv6 dhcp guard attach-policy poll
  show ipv6 dhcp guard policy poll
```
How to Attach an IPv6 DHCP Guard Policy to an Interface or a VLAN on an Interface

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

SUMMARY STEPS

1. configure terminal
2. interface Interface_type stack/module/port
3. ipv6 dhcp guard [attach-policy policy_name [ vlan vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all ] ] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } ]
4. do show running-config interface Interface_type stack/module/port

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>

<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> vlan configuration vlan_list</td>
<td>Specifies the VLANs to which the IPv6 Snooping policy will be attached; enters the VLAN interface configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# vlan configuration 334</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv6 dhcp guard [attach-policy policy_name]</td>
<td>Attaches the IPv6 Neighbor Discovery policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the attach-policy option is not used. The default policy is, device-role client, no trusted-port.</td>
</tr>
<tr>
<td>Example: Switch(config-vlan-config)#ipv6 dhcp guard attach-policy example_policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> do show running-config</td>
<td>Confirms that the policy is attached to the specified VLANs without exiting the configuration mode.</td>
</tr>
<tr>
<td>Example: Switch#(config-if)# do show running-config</td>
<td></td>
</tr>
</tbody>
</table>
# How to Configure IPv6 Source Guard

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `[no] ipv6 source-guard policy policy_name`
4. `[deny global-autoconf] [permit link-local] [default{. . .}] [exit] [no{. . .}]`
5. `end`
6. `show ipv6 source-guard policy policy_name`

## DETAILED STEPS

Configuring FIPS

Information About FIPS and Common Criteria

The Federal Information Processing Standard (FIPS) certification documents for Cisco Catalyst series switches are posted on the following website:

Click the link in the Certification column to view the Consolidated Validation Certificate and the Security Policy document. The Security Policy document describes the FIPS implementation, hardware installation, firmware initialization, and software configuration procedures for FIPS operation.

Common Criteria is an international standard (ISO/IEC 15408) for computer security certification. This standard is a set of requirements, tests, and evaluation methods that ensures that the Target of Evaluation complies with a specific Protection Profile or custom Security Target. For more information, see the security target document for specific Cisco Catalyst switch models and Cisco IOS Releases at:

http://www.niap-ccevs.org/CCEVS_Products/plcfm?tech_name=Network+Switch
Configuring Control Plane Policing

- Finding Feature Information, on page 1643
- Restrictions for Control Plane Policing, on page 1643
- Control Plane Policing, on page 1643
- Configuring Control Plane Policing, on page 1644
- Examples: Configuring CoPP, on page 1645

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Control Plane Policing

The following restrictions apply while Configuring Control Plane Policing:

- Only six among the following protocols can be configured simultaneously: rip, ospf-v6, eigrp-v6, rip-v6, dhcp-snoop-client-to-server, dhcp-snoop-server-to-client, ndp-router-solicitation, ndp-router-advertisement, ndp-redirect, dhcpv6-client-to-server, dhcpv6-server-to-client, igrp.

- For ospf, eigrp and ripv2 protocols, control packets which are destined to multicast Mac of the router are policed along with the "reserve-multicast-group" option.

Control Plane Policing

Configure the Control Plane Policing (CoPP) feature on a predefined set of protocols to control the flow of traffic coming to the CPU. The CoPP allows you to set a rate limit on specific protocol packets. These packets are policed, and the packets that conform to the defined rate limit are permitted into the CPU. COPP protects the packets from being routed to the CPU at an undesired rate that might impact the performance of a switch and the network. In addition, the CoPP protects the CPU from denial of service (DoS) attacks and ensures
routing stability, reachability, and packet delivery. You can use Multi-Layer Switching QoS CLI to set the rate limit and policing parameters on a specific protocol.

**Note**
CoPP is supported only on LAN BASE, IP Lite, and IP Service licenses.

- `igmp-query`
- `igmp-report`
- `igrp`
- `ipv6-pimv2`
- `lldp`
- `mld-gs-query`
- `mld-leave`
- `mld-query`
- `mld-report`
- `ndp-redirect`
- `ndp-router-advertisement`
- `ndp-router-solicitation`
- `ospf`
- `ospf-v6`
- `pimv1`
- `pxe`
- `rep-hfl`
- `reserve-multicast-group`
- `rip`
- `rip-v6`
- `rsvp-snoop`
- `stp`
- ` policy {pps | bps} police rate`

### Purpose

For more details about the various parameters, please refer to the **Consolidated Platform Command Reference, Cisco IOS Release 15.2(4)E**.

### Example:

```plaintext
Switch (config)# mls qos copp protocol cdp police bps 10000
Switch(config)# mls qos copp protocol cdp police pps 500
```

### Step 4

**end**

- **Example:**
  ```plaintext
  Switch (config)# end
  ```

  Returns to privileged EXEC mode.

### Step 5

**show mls qos copp protocols**

- **Example:**
  ```plaintext
  Switch# show mls qos copp protocols
  ```

  Displays the CoPP parameters and counters for all the configured protocol.

### Step 6

**copy running-config startup-config**

- **Example:**
  ```plaintext
  Switch# copy running-config startup-config
  ```

  (Optional) Saves your entries in the configuration file.

---

**What to do next**

To clear the CoPP statistics, use the `clear copp counters` command.

**Related Topics**

- Control Plane Policing, on page 1643
- Examples: Configuring CoPP, on page 1645

---

**Examples: Configuring CoPP**

The following example shows how to enable Control Plane Policing (CoPP) for a specific protocol:

```plaintext
Switch (config)# mls qos copp protocol cdp police bps ?
<8000-2000000000> Bits per second (postfix k, m, g optional; decimal point allowed)
```
Switch (config)# mls qos copp protocol cdp police bps 10000
Switch(config)# mls qos copp protocol cdp police pps ?
  <100-100000> Packet per second
Switch(config)# mls qos copp protocol cdp police pps 500

The following example shows the CoPP parameters and counters for all the configured protocol:

Switch# show running-config | inc copp
Switch# show running-config | inc copp
mls qos copp protocol rep-hfl police pps 5600
mls qos copp protocol lldp police bps 908900
mls qos copp protocol cdp police pps 3434

/* Copp detailed output */
Switch# show mls qos copp protocols

Administering the System

Information About Administering the Device

System Time and Date Management

You can manage the system time and date on your device using automatic configuration methods (RTC and NTP), or manual configuration methods.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference on Cisco.com.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- RTC
- NTP
- Manual configuration

The system clock can provide time to these services:

- User show commands
- Logging and debugging messages
The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

**Real Time Clock**

A real-time clock (RTC) keeps track of the current time on the switch. The switch is shipped to you with RTC set to GMT time until you reconfigure clocking parameters.

The benefits of an RTC are:

- RTC is battery-powered.
- System time is retained during power outage and at system reboot.

The RTC and NTP clocks are integrated on the switch. When NTP is enabled, the RTC time is periodically synchronized to the NTP clock to maintain accuracy.

**Network Time Protocol**

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The figure below shows a typical network example using NTP. Device A is the NTP master, with the Device B, C, and D configured in NTP server mode, in server association with Device A. Device E is configured as an NTP peer to the upstream and downstream Device, Device B and Device F, respectively.

*Figure 128: Typical NTP Network Configuration*

If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Stratum**

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.
NTP Associations

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 129: Typical NTP Network Configuration

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F.
If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Version 4**

NTP version 4 is implemented on the device. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

For details about configuring NTPv4, see the Implementing NTPv4 in IPv6 chapter of the Cisco IOS IPv6 Configuration Guide, Release 12.4T.

**System Name and Prompt**

You configure the system name on the Device to identify it. By default, the system name and prompt are **Switch**.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4 and the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4.

**Default System Name and Prompt Configuration**

The default switch system name and prompt is **Switch**.

**DNS**

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your device, you can substitute the hostname for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a
A commercial organization that IP identifies by a \textit{com} domain name, so its domain name is \textit{cisco.com}. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as \textit{ftp.cisco.com}.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

### Default DNS Settings

#### Table 162: Default DNS Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

### Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

---

**Note**

For complete syntax and usage information for the commands used in this section, see the \textit{Cisco IOS Configuration Fundamentals Command Reference, Release 12.4}.

### Default Banner Configuration

The MOTD and login banners are not configured.

### MAC Address Table

The MAC address table contains address information that the device uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the device learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the device resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).
Note
For complete syntax and usage information for the commands used in this section, see the command reference for this release.

MAC Address Table Creation

With multiple MAC addresses supported on all ports, you can connect any port on the device to other network devices. The device provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the device updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the device maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The device sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the device forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The device always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>

ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called address resolution.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC
address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.4 documentation on Cisco.com.

## How to Administer the Device

### Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the device can synchronize, you do not need to manually set the system clock.

### Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Follow these steps to set the system clock:

#### SUMMARY STEPS

1. `enable`
2. Use one of the following:
   - `clock set hh:mm:ss day month year`
   - `clock set hh:mm:ss month day year`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Use one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clock set hh:mm:ss day month year</code></td>
<td>Manually set the system clock using one of these formats:</td>
</tr>
<tr>
<td><code>clock set hh:mm:ss month day year</code></td>
<td>• <code>hh:mm:ss</code>—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone.</td>
</tr>
<tr>
<td><code>day</code></td>
<td>• <code>day</code>—Specifies the day by date in the month.</td>
</tr>
</tbody>
</table>
Configuring the Time Zone

Follow these steps to manually configure the time zone:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. clock timezone zone hours-offset [minutes-offset]
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>clock timezone zone hours-offset [minutes-offset]</td>
<td>Sets the time zone.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# clock timezone AST -3 30</td>
<td>Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set.</td>
</tr>
<tr>
<td>• zone—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• hours-offset—Enters the hours offset from UTC.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• (Optional) minutes-offset—Enters the minutes offset from UTC. This available where the local time zone is a percentage of an hour different from UTC.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `clock summer-time zone date date month year hh:mm date month year hh:mm [offset]]`
4. `clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Switch&gt;</code> <code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Switch#</code> <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>clock summer-time zone date date month year hh:mm date month year hh:mm [offset]]</code></td>
<td>Configures summer time to start and end on specified days every year.</td>
</tr>
</tbody>
</table>

---

Verifies your entries.

```
Step 5 show running-config
Example: `Switch#` `show running-config`
```

(Optional) Saves your entries in the configuration file.

```
Step 6 copy running-config startup-config
Example: `Switch#` `copy running-config startup-config`
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00</td>
<td>Configures summer time to start and end on the specified days every year. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. Summer time is disabled by default. If you specify <code>clock summer-time zone recurring</code> without parameters, the summer time rules default to the United States rules. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.</td>
</tr>
<tr>
<td><strong>Step 4</strong> clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# clock summer-time PDT recurring 10 March 2013 2:00 3 November 2013 2:00</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
Follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

**SUMMARY STEPS**

1. enable
2. configure terminal
3. **clock summer-time zone date**[
   month date year hh:mm month date year hh:mm [offset]]
   or **clock summer-time zone** date [date month year hh:mm date month year hh:mm [offset]]
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  Example:
  ```
  Switch> enable
  ``` | Enables privileged EXEC mode.
  • Enter your password if prompted. |
| **Step 2**
  configure terminal
  Example:
  ```
  Switch# configure terminal
  ``` | Enters global configuration mode. |
| **Step 3**
  **clock summer-time zone date**[
  month date year hh:mm month date year hh:mm [offset]]
  or **clock summer-time zone** date [date month year hh:mm date month year hh:mm [offset]] | Configures summer time to start on the first date and end on the second date.
  Summer time is disabled by default.
  • For **zone**, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect.
  • (Optional) For **week**, specify the week of the month (1 to 5 or last).
  • (Optional) For **day**, specify the day of the week (Sunday, Monday...).
  • (Optional) For **month**, specify the month (January, February...). |
Configuring a System Name

Follow these steps to manually configure a system name:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `hostname name`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>

<td></td>
</tr>
</tbody>
</table>
## Setting Up DNS

If you use the device IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip domain-name name`
4. `ip name-server server-address1 [server-address2 ... server-address6]`

### Command or Action | Purpose
--- | ---
**Step 2** | **configure terminal**
Example: `Switch# configure terminal`
Enters global configuration mode.

**Step 3** | `hostname name`
Example: `Switch(config)# hostname remote-users`
Configures a system name. When you set the system name, it is also used as the system prompt.
The default setting is Switch.
The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.

**Step 4** | `end`
Example: `remote-users(config)# end`
Returns to priviliged EXEC mode.

**Step 5** | `show running-config`
Example: `Switch# show running-config`
Verifies your entries.

**Step 6** | `copy running-config startup-config`
Example: `Switch# copy running-config startup-config`
(Optional) Saves your entries in the configuration file.
5. `ip domain-lookup [nsap | source-interface interface]`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip domain-name name</code></td>
<td>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name).</td>
</tr>
<tr>
<td>Example:</td>
<td>Do not include the initial period that separates an unqualified name from the domain name.</td>
</tr>
<tr>
<td>Switch(config)# <code>ip domain-name Cisco.com</code></td>
<td>At boot time, no domain name is configured; however, if the device configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip name-server server-address1 [server-address2 ... server-address6]</code></td>
<td>Specifies the address of one or more name servers to use for name and address resolution.</td>
</tr>
<tr>

</tbody>
</table>
Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the device.

Follow these steps to configure a MOTD login banner:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. banner motd  message  
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Follow these steps to configure a login banner:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `banner login c message c`
4. end
5. `show running-config`
6. `copy running-config startup-config`

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Switch# configure terminal</strong></td>
<td>Specifies the message of the day.</td>
</tr>
</tbody>
</table>
| **Step 3** `banner motd c message c` | *Example:*  
Switch(config)# `banner motd #`  
This is a secure site. Only authorized users are allowed. For access, contact technical support. `#`  
*c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the **Return** key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.  
`message—Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.* |
| **Step 4** `end` | *Example:*  
Switch(config)# `end`  
*Returns to privileged EXEC mode.* |
| **Step 5** `show running-config` | *Example:*  
Switch# `show running-config`  
*Verifies your entries.* |
| **Step 6** `copy running-config startup-config` | *(Optional) Saves your entries in the configuration file.*  
*Example:*  
Switch# `copy running-config startup-config` |
### Managing the MAC Address Table

#### Changing the Address Aging Time

Follow these steps to configure the dynamic address table aging time:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
* Enter your password if prompted.  |
| Example: | Switch> enable | |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Switch# configure terminal | |
| Step 3 | banner login $ message $ | Specifies the login message.  
* $— Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.  
* message—Enters a login message up to 255 characters. You cannot use the delimiting character in the message. |
| Example: | Switch(config)# banner login $  
Access for authorized users only.  
Please enter your username and password.  
$ | |
| Step 4 | end | Returns to privileged EXEC mode. |
| Example: | Switch(config)# end | |
| Step 5 | show running-config | Verifies your entries. |
| Example: | Switch# show running-config | |
| Step 6 | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: | Switch# copy running-config startup-config | |
## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `mac address-table aging-time [0 | 10-1000000] [routed-mac | vlan vlan-id]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

### Configuring MAC Address Change Notification Traps

Follow these steps to configure the switch to send MAC address change notification traps to an NMS host:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr community-string notification-type { informs | traps } {version {1 | 2c | 3}} {vrf vrf instance name}`
4. `snmp-server enable traps mac-notification change`
5. `mac address-table notification change`
6. `mac address-table notification change [interval value] [history-size value]`
7. `interface interface-id`
8. `snmp trap mac-notification change {added | removed}`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server host host-addr community-string notification-type { informs</td>
<td>traps } {version {1</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification</code></td>
<td>• <code>host-addr</code>—Specifies the name or address of the NMS.</td>
</tr>
<tr>
<td></td>
<td>• <code>traps</code> (the default)—Sends SNMP traps to the host.</td>
</tr>
<tr>
<td></td>
<td>• <code>informs</code>—Sends SNMP informs to the host.</td>
</tr>
<tr>
<td></td>
<td>• <code>version</code>—Specifies the SNMP version to support. Version 1, the default, is not available with informs.</td>
</tr>
<tr>
<td></td>
<td>• <code>community-string</code>—Specifies the string to send with the notification operation. Though you can set this string by using the <code>snmp-server host</code> command, we recommend that you define this string by using the <code>snmp-server community</code> command before using the <code>snmp-server host</code> command.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 4</th>
<th>snmp-server enable traps mac-notification change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# snmp-server enable traps</td>
</tr>
<tr>
<td></td>
<td>mac-notification change</td>
</tr>
</tbody>
</table>

Enables the device to send MAC address change notification traps to the NMS.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>mac address-table notification change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# mac address-table notification</td>
</tr>
<tr>
<td></td>
<td>change</td>
</tr>
</tbody>
</table>

Enables the MAC address change notification feature.

<table>
<thead>
<tr>
<th>Step 6</th>
<th>mac address-table notification change [interval value] [history-size value]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# mac address-table notification change interval 123</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# mac address-table notification change history-size 100</td>
</tr>
</tbody>
</table>

Enters the trap interval time and the history table size.

- (Optional) `interval value`—Specifies the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second.
- (Optional) `history-size value`—Specifies the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>interface interface-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/2</td>
</tr>
</tbody>
</table>

Enters interface configuration mode, and specifies the Layer 2 interface on which to enable the SNMP MAC address notification trap.

| Step 8          | snmp trap mac-notification change [added | removed]  |
|-----------------|--------------------------------------------------|
| Example:        | Switch(config-if)# snmp trap mac-notification  |
|                 | change added                                     |

Enables the MAC address change notification trap on the interface.

- Enables the trap when a MAC address is `added` on this interface.
- Enables the trap when a MAC address is `removed` from this interface.

<table>
<thead>
<tr>
<th>Step 9</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

Returns to privileged EXEC mode.
### Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN. Follow these steps to configure the device to send MAC address-move notification traps to an NMS host:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
4. `snmp-server enable traps mac-notification move`
5. `mac address-table notification mac-move`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>

<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the recipient of the trap message.</td>
</tr>
<tr>
<td>`snmp-server host host-addr {traps</td>
<td>informs} {version {1</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# snmp-server host</code></td>
<td>- traps (the default)—Sends SNMP traps to the host.</td>
</tr>
<tr>
<td><code>172.20.10.10 traps private mac-notification</code></td>
<td>- informs—Sends SNMP informs to the host.</td>
</tr>
<tr>
<td></td>
<td>- version—Specifies the SNMP version to support. Version 1, the default, is not available with informs.</td>
</tr>
<tr>
<td></td>
<td>- community-string—Specifies the string to send with the notification operation. Though you can set this string by using the <code>snmp-server host</code> command, we recommend that you define this string by using the <code>snmp-server community</code> command before using the <code>snmp-server host</code> command.</td>
</tr>
<tr>
<td></td>
<td>- notification-type—Uses the <code>mac-notification</code> keyword.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>snmp-server enable traps mac-notification move</code></td>
<td>Enables the device to send MAC address move notification traps to the NMS.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# snmp-server enable traps mac-notification move</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>mac address-table notification mac-move</code></td>
<td>Enables the MAC address move notification feature.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# mac address-table notification mac-move</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show running-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
What to do next

To disable MAC address-move notification traps, use the `no snmp-server enable traps mac-notification move` global configuration command. To disable the MAC address-move notification feature, use the `no mac address-table notification mac-move` global configuration command.

You can verify your settings by entering the `show mac address-table notification mac-move` privileged EXEC commands.

Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

Follow these steps to configure the switch to send MAC address table threshold notification traps to an NMS host:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
4. `snmp-server enable traps mac-notification threshold`
5. `mac address-table notification threshold`
6. `mac address-table notification threshold [limit percentage] | [interval time]`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
</tr>
</tbody>
</table>

| **Step 2** | Enters global configuration mode. |
| configure terminal | |
| Example: | Switch# configure terminal |

<p>| <strong>Step 3</strong> | Specifies the recipient of the trap message. |
| snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type | |
| Example: | Switch(config)# snmp-server host 172.20.10.10 traps private |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-notification</td>
<td>• version—Specifies the SNMP version to support. Version 1, the default, is not available with informs.</td>
</tr>
<tr>
<td></td>
<td>• community-string—Specifies the string to send with the notification operation. You can set this string by using the <code>snmp-server host</code> command, but we recommend that you define this string by using the <code>snmp-server community</code> command before using the <code>snmp-server host</code> command.</td>
</tr>
<tr>
<td></td>
<td>• notification-type—Uses the <code>mac-notification</code> keyword.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>snmp-server enable traps mac-notification threshold</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# snmp-server enable traps mac-notification threshold</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>mac address-table notification threshold</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# mac address-table notification threshold</code></td>
</tr>
<tr>
<td>Step 6</td>
<td>`mac address-table notification threshold [limit percentage]</td>

<td></td>
</tr>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

#### Command or Action

Switch# configure terminal

**Switch 3**

**mac address-table static mac-addr vlan vlan-id drop**

**Example:**

Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop

**Purpose**

Enables unicast MAC address filtering and configure the device to drop a packet with the specified source or destination unicast static address.

- **mac-addr**—Specifies a source or destination unicast MAC address (48-bit). Packets with this MAC address are dropped.
- **vlan-id**—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.

**Step 4**

**end**

**Example:**

Switch(config)# end

**Purpose**

Returns to privileged EXEC mode.

**Step 5**

**show running-config**

**Example:**

Switch# show running-config

#### Step 6

**copy running-config startup-config**

**Example:**

Switch# copy running-config startup-config

**Purpose**

(Optional) Saves your entries in the configuration file.

### Monitoring and Maintaining Administration of the Device

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>

**Configuration Examples for Device Administration**

**Example: Setting the System Clock**

This example shows how to manually set the system clock:

```
Switch# clock set 13:32:00 23 July 2013
```

**Examples: Configuring Summer Time**

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
Switch(config)# clock summer-time PDT recurring PST date
```
Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Switch(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 192.0.2.15
Trying 192.0.2.15...
Connected to 192.0.2.15.
Escape character is '^]'.
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
User Access Verification
Password:
```

Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

```
Switch(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
```

Switch(config)#
Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 123
Switch(config)# mac address-table notification change history-size 100
Switch(config)# interface gigabitethernet 1/2/1
Switch(config-if)# snmp trap mac-notification change added
```

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

```
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/1/1
```

Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```
Example: Configuring Unicast MAC Address Filtering
Performing Device Setup Configuration

- Information About Performing Device Setup Configuration, on page 1681
- How to Perform Device Setup Configuration, on page 1691
- Monitoring Device Setup Configuration, on page 1703
- Configuration Examples for Performing Device Setup, on page 1704

Information About Performing Device Setup Configuration

Review the sections in this module before performing your initial device configuration tasks that include IP address assignments and DHCP autoconfiguration.

Boot Process

To start your device, you need to follow the procedures in the getting started guide or the hardware installation guide for installing and powering on the device and setting up the initial device configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The boot loader software performs the normal boot process and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
- Loads a default operating system software image into memory and boots up the device.

The boot loader provides access to the flash file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door operation provides enough access to the system so that if it is necessary, you can format the flash file system, reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.
Before you can assign device information, make sure that you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match that of the device console port settings:

- Baud rate default is 9600.
- Data bits default is 8.

**Note**

If the data bits option is set to 8, set the parity option to none.

- Stop bits default is 2 (minor).
- Parity settings default is none.

**Devices Information Assignment**

You can assign IP information through the device setup program, through a DHCP server, or manually.

Use the device setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

**Note**

If you are using DHCP, do not respond to any of the questions in the setup program until the device receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the device configuration steps, manually configure the device. Otherwise, use the setup program described in the *Boot Process* section.

**Default Switch Information**

*Table 164: Default Switch Information*

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>

DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The device can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your device (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your device. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

The DHCP server for your device can be on the same LAN or on a different LAN than the device. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your device and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your device.

DHCP Client Request Process

When you boot up your device, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the device. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

Figure 130: DHCP Client and Server Message Exchange

The client, Device A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received
the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the device receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the device accepts replies from a BOOTP server and configures itself, the device broadcasts, instead of unicasts, TFTP requests to obtain the device configuration file.

The DHCP hostname option allows a group of devices to obtain hostnames and a standard configuration from the central management DHCP server. A client (device) includes in its DHCPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the hostname name global configuration command is not configured or the no hostname global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the ip address dhcp interface configuration command. In this case, if the client receives the DHCP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

**DHCP-based Autoconfiguration and Image Update**

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more devices in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new device added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

**Restrictions for DHCP-based Autoconfiguration**

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.
• The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the `write memory` or `copy running-configuration startup-configuration` privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

**DHCP Autoconfiguration**

DHCP autoconfiguration downloads a configuration file to one or more devices in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the device. It does not overwrite the bootup configuration saved in the flash, until you reload the device.

**DHCP Auto-Image Update**

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more devices in your network. The device (or devices) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

To enable a DHCP auto-image update on the device, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the device in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the device, and the new image is downloaded and installed on the device. When you reboot the device, the configuration is stored in the saved configuration on the device.

**DHCP Server Configuration Guidelines**

Follow these guidelines if you are configuring a device as a DHCP server:

• You should configure the DHCP server with reserved leases that are bound to each device by the device hardware address.

• If you want the device to receive IP address information, you must configure the DHCP server with these lease options:
  • IP address of the client (required)
  • Subnet mask of the client (required)
  • DNS server IP address (optional)
  • Router IP address (default gateway address to be used by the device) (required)

• If you want the device to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
  • TFTP server name (required)
  • Boot filename (the name of the configuration file that the client needs) (recommended)
• Hostname (optional)

• Depending on the settings of the DHCP server, the device can receive IP address information, the configuration file, or both.

• If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the device is not configured. If the router IP address or the TFTP server name are not found, the device might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

• The device can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your device but are not configured. (These features are not operational.)

**Purpose of the DNS Server**

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the device.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database. The DNS server can be on the same LAN or on a different LAN from the device. If it is on a different LAN, the device must be able to access it through a router.

**How to Obtain Configuration Files**

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the device obtains its configuration information in these ways:

• The IP address and the configuration filename is reserved for the device and provided in the DHCP reply (one-file read method).

  The device receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

• The IP address and the configuration filename is reserved for the device, but the TFTP server address is not provided in the DHCP reply (one-file read method).

  The device receives its IP address, subnet mask, and the configuration filename from the DHCP server. The device sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

• Only the IP address is reserved for the device and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

  The device receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the network-config or cisconet.cfg default configuration file. (If the network-config file cannot be read, the device reads the cisconet.cfg file.)

  The default configuration file contains the hostnames-to-IP-address mapping for the device. The device fills its host table with the information in the file and obtains its hostname. If the hostname is not found
in the file, the device uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the device uses the default Switch as its hostname.

After obtaining its hostname from the default configuration file or the DHCP reply, the device reads the configuration file that has the same name as its hostname (hostname-confg or hostname.cfg, depending on whether network-confg or cisconet.cfg was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.

If the device cannot read the network-confg, cisconet.cfg, or the hostname file, it reads the router-confg file. If the device cannot read the router-confg file, it reads the ciscortr.cfg file.

**Note**
The device broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

**How to Control Environment Variables**

With a normally operating device, you enter the boot loader mode only through the console connection. Unplug the switch power cord, then reconnect the power cord. Hold down the MODE button until you see the boot loader switch prompt.

The device boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader or any other software running on the system, functions. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

Environment variables store two kinds of data:

- Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.

- Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.
Common Environment Variables

This table describes the function of the most common environment variables.

<table>
<thead>
<tr>
<th>Variable</th>

<td><code>set ENABLE_BREAK yes/no</code></td>
<td><code>boot enable-break switch yes/no</code>&lt;br&gt;This command can be issued when the flash filesystem is initialized when ENABLE_BREAK is set to yes.</td>
</tr>
</tbody>
</table>
**Environment Variables for TFTP**

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

</tr>
</tbody>
</table>

**Scheduled Reload of the Software Image**

You can schedule a reload of the software image to occur on the device at a later time (for example, late at night or during the weekend when the device is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all devices in the network).

---

**Note**

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take effect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The `reload` command halts the system. If the system is not set to manually boot up, it reboots itself.

If your device is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the device from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the device prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the `CONFIG_FILE` environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.
To cancel a previously scheduled reload, use the **reload cancel** privileged EXEC command.

# How to Perform Device Setup Configuration

Using DHCP to download a new image and a new configuration to a device requires that you configure at least two devices. One device acts as a DHCP and TFTP server and the second device (client) is configured to download either a new configuration file or a new configuration file and a new image file.

## Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing device in the network so that it can support the autoconfiguration of a new device.

### SUMMARY STEPS

1.  **configure terminal**
2.  **ip dhcp pool** *poolname*
3.  **boot** *filename*
4.  **network** *network-number mask prefix-length*
5.  **default-router** *address*
6.  **option 150** *address*
7.  **exit**
8.  **tftp-server flash:** *filename.text*
9.  **interface** *interface-id*
10.  **no switchport**
11.  **ip address** *address mask*
12.  **end**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td>Example: Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.</td>
</tr>
<tr>
<td><strong>ip dhcp pool</strong> <em>poolname</em></td>
<td>Example: Switch(config)# ip dhcp pool pool</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the name of the configuration file that is used as a boot image.</td>
</tr>
<tr>
<td><strong>boot</strong> <em>filename</em></td>
<td>Example:</td>
</tr>
</tbody>
</table>
### Configuring DHCP Autoconfiguration (Only Configuration File)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(dhcp-config)# boot config-boot.text</td>
<td>Specifies the subnet network number and mask of the DHCP address pool. <strong>Note</strong> The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</td>
</tr>
</tbody>
</table>

**Step 4**

**network** network-number mask prefix-length

**Example:**

Switch(dhcp-config)# network 10.10.0 255.255.255.0

**Step 5**

**default-router** address

**Example:**

Switch(dhcp-config)# default-router 10.10.1.1

**Step 6**

**option** 150 address

**Example:**

Switch(dhcp-config)# option 150 10.10.1.1

**Step 7**

exit

**Example:**

Switch(dhcp-config)# exit

**Step 8**

**tftp-server flash:**filename.text

**Example:**

Switch(config)# tftp-server flash:config-boot.text

**Step 9**

**interface** interface-id

**Example:**

Switch(config)# interface interface-id

**Step 10**

no switchport

**Example:**

Switch(config-if)# no switchport

**Step 11**

**ip address** address mask

**Example:**

Switch(config-if)# ip address address mask
Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing device to support the installation of a new switch.

**Before you begin**

You must first create a text file (for example, autoinstall_dhcp) that will be uploaded to the device. In the text file, put the name of the image that you want to download (for example, c3750e-ipservices-mz.122-44.3.SE.tar, c3750x-ipservices-mz.122-53.3.SE2.tar). This image must be a tar and not a bin file.

**SUMMARY STEPS**

1. configure terminal
2. ip dhcp pool poolname
3. boot filename
4. network network-number mask prefix-length
5. default-router address
6. option 150 address
7. option 125 hex
8. copy tftp flash filename.txt
9. copy tftp flash imagename.bin
10. exit
11. tftp-server flash: config.text
12. tftp-server flash: imagename.bin
13. tftp-server flash: filename.txt
14. interface interface-id
15. no switchport
16. ip address address mask
17. end
18. copy running-config startup-config

---

### Command or Action | Purpose
--- | ---
Switch(config-if)# ip address 10.10.10.1 255.255.255.0 |  
**Step 12** end | Returns to privileged EXEC mode.
Example:
Switch(config-if)# end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal`  
*Example:*
Switch# configure terminal | Enters global configuration mode. |
| **Step 2** | `ip dhcp pool poolname`  
*Example:*
Switch(config)# ip dhcp pool pool1 | Creates a name for the DHCP server address pool and enter DHCP pool configuration mode. |
| **Step 3** | `boot filename`  
*Example:*
Switch(dhcp-config)# boot config-boot.text | Specifies the name of the file that is used as a boot image. |
| **Step 4** | `network network-number mask prefix-length`  
*Example:*
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0 | Specifies the subnet network number and mask of the DHCP address pool.  
*Note:* The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/). |
| **Step 5** | `default-router address`  
*Example:*
Switch(dhcp-config)# default-router 10.10.1 | Specifies the IP address of the default router for a DHCP client. |
| **Step 6** | `option 150 address`  
*Example:*
Switch(dhcp-config)# option 150 10.10.10.1 | Specifies the IP address of the TFTP server. |
| **Step 7** | `option 125 hex`  
*Example:*
Switch(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370 | Specifies the path to the text file that describes the path to the image file. |

<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# no switchport</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the Client to Download Files from DHCP Server

**Note:** You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.

**SUMMARY STEPS**

1. `configure terminal`
2. `boot host dhcp`
3. `boot host retry timeout timeout-value`
4. `banner config-save ^C warning-message ^C`
5. `end`
6. `show boot`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>boot host dhcp</code></td>
<td>Enables autoconfiguration with a saved configuration.</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(conf)# boot host dhcp</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

**boot host retry timeout timeout-value**

*Example:*

```
Switch(conf)# boot host retry timeout 300
```

(Optional) Sets the amount of time the system tries to download a configuration file.

**Note**

If you do not set a timeout, the system will try indefinitely to obtain an IP address from the DHCP server.

**Step 4**

**banner config-save ^C warning-message ^C**

*Example:*

```
Switch(conf)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot^C
```

(Optional) Creates warning messages to be displayed when you try to save the configuration file to NVRAM.

**Step 5**

**end**

*Example:*

```
Switch(config-if)# end
```

Returns to privileged EXEC mode.

**Step 6**

**show boot**

*Example:*

```
Switch# show boot
```

Verifies the configuration.

---

**Manually Assigning IP Information to Multiple SVIs**

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

**SUMMARY STEPS**

1. configure terminal
2. interface vlan vlan-id
3. ip address ip-address subnet-mask
4. exit
5. ip default-gateway ip-address
6. end
7. show interfaces vlan vlan-id
8. show ip redirects

Step 4  show boot
         Example:
         Switch# show boot

Modifying the Device Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

Before you begin
Use a standalone device for this task.

SUMMARY STEPS

1. configure terminal
2. boot config-file file name
3. end
4. show boot
5. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

Step 2  boot config-file file name
         Example:
         Switch(config)# boot config-file config.text

Specifies the configuration file to load during the next boot cycle.

file-url—The path (directory) and the configuration filename.

Filenames and directory names are case-sensitive.

Step 3  end
         Example: |
         | Returns to privileged EXEC mode. |
## Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

**Before you begin**

Use a standalone switch for this task.

### SUMMARY STEPS

1.  configure terminal
2.  boot manual
3.  end
4.  show boot
5.  copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> boot manual</td>
<td>Enables the switch to manually boot up during the next boot cycle.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# boot manual</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

The `boot` global configuration command changes the setting of the `CONFIG_FILE` environment variable.

(Optional) Saves your entries in the configuration file.
## Configuring a Scheduled Software Image Reload

This task describes how to configure your device to reload the software image at a later time.

### SUMMARY STEPS

1. configure terminal
2. copy running-config startup-config
3. reload in [hh:]mm [text]
4. reload at hh: mm [month day | day month] [text]
5. reload cancel
6. show reload

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>

Examples: Displaying Software Install

This example displays software bootup in install mode:

```
```

Configuration Examples for Performing Device Setup

Example: Configuring a Device as a DHCP Server

```
Switch# configure terminal
Switch(config)# ip dhcp pool pool1
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# boot config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.10.1
Switch(dhcp-config)# exit
Switch(config)# tftp-server flash:config-boot.text
Switch(config)# interface gigabitethernet 1/0/4
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end
```
Example: Configuring DHCP Auto-Image Update

Example: Configuring a Device to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

```plaintext
Switch# configure terminal
Switch(config)# boot host dhcp
Switch(config)# boot host retry timeout 300
Switch(config)# banner config-save

You to No longer Automatically Download Configuration Files at Reboot

Switch(config)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
  Config file: flash:/config.text
  Private Config file: flash:/private-config.text
  Enable Break: no
  Manual Boot: no
  HELPER path-list:
  NVRAM/Config file
    buffer size: 32768
  Timeout for Config Download: 300 seconds
  Config Download via DHCP: enabled (next boot: enabled)

Switch#
```

Example: Configuring NVRAM Buffer Size

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# boot buffersize 600000
Switch(config)# end
Switch# show boot
BOOT path-list:
  Config file: flash:/config.text
  Private Config file: flash:/private-config.text
  Enable Break: no
  Manual Boot: no
  HELPER path-list:
  Auto upgrade: yes
  Auto upgrade path:
  NVRAM/Config file
    buffer size: 600000
  Timeout for Config Download: 300 seconds
  Config Download via DHCP: enabled (next boot: enabled)
Switch#
```

- Configuration Examples for RTU Licensing, on page 1713

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring RTU Licenses

The following are the restrictions for configuring and using RTU licenses.

- AP count licenses can be ordered and pre-activated on your switch.
- Imaged based licenses can be upgraded. AP count licenses can be deactivated and moved between switches and controllers.
- To activate a license, you must reboot your switch after configuring the new license level. The AP-count license does not require a reboot to activate.
- An expired evaluation license can not be reactivated after reboot.
- Stack members of a switch stack must run the same license level. If the license level is different, the switch will not join the stack until it is changed and rebooted from the active switch of the stack.
- Adder AP-count licenses are installed in the factory.
Information About Configuring RTU Licenses

Right-To-Use Licensing

Right-to-use (RTU) licensing allows you to order and activate a specific license type and level, and then to manage license usage on your switch. The types of licenses available to order by duration are:

- Permanent licenses—Purchased with a specific feature set with no expiration date.
- Evaluation licenses—Pre-installed on the switch and is valid for only a 90 day in-use period.

To activate a permanent or evaluation license, you are required to accept the End-User License Agreement (EULA).

A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.

If you activate the evaluation license, it will expire in 90 days. An evaluation license is a manufacturing image on your switch and is not transferable to another switch. Once activated, this type of license cannot be deactivated until it expires. After your evaluation period expires, at the next reload your switch image will return to its default license and network operations are not impacted.

Right-To-Use Image-Based Licenses

Right-to-use image licenses support a set of features based on a specific image-based license:

- LAN Base—Layer 2 features.
- IP Base—Layer 2 and Layer 3 features.
- IP Services—Layer 2, Layer 3, and IPv6 features. (Applicable only to switches and not controllers.)

The default image license for the switches is as follows:

- Catalyst 2960-CX switches: LAN Base
- Catalyst 3560-CX switches: IP Base

Right-To-Use License States

After you configure a specific license type and level, you can manage your licenses by monitoring the license state.
Table 167: RTU License States

<table>
<thead>
<tr>
<th>License State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active, In Use</td>
<td>EULA was accepted and the license is in use after device reboot.</td>
</tr>
<tr>
<td>Active, Not In Use</td>
<td>EULA was accepted and the switch is ready to use when the license is enabled.</td>
</tr>
<tr>
<td>Not Activated</td>
<td>EULA was not accepted.</td>
</tr>
</tbody>
</table>

Guidelines to follow when monitoring your image based license state:

- A purchased permanent license is set to *Active, In Use* state only after a switch reboot.
- If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the IP Services license is activated and not the LAN Base license.
- Remaining licenses purchased after switch reboot, stay in *Active, Not In Use* state.

**Note**

For the AP count license, to change the state to *Active, In Use*, you must first make sure that the evaluation AP count license is deactivated.

---

**Mobility Controller Mode**

AP-count licenses are used only when the switch is in Mobility Controller mode. The MC is the gatekeeper for tracking the AP-count licenses and allows an access point to join or not.

Management of AP-count licenses is performed by the mobility controller mode configurable through the CLI.

**Right-To-Use Adder AP-Count Rehosting Licenses**

Revoking a license from one device and installing it on another is called rehosting. You might want to rehost a license to change the purpose of a device.

To rehost a license, you must deactivate the adder ap-count license from one device and activate the same license on another device.

Evaluation licenses cannot be rehosted.

**How to Configure RTU Licenses**

**Activating an Image Based License**

To activate image based licenses, complete the following task:
SUMMARY STEPS

1. `license right-to-use activate {ipbase | ipservices | lanbase} [ all | evaluation | slotslot-number] [ acceptEULA ]`

2. `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`

3. `show license right-to-use usage [ slot slot-number ]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Activates the license level. Activation can happen on all switches and also include the EULA acceptance.</td>
</tr>
<tr>
<td>`license right-to-use activate {ipbase</td>
<td>ipservices</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>license right-to-use activate ipservices all acceptEULA</code></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If you do not accept EULA, the modified configuration will not take effect after reload. The default license (or a license that was not deactivated) becomes active after reload.</td>
</tr>
</tbody>
</table>

| **Step 2** | Reloads a specific stack member to complete the activation process for the RTU adder AP-count license. |
| `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]` | | 
| **Example:** | Switch# `reload slot 1 Proceed with reload? [confirm] y` |
| **Note** | The reminder to accept the EULA is displayed after reload if it was not accepted earlier. |

When changing license level, you are not required to save the configuration. But, it is a good practice to ensure all the configuration is stored properly before reload. Changing from a higher license level to a lower license level on reboot will remove CLIs that are not applicable. Ensure that all features in the lower license level that are actively used are not removed.

| **Step 3** | Displays detailed usage information. |
| `show license right-to-use usage [ slot slot-number ]` | | 
| **Example:** | Switch# `show license right-to-use usage` |
| | Slot# | License Name | Type | usage-duration(y:m:d) | In-Use | EULA |
| | 1 | ipservices | Permanent | 0 :10:27 | yes | yes |
| | 1 | ipservices | Evaluation | 0 :0 :0 | no | no |
| | 1 | ipbase | Permanent | 0 :0 :9 | no | yes |
| | 1 | ipbase | Evaluation | 0 :0 :0 | no | no |
| | 1 | lanbase | Permanent | 0 :11:12 | no | yes |
| | | | | | | |
| Switch# |
Activating an AP-Count License

**SUMMARY STEPS**

Switch#
Obtaining an Upgrade or Capacity Adder License

You can use the capacity adder licenses to increase the number of access points supported by the device.

**SUMMARY STEPS**

1. `license right-to-use {activate | deactivate} apcount {ap-number | evaluation} slot slot-num [acceptEULA]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Activates one or more adder AP-count licenses and immediately accepts the EULA.</td>
</tr>
</tbody>
</table>

Example:

```
Switch# license right to use activate apcount 5 slot 2 acceptEULA
```

Rehosting a License

To rehost a license, you have to deactivate the license from one device and then activate the same license on another device.

**SUMMARY STEPS**

1. `license right-to-use deactivate [license-level] apcount ap-number slot slot-num`

2. `license right-to-use activate [license-level] slot slot-num [acceptEULA]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Deactivates the license on one device. The IP Base license level is deactivate from slot 1 in the example here.</td>
</tr>
</tbody>
</table>

Example:

```
Switch# license right-to-use deactivate apcount 1 slot 1
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Activates the license on another device. The IP Base license level is rehosted on slot 2 in the example here.</td>
</tr>
</tbody>
</table>

Example:

```
Switch# license right to use activate ipbase slot 2 acceptEULA
```
## Monitoring and Maintaining RTU Licenses

- Activating an AP-Count License, on page 1711

## Configuration Examples for RTU Licensing

### Examples: Activating RTU Image Based Licenses

This example shows how to activate an IP Services image license and accept the EULA for a specific slot:

Switch# license right-to-use activate ipservices slot 1 acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level

This example shows how to activate a license for evaluation:

Switch# license right-to-use activate ipservices evaluation acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level

### Related Topics

- Activating an Image Based License, on page 1709
Examples: Displaying RTU Licensing Information

Example: Displaying RTU License Details

This example shows all the detailed information for the RTU licenses on slot 1:

Example: Displaying RTU License Mismatch

This example shows the license information of the switches in a stack and a mismatch state of a member switch. The member must match the active.

Switch# show switch

Switch/Stack Mac Address : 1c1d.8625.7700 - Local Mac Address
Switch# Role Mac Address Priority Version State
-------------------------------------------------------------------------------
*1 Active 1c1d.8625.7700 15 V02 Ready
 2 Standby bc16.f55c.ab80 7 V04 Ready
 3 Member 580a.2095.da00 1 V03 Lic-Mismatch

Note

To resolve the license mismatch, first check the RTU license summary:

Switch# show license right-to-use

Then change the license level of the mismatched switched so that it is the same license level of the active switch. This example shows that the IP Base license was activated for the member switch to match the active switch.

Switch# license right-to-use activate ipbase slot 3 acceptEULA

Example: Displaying RTU Licensing Usage
Understanding Switch Clusters

A switch cluster is a set of up to 16 connected, cluster-capable Catalyst switches that are managed as a single entity. The Switch in the cluster use the Switch clustering technology so that you can configure and troubleshoot a group of different Catalyst desktop Switch platforms through a single IP address.

In a Switch cluster, 1 Switch must be the cluster command Switch and up to 15 other Switch can be cluster member switches. The total number of Switch in a cluster cannot exceed 16 Switch. The cluster command Switch is the single point of access used to configure, manage, and monitor the cluster member Switch. Cluster members can belong to only one cluster at a time.

A switch cluster is different from a switch stack. A switch stack is a set of Catalyst 3750-X, Catalyst 3750-E, or Catalyst 3750 Switch connected through their stack ports.

The benefits of clustering Switch include:

- Management of Catalyst Switch regardless of their interconnection media and their physical locations. The Switch can be in the same location, or they can be distributed across a Layer 2 or Layer 3 (if your cluster is using a Catalyst 3560, Catalyst 3750, Catalyst 3560-E, Catalyst 3750-E, Catalyst 3560-X, or Catalyst 3750-X Switch as a Layer 3 router between the Layer 2 Switch in the cluster) network.
- Command-switch redundancy if a cluster command Switch fails. One or more Switch can be designated as standby cluster command switches to avoid loss of contact with cluster members. A cluster standby group is a group of standby cluster command Switch.
- Management of a variety of Catalyst Switch through a single IP address. This conserves on IP addresses, especially if you have a limited number of them. All communication with the switch cluster is through the cluster command Switch IP address.

The below table lists the Catalyst switches eligible for Switch clustering, including which ones can be cluster command switches and which ones can only be cluster member switches, and the required software versions.
Cluster Command Switch Characteristics

A cluster command Switch must meet these requirements:

- It is running a supported software release.
- It has an IP address.
- It has Cisco Discovery Protocol (CDP) Version 2 enabled (the default).
- It is not a command or cluster member Switch of another cluster.
- It is connected to the standby cluster command Switch through the management VLAN and to the cluster member Switch through a common VLAN.

Standby Cluster Command Switch Characteristics

A standby cluster command Switch must meet these requirements:

- It is running a supported software release.
- It has an IP address.

</tr>
<tr>
<td>(4-MB switches)</td>
<td>11.2(8.5)SA6 (recommended)</td>
<td>Member switch only</td>
</tr>
<tr>
<td>Catalyst 1900 and 2820</td>
<td>9.00(-A or -EN) or later</td>
<td>Member switch only</td>
</tr>
</tbody>
</table>
• It has CDP Version 2 enabled.
• It is connected to the command Switch and to other standby command Switch through its management VLAN.
• It is connected to all other cluster member Switch (except the cluster command and standby command Switch) through a common VLAN.
• It is redundantly connected to the cluster so that connectivity to cluster member Switch is maintained.
• It is not a command or member Switch of another cluster.

Standby cluster command Switch must be the same type of Switch as the cluster command Switch. For example, if the cluster command Switch is a Catalyst 3750-E Switch, the standby cluster command Switch must also be Catalyst 3750-E Switch. See the switch configuration guide of other cluster-capable Switch for their requirements on standby cluster command Switch.

Candidate Switch and Cluster Member Switch Characteristics

Candidate switches are cluster-capable Switch and Switch stacks that have not yet been added to a cluster. Cluster member Switch are switches and switch stacks that have actually been added to a Switch cluster. Although not required, a candidate or cluster member Switch can have its own IP address and password.

To join a cluster, a candidate Switch must meet these requirements:

• It is running cluster-capable software.
• It has CDP Version 2 enabled.
• It is not a command or cluster member Switch of another cluster.
• If a cluster standby group exists, it is connected to every standby cluster command Switch through at least one common VLAN. The VLAN to each standby cluster command Switch can be different.
• The ip http server global configuration command must be configured on the Switch.
• It is connected to the cluster command Switch through at least one common VLAN.

Catalyst 1900, Catalyst 2820, Catalyst 2900 XL, Catalyst 2940, Catalyst 2950, and Catalyst 3500 XL candidate and cluster member Switch must be connected through their management VLAN to the cluster command switch and standby cluster command switches. For complete information about these Switch in a switch-cluster environment, see the software configuration guide for that specific switch. This requirement does not apply if you have a Catalyst 2960, Catalyst 2970, Catalyst 3550, Catalyst 3560, Catalyst 3560-E, Catalyst 3750, Catalyst 3750-E, Catalyst 3650-X, or Catalyst 3750-X cluster command switch. Candidate and cluster member Switch can connect through any VLAN in common with the cluster command switch.

Planning a Switch Cluster

Anticipating conflicts and compatibility issues is a high priority when you manage several switches through a cluster. This section describes these guidelines, requirements, and caveats that you should understand before you create the cluster.
See the release notes for the list of Catalyst switches eligible for switch clustering, including which ones can be cluster command switches and which ones can only be cluster member switches, and for the required software versions and browser and Java plug-in configurations.

**Automatic Discovery of Cluster Candidates and Members**

The cluster command switch uses Cisco Discovery Protocol (CDP) to discover cluster member switches, candidate switches, neighboring switch clusters, and edge devices across multiple VLANs and in star or cascaded topologies.

**Note**

Do not disable CDP on the cluster command switch, on cluster members, or on any cluster-capable switches that you might want a cluster command switch to discover.

**Discovery Through CDP Hops**

By using CDP, a cluster command switch can discover switches up to seven CDP hops away (the default is three hops) from the edge of the cluster. The edge of the cluster is where the last cluster member switches are connected to the cluster and to candidate switches. For example, cluster member switches 9 and 10 in the Figure are at the edge of the cluster.

In the Figure below, the cluster command switch has ports assigned to VLANs 16 and 62. The CDP hop count is three. The cluster command switch discovers switches 11, 12, 13, and 14 because they are within three hops from the edge of the cluster. It does not discover switch 15 because it is four hops from the edge of the cluster.

*Figure 131: Discovery Through CDP Hops*

**Discovery Through Non-CDP-Capable and Noncluster-Capable Devices**

If a cluster command switch is connected to a non-CDP-capable third-party hub (such as a non-Cisco hub), it can discover cluster-enabled devices connected to that third-party hub. However, if the cluster command
switch is connected to a noncluster-capable Cisco device, it cannot discover a cluster-enabled device connected beyond the noncluster-capable Cisco device.

Below figure shows that the cluster command switch discovers the switch that is connected to a third-party hub. However, the cluster command switch does not discover the switch that is connected to a Catalyst 5000 switch.

*Figure 132: Discovery Through Non-CDP-Capable and Noncluster-Capable Devices*

**Discovery Through Different VLANs**

If the cluster command switch is a Catalyst 3560-E, Catalyst 3750-E, Catalyst 3560-X, or Catalyst 3750-X switch, the cluster can have cluster member switches in different VLANs. As cluster member switches, they must be connected through at least one VLAN in common with the cluster command switch. The cluster command switch in the figure as ports assigned to VLANs 9, 16, and 62 and therefore discovers the switches in those VLANs. It does not discover the switch in VLAN 50. It also does not discover the switch in VLAN 16 in the first column because the cluster command switch has no VLAN connectivity to it.

Catalyst 2900 XL, Catalyst 2950, and Catalyst 3500 XL cluster member switches must be connected to the cluster command switch through their management VLAN.

---

**Note**

For additional considerations about VLANs in switch stacks, see the section “Switch Clusters and Switch Stacks”.

---
Discovery Through Different Management VLANs

Catalyst 2960, Catalyst 2970, Catalyst 3550, Catalyst 3560, Catalyst 3560-E, Catalyst 3750, Catalyst 3750-E, Catalyst 3560-X, or Catalyst 3750-X cluster command switches can discover and manage cluster member switches in different VLANs and different management VLANs. As cluster member switches, they must be connected through at least one VLAN in common with the cluster command switch. They do not need to be connected to the cluster command switch through their management VLAN. The default management VLAN is VLAN 1.

**Note**

If the switch cluster has a Catalyst 3750-E or Catalyst 3750-X switch or switch stack, that switch or switch stack must be the cluster command switch.

The cluster command switch and standby command switch in the figure (assuming they are Catalyst 2960 Catalyst 2970, Catalyst 3550, Catalyst 3560, Catalyst 3560-E, Catalyst 3750, Catalyst 3750-E, Catalyst 3560-X, or Catalyst 3750-X cluster command switches) have ports assigned to VLANs 9, 16, and 62. The management VLAN on the cluster command switch is VLAN 9. Each cluster command switch discovers the switches in the different management VLANs except these:

- Switches 7 and 10 (switches in management VLAN 4) because they are not connected through a common VLAN (meaning VLANs 62 and 9) with the cluster command switch.
- Switch 9 because automatic discovery does not extend beyond a noncandidate device, which is switch 7.
Discovery Through Routed Ports

If the cluster command switch has a routed port (RP) configured, it discovers only candidate and cluster member switches in the same VLAN as the routed port.

The Layer 3 cluster command switch in the Figure can discover the switches in VLANs 9 and 62 but not the switch in VLAN 4. If the routed port path between the cluster command switch and cluster member switch 7 is lost, connectivity with cluster member switch 7 is maintained because of the redundant path through VLAN 9.

Discovery of Newly Installed Switches

To join a cluster, the new, out-of-the-box switch must be connected to the cluster through one of its access ports. An access port (AP) carries the traffic of and belongs to only one VLAN. By default, the new switch and its access ports are assigned to VLAN 1.
When the new switch joins a cluster, its default VLAN changes to the VLAN of the immediately upstream neighbor. The new switch also configures its access port to belong to the VLAN of the immediately upstream neighbor.

The cluster command switch in the Figure belongs to VLANs 9 and 16. When new cluster-capable switches join the cluster:

- One cluster-capable switch and its access port are assigned to VLAN 9.
- The other cluster-capable switch and its access port are assigned to management VLAN 16.

**Figure 136: Discovery of Newly Installed Switches**

**HSRP and Standby Cluster Command Switches**

The switch supports Hot Standby Router Protocol (HSRP) so that you can configure a group of standby cluster command switches. Because a cluster command switch manages the forwarding of all communication and configuration information to all the cluster member switches, we strongly recommend the following:

- For a cluster command switch stack, a standby cluster command switch is necessary if the entire switch stack fails. However, if only the stack master in the command switch stack fails, the switch stack elects a new stack master and resumes its role as the cluster command switch stack.
- For a cluster command switch that is a standalone switch, configure a standby cluster command switch to take over if the primary cluster command switch fails.

A *cluster standby group* is a group of command-capable switches that meet the requirements described in the “Standby Cluster Command Switch Characteristics” section. Only one cluster standby group can be assigned per cluster.

---

**Note**

The cluster standby group is an HSRP group. Disabling HSRP disables the cluster standby group.

The switches in the cluster standby group are ranked according to HSRP priorities. The switch with the highest priority in the group is the *active cluster command switch* (AC). The switch with the next highest priority is the *standby cluster command switch* (SC). The other switches in the cluster standby group are the *passive cluster command switches* (PC). If the active cluster command switch and the standby cluster command switch become disabled *at the same time*, the passive cluster command switch with the highest priority becomes the active cluster command switch. The HSRP *standby priority* interface configuration commands are the same for changing the priority of cluster standby group members and router-redundancy group members.
The HSRP standby hold time interval should be greater than or equal to three times the hello time interval. The default HSRP standby hold time interval is 10 seconds. The default HSRP standby hello time interval is 3 seconds.

Virtual IP Addresses

You need to assign a unique virtual IP address and group number and name to the cluster standby group. This information must be configured on a specific VLAN or routed port on the active cluster command switch. The active cluster command switch receives traffic destined for the virtual IP address. To manage the cluster, you must access the active cluster command switch through the virtual IP address, not through the command-switch IP address. This is in case the IP address of the active cluster command switch is different from the virtual IP address of the cluster standby group.

If the active cluster command switch fails, the standby cluster command switch assumes ownership of the virtual IP address and becomes the active cluster command switch. The passive switches in the cluster standby group compare their assigned priorities to decide the new standby cluster command switch. The passive standby switch with the highest priority then becomes the standby cluster command switch. When the previously active cluster command switch becomes active again, it resumes its role as the active cluster command switch, and the current active cluster command switch becomes the standby cluster command switch again. For more information about IP address in switch clusters, see the “IP Addresses” section.

Other Considerations for Cluster Standby Groups

These requirements also apply:

- Standby cluster command switches must be the same type of switches as the cluster command switch. For example, if the cluster command switch is a Catalyst 3750-E or Catalyst 3750-X switch, the standby cluster command switches must also be Catalyst 3750-E or Catalyst 3750-X switches. See the switch configuration guide of other cluster-capable switches for their requirements on standby cluster command switches.

If your switch cluster has a Catalyst 3750-X switch or a switch stack, it should be the cluster command switch. If not, when the cluster has a Catalyst 3750-E switch or switch stack, that switch should be the cluster command switch.

- Only one cluster standby group can be assigned to a cluster. You can have more than one router-redundancy standby group.

An HSRP group can be both a cluster standby group and a router-redundancy group. However, if a router-redundancy group becomes a cluster standby group, router redundancy becomes disabled on that group. You can re-enable it by using the CLI.

- All standby-group members must be members of the cluster.

There is no limit to the number of switches that you can assign as standby cluster command switches. However, the total number of switches in the cluster—which would include the active cluster command switch, standby-group members, and cluster member switches—cannot be more than 16.
Each standby-group member (Figure below) must be connected to the cluster command switch through the same VLAN. In this example, the cluster command switch and standby cluster command switches are Catalyst 3560-E, Catalyst 3750-E, Catalyst 3560-X, or Catalyst 3750-X cluster command switches. Each standby-group member must also be redundantly connected to each other through at least one VLAN in common with the switch cluster.

Catalyst 1900, Catalyst 2820, Catalyst 2900 XL, Catalyst 2950, and Catalyst 3500 XL cluster member switches must be connected to the cluster standby group through their management VLANs.

**Figure 137: VLAN Connectivity between Standby-Group Members and Cluster Members**

**Automatic Recovery of Cluster Configuration**

The active cluster command switch continually forwards cluster-configuration information (but not device-configuration information) to the standby cluster command switch. This ensures that the standby cluster command switch can take over the cluster immediately after the active cluster command switch fails.

Automatic discovery has these limitations:

- This limitation applies only to clusters that have Catalyst 2950, Catalyst 2960, Catalyst 2970, Catalyst 3550, Catalyst 3560, Catalyst 3560-E, Catalyst 3560-X, Catalyst 3750, Catalyst 3750-E, and Catalyst 3750-X command and standby cluster command switches: If the active cluster command switch and standby cluster command switch become disabled at the same time, the passive cluster command switch with the highest priority becomes the active cluster command switch. However, because it was a passive standby cluster command switch, the previous cluster command switch did not forward cluster-configuration information to it. The active cluster command switch only forwards cluster-configuration information to the standby cluster command switch. You must therefore rebuild the cluster.

- This limitation applies to all clusters: If the active cluster command switch fails and there are more than two switches in the cluster standby group, the new cluster command switch does not discover any Catalyst 1900, Catalyst 2820, and Catalyst 2916M XL cluster member switches. You must re-add these cluster member switches to the cluster.

- This limitation applies to all clusters: If the active cluster command switch fails and becomes active again, it does not discover any Catalyst 1900, Catalyst 2820, and Catalyst 2916M XL cluster member switches. You must again add these cluster member switches to the cluster.

When the previously active cluster command switch resumes its active role, it receives a copy of the latest cluster configuration from the active cluster command switch, including members that were added while it was down. The active cluster command switch sends a copy of the cluster configuration to the cluster standby group.
IP Addresses

You must assign IP information to a cluster command switch. You can assign more than one IP address to the cluster command switch, and you can access the cluster through any of the command-switch IP addresses. If you configure a cluster standby group, you must use the standby-group virtual IP address to manage the cluster from the active cluster command switch. Using the virtual IP address ensures that you retain connectivity to the cluster if the active cluster command switch fails and that a standby cluster command switch becomes the active cluster command switch.

If the active cluster command switch fails and the standby cluster command switch takes over, you must either use the standby-group virtual IP address or any of the IP addresses available on the new active cluster command switch to access the cluster.

You can assign an IP address to a cluster-capable switch, but it is not necessary. A cluster member switch is managed and communicates with other cluster member switches through the command-switch IP address. If the cluster member switch leaves the cluster and it does not have its own IP address, you must assign an IP address to manage it as a standalone switch.

Hostnames

You do not need to assign a host name to either a cluster command switch or an eligible cluster member. However, a hostname assigned to the cluster command switch can help to identify the switch cluster. The default hostname for the switch is Switch.

If a switch joins a cluster and it does not have a hostname, the cluster command switch appends a unique member number to its own hostname and assigns it sequentially as each switch joins the cluster. The number means the order in which the switch was added to the cluster. For example, a cluster command switch named eng-cluster could name the fifth cluster member eng-cluster-5.

If a switch has a hostname, it retains that name when it joins a cluster and when it leaves the cluster.

If a switch received its hostname from the cluster command switch, was removed from a cluster, was then added to a new cluster, and kept the same member number (such as 5), the switch overwrites the old hostname (such as eng-cluster-5) with the hostname of the cluster command switch in the new cluster (such as mkg-cluster-5). If the switch member number changes in the new cluster (such as 3), the switch retains the previous name (eng-cluster-5).

Passwords

You do not need to assign passwords to an individual switch if it will be a cluster member. When a switch joins a cluster, it inherits the command-switch password and retains it when it leaves the cluster. If no command-switch password is configured, the cluster member switch inherits a null password. Cluster member switches only inherit the command-switch password.

If you change the member-switch password to be different from the command-switch password and save the change, the switch is not manageable by the cluster command switch until you change the member-switch password to match the command-switch password. Rebooting the member switch does not revert the password back to the command-switch password. We recommend that you do not change the member-switch password after it joins a cluster.

For password considerations specific to the Catalyst 1900 and Catalyst 2820 switches, see the installation and configuration guides for those switches.
SNMP Community Strings

A cluster member switch inherits the command-switch first read-only (RO) and read-write (RW) community strings with @esN appended to the community strings:

- `command-switch-readonly-community-string@esN`, where N is the member-switch number.
- `command-switch-readwrite-community-string@esN`, where N is the member-switch number.

If the cluster command switch has multiple read-only or read-write community strings, only the first read-only and read-write strings are propagated to the cluster member switch.

The switches support an unlimited number of community strings and string lengths.

For SNMP considerations specific to the Catalyst 1900 and Catalyst 2820 switches, see the installation and configuration guides specific to those switches.

TACACS+ and RADIUS

If Terminal Access Controller Access Control System Plus (TACACS+) is configured on a cluster member, it must be configured on all cluster members. Similarly, if RADIUS is configured on a cluster member, it must be configured on all cluster members. Further, the same switch cluster cannot have some members configured with TACACS+ and other members configured with RADIUS.

LRE Profiles

A configuration conflict occurs if a switch cluster has Long-Reach Ethernet (LRE) switches that use both private and public profiles. If one LRE switch in a cluster is assigned a public profile, all LRE switches in that cluster must have that same public profile. Before you add an LRE switch to a cluster, make sure that you assign it the same public profile used by other LRE switches in the cluster.

A cluster can have a mix of LRE switches that use different private profiles.

Using the CLI to Manage Switch Clusters

You can configure cluster member switches from the CLI by first logging into the cluster command switch. Enter the `rcommand` user EXEC command and the cluster member switch number to start a Telnet session (through a console or Telnet connection) and to access the cluster member switch CLI. The command mode changes, and the Cisco IOS commands operate as usual. Enter the `exit` privileged EXEC command on the cluster member switch to return to the command-switch CLI.

This example shows how to log into member-switch 3 from the command-switch CLI:

