

# QoS

This chapter contains the following QoS commands:

- class, on page 2
- class-map, on page 4
- debug qos, on page 6
- match (class-map configuration), on page 8
- mls qos, on page 10
- mls qos aggregate-policer, on page 12
- mls qos cos, on page 14
- mls qos dscp-mutation, on page 16
- mls qos map, on page 18
- mls qos queue-set output buffers, on page 19
- mls qos queue-set output threshold, on page 21
- mls qos rewrite ip dscp, on page 24
- mls qos srr-queue output cos-map, on page 26
- mls qos srr-queue output dscp-map, on page 28
- mls qos trust, on page 30
- police, on page 32
- police aggregate, on page 34
- policy map, on page 36
- queue-set, on page 38
- service-policy, on page 39
- set, on page 40
- show class-map, on page 42
- show mls qos, on page 43
- show mls qos aggregate-policer, on page 44
- show mls qos interface, on page 45
- show mls qos maps, on page 49
- show mls qos queue-set, on page 52
- show policy-map, on page 53
- srr-queue bandwidth limit, on page 54
- srr-queue bandwidth shape, on page 56
- srr-queue bandwidth share, on page 58
- trust, on page 60

## class

	To define a traffic classification match criteria for the specified class-map name, use the <b>class</b> command policy-map configuration mode. Use the <b>no</b> form of this command to delete an existing class map. <b>class</b> { <i>class-map-name</i>   <b>class-default</b> } <b>no class</b> { <i>class-map-name</i>   <b>class-default</b> }			
Syntax Description	class-map-name Assigns a name to the class map.			
	<b>class-default</b> Refers to a system default class that matches unclassified packets.			
Command Default	No policy map class-maps are defined.			
Command Modes	Policy-map configuration			
Command History	Release Modification			
	Cisco IOS Release 15.0(2)EXCisco IOS Release This command was introduced. 15.2(5)E			
Usage Guidelines	Before using the <b>class</b> command, you must use the <b>policy-map</b> global configuration command to identify the policy map and enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the <b>service-policy</b> interface configuration command.			
	After entering the <b>class</b> command, you enter policy-map class configuration mode. These configuration commands are available:			
	<ul> <li>exit—Exits policy-map class configuration mode and returns to policy-map configuration mode.</li> <li>no—Returns a command to its default setting.</li> </ul>			
	• <b>police</b> —Defines a policer or aggregate policer for the classified traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information, see police, on page 32 and police aggregate, on page 34.			
	<ul> <li>set—Specifies a value to be assigned to the classified traffic. For more information, see set, on page 40.</li> <li>trust—Defines a trust state for traffic classified with the class or the class-map command. For more information, see trust, on page 60.</li> </ul>			
	To return to policy-map configuration mode, use the <b>exit</b> command. To return to privileged EXEC mode, use the <b>end</b> command.			
	The <b>class</b> command performs the same function as the <b>class-map</b> global configuration command. Use the <b>class</b> command when a new classification, which is not shared with any other ports, is needed. Use the <b>class-map</b> command when the map is shared among many ports.			
	You can configure a default class by using the <b>class class-default</b> policy-map configuration command. Unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic.			
Examples	This example shows how to configure a default traffic class to a policy map:			

```
Device# configure terminal
Device(config) # class-map cm-3
Device(config-cmap)# match ip dscp 30
Device(config-cmap) # match protocol ipv6
Device(config-cmap)# exit
Device(config) # class-map cm-4
Device(config-cmap)# match ip dscp 40
Device(config-cmap)# match protocol ip
Device(config-cmap)# exit
Device(config) # policy-map pm3
Device(config-pmap) # class class-default
Device(config-pmap-c) # set dscp 10
Device(config-pmap-c)# exit
Device(config-pmap)# class cm-3
Device(config-pmap-c) set dscp 4
Device(config-pmap-c)# exit
Device(config-pmap) # class cm-4
Device(config-pmap-c) # trust cos
Device(config-pmap-c)# exit
Device (config-pmap) # exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

This example shows how the default traffic class is automatically placed at the end of policy-map pm3 even though **class-default** was configured first:

```
Device# show policy-map pm3
Policy Map pm3
Class cm-3
set dscp 4
Class cm-4
trust cos
Class class-default
set dscp 10
Device#
```

<b>Related Commands</b>	Command	Description
	class-map, on page 4	Creates a class map to be used for matching packets to the class whose name you specify.
	police, on page 32	Defines a policer for classified traffic.
	policy map, on page 36	Defines a policer for classified traffic.
	set, on page 40	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map, on page 53	Displays quality of service (QoS) policy maps.
	trust, on page 60	Defines a trust state for the traffic classified through the <b>class</b> policy-map configuration command or the <b>class-map</b> global configuration command.

## class-map

To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the **class-map** command in global configuration mode. Use the **no** form of this command to delete an existing class map and to return to global or policy map configuration mode.

class-map [match-any | type] class-map-name no class-map [match-any | type] class-map-name

Syntax Description	match-any (Optional) Performs a logical-OR of the matching statements under this class map. O more criteria must be matched.				
	type	(Optional) Configures the CPL class map.			
	class-map-name	<i>class-map-name</i> Name of the class for the class map. The class name is used for both the class map and to configure a policy for the class in the policy map.			
Command Default	No class maps an	e defined.			
Command Modes	Global configura	tion			
	Policy map confi	guration			
Command History	Release		Modification		
	Cisco IOS Relea 15.2(5)E	ase 15.0(2)EXCisco IOS Release	This command was introduced.		
Usage Guidelines	The <b>class-map</b> command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.				
	After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:				
	command d	isplays the description and the name	*		
<ul> <li>exit—Exits from QoS class-map configuration mode.</li> <li>match—Configures classification criteria. For more information, see the matc on page 8.</li> <li>no—Removes a match statement from a class map.</li> </ul>		ore information, see the match (class-map configuration),			
	If you enter the <b>match-any</b> keyword, you can only use it to specify an extended named access control list (ACL) with the <b>match access-group</b> class-map configuration command.				
	To define packet classification on a physical-port basis, only one <b>match</b> command per class map is supported.				
	Only one ACL c	an be configured in a class map. Th	e ACL can have multiple access control entries (ACEs).		
Examples	This example sho is an access list c	by bows how to configure the class map called $class I$ with one match criterion, which called $103$ :			

4

```
Device(config)# access-list 103 permit ip any any dscp 10
Device(config)# class-map class1
Device(config-cmap)# match access-group 103
Device(config-cmap)# exit
```

This example shows how to delete the class map *class1*:

