

Per-User ACL Support for 802.1X/MAB/Webauth Users

This feature allows per-user ACLs to be downloaded from the Cisco Access Control Server (ACS) as policy enforcement after authentication using IEEE 802.1X, MAB authentication bypass, or web authentication.

- [Prerequisites for Per-User ACL Support for 802.1X/MAB/Webauth Users, on page 1](#)
- [Restrictions for Per-User ACL Support for 802.1X/MAB/Webauth Users, on page 1](#)

Prerequisites for Per-User ACL Support for 802.1X/MAB/Webauth Users

- AAA authentication must be enabled.
- AAA authorization must be enabled by using the **network** keyword to allow interface configuration from the RADIUS server.
- 802.1X authentication must be enabled.
- The user profile and VSAs must be configured on the RADIUS server.

Restrictions for Per-User ACL Support for 802.1X/MAB/Webauth Users

- Per-user Access Control Lists (ACLs) are supported only in single-host mode.
- This feature does not support standard ACLs on the switch port.

- Only one 802.1X-authenticated user is supported on a port. If the multiple-hosts mode is enabled on the port, the per-user ACL attribute is disabled for the associated port.
- The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

Information About Per-User ACL Support for 802.1X/MAB/Webauth Users

802.1X Authentication with Per-User ACLs

Per-user access control lists (ACLs) can be configured to provide different levels of network access and service to an 802.1X-authenticated user. When the RADIUS server authenticates a user that is connected to an 802.1X port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1X port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes (VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs used for per-user ACLs are `inacl#<n>` for the ingress direction and `outacl#<n>` for the egress direction. MAB ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It does not support port ACLs in the egress direction on Layer 2 ports. For more information, see the “Configuring Network Security with ACLs” module.

The extended ACL syntax style should be used to define the per-user configuration that is stored on the RADIUS server. When the definitions are passed from the RADIUS server, they are created by using the extended naming convention. However, if the Filter-Id attribute is used, it can point to a standard ACL.

The Filter-Id attribute can be used to specify an inbound or outbound ACL that is already configured on the switch. The attribute contains the ACL number followed by `.in` for ingress filtering or `.out` for egress filtering. If the RADIUS server does not allow the `.in` or `.out` syntax, the access list is applied to the outbound ACL by default. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported only for IP ACLs numbered 1 to 199 and 1300 to 2699 (IP standard and IP extended ACLs).

Only one 802.1X-authenticated user is supported on a port. If the multiple-hosts mode is enabled on the port, the per-user ACL attribute is disabled for the associated port.

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

How to Configure Per-User ACL Support for 802.1X/MAB/Webauth Users

Configuring Downloadable ACLs

To configure a device to accept downloadable ACLs or redirect URLs from the RADIUS server during authentication of an attached host, perform this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip device tracking**
4. **aaa new-model**
5. **aaa authorization network default group radius**
6. **radius-server vsa send authentication**
7. **interface *interface-id***
8. **ip access-group *acl-id* in**
9. **end**
10. **show running-config interface *interface-id***
11. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted .
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip device tracking Example: Device(config)# ip device tracking	Enables the IP device tracking table.
Step 4	aaa new-model Example: Device(config)# aaa new-model	Enables AAA.

	Command or Action	Purpose
Step 5	aaa authorization network default group radius Example: Device(config)# aaa authorization network default group radius	Sets the authorization method. To remove the authorization method, use the no aaa authorization network default group radius command.
Step 6	radius-server vsa send authentication Example: Device(config)# radius-server vsa send authentication	Configures the network access server.
Step 7	interface interface-id Example: Device(config)# interface gigabitethernet 0/2	Specifies the port to be configured, and enters interface configuration mode.
Step 8	ip access-group acl-id in Example: Device(config-if)# ip access-group 99 in	Configures the default ACL on the port in the input direction. Note The ACL ID is an access list name or number.
Step 9	end	Device(config-if)# end Returns to Privileged EXEC mode.
Step 10	show running-config interface interface-id Example: Device# show running-config interface interface-id	Displays the specific interface configuration for verification.
Step 11	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Save entries in the configuration file.

Configuration Examples for Per-User ACL Support for 802.1X/MAB/Webauth Users

Example: Configuring a Switch for a Downloadable Policy

The following example shows how to configure a switch for a downloadable policy:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authorization network default local group radius
Device(config)# ip device tracking
Device(config)# ip access-list extended default_acl
```

```

Device(config-ext-nacl)# permit ip any any
Device(config-ext-nacl)# exit
Device(config)# radius-server vsa send authentication
Device(config)# interface fastEthernet 2/13
Device(config-if)# ip access-group default_acl in
Device(config-if)# end

```

Feature Information for Per-User ACL Support for 802.1X/MAB/Webauth Users

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Per-User ACL Support for 802.1X/MAB/Webauth Users

Feature Name	Releases	Feature Information
Per-User ACL Support for 802.1X/MAB/Webauth Users	Cisco IOS Release 15.2(5)E Cisco IOS Release 15.2(7)E1	This feature allows per-user ACLs to be downloaded from the Cisco Access Control Server (ACS) as policy enforcement after authentication using IEEE 802.1X, MAB authentication bypass, or web authentication.