```
switch# rcommand 3
```

If you do not know the member-switch number, enter the `show cluster members` privileged EXEC command on the cluster command switch. For more information about the `rcommand` command and all other cluster commands, see the switch command reference.

The Telnet session accesses the member-switch CLI at the same privilege level as on the cluster command switch. The Cisco IOS commands then operate as usual.
The CLI supports creating and maintaining switch clusters with up to 16 switch stacks.

Using SNMP to Manage Switch Clusters

When you first power on the switch, SNMP is enabled if you enter the IP information by using the setup program and accept its proposed configuration. If you did not use the setup program to enter the IP information and SNMP was not enabled, you can enable it as described in the “Configuring SNMP”. On Catalyst 1900 and Catalyst 2820 switches, SNMP is enabled by default.

When you create a cluster, the cluster command switch manages the exchange of messages between cluster member switches and an SNMP application. The cluster software on the cluster command switch appends the cluster member switch number (@esN, where N is the switch number) to the first configured read-write and read-only community strings on the cluster command switch and propagates them to the cluster member switch. The cluster command switch uses this community string to control the forwarding of gets, sets, and get-next messages between the SNMP management station and the cluster member switches.

When a cluster standby group is configured, the cluster command switch can change without your knowledge. Use the first read-write and read-only community strings to communicate with the cluster command switch if there is a cluster standby group configured for the cluster.

If the cluster member switch does not have an IP address, the cluster command switch redirects traps from the cluster member switch to the management station, as shown in the Figure. If a cluster member switch has its own IP address and community strings, the cluster member switch can send traps directly to the management station, without going through the cluster command switch.

If a cluster member switch has its own IP address and community strings, they can be used in addition to the access provided by the cluster command switch.

• Restrictions and Guidelines for AVC with DNS-AS, on page 1730
• Information About AVC with DNS-AS, on page 1730
• How to Configure AVC with DNS-AS, on page 1734
• Monitoring AVC with DNS-AS, on page 1747
• Troubleshooting AVC with DNS-AS, on page 1750
• Feature History and Information for AVC with DNS-AS, on page 1751

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AVC with DNS-AS

• You have the Cisco ONE for Access license to use AVC with DNS-AS.
• You have enabled Multilayer Switch (MLS) Quality of Service (QoS).
• You have maintained metadata in the authoritative DNS server and reachability exists - before you enable AVC with DNS-AS
• The DNS-AS client can snoop forward look-up requests originating from hosts.
• To ensure DNS packet logging or snooping, you have attached the policy map to the interface, by using the service-policy input command.
Restrictions and Guidelines for AVC with DNS-AS

- The feature is supported only on the Cisco Catalyst 3560-CX Series Switches and not the Cisco Catalyst 2960-CX Series Switches.

- Only a forward look-up is supported.

- Two DNS servers are supported (in case of a failover). One is considered the primary DNS server and other, the secondary DNS server.

- IPv6 is not supported—AAAA requests, and IPv6 DNS servers are not supported.

- AVC with DNS-AS is supported only on physical interfaces, in the ingress direction.

- Virtual Routing and Forwarding (VRF) is not supported.

- We recommend a maximum of 300 AVC with DNS-AS applications (domain names) in the binding table, because of its effect on the ternary content addressable memory (TCAM). To know how the addition of applications affects the TCAM see the Troubleshooting AVC with DNS-AS section of this chapter.

Information About AVC with DNS-AS

The Application Visibility Control (AVC) with Domain Name System as an Authoritative Source (DNS-AS) feature (AVC with DNS-AS) provides a centralized means of controlling the identification and classification of trusted network traffic in an organization. It accomplishes this by using network metadata stored in a DNS server that is authoritative to the domain in question, to identify applications, Quality of Service (QoS) to classify the corresponding traffic and apply suitable policies, and Flexible NetFlow (FNF), to monitor and export application information to an external collector.

The feature provides:

- Application Visibility—Ensuring unambiguous visibility of applications.

  The DNS-AS mechanism snoops requests and does not require a CPU-intensive, deep packet inspection (DPI). Since traffic classification is by means of a DNS request and not DPI, this feature is compatible in scenarios where network traffic is encrypted.

- Metadata Driven—Using information about applications.

  You can program the network holistically so it behaves like a self-driving car. You now have information about all the required applications in your network, irrespective of whether traffic is encrypted or not.

- Centralized Control—Using a cross-domain application intent policy controller.

  The feature leverages an existing, universally available query-response mechanism to enable local DNS servers within an organization to act as authoritative servers and propagate application classification information to DNS-AS clients (switches) in an enterprise network.

- Control without Administrative Access—Proving alternatives to controller-based approaches.

  The feature supports scenarios where your network may be in the cloud and you may not own it. You can still control network devices across the Internet, even though you may not have administrative control of these devices.
Overview of AVC with DNS-AS

The process starts with an organization’s requirements relating to management and control of network traffic. You begin by assessing the software applications that run on the various hosts (phones, PCs etc.) in your network, the domains (websites) and applications accessed by these devices, and the business-relevance of these domains and applications in your organization.

The assessment helps you arrive at a list of domains and applications that are “trusted” by your organization, designating all remaining domains and applications as untrusted.

With DNS-AS enabled on your network and the list of trusted domains at hand, the networking devices or DNS-AS clients in your network identify which applications the network traffic belongs to or which domains are being requested. As long as the traffic is part of the trusted list, the switch requests the DNS server for metadata and IP address information. This request is sent in the form of a DNS-query. The response, once received, is cached locally until the Time-to-Live (TTL) for that resource record expires. The response is bound to the traffic and allows the DNS-AS client to now identify, classify, and forward traffic accordingly.

Key Concepts for AVC with DNS-AS

<table>
<thead>
<tr>
<th>Concept</th>
<th>Meaning or Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata (RFC6759)</td>
<td>In the context of the AVC with DNS-AS feature, this includes traffic classification information, application identification information, and business relevance information. Metadata is maintained in the form of TXT records. The following is a sample metadata record in the prescribed format: CISCO-CLS=app-name:example</td>
</tr>
<tr>
<td>Forward look-up</td>
<td>A request for an IP address or a request for an “A” record, originating from a host. Being able to snoop these forward lookups in the network traffic is fundamental to the AVC with DNS-AS feature.</td>
</tr>
<tr>
<td>Host</td>
<td>A PC or mobile where users run software applications, access websites and so on. Forward look-up requests originate from hosts.</td>
</tr>
<tr>
<td>Client or DNS-AS client</td>
<td>Networking devices throughout your network. Host traffic is always routed through such a client. Note: This chapter deals with the configuration of the AVC with DNS-AS on Cisco Catalyst Switches that are deployed as access switches only. Throughout this document, the term client, DNS-AS client, refers to the switch where AVC with DNS-AS is enabled. DNS-AS clients receive metadata from an authoritative DNS server and maintain a database of this information in the form of records. How long the record remains in the client’s database, is determined by the record’s TTL.</td>
</tr>
<tr>
<td>Concept</td>
<td>Meaning or Definition</td>
</tr>
<tr>
<td>---------</td>
<td>---------------------</td>
</tr>
<tr>
<td>Binding table</td>
<td>A table that resides in the DNS-AS client and serves as a database of parsed DNS server responses [TXT records and “A” records]. Every DNS-AS client has a binding table of its own. This table not to be confused with the trusted domain list which is only a list of the trusted domains.</td>
</tr>
<tr>
<td>&quot;A&quot; record</td>
<td>A record containing the domain name and IP address information [Only IPv4 address]. This is one of the DNS-Server responses (the other being the TXT record) and has a predefined lifespan. A forward lookup request from a host is a request for an “A” record.</td>
</tr>
<tr>
<td>TXT DNS-AS resource record or TXT record</td>
<td>A record containing metadata. This is one of the DNS-Server responses (the other being the “A” record) and has a predefined lifespan. A TXT record is limited to 255 characters. For AVC with DNS-AS, the TXT attribute is always CISCO-CLS. Any TXT record that starts with CISCO-CLS= can be recognized as an AVC with DNS-AS message. The message format is as follows: CISCO-CLS=&lt;option&gt;:&lt;val&gt;{</td>
</tr>
<tr>
<td>Time-to-Live (TTL)</td>
<td>The lifespan of an “A” record and TXT record in the binding table. TTL values are configured on the DNS server. While a TTL accompanies both TXT and “A” record responses, the DNS client only goes by the “A” record response from the DNS server.</td>
</tr>
<tr>
<td>Authoritative DNS server</td>
<td>The go-to DNS server for all client metadata and “A” record requests. Every DNS domain has only one authoritative DNS server. Such a server maintains records of application metadata in the form of a TXT record, and only returns responses to queries about domain names that have been maintained in the required format. The following is a sample metadata record in the prescribed format: CISCO-CLS-app-name:example</td>
</tr>
</tbody>
</table>

**AVC with DNS-AS Process Flow**

The working of AVC with DNS-AS involves the DNS snooping process and the DNS-AS client process—both of which are loosely coupled, but independent processes.

**DNS Snooping Process**

**Step 1**  
The host initiates an “A” record request.
A user from your organization is in a meeting room in an office building. The associated DNS-AS client here is a switch (Network traffic from this meeting room is routed through this switch). The user looks up a website www.example.com, which initiates the request for an “A” record.

Step 2 The authoritative DNS-server responds with an “A” record response.

DNS-AS Client Process

Step 1 The DNS-AS client sends a DNS query (TXT request) to the authoritative DNS server.

The DNS-AS client, which is constantly snooping for requests (that correspond with entries in the trusted domain list), finds the host’s forward look-up request. Based on the snooped result, the DNS-AS client sends a TXT request to the authoritative DNS server.

Note The DNS-AS client receives a copy of the host’s “A” record request, and does not alter the host’s original request in any manner.

Step 2 The authoritative DNS-server responds with a TXT record response.

Step 3 A successful TXT response is followed by an “A” record request.

Step 4 The authoritative DNS-server responds with an “A” record response.

Step 5 The DNS-AS client parses and saves the response in its binding table.

The DNS-AS client saves the TXT record and “A” record in its binding table. The response will remain saved in the binding table for the duration specified by the TTL of the “A” record. The system automatically checks and prevents duplicate entries for a fully qualified domain name in the binding table.

The DNS-AS client uses the metadata it receives (from the DNS Server), to determine if a QoS policy should be applied. The DNS-AS client forwards information about identified applications, to FNF, enabling you to export this information.

DNS-AS is disabled.

How to Configure AVC with DNS-AS

Generating Metadata Streams

Application metadata is configured and saved on the local, authoritative DNS server. You configure application classification information, for each trusted domain, in a prescribed format (a metadata stream). This is the information that the server propagates to switches when queried for application metadata. When the switch sends a TXT query regarding an application, the DNS server sends the relevant metadata in the TXT response.

To generate metadata streams, perform the following task:

SUMMARY STEPS

1. Go to the: AVC Resource Record Generator.
2. Click one of the options to generate the metadata stream.
   - Generate predefined
   - Generate custom
3. Copy metadata into the corresponding TXT Resource Record of the DNS server in charge of the DNS domain that you have marked as a trusted domain.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | Go to the: AVC Resource Record Generator.  
Example:  
CISCO-CLS=app-name:example|app-class:TD|business:YES|app-id:CU/28202 | Helps you generate a metadata stream for an application or domain, in a TXT record format.  
You can specify the following metadata fields:  
  • (Optional) Domain Name  
  • (Mandatory) Application Name—A value is mandatory. This can be an existing application name or custom application name. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Existing Application Name (<strong>app-name:</strong>)—Select from the list of standard applications.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Custom Application Name (<strong>app-name:</strong>)—If you enter a custom application name, you must also maintain the Traffic Class and Business Relevance information in the metadata stream.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Selector ID (<strong>app-id:</strong>)—Consists of a classification engine ID (first eight bits) and a selector ID (the next twenty-four bits).</td>
</tr>
<tr>
<td></td>
<td>• Engine ID or Classification Engine ID—Defines the context for the selector ID. Only these engine IDs are allowed:</td>
</tr>
<tr>
<td></td>
<td>L3—IANA layer 3 protocol number</td>
</tr>
<tr>
<td></td>
<td>L4—IANA layer 4 well-known port number</td>
</tr>
<tr>
<td></td>
<td>L7—Cisco global application ID</td>
</tr>
<tr>
<td></td>
<td>CU—Custom protocol. Use this engine ID for custom application names.</td>
</tr>
<tr>
<td></td>
<td>• Selector ID—An application identifier, for a given classification engine ID. Enter a numeric value between 1 and 65535</td>
</tr>
<tr>
<td></td>
<td>Note When you enter the engine ID and selector ID for existing application names, be sure to align with the Network Based Application Recognition (NBAR) standard. Only then will the FNF exporters report with a common ID and in a consistent manner.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Port Range (<strong>server-port:</strong>)</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Traffic Class (<strong>app-class:</strong>)</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Business Relevance (<strong>business:</strong>)—If you do not select yes or no, the business relevance value is set based on the app-class or app-name, in that order of priority.</td>
</tr>
</tbody>
</table>

For information about how traffic class and business relevance fields here map to QoS traffic classification, see **App-Class and QoS Traffic Mapping**
### Configuring a DNS Server as the Authoritative Server

All DNS-AS clients in the network should be configured to send all DNS queries to one authoritative DNS server. On a Cisco Catalyst switch, perform the following task:

#### SUMMARY STEPS

1. `configure terminal`
2. `ip name-server server-address`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the address of the authoritative DNS server. The port number is always 53. You can configure up to two DNS Servers, in case of a failover.</td>
</tr>
<tr>
<td><code>ip name-server server-address</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# ip name-server server-address 192.0.2.1 192.0.2.2</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

The command allows you configure up to six name servers (IPv4 and IPv6). Ensure that at least the first two IP addresses in the sequence are IPv4 addresses, because the AVC with DNS-AS feature will use only these. See the example below, here the first two addresses are IPv4 (192.0.2.1 and 192.0.2.2), the third one (2001:DB8::1) is an IPv6 address. AVC with DNS-AS will use the first two.

`Switch(config)# ip name-server 192.0.2.1 192.0.2.2 2001:DB8::1`
Enabling AVC with DNS-AS

DNS-AS is disabled by default. To enable the feature on a Cisco Catalyst switch, perform the following task:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no] avc dns-as client enable`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  configure terminal  
  Example:
  Switch# configure terminal | Enters global configuration mode. |
| **Step 2**
  `[no] avc dns-as client enable`  
  Example:
  Switch(config)# avc dns-as client enable | Enables AVC with DNS-AS on the switch (DNS-AS client). The system then creates a binding table where parsed DNS server responses are stored till the TTL expires. **Note** To ensure DNS packet logging or snooping, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface by using the `service-policy input` command. For more information, see Configuring QoS for AVC with DNS-AS, on page 1738 |

**Maintaining the List of Trusted Domains**

Trusted domains are saved in every DNS-AS client where AVC with DNS-AS is enabled. When the feature is first enabled on the DNS-AS client, the list is empty. You must enter the domains that the switch should trust. The switch snoops only for network traffic that is maintained in this list. To make entries in the trusted domain list, perform the following task:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no] avc dns-as client trusted-domains`
3. `[no] domain domain-name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  configure terminal  
  Example: | Enters global configuration mode. |
**Configuring QoS for AVC with DNS-AS**

In order to isolate and classify trusted traffic as defined in the metadata stream, you must create class maps (one for each traffic class) > define traffic-class match criteria and business-relevance match criteria > create a policy map > add the class map > set action > attach the policy map to the interface. For more information, see the Classification Overview section of the Configuring QoS chapter in this guide.

**Class Map Configuration in the Easy QoS Model**

In order to determine the number of traffic classes that should be provisioned, you can use the 12-class Easy QoS Model. This model provides a uniform, standards-based recommendations to help ensure that QoS designs and deployments are unified and consistent across an organization. The following sample output displays class map configuration for traffic class and business relevance, according to the 12-class Easy QoS Model:

```
class-map match-all VOICE
match protocol attribute traffic-class voip-telephony
match protocol attribute business-relevance business-relevant
class-map match-all BROADCAST-VIDEO
match protocol attribute traffic-class broadcast-video
match protocol attribute business-relevance business-relevant
```

**Note**

Only in the context of the DNS-AS feature, you can specify up to two match attributes for each class.
Policy Map Definitions in the Easy QoS Model

The following sample output displays the policy map definitions, with traffic attribute marking for all the traffic classes in the 12-class Easy QoS Model:

```
policy-map MARKING
class VOICE
set dscp ef
class BROADCAST-VIDEO
set dscp cs5
class REAL-TIME-INTERACTIVE
set dscp cs4
class MULTIMEDIA-CONFERENCEING
set dscp af41
class MULTIMEDIA-STREAMING
set dscp af31
class SIGNALING
set dscp cs3
class NETWORK-CONTROL
set dscp cs6
class NETWORK-MANAGEMENT
set dscp cs2
class TRANSACTIONAL-DATA
set dscp af21
class BULK-DATA
set dscp af11
class SCAVENGER
set dscp cs1
class class-default
set dscp default
```
App-Class and QoS Traffic Mapping

The following table shows how the `app-class` field in the metadata stream maps to the 12-class Easy QoS Model of traffic classification.

### App-Class and QoS Traffic Mapping

<table>
<thead>
<tr>
<th>Application Class Long Text</th>
<th>Application Class Short Text</th>
<th>Corresponding QoS Traffic Class Name and Business Relevance</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOIP-TELEPHONY</td>
<td>VO</td>
<td>Traffic-class = voip-telephony Business-relevance = YES</td>
</tr>
<tr>
<td>BROADCAST-VIDEO</td>
<td>BV</td>
<td>Traffic-class = broadcast-video Business-relevance = YES</td>
</tr>
<tr>
<td>REALTIME-INTERACTIVE</td>
<td>RTI</td>
<td>Traffic-class = real-time-interactive Business-relevance = YES</td>
</tr>
<tr>
<td>MULTIMEDIA-CONFERENCING</td>
<td>MMC</td>
<td>Traffic-class = multimedia-conferencing Business-relevance = YES</td>
</tr>
<tr>
<td>MULTIMEDIA-STREAMING</td>
<td>MMS</td>
<td>Traffic-class = multimedia-streaming Business-relevance = YES</td>
</tr>
<tr>
<td>NETWORK-CONTROL</td>
<td>NC</td>
<td>Traffic-class = network-control Business-relevance = YES</td>
</tr>
<tr>
<td>SIGNALING</td>
<td>CS</td>
<td>Traffic-class = Signaling Business-relevance = YES</td>
</tr>
<tr>
<td>OPS-ADMIN-MGMT</td>
<td>OAM</td>
<td>Traffic-class = ops-admin-mgmt Business-relevance = YES</td>
</tr>
<tr>
<td>TRANSACTIONAL-DATA</td>
<td>TD</td>
<td>Traffic-class = Transactional-Data Business-relevance = YES</td>
</tr>
<tr>
<td>BULK-DATA</td>
<td>BD</td>
<td>Traffic-class = bulk-data Business-relevance = YES</td>
</tr>
<tr>
<td>BEST-EFFORT</td>
<td>BE</td>
<td>Traffic-class = &lt;no change&gt; Business-relevance = default</td>
</tr>
<tr>
<td>SCAVENGER</td>
<td>SCV</td>
<td>Traffic-Class = &lt;no change&gt; Business-relevance = NO</td>
</tr>
</tbody>
</table>
Classifying Network Control Traffic

The following example shows how to classify network control traffic. The corresponding metadata that should be maintained is:

```
CISCO-CLS=app-name:example|app-class:NC|business:YES
```

1. Create class maps and match attributes:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map NETWORK-CONTROL
Switch(config-cmap)# match protocol attribute traffic-class network-control
Switch(config-cmap)# match protocol attribute business-relevance business-relevant
Switch(config-cmap)# end
```

2. Create the policy map, attach the class map to it and specify priority:

```plaintext
Switch# configure terminal
Switch configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map MARKING
Switch(config-pmap)# class NETWORK-CONTROL
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# end
```

3. Attach the policy map to an interface:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface tengigabitethernet 1/0/1
Switch(config-if)# service-policy input MARKING
Switch(config-if)# end
```

Configuring FNF for AVC with DNS-AS

With FNF you can gain visibility into the applications running on your network, and use FNF option templates to export application ID, description, and attribute information. You must configure these FNF settings on the DNS-AS client:

- Configure a flow record to collect nonkey field `application-name`, and the key fields `ipv4 source address` and `ipv4 destination address`

- Configure a flow exporter and the two option templates. Option templates fetch application information. Option template `application-table`, exports only applications resolved by the DNS-AS client, that is, the application ID and name from the binding table. The corresponding application descriptions are from Network Based Application Recognition (NBAR) definition for standard applications. A constructed help string is used for custom applications.

  Option template `application-attributes` fetches attribute information by mapping it to the application name. Where standard application names are used, the option template uses standard Network Based Application Recognition (NBAR) attribute definitions; where custom application names are used, user-defined application names and only certain attribute fields are guaranteed to carry values.

- Configure a flow monitor and apply it to an interface to enable network traffic monitoring.

FNF Interaction with DNS-AS—With every flow that is created in the flow table, the DNS-AS client resolves the application name for the flow (if the entry exists in the binding table), by using the destination IP address (and if not available), the source IP address.
At periodic, configured intervals (600 seconds, by default), FNF exports option template data, that is mapped to the corresponding application name, to an external collector.

### Option Templates

The **application-table** and **application-attributes** option templates are supported. Option templates determine the information that is exported to an external collector.

#### option application-table

This template exports the application name, application tag, and description to the external collector.

On a device where AVC with DNS-AS is enabled, only applications resolved by the DNS-AS client are exported. But as a permanent feature, the application-table template exports applications **unclassified** and **unknown**, irrespective of whether the feature is enabled or not.

- **Application Name**—For custom and standard applications, this information is derived from the TXT response (**app-name:**) that is saved in the binding table.
- **Application Tag**—The same as the application ID in the context of the AVC with DNS-AS feature. It consists of the engine ID and selector ID.
  - **Engine ID or Classification Engine ID**—Defines the context for the selector ID. Only these values are supported:
    - **L3**—IANA layer 3 protocol number (IANA_L3_STANDARD, ID: 1)
    - **L4**—IANA layer 4 well-known port number (IANA_L4_STANDARD, ID: 3)
    - **L7**—Cisco global application ID (CISCO_L7_GLOBAL, ID: 13)
    - **CU**—Custom protocol, (NBAR_CUSTOM, ID: 6)
  - **Selector ID**—Uniquely identifies the application or classification.

For standard applications, the application tag information is derived from these sources, in the given order of precedence:

1. **TXT response (**app-id:**)
2. The NBAR definition for standard applications (if the TXT response does not carry a value).

For custom applications, the following applies to application tag information:

- **It is derived only from the TXT response (**app-id:**)
- For the engine ID, the DNS-AS client automatically uses **CU**—Custom protocol, (NBAR_CUSTOM, ID: 6).
- For the selector ID, the DNS-AS client allots a custom selector ID. A maximum of 120 custom applications are supported - out of which 110 are available to the DNS-AS client. Starting with selector ID value 243, IDs are assigned in descending order. When there are no remaining IDs to assign, the entry is not saved in the binding table.
  - **Description**—This information is derived from the NBAR definition for standard applications. For custom applications, the DNS-AS client uses: User Defined Protocol <app-name>.
option application-attributes

This template enables the collector to map the application names (from the option application-table), to attributes. Attributes are statically assigned to each protocol or application, and are not dependent on traffic. The template supports the following attributes:

For standard applications—

• Application Tag—See the Application Tag info in the option application-table section above. The same applies here.

• Category—Groups applications based on the first level of categorization for each protocol as the match criteria. Similar applications are grouped together under one category. For example, the email category contains all email applications such as, Internet Mail Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP), Lotus Notes, and so on.

• Sub-category—Groups applications based on the second level of categorization for each protocol as the match criteria. For example, clearcase, dbase, rda, mysql and other database applications are grouped under the database group.

• Application Group—Groups the same networking applications together. For instance, Example-Messenger, Example-VoIP-messenger, and Example-VoIP-over-SIP are grouped together under the example-messenger-group.

• Peer-to-peer (p2p)—Groups protocols based on whether or not they use p2p technology.

• Tunnel—Groups protocols based on whether or not a protocol tunnels the traffic of other protocols. Protocols for which the NBAR does not provide any value are categorized under the unassigned tunnel group. For example, Layer 2 Tunneling Protocols (L2TP).

• Encryption—Groups applications based on the encrypted and nonencrypted status of the applications. Protocols for which the NBAR does not provide any value are categorized under the unassigned encrypted group.

• Traffic class—Groups applications and protocols based on the traffic class they belong to. For example, all applications that have traffic class TD. Traffic class information is derived from these sources, in the given order of precedence:
  1. TXT response (app-class:)
  2. The NBAR definition for standard applications (if the TXT response does not carry a value)

• Business relevance—Groups applications based on whether or not they have been marked as business-relevant. For example, all applications that have business relevance as YES. Business relevance information is derived from these sources, in the given order of precedence:
  1. TXT response (business:)
  2. The NBAR definition for standard applications (if the TXT response does not carry a value)

For custom applications—

Only these attributes of the application-attributes options template are guaranteed to carry a value:

• Application Tag—See the Application Tag info in the option application-table section above. The same applies here.

• Traffic class—This information is derived from the TXT response (app-class:)

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)
• Business relevance—This information is derived from the TXT response (business:)

Sample FNF Configuration for AVC with DNS-AS

The following example shows how you can configure FNF for AVC with DNS-AS:

Part 1: Create a flow record. As in the example, you must configure:
• The source and destination IP addresses as key fields, in order to resolve application names.
• The use of the application name as a nonkey field in flow record.

Additionally (not mandatory), you can also configure the number of bytes or packets in a flow as a nonkey field, to display the number of applications sent to the collector

```
Switch# configure terminal
Switch(config)# flow record example-record1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# collect application name
Switch(config-flow-record)# collect counter packets
Switch(config-flow-record)# exit

Switch# show flow record example-record1
flow record example-record1
match ipv4 source address
match ipv4 destination address
collect application name
collect counter packets
```

Part 2: Create a flow exporter.

Also configure the application-table and application-attributes option templates in the exporter. Without option templates, the collector cannot retrieve meaningful application information. At a minimum we recommend that you configure the application-table option. For attribute information, also configure the application-attribute option.

You can also change the frequency of template export in seconds (the allowed range is 1 to 86400 seconds; the default is 600 seconds).

```
Switch(config)# flow exporter example-exporter1
Switch(config-flow-exporter)# option application-table
Switch(config-flow-exporter)# option application-attributes
Switch(config-flow-exporter)# template data timeout 500
Switch(config-flow-exporter)# exit

Switch# show flow exporter example-exporter1
Flow Exporter example-exporter1:
   Description: User defined
   Export protocol: NetFlow Version 9
   Transport Configuration:
     Destination IP address: 192.0.1.254
     Source IP address: 192.51.100.2
     Transport Protocol: UDP
     Destination Port: 9995
     Source Port: 54964
     DSCP: 0x0
     TTL: 255
     Output Features: Not Used
   Options Configuration:
     application-table (timeout 500 seconds)
```
application-attributes (timeout 500 seconds)

Switch# show flow exporter example-exporter1 statistics
Flow Exporter example-exporter1:
Packet send statistics (last cleared 00:00:48 ago):
Successfully sent: 2 (924 bytes)

Client send statistics:
Client: Option options application-name
  Records added: 4
    - sent: 4
  Bytes added: 332
    - sent: 332

Client: Option options application-attributes
  Records added: 2
    - sent: 2
  Bytes added: 388
    - sent: 388

Part 3: Create a flow monitor

Apply the flow monitor to an interface, to perform network traffic monitoring.

You can also apply a QoS policy to the same interface. This example applies the QoS policy created as part of the sample QoS configuration (Classifying Network Control Traffic, on page 1741)

Switch# configure terminal
Switch(config)# flow monitor example-monitor1
Switch(config-flow-monitor)# record example-record1
Switch(config-flow-monitor)# exporter example-exporter1
Switch(config-flow-monitor)# exit
Switch(config)# interface tengigabitethernet 1/0/1
Switch(config-if)# switchport access vlan 100
Switch(config-if)# switchport mode access
Switch(config-if)# ip flow monitor example-monitor1 input
Switch(config-if)# service-policy input MARKING
Switch(config-if)# end

Switch# show flow monitor
flow monitor example-monitor1
  record example-record1
  exporter example-exporter1

Switch# show interface tengigabitethernet1/0/1
interface tengigabitethernet1/0/1

Example: show avc dns-as client name-server brief

Switch# show avc dns-as client name-server brief
Server-IP | Vrf-name
--- | ---
192.0.2.1 | <default>
192.0.2.2 | <default>

Back to Table 169: AVC with DNS-AS Monitoring Commands

Example: show ip name-server

Switch# show ip name-server
192.0.2.1
192.0.2.2
2001:DB8::1

Back to Table 169: AVC with DNS-AS Monitoring Commands

Example: show platform tcam utilization

The relevant TCAM entry is IPv4 qos aces:
Switch# show platform tcam utilization
CAM Utilization for ASIC# 0 Max Used
Masks/Values Masks/values

Unicast mac addresses: 16604/16604 24/24
IPv4 IGMP groups + multicast routes: 1072/1072 3/3
IPv4 unicast directly-connected routes: 4096/4096 4/4
IPv4 unicast indirectly-connected routes: 1280/1280 40/40
IPv6 Multicast groups: 1072/1072 18/18
IPv6 unicast directly-connected routes: 4096/4096 1/1
IPv6 unicast indirectly-connected routes: 1280/1280 32/32
IPv4 policy based routing aces: 512/512 14/14
IPv4 qos aces: 512/512 51/51
IPv4 security aces: 1024/1024 78/78
IPv6 policy based routing aces: 256/256 8/8
IPv6 qos aces: 256/256 44/44
IPv6 security aces: 512/512 18/18

Note: Allocation of TCAM entries per feature uses a complex algorithm. The above information is meant to provide an abstract view of the current TCAM utilization.

Troubleshooting AVC with DNS-AS

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Causes and Solutions</th>
</tr>
</thead>
</table>
| There are no entries in the binding table. | The binding table may be empty because of either one or both of these reasons:  
  • Metadata is not maintained in DNS server—complete task Generating Metadata Streams, on page 1734  
  • The entry is not maintained in the trusted domain list—complete task Maintaining the List of Trusted Domains, on page 1737 |
| Unsuccessful DNS snooping or packet logging. | To ensure DNS snooping and packet logging, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface—See the example in the Configuring QoS for AVC with DNS-AS, on page 1738 |
| The DNS server does not return correct values. | Verify that the correct DNS-AS metadata is maintained in the DNS system.  
  • Using Linux dig:  
    ```
    dig TXT +short www.example.org [dns-server-ip]  
    "CISCO-CLS=app-name:example|app-class:TD|business:YES|app-id:CU/28202"
    ```  
  • Using Windows nslookup:  
    ```
    C:\Windows\system32>NSLookup.exe -q=TXT www.example.org [dns-server-ip]  
    www.example.org text =  
    "CISCO-CLS=app-name:example|app-class:TD|business:YES|app-id:CU/28202"
    ``` |
### Problem

The QoS policy you applied is removed from the port.

### Possible Causes and Solutions

When the DNS-AS client recognises an application, along with saving the "A" record response in the binding table, the system utilises the TCAM to save the IP address of the application. A single application can in effect have multiple IP addresses, each utilising additional space in the TCAM. When the TCAM is exhausted, QoS policies cease to be applied.

To avoid the problem, monitor TCAM utilisation on a regular basis. Enter the `show platform tcam utilisation` command in privilege EXEC mode, to display information about TCAM availability.

The DNS-AS client ignores the QoS mapping you've defined and applies default forwarding behavior in these cases:

- If the match attributes that you specify for the traffic class and business relevance do not match what you have defined in the metadata stream—Check and correct as required.
- If the binding table entry is no longer active. This refers to the age of the entry—Use the `show avc dns-as client binding-table` command to display the age of an entry.

### Feature History and Information for AVC with DNS-AS

The following table provides release information about the feature or features described in this chapter. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<table>
<thead>
<tr>

Configuring SDM Templates

• Finding Feature Information, on page 1753
• Information About Configuring SDM Templates, on page 1753
• How to Configure SDM Templates, on page 1755
• Configuration Examples for SDM Templates, on page 1757

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring SDM Templates

Restrictions for SDM Templates

The following are restrictions when using SDM templates:

SDM Templates

You can use Switch Database Management (SDM) templates to configure system resources to optimize support for specific features, depending on how your device is used in the network.

To allocate ternary content addressable memory (TCAM) resources for different usages, the switch SDM templates prioritize system resources to optimize support for certain features. The templates supported on your device:

• Default—The default template gives balance to all functions.
The SDM templates contain only those commands that are defined as part of the templates. If a template enables another related command that is not defined in the template, then this other command will be visible when the `show running config` command is entered. For example, if the SDM template enables the `switchport voice vlan` command, then the `spanning-tree portfast edge` command may also be enabled (although it is not defined on the SDM template).

If the SDM template is removed, then other such related commands are also removed and have to be reconfigured explicitly.

SDM templates do not create VLANs. You must create the VLANs before adding commands to the SDM templates.

**Default Templates for Catalyst 2960-CX**

The templates for Catalyst 2960-CX switches are applicable for the LAN Base license.

**Table 170: Approximate Number of Feature Resources Allowed by Templates**

How to Configure SDM Templates

Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

SUMMARY STEPS

1. enable
2. configure terminal
3. sdm prefer { advanced | vlan }
4. sdm prefer { default }
5. end
6. reload

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
Example:  
Switch> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
Example:  
Switch# configure terminal |
| **Step 3** sdm prefer { advanced | vlan } | Specifies the SDM template to be used on the switch. The keywords have these meanings:  
• **advanced** — Supports advanced features such as Netflow.  
• **vlan** — Maximizes VLAN configuration on the switch with no routing supported in hardware.  
**Note** The **no sdm prefer** command and a default template is not supported.  
Example:  
Switch(config)# sdm prefer advanced |
| **Step 4** sdm prefer { default } | Specifies the SDM template to be used on the switch. The keywords have these meanings:  
• **default** — The default template provides balance for all Layer 2, IPv4 and IPv6 functionality.  
Use the **no sdm prefer** command to set the switch to the default template, The default template balances the use of system resources.  
Example:  
Switch(config)# sdm prefer lanbase-routing |
| **Step 5** end | Returns to privileged EXEC mode.  
Example:  
Switch(config)# end |
| **Step 6** reload | Reloads the operating system.  
Example:  
Switch(config)# reload |
### Examples: Displaying SDM Templates

This is an example output showing the default template information.

Example output showing the default template information on a Catalyst 3560-CX switch.

```
Switch# show sdm prefer
The current template is "default" template.
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

  number of unicast mac addresses: 16K
  number of IPv4 IGMP groups + multicast routes: 1K
  number of IPv4 unicast routes: 5K
  number of directly-connected IPv4 hosts: 4K
  number of indirect IPv4 routes: 1K
  number of IPv6 multicast groups: 1K
  number of IPv6 unicast routes: 5K
  number of directly-connected IPv6 addresses: 4K
  number of indirect IPv6 unicast routes: 1K
  number of IPv4 policy based routing aces: 0.25K
  number of IPv4/MAC qos aces: 0.375K
  number of IPv4/MAC security aces: 0.375K
  number of IPv6 policy based routing aces: 0.25K
  number of IPv6 qos aces: 0.25K
  number of IPv6 security aces: 0.375K
```

Example output showing the default template information on a Catalyst 2960-CX switch.

```
Switch# show sdm prefer
The current template is "default" template.
The selected template optimizes the resources in
the switch to support this level of features for
0 routed interfaces and 255 VLANs.

  number of unicast mac addresses: 16K
  number of IPv4 IGMP groups + multicast routes: 1K
  number of IPv4 unicast routes: 3K
  number of directly-connected IPv4 hosts: 2K
  number of indirect IPv4 routes: 1K
  number of IPv6 multicast groups: 1K
  number of IPv6 unicast routes: 3K
  number of directly-connected IPv6 addresses: 2K
  number of indirect IPv6 unicast routes: 1K
  number of IPv4 policy based routing aces: 0
  number of IPv4/MAC qos aces: 0.375K
  number of IPv4/MAC security aces: 0.375K
  number of IPv6 policy based routing aces: 0
```

</tr>
</tbody>
</table>
Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

```
Switch(config)# sdm prefer lanbase-routing
Switch(config)# exit
Switch# reload
  Proceed with reload? [confirm]
```
Restrictions for Configuring System Message Logs

When the `logging discriminator` command is configured, the device may experience memory leak or crash. This usually happens during heavy syslog or debug output. The rate of the memory leak is dependent on the number of logs being produced. In extreme cases, the device may also crash. As a workaround, use the `no logging discriminator` command to disable the logging discriminator.

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and `debug` privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch. If a standalone switch, the log is lost unless you had saved it to flash memory.
You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port.

**Note**
The syslog format is compatible with 4.3 BSD UNIX.

## System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- `seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)`
- `seq no:timestamp: %facility-severity-MNEMONIC:description`

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- `service sequence-numbers`
- `service timestamps log datetime`
- `service timestamps log datetime [localtime] [msec] [show-timezone]`
- `service timestamps log uptime`

### Table 172: System Log Message Elements

<table>
<thead>
<tr>

</table>

Enabling Syslog Trap Messages

You can enable Syslog traps using the `snmp-server enable traps syslog` command.

After enabling Syslog traps, you have to specify the trap message severity. Use the `logging snmp-trap` command to specify the trap level. By default, the command enables severity 0 to 4. To enable all the severity level, configure the `logging snmp-trap 0 7` command.

To enable individual trap levels, configure the following commands:

- `logging snmp-trap emergencies`: Enables only severity 0 traps.
- `logging snmp-trap alert`: Enables only severity 1 traps.

Note that, along with the Syslog traps, the Syslog history should also be applied. Without this configuration, Syslog traps are not sent.

Use the `logging history informational` command to enable the Syslog history.
How to Configure System Message Logs

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console. This task is optional.

SUMMARY STEPS

1. configure terminal
2. logging buffered [size]
3. logging host
4. logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]
5. end
6. terminal monitor

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** logging buffered [size] | Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the stack master. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes. |
| Example: Switch(config)# logging buffered 8192 | If a standalone switch or the stack master fails, the log file is lost unless you previously saved it to flash memory. See Step 4. |

**Note** Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.

| **Step 3** logging host | Logs messages to a UNIX syslog server host. |
| Example: Switch(config)# logging 125.1.1.100 | host specifies the name or IP address of the host to be used as the syslog server. |

To build a list of syslog servers that receive logging messages, enter this command more than once.
### Synchronizing Log Messages

You can synchronize unsolicited messages and `debug` privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and `debug` command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and `debug` command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and `debug` command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `line [console | vty] line-number [ending-line-number]`
3. logging synchronous [level [severity-level | all] | limit number-of-buffers]
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> line [console</td>
<td>vty] line-number [ending-line-number]</td>
</tr>
<tr>
<td>Example: Switch(config)# line console</td>
<td></td>
</tr>
<tr>
<td>• console — Specifies configurations that occur through the switch console port or the Ethernet management port.</td>
<td></td>
</tr>
</tbody>
</table>
| • line vty line-number — Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15. You can change the setting of all 16 vty lines at once by entering:
  line vty 0 15
  You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:
  line vty 2
  When you enter this command, the mode changes to line configuration. |
| **Step 3** logging synchronous [level [severity-level | all] | limit number-of-buffers] | Enables synchronous logging of messages. |
| Example: Switch(config)# logging synchronous level 3 limit 1000 | |
| • (Optional) level severity-level — Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2. |
| • (Optional) level all — Specifies that all messages are printed asynchronously regardless of the severity level. |
| • (Optional) limit number-of-buffers — Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20. |
Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The logging synchronous global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return.

To reenable message logging after it has been disabled, use the logging on global configuration command. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. no logging console
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>

<tr>
<td><strong>Step 2</strong> no logging console</td>
<td>Disables message logging.</td>
</tr>
<tr>
<td>Example: Switch(config)# no logging console</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.

This task is optional.

SUMMARY STEPS

1. configure terminal
2. Use one of these commands:
   • service timestamps log uptime
   • service timestamps log datetime[msec | localtime | show-timezone]
3. end

DETAILED STEPS

<table>

<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enables log time stamps. |
| Use one of these commands: | | |
| • service timestamps log uptime | | |
| • service timestamps log datetime[msec | localtime | show-timezone] | | |
| Example: | | |
| Switch(config)# service timestamps log uptime | | |
| or | | |
| Switch(config)# service timestamps log datetime | | |

| **Step 3**        | Returns to privileged EXEC mode. |
| end | | |
| Example: | | |
| Switch(config)# end | | |

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.

This task is optional.
SUMMARY STEPS

1. configure terminal
2. service sequence-numbers
3. end

DETAILED STEPS

<table>

Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.

This task is optional.

SUMMARY STEPS

1. configure terminal
2. logging history level
3. logging history size number
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Step 2**

Change the default level of syslog messages stored in the history file and sent to the SNMP server.

Example:

```conf
Switch(config)# logging history 3
```

**Purpose**

Changes the default level of syslog messages stored in the history file and sent to the SNMP server.

By default, **warnings**, **errors**, **critical**, **alerts**, and **emergencies** messages are sent.

**Step 3**

Specify the number of syslog messages that can be stored in the history table.

Example:

```conf
Switch(config)# logging history size 200
```

**Purpose**

Specifies the number of syslog messages that can be stored in the history table.

The default is to store one message. The range is 0 to 500 messages.

**Step 4**

Return to privileged EXEC mode.

Example:

```conf
Switch(config)# end
```

## Logging Messages to a UNIX Syslog Daemon

This task is optional.

**Note**

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX `man syslogd` command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

**Before you begin**

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

### SUMMARY STEPS

1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

Configuration Examples for System Message Logs

Example: Switch System Message

This example shows a partial switch system message on a switch:

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down 2
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
**Examples: Displaying Service Timestamps Log**

This example shows part of a logging display with the `service timestamps log datetime` global configuration command enabled:

```
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
```

This example shows part of a logging display with the `service timestamps log uptime` global configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)
```

This example shows part of a logging display with the sequence numbers enabled.

```
000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
```
Examples: Displaying Service Timestamps Log
Configuring Online Diagnostics

- Information About Configuring Online Diagnostics, on page 1773
- How to Configure Online Diagnostics, on page 1774
- Monitoring and Maintaining Online Diagnostics, on page 1778
- Configuration Examples for Online Diagnostic Tests, on page 1779

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Device while the Device is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:
- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Device is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Device or switch stack and the diagnostic tests that have already run.
How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the diagnostic start privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

SUMMARY STEPS

1. diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive }

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 diagnostic start switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td>Example:</td>
<td>The switch number keyword is supported only on stacking switches. The range is from 1 to 8.</td>
</tr>
<tr>
<td>Switch# diagnostic start switch 2 test basic</td>
<td>You can specify the tests by using one of these options:</td>
</tr>
<tr>
<td></td>
<td>• name—Enters the name of the test.</td>
</tr>
<tr>
<td></td>
<td>• test-id—Enters the ID number of the test.</td>
</tr>
<tr>
<td></td>
<td>• test-id-range—Enters the range of test IDs by using integers separated by a comma and a hyphen.</td>
</tr>
<tr>
<td></td>
<td>• all—Starts all of the tests.</td>
</tr>
<tr>
<td></td>
<td>• basic—Starts the basic test suite.</td>
</tr>
<tr>
<td></td>
<td>• non-disruptive—Starts the non-disruptive test suite.</td>
</tr>
</tbody>
</table>

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the no form of this command to remove the scheduling.

SUMMARY STEPS

1. configure terminal
2. **diagnostic schedule switch number test {name | test-id | test-id-range | all | basic | non-disruptive |}
   {daily | on mm dd yyyy hh:mm | weekly day-of-week hh:mm}

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
| 2    | diagnostic schedule switch number test {name | test-id | test-id-range | all | basic | non-disruptive |}
   {daily | on mm dd yyyy hh:mm | weekly day-of-week hh:mm} | Schedules on-demand diagnostic tests for a specific day and time. |
|      | Example:          |         |
|      | Switch(config)# diagnostic schedule switch 1 test 1-5 on July 3 2013 23:10 |         |

When specifying the tests to be scheduled, use these options:

- **name**—Name of the test that appears in the `show diagnostic content` command output.
- **test-id**—ID number of the test that appears in the `show diagnostic content` command output.
- **test-id-range**—ID numbers of the tests that appear in the `show diagnostic content` command output.
- **all**—All test IDs.
- **basic**—Starts the basic on-demand diagnostic tests.
- **non-disruptive**—Starts the non-disruptive test suite.

You can schedule the tests as follows:

- **Daily**—Use the daily `hh:mm` parameter.
- **Specific day and time**—Use the `on mm dd yyyy hh:mm` parameter.
- **Weekly**—Use the `weekly day-of-week hh:mm` parameter.

---

**Configuring Health-Monitoring Diagnostics**

You can configure health-monitoring diagnostic testing on a Device while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Device to generate a syslog message because of a test failure, and enable a specific test.

Use the `no` form of this command to disable testing.

By default, health monitoring is disabled, but the Device generates a syslog message when a test fails.
Follow these steps to configure and enable the health-monitoring diagnostic tests:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day
4. diagnostic monitor syslog
5. diagnostic monitor threshold switch number number test {name | test-id | test-id-range | all} failure count count
6. diagnostic monitor switch number test {name | test-id | test-id-range | all}
7. end
8. show running-config
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>

<tr>
<td>Switch#</td>
<td>configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<p>| Step 3 | diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day | Configures the health-monitoring interval of the specified tests. |
|---------|------------------------------------------------------|-------------------------------------------------------------|
| Example:| Switch(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5 | When specifying the tests, use one of these parameters: |
|         |                                                     | • name—Name of the test that appears in the show diagnostic content command output. |
|         |                                                     | • test-id—ID number of the test that appears in the show diagnostic content command output. |
|         |                                                     | • test-id-range—ID numbers of the tests that appear in the show diagnostic content command output. |
|         |                                                     | • all—All of the diagnostic tests. |
|         |                                                     | When specifying the interval, set these parameters: |
|         |                                                     | • hh:mm:ss—Monitoring interval in hours, minutes, and seconds. The range for hh is 0 to 24, and the range for mm and ss is 0 to 60. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| • **milliseconds**—Monitoring interval in milliseconds (ms). The range is from 0 to 999.  
• **day**—Monitoring interval in the number of days. The range is from 0 to 20.  |
| **Step 4** | **diagnostic monitor syslog**  
**Example:** Switch(config)# diagnostic monitor syslog | (Optional) Configures the switch to generate a syslog message when a health-monitoring test fails. |
| **Step 5** | **diagnostic monitor threshold switch number number test**  
{**name** | **test-id** | **test-id-range** | **all**} **failure count** **count**  
**Example:** Switch(config)# diagnostic monitor threshold switch 2 test 1 failure count 20 | (Optional) Sets the failure threshold for the health-monitoring tests.  
The **switch number** keyword is supported only on stacking switches. The range is from 1 to 8.  
When specifying the tests, use one of these parameters:  
• **name**—Name of the test that appears in the show diagnostic content command output.  
• **test-id**—ID number of the test that appears in the show diagnostic content command output.  
• **test-id-range**—ID numbers of the tests that appear in the show diagnostic content command output.  
• **all**—All of the diagnostic tests.  
The range for the failure threshold **count** is 0 to 99. |
| **Step 6** | **diagnostic monitor switch number test** {**name** | **test-id** | **test-id-range** | **all**}  
**Example:** Switch(config)# diagnostic monitor switch 2 test 1 | Enables the specified health-monitoring tests.  
The **switch number** keyword is supported only on stacking switches. The range is from 1 to 8.  
When specifying the tests, use one of these parameters:  
• **name**—Name of the test that appears in the show diagnostic content command output.  
• **test-id**—ID number of the test that appears in the show diagnostic content command output.  
• **test-id-range**—ID numbers of the tests that appear in the show diagnostic content command output.  
• **all**—All of the diagnostic tests. |
| **Step 7** | **end**  
**Example:** | Returns to privileged EXEC mode. |
Purpose

Command or Action

Switch(config)# end

Step 8

show running-config

Example:

Switch# show running-config

Step 9

copy running-config startup-config

Example:

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

What to do next

Use the no diagnostic monitor interval test test-id | test-id-range global configuration command to change the interval to the default value or to zero. Use the no diagnostic monitor syslog command to disable generation of syslog messages when a health-monitoring test fails. Use the diagnostic monitor threshold test test-id | test-id-range failure count command to remove the failure threshold.

Monitoring and Maintaining Online Diagnostics

Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Device or Device stack and check the test results by using the privileged EXEC show commands in this table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show diagnostic content switch [number</td>
<td>all]</td>
</tr>
<tr>
<td>show diagnostic status</td>
<td>Displays the currently running diagnostic tests.</td>
</tr>
<tr>
<td>show diagnostic result switch [number</td>
<td>all] [detail</td>
</tr>
<tr>
<td>show diagnostic switch [number</td>
<td>all] [detail]</td>
</tr>
<tr>
<td>show diagnostic schedule switch [number</td>
<td>all]</td>
</tr>
<tr>
<td>show diagnostic post</td>
<td>Displays the POST results. (The output is the same as the show post command output.)</td>
</tr>
</tbody>
</table>
Configuration Examples for Online Diagnostic Tests

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive }`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>`diagnostic start switch number test {name</td>

</tr>
<tr>
<td></td>
<td>all—Starts all of the tests.</td>
</tr>
<tr>
<td></td>
<td>basic— Starts the basic test suite.</td>
</tr>
<tr>
<td></td>
<td>non-disruptive—Starts the non-disruptive test suite.</td>
</tr>
</tbody>
</table>

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Switch(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```

Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:
Switch(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30

Displaying Online Diagnostics: Examples

This example shows how to display the online diagnostic detailed information on a specific switch:

Switch# show diagnostic switch 1 detail

Switch 1: SerialNo :

Overall Diagnostic Result for Switch 1 : UNTESTED

Test results: ( . = Pass, F = Fail, U = Untested) 

___________________________________________________________________________
1) TestPortAsicStackPortLoopback ---> U
   Error code ------------------> 3 (DIAG_SKIPPED)
   Total run count -------------> 0
   Last test testing type -------> n/a

Switch#

This example shows how to display the online diagnostic test schedule for a switch:

Switch# show diagnostic schedule switch 1

Current Time = 14:39:49 PST Tue May 5 2013
Diagnostic for Switch 1:
Schedule #1:
To be run daily 12:00
Test ID(s) to be executed: 1.
Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

- Information About Troubleshooting the Software Configuration, on page 1783
- How to Troubleshoot the Software Configuration, on page 1789
- Verifying Troubleshooting of the Software Configuration, on page 1802
- Scenarios for Troubleshooting the Software Configuration, on page 1805
- Configuration Examples for Troubleshooting Software, on page 1807

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Lost or Forgotten Password on a Device

The default configuration for the device allows an end user with physical access to the device to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the device.

Note

On these devices, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.
You cannot recover encryption password key, when Cisco WLC configuration is copied from one Cisco WLC to another (in case of an RMA).

### Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

### Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Device port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the `shutdown` interface configuration command, and then enter the `no shutdown` interface command. You can also configure automatic recovery on the Device to recover from the error-disabled state.

On a Device, the `errdisable recovery cause loopback` and the `errdisable recovery interval seconds` global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

### Monitoring PoE Port Status

- `show controllers power inline` privileged EXEC command
- `show power inline` EXEC command
- `debug ilpower` privileged EXEC command

### Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the `power inline never` interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the `shutdown` and the `no shutdown` interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the `power inline never` command.
Ping

The Device supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (hostname is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a no-answer message is returned.
- Unknown host—If the host does not exist, an unknown host message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a destination-unreachable message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a network or host unreachable message is returned.

Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Device in the path. When the Device detects a device in the path that does not support Layer 2 traceroute, the Device continues to send Layer 2 trace queries and lets them time out.

The Device can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
  
  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

- A Device is reachable from another Device when you can test connectivity by using the ping privileged EXEC command. All Device in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the traceroute mac or the traceroute mac ip privileged EXEC command on a Device that is not in the physical path from the source device to the destination device. All Device in the path must be reachable from this switch.

- The traceroute mac command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.
• If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

• The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Device uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
  • If an ARP entry exists for the specified IP address, the Device uses the associated MAC address and identifies the physical path.
  • If an ARP entry does not exist, the Device sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

• When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

• This feature is not supported in Token Ring VLANs.

### IP Traceroute

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Device can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the Device is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate Device do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate Device is a multilayer Device that is routing a particular packet, this Device shows up as a hop in the traceroute output.

The traceroute privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP port-unreachable error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.
Time Domain Reflector Guidelines

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported only on 10/100/1000 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.

- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Device

- Setting up a wiring closet

- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Device reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.

- The open-ended cable is not terminated.

When you run TDR, the Device does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.

- The link is a 10-megabit or a 100-megabit link.

- The cable is a stranded cable.

- The link partner is a Cisco IP Phone.

- The link partner is not IEEE 802.3 compliant.

Debug Commands

⚠️ Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.
All debug commands are entered in privileged EXEC mode, and most debug commands take no arguments.

### Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Device. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Device problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Device and small form-factor pluggable (SFP) modules. The Device stores this information in the flash memory:

- CLI commands—Record of the OBFL CLI commands that are entered on a standalone Device.
- Environment data—Unique device identifier (UDI) information for a standalone Device and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- Message—Record of the hardware-related system messages generated by a standalone Device.
- Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone Device.
- Temperature—Temperature of a standalone Device.
- Uptime data—Time when a standalone Device starts, the reason the Device restarts, and the length of time the Device has been running since it last restarted.
- Voltage—System voltages of a standalone Device.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Device is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the Device fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Device is restarted, there is a 10-minute delay before logging of new data begins.

### Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

**Note**

You may see increased system memory usage when Cisco Catalyst 4500E Supervisor Engine 8-E is used in wireless mode.

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
• DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

Layer 3 switches:
• Dropped packets or increased latency for packets routed in software
• BGP or OSPF routing topology changes
• HSRP flapping

How to Troubleshoot the Software Configuration

Recovering from a Software Failure
Switch software can be corrupted during an upgrade by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses the Xmodem Protocol to recover from a corrupt or wrong image file. There are many software packages that support the Xmodem Protocol, and this procedure is largely dependent on the emulation software that you are using.

This recovery procedure requires that you have physical access to the switch.

Step 1 From your PC, download the software image tar file (*image_filename.tar*) from Cisco.com. The Cisco IOS image is stored as a bin file in a directory in the tar file. For information about locating the software image files on Cisco.com, see the release notes.

Step 2 Extract the bin file from the tar file. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using UNIX, follow these steps:

a) Display the contents of the tar file by using the `tar -tvf <image_filename.tar>` UNIX command.

   **Example:**
   ```
  unix-1% tar -tvf image_filename.tar
   ```

b) Locate the bin file, and extract it by using the `tar -xvf <image_filename.tar> <image_filename.bin>` UNIX command.

   **Example:**
   ```
  unix-1% tar -xvf image_filename.tar image_filename.bin
   x c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin, 2928176 bytes, 5720 tape blocks
   ```

c) Verify that the bin file was extracted by using the `ls -l <image_filename.bin>` UNIX command.

   **Example:**
   ```
  unix-1% ls -l image_filename.bin
   -rw-r--r-- 1 boba 2928176 Apr 21 12:01
   c2960x-universalk9-mz.150-2.0.66.ucp/c2960x-universalk9-mz.150-2.0.66.ucp.bin
   ```
Step 3  Connect your PC with terminal-emulation software supporting the Xmodem Protocol to the switch console port.

Step 4  Set the line speed on the emulation software to 9600 baud.

Step 5  Unplug the switch power cord.

Step 6  Press the Mode button, and at the same time reconnect the power cord to the switch. You can release the Mode button a second or two after the LED above port 1 goes off. Several lines of information about the software appear along with instructions.

**Example:**
The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software#

`flash_init`
`load_helper`
`boot`

Step 7  Initialize the flash file system.

**Example:**
```
switch: flash_init
```

Step 8  If you had set the console port speed to any speed other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

Step 9  Load any helper files.

**Example:**
```
switch: load_helper
```

Step 10  Start the file transfer by using the Xmodem Protocol.

**Example:**
```
switch: copy xmodem: flash:image_filename.bin
```

Step 11  After the Xmodem request appears, use the appropriate command on the terminal-emulation software to start the transfer and to copy the software image into flash memory.

Step 12  Boot the newly downloaded Cisco IOS image.

**Example:**
```
switch: boot flash:image_filename.bin
```

Step 13  Use the `archive download-sw` privileged EXEC command to download the software image to the switch or to the switch stack.

Step 14  Use the `reload` privileged EXEC command to restart the switch and to verify that the new software image is operating properly.

Step 15  Delete the `flash:image_filename.bin` file from the switch.
Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

Note

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

You enable or disable password recovery by using the service password-recovery global configuration command.

Step 1

Connect a terminal or PC to the switch.

• Connect a terminal or a PC with terminal-emulation software to the switch console port.

Or

• Connect a PC to the Ethernet management port.

Step 2

Set the line speed on the emulation software to 9600 baud.

Step 3

On a switch, power off the switch.

Step 4

Reconnect the power cord to the switch. Within 15 seconds, press the Mode button while the System LED is still flashing green. Continue pressing the Mode button until all the system LEDs turn on and remain solid, then release the Mode button.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.

• If you see a message that begins with this statement:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system

proceed to the "Procedure with Password Recovery Enabled" section, and follow the steps.

• If you see a message that begins with this statement:

The password-recovery mechanism has been triggered, but is currently disabled.

proceed to the "Procedure with Password Recovery Disabled" section, and follow the steps.

Step 5

After recovering the password, reload the switch.

On a switch:
Procedure with Password Recovery Enabled

If the password-recovery operation is enabled, this message appears:

```
The system has been interrupted prior to initializing the flash file system. The following
commands will initialize the flash file system, and finish loading the operating system
software:
flash_init
load_helper
boot
```

**Step 1**  Initialize the flash file system.

Switch: `flash_init`

**Step 2**  If you had set the console port speed to any number other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

**Step 3**  Load any helper files.

Switch: `load_helper`

**Step 4**  Display the contents of flash memory.

Switch: `dir: flash`

```
Directory of flash:
  13 drwx 192 Mar 01 2013 22:30:48
c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin
  11 -rwx 5825 Mar 01 2013 22:31:59 config.text

1612800 bytes total (10003456 bytes free)
```

**Step 5**  Rename the configuration file to config.text.old

This file contains the password definition.

Switch: `rename flash: config.text flash: config.text.old`

**Step 6**  Boot up the system.

Switch: `boot`

You are prompted to start the setup program. Enter N at the prompt.

Continue with the configuration dialog?? [yes/no]: No

**Step 7**  At the switch prompt, enter privileged EXEC mode.
Step 8  Rename the configuration file to its original name.

Switch# rename flash: config.text.old flash: config.text

**Note** Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. Failure to follow this step can result in a lost configuration depending on how your device is set up.

Step 9  Copy the configuration file into memory

Switch# copy flash: config.text system: running-config

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

Step 10   Enter global configuration mode.

Switch# configure terminal

Step 11   Change the password.

Switch(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 12  Return to privileged EXEC mode.

Switch(config)# exit
Switch#

Step 13  Write the running configuration to the startup configuration file.

Switch# copy running-config startup-config

The new password is now in the startup configuration.

**Note** This procedure is likely to leave your switch virtual interface in a shutdown state. You can see which interface is in this state by entering the show running-config privileged EXEC command. To reenable the interface, enter the interface vlan vlan-id global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the no shutdown command.

Step 14   Boot the device with the packages.conf file from flash.

Switch: boot flash:packages.conf

Step 15   Reload the switch stack.
Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

Caution

Returning the Device to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Device and VLAN configuration files.

- If you enter n (no), the normal boot process continues as if the Mode button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue........

- If you enter y (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

Step 1

Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? Y

Step 2

Display the contents of flash memory:

Switch: dir flash:

The Device file system appears.

Step 3

Boot up the system:

Switch: boot

You are prompted to start the setup program. To continue with password recovery, enter N at the prompt:

Continue with the configuration dialog? [yes/no]: N
Step 4  At the Device prompt, enter privileged EXEC mode:
        Switch> enable

Step 5  Enter global configuration mode:
        Switch# configure terminal

Step 6  Change the password:
        Switch(config)# enable secret password

        The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows
        spaces but ignores leading spaces.

Step 7  Return to privileged EXEC mode:
        Switch(config)# exit
        Switch#

        Note  Before continuing to Step 9, power on any connected stack members and wait until they have completely
        initialized.

Step 8  Write the running configuration to the startup configuration file:
        Switch# copy running-config startup-config

        The new password is now in the startup configuration.

Step 9  You must now reconfigure the Device. If the system administrator has the backup Device and VLAN configuration files
        available, you should use those.

---

**Recovering from a Command Switch Failure**

This section describes how to recover from a failed command switch. You can configure a redundant command
switch group by using the Hot Standby Router Protocol (HSRP).

---

**Note**

This feature is introduced from Cisco IOS Release 15.2(5)E2.

If you have not configured a standby command switch, and your command switch loses power or fails in
some other way, management contact with the member switches is lost, and you must install a new command
switch. However, connectivity between switches that are still connected is not affected, and the member
switches forward packets as usual. You can manage the members as standalone switches through the console
port, or, if they have IP addresses, through the other management interfaces.

You can prepare for a command switch failure by assigning an IP address to a member switch or another
switch that is command-capable, making a note of the command-switch password, and cabling your cluster
to provide redundant connectivity between the member switches and the replacement command switch. These
sections describe two solutions for replacing a failed command switch:
Replacing a Failed Command Switch with a Cluster Member

To replace a failed command switch with a command-capable member in the same cluster, follow these steps:

**Step 1**
Disconnect the command switch from the member switches, and physically remove it from the cluster.

**Step 2**
Insert the member switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 3**
Start a CLI session on the new command switch.

You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see *Catalyst 3560-CX and 2960-CX Switch Hardware Installation Guide*.

**Step 4**
At the switch prompt, enter privileged EXEC mode.

**Example:**
```
Switch> enable
Switch# 
```

**Step 5**
Enter the password of the failed command switch.

**Step 6**
Enter global configuration mode.

**Example:**
```
Switch# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

**Step 7**
Remove the member switch from the cluster.

**Example:**
```
Switch(config)# no cluster commander-address
```

**Step 8**
Return to privileged EXEC mode.

**Example:**
```
Switch(config)# end
Switch# 
```

**Step 9**
Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter `setup`, and press Return.

**Example:**
```
Switch# setup

--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.
Basic management setup configures only enough connectivity
for management of the system, extended setup will ask you
to configure each interface on the system
Would you like to enter basic management setup? [yes/no]:

Step 10  Enter Y at the first prompt.

**Example:**

The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y

or

Configuring global parameters:

If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

Step 11  Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

Step 12  When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.
Step 13  When prompted, make sure to enable the switch as the cluster command switch, and press Return.
Step 14  When prompted, assign a name to the cluster, and press Return.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

Step 15  After the initial configuration displays, verify that the addresses are correct.
Step 16  If the displayed information is correct, enter Y, and press Return.

If this information is not correct, enter N, press Return, and begin again at Step 9.

Step 17  Start your browser, and enter the IP address of the new command switch.
Step 18  From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.

---

**Replacing a Failed Command Switch with Another Switch**

To replace a failed command switch with a switch that is command-capable but not part of the cluster, follow these steps:

---

**Step 1**  Insert the new switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 2**  You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.