```
Device(config) # no class-map class1
```

You can verify your settings by entering the show class-map privileged EXEC command.

<b>Related Commands</b>	Command	Description
	class, on page 2	Defines a traffic classification match criteria (through the <b>police</b> , <b>set</b> , and <b>trust</b> policy-map class configuration commands) for the specified class-map name.
	match (class-map configuration), on page 8	Defines the match criteria to classify traffic.
	policy map, on page 36	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show class-map, on page 42	Displays QoS class maps.

### debug qos

To enable debugging of the quality of service (QoS) software, use the **debug qos** in privileged EXEC mode. Use the **no** form of this command to disable QoS debugging.

### debug qos

{capability|command-installation-time|events|index|pre-classify|provision|service-policy|set|snmp|tunnel\_marking} no debug qos

{capability|command-installation-time|events|index|pre-classify|provision|service-policy|set|snmp|tunnel\_marking}

Syntax Description	capability	Displays all QoS capability debug messages.	
	command-installation-time	Displays the amount of time the QoS command takes to become effective.	
	events	Displays QoS MQC events.	
	index	Displays class-based QoS MIB index persistency.	
	pre-classify	Displays QoS pre-classify events for VPN.	
	provision	Displays QoS provisions.	
	service-policy	Displays QoS service policies.	
	set	Displays QoS packet marking.	
	snmp	Displays class-based QoS configuration and statistics information.	
	tunnel_marking     Displays QoS packet tunnel marking.		
Command Default	Debugging is disabled.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)E 15.2(5)E	EXCisco IOS Release This command was introduced.	
Usage Guidelines	The undebug qos command	is the same as the <b>no debug qos</b> command.	
When you enable debugging on a switch stack, it is enabled only on the stack master. To ena on a stack member, you can start a session from the stack master by using the <b>session</b> <i>switch-nu</i> EXEC command, then enter the <b>debug</b> command at the command-line prompt of the stack m can use the <b>remote command</b> <i>stack-member-number LINE</i> privileged EXEC command on switch to enable debugging on a member switch without first starting a session.		tart a session from the stack master by using the <b>session</b> <i>switch-number</i> privileged the <b>debug</b> command at the command-line prompt of the stack member. You also <b>d</b> <i>stack-member-number LINE</i> privileged EXEC command on the stack master	

I

Related Commands	Command	Description
	show debugging	Displays information about the types of debugging that are enabled.

## match (class-map configuration)

To define the match criteria to classify traffic, use the **match** command in class-map configuration mode. Use the **no** form of this command to remove the match criteria.

match {access-group acl-index-or-name|ip {dscp dscp-list |precedence ip-precedence-list}|protocol
{arp|cdp|http|ip|ipv6}}

**no match** {access-group *acl-index-or-name*|**ip** {dscp *dscp-list* |**precedence** *ip-precedence-list*}|**protocol** {arp|cdp|http|**ip**|**ipv6**}}

Syntax Description	access-group		
	acl-index-or-name	The range is from 1 to 2799.	
	ip	Sets IP specific values.	
		• <b>dscp</b> <i>dscp-list</i> —Lists up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.	
	• <b>precedence</b> <i>ip-precedence-list</i> —Lists up to eight IP-precedence values to r against incoming packets. Separate each value with a space. The range is 0 You also can enter a mnemonic name for a commonly used value.		
	protocol	Specifies the name of a protocol to be used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.	
		The following protocols are supported: arp,cdp, http, ip, and ipv6.	
Command Default	No match criteria are defined.		
Command Modes	Class-map configuration		
Command History	Release	Modification	
	Cisco IOS 15.0(2)E	This command was introduced.	
Usage Guidelines		d is used to specify which fields in the incoming packets are examined to classify the access group or the MAC access group matching to the Ether Type/Len are supported.	
	If you enter the <b>clas</b> following <b>match</b> co	<b>s-map match-any</b> <i>class-map-name</i> global configuration command, you can enter the mmands:	
	• match access-g	group name acl-name	
	<ul><li>match ip dscp</li><li>match ip prece</li></ul>	dscp-list edence ip-precedence-list	
	You cannot enter the	e match access-group acl-index command.	
	For the match in ds	<b>cp</b> <i>dscp-list</i> or the <b>match ip precedence</b> <i>ip-precedence-list</i> command, you can enter a	

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command,

8

L

which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

You can verify your settings by entering the show class-map privileged EXEC command.

Examples

This example shows how to create a class map called *class2*, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Device(config)# class-map class2
Device(config-cmap)# match ip dscp 10 11 12
Device(config-cmap)# exit
```

This example shows how to create a class map called *class3*, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Device(config)# class-map class3
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

```
Device(config)# class-map class2
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# no match ip precedence
Device(config-cmap)# match access-group acl1
Device(config-cmap)# exit
```

Related Commands	Command	Description
	class-map, on page 4	Creates a class map to be used for matching packets to the class whose name you specify.
	show class-map, on page 42	Displays quality of service (QoS) class maps.

# mls qos

To enable quality of service (QoS) for the entire switch, use the **mls qos** command in global configuration mode. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

mls qos no mls qos

Syntax Description	This command has no arguments or keywords.		
Command Default	QoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified (CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-throug mode (packets are switched without any rewrites and classified as best effort without any policing).		
	When QoS is enabled with the <b>mls qos</b> global configuration command and all other QoS settings are set to their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. It policy maps are configured. The default port trust state on all ports is untrusted. The default egress queue settings are in effect.		
Command Modes	Global configuration		
Command History	Release Modification		
	Cisco IOS Release 15.0(2)EXCisco IOS Release 15.2(5)E This command was introduced.		
Usage Guidelines	When the <b>mls qos</b> command is entered, QoS is enabled with the default parameters on all ports in the system.		
	QoS must be globally enabled to use QoS classification, policing, marking or dropping, queueing, and traffic shaping features. You can create a policy map and attach it to a port before entering the <b>mls qos</b> command. QoS processing is disabled until you enter the <b>mls qos</b> command.		
	When you enter the <b>no mls qos</b> command, policy maps and class maps that are used to configure QoS are not deleted from the configuration, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To reenable QoS with the previous configurations, enter the <b>mls qos</b> command.		
	Toggling the QoS status of the switch with this command modifies (reallocates) the sizes of the queues. During the queue size modification, the queue is temporarily shut down during the hardware reconfiguration, and the switch drops newly arrived packets for this queue.		
Examples	This example shows how to enable QoS on the switch:		
	Device(config)# mls qos		
	You can verify your settings by entering the show mls qos privileged EXEC command.		