**Step 3**  At the switch prompt, enter privileged EXEC mode.

**Example:**

```
Switch> enable
Switch#`

---
Step 4 Enter the password of the failed command switch.

Step 5 Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter setup, and press Return.

Example:

Switch# setup

--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.
Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system
Would you like to enter basic management setup? [yes/no]:

Step 6 Enter Y at the first prompt.

Example:

The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y
or

Configuring global parameters:

If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

Step 7 Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

Step 8 When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

Step 9 When prompted, make sure to enable the switch as the cluster command switch, and press Return.

Step 10 When prompted, assign a name to the cluster, and press Return.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

Step 11 After the initial configuration displays, verify that the addresses are correct.

Step 12 If the displayed information is correct, enter Y, and press Return.

If this information is not correct, enter N, press Return, and begin again at Step 9.

Step 13 Start your browser, and enter the IP address of the new command switch.

Step 14 From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.
Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Device settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Device performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

Note

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Device, the Device software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

Note

The security error message references the GBIC_SECURITY facility. The Device supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the Device, and replace it with a Cisco module. After inserting a Cisco SFP module, use the errdisable recovery cause gbic-invalid global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Device brings the interface out of the error-disabled state and retries the operation. For more information about the errdisable recovery command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.
Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the `show interfaces transceiver` command in the command reference for this release.

Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Device.

Though other protocol keywords are available with the `ping` command, they are not supported in this release.

Use this command to ping another device on the network from the Device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ping ip host</td>
<td>address`</td>
</tr>
<tr>
<td>Switch# ping 172.20.52.3</td>
<td></td>
</tr>
</tbody>
</table>

Monitoring Temperature

The Device monitors the temperature conditions and uses the temperature information to control the fans.

Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Device (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.

Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tracetroutemac [interface interface-id] {source-mac-address} [interface interface-id] {destination-mac-address} [vlan vlan-id] [detail]</code></td>
<td>Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.</td>
</tr>
</tbody>
</table>
### Executing IP Traceroute

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>traceroute mac ip {source-ip-address</td>
<td>source-hostname} {destination-ip-address</td>
</tr>
</tbody>
</table>

**Note**
Though other protocol keywords are available with the traceroute privileged EXEC command, they are not supported in this release.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>traceroute ip host</td>
<td>Traces the path that packets take through the network.</td>
</tr>
</tbody>
</table>

**Switch# traceroute ip 192.51.100.1**

### Running TDR and Displaying the Results

To run TDR, enter the test cable-diagnostics tdr interface interface-id privileged EXEC command.

To display the results, enter the show cable-diagnostics tdr interface interface-id privileged EXEC command.

### Redirecting Debug and Error Message Output

By default, the network server sends the output from debug commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running as syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note**
Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see *Configuring System Message Logging*.

### Using the show platform forward Command

The output from the show platform forward privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the
parameters entered about the packet, the output provides lookup table results and port maps used to calculate
forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel,
who have access to detailed information about the Device application-specific integrated circuits (ASICs).
However, packet forwarding information can also be helpful in troubleshooting.

**Configuring OBFL**

⚠️ **Caution**

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the `hw-switch switch [switch-number] logging onboard [message level level]`
global configuration command. On switches, the range for `switch-number` is from 1 to 9. Use the `message`
level level parameter to specify the severity of the hardware-related messages that the switch generates
and stores in the flash memory.

- To copy the OBFL data to the local network or a specific file system, use the `copy onboard switch
switch-number url url-destination` privileged EXEC command.

- To disable OBFL, use the `no hw-switch switch [switch-number] logging onboard [message level level]`
global configuration command.

- To clear all the OBFL data in the flash memory except for the uptime and CLI command information,
use the `clear onboard switch switch-number` privileged EXEC command.

- You can enable or disable OBFL on a member switch from the stack master.

For more information about the commands in this section, see the command reference for this release.

**Verifying Troubleshooting of the Software Configuration**

**Displaying OBFL Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show logging onboard [module[switch-number ]] cliolog</code></td>
<td>Displays the OBFL CLI commands that were entered on a standalone switch.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 cliolog</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] environment</code></td>
<td>Displays the UDI information for a standalone switch and for all the connected FRU devices: the PID, the VID, and the serial number.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 environment</code></td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] message</code></td>
<td>Displays the hardware-related messages generated by a standalone switch.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 message</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] poe</code></td>
<td>Displays the power consumption of PoE ports on a standalone switch.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 poe</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] temperature</code></td>
<td>Displays the temperature of a standalone switch or.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 temperature</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] uptime</code></td>
<td>Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch have been running since they last restarted.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 uptime</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] voltage</code></td>
<td>Displays the system voltages of a standalone switch.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 voltage</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] continuous</code></td>
<td>Displays the data in the continuous file.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 continuous</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] detail</code></td>
<td>Displays both the continuous and summary data.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 detail</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ] ] end hh:mm:ss</code></td>
<td>Displays end time and date on a standalone switch.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 end 13:00:15 jul 2013</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ] ]</code></td>
<td>Displays OBFL information about the specified switches in the system.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1</code></td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] raw</code></td>
<td>Displays the raw information on a standalone switch.</td>
</tr>
<tr>
<td><code>Switch# show logging onboard 1 raw</code></td>
<td></td>
</tr>
</tbody>
</table>
Example: Verifying the Problem and Cause for High CPU Utilization

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```
Switch# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...
<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

Table 177: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.”</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts.</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”</td>
</tr>
</tbody>
</table>
Scenarios for Troubleshooting the Software Configuration

Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 178: Power over Ethernet Troubleshooting Scenarios

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</td>
<td>Verify that the powered device works on another PoE port. Use the <code>show run</code>, or <code>show interface status</code> user EXEC commands to verify that the port is not shut down or error-disabled.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional.</td>
</tr>
<tr>
<td></td>
<td>Verify that <code>power inline never</code> is not configured on that interface or port.</td>
</tr>
<tr>
<td></td>
<td>Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Cisco powered device works only with straight cable and not with crossover one.</td>
</tr>
<tr>
<td></td>
<td>Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters.</td>
</tr>
<tr>
<td></td>
<td>Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on.</td>
</tr>
<tr>
<td></td>
<td>If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <code>show inline power</code> command to verify the amount of available power.</td>
</tr>
<tr>
<td>Symptom or Problem</td>
<td>Possible Cause and Solution</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>No PoE on all ports or a group of ports. Trouble is on all switch ports. Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</td>
<td>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch. If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch. Use the <code>show log</code> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes. If there are no alarms, use the <code>show interface status</code> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <code>shut</code> and <code>no shut</code> interface configuration commands to reenable the ports. Use the <code>show env power</code> and <code>show power inline</code> privileged EXEC commands to review the PoE status and power budget (available PoE). Review the running configuration to verify that <code>power inline never</code> is not configured on the ports. Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <code>shut</code> and <code>no shut</code> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected. Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port. Use the <code>show power inline</code> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on. If a powered device can power on when only one powered device is connected to the switch, enter the <code>shut</code> and <code>no shut</code> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <code>show interface status</code> and <code>show power inline</code> privileged EXEC commands to monitor inline power statistics and port status. If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</td>
</tr>
</tbody>
</table>
### Symptom or Problem
- Cisco pre-standard powered device disconnects or resets.
  - After working normally, a Cisco phone intermittently reloads or disconnects from PoE.

### Possible Cause and Solution
- Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads.
- Verify that the cable length is not more than 100 meters from the switch port to the powered device.
- Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs.
- Notice whether any error messages appear at the same time a disconnect occurs. Use the `show log` privileged EXEC command to review error messages.
- Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.)
- Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.

### Additional Symptom or Problem
- IEEE 802.3af-compliant or IEEE 802.3at-compliant powered devices do not work on Cisco PoE switch.
  - A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.

### Possible Cause and Solution
- Use the `show power inline` command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it.
- Use the `show interface status` command to verify that the switch detects the connected powered device.
- Use the `show log` command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or inrush) current that exceeds a current-limit threshold for the port.

### Configuration Examples for Troubleshooting Software

#### Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Switch# ping 172.20.52.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:
!!!!!
```
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms

Table 179: Ping Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>C</td>
<td>A congestion experienced packet was received.</td>
</tr>
<tr>
<td>I</td>
<td>User interrupted test.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

To end a ping session, enter the escape sequence (Ctrl-^X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

Example: Performing a Traceroute to an IP Host

This example shows how to perform a traceroute to an IP host:

Switch# traceroute ip 192.0.2.10

Type escape sequence to abort.
Tracing the route to 192.0.2.10

1 192.0.2.1 0 msec 0 msec 4 msec
2 192.0.2.203 12 msec 8 msec 0 msec
3 192.0.2.100 4 msec 0 msec 0 msec
4 192.0.2.10 0 msec 4 msec 0 msec

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

Table 180: Traceroute Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>The probe timed out.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>A</td>
<td>Administratively unreachable. Usually, this output means that an access list is blocking traffic.</td>
</tr>
<tr>
<td>H</td>
<td>Host unreachable.</td>
</tr>
<tr>
<td>N</td>
<td>Network unreachable.</td>
</tr>
</tbody>
</table>
### Character Description

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>Protocol unreachable.</td>
</tr>
<tr>
<td>Q</td>
<td>Source quench.</td>
</tr>
<tr>
<td>U</td>
<td>Port unreachable.</td>
</tr>
</tbody>
</table>

To end a trace in progress, enter the escape sequence (Ctrl-^X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

## Example: Enabling All System Diagnostics

⚠️ **Caution**

Because debugging output takes priority over other network traffic, and because the `debug all` privileged EXEC command generates more output than any other `debug` command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific `debug` commands.

This command disables all-system diagnostics:

```
Switch# debug all
```

The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.
Example: Enabling All System Diagnostics

Embedded Event Manager Overview

Embedded Event Manager (EEM) is a distributed and customized approach to event detection and recovery offered directly in a Cisco IOS device. EEM offers the ability to monitor events and take informational, corrective, or any desired EEM action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

This module contains a technical overview of EEM. EEM can be used alone, or with other network management technologies to help monitor and maintain your network. Before you begin to implement EEM, it is important that you understand the information presented in this module.

- Information About Embedded Event Manager, on page 1813
- Where to Go Next, on page 1831
- Feature Information for Embedded Event Manager 4.0 Overview, on page 1831
- Additional References, on page 1831

Information About Embedded Event Manager

Embedded Event Manager

Event tracking and management has traditionally been performed by devices external to the networking device. Embedded Event Manager (EEM) has been designed to offer event management capability directly in Cisco IOS devices. The on-device, proactive event management capabilities of EEM are useful because not all event management can be done off device because some problems compromise communication between the device and the external network management device. Capturing the state of the device during such situations can be invaluable in taking immediate recovery actions and gathering information to perform root-cause analysis. Network availability is also improved if automatic recovery actions are performed without the need to fully reboot the routing device.

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs. The EEM policies that are configured using the Cisco command-line interface (CLI) then implement recovery on the basis of the current state of the system and the actions specified in the policy for the given event.

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions
to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

Embedded Event Manager 1.0

EEM 1.0 introduced the following event detectors:

- **SNMP**—The Simple Network Management Protocol (SNMP) event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

- **Syslog**—The syslog event detector allows for screening syslog messages for a regular expression pattern match.

EEM 1.0 introduced the following actions:

- Generating prioritized syslog messages.

- Generating a Cisco Networking Services (CNS) event for upstream processing by CNS devices.
Embedded Event Manager 2.0

EEM 2.0 introduced some new features. EEM 2.0 introduced the following event detectors:

- Application-Specific—The application-specific event detector allows any Embedded Event Manager policy to publish an event.
- Counter—The counter event detector publishes an event when a named counter crosses a specified threshold.
- Interface Counter—The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold.
- Timer—The timer event detector publishes events for the following four different types of timers: absolute-time-of-day, countdown, watchdog, and CRON.
- Watchdog System Monitor (IOSWDSysMon)—The Cisco IOS watchdog system monitor event detector publishes an event when CPU or memory utilization for a Cisco IOS process crosses a threshold.

EEM 2.0 introduced the following actions:

- Setting or modifying a named counter.
- Publishing an application-specific event
- Generating an SNMP trap.

The ability to run a Cisco defined sample policy written using Tool Command Language (Tcl) was introduced. A sample policy was provided that could be stored in the system policy directory.

Embedded Event Manager 2.1

EEM 2.1 introduced the following new event detectors:

- CLI—The CLI event detector screens command-line interface (CLI) commands for a regular expression match.
- None—The none event detector publishes an event when the Cisco IOS `event manager run` command executes an EEM policy.
- OIR—The online insertion and removal (OIR) event detector publishes an event when a particular hardware insertion or removal event occurs.

EEM 2.1 introduced the following actions:

- Executing a Cisco CLI command.
- Requesting system information when an event occurs.
- Sending a short e-mail.
- Manually running an EEM policy.
EEM 2.1 also permits multiple concurrent policies to be run using the new `event manager scheduler script` command. Support for SNMP event detector rate-based events is provided as is the ability to create policies using Tool Command Language (Tcl).

**Embedded Event Manager 2.1 (Software Modularity)**

EEM 2.1 (Software Modularity) is supported on Cisco Software Modularity images. EEM 2.1 (Software Modularity) introduced the following event detectors:

- **GOLD**—The Generic Online Diagnostic (GOLD) event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.
- **System Manager**—The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.
- **Watchdog System Monitor (WDSysMon)**—The Cisco Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.

EEM 2.1 for Software Modularity introduced the ability to display EEM reliability metric data for processes.

---

**Note**

EEM 2.1 for Software Modularity images also supports the resource and RF event detectors introduced in EEM 2.2, but it does not support the enhanced object tracking event detector or the actions to read and set tracked objects.

---

**Embedded Event Manager 2.2**

EEM 2.2 introduced some new features. EEM 2.2 introduced the following event detectors:

- **Enhanced Object Tracking**—The enhanced object tracking event detector publishes an event when the tracked object changes. Enhanced object tracking provides complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes.

- **Resource**—The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy.

- **RF**—The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

EEM 2.2 introduced the following actions:

- Reading the state of a tracked object.
- Setting the state of a tracked object.
Embedded Event Manager 2.3

EEM 2.3 is supported on the Cisco Catalyst 6500 Series switches and introduces enhancements to the Generic Online Diagnostics (GOLD) Event Detector on that product.

- The `event gold` command was enhanced with the addition of the `action-notify`, `testing-type`, `test-name`, `test-id`, `consecutive-failure`, `platform-action`, and `maxrun` keywords for improved reaction to GOLD test failures and conditions.

- The following platform-wide GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables:
  - Boot-up diagnostic level
  - Card index, name, serial number
  - Port counts
  - Test counts

- The following test-specific GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables (available to EEM applets only):
  - Test name, attribute, total run count
  - Test result per test, port, or device
  - Total failure count, last fail time
  - Error code
  - Occurrence of consecutive failures

These enhancements result in reduced mean time to recovery (MTTR) and higher availability through improved automation and fault detection.

Embedded Event Manager 2.4

EEM 2.4 introduced the following event detectors:

- SNMP Notification—the SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into the device. An SNMP notification event is generated when an incoming SNMP trap or inform message matches specified values or crosses specified thresholds.

- RPC—the remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

EEM 2.4 added enhancements to the following event detectors:

- Interface counter rate-based trigger—This feature adds the ability for an interface event to be triggered based on a rate of change over a period of time. A rate can be specified both for the entry value and the exit value. This feature copies the rate-based functionality that currently exists for the SNMP event detector.

- SNMP delta value—the difference between the monitored Object Identifier (OID) value at the beginning of the monitored period and the actual OID value when the event is published will be provided in the `event reqinfo` data for both the SNMP event detector and the Interface Counter event detector.

EEM 2.4 introduced the following actions:
• Multiple event support—The ability to run multiple events was introduced and show event manager commands were enhanced to show multiple events.

• Support for parameters—The parameter argument has been added to the event manager run command. A maximum of 15 parameters can be used.

• Display of Job IDs and completion status—Some of the show event manager commands were enhanced to display Job IDs and completion status.

• Bytecode support—Tcl 8 defines a specialized bytecode language (BCL) and includes a just-in-time compiler that translates Tcl scripts to BCL. Byte sequence is executed by a “virtual machine,” Tcl_ExecuteByteCode(), or TEBC for short, as often as needed. Currently EEM accepts file extensions, such as *.tcl for user policies and *.tm for system policies. Tcl standard extension for bytecode scripts are *.tbc. Now EEM will accept *.tbc as valid EEM policies.

• Registration substitution enhancement—Supports replacing multiple parameters in the event registration statement lines with a single environment variable.

• Tcl package support

Embedded Event Manager 3.0

EEM 3.0 introduced the following new event detectors:

• Custom CLI--The custom CLI event detector publishes an event to add and enhance existing CLI command syntax.

• Routing--The Routing event detector publishes an event when route entries change in the Routing Information Base (RIB).

• NetFlow--The NetFlow event detector publishes an event when a NetFlow event is triggered.

• IP SLA--The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

EEM 3.0 introduced the following features:

• Class-based scheduling--The EEM policies will be assigned a class using the class keyword when they are registered. EEM policies registered without a class will be assigned to the default class.

• High performance Tcl policies--Three new Tcl commands are introduced event_completion, event_wait, and event_completion_with_wait.

• Interactive cli support--The synchronous applets are enhanced to support interaction with the local console (TTY). Two new IOS commands, action gets and action puts, are introduced to allow users to enter and display input directly on the console.

• Variable logic for applets--The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions.

• Digital signature support--A new API performs digital signature verification for a Tcl script to check it the script is signed by Cisco before execution.

• Support authenticating e-mail servers--The action mail command is modified to include an optional username and password.
• SMTP IPv6 support--The keyword `sourceaddr` is added in Tcl e-mail templates to specify either an IPv6 or IPv4 address.

• SNMP library extensions--The EEM applet `action info` and Tcl `sys_reqinfo_snmp` commands are enhanced to include functionality for SNMP getid, inform, trap, and set-type operations.

• SNMP Notification IPv6 support--IPv6 address is supported for the source and destination IP addresses.

• CLI Library XML-PI support--Provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support.

---

**Embedded Event Manager 3.1**

EEM 3.1 introduced one new event detector:

• SNMP Object--The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

EEM 3.1 added an enhancement to the following event detector:

• SNMP Notification--The SNMP notification event detector now can wait and intercept the outgoing SNMP traps and informs.

EEM 3.1 added enhancement to the following action:

• Specify facility--The `action syslog` command has been enhanced to specify syslog facility.

EEM 3.1 introduces the following features:

• Provides the ability to create a short description for the registered policy--A new `description` command has been introduced to register policies with a brief description in Cisco IOS CLI and Tcl policies. The `show event manager policy available` command and the `show event manager policy registered` command have been enhanced to add the `description` keyword to display the description of the registered applet.

• Enables EEM policies to bypass AAA authorization--The `event manager application` command has been enhanced to provide authorization and bypass keywords to disable AAA.

• Introduces CLI Library enhancements--Provides two new commands in the CLI library: `cli_run` and `cli_run_interactive`.

---

**Embedded Event Manager 3.2**

EEM 3.2 introduced the following new event detectors:

• Neighbor Discovery--Neighbor Discovery event detector provides the ability to publish a policy to respond to automatic neighbor detection when:
  • a Cisco Discovery Protocol (CDP) cache entry is added, deleted or updated.
  • a Link Layer Discovery Protocol (LLDP) cache entry is added, deleted, or updated.
  • an interface link status changes.
• an interface line status changes.
• Identity--Identity event detector generates an event when AAA authorization and authentication is successful, when failure occurs, or after normal user traffic on the port is allowed to flow.
• Mac-Address-Table--Mac-Address-Table event detector generates an event when a MAC address is learned in the MAC address table.

The Mac-Address-Table event detector is supported only on switch platforms and can be used only on Layer 2 interfaces where MAC addresses are learned. Layer 3 interfaces do not learn addresses and devices do not usually support the mac-address-table infrastructure needed to notify EEM of a learned MAC address.

EEM 3.2 also introduces new CLI commands to support the applets to work with the new event detectors.

Embedded Event Manager 4.0

EEM 4.0 introduces the following new features:

• EEM Email Action Enhancements
  • TLS support for SMTP mail actions—The new optional secure keyword is added to the action mail CLI with tls and none keyword options. There are no updates to the corresponding Tcl Policy.
  • Custom port for SMTP mail actions—The new optional port keyword is added to the action mail CLI. In the Tcl policy, the port number can be specified by adding a line to the e-mail template.

• EEM Security Enhancements
  • Checksum-based script integrity—Where digital signature is not supported or unavailable, users can still enforce some basic integrity check on the TCL policy by using the Unix command openssl sha1. The new optional checksum, md5, and sha-1 keywords have been added to the event manager policy command.
  • Third-party digital signature support—Requires Tcl secure mode and a trustpoint to associate with the TCL scripts in order to verify the signature.
  • Script owner identification—If a policy is successfully registered with a digital signature, the owner (or signer) of the policy can be identified by using the show event manager policy registered command and checking the Dsig keyword in the show output.
  • Registration of remote Tcl policies—The new optional remote keyword has been added to the event manager policy command.

• EEM Resource Management
  • Resource consumption throttling—The new optional resource-limit keyword has been added to the event manager scheduler command.
  • Rate limiting of triggered policies per event—The new optional rate-limit keyword has been added to the event syslog command.

• EEM Usability Enhancements
  • File operations in EEM applet actions—The new CLI action file has been added to allow file selection.
  • New fields are added in EEM to track statistics of queue size, dropped events, and run-time using the show event manager statistics EXEC command. A set of new clear commands—clear event...
manager detector counters and clear event manager server counters—are introduced to clear the event manager queue counters.

- **EEM Event Detector Enhancements**
  - CLI event detector enhancement—Provides the ability to detect the session where the user enters the event cli command. Four new keywords and built-in environmental variables—username, host, privilege, and tty—are added to the event cli applet and event_reqinfo array names to the event_register_cli event detector. The show event manager detector EXEC command has also been modified to reflect the enhancement.
  - Syslog event detector performance enhancement—Provides the option to perform string matching on specific log message fields. The four new keywords—facility, mnemonic, sequence, and timestamp keywords—are added to the action syslog command, event syslog command, and to the event_register_syslog event detector. The show event manager detector EXEC command has also been modified to reflect the enhancement.

## EEM Event Detectors Available by Cisco IOS Release

EEM uses software programs known as event detectors to determine when an EEM event occurs. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. Use the table below to determine which event detectors are available in your specific Cisco IOS release. A blank entry (--) indicates that the event detector is not available: the text “Yes” indicates that the event detector is available. The event detectors shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each event detector, see the Event Detectors concept in the “Embedded Event Manager Overview” module.

**Cisco IOS Software Modularity**

**Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)**

1822
Event Detectors

Embedded Event Manager (EEM) uses software programs known as event detectors to determine when an EEM event occurs. Event detectors are separate systems that provide an interface between the agent being monitored, for example Simple Network Management Protocol (SNMP), and the EEM policies where an action can be implemented. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. For details of which event detector is supported in each Cisco IOS release, see the EEM Event Detectors Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM contains the following event detectors.

Application-Specific Event Detector

The application-specific event detector allows any Embedded Event Manager policy to publish an event. When an EEM policy publishes an event it must use an EEM subsystem number of 798 with any event type. If an existing policy is registered for subsystem 798 and a specified event type, a second policy of the same event type will trigger the first policy to run when the specified event is published.

CLI Event Detector

The CLI event detector screens command-line interface (CLI) commands for a regular expression match. When a match is found, an event is published. The match logic is performed on the fully expanded CLI command after the command is successfully parsed and before it is executed. The CLI event detector supports three publish modes:

- Synchronous publishing of CLI events--The CLI command is not executed until the EEM policy exits, and the EEM policy can control whether the command is executed. The read/write variable, _exit_status, allows you to set the exit status at policy exit for policies triggered from synchronous events. If _exit_status is 0, the command is skipped, if _exit_status is 1, the command is run.

- Asynchronous publishing of CLI events--The CLI event is published, and then the CLI command is executed.

- Asynchronous publishing of CLI events with command skipping--The CLI event is published, but the CLI command is not executed.

Counter Event Detector

The counter event detector publishes an event when a named counter crosses a specified threshold. There are two or more participants that affect counter processing. The counter event detector can modify the counter, and one or more subscribers define the criteria that cause the event to be published. After a counter event has been published, the counter monitoring logic can be reset to start monitoring the counter immediately or it can be reset when a second threshold--called an exit value--is crossed.

Custom CLI Event Detector

The custom CLI event detector publishes an event to add and enhance existing CLI command syntax. When the special parser characters Tab, ? (question mark), and Enter are entered, the parser sends the input to the custom CLI event detector for processing. The custom CLI event detector then compares this input against registered strings to determine if this is a new or enhanced CLI command. Upon a match the custom CLI event detector takes appropriate actions, such as displaying help for the command if ? is entered, displaying the entire command if Tab is entered, or executing the command if Enter was entered. If a match does not occur, the parser regains control and processes the information as usual.
**Enhanced Object Tracking Event Detector**

The enhanced object tracking (EOT) event detector publishes an event when the status of a tracked object changes. Object tracking was first introduced into the Hot Standby Router Protocol (HSRP) as a simple tracking mechanism that allowed you to track the interface line-protocol state only. If the line-protocol state of the interface went down, the HSRP priority of the device was reduced, allowing another HSRP device with a higher priority to become active.

Object tracking was enhanced to provide complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes. Thus, several clients such as HSRP, VRRP, or GLBP can register their interest with the tracking process, track the same object, and each take different action when the object changes. Each tracked object is identified by a unique number that is specified on the tracking command-line interface (CLI). Client processes use this number to track a specific object. The tracking process periodically polls the tracked objects and notes any change of value. The changes in the tracked object are communicated to interested client processes, either immediately or after a specified delay. The object values are reported as either up or down.

Enhanced object tracking is now integrated with EEM to allow EEM to report on a status change of a tracked object and to allow enhanced object tracking to track EEM objects. A new type of tracking object--a stub object--is created. The stub object can be manipulated using the existing CLI commands that already allow tracked objects to be manipulated.

**GOLD Event Detector**

The GOLD event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.

**Interface Counter Event Detector**

The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold. A threshold can be specified as an absolute value or an incremental value. If the incremental value is set to 50, for example, an event would be published when the interface counter increases by 50.

After an interface counter event has been published, the interface counter monitoring logic is reset using two methods. The interface counter is reset either when a second threshold--called an exit value--is crossed or when an elapsed period of time occurs.

**IP SLA Event Detector**

The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

**NetFlow Event Detector**

The NetFlow event detector publishes an event when a NetFlow event is triggered.

**None Event Detector**

The none event detector publishes an event when the Cisco IOS event manager run CLI command executes an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. An EEM policy must be identified and registered to be permitted to run manually before the event manager run command will execute.
**OIR Event Detector**

The online insertion and removal (OIR) event detector publishes an event when one of the following hardware insertion or removal event occurs:

- A card is removed.
- A card is inserted.

Route Processors (RPs), line cards, or feature cards can be monitored for OIR events.

**Resource Event Detector**

The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy. The ERM infrastructure tracks resource depletion and resource dependencies across processes and within a system to handle various error conditions. The error conditions are handled by providing an equitable sharing of resources between various applications. The ERM framework provides a communication mechanism for resource entities and allows communication between these resource entities from numerous locations. The ERM framework also helps in debugging CPU and memory-related issues.

The ERM monitors system resource usage to better understand scalability needs by allowing you to configure threshold values for resources such as the CPU, buffers, and memory. The ERM event detector is the preferred method for monitoring resources in Cisco software but the ERM event detector is not supported in Software Modularity images. For more details about ERM, go to “Embedded Resource Manager” module.

**RF Event Detector**

The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

**RPC Event Detector**

The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

**Routing Event Detector**

The routing event detector publishes an event when a route entry changes in the Routing Information Base (RIB).

**SNMP Event Detector**

The SNMP event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

**SNMP Notification Event Detector**

The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into or going out of the device. An SNMP notification event is generated when an incoming or outgoing SNMP trap or inform message matches specified values or crosses specified thresholds. The SNMP event detector can wait and intercept the outgoing SNMP traps and informs.
SNMP Object Event Detector

The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

Syslog Event Detector

The syslog event detector allows for screening syslog messages for a regular expression pattern match. The selected messages can be further qualified, requiring that a specific number of occurrences be logged within a specified time. A match on a specified event criteria triggers a configured policy action.

System Manager Event Detector

The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.

Timer Event Detector

The timer event detector publishes events for the following four different types of timers:

• An absolute-time-of-day timer publishes an event when a specified absolute date and time occurs.
• A countdown timer publishes an event when a timer counts down to zero.
• A watchdog timer publishes an event when a timer counts down to zero and then the timer automatically resets itself to its initial value and starts to count down again.
• A CRON timer publishes an event using a UNIX standard CRON specification to indicate when the event is to be published. A CRON timer never publishes events more than once per minute.

Watchdog System Monitor (IOSWDSysMon) Event Detector for Cisco IOS

The Cisco IOS watchdog system monitor event detector publishes an event when one of the following occurs:

• CPU utilization for a Cisco IOS task crosses a threshold.
• Memory utilization for a Cisco IOS task crosses a threshold.

Note

Cisco IOS processes are now referred to as tasks to distinguish them from Cisco IOS Software Modularity processes.

Two events may be monitored at the same time, and the event publishing criteria can be specified to require one event or both events to cross their specified thresholds.

Watchdog System Monitor (WDSysMon) Event Detector for Cisco IOS Software Modularity

The Cisco IOS Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.
EEM Actions Available by Cisco IOS Release

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some actions are available in every Cisco IOS release, but most actions have been introduced in a specific release. Use the table below to determine which actions are available in your specific Cisco IOS release. A blank entry (--) indicates that the action is not available; the text “Yes” indicates that the action is available. The actions shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each action, see the Embedded Event Manager Actions concept in the “Embedded Event Manager Overview” module.

Embedded Event Manager Actions

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some EEM actions are available on every Cisco IOS release, but most EEM actions have been introduced in a specific release. For details of which EEM action is supported in each Cisco IOS release, see the EEM Actions Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM supports the following actions:

- Executing a Cisco IOS command-line interface (CLI) command.
- Generating a CNS event for upstream processing by Cisco CNS devices.
- Setting or modifying a named counter.
- Switching to a secondary processor in a fully redundant hardware configuration.
- Requesting system information when an event occurs.
- Sending a short e-mail.
- Manually running an EEM policy.
- Publishing an application-specific event.
- Reloading the Cisco software.
- Generating an SNMP trap.
- Generating prioritized syslog messages.
- Reading the state of a tracked object.
- Setting the state of a tracked object.

EEM action CLI commands contain an EEM action label that is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumerical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

Embedded Event Manager Environment Variables

EEM allows environment variables to be used in EEM policies. Tool Command Language (Tcl) allows global variables to be defined that are known to all procedures within a Tcl script. EEM allows environment variables to be defined using a CLI command, the event manager environment command, for use within an EEM policy. All EEM environment variables are automatically assigned to Tcl global variables before a Tcl script is run. There are three different types of environment variables associated with Embedded Event Manager:

- User-defined--Defined by you if you create an environment variable in a policy that you have written.
- Cisco-defined--Defined by Cisco for a specific sample policy.
- Cisco built-in (available in EEM applets)--Defined by Cisco and can be read only or read/write. The read only variables are set by the system before an applet starts to execute. The single read/write variable, _exit_status, allows you to set the exit status at policy exit for policies triggered from synchronous events.
Cisco-defined environment variables (see the table below) and Cisco system-defined environment variables may apply to one specific event detector or to all event detectors. Environment variables that are user-defined or defined by Cisco in a sample policy are set using the `event manager environment` command. Variables that are used in the EEM policy must be defined before you register the policy. A Tcl policy contains a section called “Environment Must Define” that can be defined to check that any required environment variables are defined before the policy runs.

Cisco built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write, and these variables may apply to one specific event detector or to all event detectors. For more details and a table listing the Cisco system-defined variables, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

Note: Cisco-defined environment variables begin with an underscore character (\_). We strongly recommend that customers avoid the same naming convention to prevent naming conflicts.

The table below describes the Cisco-defined variables used in the sample EEM policies. Some of the environment variables do not have to be specified for the corresponding sample policy to run and these are marked as optional.

### Embedded Event Manager Policy Creation

EEM is a policy driven process in which the EEM policy engine receives notifications when faults and other events occur in the Cisco software system. Embedded Event Manager policies implement recovery based on the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

Although there are some EEM CLI configuration and `show` commands, EEM is implemented through the creation of policies. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tcl.

The creation of an EEM policy involves:

- Selecting the event for which the policy is run.

### Environment Variable | Description | Example
--- | --- | ---
_email_ipaddr | The source IP address of the recipient. | 209.165.201.1 or (IPv6 address) 2001:0DB8::1
_info_snmp_oid | The SNMP object ID. | 1.3.6.1.2.1.2 or iso.internet.mgmt.mib-2.interfaces
_info_snmp_value | The value string of the associated SNMP data element. | 
_show_cmd | The CLI show command to be executed when the policy is run. | `show version`
_syslog_pattern | A regular expression pattern match string that is used to compare syslog messages to determine when the policy runs. | `.*UPDOWN.*FastEthernet0/0.*`
_tm_fsys_usage_cron | (Optional) A CRON specification that is used in the `event_register` keyword extension. If unspecified, the `tm_fsys_usage.tcl` policy is triggered once per minute. | `0-59/1 0-23/1 * * 0-7`
_tm_fsys_usage_debug | (Optional) When this variable is set to a value of 1, disk usage information is displayed for all entries in the system. | 1
_tm_fsys_usage_freebytes | (Optional) Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed. | `disk2:98000000`
_tm_fsys_usage_percent | (Optional) Disk usage percentage thresholds for systems or specific prefixes. If disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems. | `nvram:25 disk2:5`
• Defining the event detector options associated with logging and responding to the event.

• Defining the environment variables, if required.

• Choosing the actions to be performed when the event occurs.

There are two ways to create an EEM policy. The first method is to write applets using CLI commands, and the second method is to write Tcl scripts. Cisco provides enhancements to Tcl in the form of Tcl command extensions that facilitate the development of EEM policies. Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. When a policy is registered with the Embedded Event Manager, the software examines the policy and registers it to be run when the specified event occurs. Policies can be unregistered or suspended. Both types of policies can be used to implement EEM in your network.

For details on writing EEM policies using the Cisco IOS CLI, go to “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

For details on writing EEM policies using Tcl, go to “Writing Embedded Event Manager Policies Using Tcl” module.

Where to Go Next

• If you want to write EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

• If you want to write EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

Feature Information for Embedded Event Manager 4.0 Overview

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Writing EEM Policies Using the Cisco IOS CLI

• Before writing EEM policies, you should be familiar with the concepts explained in the “Embedded Event Manager Overview” module.

• If the action cns-event command is used, access to a Cisco Networking Services (CNS) Event gateway must be configured.

• If the action force-switchover command is used, a secondary processor must be configured on the device.

• If the action snmp-trap command is used, the snmp-server enable traps event-manager command must be enabled to permit SNMP traps to be sent from the Cisco IOS device to the SNMP server. Other relevant snmp-server commands must also be configured; for details see the action snmp-trap command page.

Information About Writing EEM Policies Using the Cisco IOS CLI

Embedded Event Manager Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or a threshold is reached. An EEM policy is an entity that defines an event and the actions to be
taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

### EEM Applet

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In applet configuration mode, three types of configuration statements are supported. The **event** commands are used to specify the event criteria to trigger the applet to run, the **action** commands are used to specify an action to perform when the EEM applet is triggered, and the **set** command is used to set the value of an EEM applet variable. Currently only the `_exit_status` variable is supported for the **set** command.

Only one **event** configuration command is allowed within an applet configuration. When applet configuration mode is exited and no **event** command is present, a warning is displayed stating that no event is associated with this applet. If no event is specified, this applet is not considered registered. When no action is associated with this applet, events are still triggered but no actions are performed. Multiple **action** configuration commands are allowed within an applet configuration. Use the **show event manager policy registered** command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

The action configuration commands are uniquely identified using the **label** argument, which can be any string value. Actions are sorted in ascending alphanumerical key sequence using the **label** argument as the sort key, and they are run using this sequence.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the **event** and **action** commands that are entered and registers the applet to be run when a specified event occurs.

### EEM Script

Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM policy involves:

- Selecting the event for which the policy is run.
- Defining the event detector options associated with logging and responding to the event.
- Choosing the actions to be followed when the event occurs.

Cisco provides enhancements to Tcl in the form of keyword extensions that facilitate the development of EEM policies. The main categories of keywords identify the detected event, the subsequent action, utility information, counter values, and system information. For more details about writing EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

### Embedded Event Manager Built-In Environment Variables Used in EEM Applets

EEM built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write
and these variables may apply to one specific event detector or to all event detectors. The table below lists the Cisco built-in environment variables that are read-only alphabetically by event detector and subevent.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>All Events</strong></td>
<td></td>
</tr>
<tr>
<td>_event_id</td>
<td>Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.</td>
</tr>
<tr>
<td>_event_type</td>
<td>Type of event.</td>
</tr>
<tr>
<td>_event_type_string</td>
<td>An ASCII string identifier of the event type that triggered the event.</td>
</tr>
<tr>
<td>_event_pub_sec _event_pub_msec</td>
<td>The time, in seconds and milliseconds, at which the event was published to the EEM.</td>
</tr>
<tr>
<td>_event_severity</td>
<td>The severity of the event.</td>

<td>• U: diagnostic result Unknown</td>
</tr>
<tr>
<td>Environment Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| \_gold\_tr testnum d devnum | Per-device test result, where testnum is the test number and devnum is the device number. For example, \_gold\_tr3d20 is the EEM built-in variable for the test result for test 3, device 20. The test result is one of the following values:  
  • P: diagnostic result Pass  
  • F: diagnostic result Fail  
  • U: diagnostic result Unknown |
| \_gold\_tr testnum p portnum | Per-port test result, where testnum is the test number and portnum is the port number. For example, \_gold\_tr5p20 is the EEM built-in variable for the test result for test 5, port 20. The test result is one of the following values:  
  • P: diagnostic result Pass  
  • F: diagnostic result Fail  
  • U: diagnostic result Unknown |
| \_gold\_tt | The testing type, which can be one of the following:  
  • 1: a boot diagnostic  
  • 2: an on-demand diagnostic  
  • 3: a schedule diagnostic  
  • 4: a monitoring diagnostic |

**Interface Counter Event Detector**

| \_interface_is_increment | A value to indicate whether the current interface counter value is an absolute value (0) or an increment value (1). |
| \_interface_name | The name of the interface to be monitored. |
| \_interface_parameter | The name of the interface counter to be monitored. |
| \_interface_value | A value with which the current interface counter value is compared. |

**None Event Detector**

<p>| _event_id | A value of 1 indicates an insertion event; a value of 2 indicates a removal event. |</p>

How to Write EEM Policies Using the Cisco IOS CLI

Registering and Defining an Embedded Event Manager Applet

Perform this task to register an applet with Embedded Event Manager and to define the EEM applet using the Cisco IOS CLI `event` and `action` commands. Only one `event` command is allowed in an EEM applet. Multiple `action` commands are permitted. If no `event` and no `action` commands are specified, the applet is removed when you exit configuration mode.

The SNMP event detector and the syslog `action` commands used in this task are just representing any event detector and `action` commands. For examples using other event detectors and `action` commands, see the Embedded Event Manager Applet Configuration Examples, on page 1890.

EEM Environment Variables

EEM environment variables for EEM policies are defined using the EEM `event manager environment` configuration command. By convention, all Cisco EEM environment variables begin with “_”. In order to avoid future conflict, customers are urged not to define new variables that start with “_”.

You can display the EEM environment variables set on your system by using the `show event manager environment` privileged EXEC command.

For example, you can create EEM policies that can send e-mails when an event occurs. The table below describes the e-mail-specific environment variables that can be used in EEM policies.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_wd_sub1_avail _wd_sub2_avail</td>
<td>The memory available for subevents.</td>
</tr>
<tr>
<td>_wd_sub1_diff _wd_sub2_diff</td>
<td>A percentage value of the difference that triggered the event.</td>
</tr>
<tr>
<td>_wd_sub1_is_percent _wd_sub2_is_percent</td>
<td>A number that identifies whether the value is a percentage.</td>
</tr>
<tr>
<td>_wd_sub1_node _wd_sub2_node</td>
<td>The slot number for the subevent RP reporting node.</td>
</tr>
<tr>
<td>_wd_sub1_period _wd_sub2_period</td>
<td>The time period, in seconds and optional milliseconds, used for measurement in subevents.</td>
</tr>
<tr>
<td>_wd_sub1_value _wd_sub2_value</td>
<td>The CPU utilization of subevents measured as a percentage.</td>
</tr>
<tr>
<td>_wd_sub1_used _wd_sub2_used</td>
<td>The memory used by subevents.</td>
</tr>
</tbody>
</table>
### Table 186: EEM E-mail-Specific Environmental Variables

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_email_server</td>
<td>A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.</td>
<td>The e-mail server name--Mailservername-- can be in any one of the following template formats: • username:password@host • username@host • host</td>
</tr>
<tr>
<td>_email_to</td>
<td>The address to which e-mail is sent.</td>
<td><a href="mailto:engineering@example.com">engineering@example.com</a></td>
</tr>
<tr>
<td>_email_from</td>
<td>The address from which e-mail is sent.</td>
<td><a href="mailto:devtest@example.com">devtest@example.com</a></td>
</tr>
<tr>
<td>_email_cc</td>
<td>The address to which the e-mail is copied.</td>
<td><a href="mailto:manager@example.com">manager@example.com</a></td>
</tr>
</tbody>
</table>

### Alphabetical Order of EEM Action Labels

An EEM action label is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumerical (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumerical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

### SUMMARY STEPS

1. enable
2. show event manager environment [all] variable-name
3. configure terminal
4. event manager environment variable-name string
5. Repeat Alphabetical Order of EEM Action Labels for all the required environment variables.
6. event manager applet applet-name
7. Do one of the following:
   - event snmp oid oid-value get-type {exact|next} entry-op operator entry-val entry-value[exit-comb|and] | [exit-op operator] [exit-val exit-value] [exit-time exit-time-value] poll-interval poll-int-value
8. action label cli command cli-string [pattern pattern-string]
9. action label syslog [priority priority-level] msg msg-text facility string
10. action label mail server server-address to to-address from from-address [cc cc-address] subject subject body body-text
11. Add more action commands as required.
12. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show event manager environment [all] variable-name</td>
<td>(Optional) Displays the name and value of EEM environment variables.</td>
</tr>
<tr>
<td>Example:</td>
<td>• The optional <strong>all</strong> keyword displays all the EEM environment variables.</td>
</tr>
<tr>
<td>Device# show event manager environment all</td>
<td>• The optional <strong>variable-name</strong> argument displays information about the specified environment variable.</td>
</tr>
<tr>
<td><strong>Step 3</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> event manager environment variable-name string</td>
<td>Configures the value of the specified EEM environment variable.</td>
</tr>
<tr>
<td>Example:</td>
<td>• In this example, the environment variable that holds the e-mail address to which e-mail is sent is set to <a href="mailto:engineering@example.com">engineering@example.com</a>.</td>
</tr>
<tr>
<td>Device(config)# event manager environment _email_to <a href="mailto:engineering@example.com">engineering@example.com</a></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Repeat <strong>Alphabetical Order of EEM Action Labels</strong> for all the required environment variables.</td>
<td>Repeat <strong>Alphabetical Order of EEM Action Labels</strong> to configure all the environment variables required by the policy to be registered in <strong>Alphabetical Order of EEM Action Labels</strong>.</td>
</tr>
<tr>
<td><strong>Step 6</strong> event manager applet applet-name</td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager applet memory-fail</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> Do one of the following:</td>
<td>Specifies the event criteria that cause the EEM applet to run.</td>
</tr>
<tr>
<td>• event snmp oid oid-value get-type {exact</td>
<td>next}</td>
</tr>
<tr>
<td>entry-op operator entry-val entry-value[exit-comb</td>
<td>and]] [exit-op operator] [exit-val exit-value]</td>
</tr>
<tr>
<td>[exit-time exit-time-value] poll-interval poll-int-value</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1</td>
<td></td>
</tr>
<tr>
<td>get-type exact entry-op lt entry-val 5120000</td>
<td></td>
</tr>
<tr>
<td>poll-interval 90</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Step 8**

The action taken is to specify an EEM applet to run when the specified command string solicits input. The action command ends when the solicited prompt as specified in the optional pattern keyword is received. You are required to specify a regular expression pattern that will match the next solicited prompt. Specification of an incorrect pattern will cause the action cli command to wait forever until the applet execution times out due to the maxrun timer expiration.

- The action taken is to specify an EEM applet to run when the command string solicits input, such as “prompt,” which has to be completed with a “yes” or a “no” input.

---

**Step 9**

In this example, the action taken is to write a message to syslog.

- The optional priority keyword specifies the priority level of the syslog messages. If selected, the priority-level argument must be defined.
- The msg-text argument can be character text, an environment variable, or a combination of the two.
- The facility keyword specifies the location of generated message
- The string argument can be character text, an environment variable, or a combination of the two.

---

**Step 10**

Specifies the action of sending a short e-mail when an EEM applet is triggered.

- The server-address argument specifies the fully qualified domain name of the e-mail server to be used to forward the e-mail.
- The to-address argument specifies the e-mail address where the e-mail is to be sent.
- The from-address argument specifies the e-mail address from which the e-mail is sent.
- The subject argument specifies the subject line content of the e-mail as an alphanumeric string.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 11</strong></td>
<td>Add more action commands as required.</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Exits applet configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Troubleshooting Tips**

Use the `debug event manager` command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution as the volume of generated output can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

**Registering and Defining an EEM Tcl Script**

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

**Before you begin**

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided—see the details in the Sample EEM Policies, on page 1927 to see which policies are available for the Cisco IOS release image that you are using—and these sample policies are stored in the system policy directory.

**SUMMARY STEPS**

1. `enable`
2. `show event manager environment [all] variable-name`
3. `configure terminal`
4. `event manager environment variable-name string`
5. Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script.
6. `event manager policy policy-filename [type {system|user}] [trap]`
7. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step</strong></td>
<td>Enter your password if prompted.</td>
</tr>
</tbody>
</table>

Example:

```
Device> enable
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2** show event manager environment [all] variable-name | (Optional) Displays the name and value of EEM environment variables.  
  - The optional all keyword displays all the EEM environment variables.  
  - The optional variable-name argument displays information about the specified environment variable. |
| **Step 3** configure terminal | Enters global configuration mode. |
| **Step 4** event manager environment variable-name string | Configures the value of the specified EEM environment variable.  
  - In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day. |
| **Step 5** Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script. | -- |
| **Step 6** event manager policy policy-filename [type {system|user}] [trap] | Registers the EEM policy to be run when the specified event defined within the policy occurs.  
  - Use the system keyword to register a Cisco-defined system policy.  
  - Use the user keyword to register a user-defined system policy.  
  - Use the trap keyword to generate an SNMP trap when the policy is triggered.  
  - In this example, the sample EEM policy named tm_cli_cmd.tcl is registered as a system policy. |
| **Step 7** exit | Exits global configuration mode and returns to privileged EXEC mode. |

**Examples**

In the following example, the **show event manager environment** privileged EXEC command is used to display the name and value of all EEM environment variables.
Device# `show event manager environment all`

<table>
<thead>
<tr>
<th>No.</th>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>_cron_entry</td>
<td>0-59/2 0-23/1 * * 0-6</td>
</tr>
<tr>
<td>2</td>
<td>_show_cmd</td>
<td>show ver</td>
</tr>
<tr>
<td>3</td>
<td>_syslog_pattern</td>
<td>.*UPDOWN.<em>Ethernet1/0.</em></td>
</tr>
<tr>
<td>4</td>
<td>_config_cmd1</td>
<td>interface Ethernet1/0</td>
</tr>
<tr>
<td>5</td>
<td>_config_cmd2</td>
<td>no shut</td>
</tr>
</tbody>
</table>

**Unregistering Embedded Event Manager Policies**

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

**SUMMARY STEPS**

1. `enable`
2. `show event manager policy registered` [description [policy-name] | detailed policy-filename [system | user] | [event-type event-name] [system | user] [time-ordered | name-ordered]]
3. `configure terminal`
4. `no event manager policy` policy-filename
5. `exit`
6. Repeat Step 2 to ensure that the policy has been removed.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td><code>show event manager policy registered</code></td>
<td>(Optional) Displays the EEM policies that are currently registered.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# <code>show event manager policy registered</code></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><code>no event manager policy</code> policy-filename</td>
<td>Removes the EEM policy from the configuration, causing the policy to be unregistered.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>no event manager policy IPSLAping1</code></td>
</tr>
</tbody>
</table>
### Command or Action

**Step 5**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exit</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config)# exit
```

**Step 6**

Repeat Step 2 to ensure that the policy has been removed.

**Example:**

```
Device# show event manager policy registered
```

### Examples

In the following example, the `show event manager policy registered` privileged EXEC command is used to display the two EEM applets that are currently registered:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1  applet system snmp Off Fri Aug 12 17:42:52 2005 IPSLAping1
   oid (1.3.6.1.4.1.9.9.42.1.2.9.1.6.4) get-type exact entry-op eq entry-val {1}
   exit-op eq exit-val {2} poll-interval 90.000
   action 1.0 syslog priority critical msg "Server IPecho Failed: OID=$snmp_oid_val"
   action 1.1 snmp-trap strdata "EEM detected server reachability failure to 10.1.88.9"
   action 1.2 publish-event sub-system 88000101 type 1 arg1 "10.1.88.9" arg2 "IPSLAEcho"
   arg3 "fail"
   action 1.3 counter name _IPSLA1F op inc value 1
2  applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val {5120000}
   poll-interval 90
   action 1.0 syslog priority critical msg Memory exhausted; current available memory is
   $snmp_oid_val bytes
   action 2.0 force-switchover
```

In the following example, the `show event manager policy registered` privileged EXEC command is used to show that applet IPSLAping1 has been removed after entering the `no event manager policy` command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1  applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val {5120000}
   poll-interval 90
   action 1.0 syslog priority critical msg Memory exhausted; current available memory is
   $snmp_oid_val bytes
   action 2.0 force-switchover
```

### Suspending All Embedded Event Manager Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them might be necessary for reasons of temporary performance or security.
SUMMARY STEPS

1. enable
2. show event manager policy registered [description [policy-name] | detailed policy-filename [system | user] | [event-type event-name] [system | user] [time-ordered | name-ordered]]
3. configure terminal
4. event manager scheduler suspend
5. exit

</tbody>
</table>

Displaying Embedded Event Manager History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager history size {events | traps} [size]
4. exit
5. show event manager history events [detailed] [maximum number]
6. show event manager history traps {server | policy}

DETAILED STEPS

Step 1  enable
Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2  configure terminal
Enters global configuration mode.

Example:

Device# configure terminal

Step 3  event manager history size {events | traps} [size]
Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:

Example:

Device(config)# event manager history size events 30

Step 4  exit
Exits global configuration mode and returns to privileged EXEC mode.

Example:

Device(config)# exit

Step 5  show event manager history events [detailed] [maximum number]
Use this command to display detailed information about each EEM event, for example:

Example:

Device# show event manager history events

<table>
<thead>
<tr>
<th>No.</th>
<th>Time of Event</th>
<th>Event Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fri Aug 13</td>
<td>21:42:57</td>
<td>2004 snmp</td>
</tr>
<tr>
<td>2</td>
<td>Fri Aug 13</td>
<td>22:20:29</td>
<td>snmp</td>
</tr>
<tr>
<td>3</td>
<td>Wed Aug 18</td>
<td>21:54:48</td>
<td>snmp</td>
</tr>
<tr>
<td>4</td>
<td>Wed Aug 18</td>
<td>22:06:38</td>
<td>snmp</td>
</tr>
<tr>
<td>5</td>
<td>Wed Aug 18</td>
<td>22:30:58</td>
<td>snmp</td>
</tr>
<tr>
<td>6</td>
<td>Wed Aug 18</td>
<td>22:34:58</td>
<td>snmp</td>
</tr>
<tr>
<td>7</td>
<td>Wed Aug 18</td>
<td>22:51:18</td>
<td>snmp</td>
</tr>
<tr>
<td>8</td>
<td>Wed Aug 18</td>
<td>22:51:18</td>
<td>application</td>
</tr>
</tbody>
</table>

Step 6  show event manager history traps {server | policy}
Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy. In the following example, the EEM SNMP traps that were triggered from within an EEM policy are displayed.

**Example:**

```
Device# show event manager history traps policy
No. Time Trap Type Name
1  Wed Aug18 22:30:58 2004 policy EEM Policy Director
2  Wed Aug18 22:34:58 2004 policy EEM Policy Director
3  Wed Aug18 22:51:18 2004 policy EEM Policy Director
```

---

**Displaying Embedded Event Manager Registered Policies**

Perform this optional task to display registered EEM policies.

**SUMMARY STEPS**

1. `enable`
2. `show event manager policy registered [event-type *event-name*] [time-ordered| name-ordered]`

**DETAILED STEPS**

**Step 1**

`enable`

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2**

`show event manager policy registered [event-type *event-name*] [time-ordered| name-ordered]`

Use this command with the `time-ordered` keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
No. Type Event Type Time Registered Name
1 applet snmp Thu May30 05:57:16 2004 memory-fail
    oid {1.3.6.1.4.1.9.9.48.1.1.6.1} get-type exact entry-op lt entry-val
    {5120000} poll-interval 90
    action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $_snmp_oid_val bytes"
    action 2.0 force-switchover
2 applet syslog Wed Jul16 00:05:17 2004 intf-down
    pattern {.*UPDOWN.*Ethernet1/0.*}
    action 1.0 cns-event msg "Interface state change: $_syslog_msg"
```

Use this command with the `name-ordered` keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
```
Configuring Event SNMP Notification

Perform this task to configure SNMP notifications.

Before you begin

• SNMP event manager must be configured using the `snmp-server manager` command.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. event [tag event-tag] snmp-notification oid oid-string oid-val comparison-value op operator [maxrun maxruntime-number] [src-ip-address ip-address] [dest-ip-address ip-address] [default seconds] [direction {incoming | outgoing}] [msg-op {drop | send}]
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Purpose

**Step 2**

**configure terminal**

Example:

Device# configure terminal

**Enters global configuration mode.**

**Step 3**

**event manager applet applet-name**

Example:

Device(config)# event manager applet snmp

**Registers the applet with the event manager server and enters applet configuration mode.**

**Step 4**

**event [tag event-tag] snmp-notification oid oid-string oid-val comparison-value op operator [maxrun maxruntime-number] [src-ip-address ip-address] [dest-ip-address ip-address] [default seconds] [direction {incoming | outgoing}] [msg-op {drop | send}]**

Example:

Device(config-applet)# event snmp-notification dest-ip-address 192.168.1.1 oid 1 op eq oid-val 10

**Specifies the event criteria for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP) notification.**

**Step 5**

**end**

Example:

Device(config-applet)# end

**Exits applet configuration mode and returns to privileged EXEC mode.**

### Configuring Multiple Event Support

The multiple event support feature adds the ability to register multiple events in the EEM server. The multiple event support involves one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The event parameters are specified in the CLI commands. The data structure to handle multiple events contains multiple event identifiers and correlation logic. This data is used to register multiple events in the EEM Server.

### Setting the Event Configuration Parameters

The **trigger** command enters the trigger applet configuration mode and specifies the multiple event configuration statements for EEM applets. The trigger statement is used to relate multiple event statement using the **tag** argument specified in each event statement. The events are raised based on the specified parameters.

### SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. event [tag event-tag] cli pattern regular-expression sync {yes | no skip {yes | no}} [occurs num-occurrences] [period period-value] [maxrun maxruntime-number]
5. trigger [occurs occurs-value] [period period-value] [period-start period-start-value] [delay delay-value]
6. correlate \{event event-tag \| track object-number\} \{boolean-operator event event-tag\}
7. attribute tag event-tag \{occurs occurs-value\}
8. action label cli command cli-string

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager applet applet-name</td>
<td>Registers an applet with EEM and enters applet configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# event manager applet EventInterface</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> event {tag event-tag} cli pattern regular-expression sync {yes | no | skip {yes | no}} {occurs num-occurrences} {period period-value} {maxrun maxruntime-number}</td>
<td>Specifies the event criteria for an EEM applet that is run by matching a Cisco IOS command-line interface (CLI) command.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# event tag 1.0 cli pattern &quot;show bgp all&quot; sync yes occurs 32 period 60 maxrun 60</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> trigger {occurs occurs-value} {period period-value} {period-start period-start-value} {delay delay-value}</td>
<td>Specifies the complex event configuration parameters for an EEM applet.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# trigger occurs 1 period-start &quot;0 8 * * 1-5&quot; period 60</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> correlate {event event-tag | track object-number} {boolean-operator event event-tag}</td>
<td>Specifies a complex event correlation in the trigger mode for an EEM applet.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# correlate event 1.0 or event 2.0</td>
<td><strong>Note</strong> When &quot;and&quot; is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes.</td>
</tr>
<tr>
<td><strong>Step 7</strong> attribute tag event-tag {occurs occurs-value}</td>
<td>Specifies up to eight attribute statements to build a complex event for an EEM applet.</td>
</tr>
<tr>
<td>Example: Device(config-applet)# attribute tag 1.0 occurs 1</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

- **Command or Action**
  - *action label cli command cli-string*

**Example:**

```plaintext
Device(config-applet)# action 1.0 cli command "show pattern"
```

**Purpose**

Specifies the action of executing a CLI command when an EEM applet is triggered.

### Examples

In the following example, applet is run if the `show bgp all` CLI command and any syslog message that contains the string "COUNT" occurred within a period 60 seconds.

```plaintext
event manager applet delay 50
  event tag 1.0 cli pattern "show bgp all" sync yes occurs 32 period 60 maxrun 60
  event tag 2.0 syslog pattern "COUNT" trigger occurs 1 delay 50
  correlate event 1.0 or event 2.0
  attribute tag 1.0 occurs 1
  attribute tag 2.0 occurs 1
  action 1.0 cli command "show pattern"
  action 2.0 cli command "enable"
  action 3.0 cli command "config terminal"
  action 4.0 cli command "ip route 192.0.2.0 255.255.255.224 192.0.2.12"
  action 91.0 cli command "exit"
  action 99.0 cli command "show ip route | incl 192.0.2.5"
```

### Configuring EEM Class-Based Scheduling

To schedule Embedded Event Manager (EEM) policies and set policy scheduling options, perform this task. In this task, two EEM execution threads are created to run applets assigned to the default class.

The EEM policies will be assigned a class using the `class` keyword when they are registered. EEM policies registered without a class will be assigned to the default class. Threads that have default class, will service the default class when the thread is available for work. Threads that are assigned specific class letters will service any policy with a matching class letter when the thread is available for work.

If there is no EEM execution thread available to run the policy in the specified class and a scheduler rule for the class is configured, the policy will wait until a thread of that class is available for execution. Synchronous policies that are triggered from the same input event should be scheduled in the same execution thread.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `event manager scheduler {applet | axp | call-home} thread class class-options number thread-number`
4. `exit`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>

</tbody>
</table>

### Holding a Scheduled EEM Policy Event or Event Queue

To hold a scheduled EEM policy event or event queue in the EEM scheduler, perform this task. In this task, all pending EEM policies are displayed. A policy identified using a job ID of 2 is held in the EEM scheduler, and the final step shows that the policy with a job ID of 2 has changed status from pending to held.

### SUMMARY STEPS

1. enable
2. show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options] [detailed]
3. event manager scheduler hold [all | policy job-id] [queue-type {applet | call-home | axp | script} class class-options] [processor {rp_primary | rp_standby}] ]
4. show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options] [detailed]

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
## Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>show event manager policy pending [queue-type {applet</td>
</tr>
<tr>
<td>Example:</td>
<td>Displays the pending EEM policies.</td>
</tr>
<tr>
<td>Device# show event manager policy pending</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>event manager scheduler hold {all</td>
</tr>
<tr>
<td>Example:</td>
<td>Holds a scheduled EEM policy event or event queue in the EEM scheduler.</td>
</tr>
<tr>
<td>Device# event manager scheduler hold policy 2</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>show event manager policy pending [queue-type {applet</td>
</tr>
<tr>
<td>Example:</td>
<td>Displays the status of EEM policy put on hold in Step 3 as held, along with other pending policies.</td>
</tr>
<tr>
<td>Device# show event manager policy pending</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to view all pending EEM policies and to hold the EEM policy with a job ID of 2.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1   pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2   pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3   pend Thu Sep 7 02:54:04 2006 syslog applet: three
Device# event manager scheduler hold policy 2
Device# show event manager policy pending
no. job id status time of event event type name
1 1   pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2   held Thu Sep 7 02:54:04 2006 syslog applet: two
3 3   pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

### Resuming Execution of EEM Policy Events or Event Queues

To resume the execution of specified EEM policies, perform this task. In this task, the policy that was put on hold in the Holding a Scheduled EEM Policy Event or Event Queue task is now allowed to resume execution.

### SUMMARY STEPS

1. enable
2. show event manager policy pending
3. event manager scheduler release {all | policy policy-id | queue-type {applet | call-home | axp | script}} class class-options [processor {rp_primary | rp_standby}]
4. show event manager policy pending
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

| **Step 2** | Displays the pending and held EEM policies. |
| `show event manager policy pending` | Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |
| **Example:** | Device# show event manager policy pending |

| **Step 3** | Resumes execution of specified EEM policies. |
| `event manager scheduler release {all | policy policy-id | queue-type {applet | call-home | axp | script} | class class-options [processor {rp_primary | rp_standby}]` | Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |
| **Example:** | Device# event manager scheduler release policy 2 |

| **Step 4** | Displays the status of the EEM policy resumed in Step 3 as pending, along with other pending policies. |
| `show event manager policy pending` | Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |
| **Example:** | Device# show event manager policy pending |

### Examples

The following example shows how to view all pending EEM policies, to specify the policy that will resume execution, and to see that the policy is now back in a pending status.

*Device# show event manager policy pending*

<table>
<thead>
<tr>
<th>no.</th>
<th>job id</th>
<th>status</th>
<th>time of event</th>
<th>event type</th>
<th>name</th>

### Clearing Pending EEM Policy Events or Event Queues

Perform this task to clear EEM policies that are executing or pending execution. In this task, the EEM policy with a job ID of 2 is cleared from the pending queue. The `show event manager policy pending` command is used to display the policies that are pending before and after the policy is cleared.
### SUMMARY STEPS

1. **enable**
2. **show event manager policy pending**
3. **event manager scheduler clear** `{all | policy job-id | queue-type {applet | call-home | axp | script} class class-options} [processor {rp_primary | rp_standby}]`
4. **show event manager policy pending**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show event manager policy pending</td>
<td>Displays the pending EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Note</strong> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager scheduler clear `{all</td>
<td>policy job-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• In this example, the EEM policy with a job ID of 2 is cleared from the pending queue.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> show event manager policy pending</td>
<td>Displays all the pending EEM policies except the policy cleared in Step 3.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Note</strong> Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to clear the EEM policy with a job ID of 2 that was pending execution. The **show** commands are used to display the policies that are pending before and after the policy is cleared.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three

Device# event manager scheduler clear policy 2
Device# show event manager policy pending
```
## Modifying the Scheduling Parameters of EEM Policy Events or Event Queues

To modify the scheduling parameters of the EEM policies, perform this task. The `show event manager policy pending` command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the `show event manager policy pending` command shows all policies assigned as class A.

### SUMMARY STEPS

1. `enable`
2. `show event manager policy pending`
3. `event manager scheduler modify { all | policy job-id | queue-type { applet | call-home | axp | script } | class class-options } [ queue-priority { high | last | low | normal } ] [ processor { rp_primary | rp_standby } ]`
4. `show event manager policy pending`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> show event manager policy pending</td>
<td>Displays the pending EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td>Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager scheduler modify { all</td>
<td>policy job-id</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# event manager scheduler modify all class A</td>
<td>• In this example, all currently pending EEM policies are assigned to class A.</td>
</tr>
<tr>
<td><strong>Step 4</strong> show event manager policy pending</td>
<td>Displays the EEM policies modified in Step 3 along with other pending policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td>Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to modify the scheduling parameters of the EEM policies. In this example, the `show event manager policy pending` command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the `show event manager policy pending` command verifies that all policies are now assigned as class A.

```
Device# show event manager policy pending
no. class status time of event event type name
1  default pend Thu Sep 7 02:54:04 2006 syslog applet: one
2  default pend Thu Sep 7 02:54:04 2006 syslog applet: two
3  B  pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

```
Device# event manager scheduler modify all class A
Device# show event manager policy pending
no. class status time of event event type name
1  A  pend Thu Sep 7 02:54:04 2006 syslog applet: one
2  A  pend Thu Sep 7 02:54:04 2006 syslog applet: two
3  A  pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the `show event manager policy active` command.

**SUMMARY STEPS**

1. `show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]`

**DETAILED STEPS**

```
show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]
```

This command displays only the running EEM policies. This command includes class, detailed and queue-type optional keywords. The following is sample output from this command:

```
Example:

Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct 29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct 29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct 29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct 29 20:49:59 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct 29 20:51:13 2007 timer watchdog loop.tcl
default class - 6 applet events
no. job id p s status time of event event type name
1 15852 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
2 15853 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL

Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the `show event manager policy active` command.

**SUMMARY STEPS**

1. `show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]`

**DETAILED STEPS**

```
show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]
```

This command displays only the running EEM policies. This command includes `class`, `detailed` and `queue-type` optional keywords. The following is sample output from this command:

**Example:**

```
Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct29 20:49:50 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct29 21:00:01 2007 timer watchdog loop.tcl
default class - 6 applet events
no. job id p s status time of event event type name
1 15852 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
2 15853 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
3 15854 N A running Mon Oct29 21:11:10 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
4 15855 N A running Mon Oct29 21:11:10 2007 timer watchdog WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
5 15856 N A running Mon Oct29 21:11:11 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
6 15858 N A running Mon Oct29 21:11:11 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
```

Verifying Pending EEM Policies

To verify the EEM policies that are pending for execution, use the `show event manager policy pending` command. Use the optional keywords to specify EEM class-based scheduling options.

**SUMMARY STEPS**

1. `show event manager policy pending [queue-type {applet|call-home|axp|script} class class-options | detailed]`

**DETAILED STEPS**

```
show event manager policy pending [queue-type {applet|call-home|axp|script} class class-options | detailed]
```
This command displays only the pending policies. This command includes class, detailed and queue-type optional keywords. The following is sample output from this command:

Example:

Device# show event manager policy pending
no. job id p s status time of event event type name
1 12851 N A pend Mon Oct29 20:51:18 2007 timer watchdog loop.tcl
2 12868 N A pend Mon Oct29 20:51:24 2007 timer watchdog loop.tcl
3 12873 N A pend Mon Oct29 20:51:27 2007 timer watchdog loop.tcl
4 12907 N A pend Mon Oct29 20:51:41 2007 timer watchdog loop.tcl
5 13100 N A pend Mon Oct29 20:52:55 2007 timer watchdog loop.tcl

Configuring EEM Applet (Interactive CLI) Support

The synchronous applets are enhanced to support interaction with the local console (tty) using two commands, action gets and action puts, and these commands allow users to enter and display input directly on the console. The output for synchronous applets will bypass the system logger. The local console will be opened by the applets and serviced by the corresponding synchronous Event Detector pty. Synchronous output will be directed to the opened console.

Reading and Writing Input from the Active Console for Synchronous EEM Applets

Use the following tasks to implement EEM applet interactive CLI support:

Reading Input from the Active Console

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event_reqinfo call, and store the given console information for use by the action gets command.

The action gets command reads a line of the input from the active console and stores the input in the variable. The trailing new line will not be returned.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. event none
5. action label gets variable
6. action label syslog [priority priority-level] msg msg-text
7. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

`configure terminal`

*Example:*

Device# configure terminal

**Step 3**

`event manager applet applet-name`

*Example:*

Device(config)# event manager applet action

**Step 4**

`event none`

*Example:*

Device(config-applet)# event none

**Step 5**

`action label gets variable`

*Example:*

Device(config-applet)# action label2 gets input

**Step 6**

`action label syslog [priority priority-level] msg msg-text`

*Example:*

Device(config-applet)# action label3 syslog msg "Input entered was "$input"

**Step 7**

`exit`

*Example:*

Device(config-applet)# exit

### Example

The following example shows how to get the input from the local tty in a synchronous applet and store the value

Device(config)# event manager applet action
Device(config-applet)# event none
Device(config-applet)# action label2 gets input
Device(config-applet)# action label3 syslog msg "Input entered was "$input"
Writing Input to the Active Console

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event_reqinfo call, and store the given console information for use by the action puts command.

The action puts command will write the string to the active console. A new line will be displayed unless the newline keyword is specified. The output from the action puts command for a synchronous applet is displayed directly to the console, bypassing the system logger. The output of the action puts command for an asynchronous applet is directed to the system logger.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. event none
5. action label regexp string-pattern string-input [string-match [string-submatch1] [string-submatch2] [string-submatch3]]
6. action label puts [newline] string
7. exit
8. event manager run applet-name

DETAILED STEPS

<tr>
<td></td>
<td>Example: Device(config-applet)# event none</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>action label regexp string-pattern string-input [string-match [string-submatch1] [string-submatch2] [string-submatch3]]</td>
<td>Specifies the action to match the regular expression pattern on an input string when an EEM applet is triggered.</td>
</tr>
</tbody>
</table>
### Configuring SNMP Library Extensions

Depending on your release, the SNMP Library Extensions feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

### SNMP Get and Set Operations

The SNMP Library Extensions feature extends the EEM applet action info and Tcl sys_reqinfo_snmp commands to include functionality for SNMP get-one, get-next, getid and set-any operations.
SNMP Get Operation

The SNMP event manager performs the SNMP get operation to retrieve one or more variables for the managed objects. Using the `action info type snmp oid get-type` and `action info type snmp getid` commands, you can configure the SNMP event manager to send an SNMP get request by specifying the variables to retrieve, and the IP address of the agent.

For example, if you want to retrieve the variable with the OID value of 1.3.6.1.2.1.1.1, you should specify the variable value, that is 1.3.6.1.2.1.1.1. If the specified values do not match, a trap will be generated and an error message will be written to the syslog history.

The `action info type snmp oid get-type` command specifies the type of the get operation to be performed. To retrieve the exact variable, the get operation type should be specified as `exact`. To retrieve a lexicographical successor of the specified OID value, the get operation type should be set to `next`.

The table below shows the built-in variables, in which the values retrieved from SNMP get operation are stored.

**Table 187: Built-in Variables for action info type snmp oid Command**

<table>
<thead>
<tr>
<th>Built-in Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_oid</td>
<td>The SNMP object ID.</td>
</tr>
<tr>
<td>_info_snmp_value</td>
<td>The value string of the associated SNMP data element.</td>
</tr>
</tbody>
</table>

GetID Operation

The `action info type snmp getid` command retrieves the following variables from the SNMP entity:

- sysDescr.0
- sysObjectID.0
- sysUpTime.0
- sysContact.0
- sysName.0
- sysLocation.0

The table below shows the built-in variables, in which the values retrieved from the SNMP getID operation are stored.

**Table 188: Built-in Variables for action info type snmp getid Command**

<table>
<thead>
<tr>
<th>Built-in Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_syslocation_oid</td>
<td>The OID value of the sysLocation variable.</td>
</tr>
<tr>
<td>_info_snmp_syslocation_value</td>
<td>The value string for the sysLocation variable.</td>
</tr>
<tr>
<td>_info_snmp_sysdescr_oid</td>
<td>The OID value of the sysDescr variable.</td>
</tr>
<tr>
<td>_info_snmp_sysdescr_value</td>
<td>The value string for the sysDescr variable.</td>
</tr>
<tr>
<td>_info_snmp_sysobjectid_oid</td>
<td>The OID value of the sysObjectID variable.</td>
</tr>
<tr>
<td>Built-in Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>_info_snmp_sysobjectid_value</td>
<td>The value string for the sysObjectID variable.</td>
</tr>
<tr>
<td>_info_snmp_sysuptime_oid</td>
<td>The OID value of the sysUptime variable.</td>
</tr>
<tr>
<td>_info_snmp_sysuptime_value</td>
<td>The value string for the sysUptime variable.</td>
</tr>
<tr>
<td>_info_snmp_syscontact_oid</td>
<td>The OID value of the sysContact variable.</td>
</tr>
<tr>
<td>_info_snmp_syscontact_value</td>
<td>The value string for the sysContact variable.</td>
</tr>
</tbody>
</table>

The get operation requests can be sent to both local and remote hosts.

**SNMP Set Operation**

All SNMP variables are assigned a default value in the MIB view. The SNMP event manager can modify the value of these MIB variables through set operation. The set operation can be performed only on the system that allows read-write access.

To perform a set operation, you must specify the type of the variable and the value associated with it.

The table below shows the valid OID types and values for each OID type.

**Table 189: OID Type and Value for Set Operation**

<table>
<thead>
<tr>
<th>OID Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counter32</td>
<td>A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>gauge</td>
<td>A 32-bit number with a minimum value of 0. For example, the interface speed on a device is measured using a gauge object type. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>integer</td>
<td>A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a device interface, 1 represents up and 2 represents down. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>ipv4</td>
<td>IP version 4 address. IPv4 address in dotted decimal notation is valid.</td>
</tr>
<tr>
<td>octet string</td>
<td>An octet string in hexadecimal notation used to represent physical addresses. Text strings are valid.</td>
</tr>
<tr>
<td>string</td>
<td>An octet string in text notation used to represent text strings. Text strings are valid.</td>
</tr>
<tr>
<td>OID Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>unsigned32</td>
<td>A 32-bit number used to represent decimal value. Unsigned integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
</tbody>
</table>

The set operation can be carried out on both local and remote hosts.

**SNMP Traps and Inform Requests**

Traps are SNMP notifications that alert the SNMP manager or the NMS to a network condition.

SNMP inform requests refer to the SNMP notifications that alert the SNMP manager to a network condition and request for confirmation of receipt from the SNMP manager.

An SNMP event occurs when SNMP MIB object ID values are sampled, or when the SNMP counter crosses a defined threshold. If the notifications are enabled and configured for such events, the SNMP traps or inform messages generated. An SNMP notification event is triggered when an SNMP trap or inform message is received by the event manager server.

To send an SNMP trap or inform message when an Embedded Event Manager (EEM) applet is triggered, the *action info type snmp trap* and *action info type snmp inform* commands are used. The CISCO-EMBEDDED-EVENT-MGR-MIB.my is used to define the trap and inform messages.

**Configuring EEM Applet for SNMP Get and Set Operations**

While registering a policy with the event manager server, the actions associated with an SNMP event can be configured.

Perform this task to configure EEM applet for SNMP set and get operations.

**Before you begin**

- SNMP event manager must be configured using the *snmp-server manager* command.
- The SNMP community string should be set by using the *snmp-server community* command to enable access to the SNMP entity.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager applet  *applet-name*
4. Do one of the following:
   - `event snmp oid  *oid-value*  get-type  {exact | next}  entry-op  *operator*  entry-val  entry-value{exit-comb  and}  [exit-op  *operator*]  [exit-val  *exit-value*]  [exit-time  *exit-time-value*]  poll-interval  *poll-int-value*`
5. `action label info type snmp oid  *oid-value*  get-type  {exact | next}  [community  *community-string*]  [ipaddr  *ip-address*]`
6. `action label info type snmp oid  *oid-value*  set-type  *oid-type*  *oid-type-value*  *community*  *community-string*  [ipaddr  *ip-address*]`
7. `action label info type snmp getid  *oid-value*  [community  *community-string*]  [ipaddr  *ip-address*]`
### 8. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device&gt; enable</td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>event manager applet applet-name</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# event manager applet snmp</td>
<td>Registers the applet with the event manager server and enters applet configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Do one of the following:&lt;br&gt;• **event snmp oid oid-value get-type {exact</td>
<td>next} entry-op operator entry-val entry-value[exit-comb</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>**action label info type snmp oid oid-value get-type {exact</td>
<td>next} [community community-string] [ipaddr ip-address]**&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config-applet)# action 1.3 info type snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact [community public] [ipaddr 172.17.16.69]</td>
</tr>
</tbody>
</table>
### Command or Action

**Step 6**

| action label info type | snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 set-type  
oid-type oid-type-value community community-string [ipaddr ip-address]  
Example:  
Device(config-applet)# action 1.4 info type  
Example:  
snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 set-type  
Example:  
integer 42220 sysName.0 community rw ipaddr  
Example:  
172.17.16.69 |
| Purpose | (Optional) Specifies the variable to be set.  
- In this example, the sysName.0 variable is specified for the set operation and community string is specified as rw.  
**Note**  
For set operation, you must specify the SNMP community string. |

**Step 7**

| action label info type | snmp getid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 community community-string [ipaddr ip-address]  
Example:  
Device(config-applet)# action 1.3 info type  
Example:  
snmp getid community public ipaddr 172.17.16.69 |
| Purpose | (Optional) Specifies if the individual variables should be retrieved by the getid operation. |

**Step 8**

| exit |
| Purpose | Exits global configuration mode and returns to privileged EXEC mode. |

### Configuring EEM Applet for SNMP OID Notifications

Perform this task to configure SNMP notifications.

**Before you begin**

- SNMP event manager must be configured using the `snmp-server manager` command and SNMP agents must be configured to send and receive SNMP traps generated for an EEM policy.

- SNMP traps and informs must be enabled by using the `snmp-server enable traps event-manager` and `snmp-server enable traps` commands, to allow traps and inform requests to be sent from the device to the event manager server.

### SUMMARY STEPS

1. enable  
2. configure terminal
3.  event manager applet  applet-name
4.  Do one of the following:
   • event snmp oid  oid-value  get-type {exact | next} entry-op operator entry-val entry-value {exit-comb | and} | [exit-op operator] [exit-val exit-value] [exit-time exit-time-value] poll-interval poll-int-value
5.  action label info type snmp var  variable-name  oid  oid-value  oid-type  oid-type-value
6.  action label info type snmp trap  enterprise-oid  enterprise-oid-value  generic-trapnum generic-trap-number  specific-trapnum specific-trap-number  trap-oid  trap-oid-value  trap-var  trap-variable
7.  action label info type snmp inform  trap-oid  trap-oid-value  trap-var  trap-variable  community community-string  ipaddr  ip-address
8.  exit

### Configuring Variable Logic for EEM Applets

The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Before variable logic is introduced, applets have a linear structure where each action is executed in the order in which they are configured when the event is triggered. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions. Each control structure can contain a list of applet actions including looping and if/else actions which determine if the structure is executed or not.

The information in applet configuration mode is presented as background to set the context for the action commands.

To provide a consistent user interface between the Tool Command Language (Tcl) and the applet (CLI) based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl based implementation.
- Event specification data is written using the CLI applet submode configuration statements in the applet-based implementation.

Applet configuration mode is entered using the event manager applet command. In applet configuration mode the config prompt changes to (config-applet)#. In applet configuration mode two types of config statements are supported:

- **event** - used to specify the event criteria to cause this applet to run.
- **action** - used to specify a built-in action to perform.

Multiple **action** applet config commands are allowed within an applet configuration. If no **action** applet config command is present, a warning is displayed, upon exit, stating no statements are associated with this applet. When no statements are associated with this applet, events get triggered but no action is taken. If no commands are specified in applet configuration mode, the applet will be removed upon exit. The exit applet config command is used to exit from applet configuration mode.

Depending on your release, the Variable Logic for EEM Applets feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

### Configuring Variable Logic for EEM Applets

EEM 3.0 adds new applet action commands to permit simple variable logic within applets.

To configure the variable logic using action commands perform the following tasks.
## Specifying a Loop of Conditional Blocks

To specify a loop of a conditional block when an EEM applet is triggered, perform this task. In this task, a conditional loop is set to check if the value of the variable is less than 10. If the value of the variable is less than 10, then the message ‘i is $i’ is written to the syslog.

### Note
Depending on your release, the `set (EEM)` command is replaced by the `action set` command. See the `action label set` command for more information. If the `set (EEM)` command is entered in certain releases, the IOS parser translates the `set` command to the `action label set` command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **event manager applet `applet-name`**
4. **action label set**
5. **action label while `string_op1 operator string_op2`**
6. Add any action as required.
7. **action label end**

### DETAILED STEPS

<table>

<td>• In this example, a loop is set to check if the value of the variable i is less than 10.</td>
</tr>
</tbody>
</table>
### Specifying if else Conditional Blocks

To specify the beginning of an if conditional statement followed by an else conditional statement, perform this task. The if or else conditional statements can be used in conjunction with each other or separately. In this task, the value of a variable is set to 5. An if conditional block is then specified to check if the value of the variable is less than 10. Provided the if conditional block is satisfied, an action command to output the message ‘x is less than 10’ is specified.

Following the if conditional block, an else conditional block is specified. Provided the if conditional block is not satisfied, an action command to output the message ‘x is greater than 10’ is specified.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `event manager applet applet-name`
4. `action label set variable-name variable-value`
5. `action label if [stringop1] {eq | gt | ge | lt | le | ne} [stringop2]`
6. Add any action as required.
7. `action label else`
8. Add any action as required.
9. `end`

</tbody>
</table>

**Step 3**

**event manager applet** *applet-name*

**Example:**

Device(config)# event manager applet ifcondition

Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.

**Step 4**

**action** *label* **set** *variable-name* *variable-value*

**Example:**

Device(config-applet)# action 1.0 set x 5

Sets an action for the event.
- In this example, the value of the variable x is set to 5.

**Step 5**

**action** *label* **if** [*stringop1*] {**eq** | **gt** | **ge** | **lt** | **le** | **ne**} [*stringop2*]

**Example:**

Device(config-applet)# action 2.0 if $x lt 10

Specifies an if conditional statement.
- In this example, an if conditional statement to check if the value of the variable is less than 10.

**Step 6**

Add any action as required.

**Example:**

Device(config-applet)# action 3.0 puts "$x is less than 10"

Performs the action as indicated by the action command.
- In this example, the message ‘5 is less than 10’ is displayed on the screen.

**Step 7**

**action** *label* **else**

**Example:**

Device(config-applet)# action 4.0 else

Specifies an else conditional statement

**Step 8**

Add any action as required.

**Example:**

Device(config-applet)# action 5.0

Performs the action as indicated by the action command.
- In this example, the message ‘5 is greater than 10’ is displayed on the screen.

**Step 9**

**end**

**Example:**

Device(config-applet)# end

Exits from the running action.

### Specifying foreach Iterating Statements

To specify a conditional statement that iterates over an input string using the delimiter as a tokenizing pattern, perform this task. The foreach iteration statement is used to iterate through a collection to get the desired information. The delimiter is a regular expression pattern string. The token found in each iteration is assigned to the given iterator variable. All arithmetic calculations are performed as long integers without any checks for overflow. In this task, the value of the variable x is set to 5. An iteration statement is set to run through...
the input string red, blue, green, orange. For every element in the input string, a corresponding message is displayed on the screen.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **event manager applet** `applet-name`
4. **action** `label foreach` `[string-iterator] [string-input] [string-delimiter]`
5. Specify any action command
6. **action** `label` `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | **enable**
**Example:**
Device> enable | Enables privileged EXEC mode.
- Enter your password if prompted. |
| Step 2 | **configure terminal**
**Example:**
Device# configure terminal | Enters global configuration mode. |
| Step 3 | **event manager applet** `applet-name`
**Example:**
Device(config)# event manager applet iteration | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode. |
| Step 4 | **action** `label foreach` `[string-iterator] [string-input] [string-delimiter]`
**Example:**
Device(config-applet)# action 2.0 foreach iterator "red blue green orange" | Iterates over an input string using the delimiter as a tokenizing pattern.
- In this example, the iteration is run through the elements of the input string - red, blue, green and orange. |
| Step 5 | Specify any action command
**Example:**
Device(config-applet)# action 3.0 puts "Iterator is $iterator"
| Performs the action as indicated by the action command.
- In this example, the following message is displayed on the screen:
Iterator is red
Iterator is blue
Iterator is green
Iterator is orange |
Purpose

Command or Action

### Step 6

**action** [label] [end]

**Example:**

Device(config-applet)# action 4.0 end

**Purpose**

Exits from the running action.

### Using Regular Expressions

To match a regular expression pattern with an input string, perform this task. Using regular expressions, you can specify the rules for a set of possible strings to be matched.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `event manager applet` *applet-name*
4. `action` [label] [regexp] *string-pattern* *string-input* [string-match [string-submatch1] [string-submatch2] [string-submatch3]]

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| **Example:**

Device> enable |

• Enter your password if prompted.

| **Step 2** `configure terminal` | Enters global configuration mode. |
| **Example:**

Device# configure terminal |

| **Step 3** `event manager applet` *applet-name* | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode. |
| **Example:**

Device(config)# event manager applet regexp |

| **Step 4** `action` [label] [regexp] *string-pattern* *string-input* [string-match [string-submatch1] [string-submatch2] [string-submatch3]] | Specifies an expression pattern to match with an input string. |
| **Example:**

Device(config-applet)# action 2.0 regexp "(.*) (.*)(.*)" "red blue green" _match _sub1 |

• In this example, an input string of ‘red blue green’ is specified. When the expression pattern matches the input string, the entire result **red blue green** is stored in the variable **_match** and the submatch **red** is stored in the variable **_sub1**.
Incrementing the Values of Variables

To increment the value of variables, perform this task. In this task, the value of a variable is set to 20 and then the value is incremented by 12.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. action label set
5. action label increment variable-name long-integer

Configuring Event SNMP Object

Perform this task to register the Simple Network Management Protocol (SNMP) object event for an Embedded Event Manager (EEM) applet that is run by sampling SNMP object.
SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. event snmp-object oid oid-value type value sync {yes | no} skip {yes | no} istable {yes | no} [default seconds] [maxrun maxruntime-number]
5. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  Example:
  Device> enable | Enables privileged EXEC mode.
  • Enter your password if prompted. |
| **Step 2**
  configure terminal
  Example:
  Device# configure terminal | Enters global configuration mode. |
| **Step 3**
  event manager applet applet-name
  Example:
  Device(config)# event manager applet manual-policy | Registers the applet with the Embedded Event Manager and enters applet configuration mode. |
| **Step 4**
  event snmp-object oid oid-value type value sync {yes | no} skip {yes | no} istable {yes | no} [default seconds] [maxrun maxruntime-number]
  Example:
  Device(config-applet)# event snmp-object oid 1.9.9.9.9 type gauge sync yes | Registers the Simple Network Management Protocol (SNMP) object event for an Embedded Event Manager (EEM) applet to intercept SNMP GET and SET requests for an object. |
  The default for this command is that it is not configured. If this command is configured the defaults are the same as in the description of the syntax options,
  • The **oid** keyword specifies the SNMP object identifier (object ID).
  • The **oid-value** argument can be the Object ID value of the data element, in SNMP dotted notation. An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value.
  • The **istable** keyword specifies whether the OID is an SNMP table.
  • The **sync** keyword specifies that the applet is to run in synchronous mode. The return code from the applet indicates whether to reply to the SNMP request. The description for code 0 is “do not reply to the request”
and the description for code 1 is “reply to the request”. When the return code from the applet replies to the request, a value is specified in the applet for the object using **action snmp-object-value** command.

- The **type** keyword specifies the type of object.
- The **value** argument is the value of the object.
- The **skip** keyword specifies whether to skip CLI command execution.
- The **default** keyword specifies the time to process the SET or GET request normally by the applet. If the **default** keyword is not specified, the default time period is set to 30 seconds.
- The **milliseconds** argument is the time period during which the SNMP Object event detector waits for the policy to exit.
- The **maxrun** keyword specifies the maximum runtime of the applet. If the **maxrun** keyword is specified, the **maxruntime-number** value must be specified. If the **maxrun** keyword is not specified, the default applet run time is 20 seconds.
- The **milliseconds** argument is the maximum runtime of the applet in milliseconds. If the argument is not specified, the default 20-second run-time limit is used.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Step 5**

**Example:**

```
Device(config)# exit
```

**Disabling AAA Authorization**

Perform this task to allow EEM policies to bypass AAA authorization when triggered.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager applet **applet-name [authorization bypass] [class class-options] [trap]**
4. exit
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| Example:                     |         |
| Device# configure terminal   |         |

| **Step 3** event manager applet  applet-name [authorization bypass] [class class-options] [trap] | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode. |
| Example:                       |         |
| Device(config)# event manager applet one class A authorization bypass |         |

| **Step 4** exit | Exits device configuration applet mode and returns to privileged EXEC mode. |
| Example:        |         |
| Device(config-aaplet)# exit |         |

### Configuring Description of an Embedded Event Manager Applet

Perform this task to describe an EEM applet. The description of an applet can be added in any order, before or after any other applet configuration. Configuring a new description for an applet that already has a description overwrites the current description. An applet description is optional.

Perform this task to configure a new description for an applet.

### SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet  applet-name
4. description  line
5. event syslog pattern  regular-expression
6. action  label  syslog msg  msg-text
7. end

### DETAILED STEPS

<table>
<thead>
<tr>

**Step 2**

configure terminal  
Example:  
Device# configure terminal

**Step 3**

event manager applet  
applet-name
Example:  
Device(config)# event manager applet increment

**Step 4**

description  
line
Example:  
Device(config-applet)# description "This applet looks for the word count in syslog messages"

**Step 5**

event syslog pattern  
regular-expression
Example:  
Device(config-applet)# event syslog pattern "count"

**Step 6**

action  
label  
syslog  
msg  
msg-text
Example:  
Device(config-applet)# action 1 syslog msg hi

- In this example, the action taken is to write a message to syslog.
- The *msg-text* argument can be character text, an environment variable, or a combination of the two.

**Step 7**

end
Example:  
Device(config-applet)# end

**Configuration Examples for Writing Embedded Event Manager Policies Using Tcl**

**Embedded Event Manager Applet Configuration Examples**

The following examples show how to create an EEM applet for some of the EEM event detectors. These examples follow steps outlined in the *Registering and Defining an Embedded Event Manager Applet*, on page 1847.
**Application-Specific Event Detector**

The following example shows how a policy named EventPublish_A runs every 20 seconds and publishes an event type numbered 1 to an EEM subsystem numbered 798. The subsystem value of 798 specifies that a publish event has occurred from an EEM policy. A second policy named EventPublish_B is registered to run when the EEM event type 1 occurs with subsystem 798. When the EventPublish_B policy runs, it sends a message to syslog containing data passed as an argument from the EventPublish_A policy.

```bash
event manager applet EventPublish_A
    event timer watchdog time 20.0
    action 1.0 syslog msg "Applet EventPublish_A"
    action 2.0 publish-event sub-system 798 type 1 arg1 twenty
    exit

event manager applet EventPublish_B
    event application sub-system 798 type 1
    action 1.0 syslog msg "Applet EventPublish_B arg1 $_application_data1"
```

**CLI Event Detector**

The following example shows how to specify an EEM applet to run when the Cisco IOS `write memory` CLI command is run. The applet provides a notification that this event has occurred via a syslog message. In the example, the `sync` keyword is configured with the `yes` argument, and this means that the event detector is notified when this policy completes running. The exit status of the policy determines whether the CLI command will be executed. In this example, the policy exit status is set to one and the CLI command runs.

```bash
event manager applet cli-match
    event cli pattern "write mem.*" sync yes
    action 1.0 syslog msg "$_cli_msg Command Executed"
    set 2.0 _exit_status 1
```

The following example shows an applet which matches the `cli pattern` with the test argument. When `show access-list test` is entered, the CLI event detector matches the test argument, and the applet is triggered. The `debug event manager detector cli` output is added to show `num_matches` is set to one.

```bash
! event manager applet EEM-PIPE-TEST
    event cli pattern "test" sync yes
    action 1.0 syslog msg "Pattern matched!"
! *Aug 23 23:19:59.827: check_eem_cli_policy_handler: command_string=show access-lists test
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: num_matches = 1, response_code = 4
```

The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe (|) character when redirection is used.

The following example shows that when `show version | include test` is entered, the applet fails to trigger because the CLI event detector does not match on characters entered after the pipe (|) character and the `debug event manager detector cli` output shows `num_matches` is set to zero.

```bash
```
**Counter Event Detector and Timer Event Detector**

The following example shows that the EventCounter_A policy is configured to run once a minute and to increment a well-known counter called critical_errors. A second policy--EventCounter_B--is registered to be triggered when the well-known counter called critical_errors exceeds a threshold of 3. When the EventCounter_B policy runs, it resets the counter to 0.

```plaintext
event manager applet EventCounter_A
  event timer watchdog time 60.0
  action 1.0 syslog msg "EventCounter_A"
  action 2.0 counter name critical_errors op inc value 1
  exit

event manager applet EventCounter_B
  event counter name critical_errors entry-op gt entry-val 3 exit-op lt exit-val 3
  action 1.0 syslog msg "EventCounter_B"
  action 2.0 counter name critical_errors op set value 0
```

**Interface Counter Event Detector**

The following example shows how a policy named EventInterface is triggered every time the receive_throttle counter for Fast Ethernet interface 0/0 is incremented by 5. The polling interval to check the counter is specified to run once every 90 seconds.

```plaintext
event manager applet EventInterface
  event interface name FastEthernet0/0 parameter receive_throttle entry-op ge entry-val 5
  entry-val-is-increment true poll-interval 90
  action 1.0 syslog msg "Applet EventInterface"
```

**Resource Event Detector**

The following example shows how to specify event criteria based on an ERM event report for a policy defined to report high CPU usage:

```plaintext
event manager applet policy-one
  event resource policy cpu-high
  action 1.0 syslog msg "CPU high at $resource_current_value percent"
```

**RF Event Detector**

The RF event detector is only available on networking devices that contain dual Route Processors (RPs). The following example shows how to specify event criteria based on an RF state change notification:

```plaintext
event manager applet start-rf
  event rf event rf_prog_initialization
  action 1.0 syslog msg "rf state rf_prog_initialization reached"
```

**RPC Event Detector**

The RPC event detector allows an outside entity to make a Simple Object Access Protocol (SOAP) request to the device and invokes a defined EEM policy or script. The following example shows how an EEM applet called Event_RPC is being registered to run an EEM script:

```plaintext
event manager applet Event_RPC
  event rpc
  action print puts "hello there"
```
The following example shows the format of the SOAP request and reply message:

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP:Body>
    <run_eemscript>
      <script_name>Event_RPC</script_name>
    </run_eemscript>
  </SOAP:Body>
</SOAP:Envelope>
```

```xml
```

### SNMP Event Detector

The following example shows how to specify an EEM applet to run when the CPU usage is greater than 75 percent. When the EEM applet runs, the CLI commands `enable` and `show cpu processes` are run, and an e-mail containing the result of the `show cpu processes` command is sent to an engineer.

```bash
event manager applet snmpcpuge75
  event snmp oid 1.3.6.1.4.1.9.9.109.1.1.1.1.3.1 get-type exact entry-op ge entry-val 75
  poll-interval 10
  action 1.0 cli command "enable"
  action 2.0 cli command "show process cpu"
  action 3.0 mail server "192.168.1.146" to "engineer@cisco.com" from "devtest@cisco.com"
  subject "B25 PBX Alert" body "$_cli_result"
```

The next example is more complex and shows how to configure an EEM applet that causes a switch to the secondary (redundant) Route Processor (RP) when the primary RP runs low on memory.

This example illustrates a method for taking preventative action against a software fault that causes a memory leak. The action taken here is designed to reduce downtime by switching over to a redundant RP when a possible memory leak is detected.

The figure below shows a dual RP device that is running an EEM image. An EEM applet has been registered through the CLI using the `event manager applet` command. The applet will run when the available memory on the primary RP falls below the specified threshold of 5,120,000 bytes. The applet actions are to write a message to syslog that indicates the number of bytes of memory available and to switch to the secondary RP.

![Figure 140: Dual RP Topology](image)

The commands used to register the policy are shown below.

```bash
event manager applet memory-demo
  event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000
  poll-interval 90
  action 1.0 syslog priority critical msg "Memory exhausted; current available memory is"
$snmp_oid_val bytes"
    action 2.0 force-switchover

The registered applet is displayed using the `show event manager policy registered` command:

```
Device# show event manager policy registered
No. Type Event Type Time Registered Name
1  applet snmp Thu Jan30 05:57:16 2003 memory-demo
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val (5120000)
   poll-interval 90
   action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
$snmp_oid_val bytes"
   action 2.0 force-switchover
```

For the purpose of this example, a memory depletion is forced on the device, and a series of `show memory` commands are executed to watch the memory deplete:

```
Device# show memory
Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212348444 119523060 92825384 92825384 92365916
Fast 53565260 131080 70360 60720 60720 60668
Device# show memory
Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212364664 164509492 47855172 47855172 47169340
Fast 53565260 131080 70360 60720 60720 60668
Device# show memory
Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212369492 179488300 32881192 32881192 32127556
Fast 53565260 131080 70360 60720 60720 60668
```

When the threshold is reached, an EEM event is triggered. The applet named memory-demo runs, causing a syslog message to be written to the console and a switch to be made to the secondary RP. The following messages are logged:

```
00:08:31: %HA_EM-2-LOG: memory-demo: Memory exhausted; current available memory is
4484196 bytes
00:08:31: %HA_EM-6-FMS_SWITCH_HARDWARE: fh_io_msg: Policy has requested a hardware
switchover
```

The following is partial output from the `show running-config` command on both the primary RP and the secondary (redundant) RP:

```
redundancy
  mode sso
  .
  .
  !
event manager applet memory-demo
  event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val
5120000 poll-interval 90
  action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
$snmp_oid_val bytes"
  action 2.0 force-switchover
```

**SNMP Notification Event Detector**

The following example shows how to configure the `snmp-server community` public RW and `snmp-server manager` commands before `event snmp-notification` is configured.
The following example shows how an EEM applet called SNMP_Notification is being registered to run an EEM script when the device receives an SNMP notification on destination IP address 192.168.1.1 for object ID 1 whose value equals 10.

```
event manager applet SNMP_Notification
  event snmp-notification dest_ip_address 192.168.1.1 oid 1 op eq oid-value 10
  action 1 policy eem_script
```

**Syslog Event Detector**

The following example shows how to specify an EEM applet to run when syslog identifies that Ethernet interface 1/0 is down. The applet sends a message about the interface to syslog.

```
event manager applet interface-down
  event syslog pattern ".*UPDOWN.*Ethernet1/0.*" occurs 4
  action 1.0 syslog msg "Ethernet interface 1/0 changed state 4 times"
```

**Configuration Examples for Embedded Event Manager Applet**

**Example Identity Event Detector**

The following example shows how a policy named “EventIdentity” is triggered every time the authentication on the Fast Ethernet interface 0 is success.

```
event manager applet EventIdentity
  event identity interface FastEthernet0 authc success
  action 1.0 syslog msg "Applet EventIdentity"
```

**Example MAT Event Detector**

The following example shows how a policy named “EventMat” is triggered every time a mac-address is learned in the mac-address-table.

```
event manager applet EventMat
  event mat interface FastEthernet0
  action 1.0 syslog msg "Applet EventMat"
```

**Example Neighbor-Discovery Event Detector**

The following example shows how a policy named “EventNeighbor” is triggered when a Cisco Discovery Protocol (CDP) cache entry changes.

```
event manager applet EventNeighbor
  event neighbor-discovery interface FastEthernet0 cdp all
  action 1.0 syslog msg "Applet EventNeighbor"
```
Embedded Event Manager Manual Policy Execution Examples

The following examples show how to use the none event detector to configure an EEM policy (applet or script) to be run manually.

Using the event manager run Command

This example shows how to run a policy manually using the `event manager run` command. The policy is registered using the `event none` command under applet configuration mode and then run from global configuration mode using the `event manager run` command.

```
event manager applet manual-policy
  event none
  action 1.0 syslog msg "Manual-policy triggered"
end
!
event manager run manual-policy
```

Using the action policy Command

This example shows how to run a policy manually using the `action policy` command. The policy is registered using the `event none` command under applet configuration mode, and then the policy is executed using the `action policy` command in applet configuration mode.

```
event manager applet manual-policy
  event none
  action 1.0 syslog msg "Manual-policy triggered"
end
!
event manager applet manual-policy-two
  event none
  action 1.0 policy manual-policy
end
!
event manager run manual-policy-two
```

Embedded Event Manager Watchdog System Monitor (Cisco IOS) Event Detector Configuration Example

The following example shows how to configure three EEM applets to demonstrate how the Cisco IOS watchdog system monitor (IOSWD SysMon) event detector works.

Watchdog System Monitor Sample1 Policy

The first policy triggers an applet when the average CPU usage for the process named IP Input is greater than or equal to 1 percent for 10 seconds:

```
event manager applet IOSWD_Sample1
  event ioswdsysmon sub1 cpu-proc taskname "IP Input" op ge val 1 period 10
  action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
```
Watchdog System Monitor Sample2 Policy

The second policy triggers an applet when the total amount of memory used by the process named Net Input is greater than 100 kb:

```
event manager applet IOSWD_Sample2
  event ioswdsysmon sub1 mem-proc taskname "Net Input" op gt val 100 is-percent false
  action 1.0 syslog msg "IOSWD_Sample2 Policy Triggered"
```

Watchdog System Monitor Sample3 Policy

The third policy triggers an applet when the total amount of memory used by the process named IP RIB Update has increased by more than 50 percent over the sample period of 60 seconds:

```
event manager applet IOSWD_Sample3
  event ioswdsysmon sub1 mem-proc taskname "IP RIB Update" op gt val 50 is-percent true period 60
  action 1.0 syslog msg "IOSWD_Sample3 Policy Triggered"
```

The three policies are configured, and then repetitive large pings are made to the networking device from several workstations, causing the networking device to register some usage. This will trigger policies 1 and 2, and the console will display the following messages:

```
00:42:23: %HA_EM-6-LOG: IOSWD_Sample1: IOSWD_Sample1 Policy Triggered
00:42:47: %HA_EM-6-LOG: IOSWD_Sample2: IOSWD_Sample2 Policy Triggered
```

To view the policies that are registered, use the `show event manager policy registered` command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system ioswdsysmon Off Fri Jul 23 02:27:28 2004 IOSWD_Sample1
sub1 cpu_util {taskname "IP Input" op ge val 1 period 10.000 }
  action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
2 applet system ioswdsysmon Off Fri Jul 23 02:23:52 2004 IOSWD_Sample2
sub1 mem_used {taskname "Net Input" op gt val 100 is-percent FALSE}
  action 1.0 syslog msg "IOSWD_Sample2 Policy Triggered"
3 applet system ioswdsysmon Off Fri Jul 23 03:07:38 2004 IOSWD_Sample3
sub1 mem_used {taskname "IP RIB Update" op gt val 50 is-percent TRUE period 60.000 }
  action 1.0 syslog msg "IOSWD_Sample3 Policy Triggered"
```

Configuration SNMP Library Extensions Examples

SNMP Get Operations Examples

The following example shows how to send a get request to the local host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact
  community public
Device(config-applet)# action 1.3 info type snmp oid
```
The following log message will be written to the SNMP event manager log:

1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0

The following example shows how to send a get request to a remote host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
512000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp oid
1.3.6.1.2.1.1.4.0 get-type next community
ipaddr
172.17.16.69
Device(config-applet)# action 1.3 info type snmp getid
1.3.6.1.2.1.1.1.0 community
ipaddr
172.17.16.69

The following log message is written to the SNMP event manager log:

1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0

**SNMP GetID Operations Examples**

The following example shows how to send a getid request to the local host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
512000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp getid
1.3.6.1.2.1.1.1.0 community
ipaddr

The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=1.3.6.1.2.1.1.3.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_value=10131676
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_value=YYY

The following example shows how to send a getid request to a remote host.
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp getid
  1.3.6.1.2.1.1.1.0 community
  public ipaddr
  172.17.16.69

The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_syslocation_value=
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysdescr_oid=1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysuptime_oid=1.3.6.1.2.1.1.3.0
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_sysuptime_oid=10131676
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: __info_snmp_syscontact_value=YYY

Set Operations Examples

The following example shows how to perform a set operation on the local host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp oid
  1.3.6.1.2.1.1.1.4.0 set-type
  integer
  5 sysName.0 community
  public

The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX

The following example shows how to perform a set operation on a remote host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp oid
  1.3.6.1.2.1.1.1.4.0 set-type integer
  5 sysName.0 community
  public ipaddr
  172.17.16.69
The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX
```

**Generating SNMP Notifications Examples**

The following example shows how to configure SNMP traps for the sysUpTime.0 variable:

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
  lt entry-val
  512000 poll-interval
  90 Device(config-applet)# action 1.3 info type snmp var
  sysUpTime.0 oid
  1.3.6.1.4.1.9.9.43.1.1.6.1.3.41 integer
  2 Device(config-applet)# action 1.4 info type snmp trap
  enterprise-oid
ciscoSyslogMIB.2 generic-trapnum
  6 specific-trapnum
  1 trap-oid
  1.3.6.1.4.1.9.9.41.2.0.1 trap-var
  sysUpTime.0
```

The following output is generated if the debug snmp packets command is enabled:

```
Device# debug snmp packets
1d04h: SNMP: Queuing packet to 172.69.16.2
1d04h: SNMP: V1 Trap, ent ciscoSyslogMIB.2, addr 172.19.rap 1

5d04h: SNMP: Inform request, reqid 25, errstat 0, erridx 0

**Configuring Variable Logic for EEM Applets Examples**

The following sections provide examples on some selected action commands. For information on all the action commands supporting variable logic within applets, see the table below.

In this example, conditional loops **while**, **if** and **foreach** are used to print data. Other action commands such as **action divide**, **action increment** and **action puts** are used to define the actions to be performed when the conditions are met.

```
event manager applet printdata
```
When the event manager applet ex is run, the following output is obtained:

```
event manager run printdata
red green blue
square triangle rectangle
red green blue
square triangle rectangle
red green blue
```

In this example, two environment variables poll_interface and max_rx_rate are set to F0/0 and 3 respectively. Every 30 seconds there is a poll on an interface for rx rate. If the rx rate is greater than the threshold, a syslog message is displayed.

This applet makes use of the foreach conditional statement to poll the interface, the if conditional block to compare the value under RXPS with max_rx_rate that was set in the EEM environment variable.

```
event manager environment poll_interfaces F0/0
event manager environment max_rx_rate 3
ev man app check_rx_rate
ev timer watchdog name rx_timer time 30
action 100 foreach int $poll_interfaces
action 101 cli command "en"
action 102 cli command "show int $int summ | beg ------"
action 103 foreach line $_cli_result "\n"
junk rxps
action 106 if $_regexp_result eq 1
action 107 if $rxps gt $max_rx_rate
action 108 syslog msg "Warning rx rate for $int is > than threshold. Current value is $rxps"
(action threshold is $max_rx_rate)"
action 109 end
action 110 end
action 111 end
action 112 end
```

Example syslog message:

```
Current value is 4 (threshold is 3)
The output of show int F0/0 summ is of the format:
```
The output of the command "show int f0/0 summ" is as follows:

*: interface is up
IHQ: pkts in input hold queue
IQD: pkts dropped from input queue
OMQ: pkts in output hold queue
OQD: pkts dropped from output queue
RXBS: rx rate (bits/sec)
RXPS: rx rate (pkts/sec)
TXBS: tx rate (bits/sec)
TXPS: tx rate (pkts/sec)
TRTL: throttle count

<table>

To use other action commands supporting variable logic within applets, use the commands listed in the table below.

### Table 190: Available action commands

<table>
<thead>
<tr>
<th>Action Commands</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>action add</td>
<td>Adds the value of two variables when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action append</td>
<td>Appends the given value to the current value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action break</td>
<td>Causes an immediate exit from a loop of actions when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action comment</td>
<td>Adds comments to an applet when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action context retrieve</td>
<td>Retrieves variables identified by a given set of context name keys when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action context save</td>
<td>Saves information across multiple policy triggers when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action continue</td>
<td>Continues with a loop of actions when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action decrement</td>
<td>Decrement the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action divide</td>
<td>Divides the dividend value by the given divisor value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action else</td>
<td>Specifies the beginning of else conditional action block in if/else conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action elseif</td>
<td>Identifies the beginning of the else conditional action block in the else / if conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td><strong>Action Commands</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>action end</td>
<td>Specifies the identification of the end of an conditional action block in the if / else and while conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action exit</td>
<td>Specifies an immediate exit from the running applet configuration when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action foreach</td>
<td>Specifies the iteration of an input string using the delimiter as a tokenizing pattern, when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action gets</td>
<td>Gets an input from the local TTY in a synchronous applet and store the value in the given variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action if</td>
<td>Specifies the identification of the beginning of an if conditional block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action if goto</td>
<td>Instructs the applet to jump to a given label if the specified condition is true when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action increment</td>
<td>Increments the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type interface-names</td>
<td>Specifies the action of obtaining interface names when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp getid</td>
<td>Retrieves the individual variables from a Simple Network Management Protocol (SNMP) entity during the SNMP get operation.</td>
</tr>
<tr>
<td>action info type snmp inform</td>
<td>Sends an SNMP inform requests when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp oid</td>
<td>Specifies the type of SNMP get operation and the object to retrieve during the SNMP set operation, when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp trap</td>
<td>Sends SNMP trap requests when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp var</td>
<td>Creates a variable for an SNMP object identifier (OID) and its value from an EEM applet.</td>
</tr>
<tr>
<td>action multiply</td>
<td>Specifies the action of multiplying the variable value with a specified given integer value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action puts</td>
<td>Enables the action of printing data directly to the local tty when an EEM applet is triggered.</td>
</tr>
<tr>
<td>Action Commands</td>
<td>Purpose</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------</td>
</tr>
<tr>
<td>action regexp</td>
<td>Specifies the action of matching a regular expression pattern on an input string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action set (EEM)</td>
<td>Specifies the action of setting the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string compare</td>
<td>Specifies the action of comparing two unequal strings when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string equal</td>
<td>Specifies the action of verifying whether or not two strings are equal when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string first</td>
<td>Specifies the action of returning the index on the first occurrence of string1 within string2 when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string index</td>
<td>Specifies the action of returning the characters specified at a given index value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string last</td>
<td>Specifies the action of returning the index on the last occurrence of string1 within string 2 when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string length</td>
<td>Specifies the action of returning the number of characters in a string when the EEM applet is triggered.</td>
</tr>
<tr>
<td>action string match</td>
<td>Specifies the action of returning 1 to the $string_result, if the string matches the pattern when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string range</td>
<td>Specifies the action of storing a range of characters in a string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string replace</td>
<td>Specifies the action of storing a new string by replacing range of characters in the specified string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string tolower</td>
<td>Specifies the action of storing specific range of characters of a string in lowercase when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string toupper</td>
<td>Specifies the action of storing specific range of characters of a string in uppercase when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string trim</td>
<td>Specifies the action to trim a string when an EEM applet is triggered.</td>
</tr>
</tbody>
</table>
### Purpose Action Commands

<table>
<thead>
<tr>
<th>Action Commands</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>action string trimleft</td>
<td>Specifies the action to trim the characters of one string from the left end of another string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string trimright</td>
<td>Specifies the action to trim the characters one string from the right end of another string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action subtract</td>
<td>Subtracts the value of a variable from another value when an EEM applet is triggered.</td>

<td>Specifies the action of identifying the beginning of a loop of conditional block when an EEM applet is triggered.</td>
</tr>
</tbody>
</table>

### Configuring Event SNMP-Object Examples

The following example shows the SET operation and the value to set is in $_snmp_value and it is managed by the script. The example below saves the oid and its value as contexts to be retrieved later.

```bash
event manager applet snmp-object1
description "APPLET SNMP-OBJ-1"
event snmp-object oid 1.3.6.1.2.1.31.1.1.1.18 type string sync no skip no istable yes
default 0
action 1 syslog msg "SNMP-OBJ1:TRIGGERED" facility "SNMP_OBJ"
action 2 context save key myoid variable "_snmp_oid"
action 3 context save key myvalue variable "_snmp_value"
```

### Configuring Description of an EEM Applet Examples

The following example shows how to add or modify the description for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP):

```bash
event manager applet test
description "This applet looks for the word count in syslog messages"
event syslog pattern "count"
action 1 syslog msg hi
```

Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Writing Embedded Event Manager Policies Using Tcl

This module describes how software developers can write and customize Embedded Event Manager (EEM) policies using Tool command language (Tcl) scripts to handle Cisco software faults and events. EEM is a policy-driven process by means of which faults in the Cisco software system are reported through a defined application programing interface (API). The EEM policy engine receives notifications when faults and other events occur. EEM policies implement recovery on the basis of the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

- Prerequisites for Writing Embedded Event Manager Policies Using Tcl, on page 1909
- Information About Writing Embedded Event Manager Policies Using Tcl, on page 1910
- How to Write Embedded Event Manager Policies Using Tcl, on page 1916
- Configuration Examples for Writing Embedded Event Manager Policies Using Tcl, on page 1945
- Additional References, on page 1966
- Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI, on page 1967

Prerequisites for Writing Embedded Event Manager Policies Using Tcl

- Before writing EEM policies, you should be familiar with the “Embedded Event Manager Overview” module.
- If you want to write EEM policies using the command-line interface (CLI) commands, you should be familiar with the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.
Information About Writing Embedded Event Manager Policies Using Tcl

EEM Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or reach a threshold. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the command-line interface (CLI) configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

EEM Applet

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In EEM applet configuration mode, three types of configuration statements are supported. The event commands are used to specify the event criteria to trigger the applet to run, the action commands are used to specify an action to perform when the EEM applet is triggered, and the `set` command is used to set the value of an EEM applet variable. Currently only the `_exit_status` variable is supported for the `set` command.

Only one event configuration command is allowed within an applet configuration. When applet configuration submode is exited and no event command is present, a warning is displayed stating that no event is associated with the applet. If no event is specified, the applet is not considered registered. When no action is associated with the applet, events are still triggered but no actions are performed. Multiple action configuration commands are allowed within an applet configuration. Use the `show event manager policy registered` command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it, because changes are written to a temporary file. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

Action configuration commands within an applet are uniquely identified using the `label` argument, which can be any string value. Actions are sorted within an applet in ascending alphanumeric key sequence using the `label` argument as the sort key, and they are run using this sequence. The same `label` argument can be used in different applets; the labels must be unique only within one applet.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

For more details about writing EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

EEM Script

All Embedded Event Manager scripts are written in Tcl. Tcl is a string-based command language that is interpreted at run time. The version of Tcl supported is Tcl version 8.3.4 plus added script support. Scripts are defined using an ASCII editor on another device, not on the networking device. The script is then copied
to the networking device and registered with EEM. Tcl scripts are supported by EEM. As an enforced rule, Embedded Event Manager policies are short-lived run time routines that must be interpreted and executed in less than 20 seconds of elapsed time. If more than 20 seconds of elapsed time are required, the maxrun parameter may be specified in the event_register statement to specify any desired value.

EEM policies use the full range of the Tcl language’s capabilities. However, Cisco provides enhancements to the Tcl language in the form of Tcl command extensions that facilitate the writing of EEM policies. The main categories of Tcl command extensions identify the detected event, the subsequent action, utility information, counter values, and system information.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM script involves:

- Selecting the event Tcl command extension that establishes the criteria used to determine when the policy is run.
- Defining the event detector options associated with detecting the event.
- Choosing the actions to implement recovery or respond to the detected event.

### EEM Policy Tcl Command Extension Categories

There are different categories of EEM policy Tcl command extensions.

<table>
<thead>
<tr>
<th>Category</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>EEM event Tcl command extensions (three types: event information, event registration, and event publish)</td>
<td>This category is represented by the <code>event_register_.xxx</code> family of event-specific commands. There is a separate event information Tcl command extension in this category as well: <code>event_reqinfo</code>. This is the command used in policies to query the EEM for information about an event. There is also an EEM event publish Tcl command extension <code>event_publish</code> that publishes an application-specific event.</td>
</tr>
<tr>
<td>EEM action Tcl command extensions</td>
<td>These Tcl command extensions (for example, <code>action_syslog</code>) are used by policies to respond to or recover from an event or fault. In addition to these extensions, developers can use the Tcl language to implement any action desired.</td>
</tr>
<tr>
<td>EEM utility Tcl command extensions</td>
<td>These Tcl command extensions are used to retrieve, save, set, or modify application information, counters, or timers.</td>
</tr>
<tr>
<td>EEM system information Tcl command extensions</td>
<td>This category is represented by the <code>sys_reqinfo .xxx</code> family of system-specific information commands. These commands are used by a policy to gather system information.</td>
</tr>
<tr>
<td>EEM context Tcl command extensions</td>
<td>These Tcl command extensions are used to store and retrieve a Tcl context (the visible variables and their values).</td>
</tr>
</tbody>
</table>
General Flow of EEM Event Detection and Recovery

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, the core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs.

When an event or fault is detected, Embedded Event Manager determines from the event publishers—an example would be the OIR events publisher in the figure below—if a registration for the encountered fault or event has occurred. EEM matches the event registration information with the event data itself. A policy registers for the detected event with the Tcl command extension `event_register xxx`. The event information Tcl command extension `event_reqinfo` is used in the policy to query the Embedded Event Manager for information about the detected event.

**Figure 141: Embedded Event Manager Core Event Detectors**

Safe-Tcl

Safe-Tcl is a safety mechanism that allows untrusted Tcl scripts to run in an interpreter that was created in the safe mode. The safe interpreter has a restricted set of commands that prevent accessing some system resources and harming the host and other applications. For example, it does not allow commands to access critical Cisco IOS file system directories.
Cisco-defined scripts run in full Tcl mode, but user-defined scripts run in Safe-Tcl mode. Safe-Tcl allows Cisco to disable or customize individual Tcl commands. For more details about Tcl commands, go to http://www.tcl.tk/man/.

The following list of Tcl commands are restricted with a few exceptions. Restrictions are noted against each command or command keyword:

- **cd** -- Change directory is not allowed to one of the restricted Cisco directory names.

- **encoding** -- The commands `encoding names`, `encoding convertfrom`, and `encoding convertto` are permitted. The `encoding system` command with no arguments is permitted, but the `encoding system` command with the `?encoding?` keyword is not permitted.

- **exec** -- Not permitted.

- **fconfigure** -- Permitted.

- **file** -- The following are permitted:
  - `file dirname`
  - `file exists`
  - `file extension`
  - `file isdirectory`
  - `file join`
  - `file pathtype`
  - `file rootname`
  - `file split`
  - `file stat`
  - `file tail`

- **file** -- The following are not permitted:
  - `file atime`
  - `file attributes`
  - `file channels`
  - `file copy`
  - `file delete`
  - `file executable`
  - `file isfile`
  - `file link`
  - `file lstat`
  - `file mkdir`
  - `file mtime`
  - `file nativename`
  - `file normalize`
  - `file owned`
  - `file readable`
  - `file readlink`
  - `file rename`
  - `file rootname`
  - `file separator`
Bytecode Support for EEM 2.4

EEM 2.4 introduces bytecode language (BCL) support by accepting files with the standard bytecode script extension .tbc. Tcl version 8.3.4 defines a BCL and includes a compiler that translates Tcl scripts into BCL. Valid EEM policy file extensions in EEM 2.4 for user and system policies are .tcl (Tcl Text files) and .tbc (Tcl bytecode files).

Storing Tcl scripts in bytecode improves the execution speed of the policy because the code is precompiled, creates a smaller policy size, and obscures the policy code. Obfuscation makes it a little more difficult to modify scripts and hides logic to preserve intellectual property rights.

Support for bytecode is being added to provide another option for release of supported and trusted code. We recommend that you only run well understood, or trusted and supported software on network devices. To generate Tcl bytecode for IOS EEM support, use TclPro versions 1.4 or 1.5.

To translate a Tcl script to bytecode you can use procomp, part of Free TclPro Compiler, or Active State Tcl Development Kit. When a Tcl script is compiled using procomp, the code is scrambled and a .tbc file is generated. The bytecode files are platform-independent and can be generated on any operating system on which TclPro is available, including Windows, Linux, and UNIX. Procomp is part of TclPro and available from http://www.tcl.tk/software/tclpro.

Registration Substitution

In addition to regular Tcl substitution, EEM 2.3 permits the substitution of an individual parameter in an EEM event registration statement line with an environment variable.

EEM 2.4 introduces the ability to replace multiple parameters in event registration statement lines with a single environment variable.
Only the first environment variable supports multiple parameter substitution. Individual parameters can still be specified with additional environment variables after the initial variable.

To illustrate the substitution, a single environment variable, $_eem_syslog_statement is configured as:

```cisco::eem::event_register_syslog pattern COUNT```

Using the registration substitution, the $_eem_syslog_statement environment variable is used in the following EEM user policy:

```$_eem_syslog_statement occurs $_eem_occurs_val
action_syslog “this is test 3”```

Environment variables must be defined before a policy using them is registered. To define the $_eem_syslog_statement environment variable:

Device(config)# event manager environment eem_syslog_statement
::cisco::eem::event_register_syslog pattern COUNT
Device(config)# event manager environment eem_occurs_val 2

**Cisco File Naming Convention for EEM**

All Embedded Event Manager policy names, policy support files (for example, e-mail template files), and library filenames are consistent with the Cisco file naming convention. In this regard, Embedded Event Manager policy filenames adhere to the following specification:

- An optional prefix--Mandatory:--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl_text.tcl.

- A filename body part containing a two-character abbreviation (see the table below) for the first event specified; an underscore part; and a descriptive field part that further identifies the policy.

- A filename suffix part defined as .tcl.

Embedded Event Manager e-mail template files consist of a filename prefix of email_template, followed by an abbreviation that identifies the usage of the e-mail template.

Embedded Event Manager library filenames consist of a filename body part containing the descriptive field that identifies the usage of the library, followed by _lib, and a filename suffix part defined as .tcl.

*Table 193: Two-Character Abbreviation Specification*
How to Write Embedded Event Manager Policies Using Tcl

Registering and Defining an EEM Tcl Script

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

Before you begin

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided--see the details in the Sample EEM Policies, on page 1927 to see which policies are available for the Cisco IOS release image that you are using--and these sample policies are stored in the system policy directory.

SUMMARY STEPS

1. enable
2. show event manager environment [all| variable-name]
3. `configure terminal`
4. `event manager environment  variable-name string`
5. Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script.
6. `event manager policy  policy-filename [type {system|user}] [trap]`
7. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>show event manager environment [all] variable-name</code></td>
<td>(Optional) Displays the name and value of EEM environment variables.</td>
</tr>
<tr>
<td>Example: <code>Device# show event manager environment all</code></td>
<td>• The optional all keyword displays all the EEM environment variables.</td>
</tr>
<tr>
<td></td>
<td>• The optional variable-name argument displays information about the specified environment variable.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>event manager environment  variable-name string</code></td>
<td>Configures the value of the specified EEM environment variable.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6</code></td>
<td>• In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script.</td>
<td>--</td>
</tr>
<tr>
<td><strong>Step 6</strong> `event manager policy  policy-filename [type {system</td>
<td>user}] [trap]`</td>
</tr>
<tr>
<td>Example: <code>Device(config)# event manager policy tm_cli_cmd.tcl type system</code></td>
<td>• Use the system keyword to register a Cisco-defined system policy.</td>
</tr>
<tr>
<td></td>
<td>• Use the user keyword to register a user-defined system policy.</td>
</tr>
<tr>
<td></td>
<td>• Use the trap keyword to generate an SNMP trap when the policy is triggered.</td>
</tr>
</tbody>
</table>
### Displaying EEM Registered Policies

Perform this optional task to display EEM registered policies.

**SUMMARY STEPS**

1. enable
2. `show event manager policy registered [event-type event-name] [time-ordered|name-ordered] [detailed policy-filename]`

**DETAILED STEPS**

**Step 1** enable

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2** `show event manager policy registered [event-type event-name] [time-ordered|name-ordered] [detailed policy-filename]`

Use this command with the `time-ordered` keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
```
<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Trap</th>
<th>Time Registered</th>
<th>Name</th>
</tr>
</thead>
</table>
| 1   | system | timer    | cron | Off Wed May11 01:43:18 2005 | tm_cli_cmd.tcl
|     |       |           |      |                   | name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7} nice 0 priority normal maxrun 240 |
| 2   | system | syslog   | Off  | Wed May11 01:43:28 2005 | sl_intf_down.tcl
|     |       |           |      |                   | occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*} nice 0 priority normal maxrun 90 |
| 3   | system | proc abort | Off | Wed May11 01:43:38 2005 | pr_cdp_abort.tcl
|     |       |           |      |                   | instance 1 path {cdp2.iosproc} nice 0 priority normal maxrun 20 |

Use this command with the **name-ordered** keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
Device# show event manager policy registered name-ordered
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Trap</th>
<th>Time Registered</th>
<th>Name</th>
</tr>
</thead>
</table>
| 1   | system | proc abort | Off  | Wed May11 01:43:38 2005 | pr_cdp_abort.tcl
|     |       |           |      |                   | instance 1 path {cdp2.iosproc} nice 0 priority normal maxrun 20 |
| 2   | system | syslog   | Off  | Wed May11 01:43:28 2005 | sl_intf_down.tcl
|     |       |           |      |                   | occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*} nice 0 priority normal maxrun 90 |
| 3   | system | timer    | cron | Off Wed May11 01:43:18 2005 | tm_cli_cmd.tcl
|     |       |           |      |                   | name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7} nice 0 priority normal maxrun 240 |

Use this command with the **event-type** keyword to display information about currently registered policies for the event type specified in the **event-name** argument, for example:

**Example:**

```
Device# show event manager policy registered event-type syslog
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Trap</th>
<th>Time Registered</th>
<th>Name</th>
</tr>
</thead>
</table>
| 1   | system | syslog   | Off  | Wed May11 01:43:28 2005 | sl_intf_down.tcl
|     |       |           |      |                   | occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*} nice 0 priority normal maxrun 90 |

---

**Unregistering EEM Policies**

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

**SUMMARY STEPS**

1. enable
2. show event manager policy registered [event-type event-name][system| user] [time-ordered| name-ordered] [detailed policy-filename]
3. configure terminal
4. no event manager policy policy-filename
5. exit
6. Repeat Unregistering EEM Policies to ensure that the policy has been removed.
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2** show event manager policy registered \[event-type event-name\][system|user] \[time-ordered|name-ordered\] \[detailed|policy-filename\] | (Optional) Displays the EEM policies that are currently registered. |
| **Example:** | |
| Device# show event manager policy registered | - The optional **system** or **user** keyword displays the registered system or user policies. |
| | - If no keywords are specified, EEM registered policies for all event types are displayed in time order. |

| **Step 3** configure terminal | Enters global configuration mode. |
| **Example:** | |
| Device# configure terminal | |

| **Step 4** no event manager policy \(\text{policy-filename}\) | Removes the EEM policy from the configuration, causing the policy to be unregistered. |
| **Example:** | |
| Device(config)# no event manager policy pr_cdp_abort.tcl | - In this example, the **no** form of the command is used to unregister a specified policy. |

| **Step 5** exit | Exits global configuration mode and returns to privileged EXEC mode. |
| **Example:** | |
| Device(config)# exit | |

| **Step 6** Repeat Unregistering EEM Policies to ensure that the policy has been removed. | -- |
| **Example:** | |
| Device# show event manager policy registered | |

### Examples

In the following example, the **show event manager policy registered** privileged EXEC command is used to display the three EEM policies that are currently registered:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:43:18 2005 tm_cli_cmd.tcl
   name (crontimer2) cron entry (0=59/1 0-23/1 * * 0-7)
   nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:43:28 2005 sl_intf_down.tcl
```
After the current policies are displayed, it is decided to delete the `pr_cdp_abort.tcl` policy using the `no` form of the `event manager policy` command:

Device# configure terminal
Device(config)# no event manager policy pr_cdp_abort.tcl
Device(config)# exit

The `show event manager policy registered` privileged EXEC command is entered again to display the EEM policies that are currently registered. The policy `pr_cdp_abort.tcl` is no longer registered.

Device# show event manager policy registered

<table>

</tr>
</tbody>
</table>

### Suspending EEM Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them, might be necessary for reasons of temporary performance or security.

#### SUMMARY STEPS

1. enable
2. `show event manager policy registered [event-type event-name] [system] [user] [time-ordered] [name-ordered] [detailed policy-filename]`
3. configure terminal
4. event manager scheduler suspend
5. exit

#### DETAILED STEPS

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)
## Managing EEM Policies

Perform this task to specify a directory to use for storing user library files or user-defined EEM policies.