I

Related Commands	Command	Description
	show mls qos, on page 43	Displays QoS information.

## mls qos aggregate-policer

To define policer parameters that can be shared by multiple classes within the same policy map, use the **mls qos aggregate-policer** command in global configuration mode. Use the **no** form of this command to delete an aggregate policer.

mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action {drop|policed-dscp-transmit}

no mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte {drop|policed-dscp-transmit}

Image: Second				
Interview       Interview         Interview	Syntax Description	aggregate-policer-name	The name of the aggregate policer as referenced by the <b>police aggregate</b> policy-map class configuration command.	
exceed-action drop       Sets the traffic rate. If the rate is exceeded, the switch drops the         exceed-action       Sets the traffic rate. be aggregated for policing purposes. The port ASIC device, which controls more than one physical port, supports 256 policers on the sy user-configurable policers plus 1 policer reserved for internal use). The maximum number of conf		Define an aggregate policer if	f the policer is shared with multiple classes.	
user-configurable policers plus 1 policer reserved for internal use). The maximum number of configurable policers plus 1 policer reserved for internal use).				
hardware and ASIC boundaries. You cannot reserve policers per port (there is no guarantee that a be assigned to any policer).		user-configurable policers plus 1 policer reserved for internal use). The maximum number of policers supported per port is 63. Policers are allocated on demand by the software and are constructed and ASIC boundaries. You cannot reserve policers per port (there is no guarantee		
You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggreg across different policy maps.				

You cannot delete an aggregate policer if it is being used in a policy map. You must first use the **no police aggregate** *aggregate-policer-name* policy-map class configuration command to delete the aggregate policer from all policy maps before using the **no mls qos aggregate-policer** *aggregate-policer-name* command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

#### **Examples**

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

```
Device(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop
Device(config)# policy-map policy2
Device(config-pmap)# class class1
Device(config-pmap-c)# police aggregate agg_policer1
Device(config-pmap-c)# exit
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# police aggregate agg_policer1
Device(config-pmap-c)# police aggregate agg_policer1
Device(config-pmap-c)# exit
Device(config-pmap-c)# exit
Device(config-pmap-c)# trust dscp
Device(config-pmap-c)# police aggregate agg_policer2
Device(config-pmap-c)# exit
```

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	police aggregate, on page 34	Creates a policer that is shared by different classes.

L

### mls qos cos

Syntax Description

To define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port, use the **mls qos cos** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

mls qos cos {default-cos|override}
no qos mls cos {default-cos|override}

*default-cos* The default CoS value that is assigned to a port. If packets are untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7.

override Overrides the CoS value of the incoming packets, and apply the default CoS value on the port to all incoming packets.

**Command Default** The default CoS value for a port is 0.

CoS override is disabled.

Command Modes Interface configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EXCisco IOS Release
 This command was introduced.

 15.2(5)E
 This command was introduced.

**Usage Guidelines** You can use the default value to assign a CoS and Differentiated Services Code Point (DSCP) value to all incoming packets that are untagged (if the incoming packet does not have a CoS value). You also can assign a default CoS and DSCP value to all incoming packets by using the **override** keyword.

Use the **override** keyword when all incoming packets on certain ports deserve higher or lower priority than packets entering from other ports. Even if a port is previously set to trust DSCP, CoS, or IP precedence, this command overrides the previously configured trust state, and all the incoming CoS values are assigned the default CoS value configured with the **mls qos cos** command. If an incoming packet is tagged, the CoS value of the packet is modified with the default CoS of the port at the ingress port.