### Examples

In the following example, the **show event manager policy registered** privileged EXEC command is used to display all the EEM registered policies:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1  system timer cron Off Sat Oct11 01:43:18 2003 tm_cli_cmd.tcl
   name (crontimer2) cron entry {0-59/1 0-23/1 * * 0-7}
   nice 0 priority normal maxrun 240.000
2  system syslog Off Sat Oct11 01:43:28 2003 sl_intf_down.tcl
   occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
   nice 0 priority normal maxrun 90.000
3  system proc abort Off Sat Oct11 01:43:38 2003 pr_cdp_abort.tcl
   instance 1 path {cdp2.iosproc}
   nice 0 priority normal maxrun 20.000
```

The **event manager scheduler suspend** command is entered to immediately suspend the execution of all EEM policies:

```
Device# configure terminal
Device(config)# event manager scheduler suspend
*Nov 2 15:34:39.000: %HA_EM-6-FMS_POLICY_EXEC: fh_io_msg: Policy execution has been suspended
```

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# show event manager policy registered</td>
<td>• If no keywords are specified, EEM registered policies for all event types are displayed in time order.</td>
</tr>
<tr>
<td><strong>Step 3</strong> configure terminal <strong>Example:</strong> Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> event manager scheduler suspend <strong>Example:</strong> Device(config)# event manager scheduler suspend</td>
<td>Immediately suspends the execution of all EEM policies.</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit <strong>Example:</strong> Device(config)# exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
This task applies only to EEM policies that are written using Tcl scripts.

**SUMMARY STEPS**

1. `enable`
2. `show event manager directory user [library| policy]`
3. `configure terminal`
4. `event manager directory user {library path| policy path}`
5. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`show event manager directory user [library</td>
<td>policy]`</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# show event manager directory user library</td>
<td>• The optional <code>library</code> keyword displays the directory to use for user library files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The optional <code>policy</code> keyword displays the directory to use for user-defined EEM policies.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>`event manager directory user {library path</td>
<td>policy path}`</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# event manager directory user library disk0:/user_library</td>
<td>• Use the <code>path</code> argument to specify the absolute pathname to the user directory.</td>
</tr>
<tr>
<td></td>
<td>Device(config)# event manager directory user library bootflash:/user_library</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>exit</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>
Examples
In the following example, the `show event manager directory user` privileged EXEC command is used to display the directory, if it exists, to use for storing EEM user library files:

```
Device# show event manager directory user library
disk0:/user_library

Device# show event manager directory user library
bootflash:/user_library
```

Modifying History Table Size and Displaying EEM History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `event manager history size {events | traps} [size]`
4. `exit`
5. `show event manager history events [detailed] [maximum number]`
6. `show event manager history traps [server | policy]`

**DETAILED STEPS**

**Step 1** `enable`
Enables privileged EXEC mode. Enter your password if prompted.

**Example:**
```
Device> enable
```

**Step 2** `configure terminal`
Enters global configuration mode.

**Example:**
```
Device# configure terminal
```

**Step 3** `event manager history size {events | traps} [size]`
Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:

**Example:**
```
Device(config)# event manager history size events 30
```
Exits global configuration mode and returns to privileged EXEC mode.

**Example:**

```
Device(config)# exit
```

**Step 5**  
**show event manager history events [detailed] [maximum number]**

Use this command to display information about each EEM event that has been triggered.

**Example:**

```
Device# show event manager history events

No. Time of Event Event Type Name
1 Fri Sep 9 13:48:40 2005 syslog applet: one
2 Fri Sep 9 13:48:40 2005 syslog applet: two
3 Fri Sep 9 13:48:40 2005 syslog applet: three
4 Fri Sep 9 13:50:00 2005 timer cron script: tm_cli_cmd.tcl
5 Fri Sep 9 13:51:00 2005 timer cron script: tm_cli_cmd.tcl
```

**Step 6**  
**show event manager history traps [server | policy]**

Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy.

**Example:**

```
Device# show event manager history traps

No. Time Trap Type Name
1 Fri Sep 9 13:48:40 2005 server applet: four
2 Fri Sep 9 13:57:03 2005 policy script: no_snmp_test.tcl
```

---

**Displaying Software Modularity Process Reliability Metrics Using EEM**

Perform this optional task to display reliability metrics for Cisco IOS Software Modularity processes. The **show event manager metric processes** command is supported only in Software Modularity images.

**SUMMARY STEPS**

1. enable
2. show event manager metric process {all| process-name}

**DETAILED STEPS**

**Step 1**  
**enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2**  
**show event manager metric process {all| process-name}**
Use this command to display the reliability metric data for processes. The system keeps a record of when processes start and end, and this data is used as the basis for reliability analysis. In this partial example, the first and last entries showing the metric data for the processes on all the cards inserted in the system are displayed.

**Example:**

```
Device# show event manager metric process all

process name: devc-pty, instance: 1
sub_system id: 0, version: 00.00.0000
last event type: process start
recent start time: Fri Oct10 20:34:40 2005
recent normal end time: n/a
recent abnormal end time: n/a
number of times started: 1
number of times ended normally: 0
number of times ended abnormally: 0
most recent 10 process start times:
Fri Oct10  20:34:40 2005
most recent 10 process end times and types:
cumulative process available time: 6 hours 30 minutes 7 seconds 378 milliseconds
cumulative process unavailable time: 0 hours 0 minutes 0 seconds 0 milliseconds
process availability: 0.100000000
number of abnormal ends within the past 60 minutes (since reload): 0
number of abnormal ends within the past 24 hours (since reload): 0
number of abnormal ends within the past 30 days (since reload): 0

process name: cdp2.iosproc, instance: 1
sub_system id: 0, version: 00.00.0000
last event type: process start
recent start time: Fri Oct10 20:35:02 2005
recent normal end time: n/a
recent abnormal end time: n/a
number of times started: 1
number of times ended normally: 0
number of times ended abnormally: 0
most recent 10 process start times:
Fri Oct10  20:35:02 2005
most recent 10 process end times and types:
cumulative process available time: 6 hours 29 minutes 45 seconds 506 milliseconds
cumulative process unavailable time: 0 hours 0 minutes 0 seconds 0 milliseconds
process availability: 0.100000000
number of abnormal ends within the past 60 minutes (since reload): 0
number of abnormal ends within the past 24 hours (since reload): 0
number of abnormal ends within the past 30 days (since reload): 0
```
**Troubleshooting Tips**

Use the `debug event manager` command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution because the volume of output generated can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

**Modifying the Sample EEM Policies**

Perform this task to modify one of the sample policies. Cisco software contains some sample policies in the images that contain the Embedded Event Manager. Developers of EEM policies may modify these policies by customizing the event for which the policy is to be run and the options associated with logging and responding to the event. In addition, developers may select the actions to be implemented when the policy runs.

**Sample EEM Policies**

Cisco includes a set of sample policies shown in the table below. You can copy the sample policies to a user directory and then modify the policies, or you can write your own policies. Tcl is currently the only Cisco-supported scripting language for policy creation. Tcl policies can be modified using a text editor such as Emacs. Policies must execute within a defined number of seconds of elapsed time, and the time variable can be configured within a policy. The default is currently 20 seconds.

The table below describes the sample EEM policies.

**Table 194: Sample EEM Policy Descriptions**

<table>
<thead>
<tr>
<th>Name of Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pr_cdp_abort.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for</td>
</tr>
<tr>
<td></td>
<td>cdp2.iosproc process abort events. It will log a message to SYSLOG and send</td>
</tr>
<tr>
<td></td>
<td>an e-mail with the details of the abort.</td>
</tr>
<tr>
<td>pr_crash_reporter.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for</td>
</tr>
<tr>
<td></td>
<td>all process abort events. When an event occurs, the policy will send crash</td>
</tr>
<tr>
<td></td>
<td>information, including the crashdump file, to the specified URL where a CGI</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>configurable CLI command and e-mail the results.</td>
</tr>
<tr>
<td>tm_crash_history.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy runs at midnight</td>
</tr>
<tr>
<td></td>
<td>every day and e-mails a process crash history report to a specified e-mail</td>
</tr>
<tr>
<td></td>
<td>address.</td>
</tr>
</tbody>
</table>
### Name of Policy | Description
--- | ---
tm_crash_reporter.tcl | This policy runs 5 seconds after it is registered. If the policy is saved in the configuration, it will also run each time that the device is reloaded. The policy will prompt for the reload reason. If the reload was due to a crash, the policy will search for the latest crashinfo file and send this information to a specified URL location.
tm_fsys_usage.tcl | Introduced with Cisco Software Modularity images. This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message will be displayed if disk space usage crosses configurable thresholds.
wd_mem_reporter.tcl | Introduced with Cisco Software Modularity images. This policy reports on low system memory conditions when the amount of memory available falls below 20 percent of the initial available system memory. A syslog message will be displayed and, optionally, an e-mail will be sent.

For more details about the sample policies available and how to run them, see the EEM Event Detector Demo Examples, on page 1945.

### SUMMARY STEPS
1. enable
2. show event manager policy available detailed policy-filename
3. Cut and paste the contents of the sample policy displayed on the screen to a text editor.
4. Edit the policy and save it with a new filename.
5. Copy the new file back to the device flash memory.
6. configure terminal
7. event manager directory user {library path|policy path}
8. event manager policy policy-filename [{type {system|user}] [trap]}

### DETAILED STEPS

#### Step 1 enable
Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device> enable

#### Step 2 show event manager policy available detailed policy-filename
Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The detailed keyword was introduced for the show event manager policy available and the show event manager policy registered commands. Depending on your release, you may need to copy one of the two Tcl scripts from the configuration examples section in this document (see the Programming Policies with Tcl Sample Scripts Example, on page 1953). In the following example, details about the sample policy tm_cli_cmd.tcl are displayed on the screen.

**Example:**

Device# show event manager policy available detailed tm_cli_cmd.tcl
Step 3  Cut and paste the contents of the sample policy displayed on the screen to a text editor. Use the edit and copy functions to move the contents from the device to a text editor on another device.

Step 4  Edit the policy and save it with a new filename. Use the text editor to modify the policy as a Tcl script. For file naming conventions, see the Cisco File Naming Convention for EEM, on page 1915.

Step 5  Copy the new file back to the device flash memory. Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Configuration Fundamentals Configuration Guide. Copy the file to the flash file system on the device--typically bootflash:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Configuration Fundamentals Configuration Guide.

Step 6  configure terminal
Enters global configuration mode.

Example:

Device# configure terminal

Step 7  event manager directory user {library path|policy path}
Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on disk0 is specified as the directory for storing user library files. Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on bootflash is specified as the directory for storing user library files.

Example:

Device(config)# event manager directory user library disk0:/user_library
Device(config)# event manager directory user library bootflash:/user_library

Step 8  event manager policy policy-filename [type {system|user}] [trap]
Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named test.tcl is registered as a user-defined policy.

Example:

Device(config)# event manager policy test.tcl type user

---

Programming EEM Policies with Tcl

Perform this task to help you program a policy using Tcl command extensions. We recommend that you copy an existing policy and modify it. There are two required parts that must exist in an EEM Tcl policy: the event_register Tcl command extension and the body. All other sections shown in the Tcl Policy Structure and Requirements, on page 1930 concept are optional.
Tcl Policy Structure and Requirements

All EEM policies share the same structure, shown in the figure below. There are two parts of an EEM policy that are required: the event_register Tcl command extension and the body. The remaining parts of the policy are optional: environment must defines, namespace import, entry status, and exit status.

**Figure 142: Tcl Policy Structure and Requirements**

The start of every policy must describe and register the event to detect using an event_register Tcl command extension. This part of the policy schedules the running of the policy. The following example Tcl code shows how to register the event_register_timer Tcl command extension:

```tcl
::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240
```

The environment must defines section is optional and includes the definition of environment variables. The following example Tcl code shows how to check for, and define, some environment variables.

```tcl
# Check if all the env variables that we need exist.
# If any of them does not exist, print out an error msg and quit.
if {![info exists _email_server]} {
    set result \ "Policy cannot be run: variable _email_server has not been set"
    error $result $errorInfo
}
if {![info exists _email_from]} {
    set result \ "Policy cannot be run: variable _email_from has not been set"
    error $result $errorInfo
}
if {![info exists _email_to]} {
    set result \ "Policy cannot be run: variable _email_to has not been set"
    error $result $errorInfo
}
```

The namespace import section is optional and defines code libraries. The following example Tcl code shows how to configure a namespace import section.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

The body of the policy is a required structure and might contain the following:
• The `event_reqinfo` event information Tcl command extension that is used to query the EEM for information about the detected event.

• The action Tcl command extensions, such as `action_syslog`, that are used to specify EEM specific actions.

• The system information Tcl command extensions, such as `sys_reqinfo-routername`, that are used to obtain general system information.

• Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.

• The `context_save` and `context_retrieve` Tcl command extensions that are used to save Tcl variables for use by other policies.

The following example Tcl code shows the code to query an event and log a message as part of the body section.

```tcl
# Query the event info and log a message.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \\
    $_cerr_sub_num $_cerr_sub_err $_cerr posix_err $_cerr_str]
    error $result
}
global timer_type timer_time_sec
set timer_type $arr_einfo(timer_type)
set timer_time_sec $arr_einfo(timer_time_sec)
# Log a message.
set msg [format "timer event: timer type %s, time expired %s" \\
    $timer_type [clock format $timer_time_sec]]
action_syslog priority info msg $msg
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \\
    $_cerr_sub_num $_cerr_sub_err $_cerr posix_err $_cerr_str]
    error $result
}
```

EEM Entry Status

The entry status part of an EEM policy is used to determine if a prior policy has been run for the same event, and to determine the exit status of the prior policy. If the `_entry_status` variable is defined, a prior policy has already run for this event. The value of the `_entry_status` variable determines the return code of the prior policy.

Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

EEM Exit Status

When a policy finishes running its code, an exit value is set. The exit value is used by the Embedded Event Manager to determine whether or not to apply the default action for this event, if any. A value of zero means do not perform the default action. A value of nonzero means performs the default action. The exit status will be passed to subsequent policies that are run for the same event.
EEM Policies and Cisco Error Number

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable _cerrno. Whenever _cerrno is set, four other Tcl global variables are derived from _cerrno and are set along with it (_cerr_sub_num, _cerr_sub_err, _cerr_posix_err, and _cerr_str).

For example, the action_syslog command in the example below sets these global variables as a side effect of the command execution:

```tcl
action_syslog priority warning msg "A sample message generated by action_syslog"
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str] 
    error $result
}
```

_cerrno: 32-Bit Error Return Values

The _cerrno set by a command can be represented as a 32-bit integer of the following form:

```
XYSSSSSSSSSSSSSSSSSSSSSSSSSSSSS
```

For example, the following error return value might be returned from an EEM Tcl command extension:

```
862439AE
```

This number is interpreted as the following 32-bit value:

```
10000110001001100010110110
```

This 32-bit integer is divided up into the five variables shown in the table below.

Table 195: _cerrno: 32-Bit Error Return Value Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XY</td>
<td>The error class (indicates the severity of the error). This variable corresponds to the first two bits in the 32-bit error return value; 10 in the case above, which indicates CERR_CLASS_WARNING: See the table below for the four possible error class encodings specific to this variable.</td>
</tr>
<tr>
<td>SSSSSSSSSSSSS</td>
<td>The subsystem number that generated the most recent error (13 bits = 8192 values). This is the next 13 bits of the 32-bit sequence, and its integer value is contained in $_cerr_sub_num.</td>
</tr>
<tr>
<td>EEEEEEEEE</td>
<td>The subsystem specific error number (8 bits = 256 values). This segment is the next 8 bits of the 32-bit sequence, and the string corresponding to this error number is contained in $_cerr_sub_err.</td>
</tr>
<tr>
<td>PPPPPPPP</td>
<td>The pass-through POSIX error code (9 bits = 512 values). This represents the last of the 32-bit sequence, and the string corresponding to this error code is contained in $_cerr_posix_err.</td>
</tr>
</tbody>
</table>

Error Class Encodings for XY
The first variable, XY, references the possible error class encodings shown in the table below.

| CERR_CLASS_SUCCESS (00) | CERR_CLASS_INFO (01) | CERR_CLASS_WARNING (10) | CERR_CLASS_FATAL (11) |

Table 196: Error Class Encodings

An error return value of zero means SUCCESS.

**SUMMARY STEPS**

1. **enable**
2. **show event manager policy available detailed** *policy-filename*
3. Cut and paste the contents of the sample policy displayed on the screen to a text editor.
4. Define the required **event_register** Tcl command extension.
5. Add the appropriate namespace under the ::cisco hierarchy.
6. Program the must defines section to check for each environment variable that is used in this policy.
7. Program the body of the script.
8. Check the entry status to determine if a policy has previously run for this event.
9. Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.
10. Set Cisco Error Number (_errno) Tcl global variables.
11. Save the Tcl script with a new filename, and copy the Tcl script to the device.
12. **configure terminal**
13. **event manager directory user** *{library path} policy path*
14. **event manager policy** *policy-filename* *{type system|user}*[trap]*
15. Cause the policy to execute, and observe the policy.
16. Use debugging techniques if the policy does not execute correctly.

**DETAILED STEPS**

**Step 1** **enable**
Enables privileged EXEC mode. Enter your password if prompted.

*Example:*

Device> enable

**Step 2** **show event manager policy available detailed** *policy-filename*
Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The **detailed** keyword was introduced for the **show event manager policy available** and the **show event manager policy registered** commands. Depending on your release, you must copy one of the two Tcl scripts from the configuration examples section in this document (see the Programming Policies with Tcl Sample
Scripts Example, on page 1953). In the following example, details about the sample policy tm_cli_cmd.tcl are displayed on the screen.

**Example:**

Device# show event manager policy available detailed tm_cli_cmd.tcl

**Step 3** Cut and paste the contents of the sample policy displayed on the screen to a text editor.

Use the edit and copy functions to move the contents from the device to a text editor on another device. Use the text editor to edit the policy as a Tcl script.

**Step 4** Define the required event_register Tcl command extension.

Choose the appropriate event_register Tcl command extension from the table below for the event that you want to detect, and add it to the policy.

**Table 197: EEM Event Registration Tcl Command Extensions**

<table>
<thead>
<tr>
<th>Event Registration Tcl Command Extensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_register_appl</td>
</tr>
<tr>
<td>event_register_cli</td>
</tr>
<tr>
<td>event_register_counter</td>
</tr>
<tr>
<td>event_register_gold</td>
</tr>
<tr>
<td>event_register_interface</td>
</tr>
<tr>
<td>event_register_ioswdsysmon</td>
</tr>
<tr>
<td>event_register_ipsla</td>
</tr>
<tr>
<td>event_register_nf</td>
</tr>
<tr>
<td>event_register_none</td>
</tr>
<tr>
<td>event_register_oir</td>
</tr>
<tr>
<td>event_register_process</td>
</tr>
<tr>
<td>event_register_resource</td>
</tr>
<tr>
<td>event_register_rf</td>
</tr>
<tr>
<td>event_register_routing</td>
</tr>
<tr>
<td>event_register_rpc</td>
</tr>
<tr>
<td>event_register_snmp</td>
</tr>
<tr>
<td>event_register_snmp_notification</td>
</tr>
<tr>
<td>event_register_snmp_object</td>
</tr>
</tbody>
</table>
Event Registration Tcl Command Extensions

- event_register_syslog
- event_register_timer
- event_register_timer_subscriber
- event_register_track
- event_register_wdsysmon

**Step 5**

Add the appropriate namespace under the ::cisco hierarchy.

Policy developers can use the new namespace ::cisco in Tcl policies in order to group all the extensions used by Cisco IOS EEM. There are two namespaces under the ::cisco hierarchy, and the table below shows which category of EEM Tcl command extension belongs under each namespace.

**Table 198: Cisco IOS EEM Namespace Groupings**

<table>
<thead>
<tr>
<th>Namespace</th>
<th>Category of Tcl Command Extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>::cisco::eem</td>
<td>EEM event registration</td>
</tr>
<tr>
<td></td>
<td>EEM event information</td>
</tr>
<tr>
<td></td>
<td>EEM event publish</td>
</tr>
<tr>
<td></td>
<td>EEM action</td>
</tr>
<tr>
<td></td>
<td>EEM utility</td>
</tr>
<tr>
<td></td>
<td>EEM context library</td>
</tr>
<tr>
<td></td>
<td>EEM system information</td>
</tr>
<tr>
<td></td>
<td>CLI library</td>
</tr>
<tr>
<td>::cisco::lib</td>
<td>SMTP library</td>
</tr>
</tbody>
</table>

**Note**

Make sure that you import the appropriate namespaces or use the qualified command names when using the above commands.

**Step 6**

Program the must defines section to check for each environment variable that is used in this policy.

This is an optional step. Must defines are a section of the policy that tests whether any EEM environment variables that are required by the policy are defined before the recovery actions are taken. The must defines section is not required if the policy does not use any EEM environment variables. EEM environment variables for EEM scripts are Tcl global variables that are defined external to the policy before the policy is run. To define an EEM environment variable, use the Embedded Event Manager configuration command **event manager environment** CLI command. By convention all Cisco EEM environment variables begin with “_” (an underscore). In order to avoid future conflict, customers are urged not to define new variables that start with “_”.

**Note**

You can display the Embedded Event Manager environment variables set on your system by using the **show event manager environment** privileged EXEC command.
For example, Embedded Event Manager environment variables defined by the sample policies include e-mail variables. The sample policies that send e-mail must have the variables shown in the table below set in order to function properly. The table below describes the e-mail-specific environment variables used in the sample EEM policies.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| _email_server         | A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail. | The e-mail server name can be in any one of the following template formats:  
• username:password@host  
• username@host  
• host |
| _email_to             | The address to which e-mail is sent. | engineering@example.com |
| _email_from           | The address from which e-mail is sent. | devtest@example.com |
| _email_cc             | The address to which the e-mail must be copied. | manager@example.com |

The following example of a must define section shows how to program a check for e-mail-specific environment variables.

**Example of Must Defines**

**Example:**

```tcl
if {![info exists _email_server]} {
    set result "Policy cannot be run: variable _email_server has not been set"
    error $result $errorInfo
}

if {![info exists _email_from]} {
    set result "Policy cannot be run: variable _email_from has not been set"
    error $result $errorInfo
}

if {![info exists _email_to]} {
    set result "Policy cannot be run: variable _email_to has not been set"
    error $result $errorInfo
}

if {![info exists _email_cc]} {
    set result "Policy cannot be run: variable _email_cc has not been set"
    error $result $errorInfo
}
```

**Step 7** Program the body of the script.

In this section of the script, you can define any of the following:

- The `event_reqinfo` event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as `action_syslog`, that are used to specify EEM specific actions.
• The system information Tcl command extensions, such as `sys_reqinfo_routername`, that are used to obtain general system information.

• The `context_save` and `context_retrieve` Tcl command extensions that are used to save Tcl variables for use by other policies.

• Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.

**Step 8**
Check the entry status to determine if a policy has previously run for this event.

If the prior policy is successful, the current policy may or may not require execution. Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

**Step 9**
Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.

A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.

**Step 10**
Set Cisco Error Number (_cerrno) Tcl global variables.

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable _cerrno. Whenever _cerrno is set, four other Tcl global variables are derived from _cerrno and are set along with it (_cerr_sub_num, _cerr_sub_err, _cerr_posix_err, and _cerr_str).

For example, the `action_syslog` command in the example below sets these global variables as a side effect of the command execution:

**Example:**

```
action_syslog priority warning msg "$A sample message generated by action_syslog
if {${_cerrno} !- 0} {
    set result [format "$component=%s; subsys err=%s; posix err=%s;\n%s" 
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str
    error $result
}
```

**Step 11**
Save the Tcl script with a new filename, and copy the Tcl script to the device.

Embedded Event Manager policy filenames adhere to the following specification:

• An optional prefix--Mandatory.--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl_text.tcl.

• A filename body part containing a two-character abbreviation (see EEM Policies and Cisco Error Number, on page 1932) for the first event specified; an underscore character part; and a descriptive field part further identifying the policy.

• A filename suffix part defined as .tcl.

For more details, see the Cisco File Naming Convention for EEM, on page 1915.

Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Cisco IOS Configuration Fundamentals Configuration Guide.

Copy the file to the flash file system on the device--typically bootflash:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Cisco IOS Configuration Fundamentals Configuration Guide.

**Step 12**
```
configure terminal
```
Enters global configuration mode.

**Example:**

Device# configure terminal

**Step 13**  
**event manager directory user** `{library path} {policy path}

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on disk0 is specified as the directory for storing user library files.

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on bootflash is specified as the directory for storing user library files.

**Example:**

Device(config)# event manager directory user library disk0:/user_library

Device(config)# event manager directory user library bootflash:/user_library

**Step 14**  
**event manager policy** `{policy-filename} {type system} {user}] {trap}

Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named cl_mytest.tcl is registered as a user-defined policy.

**Example:**

Device(config)# event manager policy cl_mytest.tcl type user

**Step 15**  
Cause the policy to execute, and observe the policy.

To test that the policy runs, generate the conditions that will cause the policy to execute and observe that the policy runs as expected.

**Step 16**  
Use debugging techniques if the policy does not execute correctly.

Use the Cisco IOS **debug event manager** CLI command with its various keywords to debug issues. Refer to the **Troubleshooting Tips, on page 1938** for details about using Tcl-specific keywords.

---

**Troubleshooting Tips**

- Use the **debug event manager tcl commands** CLI command to debug issues with Tcl extension commands. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands they are passing to the CLI are valid.

- The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. Use the **debug event manager tcl cli-library** CLI command to debug issues with the CLI library.

- The SMTP library allows users to send e-mail messages to an SMTP e-mail server. Use the **debug event manager tcl smtp_library** CLI command to debug issues with the SMTP library. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands they are passing to the SMTP library are valid.
• Tcl is a flexible language that allows you to override commands. For example, you can modify the `set` command and create a version of the `set` command that displays a message when a scalar variable is set. When the `set` command is entered in a policy, a message is displayed anytime a scalar variable is set, and this provides a way to debug scalar variables. To view an example of this debugging technique, see the Tracing Tcl set Command Operations Example, on page 1964.

To view examples of the some of these debugging techniques, see the Debugging Embedded Event Manager Policies Examples, on page 1962.

Creating an EEM User Tcl Library Index

Perform this task to create an index file that contains a directory of all the procedures contained in a library of Tcl files. This task allows you to test library support in EEM Tcl. In this task, a library directory is created to contain the Tcl library files, the files are copied into the directory, and an index (`tclIndex`) is created that contains a directory of all the procedures in the library files. If the index is not created, the Tcl procedures will not be found when an EEM policy is run that references a Tcl procedure.

**SUMMARY STEPS**

1. On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.
2. `tclsh`
3. `auto_mkindex directory_name *.tcl`
4. Copy the Tcl library files and the `tclIndex` file to the directory used for storing user library files on the target device.
5. Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.
6. `enable`
7. `configure terminal`
8. `event manager directory user library path`
9. `event manager directory user policy path`
10. `event manager policy policy-name [type {system | user} [trap]]`
11. `event manager run policy-name`

**DETAILED STEPS**

**Step 1**
On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.

The following example files can be used to create a `tclIndex` on a workstation running the Tcl shell:

`lib1.tcl`

**Example:**

```tcl
proc test1 {} {
    puts "In procedure test1"
}

proc test2 {} {
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)
puts "In procedure test2"
}

lib2.tcl

Example:

proc test3 {} {
    puts "In procedure test3"
}

Step 2  tclsh

Use this command to enter the Tcl shell.

Example:

workstation% tclsh

Step 3  auto_mkindex  directory_name  *.tcl

Use the auto_mkindex command to create the tclIndex file. The tclIndex file that contains a directory of all the procedures contained in the Tcl library files. We recommend that you run auto_mkindex inside a directory because there can only be a single tclIndex file in any directory and you may have other Tcl files to be grouped together. Running auto_mkindex in a directory determines which tcl source file or files are indexed using a specific tclIndex.

Example:

workstation% auto_mkindex eem_library *.tcl

The following example TclIndex is created when the lib1.tcl and lib2.tcl files are in a library file directory and the auto_mkindex command is run.

tclIndex

Example:

# Tcl autoload index file, version 2.0
# This file is generated by the "auto_mkindex" command
# and sourced to set up indexing information for one or
# more commands. Typically each line is a command that
# sets an element in the auto_index array, where the
# element name is the name of a command and the value is
# a script that loads the command.

set auto_index(test1) [list source [file join $dir lib1.tcl]]
set auto_index(test2) [list source [file join $dir lib1.tcl]]
set auto_index(test3) [list source [file join $dir lib2.tcl]]

Step 4  Copy the Tcl library files and the tclIndex file to the directory used for storing user library files on the target device.

Step 5  Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl library support in EEM.

libtest.tcl

Example:

::cisco::eem::event_register_none
namespaces import ::cisco::eem::*
namespace import ::cisco::lib::*

global auto_index auto_path

puts [array names auto_index]

if { [catch {test1} result]} {
    puts "calling test1 failed result = $result $auto_path"
}

if { [catch {test2} result]} {
    puts "calling test2 failed result = $result $auto_path"
}

if { [catch {test3} result]} {
    puts "calling test3 failed result = $result $auto_path"
}

Step 6

enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 7

configure terminal

Enables global configuration mode.

Example:

Device# configure terminal

Step 8

event manager directory user library path

Use this command to specify the EEM user library directory; this is the directory to which the files were copied.

Example:

Device(config)# event manager directory user library disk2:/eem_library

Step 9

event manager directory user policy path

Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

Example:

Device(config)# event manager directory user policy disk2:/eem_policies

Step 10

event manager policy policy-name [type {system | user}] [trap]

Use this command to register a user-defined EEM policy. In this example, the policy named libtest.tcl is registered.

Example:

Device(config)# event manager policy libtest.tcl

Step 11

event manager run policy-name
Use this command to manually run an EEM policy. In this example, the policy named libtest.tcl is run to test the Tcl support in EEM. The example output shows that the test for Tcl support in EEM was successful.

**Example:**

```
Device(config)# event manager run libtest.tcl
The following output is displayed:
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test1
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test2
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test3
```

### Creating an EEM User Tcl Package Index

Perform this task to create a Tcl package index file that contains a directory of all the Tcl packages and version information contained in a library of Tcl package files. Tcl packages are supported, depending on your release, using the Tcl `package` keyword.

Tcl packages are located in either the EEM system library directory or the EEM user library directory. When a `package require` Tcl command is executed, the user library directory is searched first for a pkgIndex.tcl file. If the pkgIndex.tcl file is not found in the user directory, the system library directory is searched. In this task, a Tcl package directory--the pkgIndex.tcl file--is created in the appropriate library directory using the `pkg_mkIndex` command to contain information about all of the Tcl packages contained in the directory along with version information. If the index is not created, the Tcl packages will not be found when an EEM policy is run that contains a `package require` Tcl command.

Using the Tcl package support in EEM, users can gain access to packages such as XML_RPC for Tcl. When the Tcl package index is created, a Tcl script can easily make an XML-RPC call to an external entity.

---

**Note**

Packages implemented in C programming code are not supported in EEM.

---

### SUMMARY STEPS

1. On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.
2. `tclsh`
3. `pkg_mkindex  directory_name  *.tcl`
4. Copy the Tcl library files and the pkgIndex file to the directory used for storing user library files on the target device.
5. Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.
6. `enable`
7. `configure terminal`
8. `event manager directory user library  path`
9. `event manager directory user policy  path`
10. `event manager policy  policy-name [type {system | user} [trap]`
11. `event manager run  policy-name`
DETAILED STEPS

Step 1  On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.

Step 2  tclsh
Use this command to enter the Tcl shell.

Example:

workstation% tclsh

Step 3  pkg_mkindex  \directory_name  *.tcl
Use the pkg_mkindex command to create the pkgIndex file. The pkgIndex file contains a directory of all the packages contained in the Tcl library files. We recommend that you run pkg_mkindex inside a directory because there can only be a single pkgIndex file in any directory and you may have other Tcl files to be grouped together. Running pkg_mkindex in a directory determines which Tcl package file or files are indexed using a specific pkgIndex.

Example:

workstation% pkg_mkindex eem_library *.tcl

The following example pkgIndex is created when some Tcl package files are in a library file directory and the pkg_mkindex command is run.

pkgIndex

Example:

# Tcl package index file, version 1.1
# This file is generated by the "pkg_mkIndex" command
# and sourced either when an application starts up or
# by a "package unknown" script. It invokes the
# "package ifneeded" command to set up package-related
# information so that packages will be loaded automatically
# in response to "package require" commands. When this
# script is sourced, the variable $dir must contain the
# full path name of this file's directory.
package ifneeded xmlrpc 0.3 [list source [file join $dir xmlrpc.tcl]]

Step 4  Copy the Tcl library files and the pkgIndex file to the directory used for storing user library files on the target device.

Step 5  Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl package support in EEM.

package test.tcl

Example:

::cisco::eem::event_register_none maxrun 1000000.000
#
# test if xmlrpc available
#
#
# Namespace imports
# namespace import ::cisco::eem::*
# namespace import ::cisco::lib::*
# package require xmlrpc
puts "Did you get an error?"

Step 6 enable
Enables privileged EXEC mode. Enter your password if prompted.
Example:
Device> enable

Step 7 configure terminal
Enables global configuration mode.
Example:
Device# configure terminal

Step 8 event manager directory user library  path
Use this command to specify the EEM user library directory; this is the directory to which the files in were copied.
Example:
Device(config)# event manager directory user library disk2:/eem_library

Step 9 event manager directory user policy  path
Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.
Example:
Device(config)# event manager directory user policy disk2:/eem_policies

Step 10 event manager policy  policy-name [type {system | user} [trap]]
Use this command to register a user-defined EEM policy. In this example, the policy named packagetest.tcl is registered.
Example:
Device(config)# event manager policy packagetest.tcl

Step 11 event manager run  policy-name
Use this command to manually run an EEM policy. In this example, the policy named packagetest.tcl is run to test the Tcl package support in EEM.
Example:
Device(config)# event manager run packagetest.tcl
Configuration Examples for Writing Embedded Event Manager Policies Using Tcl

Assigning a Username for a Tcl Session Examples

The following example shows how to set a username to be associated with a Tcl session. If you are using authentication, authorization, and accounting (AAA) security and implement authorization on a command basis, you should use the `event manager session cli username` command to set a username to be associated with a Tcl session. The username is used when a Tcl policy executes a CLI command. TACACS+ verifies each CLI command using the username associated with the Tcl session that is running the policy. Commands from Tcl policies are not usually verified because the device must be in privileged EXEC mode to register the policy. In the example, the username is yourname, and this is the username that is used whenever a CLI command session is initiated from within an EEM policy.

```
configure terminal
  event manager session cli username yourname
end
```

EEM Event Detector Demo Examples

**EEM Sample Policy Descriptions**

This configuration example features some of the sample EEM policies:

- `ap_perf_test_base_cpu.tcl`--Is run to measure the the CPU performance of EEM policies.
- `no_perf_test_init.tcl`--Is run to measure the CPU performance of EEM policies.
- `sl_intf_down.tcl`--Is run when a configurable syslog message is logged. It executes up to two configurable CLI commands and e-mails the results.
- `tm_cli_cmd.tcl`--Is run using a configurable CRON entry. It executes a configurable CLI command and e-mails the results.
- `tm_crash_reporter.tcl`--Is run 5 seconds after it is registered and 5 seconds after the device boots up. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable `crash_reporter_url`.
- `tm_fsys_usage.tcl`--This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message is displayed if disk space usage crosses configurable thresholds.

**Event Manager Environment Variables for the Sample Policies**

Event manager environment variables are Tcl global variables that are defined external to the EEM policy before the policy is registered and run. The sample policies require three of the e-mail environment variables to be set; only `email_cc` is optional. Other required and optional variable settings are outlined in the following tables.
The table below describes the EEM environment variables that must be set before the `ap_perf_test_base_cpu.tcl` sample policy is run.

**Table 200: Environment Variables Used in the `ap_perf_test_base_cpu.tcl` Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_perf_iterations</td>
<td>The number of iterations over which to run the measurement.</td>
<td>100</td>

</thead>
<tbody>
<tr>
<td>_tm_fsys_usage_cron</td>
<td>A CRON specification that is used in the <em>event_register</em> Tcl command extension. If unspecified, the tm_fsys_usage.tcl policy is triggered once per minute. This variable is optional and need not be specified.</td>
<td>0-59/1 0-23/1 * * 0-7</td>
</tr>
<tr>
<td>_tm_fsys_usage_debug</td>
<td>When this variable is set to a value of 1, disk usage information is displayed for all entries in the system. This variable is optional and need not be specified.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Registration of Some EEM Policies

Some EEM policies must be unregistered and then reregistered if an EEM environment variable is modified after the policy is registered. The event_register_xxx statement that appears at the start of the policy contains some of the EEM environment variables, and this statement is used to establish the conditions under which the policy is run. If the environment variables are modified after the policy has been registered, the conditions may become invalid. To avoid any errors, the policy must be unregistered and then reregistered. The following variables are affected:

- _cron_entry_ in the tm_cli_cmd.tcl policy
- _syslog_pattern_ in the sl_intf_down.tcl policy

### Basic Configuration Details for All Sample Policies

To allow e-mail to be sent from the Embedded Event Manager, the **hostname** and **ip domain-name** commands must be configured. The EEM environment variables must also be set. After a Cisco IOS image has been booted, use the following initial configuration, substituting appropriate values for your network. The environment variables for the tm_fsys_usage sample policy (see the table above) are all optional and are not listed here:

```plaintext
hostname cpu
ip domain-name example.com
event manager environment _email_server ms.example.net
event manager environment _email_to username@example.net
event manager environment _email_from engineer@example.net
event manager environment _email_cc projectgroup@example.net
event manager environment _cron_entry 0-59/2 0-23/1 * * 0-7
event manager environment _show_cmd show event manager policy registered

### Using the Sample Policies

This section contains the following configuration scenarios to demonstrate how to use the some sample Tcl policies:

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>tm_fsys_usage_freebytes</em></td>
<td>Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed. This variable is optional and need not be specified.</td>
<td>disk2:98000000</td>
</tr>
<tr>
<td><em>tm_fsys_usage_percent</em></td>
<td>Disk usage percentage thresholds for systems or specific prefixes. If the disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems. This variable is optional and need not be specified.</td>
<td>nvram:25 disk2:5</td>
</tr>
</tbody>
</table>
Running the Mandatory.go_*.tcl Sample Policy

There are GOLD TCL scripts for each test which runs as a part of GOLD EEM Policy. You can modify the TCL script for the test, specify the consecutive failure count, and also change the default corrective action. For example, one could chose to power down a linecard card, instead of reset or other CLI based actions.

For each registered test, a default TCL script is available, which can be registered with the system, and matches with the default action. This can then be overridden by modifying these scripts.

The following table shows a list of the mandatory polices that GOLD installed into EEM. Each of the policies performs some sort of action such as resetting the card or disabling the port.

<table>
<thead>
<tr>
<th>GOLD Tcl Scripts</th>
<th>Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory.go_asicsync.tcl</td>
<td>TestAsicSync</td>
</tr>
<tr>
<td>Mandatory.go_bootup.tcl</td>
<td>Common for all bootup tests.</td>
</tr>
<tr>
<td>Mandatory.go_fabric.tcl</td>
<td>TestFabricHealth</td>
</tr>
<tr>
<td>Mandatory.go_fabrich0.tcl</td>
<td>TestFabricCh0Health</td>
</tr>
<tr>
<td>Mandatory.go_fabrich1.tcl</td>
<td>TestFabricCh1Health</td>
</tr>
<tr>
<td>Mandatory.go_ipsec.tcl</td>
<td>TestIPSecEncrypDecrypPkt</td>
</tr>
<tr>
<td>Mandatory.go_mac.tcl</td>
<td>TestMacNotification</td>
</tr>
<tr>
<td>Mandatory.go_nondislp.tcl</td>
<td>TestNonDisruptiveLoopback</td>
</tr>
<tr>
<td>Mandatory.go_scratchreg.tcl</td>
<td>TestScratchRegister</td>
</tr>
<tr>
<td>Mandatory.go_sprping.tcl</td>
<td>TestSPRPInbandPing</td>
</tr>
</tbody>
</table>

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the mandatory.go_*.tcl policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy Mandatory.go_spuriousisr.tcl
end
show event manager policy registered
show event manager environment
```

Running the ap_perf_test_base_cpu.tcl and no_perf_test_init.tcl Sample Policies

These sample policies measures the CPU performance of EEM policies. The policies help find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables _perf_cmd1 and, optionally, _perf_cmd2 and _perf_cmd3.
The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, enter the `service timestamps debug datetime msec` command and then you can register the `ap_perf_test_base_cpu.tcl` and `no_perf_test_init.tcl` policies with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

The policies `ap_perf_test_base_cpu.tcl` and `no_perf_test_init.tcl` need to be registered together, as they run as a test suite. You can run the `no_perf_test_init.tcl` policy to start the tests. Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable `_perf_iterations`. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```
enable
show event manager policy registered
show event manager policy available
show event manager environment
configure terminal
  service timestamps debug datetime msec
  event manager environment _perf_iterations 100
  event manager policy ap_perf_test_base_cpu.tcl
  event manager policy no_perf_test_init.tcl
end
show event manager policy registered
show event manager policy available
show event manager environment
event manager run no_perf_test_init.tcl
```

**Running the no_perf_test_init.tcl Sample Policy**

This sample policy measures the the cpu performance of EEM policies. The policy helps to find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables `_perf_cmd1` and, optionally, `_perf_cmd2` and `_perf_cmd3`.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the `no_perf_test_init.tcl` policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable `_perf_iterations`. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy no_perf_test_init.tcl
end
```
show event manager policy registered
show event manager environment

Running the sl_intf_down.tcl Sample Policy

This sample policy demonstrates the ability to modify the configuration when a syslog message with a specific pattern is logged. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variables _config_cmd1 and, optionally, _config_cmd2. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the enable command at the device prompt. The device enters privileged EXEC mode, where you can enter the show event manager policy registered command to verify that no policies are currently registered. The next command is the show event manager policy available command to display which policies are available to be installed. After you enter the configure terminal command to reach global configuration mode, you can register the sl_intf_down.tcl policy with EEM using the event manager policy command. Exit from global configuration mode and enter the show event manager policy registered command again to verify that the policy has been registered.

The policy runs when an interface goes down. Enter the show event manager environment command to display the current environment variable values. Unplug the cable (or configure a shutdown) for the interface specified in the _syslog_pattern EEM environment variable. The interface goes down, prompting the syslog daemon to log a syslog message about the interface being down, and the syslog event detector is called.

The syslog event detector reviews the outstanding event specifications and finds a match for interface status change. The EEM server is notified, and the server runs the policy that is registered to handle this event--sl_intf_down.tcl.

enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy sl_intf_down.tcl
end
show event manager policy registered
show event manager environment

Running the tm_cli_cmd.tcl Sample Policy

This sample policy demonstrates the ability to periodically execute a CLI command and to e-mail the results. The CRON specification “0-59/2 0-23/1 * * 0-7” causes this policy to be run on the second minute of each hour. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variable _show_cmd. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the enable command at the device prompt. The device enters privileged EXEC mode where you can enter the show event manager policy registered command to verify that no policies are currently registered. The next command is the show event manager policy available command to display which policies are available to be installed. After you enter the configure terminal command to reach global configuration mode, you can register the tm_cli_cmd.tcl policy with EEM using the event manager policy command. Exit from global configuration mode and enter the show event manager policy registered command to verify that the policy has been registered.

enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_cli_cmd.tcl
end
show event manager policy registered
show event manager environment
The timer event detector triggers an event for this case periodically according to the CRON string set in the EEM environment variable _cron_entry. The EEM server is notified, and the server runs the policy that is registered to handle this event--tm_cli_cmd.tcl.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_cli_cmd.tcl
end
show event manager policy registered
```

**Running the tm_crash_reporter.tcl Sample Policy**

This sample policy demonstrates the ability to send an HTTP-formatted crash report to a URL location. If the policy registration is saved in the startup configuration file, the policy is triggered 5 seconds after bootup. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable _crash_reporter_url. A CGI script, interface_tm.cgi, has been created to receive the URL from the tm_crash_reporter.tcl policy and save the crash information in a local database on the target URL machine.

A Perl CGI script, interface_tm.cgi, has been created and is designed to run on a machine that contains an HTTP server and is accessible by the device that runs the tm_crash_reporter.tcl policy. The interface_tm.cgi script parses the data passed into it from tm_crash_reporter.tcl and appends the crash information to a text file, creating a history of all crashes in the system. Additionally, detailed information on each crash is stored in three files in a crash database directory that is specified by the user. Another Perl CGI script, crash_report_display.cgi, has been created to display the information stored in the database created by the interface_tm.cgi script. The crash_report_display.cgi script should be placed on the same machine that contains interface_tm.cgi. The machine should be running a web browser such as Internet Explorer or Netscape. When the crash_report_display.cgi script is run, it displays the crash information in a readable format.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the tm_crash_reporter.tcl policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command to verify that the policy has been registered.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_crash_reporter.tcl
end
show event manager policy registered
```

**Running the tm_fsys_usage.tcl Sample Policy**

This sample policy demonstrates the ability to periodically monitor disk space usage and report through syslog when configurable thresholds have been crossed.
The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the `tm_fsys_usage.tcl` policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered. If you had configured any of the optional environment variables that are used in the `tm_fsys_usage.tcl` policy, the `show event manager environment` command displays the configured variables.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_fsys_usage.tcl
end
show event manager policy registered
show event manager environment
```

**Programming Policies with Tcl Sample Scripts Example**

This section contains some of the sample policies that are included as EEM system policies. For more details about these policies, see the EEM Event Detector Demo Examples, on page 1945.

**Mandatory.go_ipsec.tcl Sample Policy**

The following sample policy for the TestIPSecEncrypDecrypPkt Test.

```
::cisco::eem::event_register_gold card all testing_type monitoring test_name TestIPSecEncrypDecrypPkt consecutive_failure 6 platform_action 0 queue_priority last
#
# GOLD TestIPSecEncrypDecrypPkt Test TCL script
#
# March 2005, Hai Qiu
#
# Copyright (c) 2005-2007 by cisco Systems, Inc.
# All rights reserved.
#
# Register for TestIPSecEncrypDecrypPkt test even
# the elements for register the event
# card [all | card #]
# sub_card [all | sub_card #]
# severity_major | severity_minor | severity_normal default : severity_normal
# new_failure [true | false] default: dont_care
# testing_type [bootup | ondemand | schedule | monitoring]
# test_name [ test name ]
# test_id [ test # ]
# consecutive_failure [ consecutive_failure # ]
# platform_action [action_flag]
# action_flag [ 0 | 1 | 2 ]
# queue_priority [ normal | low | high | last ] default: normal
#
# Note:
# 1: "card" element is required. If other elements are not specified,
# treat them as dont care, or default.
```
# 2: action_flag is platform specific. It is up to platform to
determine what action need to be taken based on the value
For Cat6k platform
  # action_flag 0 : TCL script take action to reset card
  # action_flag 1 : TCL script doesn't take action to reset card
  # action_flag 2 : TCL script takes action to reset card for bootup diag
    when there is major error
  # action_flag 3 : TCL script doesn't take action to reset card for
    bootup diag when there is major error

# 3: "queue_priority last" would guarantee this policy will be executed last
  if there are other EEM events in queue with queue priority other
  than "last"

namespace import ::cisco::eem::*

ap_perf_test_base_cpu.tcl Sample Policy

The following sample policy measures the CPU performance of EEM policies.

::cisco::eem::event_register_appl sub_system 798 type 9999
#-----------------------------
# EEM policy used for measuring the cpu performance of EEM policies.
# July 2005, Cisco EEM team
# Copyright (c) 2005, 2006 by cisco Systems, Inc.
# All rights reserved.
#------------------
### Input arguments:
### arg1 $iter - current iteration count
### The following EEM environment variables are used:
### _perf_iterations (mandatory) - number of iterations over which we
### will run our measurement.
### Example:
### event manager environment _perf_iterations 100
### _perf_cmd1 (optional) - optional non interactive cli command
### to be executed as part of the
### measurement test.
### Example:
### event manager environment _perf_cmd1 enable
### _perf_cmd2 (optional) - optional non interactive cli command
### to be executed as part of the
### measurement test.
### To use _perf_cmd2, _perf_cmd1 MUST
### be defined.
### Example:
### event manager environment _perf_cmd2 show ver
### _perf_cmd3 (optional) - optional non interactive cli command
### to be executed as part of the
### measurement test.
### To use _perf_cmd3, _perf_cmd1 MUST
### be defined.
### Example:
### event manager environment _perf_cmd3 show int counters protocol status
### Description:
### Iterate through _perf_iterations of this policy.
### It is up to the user to calculate the average
### execution time based on the system timestamps.
### Optional commands _perf_cmd1,
### _perf_cmd2 and _perf_cmd3 are executed if defined.
### A value of 100 is a good starting point.
### Outputs:
### Console output.
### Usage example:
### >conf t
### >service timestamps debug datetime msec
### >event manager environment _perf_iterations 100
### >event manager policy ap_perf_base_cpu.tcl
### >event manager policy no_perf_test_init.tcl
### >end
### 2d19h: %SYS-5-CONFIG_I: Configured from console by console
### >event manager run no_perf_test_init.tcl
### Oct 16 14:57:17.284: %SYS-5-CONFIG_I: Configured from console by console
### >event manager run no_perf_test_init.tcl
### Oct 16 19:32:02.772: %HA_EM-6-LOG:
### eem_policy/no_perf_test_init.tcl: EEM performance test start
### Oct 16 19:32:03.115: %HA_EM-6-LOG:
The user must calculate execution time and average time of execution.

In this example, total time = 19:32:36.936 - 19:32:02.772 = 34.164
Average script execution time = 341.64 milliseconds

# check if all the env variables we need exist

---

**tm_cli_cmd.tcl Sample Policy**

The following sample policy runs a configurable CRON entry. The policy executes a configurable Cisco IOS CLI command and e-mails the results. An optional log file can be defined to which the output is appended with a timestamp.

::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240

# EEM policy that will periodically execute a cli command and email the results to a user.
# July 2005, Cisco EEM team
# Copyright (c) 2005 by cisco Systems, Inc.
# All rights reserved.
### The following EEM environment variables are used:
###
### _cron_entry (mandatory) - A CRON specification that determines when the policy will run. See the IOS Embedded Event Manager documentation for more information on how to specify a cron entry.
### Example: _cron_entry
0-59/1 0-23/1 * * 0-7

### _log_file (mandatory without _email_...)
- A filename to append the output to.
- If this variable is defined, the output is appended to the specified file with a timestamp added.
- Example: _log_file
  bootflash:/my_file.log

### _email_server (mandatory without _log_file)
- A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.
- Example: _email_server
  mailserver.example.com

### _email_from (mandatory without _log_file)
- The address from which e-mail is sent.
- Example: _email_from
  devtest@example.com

### _email_to (mandatory without _log_file)
- The address to which e-mail is sent.
  engineering@example.com

### _email_cc (optional) - The address to which the e-mail must be copied.
- Example: _email_cc
  manager@example.com

### _show_cmd (mandatory) - The CLI command to be executed when the policy is run.
- Example: _show_cmd
  show version

# check if all required environment variables exist
# If any required environment variable does not exist, print out an error msg and quit

sl_intf_down.tcl Sample Policy

The following sample policy runs when a configurable syslog message is logged. The policy executes a configurable CLI command and e-mails the results.

```
::cisco::eem::event_register_syslog occurs 1 pattern $_syslog_pattern maxrun 90
# EEM policy to monitor for a specified syslog message.
# Designed to be used for syslog interface-down messages.
# When event is triggered, the given config commands will be run.
#
# July 2005, Cisco EEM team
#
# Copyright (c) 2005 by cisco Systems, Inc.
# All rights reserved.

### The following EEM environment variables are used:
###
### _syslog_pattern (mandatory) - A regular expression pattern match string
### that is used to compare syslog messages
### to determine when policy runs
### Example: _syslog_pattern .*UPDOWN.*FastEthernet0/0.*
###
### _email_server (mandatory) - A Simple Mail Transfer Protocol (SMTP)
### mail server used to send e-mail.
### Example: _email_server mailserver.example.com
###
### _email_from (mandatory) - The address from which e-mail is sent.
### Example: _email_from devtest@example.com
###
### _email_to (mandatory) - The address to which e-mail is sent.
### Example: _email_to engineering@example.com
###
### _email_cc (optional) - The address to which the e-mail must
### be copied.
### Example: _email_cc manager@example.com
##
### _config_cmd1 (optional) - The first configuration command that
### is executed.
### Example: _config_cmd1 interface Ethernet1/0
###
### _config_cmd2 (optional) - The second configuration command that
### is executed.
### Example: _config_cmd2 no shutdown
##

# check if all the env variables we need exist
# If any of them doesn't exist, print out an error msg and quit
if {![info exists _email_server]} {

    error $result $errorInfo
}
if [catch {smtp_send_email $result} result] {
    error $result $errorInfo
}

The following e-mail template file is used with the EEM sample policy above:

email_template_cfg.tm
Mailservername: $_email_server
From: $_email_from
To: $_email_to
Cc: $_email_cc
Subject: From router $routername: Periodic $show_cmd Output
$cmd_output

**Debugging Embedded Event Manager Policies Examples**

The following examples show how to debug the CLI library and the SMTP library.

**Debugging the CLI Library**

The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. An Embedded Event Manager **debug** command has been provided for users of this library. The command to enable CLI library debugging is **debug event manager tcl cli_library**. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands that they are passing to the CLI are valid.

**Example of the debug event manager tcl cli_library Command**

This example uses the sample policy sl_intf_down.tcl. When triggered, sl_intf_down.tcl passes a configuration command to the CLI through the CLI library. The command passed in below is **show event manager environment**. This command is not a valid command in configuration mode. Without the **debug** command enabled, the output is shown below:

```
00:00:57:sl_intf_down.tcl[0]:config_cmds are show eve man env
00:00:57:%SYS-5-CONFIG_I:Configured from console by vty0
```

Notice that with the output above the user would not know whether or not the command succeeded in the CLI. With the **debug event manager tcl cli_library** command enabled, the user sees the following:

```
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : CTL : cli_open called.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson>
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson>enable
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#
```
The output above shows that `show event manager environment` is an invalid command in configuration mode. The IN keyword signifies all data passed in to the TTY through the CLI library. The OUT keyword signifies all data read back from the TTY through the CLI library. The CTL keyword signifies helper functions used in the CLI library. These helper functions are used to set up and remove connections to the CLI.

### Debugging the SMTP Library

The SMTP library allows users to send e-mail messages to an SMTP e-mail server. An Embedded Event Manager `debug` command has been provided for users of this library. The command to enable SMTP library debugging is `debug event manager tcl smtp_library`. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands that they are passing to the SMTP library are valid.

#### Example of the `debug event manager tcl smtp_library` Command

This example uses the sample policy `tm_cli_cmd.tcl`. When triggered, `tm_cli_cmd.tcl` runs the command `show event manager policy available system` through the CLI library. The result is then mailed to a user through the SMTP library. The output will help debug any issues related to using the SMTP library.

With the `debug event manager tcl smtp_library` command enabled, the users see the following on the console:

```plaintext
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 220 XXXX.example.com ESMTP XXXX 1.1.0; Tue, 25 Jun 2002 14:30:02 -0700 (PDT)
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : HELO XXXX.example.com
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 250 XXXX.example.com Hello XXXX.example.com [XXXX], pleased to meet you
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : MAIL FROM:<XX@example.com>
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 250 <XX@example.com>... Sender ok
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : RCPT TO:<XX@example.com>
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 250 <XX@example.com>... Recipient ok
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : DATA
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 354 Enter mail, end with "." on a line by itself
00:39:45: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : Date: 25 Jun 2002 14:35:00 UTC
```
Tracing Tcl set Command Operations Example

Tcl is a flexible language. One of the flexible aspects of Tcl is that you can override commands. In this example, the `Tcl set` command is renamed as `_set` and a new version of the `set` command is created that displays a message containing the text “setting” and appends the scalar variable that is being set. This example can be used to trace all instances of scalar variables being set.

```tcl
rename set _set
proc set {var args} {
    puts [list setting $var $args]
    uplevel _set $var $args
};
```

When this is placed in a policy, a message is displayed anytime a scalar variable is set, for example:

```
02:17:58: sl_intf_down.tcl[0]: setting test_var 1
```

RPC Event Detector Example

```tcl
TCL script (rpccli.tcl):
::cisco::eem::event_register_rpc
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
proc run_cli { clist } {
    set rbuf ""
    if { [llength $clist] < 1 } {
        return -code ok $rbuf
    } if ![catch {cli_open} result] {
        return -code error $result
    }
```
) else {
    array set cliarr $result
} else {
    array set cliarr $result
    if {{catch {cli_exec $cliarr(fd) "enable"} result}} {
        return -code error $result
    }
    if {{catch {cli_exec $cliarr(fd) "term length 0"} result}} {
        return -code error $result
    }
    foreach cmd $clist {
        if {{catch {cli_exec $cliarr(fd) $cmd} result}} {
            return -code error $result
        }
        append rbuf $result
    }
    if {{catch {cli_close $cliarr(fd) $cliarr(tty_id)} result}} {
        puts "WARNING: $result"
    }
    return -code ok $rbuf
}
proc run_cli_interactive { clist } {
    set rbuf ""
    if {{{llength $clist] < 1]}} {
        return -code ok $rbuf
    }
    if {{catch {cli_open} result}} {
        return -code error $result
    } else {
        array set cliarr $result
    }
    if {{catch {cli_exec $cliarr(fd) "enable"} result}} {
        return -code error $result
    }
    if {{catch {cli_exec $cliarr(fd) "term length 0"} result}} {
        return -code error $result
    }
    foreach cmd $clist {
        array set sendexp $cmd
        if {{catch {cli_write $cliarr(fd) $sendexp(send)} result}} {
            return -code error $result
        }
        foreach response $sendexp(responses) {
            array set resp $response
            if {{catch {cli_read_pattern $cliarr(fd) $resp(expect) result}} {
                return -code error $result
            } if {{catch {cli_write $cliarr(fd) $resp(reply) result}} {
                return -code error $result
            }
        }
        if {{catch {cli_read $cliarr(fd)} result}} {
            return -code error $result
        }
        append rbuf $result
    }
    if {{catch {cli_close $cliarr(fd) $cliarr(tty_id)} result}} {
        puts "WARNING: $result"
    }
    return -code ok $rbuf
}
array set arr_einfo [event_reqinfo]
set args $arr_einfo(argc)
set cmds [list]
for { set i 0 } { $i < $args } { incr i } {

Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI
Signed Tcl Scripts

The Signed Tcl Scripts feature allows you to create a certificate to generate a digital signature and sign a Tool Command Language (Tcl) script with that digital signature. This feature also allows you to work with existing scripts and certificates. The digital signature is verified for authentication and then run with trusted access to the Tcl interpreter. If the script does not contain the digital signature, the script may run in a limited mode for untrusted scripts, or may not run at all.

- Prerequisites for Signed Tcl Scripts, on page 1969
- Restrictions for Signed Tcl Scripts, on page 1969
- Information About Signed Tcl Scripts, on page 1970
- How to Configure Signed Tcl Scripts, on page 1971
- Configuration Examples for Signed Tcl Script, on page 1984
- Additional References, on page 1988
- Feature Information for Signed Tcl Scripts, on page 1989
- Glossary, on page 1989
- Notices, on page 1990

Prerequisites for Signed Tcl Scripts

For this feature to work, the Cisco public key infrastructure (PKI) configuration trustpoint commands must be enabled.

Restrictions for Signed Tcl Scripts

For this feature to work, you must be running the following:

- Cisco IOS Crypto image
- OpenSSL Version 0.9.7a or above
- Expect
Information About Signed Tcl Scripts

The Signed Tcl Scripts feature introduces security for the Tcl scripts. This feature allows you to create a certificate to generate a digital signature and sign a Tcl script with that digital signature. This certificate examines the Tcl scripts prior to running them. The script is checked for a digital signature from Cisco. In addition, third parties may also sign a script with a digital signature. You may wish to sign your own internally developed Tcl scripts or you could use a script developed by a third party. If the script contains the correct digital signature, it is believed to be authentic and runs with full access to the Tcl interpreter. If the script does not contain the digital signature, the script may be run in a limited mode, known as Safe Tcl mode, or may not run at all.

To create and use signed Tcl scripts, you should understand the following concepts:

Cisco PKI

Cisco PKI provides certificate management to support security protocols such as IP security (IPsec), secure shell (SSH), and secure socket layer (SSL). A PKI is composed of the following entities:

- Peers communicating on a secure network
- At least one certification authority (CA) that grants and maintains certificates
- Digital certificates, which contain information such as the certificate validity period, peer identity information, encryption keys that are used for secure communication, and the signature of the issuing CA
- An optional registration authority (RA) to offload the CA by processing enrollment requests
- A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides you with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every routing device participating in the secured communication is enrolled in the PKI in a process where the routing device generates a Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has its identity validated by a trusted routing device (also known as a CA or trustpoint).

After each routing device enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

RSA Key Pair

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data that is sent to the device. The private key is kept on the device and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.
RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

Certificate and Trustpoint

A certification authority (CA), also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an internal CA, which is the Cisco Certificate Server.

How to Configure Signed Tcl Scripts

Generating a Key Pair

The key pair consists of a private key and a public key. The private key is intended to be kept private, accessible only to the creator. The public key is generated from the private key and is intended to be known to the public.

To generate a key pair, use the `openssl genrsa` command and then the `openssl rsa` command.

**SUMMARY STEPS**

1. `openssl genrsa -out private-key-file bit-length`
2. `ls -l`
3. `openssl rsa -in private-key-file -pubout -out public-key-file`
4. `ls -l`

**DETAILED STEPS**

**Step 1**

```plaintext
openssl genrsa -out private-key-file bit-length
```

This command generates a private key that is `bit-length` bits long and writes the key to the `private-key-file` file.

**Example:**

```
Host% openssl genrsa -out privkey.pem 2048
```

Generating RSA private key, 2048 bit long modulus
.................................................................
............
e is 65537 (0x10001)

**Step 2**

```plaintext
ls -l
```

**Example:**

```
-rw-r--r-- 1 user user 2048 May 31 15:32 privkey.pem
```
Generating a Certificate

Perform this task to generate a certificate. To generate an X.509 certificate, use the `openssl req` command.

**SUMMARY STEPS**

1. `openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`
2. `ls -l`

**DETAILED STEPS**

**Step 1**

`openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`

This command creates an X.509 certificate, with full access to a private key that is stored in the `private-key-file` file, and stores the certificate in the `certificate-file` file. The certificate is configured to expire in `expiration-days` days.
To complete the command, enter the following Distinguished Name (DN) information when prompted:

- Country name
- State or province name
- Organization name
- Organizational unit name
- Common name
- Email address

At each prompt, text enclosed in square brackets indicates the default value that will be used if you do not enter a value before you press Enter.

This example shows how to create an X.509 certificate that has full access to the private key in the privkey.pem file. The certificate is written to the cert.pem file and will expire 1095 days after the creation date.

**Example:**

```
Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
```

You are about to be asked to enter information that will be incorporated into your certificate request.

What you are about to enter is what is called a Distinguished Name or a DN. There are quite a few fields but you can leave some blank.

For some fields there will be a default value. If you enter '.', the field will be left blank.

-----

Country Name (2 letter code) [GB]: US
State or Province Name (full name) [Berkshire]: California
Locality Name (eg, city) [Newbury]: San Jose
Organization Name (eg, company) [My Company Ltd]: Cisco Systems, Inc.
Organizational Unit Name (eg, section) []: DEPT_ACCT
Common Name (eg, your name or your server's hostname) []: Jane
Email Address []: janedoe@company.com

**Step 2**

```
ls -l
```

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The cert.pem file contains the X.509 certificate created using the **openssl req** command.
Signing the Tcl Scripts

Perform this task to sign the Tcl scripts. You will need to sign the Tcl file and output in OpenSSL document in pkcs7 (PKCS#7) format.

To sign the Tcl file, use the `openssl smime` command with the `-sign` keyword.

**SUMMARY STEPS**

1. `openssl smime -sign -in tcl-file -out signed-tcl-file -signer certificate-file -inkey private-key-file -outform DER -binary`
2. `ls -l`

**DETAILED STEPS**

**Step 1**

`openssl smime -sign -in tcl-file -out signed-tcl-file -signer certificate-file -inkey private-key-file -outform DER -binary`

This command signs the Tcl filename `tcl-file` using the certificate stored in `certificate-file` and the private key stored in `private-key-file` file and then writes the signed Tcl file in DER PKCS#7 format to the `signed-tcl-file` file.