### **Examples** This example shows how to configure the default port CoS to 4 on a port:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# mls qos trust cos
Device(config-if)# mls qos cos 4
```

This example shows how to assign all the packets entering a port to the default port CoS value of 4 on a port:

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# mls qos cos 4
Device(config-if)# mls qos cos override

You can verify your settings by entering the **show mls qos interface** privileged EXEC command.

Related Commands	Command	Description	
	show mls qos interface, on page 45	Displays quality of service (QoS) information.	

# mls qos dscp-mutation

To apply a Differentiated Services Code Point (DSCP)-to-DSCP-mutation map to a DSCP-trusted port, use the **mls qos dscp-mutation** command in interface configuration mode. Use the **no** form of this command to return the map to the default settings.

mls qos dscp-mutation dscp-mutation-name no mls qos dscp-mutation dscp-mutation-name

Syntax Description	<i>dscp-mutation-name</i> The name of the DSCP-to-DSCP-mutation map. This map was previously defined with the <b>mls qos map dscp-mutation</b> global configuration command.				
Command Default	The default DSCP-to-DSCP-mutation map is a null map, which maps incoming DSCPs to the same DSCP values.				
Command Modes	Interface configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EXCisco IOS Release 15.2(5)E	This command was introduced.			
Usage Guidelines	If two quality of service (QoS) domains have different DSCP definitions, use the DSCP-to-DSCP- map to translate one set of DSCP values to match the definition of another domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a QoS adm domain.				
	With ingress mutation, the new DSCP value overwr with this new value. The switch sends the packet ou	ites the one in the packet, and QoS handles the packet t the port with the new DSCP value.			
	You can configure multiple DSCP-to-DSCP-mutation maps on ingress ports.				
		ou apply the DSCP mutation map to an untrusted port, to no immediate effect until the port becomes DSCP-trusted.			
Examples	This example shows how to define the DSCP-to-DSCP mutation map named <i>dscpmutation1</i> and to apply the map to a port:				
	Device(config)# mls qos map dscp-mutation da Device(config)# interface gigabitethernet3/ Device(config-if)# mls qos trust dscp Device(config-if)# mls qos dscp-mutation dsc	0/1			
	This example shows how to remove the DSCP-to-D the port and to reset the map to the default:	SCP mutation map name <i>dscpmutation1</i> from			
	Device(config-if)# no mls qos dscp-mutation	dscpmutation1			

You can verify your settings by entering the show mls qos maps privileged EXEC command.

### mls qos queue-set output threshold

To configure the weighted tail-drop (WTD) thresholds, to guarantee the availability of buffers, and to configure the maximum memory allocation to a queue set (four egress queues per port), use the **mls qos queue-set output threshold** command in global configuration mode. Use the **no** form of this command to return to the default setting.

mls qos queue-set output qset-id threshold [queue-id] drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold

no mls qos queue-set output qset-id threshold [queue-id]

Syntax Description	qset-id					eue set, which defines all the per port. The range is 1 to 2.	
	queue-id(Optional) The queue in the queue set on which the command is performed. The range is 1 to 4.drop-threshold1 drop-threshold2Two WTD thresholds expressed as a percentage of the allocated memory of the queue. The range is 1 to 3200 percent.reserved-thresholdThe amount of memory to be guaranteed (reserved) for the queue and expressed as a percentage of the allocated memory. The range is 1 to 100 percent.						
	maximum-threshold	for		e maximum	memory the	d to get more buffers than are requeue can have before the pack	
Command Default	When quality of servic	e (QoS) is	enabled, W	TD is enable	ed.		
Command Default						Egress Queue WTD Threshold S	ettings
	For default egress queu					Egress Queue WTD Threshold S	ettings

Global configuration Release Cisco IOS Release 15 15.2(5)E Use the mls qos queue	e WTD thr .0(2)EXCis e-set outpu ueues in a	sco IOS Rel t <i>qset-id</i> <b>bu</b> queue set.	es , see Table M ease Th	e 1: Default I odification	l was introduced.	
Command Modes Command History	For default egress queu on page 21. Global configuration <b>Release</b> Cisco IOS Release 15 15.2(5)E Use the <b>mls qos queue</b> of buffers to the four q	e WTD thr .0(2)EXCis e-set outpu ueues in a	sco IOS Rel t <i>qset-id</i> <b>bu</b> queue set.	es , see Table M ease Th	e 1: Default I odification	l was introduced.	

Feature	Queue 1	Queue 2	Queue 3	Queue 4
WTD drop threshold 2	100	200	100	100
	percent	percent	percent	percent
Reserved threshold	50 percent	100 percent	50 percent	50 percent
Maximum threshold	400	400	400	400
	percent	percent	percent	percent

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue set to use more of the common pool when available, the maximum user-configurable number of packets for each queue is still internally limited to 3200 percent, or 32 times the allocated number of buffers. One packet can use one 1 or more buffers.

**Note** The egress queue default settings are suitable for most situations. Change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

#### Examples

This example shows how to map a port to queue set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

Device(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

### mls qos rewrite ip dscp

To configure the switch to change or rewrite the Differentiated Services Code Point (DSCP) field of an incoming IP packet, use the **mls qos rewrite ip dscp** command in global configuration mode. Use the **no** form of this command to configure the switch to not modify or rewrite the DSCP field of the packet and to enable DSCP transparency.

mls qos rewrite ip dscp no mls qos rewrite ip dscp

Syntax Description This command has no arguments or keywords.

**Command Default** DSCP transparency is disabled. The switch changes the DSCP field of the incoming IP packet.

**Command Modes** Global configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EXCisco IOS Release
 This command was introduced.

 15.2(5)E
 This command was introduced.

**Usage Guidelines** 

DSCP transparency affects only the DSCP field of a packet at the egress. If DSCP transparency is enabled by using the **no mls qos rewrite ip dscp** command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

Note Enabling DSCP transparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.

By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet that the switch uses to generate a class of service (CoS) value representing the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

For example, if QoS is enabled and an incoming packet has a DSCP value of 32, the switch might modify the internal DSCP value based on the policy-map configuration and change the internal DSCP value to 16. If DSCP transparency is enabled, the outgoing DSCP value is 32 (same as the incoming value). If DSCP transparency is disabled, the outgoing DSCP value is 16 because it is based on the internal DSCP value.

**Examples** This example shows how to enable DSCP transparency and configure the switch to not change the DSCP value of the incoming IP packet:

Device (config) # mls qos
Device (config) # no mls qos rewrite ip dscp

This example shows how to disable DSCP transparency and configure the switch to change the DSCP value of the incoming IP packet:

```
Device(config) # mls qos
Device(config) # mls qos rewrite ip dscp
```

You can verify your settings by entering the **show running config include rewrite** privileged EXEC command.

### mls qos trust

To configure the port trust state, use the **mls qos trust** command in interface configuration mode. Use the **no** form of this command to return a port to its untrusted state.

mls qos trust [{cos|device {cisco-phone|cts|ip-camera|media-player}|dscp|ip-precedence}] no mls qos trust [{cos|device {cisco-phone|cts|ip-camera|media-player}|dscp|ip-precedence}]

Syntax Description	cos	(Optional) Classifies an ingress packet by using the packet CoS value. For an untagged packet, use the port default CoS value.				
	device cisco-phone	(Optional) Classifies an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.				
	device {cts   ip-camera	(Optional) Classifies an ingress packet by trusting the CoS or DSCP value for these video devices:				
	media-player}	<b>cts</b> —Cisco TelePresence System				
		• ip-camera—Cisco IP camera				
		• media-player—Cisco digital media player				
		For an untagged packet, use the port default CoS value.				
	dscp	(Optional) Classifies an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.				
	ip-precedence	(Optional) Classifies an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.				
Command Default	The port is not trusted.	. If no keyword is specified when you enter the command, the default is <b>dscp</b> .				
Command Modes	Interface configuration	1				
Command History	Release	Modification				
	Cisco IOS Release 15 15.2(5)E	5.0(2)EXCisco IOS Release This command was introduced.				
Usage Guidelines	are classified at the edg because there is no nee	lity of service (QoS) domain are classified at the edge of the domain. When the packets ge, the switch port within the QoS domain can be configured to one of the trusted states ed to classify the packets at every switch within the domain. Use this command to ort is trusted and which fields of the packet to use to classify traffic.				
	the CoS-to-DSCP map	red with trust DSCP or trust IP precedence and the incoming packet is a non-IP packet, o is used to derive the corresponding DSCP value from the CoS value. The CoS can be nk ports or the port default CoS for nontrunk ports.				

30

If the DSCP is trusted, the DSCP field of the IP packet is not modified. However, it is still possible that the CoS value of the packet is modified (according to DSCP-to-CoS map).

If the CoS is trusted, the CoS field of the packet is not modified, but the DSCP can be modified (according to CoS-to-DSCP map) if the packet is an IP packet.

The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cisco IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You must globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP phone. If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port and prevents misuse of a high-priority queue.

If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the **mls qos cos override** interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.

For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.

Classification using a port trust state (for example, **mls qos trust** [**cos** | **dscp** | **ip-precedence**] and a policy map (for example, **service-policy input** *policy-map-name*) are mutually exclusive. The last one configured overwrites the previous configuration.

**Related Commands** This example shows how to configure a port to trust the IP precedence field in the incoming packet:

```
Device (config) # interface gigabitethernet2/0/1
Device (config-if) # mls qos trust ip-precedence
```

This example shows how to specify that the Cisco IP Phone connected on a port is a trusted device:

```
Device (config) # interface gigabitethernet2/0/1
Device (config-if) # mls qos trust device cisco-phone
```

You can verify your settings by entering the **show mls qos interface** privileged EXEC command.

Related Commands	Command	Description
	mls qos cos, on page 14	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
	mls qos dscp-mutation, on page 16	Applies a DSCP-to DSCP-mutation map to a DSCP-trusted port.
	mls qos map, on page 18	Defines the CoS-to-DSCP map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map.
	show mls qos interface, on page 45	Displays QoS information.

# police

To define a policer for classified traffic, use the **police** command in policy-map class configuration mode. Use the **no** form of this command to remove an existing policer.

police rate-bps burst-byte [exceed-action [drop | policed-dscp-transmit ]]
no police rate-bps burst-byte [exceed-action [drop | policed-dscp-transmit ]]

rate-bps	Specifies the average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.		
burst-byte	Specifies the normal burst size in bytes. The range is 8000 to 1000000.		
exceed-action drop	(Optional) Sets the traffic rate. If the rate is exceeded, the switch drops the packet .		
exceed-action policed-dscp-transmit	(Optional) Sets the traffic rate. If the rate is exceeded, the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.		
aggregate	Chooses the aggregate policer for the current class.		
No policers are defined.			
Policy-map class configuration	on

an action to take if either mat The port ASIC device, which user-configurable policers pl policers supported per port is hardware and ASIC boundar be assigned to any policer.	ximum is exceeded. n controls more than one physical port, supports 256 policers on the switch (255 us 1 policer reserved for internal use). The maximum number of configurable 63. Policers are allocated on demand by the software and are constrained by the		
	burst-byte         exceed-action drop         exceed-action policed-dscp-transmit         aggregate         No policers are defined.         Policy-map class configurati         Release		

#### **Examples**

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Device(config) # policy-map policy1
Device(config-pmap) # class class1
Device(config-pmap-c) # trust dscp
Device(config-pmap-c) # police 1000000 20000 exceed-action drop
Device(config-pmap-c) # exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Device(config)# policy-map policy2
Device(config-pmap)# class class2
Device(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Device(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

### Related Commands Co

Command	Description
class, on page 2	Defines a traffic classification match criteria (through the <b>police</b> , <b>set</b> , and <b>trust</b> policy-map class configuration commands) for the specified class-map name.
class-map, on page 4	Create a class map to be used for matching packets to the class whose name you specify with the <b>class</b> command.
mls qos map, on page 18 policed-dscp	Applies a policed-DSCP map to a DSCP-trusted port.
policy map, on page 36	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
set, on page 40	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
show policy-map, on page 53	Displays QoS policy maps.

### police aggregate

To apply an aggregate policer to multiple classes in the same policy map, use the **police aggregate** command in policy-map class configuration mode. Use the **no** form of this command to remove the specified policer.

**police aggregate** aggregate-policer-name **no police aggregate** aggregate-policer-name

Syntax Description aggregate-policer-name The name of the aggregate policer.

**Command Default** No aggregate policers are defined.

**Command Modes** Policy-map class configuration

<b>Command History</b>	Release	Modification		
	Cisco IOS Release 15.0(2)EXCisco IOS Release 15.2(5)E	This command was introduced.		
Usage Guidelines	A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded.			
	user-configurable policers plus 1 policer reserved fo policers supported per port is 63. Policers are allocate	e physical port, supports 256 policers on the switch (255 r internal use). The maximum number of configurable ed on demand by the software and are constrained by the policers per port. There is no guarantee that a port will		

You set aggregate policer parameters by using the **mls qos aggregate-policer** global configuration command. You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

You cannot configure aggregate policers in hierarchical policy maps.

**Examples** This example shows how to define the aggregate policer parameters and to apply the policer to multiple classes in a policy map:

Device(config)# mls qos aggregate-policer agg\_policer1 10000 1000000 exceed-action drop Device(config)# policy-map policy2 Device(config-pmap)# class class1 Device(config-pmap-c)# police aggregate agg\_policer1 Device(config-pmap-c)# exit Device(config-pmap-c)# set dscp 10 Device(config-pmap-c)# police aggregate agg\_policer1 Device(config-pmap-c)# police aggregate agg\_policer1 Device(config-pmap-c)# exit Device(config-pmap-c)# exit Device(config-pmap-c)# exit Device(config-pmap-c)# trust dscp Device(config-pmap-c)# police aggregate agg\_policer2
Device(config-pmap-c)# exit

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

### **Related Commands**

Command	Description
mls qos aggregate-policer, on page 12	Defines policer parameters, which can be shared by multiple classes within a policy map.
show mls qos aggregate-policer, on page 44	Displays the quality of service (QoS) aggregate policer configuration.

## policy map

To create or modify a policy map that can be attached to multiple physical ports and to enter policy-map configuration mode, use the **policy-map** command in global configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name no policy-map policy-map-name

Syntax Description	<i>policy-map-name</i> The name of the map.	e policy
Command Default	No policy maps are defined.	
	The default behavior is to set the Differentiated Services Code Point (DSCP) to 0 if the packet is an IP packet and to set the class of service (CoS) to 0 if the packet is tagged. No policing is performed.	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS 15.0(2)EX	This command was introduced.
Usage Guidelines	After entering the <b>policy-map</b> command, you enter policy-map configuration mode, and these configuration commands are available:	
	<ul> <li>class—Defines the classification match criteria for the specified class map.</li> <li>description—Describes the policy map (up to 200 characters).</li> <li>exit—Exits policy-map configuration mode and returns you to global configuration mode.</li> <li>no—Removes a previously defined policy map.</li> </ul>	
	To return to global configuration mode, use the <b>exit</b> command. To return to privileged EXEC mode, use the <b>end</b> command.	
	Before configuring policies for classes whose match criteria are defined in a class map, use the <b>policy-map</b> command to specify the name of the policy map to be created, added to, or modified. Entering the <b>policy-map</b> command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.	
	You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the <b>class-map</b> global configuration and <b>match</b> class-map configuration commands. You define packet classification on a physical-port basis.	
	You can configure QoS only on physical ports. Configure the QoS settings, such as classification, queueing, and scheduling, and apply the policy map to a port. When configuring QoS on a physical port, you apply a nonhierarchical policy map to a port. A nonhierarchical policy map is the same as the port-based policy maps in the device.	
Examples	This example shows how to create a policy map called <i>policy1</i> .	

Device(config) # policy-map policy1

This example shows how to delete *policymap2*:

Device(config) # no policy-map policymap2

You can verify your settings by entering the **show policy-map** privileged EXEC command.

Related Commands	Command	Description
	class, on page 2	Defines a traffic classification match criteria (through the <b>police</b> , <b>set</b> , and <b>trust</b> policy-map class configuration command) for the specified class-map name.
	class-map, on page 4	Creates a class map to be used for matching packets to the class whose name you specify.
	service-policy, on page 39	Applies a policy map to a physical port.
	show policy-map, on page 53	Displays QoS policy maps.

## queue-set

To map a port to a queue set, use the **queue-set** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