*Example:*

Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary

**Step 2**

`ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

*Example:*

Host% ls -l

```bash
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `hello.pk7` file contains the signed Tcl file created by the `openssl smime` command from the unsigned Tcl file named `hello` and using the X.509 certificate in the `cert.pem` file.

---

**Verifying the Signature**

Perform this task to verify that the signature matches the data, use the `openssl smime` command with the `-verify` keyword. The original Tcl content must be provided in the input file, because the file does not have the original content.
**SUMMARY STEPS**

1. `openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file`

2. `ls -l`

**DETAILED STEPS**

**Step 1**
`openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file`

This command verifies the signed Tcl file stored in DER PKCS#7 format in `signed-tcl-file` using the trusted Certificate Authority (CA) certificates in `certificate-file` and then writes the detached content to the file `tcl-file`.

The following example shows how to verify the signature with the input file `hello.pk7`:

**Example:**

```
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
```

```
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful
```

**Note**

The SSL command page describes `-in filename` as the input message to be encrypted or signed or the MIME message to be decrypted or verified. For more information, go to [http://www.openssl.org/](http://www.openssl.org/).

**Step 2**
`ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `hello` file contains the content detached from the signed Tcl file `hello.pk7` by running the `openssl smime` command with the `-verify` keyword. If the verification was successful, the signer’s certificates are written to the X.509 certificate in the `cert.pem` file.

---

**Converting the Signature into Nonbinary Data**

Perform this task to convert the signature from binary to nonbinary data.
SUMMARY STEPS

1. **xxd** -ps **signed-tcl-file** > **nonbinary-signature-file**

2. Create a script that displays **#Cisco Tcl Signature V1.0** in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “_sig” to the name of the input file.

3. Run the script, supplying the name of the file containing the nonbinary signature file (**nonbinary-signature-file**) as the input argument.

4. **ls** -l

5. **cat** **signed-tcl-file** **commented-nonbinary-signature-file** > **signed-tcl-script**

6. **cat** **signed-tcl-script**

DETAILED STEPS

---

**Step 1**

**xxd** -ps **signed-tcl-file** > **nonbinary-signature-file**

This command converts the signature in **signed-tcl-file** from binary to nonbinary data and stores it as a hexadecimal dump in the file **nonbinary-signature-file**.

**Example:**

Host% **xxd** -ps **hello.pk7** > **hello.hex**

**Step 2**

Create a script that displays **#Cisco Tcl Signature V1.0** in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “_sig” to the name of the input file.

In this example the **cat** command is used to display the contents of the script file named **my_append**.

**Example:**

Host% **cat** **my_append**

```
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {} 
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
    set new_line (#)
    append new_line $line
    puts $my_new_handle $new_line
}
close $my_new_handle
close $my_handle
```

**Step 3**

Run the script, supplying the name of the file containing the nonbinary signature file (**nonbinary-signature-file**) as the input argument.

In this example, the **my_append** script is run with the nonbinary signature file **hello.hex** specified as input. The output file will be named **hello.hex_sig**.
Example:

```
Host% my_append hello.hex
```

**Step 4**

**ls -l**

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
-rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.hex_sig
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rwxr--r-- 1 janedoe eng12 444 Jun 13 10:22 my_append
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `hello.hex` file contains nonbinary data (stored as a hexadecimal dump) converted from the binary signature in the signed Tcl file `hello.pk7`. The `my_append` file contains the script that inserts a comment character at the beginning of each line of the input file. The `hello.hex_sig` file is the file created by running the `my_append` script on the nonbinary signature file.

**Step 5**  
**cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script**

This command appends the contents of the nonbinary signature file (`commented-nonbinary-signature-file`) to the signed Tcl file stored in DER PKCS#7 format (in the `signed-tcl-file` file). The concatenated output is written to the file `signed-tcl-script`.

**Example:**

```
Host% cat hello hello.hex_sig > hello.tcl
```

**Step 6**  
**cat signed-tcl-script**

This command displays the contents of the file `signed-tcl-script`, which is the concatenation of content detached from the signed Tcl file and the nonbinary signature file.

**Example:**

```
Host% cat hello.tcl
```

```
puts hello
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = "$tcl_interactive"
#Cisco Tcl Signature V1.0

```
Configuring the Device with a Certificate

Perform this task to configure the device with a certificate.
Before you begin

You must already have a Cisco IOS Crypto image; otherwise you cannot configure a certificate.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki trustpoint name
4. enrollment terminal
5. exit
6. crypto pki authenticate name
7. At the prompt, enter the base-encoded CA certificate.
8. scripting tcl secure-mode
9. scripting tcl trustpoint name name
10. scripting tcl trustpoint untrusted {execute | safe-execute | terminate}
11. exit
12. tclsafe

DETAILED STEPS

Step 1  enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2  configure terminal

Enters global configuration mode.

Example:

Device# configure terminal

Step 3  crypto pki trustpoint name

Declares the device is to use the Certificate Authority (CA) mytrust and enters ca-trustpoint configuration mode.

Example:

Device(config)# crypto pki trustpoint mytrust

Step 4  enrollment terminal

Specifies manual cut-and-paste certificate enrollment. When this command is enabled, the device displays the certificate request on the console terminal, allowing you to enter the issued certificate on the terminal.

Example:

Device(ca-trustpoint)# enrollment terminal
Configuring the Device with a Certificate

**Step 5** exit

Exits ca-trustpoint configuration mode and returns to global configuration mode.

**Example:**

```
Device(ca-trustpoint)# exit
```

**Step 6** crypto pki authenticate *name*

Retrieves the CA certificate and authenticates it. Check the certificate fingerprint if prompted.

**Note** Because the CA signs its own certificate, you should manually authenticate the public key of the CA by contacting the CA administrator when you perform this command.

**Example:**

```
Device(config)# crypto pki authenticate mytrust
```

**Step 7**

At the prompt, enter the base-encoded CA certificate.

**Example:**

```
Enter the base 64 encoded CA certificate.
End with a blank line or the word "quit" on a line by itself

Certificate has the following attributes:
Fingerprint MD5: 1E327DBB 330936EB 2FB8EACB 4DF1133E
Fingerprint SHA1: EE7FF9F4 05148842 B976FDCF9C E0732046
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.
% Certificate successfully imported
```

**Step 8** scripting tcl secure-mode

Enables signature verification of the interactive Tcl scripts.
Device(config)# scripting tcl secure-mode

**Step 9** scripting tcl trustpoint name  name
Associates an existing configured trustpoint name with a certificate to verify Tcl scripts.

Device(config)# scripting tcl trustpoint name mytrust

**Step 10** scripting tcl trustpoint untrusted  {execute | safe-execute | terminate}
(Optional) Allows the interactive Tcl scripts to run regardless of the scripts failing in the signature check or in untrusted mode using one of the three keywords: execute, safe-execute, or terminate.

- **execute** --Executes Tcl scripts even if the signature verification fails. If the execute keyword is configured, signature verification is not at all performed.

**Note** Use of this keyword is usually not recommended because the signature verification is not at all performed.

The execute keyword is provided for internal testing purposes and to provide flexibility. For example, in a situation where a certificate has expired but the other configurations are valid and you want to work with the existing configuration, then you can use the execute keyword to work around the expired certificate.

- **safe-execute** --Allows the script to run in safe mode. You can use the telsafe command and also enter the interactive Tcl shell safe mode to explore the safe mode Tcl commands that are available. In order to get a better understanding of what is available in this limited safe mode, use the telsafe Exec command to explore the options.

- **terminate** --Stops any script from running and reverting to default behavior. The default policy is to terminate. When the last trustpoint name is removed, the untrusted action is also removed. The untrusted action cannot be entered until at least one trustpoint name is configured for Tcl.

The following example shows how to execute the Tcl script in safe mode using the safe-execute keyword when the signature verification fails.

Device(config)# scripting tcl trustpoint untrusted safe-execute

**Step 11** exit
Exits global configuration mode and returns to privileged EXEC mode.

Device(config)# exit

**Step 12** tclsafe
(Optional) Enables the interactive Tcl shell untrusted safe mode. This allows you to manually run Tcl commands from the Cisco command line interface in untrusted safe mode.

Device# tclsafe

**Example:**
Verifying the Trustpoint

To display the trustpoints that are configured in the device, use the `show crypto pki trustpoints` command.

**SUMMARY STEPS**

1. `enable`
2. `show crypto pki trustpoints`

**DETAILED STEPS**

**Step 1** `enable`

This command enables privileged EXEC mode.

*Example:*

```
Device> enable
```

**Step 2** `show crypto pki trustpoints`

This command displays the trustpoints that are configured in the device.

*Example:*

```
Device# show crypto pki trustpoints
Trustpoint mytrust:
    Subject Name: ea-janedoe@cisco.com
    cn=Jane
    ou=DEPT_ACCT
    o=Cisco
    l=San Jose
    st=California
    c=US
    Serial Number: 00
    Certificate configured.
```

Verifying the Signed Tcl Script

To verify that the Signed Tcl Script is properly running, use the `debug crypto pki transactions` command and the `tclsh` command.

**SUMMARY STEPS**

1. `enable`
2. debug crypto pki transactions
3. tclsh flash:signed-tcl-file

DETAILED STEPS

Step 1  enable
This command enables privileged EXEC mode.
Example:
Device> enable

Step 2  debug crypto pki transactions
This command displays debugging messages for the trace of interaction (message type) between the CA and the device.
Example:
Device# debug crypto pki transactions
Crypto PKI Trans debugging is on

Step 3  tclsh flash:signed-tcl-file
This command executes the Tcl script in Tcl shell.
Note  The file should be a signed Tcl file.
Example:
Device# tclsh flash:hello.tcl
hello
argc = 0
argv =
argv0 = flash:hello.tcl
tcl_interactive = 0
device#
*Apr 21 04:46:18.563: CRYPTO_PKI: locked trustpoint mytrust, refcount is 1
*Apr 21 04:46:18.563: The PKCS #7 message has 0 verified signers.
*Apr 21 04:46:18.563: CRYPTO_PKI: Success on PKCS7 verify!
*Apr 21 04:46:18.563: CRYPTO_PKI: unlocked trustpoint mytrust, refcount is 0

What to Do Next

• To get an overview of Crypto, refer to the “Part 5: Implementing and Managing a PKI” section of the Security Configuration Guide.
Configuration Examples for Signed Tcl Script

Generating a Key Pair Example

The following example shows how to generate the key pair—a private key and a public key:

Generate a Private Key: Example

```sh
Host% openssl genrsa -out privkey.pem 2048
Generating RSA private key, 2048 bit long modulus
........+++...............................................................................+++ e is 65537 (0x10001)
Host% ls -l
total 8
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
Host%
```

Generate a Public Key from the Private Key

```sh
Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
Host% ls -l
total 16
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

Generating a Certificate Example

The following example shows how to generate a certificate:

```sh
Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value, If you enter ".", the field will be left blank.
-----
Country Name (2 letter code) [GB]:US
State or Province Name (full name) [Berkshire]:California
Locality Name (eg, city) [Newbury]:San Jose
Organization Name (eg, company) [My Company Ltd]:Cisco Systems, Inc.
Organizational Unit Name (eg, section) []:DEPT_ACCT
Common Name (eg, your name or your server's hostname) []:Jane
Email Address []:janedoe@company.com
Host% ls -l
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```
Signing the Tcl Scripts Example

The following example shows how to sign the Tcl scripts:

```bash
Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary
Host% ls -l
```

Verifying the Signature Example

The following example shows how to verify the signature:

```bash
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
```

Converting the Signature with Nonbinary Data Example

The following example shows how to convert the Tcl signature with nonbinary data:

```bash
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)
```tcl
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
```
Configuring the Device with a Certificate Example

The following example shows how to configure the device with a certificate:

```plaintext
crypto pki trustpoint mytrust
enrollment terminal

crypto pki authentication mytrust
crypto pki certificate chain mytrust
certificate ca 00

Feature Information for Signed Tcl Scripts

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Glossary

CA--certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPsec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

certificates--Electronic documents that bind a user's or device's name to its public key. Certificates are commonly used to validate a digital signature.

CRL--certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

IPsec--IP security

peer certificate--Certificate presented by a peer, which contains the peer's public key and is signed by the trustpoint CA.
PKI--public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

RA--registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

RSA keys--Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your device.

SHA1--Secure Hash Algorithm 1

SSH--secure shell

SSL--secure socket layer

**Notices**

The license and distribution terms for any publicly available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License].
EEM CLI Library Command Extensions

All command-line interface (CLI) library command extensions belong to the `::cisco::eem` namespace.

This library provides users the ability to run CLI commands and get the output of the commands in Tcl. Users can use commands in this library to spawn an exec and open a virtual terminal channel to it, write the command to execute to the channel so that the command will be executed by exec, and read back the output of the command.

There are two types of CLI commands: interactive commands and non-interactive commands.

For interactive commands, after the command is entered, there will be a "Q&A" phase in which the device will ask for different user options, and the user is supposed to enter the answer for each question. Only after all the questions have been answered properly will the command run according to the user’s options until completion.

For noninteractive commands, once the command is entered, the command will run to completion. To run different types of commands using an EEM script, different CLI library command sequences should be used, which are documented in the "Using the CLI Library to Run a Noninteractive Command" section and in the "Using the CLI Library to Run an Interactive Command" section in the cli_write Tcl command.

The vty lines are allocated from the pool of vty lines that are configured using the `line vty` CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

Your release may support XML-PI. For details about the XML-PI support, the new CLI library command extensions, and some examples of how to implement XML-PI, see EEM CLI Library XML-PI Support.

- cli_run, on page 1998
- cli_run_interactive, on page 1999
- cli_write, on page 2000
cli_close

Closes the exec process and releases the vty and the specified channel handler connected to the command-line interface (CLI).

Syntax

cli_close fd tty_id

Arguments

+ **fd** (Mandatory) The CLI channel handler.
+ **tty_id** (Mandatory) The TTY ID returned from the cli_open command extension.

Result String

None

Set _cerrno

Cannot close the channel.

cli_exec

Writes the command to the specified channel handler to execute the command. Then reads the output of the command from the channel and returns the output.

Syntax

cli_exec fd cmd

Arguments

+ **fd** (Mandatory) The command-line interface (CLI) channel handler.
+ **cmd** (Mandatory) The CLI command to execute.

Result String

The output of the CLI command executed.

Set _cerrno

Error reading the channel.
**cli_get_ttyname**

Returns the real and pseudo TTY names for a given TTY ID.

**Syntax**

```cli_get_ttyname tty_id```

**Arguments**

- `tty_id` (Mandatory) The TTY ID returned from the `cli_open` command extension.

**Result String**

`pty %s tty %s`

**Set _cerrno**

None

---

**cli_open**

Allocates a vty, creates an EXEC command-line interface (CLI) session, and connects the vty to a channel handler. Returns an array including the channel handler.

**Note**

Each call to `cli_open` initiates a Cisco IOS EXEC session that allocates a Cisco IOS vty line. The vty remains in use until the `cli_close` routine is called. The vty lines are allocated from the pool of vty lines that are configured using the `line vty` CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

**Syntax**

```cli_open```

**Arguments**

None

**Result String**

"tty_id {%s} pty {%d} tty {%d} fd {%d}"
<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tty_id</td>
<td>TTY ID.</td>
</tr>
<tr>
<td>pty</td>
<td>PTY device name.</td>
</tr>
<tr>
<td>tty</td>
<td>TTY device name.</td>
</tr>
<tr>
<td>fd</td>
<td>CLI channel handler.</td>
</tr>
</tbody>
</table>

Set _cerrno

- Cannot get pty for EXEC.
- Cannot create an EXEC CLI session.
- Error reading the first prompt.

**cli_read**

Reads the command output from the specified command-line interface (CLI) channel handler until the pattern of the device prompt occurs in the contents read. Returns all the contents read up to the match.

**Syntax**

```
cli_read fd
```

**Arguments**

| fd | (Mandatory) The CLI channel handler. |

**Result String**

All the contents read.

**Set _cerrno**

Cannot get device name.

---

**Note**

This Tcl command extension will block waiting for the device prompt to show up in the contents read.

**cli_read_drain**

Reads and drains the command output of the specified command-line interface (CLI) channel handler. Returns all the contents read.
Syntax
cli_read_drain fd

Arguments
| fd | (Mandatory) The CLI channel handler |

Result String
All the contents read.

Set_cerrno
None

cli_read_line
Reads one line of the command output from the specified command-line interface (CLI) channel handler. Returns the line read.

Syntax
cli_read_line fd

Arguments
| fd | (Mandatory) The CLI channel handler |

Result String
The line read.

Set_cerrno
None

Note
This Tcl command extension will block waiting for the end of line to show up in the contents read.

cli_read_pattern
Reads the command output from the specified command-line interface (CLI) channel handler until the pattern that is to be matched occurs in the contents read. Returns all the contents read up to the match.
The pattern matching logic attempts a match by looking at the command output data as it is delivered from the Cisco IOS command. The match is always done on the most recent 256 characters in the output buffer unless there are fewer characters available, in which case the match is done on fewer characters. If more than 256 characters in the output buffer are required for the match to succeed, the pattern will not match.

Syntax

cli_read_pattern fd ptn

Arguments

<table>
<thead>
<tr>
<th>fd</th>
<th>(Mandatory) The CLI channel handler.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ptn</td>
<td>(Mandatory) The pattern to be matched when reading the command output from the channel.</td>
</tr>
</tbody>
</table>

Result String

All the contents read.

Set _cerrno

None

Note

This Tcl command extension will block waiting for the specified pattern to show up in the contents read.

cli_run

Iterates over the items in the clist and assumes that each one is a command-line-interface (CLI) command to be executed in the enable mode. On success, returns the output of all executed commands and on failure, returns error from the failure.

Syntax

cli_run clist

Arguments

| clist | (Mandatory) The list of commands to be executed. |

Result String

Output of all the commands that are executed or an error message.
Set _cerrno
None.

Sample Usage
The following example shows how to use the cli_run command extension.

```
set clist [list {sh run} {sh ver} {sh event man pol reg}]
cli_run { clist }
```

**cli_run_interactive**

Provides a sublist to the clist which has three items. On success, returns the output of all executed commands and on failure, returns error from the failure. Also uses arrays when possible as a way of making things easier to read later by keeping expect and reply separated.

**Syntax**

```
cli_run_interactive clist
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clist</td>
<td>(Mandatory) List of three items:</td>
</tr>
<tr>
<td></td>
<td>• command– Command to be executed</td>
</tr>
<tr>
<td></td>
<td>• expect– A regular expression pattern match for the expected reply prompt</td>
</tr>
<tr>
<td></td>
<td>• responses– A list of possible responses to the reply prompt constructed</td>
</tr>
<tr>
<td></td>
<td>as an array of two items:</td>
</tr>
<tr>
<td></td>
<td>• expect– A regular expression pattern match for a possible reply prompt</td>
</tr>
<tr>
<td></td>
<td>• reply- A reply for that expected prompt</td>
</tr>
</tbody>
</table>

**Result String**

Output of all the commands that are executed or an error message. As each command is executed its output is appended to a result variable. Upon exhaustion of the input list, the CLI channel is closed and the aggregate result is returned.

Set _cerrno
None.

Sample Usage
The following example shows how to clear counters for interface fa0/0 use the cli_run_interactive command extension.
set cmdarr(command) "clear counters fa0/0"
set cmdarr(responses) [list]
set resps(expect) {{confirm}}
set resps(reply) "y"
lappend cmdarr(responses) [array get resps]
set rc [catch {cli_run_interactive [list [array get cmdarr]]} result]

Possible errors raised include:
- cannot get pty for exec
- cannot spawn exec
- error reading the first prompt
- error reading the channel
- cannot close channel

## cli_write

Writes the command that is to be executed to the specified CLI channel handler. The CLI channel handler executes the command.

### Syntax

cli_write fd cmd

### Arguments

<table>
<thead>
<tr>
<th>fd</th>
<th>(Mandatory) The CLI channel handler.</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmd</td>
<td>(Mandatory) The CLI command to execute.</td>
</tr>
</tbody>
</table>

### Result String

None

### Set _cerrno

None

### Sample Usage

As an example, use configuration CLI commands to bring up Ethernet interface 1/0:

```bash
if [catch {cli_open} result] {
    puts stderr $result
    exit 1
} else {
    array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
    puts stderr $result
    exit 1
}
```
Using the CLI Library to Run a Noninteractive Command

To run a noninteractive command, use the `cli_exec` command extension to issue the command, and then wait for the complete output and the device prompt. For example, the following shows the use of configuration CLI commands to bring up Ethernet interface 1/0:

```bash
if [catch {cli_exec $fd "config t"} result] {
    puts stderr $result
    exit 1
}
if [catch {cli_exec $fd "interface Ethernet1/0"} result] {
    puts stderr $result
    exit 1
}
if [catch {cli_exec $fd "no shut"} result] {
    puts stderr $result
    exit 1
}
if [catch {cli_exec $fd "end"} result] {
    puts stderr $result
    exit 1
}
if [catch {cli_close $fd} result] {
    puts stderr $result
    exit 1
}
```

Using the CLI Library to Run an Interactive Command

To run interactive commands, three phases are needed:

- Phase 1: Issue the command using the `cli_write` command extension.
- Phase 2: Q&A Phase. Use the `cli_read_pattern` command extension to read the question (the regular pattern that is specified to match the question text) and the `cli_write` command extension to write back the answers alternately.
• Phase 3: Noninteractive phase. All questions have been answered, and the command will run to completion. Use the cli_read command extension to wait for the complete output of the command and the device prompt.

For example, use CLI commands to do squeeze bootflash: and save the output of this command in the Tcl variable cmd_output.

```tcl
if [catch {cli_open} result] {  
    error $result $errorInfo
} else {
    array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
    error $result $errorInfo
}
# Phase 1: issue the command
if [catch {cli_write $cli1(fd) "squeeze bootflash:"} result] {
    error $result $errorInfo
}
# Phase 2: Q&A phase
# wait for prompted question:
# All deleted files will be removed. Continue? [confirm]
if [catch {cli_read_pattern $cli1(fd) "All deleted"} result] {
    error $result $errorInfo
}
# write a newline character
if [catch {cli_write $cli1(fd) "\n"} result] {
    error $result $errorInfo
}
# wait for prompted question:
# Squeeze operation may take a while. Continue? [confirm]
if [catch {cli_read_pattern $cli1(fd) "Squeeze operation"} result] {
    error $result $errorInfo
}
# write a newline character
if [catch {cli_write $cli1(fd) "\n"} result] {
    error $result $errorInfo
}
# Phase 3: noninteractive phase
# wait for command to complete and the router prompt
if [catch {cli_read $cli1(fd) } result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
    error $result $errorInfo
}
```

The following example causes a device to be reloaded using the CLI reload command. Note that the EEM action_reload command accomplishes the same result in a more efficient manner, but this example is presented to illustrate the flexibility of the CLI library for interactive command execution.

```tcl
# 1. execute the reload command
if [catch {cli_open} result] {  
    error $result $errorInfo
} else {
    array set cli1 $result
}
EEM 4.0 CLI Library XML-PI Support

EEM CLI Library XML-PI Support

XML Programmatic Interface (XML-PI) was introduced in Cisco IOS Release 12.4(22)T. XML-PI provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support to “screen-scrape” output.

The benefit of using the XML-PI command extensions is to facilitate the extraction of specific output information that is generated using a CLI show command. Most show commands return many fields within the output and currently a regular expression has to be used to extract specific information that may appear in the middle of a line. XML-PI support provides a set of Tcl library functions to facilitate the parsing of output from the IOS CLI format extension in the form of:

```tcl
show < show-command
> | format
```
spec-file
}

where a spec-file is a concatenation of all Spec File Entries (SFE) for each show command currently supported. As part of the XML-PI project a default spec-file will be included in the IOS Release 12.4(22)T images. The default spec-file will have a small set of commands and the SFE for the commands will have a subset of the possible tags. If no spec-file is provided with the format command, the default spec-file is used.

For more general details about XML-PI, see the "XML-PI" module.
EEM Context Library Command Extensions

All the Tcl context library command extensions belong to the ::cisco::eem namespace.

- context_retrieve, on page 2005
- context_save, on page 2008

**context_retrieve**

Retrieves Tcl variable(s) identified by the given context name, and possibly the scalar variable name, the array variable name, and the array index. Retrieved information is automatically deleted.

**Note**

Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the context_retrieve command extension) should also save it again (using the context_save command extension).

**Syntax**

context_retrieve ctxt [var] [index_if_array]

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxt</td>
<td>(Mandatory) Context name.</td>
</tr>
<tr>
<td>var</td>
<td>(Optional) Scalar variable name or array variable name. Defaults to a null string if this argument is not specified.</td>
</tr>
<tr>
<td>index_if_array</td>
<td>(Optional) The array index.</td>
</tr>
</tbody>
</table>

**Note**

The index_if_array argument will be ignored when the var argument is a scalar variable.

If var is unspecified, retrieves the whole variable table saved in the context.
If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

If var is specified, and index_if_array is specified, and var is an array variable, retrieves the value of the specified array element.

**Result String**

Resets the Tcl global variables to the state that they were in when the save was performed.

**Set _cerrno**

- A string displaying _cerrno, _cerr_sub_num, _cerr_sub_err, _cerr_posix_err, _cerr_str due to appl_reqinfo error.
- Variable is not in the context.

**Sample Usage**

The following examples show how to use the context_save and context_retrieve command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

**Example 1: Save**

If var is unspecified or if a pattern if specified, saves multiple variables to the context.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if { [catch {context_save TESTCTX "testvar*"} errmsg] } {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

**Example 1: Retrieve**

If var is unspecified, retrieves multiple variables from the context.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if { [catch {foreach {var value} [context_retrieve TESTCTX] {set $var $value}} errmsg] } {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if { [info exists testvara] } {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
}
if { [info exists testvarb] } {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
}
```
if {
    if {
        action_syslog msg "testvarb does not exist"
    }
} else {
    action_syslog msg "testvarb does not exist"
}

if {
    if {
        action_syslog msg "testvarc exists and is $testvarc"
    } else {
        action_syslog msg "testvarc does not exist"
    }
} else {
    action_syslog msg "testvarc does not exist"
}

**Example 2: Save**

If var is specified, saves the value of var.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {
    if {
        action_syslog msg "context_save failed: $errmsg"
    } else {
        action_syslog msg "context_save succeeded"
    }
} else {
    action_syslog msg "context_save failed: $errmsg"
}

**Example 2: Retrieve**

If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    if {
        action_syslog msg "context_retrieve failed: $errmsg"
    } else {
        action_syslog msg "context_retrieve succeeded"
    }
} else {
    action_syslog msg "context_retrieve succeeded"
}

if {
    if {
        action_syslog msg "testvar exists and is $testvar"
    } else {
        action_syslog msg "testvar does not exist"
    }
} else {
    action_syslog msg "testvar does not exist"
}

**Example 3: Save**

If var is specified, saves the value of var even if it is an array.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {
    if {
        action_syslog msg "context_save failed: $errmsg"
    } else {
        action_syslog msg "context_save succeeded"
    }
} else {
    action_syslog msg "context_save succeeded"
}
Example 3: Retrieve

If var is specified, and index_if_array is not specified, and var is an array variable, retrieves the entire array.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {
        array set testvar [context_retrieve TESTCTX testvar] }
    errmsg]
}
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {
    [info exists testvar]
}
    action_syslog msg "testvar exists and is [array get testvar]"
} else {
    action_syslog msg "testvar does not exist"
}
```

Example 4: Save

If var is specified, saves the value of var even if it is an array.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {
    [catch {
        context_save TESTCTX testvar }
    errmsg]
}
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 4: Retrieve

If var is specified, and index_if_array is specified, and var is an array variable, retrieves the specified array element value.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {
        set testvar [context_retrieve TESTCTX testvar testvar1] }
    errmsg]
}
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {
    [info exists testvar]
}
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar doesn't exist"
}
```

context_save

Saves Tcl variables that match a given pattern in current and global namespaces with the given context name as identification. Use this Tcl command extension to save information outside of a policy. Saved information can be retrieved by a different policy using the context_retrieve command extension.
Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the `context_retrieve` command extension) should also save it again (using the `context_save` command extension).

**Syntax**

```
context_save ctxt [pattern]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxt</td>
<td>(Mandatory) Context name.</td>
</tr>
</tbody>
</table>
| pattern | (Optional) The glob-style pattern as used by the `string match` Tcl command. If this argument is not specified, the pattern defaults to the wildcard `*`. There are three constructs used in glob patterns:  
- `*` = all characters  
- `?` = 1 character  
- `[abc]` = match one of a set of characters |

**Result String**

None

**Set _cerrno**

A string displaying `_cerrno, _cerr_sub_num, _cerr_sub_err, _cerr_posix_err, _cerr_str` due to `appl_setinfo` error.

**Sample Usage**

The following examples show how to use the `context_save` and `context_retrieve` command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

**Example 1: Save**

If var is unspecified or if a pattern if specified, saves multiple variables to the context.

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```
Example 1: Retrieve

If var is unspecified, retrieves multiple variables from the context.

::<cisco>::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {
        foreach {var value} [context_retrieve TESTCTX] {set $var $value}
    } errmsg] } {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {
    [info exists testvara] } {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
}
if {
    [info exists testvarb] } {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
}
if {
    [info exists testvarc] } {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
}

Example 2: Save

If var is specified, saves the value of var.

::<cisco>::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {
    [catch {context_save TESTCTX testvar} errmsg] } {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}

Example 2: Retrieve

If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

::<cisco>::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {set testvar [context_retrieve TESTCTX testvar]} errmsg] } {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {
    [info exists testvar] } {
    action_syslog msg "testvar exists and is $testvar"
} else {
Example 3: Save
If var is specified, saves the value of var even if it is an array.

```cisco
c::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {
    [catch {context_save TESTCTX testvar} errmsg]
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 3: Retrieve
If var is specified, and index_if_array is not specified, and var is an array variable, retrieves the entire array.

```cisco
c::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg]
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {
    [info exists testvar]
    action_syslog msg "testvar exists and is [array get testvar]"
} else {
    action_syslog msg "testvar does not exist"
}
```

Example 4: Save
If var is specified, saves the value of var even if it is an array.

```cisco
c::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {
    [catch {context_save TESTCTX testvar} errmsg]
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 4: Retrieve
If var is specified, and index_if_array is specified, and var is an array variable, retrieves the specified array element value.

```cisco
c::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {set testvar [context_retrieve TESTCTX testvar testvar1]} errmsg]
```
action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {info exists testvar} {
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar doesn't exist"
}
CHAPTER 92

EEM Event Registration Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

[type ?]

- A question mark ? represents a variable to be entered.

- Choices between arguments are represented by pipes, for example:

priority low|normal|high

**Note**
For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

**Note**
Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

event_register_appl

Registers for an application event. Use this Tcl command extension to run a policy when an application event is triggered following another policy’s execution of an event_publish Tcl command extension; the event_publish command extension publishes an application event.

In order to register for an application event, a subsystem must be specified. Either a Tcl policy or the internal Embedded Event Manager (EEM) API can publish an application event. If the event is being published by a policy, the sub_system argument that is reserved for a policy is 798.

Syntax

event_register_appl [tag ?] sub_system ? type ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]

Arguments

tag (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.

sub_system (Mandatory) Number assigned to the EEM policy that published the application event. The number is set to 798 because all other numbers are reserved for Cisco use. If this argument is not specified, all components are matched.

type (Mandatory) Event subtype within the specified event. The sub_system and type arguments uniquely identify an application event. If this argument is not specified, all types are matched. If you specify this argument, you must choose an integer between 1 and 4294967295, inclusive.

There must be a match of component and type between the event_publish command extension and the event_register_appl command extension in order for the publishing and registration to work.
<table>
<thead>
<tr>
<th>queue_priority</th>
<th>(Optional) Priority level at which the script will be queued:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
<tr>
<td>Note</td>
<td>The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default queuing priority is normal.</td>
</tr>
</tbody>
</table>

| maxrun         | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS.MM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |

| nice           | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0. |

If multiple conditions exist, the application event will be raised when all the conditions are satisfied.

**Result String**

None

**Set_cerrno**

No

**Event_reqinfo**

"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u"
"sub_system 0x%x type %u data1 {%s} data2 {%s} data3 {%s} data4 {%s}"

**Event Type** | **Description**
--- | ---
**event_id** | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.
**event_type** | Type of event.
**event_type_string** | An ASCII string that represents the name of the event for this event type.
<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_pub_sec</td>
<td>The time, in seconds and milliseconds, when the event was published to the Embedded Event Manager (EEM).</td>
</tr>
<tr>
<td>event_pub_msec</td>
<td>Number assigned to the EEM policy that published the application event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td>sub_system</td>
<td>Event subtype within the specified component.</td>
</tr>
<tr>
<td>type</td>
<td>Argument data that is passed to the application-specific event when the event is published. The data is character text, an environment variable, or a combination of the two.</td>
</tr>
</tbody>
</table>

**event_register_cli**

Registers for a CLI event. Use this Tcl command extension to run a policy when a CLI command of a specific pattern is entered based on pattern matching performed against an expanded CLI command.

**Note**

The user can enter an abbreviated CLI command, such as `sh mem summary`, and the parser will expand the command to `show memory summary` to perform the matching.

**Note**

The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe character when redirection is used.

**Syntax**

```
event_register_cli [tag ?] sync yes|no skip yes|no [occurs ?] [period ?] pattern ? [default ?] [enter] [questionmark] [tab] [mode] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>sync</td>
<td>(Mandatory) A &quot;yes&quot; means that the policy (the event publish) will run synchronously with the CLI command; a &quot;no&quot; means that the event publish will be performed asynchronously with the CLI command. The event detector will be notified when the policy completes running. The exit status of the policy indicates whether or not the CLI command should be executed: if the exit status is zero, which means that the policy is executed successfully, the CLI command will not be executed; otherwise, the CLI command will be executed.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>skip</td>
<td>Mandatory if the sync argument is &quot;no&quot; and should not exist if the sync argument is &quot;yes.&quot; If the skip argument is &quot;yes,&quot; it means that the CLI command should not be executed. If the skip argument is &quot;no,&quot; it means that the CLI command should be executed. <strong>Caution</strong> When the skip argument is &quot;yes,&quot; unintended results may be produced if the pattern match is made for configuration commands because the CLI command that matches the regular expression will not be executed.</td>
</tr>
<tr>
<td>occurs</td>
<td>(Optional) The number of occurrences before the event is raised. If this argument is not specified, the event is raised on the first occurrence. If this argument is specified, it must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) Specifies a backward looking time window in which all CLI events must occur (the occurs clause must be satisfied) in order for an event to be published (specified in SSSSSSSSSSS.MMM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent event is used.</td>
</tr>
<tr>
<td>pattern</td>
<td>(Mandatory) Specifies the regular expression used to perform the CLI command pattern match.</td>
</tr>
<tr>
<td>default</td>
<td>(Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSSSS.MMM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds.</td>
</tr>
<tr>
<td>queue_priority</td>
<td>(Optional) Priority level at which the script will be queued:</td>
</tr>
<tr>
<td></td>
<td>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
<tr>
<td></td>
<td>If more than one script is registered with the &quot;queue_priority_last&quot; argument set, these scripts will execute in the order in which the events are published. <strong>Note</strong> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default queuing priority is normal.</td>
</tr>
<tr>
<td>enter</td>
<td>(Optional) Specifies to perform the event match when the user presses the Enter key. When this parameter is used, the input string will not be expanded before matching.</td>
</tr>
<tr>
<td>questionmark</td>
<td>(Optional) Specifies to perform the event match when the user presses the ? key. When this parameter is used, the input string will not be expanded before matching.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>tab</td>
<td>(Optional) Specifies to perform the event match when the user presses the Tab key. When this parameter is used, the input string will not be expanded before matching.</td>
</tr>
<tr>
<td>mode</td>
<td>(Optional) Events will only be generated when the parser is in the specified parser mode. The available modes can be listed using the <code>show parser dump</code> CLI command. The mode parameter is checked when any one of the optional parameters--enter, questionmark, or tab--is specified.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

If multiple conditions are specified, the CLI event will be raised when all the conditions are matched.

### Result String

None

### Set _cerrno

No

---

**Note**

This policy runs before the CLI command is executed. For example, suppose policy_CLI is registered to run when the `copy` command is entered. When the `copy` command is entered, the CLI event detector finds a pattern match and triggers this policy to run. When the policy execution ends, the CLI event detector determines if the `copy` command needs to be executed according to "sync", "skip" (set in the policy), and the exit status of the policy execution if needed.

### Event_reqinfo

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u event_severity %u msg {%s} msg_count %d line %u key %u tty %u error_code %u"
```

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_id</td>
<td>Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.</td>
</tr>
<tr>
<td>event_type</td>
<td>Type of event.</td>
</tr>
<tr>
<td>event_type_string</td>
<td>An ASCII string that represents the name of the event for this event type.</td>
</tr>
<tr>
<td>event_pub_sec</td>
<td>The time, in seconds and milliseconds, at which the event was published to the EEM.</td>
</tr>
<tr>
<td>event_pub_msec</td>
<td></td>
</tr>
<tr>
<td>event_severity</td>
<td>The severity of the event.</td>
</tr>
</tbody>
</table>
### event_register_counter

Registers for a counter event as both a publisher and a subscriber. Use this Tcl command extension to run a policy on the basis of a named counter crossing a threshold. This event counter, as a subscriber, identifies the name of the counter to which it wants to subscribe and depends on another policy or another process to actually manipulate the counter. For example, let policyB act as a counter policy, whereas policyA (although it does not need to be a counter policy) uses register_counter, counter_modify, or unregister_counter Tcl command extensions to manipulate the counter defined in policyB.

#### Syntax

```
event_register_counter [tag ?] name ? entry_op gt|ge|eq|ne|lt|le entry_val ?
exit_op gt|ge|eq|ne|lt|le exit_val ? [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) Name of the counter.</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Entry comparison operator used to compare the current counter value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.</td>
</tr>
<tr>
<td>entry_val</td>
<td>(Mandatory) Value with which the current counter value should be compared to decide if the counter event should be raised.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Mandatory) Exit comparison operator used to compare the current counter value with the exit value; if true, event monitoring for this event will be reenabled.</td>
</tr>
</tbody>
</table>
### exit_val
(Mandatory) Value with which the current counter value should be compared to decide if the exit criteria are met.

### queue_priority
(Optional) Priority level at which the script will be queued:
- `queue_priority low`--Specifies that the script is to be queued at the lowest of the three priority levels.
- `queue_priority normal`--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- `queue_priority high`--Specifies that the script is to be queued at the highest of the three priority levels.
- `queue_priority last`--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note**
The `queue_priority` argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

### maxrun
(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

### nice
(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### Result String
None

### Set_cerrno
No

### Event_reqinfo

```
"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"name {%s}"
```

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_id</td>
<td>Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.</td>
</tr>
<tr>
<td>event_type</td>
<td>Type of event.</td>
</tr>
</tbody>
</table>
### event_register_gold

Registers for a Generic Online Diagnostic (GOLD) failure event. Use this Tcl command extension to run a policy on the basis of a Generic Online Diagnostic (GOLD) failure event for the specified card and subcard.

**Syntax**

```tcl
event_register_gold card all|card_number [subcard all|subcard_number] [new_failure TRUE|FALSE] [severity_major TRUE] [severity_minor TRUE] [severity_normal TRUE] [action_notify TRUE|FALSE] [testing_type [bootup|ondemand|schedule|monitoring]] [test_name [testname]] [test_id [testnumber]] [consecutive_failure consecutive_failure_number] [platform_action [action_flag]] [maxrun ?] [queue_priority low|normal|high|last] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| card     | (Mandatory) Specifies whether all cards or one card is to be monitored:  
  - card all--Specifies that all cards are to be monitored. This is the default.  
  - card-number--Specifies that the card identified by the number card-number is to be monitored.  
  This argument must be specified to complete the `event_register_gold` Tcl command extension. |
| subcard  | (Optional) Specifies that one or more subcards are to be monitored:  
  - subcard all--Specifies that all subcards are to be monitored.  
  - subcard-number--Specifies that the subcard identified by the number subcard-number is to be monitored.  
  If this argument is not specified, all subcards are monitored by default. |
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_failure</td>
<td>Specifies event criteria based on the new test failure information from GOLD:</td>
</tr>
<tr>
<td></td>
<td>- new_failure TRUE--Specifies that the event criterion for the new test failure is true from GOLD.</td>
</tr>
<tr>
<td></td>
<td>- new_failure FALSE--Specifies that the event criterion for the new test failure is false from GOLD.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the new test failure information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>severity_major</td>
<td>Specifies that the event criteria for diagnostic result matches with the diagnostic major error from GOLD.</td>
</tr>
<tr>
<td>severity_minor</td>
<td>Specifies that the event criteria for diagnostic result matches with diagnostic minor error from GOLD.</td>
</tr>
<tr>
<td>severity_normal</td>
<td>Specifies that the event criteria for diagnostic result matches with diagnostic normal from GOLD. This is the default.</td>
</tr>
<tr>
<td>action_notify</td>
<td>Specifies the event criteria based on the action notify information from GOLD:</td>
</tr>
<tr>
<td></td>
<td>- action_notify TRUE--Specifies that the event criterion for the action notify is true from GOLD.</td>
</tr>
<tr>
<td></td>
<td>- action_notify FALSE--Specifies that the event criterion for the action notify is false from GOLD.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the action notify information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>testing_type</td>
<td>Specifies the event criteria based on the testing types of the diagnostic from GOLD:</td>
</tr>
<tr>
<td></td>
<td>- testing_type bootup--Specifies the diagnostic tests that are running on system bootup.</td>
</tr>
<tr>
<td></td>
<td>- testing_type ondemand--Specifies the diagnostic tests that are running from CLI after the card is online.</td>
</tr>
<tr>
<td></td>
<td>- testing_type schedule--Specifies the scheduled diagnostic tests.</td>
</tr>
<tr>
<td></td>
<td>- testing_type monitoring--Specifies the diagnostic tests that are running periodically in the background to monitor the health of the system.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the testing type information from GOLD is not considered in the event criteria and the policy applies to all the diagnostic testing types.</td>
</tr>
<tr>
<td>test_name</td>
<td>Specifies the event criteria based on the test name:</td>
</tr>
<tr>
<td></td>
<td>- test_name test-name--Specifies the event criteria based on the test with the name test-name.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the test name information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>Argument</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>test_id</td>
<td>(Optional) Specifies the event criteria based on test ID:</td>
</tr>
<tr>
<td></td>
<td>• test_id test-id--Specifies the event criteria based on the test with the ID number test-id. The maximum value of test-id is 65535.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Because the test ID can be different for the same test on different line cards, usually the test_name keyword should be used instead. If the test ID is specified and conflicts with the specified test name, the test name overwrites the test ID.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, test ID information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>consecutive_failure</td>
<td>(Optional) Specifies the event criteria based on consecutive test failure information from GOLD:</td>
</tr>
<tr>
<td></td>
<td>• consecutive_failure consecutive-failure-number--Specifies that the event criterion is based on the occurrence of consecutive-failure-number consecutive test failures.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, consecutive test failure information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>platform_action</td>
<td>(Optional) Specifies whether callback to the platform is needed when all the event criteria are matched. When callback is needed, the platform needs to register a callback function through the provided registry.</td>
</tr>
<tr>
<td></td>
<td>• platform_action action-flag-number--Specifies that, when callback to the platform is needed, specific information is specified by the platform-specific action-flag-number value. The maximum value of action-flag-number is 65535.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> It is up to the platform to determine what action needs to be taken based on the flag.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, there is no callback.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Specifies the maximum runtime of the script.</td>
</tr>
<tr>
<td></td>
<td>• maxrun max-run-time-number--Specifies that the maximum run time of the script is max-run-time-number seconds. The maximum value of max-run-time-number is 4294967295 seconds.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default run time is 20 seconds.</td>
</tr>
</tbody>
</table>
**queue_priority**

(Optional) Priority level at which the script will be queued:

- **queue_priority low**--Specifies that the script is to be queued at the lowest of the three priority levels.
- **queue_priority normal**--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- **queue_priority high**--Specifies that the script is to be queued at the highest of the three priority levels.
- **queue_priority last**--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

**nice**

(Optional) Policy run-time priority setting:

- **nice 0**--Specifies that the policy is run at the default run-time priority level.
- **nice 1**--Specifies that the policy is run at a run-time priority that is less than the default priority.

If this argument is not specified, the default run-time priority is used.

</table>
| bl         | The boot-up diagnostic level, which can be one of the following values:  
|            | • 0: complete diagnostic  
|            | • 1: minimal diagnostics  
|            | • 2: bypass diagnostic |
| card       | Card information for the GOLD event. |
| cf testnum | Consecutive failure, where testnum is the test number. For example, cf3 is the EEM built-in environment variable for consecutive failure of test 3. |
| ci         | Card index. |
| cn         | Card name. |
| ec testnum | Test error code, where testnum is the test number. For example, ec3 is the EEM built-in environment variable for the error code of test 3. |
| event_id   | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_pub_msec event_pub_sec | The time, in milliseconds and seconds, when the event was published to the EEM. |
| event_severity | GOLD event severity, which can be one of the following values:  
|              | • normal  
|              | • minor  
|              | • major. |
| event_type | Type of event. |
| event_type_string | An ASCII string that represents the name of the event for this event type. |
| If testnum  | Last fail time, where testnum is the test number. For example, If3 is the EEM built-in variable for the last fail time of test 3.  
|             | The timestamp format is mmm dd yyyy hh:mm:ss. For example, Mar 11 1960 08:47:00. |
| new_failure | The new test failure information in a GOLD event flag: true or false. |
| overall_result | The overall diagnostic result, which can be one of the following values:  
|                | • 0: OK  
|                | • 3: minor error  
|                | • 4: major error  
<p>|                | • 14: unknown result |</p>

</tr>
<tr>
<td></td>
<td>• 4: A monitoring diagnostic</td>
</tr>
</tbody>
</table>

### event_register_identity

Registers for an identity event. Use this Tcl command extension to generate an event when AAA authentication or authorization is successful or failure or after normal user traffic on the port is allowed to flow.

#### Syntax

```tcl
event_register_identity [tag ?] interface ?
[aaa-attribute ?]
/authc {all | fail | success})
/authz {all | fail | success})
/authz-complete
/mac-address ?
[queue_priority {normal | low | high | last})
[maxrun ?] [nice {0 | 1}]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>interface</td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td>aaa-attribute</td>
<td>(Optional) A regular expression that can be used to filter events by specific AAA attributes.</td>
</tr>
<tr>
<td>authc</td>
<td>(Optional) Triggers events on successful, failed or both successful and failed authentication.</td>
</tr>
<tr>
<td>authz</td>
<td>(Optional) Triggers events on successful, failed or both successful and failed authorization.</td>
</tr>
<tr>
<td>authz-complete</td>
<td>(Optional) Triggers events once the device connected to the interface is fully authenticated, authorized and normal traffic has begun to flow on that interface.</td>
</tr>
<tr>
<td>mac-address</td>
<td>(Optional) A regular expression pattern that can be used to filter events by mac addresses of the remote device.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

<table>
<thead>
<tr>
<th>queue_priority</th>
<th>(Optional) Priority level at which the script will be queued:</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_priority low</td>
<td>Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>
<td>queue_priority normal</td>
<td>Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</td>
</tr>
<tr>
<td>queue_priority high</td>
<td>Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td>queue_priority last</td>
<td>Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
</tbody>
</table>

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

Result String

None

Set _cerrno

No

Event_reqinfo For EEM_EVENT_IDENTITY

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u
event_severity %u identity_stage %u identity_status %u interface %u identity_mac %u identity_<attribute> {%s}"
```
### Description

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identity_stage</td>
<td>One among authentication, authorization or authorization-complete stages.</td>
</tr>
<tr>
<td>identity_status</td>
<td>Success or one of these failure types: fail_authc, fail_aaa_server, fail_no_response, fail_timeout, fail_authz. For authorization-complete it is always success.</td>
</tr>
<tr>
<td>interface</td>
<td>The interface for the event.</td>
</tr>
<tr>
<td>identity_mac</td>
<td>The MAC address of the remote device for the event.</td>
</tr>
<tr>
<td>identity_&lt;attribute&gt;</td>
<td>For each AAA attribute, a set a dynamic variable to the value corresponding to that AAA attribute in the attribute or value list.</td>
</tr>
</tbody>
</table>

### event_register_interface

Registers for an interface counter event. Use this Tcl command extension to generate an event when specified interface counters exceed specified thresholds.

#### Syntax

```
event_register_interface [tag ?] name ?
parameter ? entry_op gt|ge|eq|ne|lt|le
entry_val ? entry_val_is_increment TRUE|FALSE
entry_type value|increment|rate
[exit_comb or|and]
[exit_op gt|ge|eq|ne|lt|le]
[exit_val ?] [exit_val_is_increment TRUE|FALSE]
[exit_type value|increment|rate]
[exit_time ?] [poll_interval ?]
[average_factor ?] [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) The name of the interface being monitored, for example, Ethernet 0/0. Abbreviations and spaces are not allowed.</td>
</tr>
<tr>
<td>parameter</td>
<td>(Mandatory) The name of the counter being compared as follows:</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>input_errors</td>
<td>Includes runts, giants, no buffer, CRC, frame, overrun, and ignored counts. Other input-related errors can also cause the input errors count to be increased, and some datagrams may have more than one error; therefore, this sum may not balance with the sum of enumerated input error counts.</td>
</tr>
<tr>
<td>input_errors_crc</td>
<td>Cyclic redundancy checksum generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.</td>
</tr>
<tr>
<td>input_errors_frame</td>
<td>Number of packets received incorrectly having a CRC error and a noninteger number of octets.</td>
</tr>
<tr>
<td>input_errors_overrun</td>
<td>Number of times the receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.</td>
</tr>
<tr>
<td>input_packets_dropped</td>
<td>Number of packets dropped because of a full input queue.</td>
</tr>
<tr>
<td>interface_resets</td>
<td>Number of times that an interface has been completely reset.</td>
</tr>
<tr>
<td>output_buffer_failures</td>
<td>Number of failed buffers and number of buffers swapped out.</td>
</tr>
<tr>
<td>output_buffer_swappedout</td>
<td>Number of packets swapped to DRAM.</td>
</tr>
</tbody>
</table>
parameter (continued)

• output_errors--Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this may not balance with the sum of the enumerated output errors, because some datagrams may have more than one error, and others may have errors that do not fall into any of the specifically tabulated categories.

• output_errors_underrun--Number of times that the transmitter has been running faster than the device can handle.

• output_packets_dropped--Number of packets dropped because of a full output queue.

• receive_broadcasts--Number of broadcast or multicast packets received by the interface.

• receive_giants--Number of packets that are discarded because they exceed the maximum packet size of the medium.

• receive_rate_bps--Interface receive rate in bytes per second.

• receive_rate_pps--Interface receive rate in packets per second.

• receive_runts--Number of packets that are discarded because they are smaller than the minimum packet size of the medium.

• receive_throttle--Number of times that the receiver on the port was disabled, possibly because of buffer or processor overload.

• reliability--Reliability of the interface as a fraction of 255 (255/255 is 100 percent reliability), calculated as an exponential average over 5 minutes.

• rxload--Receive rate of the interface as a fraction of 255 (255/255 is 100 percent).

• transmit_rate_bps--Interface transmit rate in bytes per second.

• transmit_rate_pps--Interface transmit rate in packets per second.

• txload--Transmit rate of the interface as a fraction of 255 (255/255 is 100 percent).

entry_op

(Mandatory) The comparison operator used to compare the current interface value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.

entry_val

(Mandatory) The value at which the event will be triggered.

entry_val_is_increment

(Mandatory) If TRUE, the entry_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true (the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the entry_val field is compared against the current counter value.

Note This keyword has been deprecated, and if specified, the syntax is converted into equivalent entry-type keyword syntax.
| entry-type | Specifies a type of operation to be applied to the object ID specified by the entry-val argument.  
Value is defined as the actual value of the entry-val argument.  
Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.  
Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| exit_comb | (Optional) Used to indicate the combination of exit condition tests required to rearm the event trigger; if the and operator is specified, both exit value and exit time tests must be true to cause rearm; if the or operator is specified, either exit value or exit time tests can be true to cause event monitoring to be rearmed. |
| exit_op | (Optional) The comparison operator used to compare the current interface value with the exit value; if true, event monitoring for this event will be reenabled. |
| exit_val | (Optional) The value at which the event is rearmed to be monitored again. |
| exit_val_is_increment | (Optional) If TRUE, the exit_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true. A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the exit_val field is compared against the current counter value.  
**Note** In Cisco IOS Release 12.4(20)T, this keyword is deprecated, and if specified, the syntax is converted into equivalent exit-type keyword syntax. |
| exit-type | (Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed.  
Value is defined as the actual value of the exit-val argument.  
Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.  
Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| exit_time | (Optional) The time period at which the event is rearmed to be monitored again (specified in SSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSS
| poll_interval | (Optional) The frequency used to collect the samples (specified in SSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 60 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). The poll interval value must not be less than 1 second. The default is 1 second. |
| average-factor | (Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1. |
| queue_priority | (Optional) Priority level at which the script will be queued:  
  - queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.  
  - queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
  - queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.  
  - queue_priority last--Specifies that the script is to be queued at the lowest priority level.  

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.  

**Note**  
The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.  

If this argument is not specified, the default queuing priority is normal. |
| maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0. |

**Result String**  
None  

**Set_cerrno**

```
### event_register_ioswdsysmon

Registers for an IOSWDSysMon event. Use this Tcl command extension to generate an event when a Cisco IOS task exceeds specific CPU utilization or memory thresholds. A Cisco IOS task is called a Cisco IOS process in native Cisco IOS.

**Syntax**

```
event_register_ioswdsysmon [tag ?] [timewin ?] [sub12_op and|or] [sub1 ?] [sub2 ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>timewin</td>
<td>(Optional) Defines the time window within which all of the subevents must occur in order for an event to be generated (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>sub12_op</td>
<td>(Optional) The combination operator for comparison between subevent 1 and subevent 2.</td>
</tr>
<tr>
<td>sub1</td>
<td></td>
</tr>
<tr>
<td>sub2</td>
<td></td>
</tr>
<tr>
<td>queue_priority</td>
<td>Name of the priority queue for event generation.</td>
</tr>
<tr>
<td>maxrun</td>
<td></td>
</tr>
<tr>
<td>nice</td>
<td></td>
</tr>
</tbody>
</table>
The subevent specification.

sub2 (Optional) The subevent 2 specification.

queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

Subevent Syntax

cpu_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [period ?]

mem_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [is_percent TRUE|FALSE] ? [period ?]

Subevent Arguments

cpu_proc (Mandatory) Specifies the use of a sample collection of CPU statistics.

path (Mandatory) Software Modularity images only. The pathname of the POSIX process that contains the Cisco IOS scheduler to be monitored. For example, /sbin/cdp2.iosproc.

taskname (Mandatory) The name of the Cisco IOS task to be monitored.

op (Mandatory) The comparison operator used to compare the collected usage sample with the specified value; if true, an event will be raised.

val (Mandatory) The value to be compared.
**Example Configuration**

```
period (Optional) The elapsed time period for the collection samples to be averaged (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

mem_proc (Mandatory) Specifies the use of a sample collection of memory statistics.

is_percent (Optional) Whether the specified value is a percentage.
```

</tr>
<tr>
<td>value</td>
<td>Total memory use in KB or the actual average memory utilization for this measured interval.</td>
</tr>
<tr>
<td>diff</td>
<td>The percentage difference between the oldest sample in the measured interval and the latest sample; a negative value represents a decrease.</td>
</tr>
<tr>
<td>sec , msec</td>
<td>Elapsed time period for this measured interval.</td>
</tr>
</tbody>
</table>

### event_register_ipsla

Registers for an event that is triggered by the `event ipsla` command. Use this Tcl command to publish an event when an IPSLA reaction is triggered. The group ID or the operation ID is required to register the event.

**Syntax**

```tcl
event_register_ipsla [tag ?] group_name ? operation_id ? [reaction_type ?] [dest_ip_addr ?][queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>group_name</td>
<td>(Mandatory) Specifies the IP SLAs group name.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>operation_id</td>
<td>(Mandatory) Specifies the IP SLA operation ID. Number must be in the range from 1 to 2147483647.</td>
</tr>
</tbody>
</table>
| reaction_type     | (Optional) Specifies the reaction to be taken for the specified IP SLAs operation. Type of IP SLAs reaction--One of the following keywords can be specified: `connectionLoss`, `icpif`, `jitterAvg`, `jitterDSAvg`, `jitterSDAvg`, `maxOfNegativeDS`, `maxOfNegativeSD`, `maxOfPositiveDS`, `maxOfPositiveSD`, `mos`, `packetLateArrival`, `packetLossDS`, `packetLossSD`, `packetMIA`, `packetOutOfSequence`, `rtt`, `timeout` or `verifyError` can be specified. Type of IP SLAs reaction. One of the following keywords can be specified:  
  - `connectionLoss`
  - `icpif`
  - `jitterAvg`
  - `jitterDSAvg`
  - `jitterSDAvg`
  - `maxOfNegativeDS`
  - `maxOfNegativeSD`
  - `maxOfPositiveDS`
  - `maxOfPositiveSD`
  - `mos`
  - `packetLateArrival`
  - `packetLossDS`
  - `packetLossSD`
  - `packetMIA`
  - `packetOutOfSequence`
  - `rtt`
  - `timeout`
  - `verifyError` |
| dest_ip_address   | (Optional) Specifies the destination IP address of the destination port for which the IP SLAs events are monitored. |
queue_priority | (Optional) Priority level at which the script will be queued:
---|---
| • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
| • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
| • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
| • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note: The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum runtime of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.
	nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### Result String

None

### Set_cerrno

No

### Event_reginfo

<td>The type of event to monitor for the create, update, and delete flow.</td>
</tr>
<tr>
<td>event_type_string</td>
<td>An ASCII string that represents the name of the event for this event type.</td>
</tr>
</tbody>
</table>
### Event Register Mat

Registers for a MAT event. Use this Tcl command extension to generate an event when a mac-address is learned in the mac-address-table.

**Syntax**

```
event_register_identity [tag ?] interface ?
[mac-address ?]
[type {add | delete}]
[hold-down ?]
[maxrun ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>interface</td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td>mac-address</td>
<td>Mandatory if the interface parameter is not specified. A regular expression pattern that can be used to filter events by mac addresses of the remote device.</td>
</tr>
</tbody>
</table>
type  (Optional) Filter based on a mac-address-table event type of add or delete. If not specified, the event type is not used in determining whether the event should be triggered.

hold-down  (Optional) When a mac-address-table event comes in, the hold-down timer can be set to make the event to wait between 1 and 4294967295 seconds before processing the policy. If not set then the policy is not delayed in being processed.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

Result String

<td>The mac-address for the address table entry.</td>
</tr>
</tbody>
</table>
event_register_neighbor_discovery

Registers for a neighbor discover event. Use this Tcl command extension to generate an event when a Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) cache entry or a interface link status changes.

Syntax

```
event_register_neighbor_discovery [tag ?] interface ?
[cdp {add | update | delete | all}]
[lldp {add | update | delete | all}]
[link-event]
[line-event]
[queue_priority {normal | low | high | last}]
[maxrun ?] [nice {0 | 1}]
```

Arguments

<table>

<tr>
<td></td>
<td>• delete--Trigger events only when a cdp cache entry is deleted from the cdp table.</td>
</tr>
<tr>
<td></td>
<td>• update--Trigger an event when a cdp cache entry is added to the cdp table or when the remote cdp device sends a cdp keepalive to update the cdp cache entry.</td>
</tr>
<tr>
<td>line-event</td>
<td>Trigger an event when the interface line protocol status changes.</td>
</tr>
<tr>
<td>link-event</td>
<td>Trigger an event when the interface link status changes.</td>
</tr>
</tbody>
</table>
queue_priority  (Optional) Priority level at which the script will be queued:
- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSS.MM format, where SSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

## event_register_nf

Registers for an event when a NetFlow event is triggered by the `event nf` command. Use this Tcl command to publish an event when an NetFlow reaction is triggered.

### Syntax

```plaintext
event_register_nf [tag ?] monitor_name ? event_type create|update|delete
exit_event_type create|update|delete event1-event4 ? [maxrun ?] [nice 0|1]
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>monitor_name</td>
<td>(Mandatory) The name of the NetFlow monitor.</td>
</tr>
<tr>
<td>event_type</td>
<td>(Mandatory) The type of event to monitor for the create, update, and delete flow.</td>
</tr>
<tr>
<td>exit_event_type</td>
<td>(Mandatory) The event-type (create, delete, update) at which the event is rearmed to be monitored again.</td>
</tr>
<tr>
<td>event1-event4</td>
<td>(Mandatory) Specifies the event and its attributes to monitor. Valid values are event1, event2, event3, and event4. The subevent keywords can be used alone, together, or in any combination with each other, but each keyword can be used only once.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

Subevent Syntax

```
field ? rate_interval ? event1 only entry_value ? entry_op eq|ge|gt|le|lt|wc [exit_value ?] [exit_op eq|ge|gt|le|lt|wc] [exit_rate_interval ? event1 only]
```

Subevent Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>(Mandatory) Specifies the cache or field attribute to be monitored. One of the following attributes can be specified:</td>
</tr>
<tr>
<td></td>
<td>• <strong>counter</strong> {bytes</td>
</tr>
<tr>
<td></td>
<td>• <strong>datalink</strong> {dot1q</td>
</tr>
<tr>
<td></td>
<td>• <strong>flow</strong> {direction</td>
</tr>
<tr>
<td></td>
<td>• <strong>interface</strong> {input</td>
</tr>
<tr>
<td></td>
<td>• <strong>ipv4</strong> field-type -- Specifies the IPv4 fields.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ipv6</strong> field-type -- IPv6 fields</td>
</tr>
<tr>
<td></td>
<td>• <strong>routing</strong> routing-attribute -- Specifies the routing attributes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>timestamp</strong> sysuptime {first</td>
</tr>
<tr>
<td></td>
<td>• <strong>transport</strong> field-type -- Specifies the Transport layer fields.</td>
</tr>
<tr>
<td>rate_interval</td>
<td>(Mandatory) Specifies the rate interval value in seconds used to calculate the rate. This field is only valid for event1.</td>
</tr>
<tr>
<td>entry_value</td>
<td>(Mandatory) Specifies the field or rate value.</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Specifies the field operator. The comparison operator valid values are:</td>
</tr>
<tr>
<td></td>
<td>• eq - Equal to</td>
</tr>
<tr>
<td></td>
<td>• ge - Greater than or equal to</td>
</tr>
<tr>
<td></td>
<td>• gt - Greater than</td>
</tr>
<tr>
<td></td>
<td>• le - Less than or equal to</td>
</tr>
<tr>
<td></td>
<td>• lt - Less than</td>
</tr>
<tr>
<td></td>
<td>• wc - Wildcard</td>
</tr>
<tr>
<td>exit_value</td>
<td>(Optional) The value at which the event is rearmed to be monitored again.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Optional) The comparison operator used to compare the current event field or rate value with the exit value; if true, event monitoring for this event is reenabled. The comparison operator valid values are:</td>
</tr>
<tr>
<td></td>
<td>• eq - Equal to</td>
</tr>
<tr>
<td></td>
<td>• ge - Greater than or equal to</td>
</tr>
<tr>
<td></td>
<td>• gt - Greater than</td>
</tr>
<tr>
<td></td>
<td>• le - Less than or equal to</td>
</tr>
<tr>
<td></td>
<td>• lt - Less than</td>
</tr>
<tr>
<td></td>
<td>• wc - Wildcard</td>
</tr>
<tr>
<td>exit_rate_interval</td>
<td>(Optional) Specifies the exit rate interval value in seconds used to calculate the exit rate value. This field is only valid for event1.</td>
</tr>
</tbody>

### event_register_none

Registers for an event that is triggered by the `event manager run` command. These events are handled by the None event detector that screens for this event.

#### Syntax

```
event_register_none [tag ?] [sync {yes|no}] [default ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
</tbody>
</table>
| sync          | (Optional) A "yes" or a "no" is required to complete this keyword.  
  + If the yes keyword is specified, the policy will run synchronously with the CLI command.  
  + If the no keyword is specified, the policy will run asynchronously with the CLI command. |
| default       | (Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds. |
queue_priority  (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Result String**

None

**Set_cerrno**

### event_register_oir

Registers for an online insertion and removal (OIR) event. Use this Tcl command extension to run a policy on the basis of an event raised when a hardware card OIR occurs. These events are handled by the OIR event detector that screens for this event.

#### Syntax

```
event_register_oir [tag?] [queue_priority low|normal|high|last] [maxrun?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>

<td>The time, in seconds and milliseconds, when the event was published to the EEM.</td>
</tr>
</tbody>
</table>
### event_register_process

Registers for a process event. Use this Tcl command extension to run a policy on the basis of an event raised when a Cisco IOS Software Modularity process starts or stops. These events are handled by the System Manager event detector that screens for this event. This Tcl command extension is supported only in Software Modularity images.

#### Syntax

```
event_register_process [tag ?] abort|term|start|user_restart|user_shutdown
[sub_system ?] [version ?] [instance ?] [path ?] [node ?]
[queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tag</strong></td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td><strong>abort</strong></td>
<td>(Mandatory) Abnormal process termination. Process may abort because of exiting with a nonzero exit status, receiving a kernel-generated signal, or receiving a SIGTERM or SIGKILL signal that is not sent because of user request.</td>
</tr>
<tr>
<td><strong>term</strong></td>
<td>(Mandatory) Normal process termination.</td>
</tr>
<tr>
<td><strong>start</strong></td>
<td>(Mandatory) Process start.</td>
</tr>
<tr>
<td><strong>user_restart</strong></td>
<td>(Mandatory) Process termination due to the process restart request from the CLI command.</td>
</tr>
<tr>
<td><strong>user_shutdown</strong></td>
<td>(Mandatory) Process termination due to the process kill request from the CLI command.</td>
</tr>
<tr>
<td><strong>sub_system</strong></td>
<td>(Optional) Number assigned to the EEM policy that published the process event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td><strong>version</strong></td>
<td>(Optional) Version number of the process assigned by the version manager. Must be of the form major_number.minor_number.level. If specified, each component of the version number must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td><strong>instance</strong></td>
<td>(Optional) Process instance ID. If specified, this argument must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td><strong>path</strong></td>
<td>(Optional) Process pathname (a regular expression string). If the value of the process-name argument contains embedded blanks, enclose it in double quotation marks. Use path &quot;.*&quot; to match all processes.</td>
</tr>
</tbody>
</table>
| **node** | (Optional) The node name is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:
node<slot-number>/<cpu-number>
The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is always the regular expression pattern match of * representing all applicable nodes. |
| **queue_priority** | (Optional) Priority level at which the script will be queued:
- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.
If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published. **Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.
If this argument is not specified, the default queuing priority is normal. |
| **maxrun** | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS,[MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| **nice** | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0. |

If an optional argument is not specified, the event matches all possible values of the argument. If multiple arguments are specified, the process event will be raised when all the conditions are matched.

</tr>
</tbody>
</table>

**event_register_resource**

 Registers for an Embedded Resource Manager (ERM) event. Use this Tcl command extension to run a policy on the basis of an ERM event report for a specified policy. ERM events are screened by the EEM Resource event detector, allowing an EEM policy to be run when a match occurs for the specified ERM policy.
Syntax

```
event_register_resource policy policy-name [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>

</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

Result String

</tr>
<tr>
<td><code>event</code></td>
<td>RF progression or status event notification that caused this event to be published.</td>
</tr>
</tbody>
</table>

```
event_register_routing [tag ?] network ? length ? ge|le|ne ? [type add|remove|modify|all] [protocol ?] [queue_priority normal|low|high|last] [maxrun ?] [nice {0 | 1}]
```

### Arguments

<table>
<thead>
<tr>
<th>tag</th>
<th>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</th>
</tr>
</thead>
<tbody>
<tr>
<td>network</td>
<td>Specifies the network IP address. The network number can be any valid IP address or prefix.</td>
</tr>
<tr>
<td>length</td>
<td>Specifies the length of the network mask in bits. The bit mask can be a number from 0 to 32.</td>
</tr>
<tr>
<td></td>
<td>- <code>ge</code> -- (Optional) Specifies the minimum prefix length to be matched. The <code>ge</code> keyword represents greater than or equal to operator.</td>
</tr>
<tr>
<td></td>
<td>- <code>le</code> -- (Optional) Specifies the maximum prefix length to be matched. The <code>le</code> keyword represents the less than or equal to operator.</td>
</tr>
<tr>
<td></td>
<td>- <code>ne</code> -- (Optional) Specifies the prefix length not to be matched. The <code>ne</code> keyword represents not equal to operator.</td>
</tr>
<tr>
<td></td>
<td>When <code>ge</code>, <code>le</code> and <code>ne</code> keywords are not configured, an exact match of network length is processed.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Specifies the desired policy trigger. The type options are <code>add</code>, <code>remove</code>, <code>modify</code>, and <code>all</code>. The default is <code>all</code>.</td>
</tr>
<tr>
<td>protocol</td>
<td>(Optional) Specifies the protocol value for the network being monitored.</td>
</tr>
</tbody>
</table>

One of the following protocols can be used: `all`, `bgp`, `connected`, `eigrp`, `isis`, `iso-igrp`, `mobile`, `odr`, `ospf`, `rip`, and `static`. The default is `all`.  

---

**event_register_routing**

Registers for an event that is triggered by the `event routing` command. These events are handled by the routing event detector to publish an event when route entries change in Routing Information Base (RIB) infrastructure. Use this Tcl command extension to run a routing policy for this script. The network IP address for the route to be monitored must be specified.

### Syntax

```
event_register_routing [tag ?] network ? length ? ge|le|ne ? [type add|remove|modify|all] [protocol ?] [queue_priority normal|low|high|last] [maxrun ?] [nice {0 | 1}]
```
queue_priority | (Optional) Priority level at which the script will be queued:
--- | ---
| • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
| • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
| • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
| • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note**  The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

---

**Result String**

</tbody>
</table>

**event_register_rpc**

Registers for an event that is triggered by the EEM SSH Remote Procedure Call (RPC) command. These events are handled by the RPC event detector that screens for this event. Use this Tcl command extension to run a RPC policy for this script.

**Syntax**

```
event_register_rpc [queue_priority {normal | low | high | last}] [maxrun <sec.msec>] [nice {0 | 1}] [default <sec.msec>]
```
**Arguments**

<table>

**event_register_snmp**

Registers for a Simple Network Management Protocol (SNMP) statistics event. Use this Tcl command extension to run a policy when a given counter specified by an SNMP object ID (oid) crosses a defined threshold.

**Syntax**

```
event_register_snmp [tag ?] oid ? get_type exact|next
entry_op gt|ge|eq|lt|le entry_val ?
entry_type value|increment|rate
[exit_comb or|and]
[exit_op gt|ge|eq|lt|le] [exit_val ?]
[exit_type value|increment|rate]
[exit_time ?] poll_interval ? [average_factor ?]
[queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tag</strong></td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td><strong>oid</strong></td>
<td>(Mandatory) OID number of data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). The types of OIDs allowed are:</td>
</tr>
<tr>
<td></td>
<td>- COUNTER_TYPE</td>
</tr>
<tr>
<td></td>
<td>- COUNTER_64_TYPE</td>
</tr>
<tr>
<td></td>
<td>- GAUGE_TYPE</td>
</tr>
<tr>
<td></td>
<td>- INTEGER_TYPE</td>
</tr>
<tr>
<td></td>
<td>- OCTET_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>- OPAQUE_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>- TIME_TICKS_TYPE</td>
</tr>
<tr>
<td><strong>entry_op</strong></td>
<td>(Mandatory) Entry comparison operator used to compare the current OID data value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.</td>
</tr>
<tr>
<td><strong>get_type</strong></td>
<td>(Mandatory) Type of SNMP get operation that needs to be applied to the OID specified. If the get_type argument is &quot;exact,&quot; the value of the specified OID is retrieved; if the get_type argument is &quot;next,&quot; the value of the lexicographical successor to the specified OID is retrieved.</td>
</tr>
<tr>
<td><strong>entry_val</strong></td>
<td>(Mandatory) Value with which the current oid data value should be compared to decide if the SNMP event should be raised.</td>
</tr>
<tr>
<td><strong>entry-type</strong></td>
<td>Specifies a type of operation to be applied to the object ID specified by the entry-val argument. Value is defined as the actual value of the entry-val argument. Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</td>
</tr>
<tr>
<td><strong>exit_comb</strong></td>
<td>(Optional) Exit combination operator used to indicate the combination of exit condition tests required to decide if the exit criteria are met so that the event monitoring can be reenabled. If it is &quot;and,&quot; both exit value and exit time tests must be passed to meet the exit criteria. If it is &quot;or,&quot; either exit value or exit time tests can be passed to meet the exit criteria. When exit_comb is &quot;and,&quot; exit_op, and exit_val (exit_time) must exist. When exit_comb is &quot;or,&quot; (exit_op and exit_val) or (exit_time) must exist.</td>
</tr>
<tr>
<td><strong>exit_op</strong></td>
<td>(Optional) Exit comparison operator used to compare the current oid data value with the exit value; if true, event monitoring for this event will be reenabled.</td>
</tr>
<tr>
<td><strong>exit_val</strong></td>
<td>(Optional) Value with which the current oid data value should be compared to decide if the exit criteria are met.</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>exit-type</strong></td>
<td>(Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed. Value is defined as the actual value of the exit-val argument. Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</td>
</tr>
<tr>
<td><strong>exit_time</strong></td>
<td>(Optional) Number of POSIX timer units after an event is raised when event monitoring will be enabled again. Specified in SSSSSSSSSS[.MMM] format where SSSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive. MMM represents milliseconds and must be an integer number between 0 and 999.</td>
</tr>
<tr>
<td><strong>poll_interval</strong></td>
<td>(Mandatory) Interval between consecutive polls in POSIX timer units. Currently the interval is forced to be at least 1 second (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td><strong>average-factor</strong></td>
<td>(Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1.</td>
</tr>
<tr>
<td><strong>queue_priority</strong></td>
<td>(Optional) Priority level at which the script will be queued: • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels. • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority. • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels. • queue_priority last--Specifies that the script is to be queued at the lowest priority level. If more than one script is registered with the &quot;queue_priority_last&quot; argument set, these scripts will execute in the order in which the events are published. <strong>Note</strong> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered. If this argument is not specified, the default queuing priority is normal.</td>
</tr>
</tbody>
</table>
maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

</tbody>
</table>
## event_register_snmp_notification

Registers for a Simple Network Management Protocol (SNMP) notification trap event. Use this Tcl command extension to run a policy when an SNMP trap with the specified SNMP object ID (oid) is encountered on a specific interface or address. The **snmp-server manager** CLI command must be enabled for the SNMP notifications to work using Tcl policies.