**queue-set** *qset-id* **no queue-set** *qset-id* 

**Syntax Description** *qset-id* Queue-set ID. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.

**Command Default** The queue set ID is 1.

**Command Modes** Interface configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EXCisco IOS Release 15.2(5)E	This command was introduced.

**Usage Guidelines** For information about automatic generation of the queue-set ID with the **auto qos voip** command, see the "Usage Guidelines" section for the auto qos voip command.

### **Examples** This example shows how to map a port to queue-set 2:

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers, on page 19	Allocates buffers to a queue set.
	mls qos queue-set output threshold, on page 21	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue set.
	show mls qos interface, on page 45	Displays quality of service (QoS) information.

38

# service-policy

To apply a policy map to the input of a physical port, use the **service-policy** command in interface configuration mode. Use the **no** form of this command to remove the policy map and port association.

service-policy {input | output} policy-map-name
no service-policy {input | output} policy-map-name

Syntax Description	inputApplies the specified policy map to the input of a physical port.policy-map-name			
Command Default	No policy maps are attached to the port.			
Command Modes	Interface configuration			
Command History	Release Modification			
	Cisco IOS 15.0(2)EX	This command was introduced.		
Usage Guidelines	Though visible in the command-line help strings, the <b>output</b> keyword is not supported.			
	Policy maps can be configured on physical ports. A policy map is defined by the <b>policy map</b> command.			
	Only one policy map is supported per port, per direction. In other words, only one input policy and one output policy is allowed on any one port.			
	You can apply a policy map to incoming traffic on a physical port			
	Classification using a port trust state (for example, <b>mls qos trust</b> [ <b>cos</b>   <b>dscp</b>   <b>ip-precedence</b> ] and a policy map (for example, <b>service-policy input</b> <i>policy-map-name</i> ) are mutually exclusive. The last one configured overwrites the previous configuration.			
Examples	This example shows how to remove <i>plcmap2</i> from a physical port:			
	Device(config)# interface gigabitethernet2/0/2 Device(config-if)# no service-policy input plcmap2			
	You can verify your se	ettings by entering the show running-config privileged EXEC command.		
Related Commands	Command	Description		

policy map, on page 36	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
show policy-map, on page 53	Displays QoS policy maps.
show running-config	Displays the operating configuration.

## set

To classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet, use the **set** command in policy-map class configuration mode. Use the **no** form of this command to remove traffic classification.

set {dscp new-dscp |ip {dscp|precedence}|precedence precedence}
no set {dscp new-dscp |ip {dscp|precedence}|precedence precedence}

Syntax Description	dscp new-dscp	Sets the DSCP value in IF	v4 and IPv6 packets.			
		The range is 0 to 63.				
	ip {dscp   preceden	<b>ce</b> } Sets the IP values.				
		• dscp—Sets the IP D	SCP value.			
		• precedence—Sets th value.	he IP precedence			
	precedence new-prece	dence Sets the precedence in IP	v4 and IPv6 packets.			
		The range is 0 to 7.				
Command Default	No traffic classification	s defined.				
Command Modes	Policy-map class configu	iration				
Command History	Release	Μ	odification			
	Cisco IOS Release 15.0(2)EXCisco IOS Release This command was introduced. 15.2(5)E					
Usage Guidelines	If you have used the <b>set ip dscp</b> policy-map class configuration command, the device changes this command to <b>set dscp</b> in the device configuration. If you enter the <b>set ip dscp</b> policy-map class configuration command, this setting appears as <b>set dscp</b> in the device configuration.					
	You can use the <b>set ip precedence</b> policy-map class configuration command or the <b>set precedence</b> policy-map class configuration command. This setting appears as <b>set ip precedence</b> in the device configuration.					
	The <b>set</b> command is mutually exclusive with the <b>trust</b> policy-map class configuration command within the same policy map.					
	For the <b>set dscp</b> <i>new-dscp</i> or the <b>set ip precedence</b> <i>new-precedence</i> command, you can enter a mnemonic name for a commonly used value. For example, you can enter the <b>set dscp af11</b> command, which is the same as entering the <b>set dscp 10</b> command. You can enter the <b>set ip precedence critical</b> command, which is the same as entering the <b>set ip precedence 5</b> command. For a list of supported mnemonics, enter the <b>set dscp ?</b> or the <b>set ip precedence ?</b> command to see the command-line help strings.					
	To return to policy-map configuration mode, use the <b>exit</b> command. To return to privileged EXEC mode, use the <b>end</b> command.					

40

#### **Examples**

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```
Device(config)# policy-map policy_ftp
Device(config-pmap)# class-map ftp_class
Device(config-cmap)# exit
Device(config)# policy-map policy_ftp
Device(config-pmap)# class ftp_class
Device(config-pmap-c)# set dscp 10
Device(config-pmap)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

<b>Related Commands</b>	Command	Description
	class, on page 2	Defines a traffic classification match criteria (through the <b>police</b> , <b>set</b> , and <b>trust</b> policy-map class configuration commands) for the specified class-map name.
	police, on page 32	Defines a policer for classified traffic.
	policy map, on page 36	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show policy-map, on page 53	Displays QoS policy maps.
	trust, on page 60	Defines a trust state for traffic classified through the <b>class</b> policy-map configuration command or the <b>class-map</b> global configuration command.

# show class-map

To display quality of service (QoS) class maps, which define the match criteria to classify traffic, use the **show class-map** command in EXEC mode.

Syntax Description	class-map-name	(Optional) Class map nan	ne.	
	type control subscribe	er (Optional) Displays infor	mation about control class maps.

 Cisco IOS Release 15.0(2)EXCisco IOS Release
 This command was introduced.

 15.2(5)E
 A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded.

 This command is supported only on the LAN Base image.

 Examples

 This is an example of output from the show mls qos aggregate-policer command:

 Device# show mls qos aggregate-policer policer1

 aggregate-policer policer1 1000000 2000000 exceed-action drop

 Not used by any policy map

Related Commands	Command	Description
		Defines policer parameters that can be shared by multiple classes within a policy map.

# show mls qos interface

To display quality of service (QoS) information at the port level, use the **show mls qos interface** command in EXEC mode.

show mls qos interface [interface-id] [{buffers|queueing|statistics}]

Syntax Description	interface-id	(Optional) The QoS information for the specified port. Valid interfaces include physical ports.		
	buffers	(Optional) Displays the buffer allocation among the queues.		
	queueing	(Optional) Displays the queueing strategy (shared or shaped) and the weights corresponding to the queues.		
	statistics	(Optional) Displays statistics for sent and received Differentiated Services Code Points (DSCPs) and class of service (CoS) values, the number of packets enqueued or dropped per egress queue, and the number of in-profile and out-of-profile packets for each policer.		
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EXCisco IOS Releas 15.2(5)E	e This command was introduced.		
Usage Guidelines	Though visible in the command-line help string, the <b>policers</b> keyword is not supported.			
	This command is supported only on the LAN Ba	ase image.		
Examples	This is an example of output from the <b>show mls q</b> QoS is enabled:	os interface interface-id command when port-based		
	Device# show mls qos interface gigabitet GigabitEthernet1/0/1 trust state: trust cos trust mode: trust cos trust enabled flag: ena COS override: dis default COS: 0 DSCP Mutation Map: Default DSCP Mutation Trust device: none qos mode: port-based			
	This is an example of output from the <b>show mls q</b> QoS is disabled:	os interface interface-id command when port-based		

```
Device# show mls qos interface gigabitethernet1/0/1
GigabitEthernet1/0/1
QoS is disabled. When QoS is enabled, following settings will be applied
trust state: trust cos
trust mode: trust cos
trust enabled flag: ena
COS override: dis
default COS: 0
DSCP Mutation Map: Default DSCP Mutation Map
Trust device: none
qos mode: port-based
```

This is an example of output from the **show mls qos interface** interface-id **buffers** command:

```
Device# show mls qos interface gigabitethernet1/0/2 buffers
GigabitEthernet1/0/2
The port is mapped to qset : 1
The allocations between the queues are : 25 25 25 25
```

This is an example of output from the **show mls qos interface** *interface-id* **queueing** command. The egress expedite queue overrides the configured shaped round robin (SRR) weights.

```
Device# show mls qos interface gigabitethernet1/0/2 queueing
GigabitEthernet1/0/2
Egress Priority Queue :enabled
Shaped queue weights (absolute) : 25 0 0 0
Shared queue weights : 25 25 25 25
The port bandwidth limit : 100 (Operational Bandwidth:100.0)
The port is mapped to qset : 1
```

This is an example of output from the **show mls qos interface** *interface-id* **statistics** command:

Device# show mls qos interface gigabitethernet1/0/1 statistics GigabitEthernet1/0/1 (All statistics are in packets)

# show mls qos maps

To display quality of service (QoS) mapping information, use the **show mls qos maps** command in EXEC mode.

show mls qos maps [{cos-dscp|cos-output-q|dscp-cos|dscp-mutation
dscp-mutation-name|dscp-output-q|ip-prec-dscp|policed-dscp}]

Syntax Description	cos-dscp	(Optional) Displays class of service (CoS)-to-DSCP map.				
	cos-output-q	(Optional) Displays the CoS output queue threshold map.				
	dscp-cos	(Optional) Displays DSCP-to-CoS map.				
	dscp-mutation dscp-mutation-name	(Optional) Displays the specified DSCP-to-DSCP-mutation map.				
	dscp-output-q	(Optional) Displays the DSCP output queue threshold map.				
	ip-prec-dscp	(Optional) Displays the IP-precedence-to-DSCP map.				
	policed-dscp	(Optional) Displays the policed-DSCP map.				
Command Default	- None					
Command Modes	User EXEC					
	Privileged EXEC					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EXCisco 15.2(5)E	IOS Release This command was introduced.				
Usage Guidelines		mapping tables to represent the priority of the traffic and to derive a ) or Differentiated Services Code Point (DSCP) value from the received				
	specifies the most-significant digit in The intersection of the d1 and d2 va	nd the DSCP-to-DSCP-mutation maps appear as a matrix. The d1 column n the DSCP. The d2 row specifies the least-significant digit in the DSCP lues provides the policed-DSCP, the CoS, or the mutated-DSCP value. nap, a DSCP value of 43 corresponds to a CoS value of 5.				
	The DSCP output queue threshold maps appear as a matrix. The d1 column specifies the most-significant digit of the DSCP number. The d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID. For example, in the DSCP output queue threshold map, a DSCP value of 43 corresponds to queue 1 and threshold 3 (01-03).					
		ps show the CoS value in the top row and the corresponding queue ID For example, in the CoS output queue threshold map, a CoS value of 5 d 3 (1-3).				

### Examples

### This is an example of output from the **show mls qos maps** command:

#### Device# show mls qos maps

	mls qos srr-queue output cos-map, on page 26	Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue output dscp-map, on page 28	Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID.

## show mls qos queue-set

To display quality of service (QoS) settings for the egress queues, use the **show mls qos queue-set** command in EXEC mode.

show mls qos queue-set [gset-id]

**Syntax Description** *qset-id* (Optional) Queue set ID. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.

Command Modes User EXEC

Privileged EXEC

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EXCisco IOS Release 15.2(5)E	This command was introduced.

#### **Examples**

This is an example of output from the **show mls qos queue-set** command:

Device# <b>show mls</b> Oueueset: 1	qos que	ue-set		
Queue :	1	2	3	4
<pre>buffers : threshold1: threshold2: reserved : maximum : Queueset: 2</pre>	25 100 100 50 400	25 200 200 50 400	25 100 100 50 400	25 100 100 50 400
Queue :	1	2	3	4
buffers : threshold1: threshold2: reserved : maximum :	25 100 100 50 400	25 200 200 50 400	25 100 100 50 400	25 100 100 50 400

Related Commands	Command	Description

# srr-queue bandwidth shape

To assign the shaped weights and to enable bandwidth shaping on the four egress queues mapped to a port, use the **srr-queue bandwidth shape** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

srr-queue bandwidth shape weight1 weight2 weight3 weight4
no srr-queue bandwidth shape

Syntax Description	weight1 weight2 weight3 weight4	The weights that specify the percentage of the port that is shaped. The inverse ratio (1/weight) specifies the shaping bandwidth for this queue. Separate each value with a space. The range is 0 to 65535.	
Command Default	Weight1 is set to 25; weight2, weight3, and weight4 are set to 0, and these queues are in shared mode.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)E 15.2(5)E	XCisco IOS Release This command was introduced.	
Usage Guidelines	In shaped mode, the queues are guaranteed a percentage of the bandwidth, and they are rate-limited to that amount. Shaped traffic does not use more than the allocated bandwidth even if the link is idle. Use shaping to smooth bursty traffic or to provide a smoother output over time.		
	The shaped mode overrides the shared mode.		
	If you configure a shaped queue weight to 0 by using the <b>srr-queue bandwidth shape</b> interface configuration command, this queue participates in shared mode. The weight specified with the <b>srr-queue bandwidth shape</b> command is ignored, and the weights specified with the <b>srr-queue bandwidth share</b> interface configuration command for a queue come into effect.		
	When configuring queues fo lowest numbered queue for s	r the same port for both shaping and sharing, make sure that you configure the haping.	
Note	The egress queue default settings are suitable for most situations. You should change them only when y have a thorough understanding of the egress queues and if these settings do not meet your QoS solution		
Queues 2, 3, and 4 operate in the shared mode, because the wei 0. The bandwidth weight for queue 1 is 1/8, which is 12.5 perce bandwidth and limited to it; it does not extend its slot to the oth have no traffic and are idle. Queues 2, 3, and 4 are in shared mode		configure the queues for the same port for both shaping and sharing. In the shared mode, because the weight ratios for these queues are set to queue 1 is $1/8$ , which is 12.5 percent. Queue 1 is guaranteed this it does not extend its slot to the other queues even if the other queues Queues 2, 3, and 4 are in shared mode, and the setting for queue 1 is allocated for the queues in shared mode is $4/(4+4+4)$ , which is 33	