### Syntax

```
event_register_snmp_notification [tag?] oid ? oid_val ?
  [op {gt|ge|eq|ne|lt|le}]
  [maxrun ?]
  [src_ip_address ?]
  [dest_ip_address ?]
  [queue_priority {normal|low|high|last}]
  [maxrun ?]
  [nice {0|1}]
  [default ?]
  [direction {incoming|outgoing}]
  [msg_op {drop|send}]
```

### event_register_snmp_object

Registers for a Simple Network Management Protocol (SNMP) object event. Use this Tcl command extension to replace the value when an SNMP with the specified SNMP-object ID (OID) is encountered on a specific interface or address.

**Syntax**

```tcl
event_register_snmp_object oid ?
type {int|uint|counter|counter64|gauge|ipv4|oid|string}
sync {yes|no}
skip {yes|no}
[istable {yes|no}]
[default ?]
[queue_priority {normal|low|high|last}]
[maxrun ?]
[nice {0|1}]
```

## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>oid</strong></td>
<td>(Mandatory) OID number of the data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). If the specified OID ends with a dot (.), then all OIDs that start with the OID number before the dot are matched. The types of OIDs allowed are:</td>
</tr>
</tbody>
</table>
|               | • COUNTER_TYPE  
|               | • COUNTER_64_TYPE  
|               | • GAUGE_TYPE  
|               | • INTEGER_TYPE  
|               | • OCTET_PRIM_TYPE  
|               | • OPAQUE_PRIM_TYPE  
|               | • TIME_TICKS_TYPE  |
| **type**      | (Mandatory) OID value type.                                                                                                                   |
| **sync**      | (Mandatory) A "yes" means that the EEM policy will be notified. If the applet set_exit_status or Tcl return value is 0, then SNMP will handle the request. If the return value is 1, SNMP will use the value provided by the policy for the get request and will not process the set request. A "no" means that EEM will not be notified and SNMP will handle the request. Only one OID can be associated with a synchronous policy. However, multiple synchronous policies can be registered for the same OID. |
| **skip**      | Mandatory if the sync argument is "no" and should not exist if the sync argument is "yes." If the skip argument is "yes," it means that SNMP will handle the request. If the skip argument is "no," it means that SNMP will act as if the object does not exist. |
| **istable**   | (Optional) A value of "no" means the OID is scalar object, and "yes" means the OID is table object.                                             |
| **default**   | (Optional) The time period during which the SNMP Object event detector waits for the policy to exit (specified in sssssssss[.mmm] format, where sssssssss must be an integer representing seconds between 0 and 4294967295, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to process the set or get request normally by SNMP subsystem. If this argument is not specified, the default time period is set to 30 seconds. |
| **maxrun**    | (Optional) Maximum run time of the script (specified in sssssssss[.mmm] format, where sssssssss must be an integer representing seconds between 0 and 31536000, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
queue_priority *(Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the queue_priority_last argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

nice *(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Result String**

None

**Set_cerrno**

No

<td>The ID of the SNMP object in the received get or set request.</td>
</tr>
</tbody>
</table>
**event_register_syslog**

Registers for a syslog event. Use this Tcl command extension to trigger a policy when a syslog message of a specific pattern is logged after a certain number of occurrences during a certain period of time.

**Syntax**

```tcl
event_register_syslog [tag ?] [occurs ?] [period ?] pattern ?
[priority all|emergencies|alerts|critical|errors|warnings|notifications|
informational|debugging|0|1|2|3|4|5|6|7]
[queue_priority low|normal|high|last]
[severity_fatal] [severity_critical] [severity_major]
[severity_minor] [severity_warning] [severity_notification]
[severity_normal] [severity_debugging]
[maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>occurs</td>
<td>(Optional) Number of occurrences before the event is raised; if not specified, the event is raised on the first occurrence. If specified, the value must be greater than 0.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) Time interval, in seconds and milliseconds, during which the one or more occurrences must take place in order to raise an event (specified in SSSSSSSSSS[.MMM] format where SSSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive, and where MMM represents milliseconds and must be an integer number between 0 and 999). If this argument is not specified, no period check is applied.</td>
</tr>
<tr>
<td>pattern</td>
<td>(Mandatory) A regular expression used to perform syslog message pattern match. This argument is what the policy uses to identify the logged syslog message.</td>
</tr>
<tr>
<td>priority</td>
<td>(Optional) The message priority to be screened. If this argument is specified, only messages that are at the specified logging priority level, or lower, are screened. If this argument is not specified, the default priority is 0.</td>
</tr>
</tbody>
</table>
queue_priority  (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note**  The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum runtime of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

severity_xxx  (Optional) The event severity to be screened. If this argument is specified, only messages that are at the specified severity level are screened. See the table titled "Severity Level Mapping For Syslog Events" for the severity level mapping for syslog events.

If multiple conditions are specified, the syslog event will be raised when all the conditions are matched.

**event_register_timer**

Creates a timer and registers for a timer event as both a publisher and a subscriber. Use this Tcl command extension when there is a need to trigger a policy that is time specific or timer based. This event timer is both an event publisher and a subscriber. The publisher part indicates the conditions under which the named timer is to go off. The subscriber part identifies the name of the timer to which the event is subscribing.

**Note**

Both the CRON and absolute time specifications work on local time.

**Syntax**

```tcl
event_register_timer [tag?] watchdog|countdown|absolute|cron 
[name?] [cron_entry?]  
[time?]  
[queue_priority low|normal|high|last] [maxrun?]  
[nice 0|1]
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>watchdog</td>
<td>(Mandatory) Watchdog timer.</td>
</tr>
<tr>
<td>countdown</td>
<td>(Mandatory) Countdown timer.</td>
</tr>
<tr>
<td>absolute</td>
<td>(Mandatory) Absolute timer.</td>
</tr>
<tr>
<td>cron</td>
<td>(Mandatory) CRON timer.</td>
</tr>
<tr>
<td>name</td>
<td>(Optional) Name of the timer.</td>
</tr>
<tr>
<td>cron_entry</td>
<td>(Optional) Must be specified if the CRON timer type is specified. Must not be specified if any other timer type is specified. A cron_entry is a partial UNIX crontab entry (the first five fields) as used with the UNIX CRON daemon. A cron_entry specification consists of a text string with five fields. The fields are separated by spaces. The fields represent the time and date when CRON timer events will be triggered. The fields are described in the table titled &quot;Time and Date When CRON Events Will Be Triggered.&quot; Ranges of numbers are allowed. Ranges are two numbers separated with a hyphen. The specified range is inclusive. For example, 8-11 for an hour entry specifies execution at hours 8, 9, 10, and 11. A field may be an asterisk (<em>), which always stands for &quot;first-last.&quot; Lists are allowed. A list is a set of numbers (or ranges) separated by commas. Examples: &quot;1,2,5,9&quot; and &quot;0-4,8-12&quot;. Step values can be used in conjunction with ranges. Following a range with &quot;/&lt;number&gt;&quot; specifies skips of the number's value through the range. For example, &quot;0-23/2&quot; can be used in the hour field to specify an event that is triggered every other hour. Steps are also permitted after an asterisk, so if you want to say &quot;every two hours&quot;, use &quot;</em>/2&quot;. Names can also be used for the month and the day of week fields. Use the first three letters of the particular day or month (case does not matter). Ranges or lists of names are not allowed. The day on which a timer event is triggered can be specified by two fields: day of month and day of week. If both fields are restricted (that is, are not *), an event will be triggered when either field matches the current time. For example, &quot;30 4 1,15 * 5&quot; would cause an event to be triggered at 4:30 a.m. on the 1st and 15th of each month, plus every Friday. Instead of the first five fields, one of seven special strings may appear. These seven special strings are described in the table titled &quot;Special Strings for cron_entry.&quot; Example 1: &quot;0 0 1,15 * 1&quot; would trigger an event at midnight on the 1st and 15th of each month, as well as on every Monday. To specify days by only one field, the other field should be set to *; &quot;0 0 * * 1&quot; would trigger an event at midnight only on Mondays. Example 2: &quot;15 16 1 * *&quot; would trigger an event at 4:15 p.m. on the first day of each month. Example 3: &quot;0 12 * * 1-5&quot; would trigger an event at noon on Monday through Friday of each week. Example 4: &quot;@weekly&quot; would trigger an event at midnight once a week on Sunday.</td>
</tr>
</tbody>
</table>
time

(Optional) Must be specified if a timer type other than CRON is specified. Must not be specified if the CRON timer type is specified. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for the absolute timer, the calendar time of the expiration time. Time is specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999. An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately.

queue_priority

(Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun

(Optional) Maximum runtime of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice

(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

See Also

**event_register_timer_subscriber**

Registers for a timer event as a subscriber. Use this Tcl command extension to identify the name of the timer to which the event timer, as a subscriber, wants to subscribe. The event timer depends on another policy or another process to actually manipulate the timer. For example, let policyB act as a timer subscriber policy, but policyA (although it does not need to be a timer policy) uses register_timer, timer_arm, or timer_cancel Tcl command extensions to manipulate the timer referenced in policyB.

**Syntax**

```
event_register_timer_subscriber watchdog|countdown|absolute|cron name ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>watchdog</td>
<td>(Mandatory) Watchdog timer.</td>
</tr>
<tr>
<td>countdown</td>
<td>(Mandatory) Countdown timer.</td>

</tr>
<tr>
<td>cron</td>
<td>(Mandatory) CRON timer.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) Name of the timer.</td>
</tr>
</tbody>
</table>
queue_priority  (Optional) Priority level at which the script will be queued:

• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.

• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.

• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.

• queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note**  The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

---

**Note**  An EEM policy that registers for a timer event or a counter event can act as both publisher and subscriber.

"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u" "track_number {%u} track_state {%s}"
## event_register_wdsysmon

Registers for a Watchdog system monitor event. Use this Tcl command extension to register for a composite event which is a combination of several subevents or conditions. For example, you can use this command to register for the combination of conditions wherein the CPU usage of a certain process is over 80 percent and the memory used by the process is greater than 50 percent of its initial allocation. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
event_register_wdsysmon [tag ?] [timewin ?] [sub12_op and|or|andnot] [sub23_op and|or|andnot] [sub34_op and|or|andnot] [sub1 subevent-description] [sub2 subevent-description] [sub3 subevent-description] [sub4 subevent-description] [node ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

Each argument is position independent.

### Operator definitions

- **and**: logical and operation
- **or**: logical or operation
- **andnot**: logical and not operation

For example, "sub12_op and" is defined as raise an event when subevent 1 and subevent 2 are true; "sub23_op or" is defined as raise an event when the condition specified in sub12_op is true or subevent 3 is true. The logic can be diagrammed using: if (((sub1 sub12_op sub2) sub23_op sub3) sub34_op sub4) is TRUE, raise event

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>timewin</td>
<td>(Optional) Time window within which all of the subevents have to occur in order for an event to be generated (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>sub12_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and subevent 2.</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sub23_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3.</td>
</tr>
<tr>
<td>sub34_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3 and subevent 4.</td>
</tr>
<tr>
<td>sub1</td>
<td>(Optional) Indicates that subevent 1 is specified.</td>
</tr>
<tr>
<td>subevent-description</td>
<td>(Optional) Syntax for the subevent.</td>
</tr>
<tr>
<td>sub2</td>
<td>(Optional) Indicates that subevent 2 is specified.</td>
</tr>
<tr>
<td>sub3</td>
<td>(Optional) Indicates that subevent 3 is specified.</td>
</tr>
<tr>
<td>sub4</td>
<td>(Optional) Indicates that subevent 4 is specified.</td>
</tr>
<tr>
<td>node</td>
<td>(Optional) The node name to be monitored for deadlock conditions is a string that consists of the word &quot;node&quot; followed by two fields separated by a slash character using the following format: node&lt;slot-number&gt;/&lt;cpu-number&gt;</td>
</tr>
<tr>
<td></td>
<td>The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is the local node on which the registration is done.</td>
</tr>
<tr>
<td>queue_priority</td>
<td>(Optional) Priority level at which the script will be queued:</td>
</tr>
<tr>
<td></td>
<td>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
<tr>
<td></td>
<td>If more than one script is registered with the &quot;queue_priority_last&quot; argument set, these scripts will execute in the order in which the events are published.</td>
</tr>
<tr>
<td></td>
<td>Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default queuing priority is normal.</td>
</tr>
</tbody>
</table>
maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS.MM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### Subevents

The syntax of subevent descriptions can be one of seven cases.

For arguments in subevent description, the following constraints apply on the value of number arguments:

- For dispatch_mgr, val must be an integer between 0 and 4294967295, inclusive.
- For cpu_proc and cpu_tot, val must be an integer between 0 and 100, inclusive.
- For mem_proc, mem_tot_avail, and mem_tot_used, if is_percent is FALSE, val must be an integer between 0 and 4294967295, inclusive.

1. deadlock procname ?

#### Arguments

| procname | (Mandatory) A regular expression that specifies the process name that you wish to monitor for deadlock conditions. This subevent will ignore the time window even if it is given. |

2. dispatch_mgr [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [period ?]

#### Arguments

| procname | (Optional) A regular expression that specifies the process name that you wish to monitor for dispatch_manager status. |
| op | (Optional) Comparison operator used to compare the collected number of events with the specified value; if true, an event will be raised. |
| val | (Optional) The value with which the number of events that have occurred should be compared. |
| period | (Optional) The time period for the number of events that have occurred (specified in SSSSSSSSSSS.MM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

3. cpu_proc [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [period ?]
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proname</td>
<td>(Optional) A regular expression that specifies the process name that you wish to monitor for CPU utilization conditions.</td>
</tr>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected CPU usage sample percentage with the specified percentage value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) The percentage value with which the average CPU usage during the sample period should be compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) The time period for averaging the collection of samples (specified in SSSSSSSSXXX[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

4. cpu_tot [op gt|ge|eq|ne|lt|le] [val?] [period?] Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected total system CPU usage sample percentage with the specified percentage value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) The percentage value with which the average CPU usage during the sample period should be compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) The time period for averaging the collection of samples (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

5. mem_proc [proname?] [op gt|ge|eq|ne|lt|le] [val?] [is_percent TRUE|FALSE] [period?] Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proname</td>
<td>(Optional) A regular expression that specifies the process name that you wish to monitor for memory usage.</td>
</tr>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected memory used with the specified value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
</tbody>
</table>
If `is_percent` is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in `SSSSSSSSSS[.MMM]` format, where `SSSSSSSSSS` must be an integer representing seconds between 0 and 4294967295, inclusive, and where `MMM` must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

<table>
<thead>
<tr>
<th>Argument</th>

</tr>
<tr>
<td>pid</td>
<td>POSIX process ID for this subevent.</td>
</tr>
</tbody>
</table>

**Note** The three fields above describe the owner process of this dispatch manager.

| value | If the \texttt{sec} and \texttt{msec} variables are specified as 0 or are unspecified in the event registration Tcl command extension, the number of events processed by the dispatch manager is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the total number of events processed by this dispatch manager is in the given time window. |
| sec | If the \texttt{sec} and \texttt{msec} variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the \texttt{sec} and \texttt{msec} variables are the actual time difference between the time stamps of the oldest and latest samples in this time window. |
| msec |

### For cpu\_proc Subevent

```
"{type %s node {%s} procname {%s} pid %u value %u sec %ld msec %ld}"
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td>node</td>
<td>Name of the node that the POSIX process is on.</td>

</tr>
</tbody>
</table>

#### For cpu_tot Subevent

```
"{type %s node {%s} value %u sec %ld msec %ld}"
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td><strong>node</strong></td>
<td>Name of the node on which the total CPU utilization is being monitored.</td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>If the <strong>sec</strong> and <strong>msec</strong> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total CPU utilization is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total CPU utilization is in the given time window.</td>
</tr>
<tr>
<td><strong>sec msec</strong></td>
<td>If the <strong>sec</strong> and <strong>msec</strong> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <strong>sec</strong> and <strong>msec</strong> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

#### For mem_proc Subevent

```
"{type %s node {%s} procname {%s} pid %u is_percent %s value %u diff %d sec %ld msec %ld}"
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td><strong>node</strong></td>
<td>Name of the node that the POSIX process is on.</td>
</tr>
<tr>
<td><strong>procname</strong></td>
<td>POSIX process name for this subevent.</td>
</tr>
<tr>
<td><strong>pid</strong></td>
<td>POSIX process ID for this subevent.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The three fields above describe the process whose memory usage is being monitored.</td>
</tr>
<tr>
<td>Subevent Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>is_percent</strong></td>
<td>Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).</td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the process used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged process used memory utilization is in the given time window.</td>
</tr>
<tr>
<td><strong>diff</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the oldest and latest process used memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>sec msec</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>sec</code> and <code>msec</code> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

If the `is_percent` argument is FALSE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is the process used memory in the latest sample.
- **diff** is 0.
- **sec** and **msec** are both 0.

If the `is_percent` argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is the averaged process used memory sample value in the specified time window.
- **diff** is 0.
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest samples in this time window.

If the `is_percent` argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is 0.
- **diff** is the percentage difference between the oldest and latest process used memory samples in the specified time window.
- **sec** and **msec** are the actual time difference between the time stamps of the oldest and latest process used memory samples in this time window.
If the `is_percent` argument is TRUE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is 0.
- **diff** is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample.
- **sec** and **msec** are the actual time difference between the time stamps of the first process used memory sample ever collected and the latest process used memory sample.

### For `mem_tot_avail` Subevent

```
"{type %s node (%s) is_percent %s used %u avail %u diff %d sec %ld msec %ld}" 
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>type</strong></td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td><strong>node</strong></td>
<td>Name of the node for which the total available memory is being monitored.</td>
</tr>
<tr>
<td><strong>is_percent</strong></td>
<td>Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).</td>
</tr>
<tr>
<td><strong>used</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total used memory utilization is in the given time window.</td>
</tr>
<tr>
<td><strong>avail</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>avail</code> is in the latest total available memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>avail</code> is the total available memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>diff</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the oldest and latest total available memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>sec msec</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, they are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

If the `is_percent` argument is FALSE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is the total used memory in the latest sample.
- **avail** is the total available memory in the latest sample.
- **diff** is 0.
• sec and msec are both 0.

If the is_percent argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

• used is 0.
• avail is the averaged total available memory sample value in the specified time window.
• diff is 0.
• sec and msec are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the is_percent argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

• used is 0.
• avail is 0.
• diff is the percentage difference between the oldest and latest total available memory samples in the specified time window.
• sec and msec are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the is_percent argument is TRUE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

• used is 0.
• avail is 0.
• diff is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample.
• sec and msec are the actual time difference between the time stamps of the first total available memory sample ever collected and the latest total available memory sample.

For mem_tot_used Subevent

"{type %s node {%s} is_percent %s used %u avail %u diff %d sec %ld msec %ld}"

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td>node</td>
<td>Name of the node for which the total used memory is being monitored.</td>
</tr>
<tr>
<td>is_percent</td>
<td>Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).</td>
</tr>
<tr>
<td>Subevent Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>used</strong></td>
<td>If the sec and msec variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total used memory utilization is in the given time window.</td>
</tr>
<tr>
<td><strong>avail</strong></td>
<td>If the sec and msec variables are specified as 0 or are unspecified in the event registration Tcl command extension, the avail is in the latest total used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the avail is the total used memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>diff</strong></td>
<td>If the sec and msec variables are specified as 0 or are unspecified in the event registration Tcl command extension, the diff is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the diff is the percentage difference between the oldest and latest total used memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>sec msec</strong></td>
<td>If the sec and msec variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the sec and msec variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

If the is_percent argument is FALSE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is the total used memory in the latest sample,
- **avail** is the total available memory in the latest sample,
- **diff** is 0,
- **sec** and **msec** are both 0,

If the is_percent argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **used** is the averaged total used memory sample value in the specified time window,
- **avail** is 0,
- **diff** is 0,
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window,

If the is_percent argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **used** is 0.
- **avail** is 0.
• **diff** is the percentage difference between the oldest and latest total used memory samples in the specified time window.

• **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window.

If the **is_percent** argument is TRUE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

• **used** is 0.

• **avail** is 0.

• **diff** is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample.

• **sec** and **msec** are the actual time difference between the time stamps of the first total used memory sample ever collected and the latest total used memory sample.

---

**Note**

Inside a subevent description, each argument is position independent.
event_register_wdsysmon
CHAPTER 93

EEM Event Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  `[type ?]`

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

  `priority low|normal|high`

---

Note

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

Note

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- `event_completion`, on page 2097
- `event_completion_with_wait`, on page 2098
- `event_publish`, on page 2099
- `event_wait`, on page 2102

---

**event_completion**

Sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the return code of this event instance.

**Syntax**

```
event_completion status ?
```
Arguments

| status | (Mandatory) Exit status (return_code) of this event instance. A value of zero indicates no error and any other integer value indicates an error. |

Result String
None

Set _cerrno
No

event_completion_with_wait

The event_completion_with_wait command combines the two commands event_completion and event_wait into a single command for ease of use.

The event_completion command sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the return_code of this event instance.

The event_wait places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If event_wait policy is invoked before event_completed policy, an error results and the policy exits.

Syntax

event_completion_with_wait status ? [refresh_vars]

Arguments

| status | (Mandatory) exit_status (return_code) of this event instance. A value of zero indicates no error. Any other integer value indicates an error. |
| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

Result String
None

Set _cerrno
Yes

Sample Usage

Here is a similar example as above using this single command:

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```
```
set i 1
while {1 == 1} { # Start high performance policy loop
    array set arr_einfo [event_reqinfo]
    if {$_errno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
            $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    } action_syslog msg "event $i serviced" priority info
    if {$i == 5} {
        action_syslog msg "Exiting after servicing 5 events" priority info
        exit 0
    } incr i
    array set _event_state_arr [event_completion_with_wait status 0 refresh_vars 1]
    if {$_event_state_arr(event_state) != 0} {
        action_syslog msg "Exiting: failed event_state " 
            "$event_state_arr(event_state)" priority info
        exit 0
    }
}
```

Note

The running configuration output is the same as the event_publish Tcl command.

---

**event_publish**

Publishes an application-specific event.

**Syntax**

```
event_publish sub_system ? type ? [arg1 ?] [arg2 ?] [arg3 ?] [arg4 ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sub_system</td>
<td>(Mandatory) Number assigned to the EEM policy that published the application-specific event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td>type</td>
<td>(Mandatory) Event subtype within the specified component. The sub_system and type arguments uniquely identify an application event. Must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>[arg1 ?]-[arg4 ?]</td>
<td>(Optional) Four pieces of application event publisher string data.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set _errno**

Yes
(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

Sample Usage

This example demonstrates how to use the `event_publish` Tcl command extension to execute a script n times repeatedly to perform some function (for example, to measure the amount of CPU time taken by a given group of Tcl statements). This example uses two Tcl scripts.

Script1 publishes a type 9999 EEM event to cause Script2 to run for the first time. Script1 is registered as a none event and is run using the Cisco IOS CLI `event manager run` command. Script2 is registered as an EEM application event of type 9999, and this script checks to see if the application publish arg1 data (the iteration number) exceeds the EEM environment variable test_iterations value. If the test_iterations value is exceeded, the script writes a message and exits; otherwise the script executes the remaining statements and reschedules another run. To measure the CPU utilization for Script2, use a value of test_iterations that is a multiple of 10 to calculate the amount of average CPU time used by Script2.

To run the Tcl scripts, enter the following Cisco IOS commands:

```bash
configure terminal
  event manager environment test_iterations 100
  event manager policy script1.tcl
  event manager policy script2.tcl
end
event manager run script1.tcl
```

The Tcl script Script2 will be executed 100 times. If you execute the script without the extra processing and derive the average CPU utilization, and then add the extra processing and repeat the test, you can subtract the former CPU utilization from the later CPU utilization to determine the average for the extra processing.

Script1 (script1.tcl)

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
# Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
  set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
    $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
  error $result
}
# Cause the first iteration to run.
event_publish sub_system 798 type 9999 arg1 0
if {$_cerrno != 0} {
  set result [format \n    "component=%s; subsys err=%s; posix err=%s;\n%s" \
    $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
  error $result
}
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 3560-CX and 2960-CX Switches)
error $result
}

Script2 (script2.tcl)

::cisco::eem::event_register_appl sub_system 798 type 9999

# Check if all the required environment variables exist.
# If any required environment variable does not exist, print out an error msg and quit.
if {![info exists test_iterations]} {
    set result "Policy cannot be run: variable test_iterations has not been set"
    error $result $errorInfo
}

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

# Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str] 
    error $result
}

# Datal contains the arg1 value used to publish this event.
set iter [lindex $arr_einfo 0]

# Use the arg1 info from the previous run to determine when to end.
if {$iter >= $test_iterations} {
    # Log a message.
    action_syslog priority info msg "EEM application_publish test end"
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                     $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str] 
        error $result
    }
    exit 0
}

set iter [expr $iter + 1]

# Log a message.
set msg [format "EEM application_publish test iteration %s" $iter]
action_syslog priority info msg $msg
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str] 
    error $result
}

# Do whatever processing that you want to measure here.

# Cause the next iteration to run. Note that the iteration is passed to the
# next operation as arg1.
event_publish sub_system 798 type 9999 arg1 $iter
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                 $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str] 
    error $result
}
**event_wait**

Places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If **event_wait** policy is invoked before **event_completed** policy, an error results and the policy exits.

**Syntax**

```
event_wait [refresh_vars]
```

**Arguments**

| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

**Result String**

None

**Set_cerrno**

No

**Sample Usage**

The **event_wait** event detector returns an array type value with a single element named **event_state**. **Event_state** is a value sent back from the EEM Server indicating whether or not an error has occurred in processing the event. An example of an error here would be if the user configured **event_wait** before configuring **event_completion** when handling the event instance.

The following sample output shows the use of both **event_completion** and **event_wait** Tcl commands:

```plaintext
::cisco::eem::event_register_syslog tag e1 occurs 1 pattern CLEAR maxrun 0
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set i 1
while {1 == 1} {
    # Start high performance policy loop
    array set arr_einfo [event_reqinfo]
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \\
                    $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    }
    action_syslog msg "event $i serviced" priority info
    if {$_i == 5} {
        action_syslog msg "Exiting after servicing 5 events" priority info
        exit 0
    }
    incr i
    event_completion status 0
    array set _event_state_arr [event_wait refresh_vars 0]
    if {$_event_state_arr(event_state) != 0} {
        action_syslog msg "Exiting: failed event_state " \\
        "$_event_state_arr(event_state)" priority info
    }
}
```
exit 0
}
)

Here is an example of the running configuration:

```plaintext

Device#

Also while an event has been serviced and is waiting for the next event to come in show event manager policy active command will display the following output:

```
Device#show event manager policy active
Key: p - Priority  :L - Low, H - High, N - Normal, Z - Last
     s - Scheduling node :A - Active, S - Standby
default class - i script event
  no. job id  p s status time of event event type  name
  1  11  N  A wait  Mon Oct20 14:15:24 2008  syslog high_perf_example.tcl

In the above example the status is wait. This indicates that the policy is waiting for the next event to come in.
```
EEM Library Debug Command Extensions

- cli_debug, on page 2105
- smtp_debug, on page 2105

**cli_debug**

Prints a command-line interface (CLI) debug statement to syslog. This Tcl command extension is used to print a CLI debug statement to syslog if the debug event manager tcl cli_library Cisco IOS CLI command is in effect.

**Syntax**

```
cli_debug spec_string debug_string
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spec_string</td>
<td>(Mandatory) The spec_string argument is used to indicate the type of debug statement.</td>
</tr>
<tr>
<td>debug_string</td>
<td>(Mandatory) The debug_string argument is used to indicate the debugging text.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set _cerrno**

No

**smtp_debug**

Prints a Simple Mail Transfer Protocol (SMTP) debug statement to syslog. This Tcl command extension prints a SMTP debug statement to syslog if the debug event manager tcl smtp_library Cisco IOS command-line interface (CLI) command is in effect.
Syntax

smtp_debug spec_string debug_string

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spec_string</td>
<td>(Mandatory) The spec_string argument is used to indicate the type of debug statement.</td>
</tr>
<tr>
<td>debug_string</td>
<td>(Mandatory) The debug_string argument is used to indicate the debugging text.</td>
</tr>
</tbody>
</table>

Result String

None

Set _cerrno

No
EEM Multiple Event Support Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  [type ?]

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

    priority low|normal|high

**Note**

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

**Note**

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- attribute, on page 2107
- correlate, on page 2108
- trigger, on page 2109

**attribute**

Specifies a complex event.

**Syntax**

```
attribute tag ? [occurs ?]
```
Arguments

<table>
<thead>
<tr>
<th>tag</th>
<th>Specifies a tag using the event-tag argument that can be used with the attribute command to associate an event.</th>
</tr>
</thead>
<tbody>
<tr>
<td>occurs</td>
<td>(Optional) Specifies the number of occurrences before an EEM event is triggered. If not specified, an EEM event is triggered on the first occurrence. The range is from 1 to 4294967295.</td>
</tr>
</tbody>
</table>

Result String

None

Set _cerrno

No

**correlate**

Builds a single complex event and allows boolean logic to relate events and tracked objects.

**Syntax**

correlate event ? track ? [andnot | and | or] event ? track ?

**Arguments**

| event     | Specifies the event that can be used with the trigger command to support multiple event statements within a script.  
            | If the event associated with the event-tag argument occurs for the number of times specified by the trigger command, the result is true. If not, the result is false. |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| track     | Specifies the event object number for tracking. The range is from 1 to 500.  
            | If the tracked object is set, the result of the evaluation is true. If the tracked object is not set or is undefined, the result of the evaluation is false. This result is regardless of the state of the object. |
| andnot    | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is not executed. |
| and       | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is executed.  
            | **Note** When "and" is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes. |
| or        | (Optional) Specifies that if event 1 occurs the action is executed, or else if event 2 and event 3 occur together the action is executed. |
**trigger**

Specifies the multiple event configuration ability of Embedded Event Manager (EEM) events. A multiple event is one that can involve one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The events are raised based on the specified parameters.

**Syntax**

```
trigger [occurs?] [period?] [period-start?] [delay?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>occurs</strong></td>
<td>(Optional) Specifies the number of times the total correlation occurs before an EEM event is raised. When a number is not specified, an EEM event is raised on the first occurrence. The range is from 1 to 4294967295.</td>
</tr>
<tr>
<td><strong>period</strong></td>
<td>(Optional) Time interval in seconds and optional milliseconds, during which the one or more occurrences must take place. This is specified in the format <code>ssssssssss[.mmm]</code>, where <code>ssssssssss</code> must be an integer number representing seconds between 0 and 4294967295, inclusive and <code>mmm</code> represents milliseconds and must be an integer number between 0 to 999.</td>
</tr>
<tr>
<td><strong>period-start</strong></td>
<td>(Optional) Specifies the start of an event correlation window. If not specified, event monitoring is enabled after the first CRON period occurs.</td>
</tr>
<tr>
<td><strong>delay</strong></td>
<td>(Optional) Specifies the number of seconds and optional milliseconds after which an event will be raised if all the conditions are true (specified in the format <code>ssssssssss[.mmm]</code>, where <code>ssssssssss</code> must be an integer number representing seconds between 0 and 4294967295, inclusive and <code>mmm</code> represents milliseconds and must be an integer number between 0 to 999).</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set_cerrno**

No
EEM SMTP Library Command Extensions

All Simple Mail Transfer Protocol (SMTP) library command extensions belong to the :cisco:lib namespace.

To use this library, the user needs to provide an e-mail template file. The template file can include Tcl global variables so that the e-mail service and the e-mail text can be configured through the event manager environment Cisco IOS command-line interface (CLI) configuration command. There are commands in this library to substitute the global variables in the e-mail template file and to send the desired e-mail context with the To address, CC address, From address, and Subject line properly configured using the configured e-mail server.

E-Mail Template

The e-mail template file has the following format:

```
Mailservername: <space><the list of candidate SMTP server addresses>
From: <space><the e-mail address of sender>
To: <space><the list of e-mail addresses of recipients>
Cc: <space><the list of e-mail addresses that the e-mail will be copied to>
Sourceaddr: <space><the IP addresses of the recipients>
Subject: <subject line>
<body>
```

Based on RFC 2554, the SMTP e-mail server name--Mailservername-- can be in any one of the following template formats: username:password@host, username@host, or host.

```
Mailservername: _$email_server
From: _$email_from
To: _$email_to
Cc: _$email_cc
```

Note that the template normally includes Tcl global variables for configuration.

In a Tcl policy, the port number can be specified by a "Port" line in the e-mail template. If port is not specified, the default port of 25 is used.

Below is a sample e-mail template file:

```
Mailservername: $_email_server
From: $_email_from
To: $_email_to
Cc: $_email_cc
```
smtp_send_email

Given the text of an e-mail template file with all global variables already substituted, sends the e-mail out using Simple Mail Transfer Protocol (SMTP). The e-mail template specifies the candidate mail server addresses, To addresses, CC addresses, From address, subject line, and e-mail body.

Note

A list of candidate e-mail servers can be provided so that the library will try to connect the servers on the list one by one until it can successfully connect to one of them.

Syntax

smtp_send_email text

Arguments

text (Mandatory) The text of an e-mail template file with all global variables already substituted.

Result String

None

Set _cerrno

- Wrong 1st line format--Mailservername:list of server names.
- Wrong 2nd line format--From:from-address.
- Wrong 3rd line format--To:list of to-addresses.
- Wrong 4th line format--CC:list of cc-addresses.
- Error connecting to mail server:--$sock closed by remote server (where $sock is the name of the socket opened to the mail server).
- Error connecting to mail server:--$sock reply code is $k instead of the service ready greeting (where $sock is the name of the socket opened to the mail server; $k is the reply code of $sock).
- Error connecting to mail server:--cannot connect to all the candidate mail servers.
- Error disconnecting from mail server:--$sock closed by remote server (where $sock is the name of the socket opened to the mail server).
Sample Scripts

After all needed global variables in the e-mail template are defined:

```tcl
if [catch {smtp_subst [file join $tcl_library email_template_sm]} result] {
    puts stderr $result
    exit 1
}
if [catch {smtp_send_email $result} result] {
    puts stderr $result
    exit 1
}
```

smtp_subst

Given an e-mail template file `e-mail_template`, substitutes each global variable in the file by its user-defined value. Returns the text of the file after substitution.

Syntax

```tcl
smtp_subst e-mail_template
```

Arguments

<table>
<thead>
<tr>
<th>e-mail_template</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Mandatory) Name of an e-mail template file in which global variables need to be substituted by a user-defined value. An example filename could be /disk0://example.template which represents a file named example.template in a top-level directory on an ATA flash disk in slot 0.</td>
</tr>
</tbody>
</table>

Result String

The text of the e-mail template file with all the global variables substituted.

Set _cerrno

- cannot open e-mail template file
- cannot close e-mail template file
CHAPTER 97

EEM System Information Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  \[type\]

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

    priority low|normal|high

---

**Note**

All EEM system information commands--`sys_reqinfo_xxx`--have the Set _cerrno section set to yes.

---

**Note**

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- `sys_reqinfo_cli_freq`, on page 2116
- `sys_reqinfo_cli_history`, on page 2117

- `sys_reqinfo_snmp`, on page 2123
- `sys_reqinfo_syslog_freq`, on page 2124
sys_reqinfo_cli_freq

Queries the frequency information of all command-line interface (CLI) events.

Syntax

sys_reqinfo_cli_freq

Arguments

None

Result String

rec_list {{CLI frequency string 0},{CLI frequency str 1}, ...

Where each CLI frequency string is:
time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u period_sec %ld period_msec %ld pattern {%s}

<table>
<thead>
<tr>
<th>rec_list</th>
<th>Marks the start of the CLI event frequency list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_sec time_msec</td>
<td>Last time when this CLI event was raised.</td>
</tr>
<tr>
<td>match_count</td>
<td>Number of times that a CLI command matches the pattern specified by this CLI event specification.</td>
</tr>
</tbody>
</table>
| raise_count | Number of times that this CLI event was raised. The following fields are information about the CLI event specification:
  - sync--A "yes" means that event publish should be performed sychronously. The event detector will be notified when the Event Manager Server has completed publishing the event. The Event Manager Server will return a code that indicates whether or not the CLI command should be executed.
  - skip--A "yes" means that the CLI command should not be executed if the sync flag is not set. |
| occurs | Number of occurrences before an event is raised; if this argument is not specified, an event is raised on the first occurrence. |
| period_sec period_msec | Number of occurrences must occur within this number of POSIX timer units in order to raise event; if this argument is not specified, it does not apply. |
| pattern | Regular expression used to perform CLI command pattern matching. |

Set _cerrno

Yes
**sys_reqinfo_cli_history**

Queries the history of command-line interface (CLI) commands.

**Syntax**

```bash
sys_reqinfo_cli_history
```

**Arguments**

None

**Result String**

```text
rec_list {{CLI history string 0}, {CLI history str 1},...}
```

Where each CLI history string is:

```text
time_sec %ld time_msec %ld cmd {%s}
```

<table>
<thead>
<tr>
<th>rec_list</th>
<th>Marks the start of the CLI command history list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_sec</td>
<td>Time when the CLI command was run.</td>
</tr>
<tr>
<td>time_msec</td>
<td></td>
</tr>
<tr>
<td>cmd</td>
<td>Text of the CLI command.</td>
</tr>
</tbody>
</table>

**Set_cerrno**

Yes

**sys_reqinfo_cpu_all**

Queries the CPU utilization of the top processes (both POSIX processes and IOS processes) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```bash
sys_reqinfo_cpu_all order cpu_used [sec ?] [msec ?] [num ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>order</td>
<td>(Mandatory) Order used for sorting the CPU utilization of processes.</td>
</tr>
<tr>
<td>cpu_used</td>
<td>(Mandatory) Specifies that the average CPU utilization, for the specified time window, will be sorted in descending order.</td>
</tr>
</tbody>
</table>
### sec msec
(Optional) The time period, in seconds and milliseconds, during which the average CPU utilization is calculated. Must be integers in the range from 0 to 4294967295. If not specified, or if both sec and msec are specified as 0, the most recent CPU sample is used.

### num
(Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

### Result String

```
rec_list {{process CPU info string 0},{process CPU info string 1}, ...}
```

Where each process CPU info string is:

```
pid %u name {%s} cpu_used %u
```

- **rec_list** Marks the start of the process CPU information list.
- **pid** Process ID.
- **name** Process name.
- **cpu_used** Specifies that if sec and msec are specified with a number greater than zero, the average percentage is calculated from the process CPU utilization during the specified time period. If sec and msec are both zero or not specified, the average percentage is calculated from the process CPU utilization in the latest sample.

### Set _errno

Yes

### sys_reqinfo_crash_history

Queries the crash information of all processes that have ever crashed. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
sys_reqinfo_crash_history
```

### Arguments

None

### Result String

```
rec_list {{crash info string 0},{crash info string 1}, ...}
```

Where each crash info string is:

```
job_id %u name {%s} respawn_count %u fail_count %u dump_count %u
inst_id %d exit_status 0x%x exit_type %d proc_state {%s} component_id 0x%x
  crash_time_sec %ld crash_time_msec %ld
```

- **rec_list** Marks the start of the crash information list.
<table>
<thead>
<tr>
<th>job_id</th>
<th>System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Process name.</td>
</tr>
<tr>
<td>respawn_count</td>
<td>Total number of restarts for the process.</td>
</tr>
<tr>
<td>fail_count</td>
<td>Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.</td>
</tr>
<tr>
<td>dump_count</td>
<td>Number of core dumps performed.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Process instance ID.</td>
</tr>
<tr>
<td>exit_status</td>
<td>Last exit status of the process.</td>
</tr>
<tr>
<td>exit_type</td>
<td>Last exit type.</td>
</tr>
<tr>
<td>proc_state</td>
<td>Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_rnode, stop, waitEOLtimer, wait_rnode, wait_spawntimer, wait_tpl.</td>
</tr>
<tr>
<td>component_id</td>
<td>Version manager assigned component ID for the component to which the process belongs.</td>
</tr>
<tr>
<td>crash_time_sec crash_time_msec</td>
<td>Seconds and milliseconds since January 1, 1970, which represent the last time the process crashed.</td>
</tr>
</tbody>
</table>

**Set_errno**

Yes

---

**sys_reqinfo_mem_all**

Queries the memory usage of the top processes (both POSIX and IOS) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```tcl
sys_reqinfo_mem_all order allocates|increase|used [sec ?] [msec ?] [num ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>order</th>
<th>(Mandatory) Order used for sorting the memory usage of processes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>allocates</td>
<td>(Mandatory) Specifies that the memory usage is sorted by the number of process allocations during the specified time window, and in descending order.</td>
</tr>
<tr>
<td>increase</td>
<td>(Mandatory) Specifies that the memory usage is sorted by the percentage of process memory increase during the specified time window, and in descending order.</td>
</tr>
<tr>
<td>used</td>
<td>(Mandatory) Specifies that the memory usage is sorted by the current memory used by the process.</td>
</tr>
</tbody>
</table>
sec msec  (Optional) The time period, in seconds and milliseconds, during which the process memory usage is calculated. Must be integers in the range from 0 to 4294967295. If both sec and msec are specified and are nonzero, the number of allocations is the difference between the number of allocations in the oldest and latest samples collected in the time period. The percentage is calculated as the the percentage difference between the memory used in the oldest and latest samples collected in the time period. If not specified, or if both sec and msec are specified as 0, the first sample ever collected is used as the oldest sample; that is, the time period is set to be the time from startup until the current moment.

num  (Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

Result String

rec_list {{process mem info string 0},{process mem info string 1}, ...}

Where each process mem info string is:

pid %u name {%s} delta_allocs %d initial_alloc %u current_alloc %u percent_increase %d

rec_list Marks the start of the process memory usage information list.

pid Process ID.

name Process name.

delta_allocs Specifies the difference between the number of allocations in the oldest and latest samples collected in the time period.

initial_alloc Specifies the amount of memory, in kilobytes, used by the process at the start of the time period.

current_alloc Specifies the amount of memory, in kilobytes, currently used by the process.

percent_increase Specifies the percentage difference between the memory used in the oldest and latest samples collected in the time period. The percentage difference can be expressed as current_alloc minus initial_alloc times 100 and divided by initial_alloc.

Set __errno

Yes

sys_reqinfo_proc

Queries the information about a single POSIX process. This Tcl command extension is supported only in Software Modularity images.

Syntax

sys_reqinfo_proc job_id ?
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_id</td>
<td>(Mandatory) System manager assigned job ID for the process. Must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

### Result String

```
job_id %u component_id 0x%x name {%s} helper_name {%s} helper_path {%s} path {%s}
node_name {%s} isRespawn %u isMandatory %u isHold %u dumpOption %d
max_dump_count %u respawn_count %u fail_count %u dump_count %u
lastRespawnSec %ld lastRespawnMsec %ld instId %u procState %s
level %d exitStatus 0x%x exitType %d
```

- **job_id**: System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.
- **component_id**: Version manager assigned component ID for the component to which the process belongs.
- **name**: Process name.
- **helper_name**: Helper process name.
- **helper_path**: Executable path of the helper process.
- **path**: Executable path of the process.
- **node_name**: System manager assigned node name for the node to which the process belongs.
- **isRespawn**: Flag that specifies that the process can be respawned.
- **isMandatory**: Flag that specifies that the process must be alive.
- **isHold**: Flag that specifies that the process is spawned until called by the API.
- **dumpOption**: Core dumping options.
- **max_dump_count**: Maximum number of core dumping permitted.
- **respawn_count**: Total number of restarts for the process.
- **fail_count**: Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.
- **dump_count**: Number of core dumps performed.
- **lastRespawnSec**: Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the last time the process was started.
- **instId**: Process instance ID.
- **procState**: Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_mode, stop, waitEOLtimer, wait_mode, wait_spawntimer, wait_templ.
**sys_reqinfo_proc_all**

Queries the information of all POSIX processes. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```
sys_reqinfo_proc_all
```

**Arguments**

None

**Result String**

```
rec_list {(process info string 0), (process info string 1),...}
```

Where each process info string is the same as the result string of the `sysreq_info_proc` Tcl command extension.

**Set _cerrno**

Yes

---

**sys_reqinfo_routername**

Queries the device name.

**Syntax**

```
sys_reqinfo_routername
```

**Arguments**

None

**Result String**

```
routername %s
```

---

<table>
<thead>
<tr>
<th>level</th>
<th>Process run level.</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit_status</td>
<td>Last exit status of the process.</td>
</tr>
<tr>
<td>exit_type</td>
<td>Last exit type.</td>
</tr>
</tbody>
</table>
Where routernam is the name of the device.

Set _cerrno
Yes

**sys_reqinfo_snmp**

Queries the value of the entity specified by a Simple Network Management Protocol (SNMP) object ID.

**Syntax**

```
sys_reqinfo_snmp oid ? get_type exact|next
```

**Arguments**

<table>
<thead>
<tr>
<th>oid</th>
<th>(Mandatory) SNMP OID in dot notation (for example, 1.3.6.1.2.1.2.1.0).</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_type</td>
<td>(Mandatory) Type of SNMP get operation that needs to be applied to the specified oid. If the get_type is &quot;exact,&quot; the value of the specified oid is retrieved; if the get_type is &quot;next,&quot; the value of the lexicographical successor to the specified oid is retrieved.</td>
</tr>
</tbody>
</table>

**Result String**

```
oid {%s} value {%s}
```

<table>
<thead>
<tr>
<th>oid</th>
<th>SNMP OID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value string of the associated SNMP data element.</td>
</tr>
</tbody>
</table>

Set _cerrno
Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 37)  FH_ENOSNMPDATA  (can't retrieve data from SNMP)

This error means that there was no data for the SNMP object type.

(_cerr_sub_err = 51)  FH_ESTATSTYP  (invalid statistics data type)

This error means that the SNMP statistics data type was invalid.
sys_reqinfo_syslog_freq

Queries the frequency information of all syslog events.

**Syntax**

```
sys_reqinfo_syslog_freq
```

**Arguments**

None

**Result String**

```
rec_list {{event frequency string 0}, {log freq str 1}, ...}
```

Where each event frequency string is:

```
time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u
period_sec %ld period_msec %ld pattern {%s}
```

- `time_sec`: Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the time the last event was raised.
- `match_count`: Number of times that a syslog message matches the pattern specified by this syslog event specification since event registration.
- `raise_count`: Number of times that this syslog event was raised.
- `occurs`: Number of occurrences needed in order to raise the event; if not specified, the event is raised on the first occurrence.
- `period_sec`: Number of occurrences must occur within this number of POSIX timer units in order to raise the event; if not specified, the period check does not apply.
- `pattern`: Regular expression used to perform syslog message pattern matching.

**Set _cerrno**

Yes

```
(_cerr_sub_err = 54)   FH_EFDUNAVAIL  (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```
(_cerr_sub_err = 2)   FH_ESYSERR   (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 9)   FH_EMEMORY   (insufficient memory for request)
```
This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 45)  FH_ESEQNUM  (sequence or workset number out of sync)
This error means that the event detector sequence or workset number was invalid.

(_cerr_sub_err = 46)  FH_EREGEMPTY  (registration list is empty)
This error means that the event detector registration list was empty.

(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)
This error means that the event detector was unavailable.

**sys_reqinfo_syslog_history**

Queries the history of the specified syslog message.

**Syntax**

```plaintext
sys_reqinfo_syslog_history
```

**Arguments**

None

**Result String**

```plaintext
rec_list {{log hist string 0}, {log hist str 1}, ...}
```

Where each log hist string is:

```plaintext
time_sec %ld time_msec %ld msg {%s}
```

- `time_sec` and `time_msec`: Seconds and milliseconds since January 1, 1970, which represent the time the message was logged.
- `msg`: Syslog message.

**Set _cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.
(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 44)  FH_EHISTEMPTY  (history list is empty)
This error means that the history list was empty.

(_cerr_sub_err = 45)  FH_ESEQNUM  (sequence or workset number out of sync)
This error means that the event detector sequence or workset number was invalid.

(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)
This error means that the event detector was unavailable.
The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

\[[\text{type}]\]

  - A question mark ? represents a variable to be entered.
  
  - Choices between arguments are represented by pipes, for example:

\[\text{priority low}\mid\text{normal}\mid\text{high}\]

---

**Note**

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- appl_read, on page 2128
- appl_reqinfo, on page 2128
- appl_setinfo, on page 2129
- counter_modify, on page 2130
- description, on page 2131
- fts_get_stamp, on page 2132
- register_counter, on page 2133
- register_timer, on page 2134
- timer_arm, on page 2136
- timer_cancel, on page 2137
- unregister_counter, on page 2138
**appl_read**

Reads Embedded Event Manager (EEM) application volatile data. This Tcl command extension provides support for reading EEM application volatile data. EEM application volatile data can be published by a Cisco software process that uses the EEM application publish API. EEM application volatile data cannot be published by an EEM policy.

---

**Note**

Currently there are no Cisco software processes that publish application volatile data.

---

**Syntax**

appl_read name ? length ?

**Arguments**

<table>
<thead>
<tr>
<th>name</th>
<th>(Mandatory) Name of the application published string data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>(Mandatory) Length of the string data to read. Must be an integer number between 1 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

**Result String**

data %s

Where data is the application published string data to be read.

**Set _cerrno**

Yes

(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 7) FH_ENOSUCHKEY (could not find key)

This error means that the application event detector info key or other ID was not found.

(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)

This error means that an internal EEM request for memory failed.

---

**appl_reqinfo**

Retrieves previously saved information from the Embedded Event Manager (EEM). This Tcl command extension provides support for retrieving information from EEM that has been previously saved with a unique
key, which must be specified in order to retrieve the information. Note that retrieving the information deletes it from EEM. It must be resaved if it is to be retrieved again.

Syntax

appl_reqinfo key ?

Arguments

key (Mandatory) The string key of the data.

Result String

data %s

Where data is the application string data to be retrieved.

Set_cerrno

Yes

(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = ?) FH_ENOSUCHKEY (could not find key)

This error means that the application event detector info key or other ID was not found.

appl_setinfo

Saves information in the Embedded Event Manager (EEM). This Tcl command extension provides support for saving information in the Embedded Event Manager that can be retrieved later by the same policy or by another policy. A unique key must be specified. This key allows the information to be retrieved later.

Syntax

appl_setinfo key ? data ?

Arguments

key (Mandatory) The string key of the data.
data (Mandatory) The application string data to save.

Result String

None
Set_cerrno

Yes

(_cerr_sub_err = 2)    FH_ESYSERR    (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 8)    FH_EDUPLICATEKEY    (duplicate appl info key)
This error means that the application event detector info key or other ID was a duplicate.

(_cerr_sub_err = 9)    FH_EMEMORY    (insufficient memory for request)
This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 34)    FH_EMAXLEN    (maximum length exceeded)
This error means that the object length or number exceeded the maximum.

(_cerr_sub_err = 43)    FH_EBADLENGTH    (bad API length)
This error means that the API message length was invalid.

counter_modify

Modifies a counter value.

Syntax

counter_modify event_id ? val ? op nop|set|inc|dec

Arguments

table:

<table>
<thead>
<tr>
<th>event_id</th>
<th>(Mandatory) The counter event ID returned by the register_counter Tcl command extension. Must be an integer between 0 and 4294967295, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>(Mandatory)</td>
</tr>
<tr>
<td>Note</td>
<td>Mandatory except when the op nop argument value combination is specified.</td>
</tr>
<tr>
<td></td>
<td>• If op is set, this argument represents the counter value that is to be set.</td>
</tr>
<tr>
<td></td>
<td>• If op is inc, this argument is the value by which to increment the counter.</td>
</tr>
<tr>
<td></td>
<td>• If op is dec, this argument is the value by which to decrement the counter.</td>
</tr>
<tr>
<td>op</td>
<td>(Mandatory)</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>- nop</td>
<td>Retrieves the current counter value.</td>
</tr>
<tr>
<td>- set</td>
<td>Sets the counter value to the given value.</td>
</tr>
<tr>
<td>- inc</td>
<td>Increments the counter value by the given value.</td>
</tr>
<tr>
<td>- dec</td>
<td>Decrement the counter value by the given value.</td>
</tr>
</tbody>
</table>

**Result String**

val_remain %d

Where val_remain is the current value of the counter.

**Set _cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 11)  FH_ENOSUCHESID  (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 30)  FH_ECTBADOPER  (bad counter threshold operator)

This error means that the counter event detector set or modify operator was invalid.

**description**

Provides a brief description of the registered policy.

**Syntax**

description ?

**Arguments**

| line | (Optional) Brief description of the policy consisting of 1 to 240 characters. |
Result String
None

Set _cerrno
Yes

Sample Usage
The description statement is entered by the author of the policy. It can appear before or after any event registration statement in Tcl. The policy can have only one description.

Note
Registration of a policy with more than one description statement will fail.

The following example shows how a brief description is provided for the event_register_syslog policy:

```tcl
::cisco::eem::description "This Tcl command looks for the word count in syslog messages."
::cisco::eem::event_register_syslog tag 1 ...
::cisco::eem::event_register_snmp_object tag 2 ...
::cisco::eem::trigger {
    ::cisco::eem::correlate event 1 and event 2
    ::cisco::eem::attribute tag 1 occurs 1
    ::cisco::eem::attribute tag 2 occurs 1
}
```

fts_get_stamp

Returns the time period elapsed since the last software boot. Use this Tcl command extension to return the number of nanoseconds since boot in an array "nsec nnnn" where nnnn is the number of nanoseconds.

Syntax

```tcl```
fts_get_stamp
```tcl```

Arguments
None

Result String
nsec %d

Where nsec is the number of nanoseconds since boot.

Set _cerrno
No
**register_counter**

Registers a counter and returns a counter event ID. This Tcl command extension is used by a counter publisher to perform this registration before using the event ID to manipulate the counter.

**Syntax**

```
register_counter name ?
```

**Arguments**

| name | (Mandatory) The name of the counter to be manipulated. |

**Result String**

```
event_id %d
event_spec_id %d
```

Where `event_id` is the counter event ID for the specified counter; it can be used to manipulate the counter by the `unregister_counter` or `counter_modify` Tcl command extensions. The `event_spec_id` argument is the event specification ID for the specified counter.

**Set _cerrno**

Yes

| (_cerr_sub_err = 2) | FH_ESYSERR  (generic/unknown error from OS/system) |

This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

| (_cerr_sub_err = 4) | FH_EINITONCE  (Init() is not yet done, or done twice.) |

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

| (_cerr_sub_err = 6) | FH_EBADEVENTTYPE  (unknown EEM event type) |

This error means that the event type specified in the internal event specification was invalid.

| (_cerr_sub_err = 9) | FH_EMEMORY  (insufficient memory for request) |

This error means that an internal EEM request for memory failed.

| (_cerr_sub_err = 10) | FH_ECORRUPT  (internal EEM API context is corrupt) |

This error means that the internal EEM API context structure is corrupt.

| (_cerr_sub_err = 11) | FH_ENOSUCHESID  (unknown event specification ID) |

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.
(_cerr_sub_err = 12) FH_ENOSUCHEID  (unknown event ID)
This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 16) FH_EBADFMPPTR  (bad ptr to fh_p data structure)
This error means that the context pointer that is used with each EEM API call is incorrect.

(_cerr_sub_err = 17) FH_EBADADDRESS  (bad API control block address)
This error means that a control block address that was passed in the EEM API was incorrect.

(_cerr_sub_err = 22) FH_ENULLPTR  (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 25) FH_ESUBSEXCEED  (number of subscribers exceeded)
This error means that the number of timer or counter subscribers exceeded the maximum.

(_cerr_sub_err = 26) FH_ESUBSIDXINV  (invalid subscriber index)
This error means that the subscriber index was invalid.

(_cerr_sub_err = 54) FH_EFDUNAVAIL  (connection to event detector unavailable)
This error means that the event detector was unavailable.

(_cerr_sub_err = 56) FH_EFDCONNERR  (event detector connection error)
This error means that the EEM event detector that handles this request is not available.

register_timer

Registers a timer and returns a timer event ID. This Tcl command extension is used by a timer publisher to perform this registration before using the event ID to manipulate the timer if it does not use the event_register_timer command extension to register as a publisher and subscriber.

Syntax

register_timer watchdog|countdown|absolute|cron name ?

Arguments

name  (Mandatory) The name of the timer to be manipulated.

Result String

event_id %u
Where event_id is the timer event ID for the specified timer (can be used to manipulate the timer by the `timer_arm` or `timer_cancel` command extensions).

**Set _cerrno**

Yes

```
(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

```
(_cerr_sub_err = 4)  FH_EINITONCE  (Init() is not yet done, or done twice.)
```

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

```
(_cerr_sub_err = 6)  FH_EBADEVENTTYPE  (unknown EEM event type)
```

This error means that the event type specified in the internal event specification was invalid.

```
(_cerr_sub_err = 9)  FH_EMEMORY  (insufficient memory for request)
```

This error means that an internal EEM request for memory failed.

```
(_cerr_sub_err = 10)  FH_ECORRUPT  (internal EEM API context is corrupt)
```

This error means that the internal EEM API context structure is corrupt.

```
(_cerr_sub_err = 11)  FH_ENOSUCHESID  (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```
(_cerr_sub_err = 16)  FH_EBADFMPPTR  (bad ptr to fh_p data structure)
```

This error means that the context pointer that is used with each EEM API call is incorrect.

```
(_cerr_sub_err = 17)  FH_EBADADDRESS  (bad API control block address)
```

This error means that a control block address that was passed in the EEM API was incorrect.

```
(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```
(_cerr_sub_err = 25)  FH_ESUBSEXCEED  (number of subscribers exceeded)
```

This error means that the number of timer or counter subscribers exceeded the maximum.

```
(_cerr_sub_err = 26)  FH_ESUBSIDXINV  (invalid subscriber index)
```

This error means that the subscriber index was invalid.

```
(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)
```
This error means that the event detector was unavailable.

\[ (_\text{cerr}_{-}\text{sub}_{-}\text{err} = 56) \quad \text{FH}_{-}\text{EFDCONNERR} \quad (\text{event detector connection error}) \]

This error means that the EEM event detector that handles this request is not available.

---

**timer\_arm**

Arms a timer. The type could be CRON, watchdog, countdown, or absolute.

**Syntax**

\[ \text{timer\_arm} \ \text{event\_id} \ ? \ \text{cron\_entry} \ ? \ | \text{time} \ ? \]

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_id</td>
<td>(Mandatory) The timer event ID returned by the register_timer command extension. Must be an integer between 0 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>cron_entry</td>
<td>(Mandatory) Must exist if the timer type is CRON. Must not exist for other types of timer. CRON timer specification uses the format of the CRON table entry.</td>
</tr>
<tr>
<td>time</td>
<td>(Mandatory) Must exist if the timer type is not CRON. Must not exist if the timer type is CRON. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for an absolute timer, the calendar time of the expiration time (specified in [ \text{SSSSSSSSSS[MMM]} ] format, where [ \text{SSSSSSSSSS} ] must be an integer representing seconds between 0 and 4294967295, inclusive, and where [ \text{MMM} ] must be an integer representing milliseconds between 0 and 999). An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately.</td>
</tr>
</tbody>
</table>

**Result String**

\[ \text{sec\_remain} \ %ld \ \text{msec\_remain} \ %ld \]

Where sec\_remain and msec\_remain are the remaining time before the next expiration of the timer.

---

**Note**

A value of 0 will be returned for the sec\_remain and msec\_remain arguments if the timer type is CRON.

---

**Set\_cerrno**

Yes

\[ (_\text{cerr}_{-}\text{sub}_{-}\text{err} = 2) \quad \text{FH}_{-}\text{ESYSERR} \quad (\text{generic/unknown error from OS/system}) \]

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.
(_cerr_sub_err = 6) FH_EBADEVENTTYPE (unknown EEM event type)

This error means that the event type specified in the internal event specification was invalid.

(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)

This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 12) FH_ENOSUCHEID (unknown event ID)

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 27) FH_ETMDELAYZR (zero delay time)

This error means that the time specified to arm a timer was zero.

(_cerr_sub_err = 42) FH_ENOTREGISTERED (request for event spec that is unregistered)

This error means that the event was not registered.

(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)

This error means that the event detector was unavailable.

(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)

This error means that the EEM event detector that handles this request is not available.

timer_cancel

Cancels a timer.

**Syntax**

timer_cancel event_id ?

**Arguments**

| event_id | (Mandatory) The timer event ID returned by the register_timer command extension. Must be an integer between 0 and 4294967295, inclusive. |
Result String

sec_remain %ld msec_remain %ld

Where sec_remain and msec_remain are the remaining time before the next expiration of the timer.

Note

A value of 0 will be returned for sec_remain and msec_remain if the timer type is CRON.

Set _cerrno

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 6)  FH_EBADEVENTTYPE  (unknown EEM event type)

This error means that the event type specified in the internal event specification was invalid.

(_cerr_sub_err = 7)  FH_ENOSUCHKEY  (could not find key)

This error means that the application event detector info key or other ID was not found.

(_cerr_sub_err = 11)  FH_ENOSUCHESID  (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 12)  FH_ENOSUCHEID  (unknown event ID)

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)

This error means that the event detector was unavailable.

(_cerr_sub_err = 56)  FH_EFDCONNERR  (event detector connection error)

This error means that the EEM event detector that handles this request is not available.

unregister_counter

Unregisters a counter. This Tcl command extension is used by a counter publisher to unregister a counter that was previously registered with the register_counter Tcl command extension.
Syntax

\texttt{unregister\_counter event\_id ? event\_spec\_id ?}

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_id</td>
<td>(Mandatory) Counter event ID returned by the \texttt{register_counter} command extension. Must be an integer between 0 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>event_spec_id</td>
<td>(Mandatory) Counter event specification ID for the specified counter returned by the \texttt{register_counter} command extension. Must be an integer between 0 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

Result String

None

Set \_cerrno

Yes

\begin{itemize}
  \item [\texttt{(_cerr\_sub\_err = 2)}] \texttt{FH\_ESYSERR} (generic/unknown error from OS/system)
  \item [\texttt{(_cerr\_sub\_err = 9)}] \texttt{FH\_EMEMORY} (insufficient memory for request)
  \item [\texttt{(_cerr\_sub\_err = 11)}] \texttt{FH\_ENOSUCHESID} (unknown event specification ID)
  \item [\texttt{(_cerr\_sub\_err = 22)}] \texttt{FH\_ENULLPTR} (event detector internal error - ptr is null)
  \item [\texttt{(_cerr\_sub\_err = 26)}] \texttt{FH\_ESUBSIDXINV} (invalid subscriber index)
  \item [\texttt{(_cerr\_sub\_err = 54)}] \texttt{FH\_EFDUNAVAIL} (connection to event detector unavailable)
  \item [\texttt{(_cerr\_sub\_err = 56)}] \texttt{FH\_EFDCONNERR} (event detector connection error)
\end{itemize}

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

This error means that an internal EEM request for memory failed.