```
Device (config) # interface gigabitethernet2/0/1
Device (config-if) # srr-queue bandwidth shape 8 0 0 0
Device (config-if) # srr-queue bandwidth share 4 4 4 4
```

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** privileged EXEC command.

## srr-queue bandwidth share

To assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port, use the **srr-queue bandwidth share** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

srr-queue bandwidth share weight1 weight2 weight3 weight4 no srr-queue bandwidth share

Syntax Description	weight1 weight2 weight3 weight4	The ratios of <i>weight1</i> , <i>weight2</i> , <i>weight3</i> , and <i>weight4</i> specify the ratio of the frequency in which the SRR scheduler dequeues packets. Separate each value with a space. The range is 1 to 255.	
Command Default			
Command Modes			
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)E 15.2(5)E	XCisco IOS Release This command was introduced.	
Usage Guidelines	The ratio of the weights is the ratio of frequency in which the shaped round-robin (SRR) scheduler dequeues packets from each queue.		
	The absolute value of each weight is meaningless, and only the ratio of parameters is used.		
¢	In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue empties and does not require a share of the link, the remaining queues can expand into the unused bandwidth and share it among themselves.		
	If you configure a shaped queue weight to 0 by using the <b>srr-queue bandwidth shape</b> interface configuration command, this queue participates in SRR shared mode. The weight specified with the <b>srr-queue bandwidth shape</b> command is ignored, and the weights specified with the <b>srr-queue bandwidth share</b> interface configuration command for a queue take effect.		
	When configuring queues for lowest numbered queue for s	r the same port for both shaping and sharing, make sure that you configure the haping.	
Note	•	ngs are suitable for most situations. Change them only when you have a thorough queues and if these settings do not meet your QoS solution.	
Examples	This example shows how to configure the weight ratio of the SRR scheduler running on an egress port. Four queues are used. The bandwidth ratio allocated for each queue in shared mode is $1/(1+2+3+4)$ , $2/(1+2+3+4)$ , $3/(1+2+3+4)$ , and $4/(1+2+3+4)$ , which is 10 percent, 20 percent, 30 percent, and 40 percent for queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth of queue 1, twice the bandwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.		

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# srr-queue bandwidth share 1 2 3 4
```

You can verify your settings by entering the **show mls qos interface** [*interface-id* **queueing**] privileged EXEC command.

Related Commands	Command	Description

	srr-queue bandwidth shape, on page 56	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.

## trust

To define a trust state for traffic classified through the **class** policy-map configuration or the **class-map** global configuration command, use the **trust** command in policy-map class configuration mode. Use the **no** form of this command to return to the default setting.

trust [{cos|dscp|ip-precedence}]
no trust [{cos|dscp|ip-precedence}]

Syntax Description	<b>cos</b> (Optional) Classifies an ingress packet by using the packet class of service (CoS) value. For an untagged packet, the port default CoS value is used.		
	dscp(Optional) Classifies an ingress packet by using the packet Differentiated Services Code Point (DSCP) values (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the default port CoS value is used to map CoS to DSCP.ip-precedence(Optional) Classifies an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the port default CoS value is used if the packet is tagged. If the packet is untagged, the port default CoS value is used to map CoS to DSCP.		
Command Default	The action is no	ot trusted. If no keyword is specified	when the command is entered, the default is <b>dscp</b> .
Command Modes	Policy-map class configuration		
Command History	Release		Modification
	Cisco IOS Rel 15.2(5)E	ease 15.0(2)EXCisco IOS Release	This command was introduced.
Usage Guidelines	Use this command to distinguish the quality of service (QoS) trust behavior for certain traffic from other traffic. For example, incoming traffic with certain DSCP values can be trusted. You can configure a class map to match and trust the DSCP values in the incoming traffic.		
	Trust values set with this command supersede trust values set with the <b>mls qos trust</b> interface configuration command.		
	The <b>trust</b> command is mutually exclusive with <b>set</b> policy-map class configuration command within the same policy map.		
	If you specify <b>trust cos</b> , QoS uses the received or default port CoS value and the CoS-to-DSCP map to generate a DSCP value for the packet.		
	If you specify <b>trust dscp</b> , QoS uses the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP value for the packet is derived from the CoS-to-DSCP map.		
			precedence value from the ingress packet and the are tagged, QoS uses the received CoS value; for non-IF

packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP for the packet is derived from the CoS-to-DSCP map.

To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.

#### **Examples**

This example shows how to define a port trust state to trust incoming DSCP values for traffic classified with a default class:

```
Device(config) # policy-map policy1
Device(config-pmap)# class class-default
Device(config-pmap-c)# trust dscp
Device(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Device(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class, on page 2	Defines a traffic classification match criteria (through the <b>police</b> , <b>set</b> , and <b>trust</b> policy-map class configuration command) for the specified class-map name.
	police, on page 32	Defines a policer for classified traffic.
	policy map, on page 36	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set, on page 40	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map, on page 53	Displays QoS policy maps.