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

This error means that an internal EEM event detector pointer was null when it should have contained a value.

This error means that the subscriber index was invalid.

This error means that the event detector was unavailable.

This error means that the EEM event detector that handles this request is not available.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VTP

Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more devices and have those changes automatically communicated to all the other devices in the network. Without VTP, you cannot send information about VLANs to other devices.

VTP is designed to work in an environment where updates are made on a single device and are sent through VTP to other devices in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on devices in the same domain, which would result in an inconsistency in the VLAN database.

The device supports a total of 1000 VLANs. However, the number of routed ports, SVIs, and other configured features affects the usage of the device hardware. If the device is notified by VTP of a new VLAN and the device is already using the maximum available hardware resources, it sends a message that there are not
enough hardware resources available and shuts down the VLAN. The output of the `show vlan` user EXEC command shows the VLAN in a suspended state.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the device and that this trunk port is connected to the trunk port of another device. Otherwise, the device cannot receive any VTP advertisements.

Restrictions for VTP

Note

Before adding a VTP client device to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. If you add a device that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

The following are restrictions for configuring VTPs:

- 1K VLAN is supported only on switches running the LAN Base image with the lanbase-default template set.

- To avoid warning messages of high CPU utilization with a normal-range VLAN configuration, we recommended to have no more than 256 VLANs.

In such cases, approximately 10 access interfaces or 5 trunk interfaces can flap simultaneously with negligible impact to CPU utilization (if there are more interfaces that flap simultaneously, then CPU usage may be excessively high.)

Information About VTP

VTP

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3.

You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

VTP Domain

A VTP domain (also called a VLAN management domain) consists of one device or several interconnected devices under the same administrative responsibility sharing the same VTP domain name. A device can be in only one VTP domain. You make global VLAN configuration changes for the domain.
By default, the device is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the device receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The device then ignores advertisements with a different domain name or an earlier configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all devices in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a device for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other devices in the domain, and they affect only the individual device. However, configuration changes made when the device is in this mode are saved in the device running configuration and can be saved to the device startup configuration file.

### VTP Modes

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP server</td>
<td>In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other devices in the same VTP domain and synchronize their VLAN configurations with other devices based on advertisements received over trunk links. VTP server is the default mode. In VTP server mode, VLAN configurations are saved in NVRAM. If the device detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the device cannot be returned to VTP server mode until the NVRAM is functioning.</td>
</tr>
</tbody>
</table>
### VTP Modes

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP client</td>
<td>A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode. In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode.</td>
</tr>
<tr>
<td>VTP transparent</td>
<td>VTP transparent devices do not participate in VTP. A VTP transparent device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent devices do forward VTP advertisements that they receive from other devices through their trunk interfaces. You can create, modify, and delete VLANs on a device in VTP transparent mode. In VTP versions 1 and 2, the device must be in VTP transparent mode when you create private VLANs and when they are configured, you should not change the VTP mode from transparent to client or server mode. VTP version 3 also supports private VLANs in client and server modes. When private VLANs are configured, do not change the VTP mode from transparent to client or server mode. When the device is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other devices. In this mode, VTP mode and domain name are saved in the device running configuration, and you can save this information in the device startup configuration file by using the <code>copy running-config startup-config</code> privileged EXEC command.</td>
</tr>
<tr>
<td>VTP off</td>
<td>A device in VTP off mode functions in the same manner as a VTP transparent device, except that it does not forward VTP advertisements on trunks.</td>
</tr>
</tbody>
</table>

**Related Topics**

- Configuring VTP Mode, on page 2152
- Example: Configuring Switch as VTP Server, on page 2164
VTP Advertisements

Each device in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring devices receive these advertisements and update their VTP and VLAN configurations as necessary.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
- Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:

- VLAN IDs (including IEEE 802.1Q)
- VLAN name
- VLAN type
- VLAN state
- Additional VLAN configuration information specific to the VLAN type

In VTP version 3, VTP advertisements also include the primary server ID, an instance number, and a start index.

Related Topics

Prerequisites for VTP

VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:

- Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.
- Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the device is operating in VTP server mode.
- Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent device inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent device forwards a message only when the domain name matches.
• Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

**Related Topics**
* Enabling the VTP Version, on page 2156

**VTP Version 3**

VTP version 3 supports these features that are not supported in version 1 or version 2:

- Enhanced authentication—You can configure the authentication as hidden or secret. When hidden, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format in the running configuration. You must reenter the password if you enter a takeover command in the domain. When you enter the secret keyword, you can directly configure the password secret key.

- Support for extended range VLAN (VLANs 1006 to 4094) database propagation—VTP versions 1 and 2 propagate only VLANs 1 to 1005.

  **Note**
  VTP pruning still applies only to VLANs 1 to 1005, and VLANs 1002 to 1005 are still reserved and cannot be modified.

- Private VLAN support.

- Support for any database in a domain—In addition to propagating VTP information, version 3 can propagate Multiple Spanning Tree (MST) protocol database information. A separate instance of the VTP protocol runs for each application that uses VTP.

- VTP primary server and VTP secondary servers—A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to its NVRAM.

  By default, all devices come up as secondary servers. You can enter the `vtp primary` privileged EXEC command to specify a primary server. Primary server status is only needed for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers. Primary server status is lost if the device reloads or domain parameters change, even when a password is configured on the device.

  **Related Topics**
  * Enabling the VTP Version, on page 2156

**VTP Pruning**

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a device floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving devices might discard them. VTP pruning is disabled by default.
VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible device trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each device in the domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all devices in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

---

**VTP Configuration Guidelines**

**VTP Configuration Requirements**

When you configure VTP, you must configure a trunk port so that the device can send and receive VTP advertisements to and from other devices in the domain.

VTP versions 1 and 2 do not support private VLANs. VTP version 3 does support private VLANs. If you configure private VLANs, the device must be in VTP transparent mode. When private VLANs are configured on the device, do not change the VTP mode from transparent to client or server mode.

**VTP Settings**

The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the device running configuration file, and you can save it in the device startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the device resets.

When you save VTP information in the device startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

**Related Topics**

[Configuring a VTP Version 3 Primary Server](#), on page 2155
Domain Names for Configuring VTP

When configuring VTP for the first time, you must always assign a domain name. You must configure all devices in the VTP domain with the same domain name. Devices in VTP transparent mode do not exchange VTP messages with other devices, and you do not need to configure a VTP domain name for them.

Note

If the NVRAM and DRAM storage is sufficient, all devices in a VTP domain should be in VTP server mode.

Caution

Do not configure a VTP domain if all devices are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one device in the VTP domain for VTP server mode.

Related Topics

Adding a VTP Client to a VTP Domain, on page 2160

Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain devices must share the same password and you must configure the password on each device in the management domain. Devices without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a device that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the device accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new device to an existing network with VTP capability, the new device learns the domain name only after the applicable password has been configured on it.

Caution

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each device in the domain.

Related Topics

Configuring a VTP Version 3 Password, on page 2154
Example: Configuring a Switch as the Primary Server, on page 2163

VTP Version

Follow these guidelines when deciding which VTP version to implement:

• All devices in a VTP domain must have the same domain name, but they do not need to run the same VTP version.

• A VTP version 2-capable device can operate in the same VTP domain as a device running VTP version 1 if version 2 is disabled on the version 2-capable device (version 2 is disabled by default).

• If a device running VTP version 1, but capable of running VTP version 2, receives VTP version 3 advertisements, it automatically moves to VTP version 2.
• If a device running VTP version 3 is connected to a device running VTP version 1, the VTP version 1 device moves to VTP version 2, and the VTP version 3 device sends scaled-down versions of the VTP packets so that the VTP version 2 device can update its database.

• A device running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.

• Do not enable VTP version 2 on a device unless all of the devices in the same VTP domain are version-2-capable. When you enable version 2 on a device, all of the version-2-capable devices in the domain enable version 2. If there is a version 1-only device, it does not exchange VTP information with devices that have version 2 enabled.

• Cisco recommends placing VTP version 1 and 2 devices at the edge of the network because they do not forward VTP version 3 advertisements.

• If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.

• When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.

• When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.

• A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.

• Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.

• Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.

### Default VTP Configuration

The following table shows the default VTP configuration.

### Table 212: Default VTP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP domain name</td>
<td>Null</td>
</tr>
<tr>
<td>VTP mode (VTP version 1 and version 2)</td>
<td>Server</td>
</tr>
</tbody>
</table>
How to Configure VTP

Configuring VTP Mode

You can configure VTP mode as one of these:

- **VTP server mode**—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.

- **VTP client mode**—In VTP client mode, you cannot change its VLAN configuration. The client device receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.

- **VTP transparent mode**—In VTP transparent mode, VTP is disabled on the device. The device does not send VTP updates and does not act on VTP updates received from other device. However, a VTP transparent device running VTP version 2 does forward received VTP advertisements on its trunk links.

- **VTP off mode**—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a device to a different domain.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vtp domain domain-name`
4. `vtp mode {client | server | transparent | off; {vlan | mst | unknown}}`
5. `vtp password password`
6. `end`
7. `show vtp status`
8. `copy running-config startup-config`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; <code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>vtp domain domain-name</code></td>
<td>Configures the VTP administrative-domain name. The name can be 1 to 32 characters. All devices operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# <code>vtp domain eng_group</code></td>
<td>This command is optional for modes other than server mode. VTP server mode requires a domain name. If the device has a trunk connection to a VTP domain, the device learns the domain name from the VTP server in the domain. You should configure the VTP domain before configuring other VTP parameters.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`vtp mode {client</td>
<td>server</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# <code>vtp mode server</code></td>

</tbody>
</table>
### Configuring a VTP Version 3 Password

You can configure a VTP version 3 password on the device.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vtp version 3`
4. `vtp password password [hidden | secret]`
5. `end`
6. `show vtp password`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

### Configuring a VTP Version 3 Password

- Verifies your entries in the *VTP Operating Mode* and the *VTP Domain Name* fields of the display.
- (Optional) Saves the configuration in the startup configuration file.
- Only VTP mode and domain name are saved in the device running configuration and can be copied to the startup configuration file.

---

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vtp version 3`
4. `vtp password password [hidden | secret]`
5. `end`
6. `show vtp password`
7. `copy running-config startup-config`
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 3    | vtp version 3  
**Example:**  
Switch(config)# vtp version 3 | Enables VTP version 3 on the device. The default is VTP version 1. |
| 4    | vtp password *password [hidden | secret]  
**Example:**  
Switch(config)# vtp password mypassword hidden | (Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters. 
- (Optional) **hidden**—Saves the secret key generated from the password string in the nvram:vlan.dat file. If you configure a takeover by configuring a VTP primary server, you are prompted to reenter the password. 
- (Optional) **secret**—Directly configures the password. The secret password must contain 32 hexadecimal characters. |
| 5    | end  
**Example:**  
Switch(config)# end | Returns to privileged EXEC mode. |
| 6    | show vtp password  
**Example:**  
Switch# show vtp password | Verifies your entries. The output appears like this:  
VTP password: 89914640C8D90868B6A0D8103847A733 |
| 7    | copy running-config startup-config  
**Example:**  
Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

  Example: Configuring a Switch as the Primary Server, on page 2163

### Configuring a VTP Version 3 Primary Server

When you configure a VTP server as a VTP primary server, the takeover operation starts.

**SUMMARY STEPS**

1. vtp version 3
2. `vtp primary [vlan | mst] [force]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>vtp version 3</strong></td>
<td>Enables VTP version 3 on the device. The default is VTP version 1.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# vtp version 3</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>`vtp primary [vlan</td>
<td>mst] [force]`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# vtp primary vlan force</code></td>
<td></td>
</tr>
</tbody>
</table>

- **(Optional) vlan**—Selects the VLAN database as the takeover feature. This is the default.
- **(Optional) mst**—Selects the multiple spanning tree (MST) database as the takeover feature.
- **(Optional) force**—Overwrites the configuration of any conflicting servers. If you do not enter `force`, you are prompted for confirmation before the takeover.

**Related Topics**

---

**Enabling the VTP Version**

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a device, every VTP version 2-capable device in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each device.

- With VTP versions 1 and 2, you can configure the version only on devices in VTP server or transparent mode. If a device is running VTP version 3, you can change to version 2 when the device is in client mode if no extended VLANs exist, no private VLANs exist, and no hidden password was configured.

**Caution**

VTP version 1 and VTP version 2 are not interoperable on devices in the same VTP domain. Do not enable VTP version 2 unless every device in the VTP domain supports version 2.

- In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.
In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. vtp version {1 | 2 | 3}
4. end
5. show vtp status
6. copy running-config startup-config

**DETAILED STEPS**

<td></td>
</tr>
</tbody>
</table>
Enabling VTP Pruning

Before you begin

VTP pruning is not designed to function in VTP transparent mode. If one or more devices in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the device upstream to the VTP transparent device pruning ineligible.

To configure VTP pruning on an interface, use the `switchport trunk pruning vlan` interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

### SUMMARY STEPS

1. enable
2. configure terminal
3. vtp pruning
4. end
5. show vtp status

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>

**Adding a VTP Client to a VTP Domain**

Follow these steps to verify and reset the VTP configuration revision number on a device **before** adding it to a VTP domain.
Before you begin

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a device that has a revision number higher than the revision number in the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the `vtp mode transparent` global configuration command to disable VTP on the device and then to change its VLAN information without affecting the other devices in the VTP domain.

SUMMARY STEPS

1. enable
2. show vtp status
3. configure terminal
4. vtp domain *domain-name*
5. end
6. show vtp status
7. configure terminal
8. vtp domain *domain-name*
9. end
10. show vtp status

</tr>
</thead>
<tbody>
<tr>
<td>show vtp counters</td>
<td>Displays counters about VTP messages that have been sent and received.</td>
</tr>
<tr>
<td>show vtp devices [conflict]</td>
<td>Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The <code>show vtp devices</code> command does not display information when the device is in transparent or off mode.</td>
</tr>
<tr>
<td>show vtp interface [interface-id]</td>
<td>Displays VTP status and configuration for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>show vtp password</td>
<td>Displays the VTP password. The form of the password displayed depends on whether or not the <code>hidden</code> keyword was entered and if encryption is enabled on the device.</td>
</tr>
<tr>
<td>show vtp status</td>
<td>Displays the VTP device configuration information.</td>
</tr>
</tbody>
</table>

Configuration Examples for VTP

Example: Configuring a Switch as the Primary Server

This example shows how to configure a device as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

```
Switch# vtp primary vlan
Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain

VTP Database  Conf  Switch ID  Primary Server Revision  System Name
-------------  ----  -------------  -----------------  ------------------
VLANDB        Yes  00d0.00b8.1400-00d0.00b8.1400  1  stp7

Do you want to continue (y/n) [n]? y
```
Example: Configuring Switch as VTP Server

This example shows how to configure the switch as a VTP server with the domain name `eng_group` and the password `mypassword`:

```
Switch(config)# vtp domain eng_group
Setting VTP domain name to eng_group.

Switch(config)# vtp mode server
Setting device to VTP Server mode for VLANS.

Switch(config)# vtp password mypassword
Setting device VLAN database password to mypassword.
Switch(config)# end
```

Example: Enabling VTP on the Interface

To enable VTP on the interface, use the `vtp` interface configuration command. To disable VTP on the interface, use the `no vtp` interface configuration command.

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# vtp
Switch(config-if)# end
```

Example: Creating the VTP Password

The follow is an example of creating the VTP password.

```
Switch(config)# vtp password mypassword hidden
Generating the secret associated to the password.
Switch(config)# end
Switch# show vtp password
VTP password: 89914640C8D90868B6A0D8103847A733
```

Where to Go Next

After configuring VTP, you can configure the following:

- VLANS
- VLAN Trunking
• VLAN Membership Policy Server (VMPS)
• Voice VLANs
CHAPTER 100

VLANs

• Finding Feature Information, on page 2167
• Prerequisites for VLANs, on page 2167

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

• Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.

• The switch supports 1000 VLANs in VTP client, server, and transparent modes.

Restrictions for VLANs

The following are restrictions for configuring VLANs:
• To avoid warning messages of high CPU utilization with a normal-range VLAN configuration, we recommend that you have no more than 256 VLANs. In such cases, approximately 10 access interfaces or 5 trunk interfaces can flap simultaneously with negligible impact to CPU utilization (if there are more interfaces that flap simultaneously, then CPU usage may be excessively high.)

**Information About VLANs**

**Logical Networks**

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any device port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a device supporting fallback bridging. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the device is assigned manually on an interface-by-interface basis. When you assign device interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed.

The device can route traffic between VLANs by using device virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.

**Supported VLANs**

The switch supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). In these versions, the switch must be in VTP transparent mode when you create VLAN IDs from 1006 to 4094. Cisco IOS Release 12.2(52)SE and later support VTP version 3. VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3. You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

The switch supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN. The switch supports only IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.

**VLAN Port Membership Modes**

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the device learns and manages the addresses associated with the port on a per-VLAN basis.
Table 214: Port Membership Modes and Characteristics

<table>
<thead>
<tr>
<th>Membership Mode</th>
<th>VLAN Membership Characteristics</th>
<th>VTP Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static-access</td>
<td>A static-access port can belong to one VLAN and is manually assigned to that VLAN.</td>
<td>VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the device connected to a trunk port of a second device.</td>
</tr>
<tr>
<td>Trunk (IEEE 802.1Q):</td>
<td>A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list.</td>
<td>VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other devices over trunk links.</td>
</tr>
<tr>
<td>Dynamic access</td>
<td>A dynamic-access port can belong to one VLAN (VLAN ID 1 to 4094) and is dynamically assigned by a VLAN Member Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch, for example, but never a Catalyst switch. The Catalyst switch is a VMPS client. You can have dynamic-access ports and trunk ports on the same device, but you must connect the dynamic-access port to an end station or hub and not to another device.</td>
<td>VTP is required. Configure the VMPS and the client with the same VTP domain name. To participate in VTP, at least one trunk port on the device must be connected to a trunk port of a second device.</td>
</tr>
<tr>
<td>Voice VLAN</td>
<td>A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.</td>
<td>VTP is not required; it has no effect on a voice VLAN.</td>
</tr>
</tbody>
</table>

VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the vlan.dat file (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The vlan.dat file is stored in flash memory. If the VTP mode is transparent, they are also saved in the device running configuration file.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the device, the device configuration is selected as follows:
• If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

• If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.

• In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

• From image 15.0(02)SE6, on vtp transparent and off modes, vlans get created from startup-config even if they are not applied to the interface.

Note
Ensure that you delete the vlan.dat file along with the configuration files before you reset the switch configuration using write erase command. This ensures that the switch reboots correctly on a reset.

Normal-Range VLAN Configuration Guidelines

Normal-range VLANs are VLANs with IDs from 1 to 1005.

VTP 1 and 2 only support normal-range VLANs.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

• Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

• VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the device running configuration file.

• If the device is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)

• With VTP versions 1 and 2, the device supports VLAN IDs 1006 through 4094 only in VTP transparent mode (VTP disabled). These are extended-range VLANs and configuration options are limited. Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode. If extended VLANs are configured, you cannot convert from VTP version 3 to version 1 or 2.

• Before you can create a VLAN, the device must be in VTP server mode or VTP transparent mode. If the device is a VTP server, you must define a VTP domain or VTP will not function.

• The device does not support Token Ring or FDDI media. The device does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.

• The device supports 128 spanning tree instances. If a device has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs.
If you have already used all available spanning-tree instances on a device, adding another VLAN anywhere in the VTP domain creates a VLAN on that device that is not running spanning-tree. If you have the default allowed list on the trunk ports of that device (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent devices that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of devices that have used up their allocation of spanning-tree instances.

If the number of VLANs on the device exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your device to map multiple VLANs to a single spanning-tree instance.

**Extended-Range VLAN Configuration Guidelines**

Extended-range VLANs are VLANs with IDs from 1006 to 4094. VTP 3 only supports extended-range VLANs.

Follow these guidelines when creating extended-range VLANs:

- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the device is running VTP version 3.

- You cannot include extended-range VLANs in the pruning eligible range.

- For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the device boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the device resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.

**Default VLAN Configurations**

**Default Ethernet VLAN Configuration**

The following table displays the default configuration for Ethernet VLANs.
The switch supports Ethernet interfaces exclusively. Because FDDI and Token Ring VLANs are not locally supported, you only configure FDDI and Token Ring media-specific characteristics for VTP global advertisements to other switches.

### Table 215: Ethernet VLAN Defaults and Range

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>1</td>
<td>1 to 4094.</td>
</tr>
<tr>
<td>VLAN name</td>
<td>VLANxxxx, where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number</td>
<td>No range</td>
</tr>
<tr>
<td>IEEE 802.10 SAID</td>
<td>100001 (100000 plus the VLAN ID)</td>
<td>1 to 4294967294</td>
</tr>
<tr>
<td>IEEE 802.10 SAID</td>
<td>1500</td>
<td>576-18190</td>
</tr>
<tr>
<td>Private VLANs</td>
<td>none configured</td>
<td>2 to 1001, 1006 to 4094</td>
</tr>
</tbody>
</table>

**Note**

Extended-range VLANs (VLAN IDs 1006 to 4094) are only saved in the VLAN database in VTP version 3.

### Default VLAN Configuration

You can change only the MTU size, private VLAN, and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

**Note**

The switch must be running the LAN Base image to support remote SPAN.

### How to Configure VLANs

#### How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
Creating or Modifying an Ethernet VLAN

Each Ethernet VLAN in the VLAN database has a unique, 4-digit ID that can be a number from 1 to 1001. VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs. To create a normal-range VLAN to be added to the VLAN database, assign a number and name to the VLAN.

Note
With VTP version 1 and 2, if the device is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

SUMMARY STEPS

1. enable
2. configure terminal
3. vlan vlan-id
4. name vlan-name
5. mtu mtu-size
6. remote-span
7. end
8. show vlan {name vlan-name | id vlan-id}
9. copy running-config startup-config

You can cause inconsistency in the VLAN database if you attempt to manually delete the vlan.dat file. If you want to modify the VLAN configuration, follow the procedures in this section.
### Detailed Steps

<table>

<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> mtu mtu-size</td>
<td>(Optional) Changes the MTU size (or other VLAN characteristic).</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-vlan)# mtu 256</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> remote-span</td>
<td>(Optional) Configures the VLAN as the RSPAN VLAN for a remote SPAN session.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-vlan)# remote-span</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> show vlan {name vlan-name</td>
<td>id vlan-id}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# show vlan name test20 id 20</td>
<td></td>
</tr>
</tbody>
</table>
Deleting a VLAN

When you delete a VLAN from a device that is in VTP server mode, the VLAN is removed from the VLAN database for all devices in the VTP domain. When you delete a VLAN from a device that is in VTP transparent mode, the VLAN is deleted only on that specific device.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

Caution
When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

SUMMARY STEPS

1. enable
2. configure terminal
3. no vlan vlan-id
4. end
5. show vlan brief
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>

### Assigning Static-Access Ports to a VLAN

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `switchport mode access`
4. `switchport access vlan vlan-id`
5. `end`
6. `show running-config interface interface-id`
7. `show interfaces interface-id switchport`

#### Command or Action | Purpose
--- | ---
`Switch(config)# no vlan 4` | Shows the removal of VLAN 4.

**Step 4**

`end`

**Example:**

`Switch(config)# end`

**Step 5**

`show vlan brief`

**Example:**

`Switch# show vlan brief`

**Step 6**

`copy running-config startup-config`

**Example:**

`Switch# copy running-config startup-config`

| Step 7 | **show interfaces interface-id switchport**  
*Example:*  
Switch# show interfaces gigabitethernet 1/0/1 switchport | Verifies your entries in the *Administrative Mode* and the *Access Mode* *VLAN* fields of the display. |
How to Configure Extended-Range VLANs

With VTP version 1 and version 2, when the switch is in VTP transparent mode (VTP disabled), you can create extended-range VLANs (in the range 1006 to 4094). VTP version supports extended-range VLANs in server or transparent move. Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any switchport commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file by using the copy running-config startup-config privileged EXEC command. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

Creating an Extended-Range VLAN

You create an extended-range VLAN in global configuration mode by entering the vlan global configuration command with a VLAN ID from 1006 to 4094. The extended-range VLAN has the default Ethernet VLAN characteristics and the MTU size, and RSPAN configuration are the only parameters you can change. See the description of the vlan global configuration command in the command reference for the default settings of all parameters. In VTP version 1 or 2, if you enter an extended-range VLAN ID when the switch is not in VTP transparent mode, an error message is generated when you exit VLAN configuration mode, and the extended-range VLAN is not created.

In VTP version 1 and 2, extended-range VLANs are not saved in the VLAN database; they are saved in the switch running configuration file. You can save the extended-range VLAN configuration in the switch startup configuration file by using the copy running-config startup-config privileged EXEC command. VTP version 3 saves extended-range VLANs in the VLAN database.

SUMMARY STEPS

1. configure terminal
2. vtp mode transparent
3. vlan vlan-id
4. mtu mtu size
5. remote-span
6. end
7. show vlan id vlan-id
8. copy running-config startup config

Configuration Examples

Example: Creating a VLAN Name

This example shows how to create Ethernet VLAN 20, name it test20, and add it to the VLAN database:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# name test20
Switch(config-vlan)# end
```

Example: Configuring a Port as Access Port

This example shows how to configure a port as an access port in VLAN 2:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 2
Switch(config-if)# end
```

Example: Creating an Extended-Range VLAN

This example shows how to create a new extended-range VLAN with all default characteristics, enter VLAN configuration mode, and save the new VLAN in the switch startup configuration file:

```
Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config
```
Where to Go Next

After configuring VLANs, you can configure the following:

• VLAN Trunking Protocol (VTP)
• VLAN trunks
• Private VLANs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco devices connected through IEEE 802.1Q trunks, the devices maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco device to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco device combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q device. However, spanning-tree information for each VLAN is maintained by Cisco devices separated by a cloud of non-Cisco IEEE 802.1Q devices. The non-Cisco IEEE 802.1Q cloud separating the Cisco devices is treated as a single trunk link between the devices.

- Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
• Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

Information About VLAN Trunks

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet device interfaces and another networking device such as a router or a device. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

Note

You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle.

Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

Layer 2 Interface Modes, on page 2184

Layer 2 Interface Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchport mode access</td>
<td>Puts the interface (access port) into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The interface becomes a nontrunk interface regardless of whether or not the neighboring interface is a trunk interface.</td>
</tr>
<tr>
<td>switchport mode dynamic auto</td>
<td>Makes the interface able to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to trunk or desirable mode. The default switchport mode for all Ethernet interfaces is dynamic auto.</td>
</tr>
</tbody>
</table>
### Mode | Function
---|---
switchport mode dynamic desirable | Makes the interface actively attempt to convert the link to a trunk link. The interface becomes a trunk interface if the neighboring interface is set to trunk, desirable, or auto mode.

switchport mode trunk | Puts the interface into permanent trunking mode and negotiates to convert the neighboring link into a trunk link. The interface becomes a trunk interface even if the neighboring interface is not a trunk interface.

switchport nonegotiate | Prevents the interface from generating DTP frames. You can use this command only when the interface switchport mode is access or trunk. You must manually configure the neighboring interface as a trunk interface to establish a trunk link.

switchport mode private-vlan | Configures the private VLAN mode.

**Note** The `switchport mode private-vlan` command option is not supported.

- Trunking Modes, on page 2184

### Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the `switchport trunk allowed` setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

### Related Topics
- Defining the Allowed VLANs on a Trunk, on page 2189
Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting devices. To avoid loops, STP normally blocks all but one parallel link between devices. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same device. For load sharing using STP path costs, each load-sharing link can be connected to the same device or to two different devices.

Network Load Sharing Using STP Priorities

When two ports on the same device form a loop, the device uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

Related Topics

Configuring Load Sharing Using STP Port Priorities, on page 2194

Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

Related Topics

Configuring Load Sharing Using STP Path Cost, on page 2197

Feature Interactions

Trunking interacts with other features in these ways:

- A trunk port cannot be a secure port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
  - Allowed-VLAN list.
  - STP port priority for each VLAN.
  - STP Port Fast setting.
  - Trunk status:
    - If one port in a port group ceases to be a trunk, all ports cease to be trunks.
- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
• If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

• A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

Default Layer 2 Ethernet Interface VLAN Configuration

The following table shows the default Layer 2 Ethernet interface VLAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface mode</td>
<td><code>switchport mode dynamic auto</code></td>
</tr>
<tr>
<td>Allowed VLAN range</td>
<td>VLANs 1 to 4094</td>
</tr>
<tr>
<td>VLAN range eligible for pruning</td>
<td>VLANs 2 to 1001</td>
</tr>
<tr>
<td>Default VLAN (for access ports)</td>
<td>VLAN 1</td>
</tr>
<tr>
<td>Native VLAN (for IEEE 802.1Q trunks)</td>
<td>VLAN 1</td>
</tr>
</tbody>
</table>

How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

• If you do not intend to trunk across those links, use the `switchport mode access` interface configuration command to disable trunking.

• To enable trunking to a device that does not support DTP, use the `switchport mode trunk` and `switchport nonegotiate` interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Configuring an Ethernet Interface as a Trunk Port

Configuring a Trunk Port

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the device and that this trunk port is connected to the trunk port of a second device. Otherwise, the device cannot receive any VTP advertisements.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode {dynamic {auto | desirable} | trunk}`
5. `switchport access vlan vlan-id`
6. `switchport trunk native vlan vlan-id`
7. `end`
8. `show interfaces interface-id switchport`
9. `show interfaces interface-id trunk`
10. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> switchport mode {dynamic {auto</td>
<td>desirable}</td>
</tr>
<tr>
<td>Example: Switch(config-if)# switchport mode dynamic desirable</td>
<td>- <strong>dynamic auto</strong>—Sets the interface to a trunk link if the neighboring interface is set to trunk or desirable mode. This is the default.</td>
</tr>
<tr>
<td></td>
<td>- <strong>dynamic desirable</strong>—Sets the interface to a trunk link if the neighboring interface is set to trunk, desirable, or auto mode.</td>
</tr>
<tr>
<td></td>
<td>- <strong>trunk</strong>—Sets the interface in permanent trunking mode and negotiate to convert the link to a trunk link even if the neighboring interface is not a trunk interface.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> switchport access vlan vlan-id</td>
<td>(Optional) Specifies the default VLAN, which is used if the interface stops trunking.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Defining the Allowed VLANs on a Trunk

VLAN 1 is the default VLAN on all trunk ports in all Cisco devices, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

<table>
<thead>
<tr>

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport mode trunk
5. end
6. show interfaces interface-id switchport
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
   enable
   Example:
   Switch> enable | Enables privileged EXEC mode.
   • Enter your password if prompted. |
| **Step 2**
   configure terminal
   Example:
   Switch# configure terminal | Enters global configuration mode. |
| **Step 3**
   interface interface-id
   Example:
   Switch(config)# interface gigabitethernet 1/0/1 | Specifies the port to be configured, and enters interface configuration mode. |
| **Step 4**
   switchport mode trunk
   Example:
   Switch(config-if)# switchport mode trunk | Configures the interface as a VLAN trunk port. |
| **Step 5**
   end
   Example:
   Switch(config)# end | Returns to privileged EXEC mode. |
| **Step 6**
   show interfaces interface-id switchport
   Example:
   Switch# show interfaces gigabitethernet 1/0/1 switchport | Verifies your entries in the Trunking VLANs Enabled field of the display. |
### Purpose

Command or Action | Purpose
--- | ---
**Step 7** | 
| copy running-config startup-config | (Optional) Saves your entries in the configuration file.

<tr>
<td>Switch(config)# interface gigabitethernet0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport trunk pruning vlan {add</td>
</tr>
</tbody>
</table>
### Configuring the Native VLAN for Untagged Traffic

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the device forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the device sends the packet with a tag.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport trunk native vlan vlan-id`
5. `end`

<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**
- **vtp domain domain-name**
- **Example:**
  ```
  Switch(config)# vtp domain workdomain
  ```
  Configures a VTP administrative domain. The domain name can be 1 to 32 characters.

**Step 4**
- **vtp mode server**
- **Example:**
  ```
  Switch(config)# vtp mode server
  ```
  Configures Device A as the VTP server.

**Step 5**
- **end**
- **Example:**
  ```
  Switch(config)# end
  ```
  Returns to privileged EXEC mode.

**Step 6**
- **show vtp status**
- **Example:**
  ```
  Switch# show vtp status
  ```
  Verifies the VTP configuration on both Device A and Device B. In the display, check the *VTP Operating Mode* and the *VTP Domain Name* fields.

**Step 7**
- **show vlan**
- **Example:**
  ```
  Switch# show vlan
  ```
  Verifies that the VLANs exist in the database on Device A.

**Step 8**
- **configure terminal**
- **Example:**
  ```
  Switch# configure terminal
  ```
  Enters global configuration mode.

**Step 9**
- **interface interface-id**
- **Example:**
  ```
  Switch(config)# interface gigabitethernet1/0/1
  ```
  Defines the interface to be configured as a trunk, and enters interface configuration mode.

**Step 10**
- **switchport mode trunk**
- **Example:**
  ```
  ```
  Configures the port as a trunk port.
### Purpose

**Command or Action**

```
Switch(config-if)# switchport mode trunk
```

**Step 11**

**Example:**

```
Switch(config-if)# end
```

Returns to privileged EXEC mode.

### Step 12

**Example:**

```
Switch# show interfaces gigabitethernet 1/0/1 switchport
```

Verifies the VLAN configuration.

### Step 13

Repeat the above steps on Device A for a second port in the device.

### Step 14

Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.

### Step 15

**Example:**

```
Switch# show vlan
```

When the trunk links come up, VTP passes the VTP and VLAN information to Device B. This command verifies that Device B has learned the VLAN configuration.

### Step 16

**Example:**

```
Switch# configure terminal
```

Enters global configuration mode on Device A.

### Step 17

**Example:**

```
Switch(config)# interface gigabitethernet 1/0/1
```

Defines the interface to set the STP port priority, and enters interface configuration mode.

### Step 18

**Example:**

```
Switch(config-if)# spanning-tree vlan 8-10 port-priority 16
```

Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16.

### Step 19

**Example:**

```
Switch(config-if)# exit
```

Returns to global configuration mode.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config-if)# exit</td>
<td>Defines the interface to set the STP port priority, and enters interface configuration mode.</td>
</tr>
</tbody>
</table>

#### Step 20

**interface interface-id**

**Example:**

```
Switch(config)# interface gigabitethernet 1/0/2
```

#### Step 21

**spanning-tree vlan vlan-range port-priority priority-value**

**Example:**

```
Switch(config-if)# spanning-tree vlan 3-6 port-priority 16
```

#### Step 22

**end**

**Example:**

```
Switch(config-if)# end
```

#### Step 23

**show running-config**

**Example:**

```
Switch# show running-config
```

#### Step 24

**copy running-config startup-config**

(Optional) Saves your entries in the configuration file.

**Example:**

```
Switch# copy running-config startup-config
```

**Configuring Load Sharing Using STP Path Cost**

These steps describe how to configure a network with load sharing using STP path costs.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. switchport mode trunk
5. exit
6. Repeat Steps 2 through 4 on a second interface in Device A.
7. end
8. show running-config
9. show vlan
10. configure terminal
11. interface interface-id
12. spanning-tree vlan vlan-range cost cost-value
13. end
14. Repeat Steps 9 through 13 on the other configured trunk interface on Device A, and set the spanning-tree path cost to 30 for VLANs 8, 9, and 10.
15. exit
16. show running-config
17. copy running-config startup-config

### Configuration Examples for VLAN Trunking

#### Example: Configuring a Trunk Port

The following example shows how to configure a port as an IEEE 802.1Q trunk. The example assumes that the neighbor interface is configured to support IEEE 802.1Q trunking.

```
Switch# **configure terminal**
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# **interface gigabitethernet1/0/2**
Switch(config-if)# **switchport mode dynamic desirable**
Switch(config-if)# **end**
```

#### Example: Removing a VLAN from a Port

This example shows how to remove VLAN 2 from the allowed VLAN list on a port:

```
Switch(config)# **interface gigabitethernet 1/0/1**
Switch(config-if)# **switchport trunk allowed vlan remove 2**
Switch(config-if)# **end**
```
Where to Go Next

After configuring VLAN trunks, you can configure the following:

• VLANs
• Private VLANs
CHAPTER 102

Configuring VMPS

• Finding Feature Information, on page 2203
• Prerequisites for VMPS, on page 2203
• Restrictions for VMPS, on page 2203
• Information About VMPS, on page 2204
• How to Configure VMPS, on page 2206
• Monitoring the VMPS, on page 2212
• Configuration Example for VMPS, on page 2213
• Where to Go Next, on page 2214

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VMPS

You should configure the VLAN Membership Policy Server (VMPS) before you configure ports as dynamic-access ports.

When you configure a port as a dynamic-access port, the spanning-tree Port Fast feature is automatically enabled for that port. The Port Fast mode accelerates the process of bringing the port into the forwarding state.

The VTP management domain of the VMPS client and the VMPS server must be the same.

Restrictions for VMPS

The following are restrictions for configuring VMPS:
• IEEE 802.1x ports cannot be configured as dynamic-access ports. If you try to enable IEEE 802.1x on a dynamic-access (VQP) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

• Trunk ports cannot be dynamic-access ports, but you can enter the switchport access vlan dynamic interface configuration command for a trunk port. In this case, the device retains the setting and applies it if the port is later configured as an access port. You must turn off trunking on the port before the dynamic-access setting takes effect.

• Dynamic-access ports cannot be monitor ports.

• Secure ports cannot be dynamic-access ports. You must disable port security on a port before it becomes dynamic.

• Private VLAN ports cannot be dynamic-access ports.

• Dynamic-access ports cannot be members of an EtherChannel group.

• Port channels cannot be configured as dynamic-access ports.

• The VLAN configured on the VMPS server should not be a voice VLAN.

Information About VMPS

Dynamic VLAN Assignments

The VLAN Query Protocol (VQP) is used to support dynamic-access ports, which are not permanently assigned to a VLAN, but give VLAN assignments based on the MAC source addresses seen on the port. Each time an unknown MAC address is seen, the device sends a VQP query to a remote VLAN Membership Policy Server (VMPS); the query includes the newly seen MAC address and the port on which it was seen. The VMPS responds with a VLAN assignment for the port. The device cannot be a VMPS server but can act as a client to the VMPS and communicate with it through VQP.

Each time the client device receives the MAC address of a new host, it sends a VQP query to the VMPS. When the VMPS receives this query, it searches its database for a MAC-address-to-VLAN mapping. The server response is based on this mapping and whether or not the server is in open or secure mode. In secure mode, the server shuts down the port when an illegal host is detected. In open mode, the server denies the host access to the port.

If the port is currently unassigned (that is, it does not yet have a VLAN assignment), the VMPS provides one of these responses:

• If the host is allowed on the port, the VMPS sends the client a vlan-assignment response containing the assigned VLAN name and allowing access to the host.

• If the host is not allowed on the port and the VMPS is in open mode, the VMPS sends an access-denied response.

• If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a port-shutdown response.

If the port already has a VLAN assignment, the VMPS provides one of these responses:
• If the VLAN in the database matches the current VLAN on the port, the VMPS sends a success response, allowing access to the host.

• If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an access-denied or a port-shutdown response, depending on the secure mode of the VMPS.

If the device receives an access-denied response from the VMPS, it continues to block traffic to and from the host MAC address. The device continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new host address. If the device receives a port-shutdown response from the VMPS, it disables the port. The port must be manually reenabled by using Network Assistant, the CLI, or SNMP.

Configuring Dynamic-Access Ports on VMPS Clients, on page 2207
Example: VMPS Configuration, on page 2213

Dynamic-Access Port VLAN Membership

A dynamic-access port can belong to only one VLAN with an ID from 1 to 4094. When the link comes up, the device does not forward traffic to or from this port until the VMPS provides the VLAN assignment. The VMPS receives the source MAC address from the first packet of a new host connected to the dynamic-access port and attempts to match the MAC address to a VLAN in the VMPS database.

If there is a match, the VMPS sends the VLAN number for that port. If the client device was not previously configured, it uses the domain name from the first VTP packet it receives on its trunk port from the VMPS. If the client device was previously configured, it includes its domain name in the query packet to the VMPS to obtain its VLAN number. The VMPS verifies that the domain name in the packet matches its own domain name before accepting the request and responds to the client with the assigned VLAN number for the client. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS secure mode setting).

Multiple hosts (MAC addresses) can be active on a dynamic-access port if they are all in the same VLAN; however, the VMPS shuts down a dynamic-access port if more than 20 hosts are active on the port.

If the link goes down on a dynamic-access port, the port returns to an isolated state and does not belong to a VLAN. Any hosts that come online through the port are checked again through the VQP with the VMPS before the port is assigned to a VLAN.

Dynamic-access ports can be used for direct host connections, or they can connect to a network. A maximum of 20 MAC addresses are allowed per port on the device. A dynamic-access port can belong to only one VLAN at a time, but the VLAN can change over time, depending on the MAC addresses seen.

How to Configure VMPS

Entering the IP Address of the VMPS

Note

If the VMPS is being defined for a cluster of switches, enter the address on the command switch.

Before you begin

You must first enter the IP address of the server to configure the switch as a client.

SUMMARY STEPS

1. enable
2. configure terminal
3. vmps server ipaddress primary
4. vmps server ipaddress
5. end
6. show vmps
7. copy running-config startup-config

### Configuring Dynamic-Access Ports on VMPS Clients

#### Caution
Dynamic-access port VLAN membership is for end stations or hubs connected to end stations. Connecting dynamic-access ports to other switches can cause a loss of connectivity.

If you are configuring a port on a cluster member device as a dynamic-access port, first use the `rcommand` privileged EXEC command to log in to the cluster member device.

**Before you begin**
You must have IP connectivity to the VMPS for dynamic-access ports to work. You can test for IP connectivity by pinging the IP address of the VMPS and verifying that you get a response.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> vmps server ipaddress primary</td>
<td>Enters the IP address of the device acting as the primary VMPS server.</td>
</tr>
<tr>
<td>Example: Switch(config)# vmps server 10.1.2.3 primary</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> vmps server ipaddress</td>
<td>(Optional) Enters the IP address of the device acting as a secondary VMPS server.</td>
</tr>
<tr>

<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
To return an interface to its default configuration, use the `default interface interface-id` interface configuration command. To return an interface to its default switchport mode (dynamic auto), use the `no switchport mode` interface configuration command. To reset the access mode to the default VLAN for the device, use the `no switchport access vlan` interface configuration command.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode access`
5. `switchport access vlan dynamic`
6. `end`
7. `show interfaces interface-id switchport`
8. `copy running-config startup-config`

</tbody>
</table>
### Changing the Reconfirmation Interval

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes after which reconfirmation occurs.

**Note**

If you are configuring a member device in a cluster, this parameter must be equal to or greater than the reconfirmation setting on the command device. You also must first use the `rcommand` privileged EXEC command to log in to the member device.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vmps reconfirm minutes`
4. `end`
5. `show vmps`
6. `copy running-config startup-config`

### Troubleshooting Dynamic-Access Port VLAN Membership

**Problem** The VMPS shuts down a dynamic-access port under these conditions:

- **Problem** The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS shuts down the port to prevent the host from connecting to the network.
- **Problem** More than 20 active hosts reside on a dynamic-access port.

**Solution** To reenable a disabled dynamic-access port, enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command.

### Monitoring the VMPS

You can display information about the VMPS by using the `show vmps` privileged EXEC command. The device displays this information about the VMPS:
• VMPS VQP Version—The version of VQP used to communicate with the VMPS. The device queries the VMPS that is using VQP Version 1.

• Reconfirm Interval—The number of minutes the device waits before reconfirming the VLAN-to-MAC-address assignments.

• Server Retry Count—The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the device starts to query the secondary VMPS.

• VMPS domain server—The IP address of the configured VLAN membership policy servers. The device sends queries to the one marked current. The one marked primary is the primary server.

• VMPS Action—The result of the most recent reconfirmation attempt. A reconfirmation attempt can occur automatically when the reconfirmation interval expires, or you can force it by entering the `vmps reconfirm` privileged EXEC command or its Network Assistant or SNMP equivalent.

This is an example of output for the `show vmps` privileged EXEC command:

```
Switch# show vmps
VQP Client Status:
--------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.86 (primary, current)
                      172.20.128.87

Reconfirmation status
----------------------
VMPS Action: other
```

### Configuration Example for VMPS

#### Example: VMPS Configuration

*Figure 143: Dynamic Port VLAN Membership Configuration*

This network has a VMPS server switch and VMPS client switches with dynamic-access ports with this configuration:

• The VMPS server and the VMPS client are separate switches.

• The Catalyst 6500 series Switch A is the primary VMPS server.

• The Catalyst 6500 series Switch C and Switch J are secondary VMPS servers.

• End stations are connected to the clients, Switch B and Switch I.

• The database configuration file is stored on the TFTP server with the IP address 172.20.22.7.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

- Voice VLAN configuration is only supported on device access ports; voice VLAN configuration is not supported on trunk ports.

Note

Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.

- Before you enable voice VLAN, we recommend that you enable QoS on the device by entering the mls qos global configuration command and configure the port trust state to trust by entering the mls qos
trust cos interface configuration command. If you use the auto-QoS feature, these settings are automatically configured.

- You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all device interfaces.)

Restrictions for Voice VLANs

You cannot configure static secure MAC addresses in the voice VLAN.

Information About Voice VLAN

Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the device is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the device supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the device in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the device to trust or override the traffic priority assigned by a Cisco IP Phone.

Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the device to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the device in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

Note

In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Related Topics

Configuring Cisco IP Phone Voice Traffic
Example: Configuring Cisco IP Phone Voice Traffic, on page 2224
Cisco IP Phone Data Traffic

The device can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the device to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

• In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.

• In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

Note

Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

Voice VLAN Configuration Guidelines

• Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the device to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.

• The voice VLAN should be present and active on the device for the IP phone to correctly communicate on the voice VLAN. Use the show vlan privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.

• The Power over Ethernet (PoE) devices are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.

• The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

• If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
  • They both use IEEE 802.1p or untagged frames.
  • The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
  • The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.

• The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).

• Voice VLAN ports can also be these port types:
• Dynamic access port.
• IEEE 802.1x authenticated port.

**Note**

If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the device for up to 30 seconds.

• Protected port.
• A source or destination port for a SPAN or RSPAN session.
• Secure port.

**Note**

When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.

## Default Voice VLAN Configuration

The voice VLAN feature is disabled by default.

When the voice VLAN feature is enabled, all untagged traffic is sent according to the default CoS priority of the port.

The CoS value is not trusted for IEEE 802.1p or IEEE 802.1Q tagged traffic.

## How to Configure Voice VLAN

### Configuring Cisco IP Phone Voice Traffic

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `mls qos trust cos`
5. `switchport voice {vlan|dot1p|none|untagged}`
6. `end`
7. Use one of the following:
   - `show interfaces interface-id switchport`
   - `show running-config interface interface-id`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>interface interface-id</code></td>
<td>Specifies the interface connected to the phone, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>mls qos trust cos</code></td>
<td>Configures the interface to classify incoming traffic packets by using the packet CoS value. For untagged packets, the port default CoS value is used.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-if)# mls qos trust cos</code></td>
<td><strong>Note</strong> Before configuring the port trust state, you must first globally enable QoS by using the <code>mls qos</code> global configuration command.</td>
</tr>
<tr>
<td>Step 5</td>
<td>`switchport voice {vlan</td>
<td>dot1p</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-if)# switchport voice vlan dot1p</code></td>
<td>• <code>vlan-id</code>—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>dot1p</code>—Configures the device to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the device drops all voice and data traffic tagged with VLAN 0. If</td>
</tr>
</tbody>
</table>
Configuring the Priority of Incoming Data Frames

You can connect a PC or other data device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the device to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`

---

### Configuring the Priority of Incoming Data Frames

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5.</td>
<td></td>
</tr>
<tr>
<td>• <strong>none</strong>—Allows the phone to use its own configuration to send untagged voice traffic.</td>
<td></td>
</tr>
<tr>
<td>• <strong>untagged</strong>—Configures the phone to send untagged voice traffic.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**

`end`

**Example:**

```
Switch(config-if)# end
```

Returns to privileged EXEC mode.

**Step 7**

Use one of the following:

- `show interfaces interface-id switchport`
- `show running-config interface interface-id`

**Example:**

```
Switch# show interfaces gigabitethernet 1/0/1 switchport
or
Switch# show running-config interface gigabitethernet 1/0/1
```

Verifies your voice VLAN entries or your QoS and voice VLAN entries.

**Step 8**

`copy running-config startup-config`

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.
### Detailed Steps

<tr>
<td>Switch# show interfaces gigabitethernet1/0/1</td>
<td></td>
</tr>
</tbody>
</table>
### Monitoring Voice VLAN

To display voice VLAN configuration for an interface, use the `show interfaces interface-id switchport` privileged EXEC command.

### Configuration Examples

#### Example: Configuring Cisco IP Phone Voice Traffic

This example shows how to configure a port connected to a Cisco IP Phone to use the CoS value to classify incoming traffic and to accept voice and data priority traffic tagged with VLAN ID 0:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# switchport voice vlan dot1p
Switch(config-if)# end
```

To return the port to its default setting, use the `no switchport voice vlan` interface configuration command.

- Cisco IP Phone Voice Traffic, on page 2218

#### Example: Configuring the Priority of Incoming Data Frames

This example shows how to configure a port connected to a Cisco IP Phone to not change the priority of frames received from the PC or the attached device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

### Table: Command or Action

### Step 7

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

**Related Topics**
- Cisco IP Phone Data Traffic, on page 2219
- Example: Configuring the Priority of Incoming Data Frames, on page 2224
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport priority extend trust
Switch(config-if)# end

To return the port to its default setting, use the `no switchport priority extend` interface configuration command.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Private VLANs

Private vlans are supported in transparent mode for VTP 1, 2 and 3. Private VLANS are also supported on server mode with VTP 3.

When configuring private VLANs on the device, always use the default Switch Database Management (SDM) template to balance system resources between unicast routes and Layer 2 entries. If another SDM template is configured, use the `sdm prefer default` global configuration command to set the default template.

Restrictions for Private VLANs

Private VLANs are not supported on switches running the LAN Base image.
In some cases, the configuration is accepted with no error messages, but the commands have no effect.

- Do not configure fallback bridging on devices with private VLANs.
- Do not configure a remote SPAN (RSPAN) VLAN as a private-VLAN primary or secondary VLAN.
- Do not configure private-VLAN ports on interfaces configured for these other features:
  - Dynamic-access port VLAN membership
  - Dynamic Trunking Protocol (DTP)
  - IPv6 Security Group (SG)
  - Port Aggregation Protocol (PAgP)
  - Link Aggregation Control Protocol (LACP)
  - Multicast VLAN Registration (MVR)
  - Voice VLAN
  - Web Cache Communication Protocol (WCCP)

- You can configure IEEE 802.1x port-based authentication on a private-VLAN port, but do not configure 802.1x with port security, voice VLAN, or per-user ACL on private-VLAN ports.
- A private-VLAN host or promiscuous port cannot be a SPAN destination port. If you configure a SPAN destination port as a private-VLAN port, the port becomes inactive.
- If you configure a static MAC address on a promiscuous port in the primary VLAN, you need not add the same static address to all associated secondary VLANs. Similarly, if you configure a static MAC address on a host port in a secondary VLAN, you need not add the same static MAC address to the associated primary VLAN. Also, when you delete a static MAC address from a private-VLAN port, you do not have to remove all instances of the configured MAC address from the private VLAN.

Dynamic MAC addresses learned in Secondary VLAN of a private VLAN are replicated to the Primary VLANs. All mac entries are learnt on secondary VLANs, even if the traffic ingresses from primary VLAN. If a mac-address is dynamically learnt in the primary VLAN it will not get replicated in the associated secondary VLANs.

- Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs.
Information About Private VLANs

Private VLAN Domains

The private VLAN feature addresses two problems that service providers face when using VLANs:

- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

**Figure 144: Private VLAN Domain**

Using private VLANs addresses the scalability problem and provides IP address management benefits for service providers and Layer 2 security for customers. Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a primary VLAN and a secondary VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another.

Secondary VLANs

There are two types of secondary VLANs:

- Isolated VLANs—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.

- Community VLANs—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.

**Related Topics**

- Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface, on page 2243
- Example: Mapping Secondary VLANs to a Primary VLAN Interface, on page 2246
Private VLANs provide Layer 2 isolation between ports within the same private VLAN. Private VLAN ports are access ports that are one of these types:

- **Promiscuous**—A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports that belong to the secondary VLANs associated with the primary VLAN.

- **Isolated**—An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.

- **Community**—A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN.

**Trunk ports** carry traffic from regular VLANs and also from primary, isolated, and community VLANs.

Primary and secondary VLANs have these characteristics:

- **Primary VLAN**—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.

- **Isolated VLAN**—A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.

- **Community VLAN**—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the device through a promiscuous port. With a promiscuous port, you can connect a wide range of devices as access points to a private VLAN. For example, you can use a promiscuous port to monitor or back up all the private VLAN servers from an administration workstation.

**Related Topics**

- Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port, on page 2241
- Example: Configuring an Interface as a Host Port, on page 2245
- Example: Configuring an Interface as a Private VLAN Promiscuous Port, on page 2246
Private VLANs in Networks

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.

- Configure interfaces connected to default gateways and selected end stations (for example, backup servers) as promiscuous ports to allow all end stations access to a default gateway.

You can extend private VLANs across multiple devices by trunking the primary, isolated, and community VLANs to other devices that support private VLANs. To maintain the security of your private VLAN configuration and to avoid other use of the VLANs configured as private VLANs, configure private VLANs on all intermediate devices, including devices that have no private VLAN ports.

IP Addressing Scheme with Private VLANs

Assigning a separate VLAN to each customer creates an inefficient IP addressing scheme:

- Assigning a block of addresses to a customer VLAN can result in unused IP addresses.

- If the number of devices in the VLAN increases, the number of assigned address might not be large enough to accommodate them.

These problems are reduced by using private VLANs, where all members in the private VLAN share a common address space, which is allocated to the primary VLAN. Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses allocated to the primary VLAN. Subsequent IP addresses can be assigned to customer devices in different secondary VLANs, but in the same primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses.

Private VLANs Across Multiple Devices

As with regular VLANs, private VLANs can span multiple devices. A trunk port carries the primary VLAN and secondary VLANs to a neighboring device. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple devices is that traffic from an isolated port in Device A does not reach an isolated port on Device B.
Private VLANs are supported in transparent mode for VTP 1, 2 and 3. Private vlan is also supported on server mode for VTP 3. If we have a server client setup using VTP 3, private vlans configured on the server should be reflected on the client.

**Private-VLAN Interaction with Other Features**

**Private VLANs and Unicast, Broadcast, and Multicast Traffic**

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private VLAN broadcast forwarding depends on the port sending the broadcast:

- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLAN multicast forwarding supports the following:

- Sender can be outside the VLAN and the Receivers can be inside the VLAN domain.
- Sender can be inside the VLAN and the Receivers can be outside the VLAN domain.
- Sender and Receiver can both be in the same community vlan.
Private VLANs and SVIs

In a Layer 3 device, a device virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.

Private-VLAN Configuration Guidelines

Secondary and Primary VLAN Configuration

Follow these guidelines when configuring private VLANs:

- Private VLANs are supported in transparent mode for VTP 1, 2 and 3. If the device is running VTP version 1 or 2, you must set VTP to transparent mode. After you configure a private VLAN, you should not change the VTP mode to client or server. VTP version 3 supports private VLANs in all modes.
- With VTP version 1 or 2, after you have configured private VLANs, use the copy running-config startup config privileged EXEC command to save the VTP transparent mode configuration and private-VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it defaults to VTP server mode, which does not support private VLANs. VTP version 3 does support private VLANs.
- VTP version 1 and 2 do not propagate private-VLAN configuration. You must configure private VLANs on each device where you want private-VLAN ports unless the devices are running VTP version 3, as VTP3 propagate private vlus.
- You cannot configure VLAN 1 or VLANs 1002 to 1005 as primary or secondary VLANs. Extended VLANs (VLAN IDs 1006 to 4094) can belong to private VLANs.
- A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it. An isolated or community VLAN can have only one primary VLAN associated with it.
- Although a private VLAN contains more than one VLAN, only one Spanning Tree Protocol (STP) instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.
- When copying a PVLAN configuration from a tftp server and applying it on a running-config, the PVLAN association will not be formed. You will need to check and ensure that the primary VLAN is associated to all the secondary VLANs.

You can also use configure replace flash:config_file force instead of copy flash:config_file running-config.
- You can enable DHCP snooping on private VLANs. When you enable DHCP snooping on the primary VLAN, it is propagated to the secondary VLANs. If you configure DHCP on a secondary VLAN, the configuration does not take effect if the primary VLAN is already configured.

- When you enable IP source guard on private-VLAN ports, you must enable DHCP snooping on the primary VLAN.

- We recommend that you prune the private VLANs from the trunks on devices that carry no traffic in the private VLANs.

- You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs.

- Note the following considerations for sticky ARP:
  - Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out.
  - The `ip sticky-arp` global configuration command is supported only on SVIs belonging to private VLANs.
  - The `ip sticky-arp` interface configuration command is only supported on:
    - Layer 3 interfaces
    - SVIs belonging to normal VLANs
    - SVIs belonging to private VLANs

  For more information about using the `ip sticky-arp global` configuration and the `ip sticky-arp interface` configuration commands, see the command reference for this release.

- You can configure VLAN maps on primary and secondary VLANs. However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.

- PVLANs are bidirectional. They can be applied at both the ingress and egress sides.

  When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side.

  **Bridging**

  - For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.

  - For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

- **Routing**

  If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

  - The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port.

  - The MAP of sec1 and L3 ACL of prim2 is applied in the egress port.
For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN’s VACL is applied in the ingress direction and primary VLAN’S VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

- You can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.
- Although private VLANs provide host isolation at Layer 2, hosts can communicate with each other at Layer 3.
- Private VLANs support these Switched Port Analyzer (SPAN) features:
  - You can configure a private-VLAN port as a SPAN source port.
  - You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to separately monitor egress or ingress traffic.

**Private VLAN Port Configuration**

Follow these guidelines when configuring private VLAN ports:

- Use only the private VLAN configuration commands to assign ports to primary, isolated, or community VLANs. Layer 2 access ports assigned to the VLANs that you configure as primary, isolated, or community VLANs are inactive while the VLAN is part of the private VLAN configuration. Layer 2 trunk interfaces remain in the STP forwarding state.
- Do not configure ports that belong to a PAgP or LACP EtherChannel as private VLAN ports. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.
- Enable Port Fast and BPDU guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence. When enabled, STP applies the BPDU guard feature to all Port Fast-configured Layer 2 LAN ports. Do not enable Port Fast and BPDU guard on promiscuous ports.
- If you delete a VLAN used in the private VLAN configuration, the private VLAN ports associated with the VLAN become inactive.
- Private VLAN ports can be on different network devices if the devices are trunk-connected and the primary and secondary VLANs have not been removed from the trunk.

**Private VLAN Configuration Tasks**

To configure a private VLAN, perform these steps:

1. Set VTP mode to transparent.
2. Create the primary and secondary VLANs and associate them.
If the VLAN is not created already, the private VLAN configuration process creates it.

3. Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.

4. Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.

5. If inter-VLAN routing will be used, configure the primary SVI, and map the secondary VLANs to the primary.

6. Verify the private VLAN configuration.

How to Configure Private VLANs

Configuring and Associating VLANs in a Private VLAN

The `private-vlan` commands do not take effect until you exit VLAN configuration mode.

To configure and associate VLANs in a Private VLAN, perform these steps:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vtp mode transparent`
4. `vlan vlan-id`
5. `private-vlan primary`
6. `exit`
7. `vlan vlan-id`
8. `private-vlan isolated`
9. `exit`
10. `vlan vlan-id`
11. `private-vlan community`
12. `exit`
13. `vlan vlan-id`
14. `private-vlan community`
15. `exit`
16. `vlan vlan-id`
17. `private-vlan association [add | remove] secondary_vlan_list`
18. `end`
19. `show vlan private-vlan [type]` or `show interfaces status`
20. `copy running-config startup config`

Example:  
Switch> enable |  
- Enter your password if prompted.  |
| 2    | configure terminal | Enters global configuration mode.  
Example:  
Switch# configure terminal | |
| 3    | interface interface-id | Enters interface configuration mode for the Layer 2 interface to be configured.  
Example:  
Switch(config)# interface gigabitethernet1/0/2 | |
| 4    | switchport mode private-vlan promiscuous | Configures the Layer 2 port as a private VLAN promiscuous port.  
Example:  
Switch(config-if)# switchport mode private-vlan promiscuous | |
| 5    | switchport private-vlan mapping primary_vlan_id {add | remove} secondary_vlan_list | Maps the private VLAN promiscuous port to a primary VLAN and to selected secondary VLANs.  
Example:  
Switch(config-if)# switchport private-vlan mapping 20 add 501-503  
- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs.  
- Enter a *secondary_vlan_list*, or use the *add* keyword with a *secondary_vlan_list* to map the secondary VLANs to the private VLAN promiscuous port.  
- Use the *remove* keyword with a *secondary_vlan_list* to clear the mapping between secondary VLANs and the private VLAN promiscuous port. | |
| 6    | end               | Returns to privileged EXEC mode.  
Example:  
Switch(config)# end | |

**Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface**

If the private VLAN will be used for inter-VLAN routing, you configure an SVI for the primary VLAN and map secondary VLANs to the SVI.

---

**Note**

Isolated and community VLANs are both secondary VLANs.

Follow these steps to map secondary VLANs to the SVI of a primary VLAN to allow Layer 3 switching of private VLAN traffic:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface vlan primary_vlan_id
4. private-vlan mapping [add | remove] secondary_vlan_list
5. end
6. show interface private-vlan mapping
7. copy running-config startup config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters interface configuration mode for the primary VLAN, and configures the VLAN as an SVI. The VLAN ID range is 2 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# configure terminal
```

**Step 3**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface vlan primary_vlan_id</td>
<td>Maps the secondary VLANs to the Layer 3 VLAN interface of a primary VLAN to allow Layer 3 switching of private VLAN ingress traffic.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# interface vlan 20
```

**Step 4**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>private-vlan mapping [add</td>
<td>remove] secondary_vlan_list</td>
</tr>
</tbody>
</table>

**Note**

- The `private-vlan mapping` interface configuration command only affects private VLAN traffic that is Layer 3 switched.
- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.
- Enter a `secondary_vlan_list`, or use the `add` keyword with a `secondary_vlan_list` to map the secondary VLANs to a primary VLAN.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the mapping between secondary VLANs and a primary VLAN.

**Example:**

```
Switch(config-if)# private-vlan mapping 501-503
```

**Step 5**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# end
```

**Step 6**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface private-vlan mapping</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# show interfaces private-vlan mapping
```

**Step 7**

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config startup config</td>
<td>Saves your entries in the device startup configuration file.</td>
</tr>
</tbody>
</table>

**Example:**

```
```
### Monitoring Private VLANs

The following table displays the commands used to monitor private VLANs.

**Table 220: Private VLAN Monitoring Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces status</code></td>
<td>Displays the status of interfaces, including the VLANs to which they belongs.</td>
</tr>
<tr>
<td><code>show vlan private-vlan [type]</code></td>
<td>Displays the private VLAN information for the Switch.</td>
</tr>
<tr>
<td><code>show interface switchport</code></td>
<td>Displays private VLAN configuration on interfaces.</td>
</tr>
<tr>
<td><code>show interface private-vlan mapping</code></td>
<td>Displays information about the private VLAN mapping for VLAN SVIs.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Private VLANs

#### Example: Configuring an Interface as a Host Port

This example shows how to configure an interface as a private VLAN host port, associate it with a private VLAN pair, and verify the configuration:

```bash
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/22
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 20 501
Switch(config-if)# end
Switch# show interfaces gigabitethernet1/0/22 switchport
Name: Gi1/0/22
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
```
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: 20 501
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan:
20 501

Example: Configuring an Interface as a Private VLAN Promiscuous Port

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport mode private-vlan promiscous
Switch(config-if)# switchport private-vlan mapping 20 add 501-503
Switch(config-if)# end

Use the show vlan private-vlan or the show interface status privileged EXEC command to display primary and secondary VLANs and private-VLAN ports on the Switch.

Example: Mapping Secondary VLANs to a Primary VLAN Interface

This example shows how to map the interfaces fo VLANs 501 and 502 to primary VLAN 10, which permits routing of secondary VLAN ingress traffic from private VLANs 501 and 502:

Switch# configure terminal
Switch(config)# interface vlan 20
Switch(config-if)# private-vlan mapping 501-503
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
--------- -------------- -----------------
vlant0 501 isolated
vlant0 502 community
Example: Monitoring Private VLANs

This example shows output from the `show vlan private-vlan` command:

```
Switch# show vlan private-vlan
Primary Secondary Type Ports
-------- --------- ----------------- ------------------------------------------
20       501     isolated        Gi1/0/22, Gi1/0/2
20       502     community      Gi1/0/2
20       503     community      Gi1/0/2
```

Where to Go Next

You can configure the following:

- VTP
- VLANs
- VLAN trunking
- VLAN Membership Policy Server (VMPS)
- Voice VLANs
