Document Conventions

This document uses the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^ or Ctrl</td>
<td>Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination ^D or Ctrl-D means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)</td>
</tr>
<tr>
<td>bold font</td>
<td>Commands and keywords and user-entered text appear in bold font.</td>
</tr>
<tr>
<td>Italic font</td>
<td>Document titles, new or emphasized terms, and arguments for which you supply values are in italic font.</td>
</tr>
<tr>
<td>Courier font</td>
<td>Terminal sessions and information the system displays appear in courier font.</td>
</tr>
<tr>
<td>Bold Courier font</td>
<td>Bold Courier font indicates text that the user must enter.</td>
</tr>
<tr>
<td>[x]</td>
<td>Elements in square brackets are optional.</td>
</tr>
<tr>
<td>...</td>
<td>An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Convention</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
<tr>
<td>[x {y</td>
<td>z}]</td>
</tr>
<tr>
<td>string</td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
<tr>
<td>&lt; &gt;</td>
<td>Nonprinting characters such as passwords are in angle brackets.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Default responses to system prompts are in square brackets.</td>
</tr>
<tr>
<td>!, #</td>
<td>An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.</td>
</tr>
</tbody>
</table>

**Reader Alert Conventions**

This document uses the following conventions for reader alerts:

- **Note**
  - Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

- **Tip**
  - Means *the following information will help you solve a problem*.

- **Caution**
  - Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

- **Timesaver**
  - Means *the described action saves time*. You can save time by performing the action described in the paragraph.

- **Warning**
  - Means *reader be warned*. In this situation, you might perform an action that could result in bodily injury.
Related Documentation

Note Before installing or upgrading the switch, refer to the release notes.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What's New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
CHAPTER 1

Using the Command-Line Interface

This chapter contains the following topics:

• Information About Using the Command-Line Interface, page 1
• How to Use the CLI to Configure Features, page 5

Information About Using the Command-Line Interface

This section describes the Cisco IOS command-line interface (CLI) and how to use it to configure your switch.

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, a SSH, or by using the browser. When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as show commands, which show the current configuration status, and clear commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.
### Table 1: Command Mode Summary

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
<th>About This Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>Begin a session using Telnet, SSH, or console.</td>
<td>Switch&gt;</td>
<td>Enter <strong>logout</strong> or <strong>quit</strong>.</td>
<td>Use this mode to • Change terminal settings. • Perform basic tests. • Display system information.</td>
</tr>
<tr>
<td>Privileged EXEC</td>
<td>While in user EXEC mode, enter the <strong>enable</strong> command.</td>
<td>Switch#</td>
<td>Enter <strong>disable</strong> to exit.</td>
<td>Use this mode to verify commands that you have entered. Use a password to protect access to this mode.</td>
</tr>
<tr>
<td>Global configuration</td>
<td>While in privileged EXEC mode, enter the <strong>configure</strong> command.</td>
<td>Switch(config)#</td>
<td>To exit to privileged EXEC mode, enter <strong>exit</strong> or <strong>end</strong>, or press <strong>Ctrl-Z</strong>.</td>
<td>Use this mode to configure parameters that apply to the entire switch.</td>
</tr>
<tr>
<td>VLAN configuration</td>
<td>While in global configuration mode, enter the <strong>vlan</strong> <strong>vlan-id</strong> command.</td>
<td>Switch(config-vlan)#</td>
<td>To exit to global configuration mode, enter the <strong>exit</strong> command. To return to privileged EXEC mode, press <strong>Ctrl-Z</strong> or enter <strong>end</strong>.</td>
<td>Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.</td>
</tr>
<tr>
<td>Interface configuration</td>
<td>While in global configuration mode, enter the <strong>interface</strong> command (with a specific interface).</td>
<td>Switch(config-if)#</td>
<td>To exit to global configuration mode, enter <strong>exit</strong>. To return to privileged EXEC mode, press <strong>Ctrl-Z</strong> or enter <strong>end</strong>.</td>
<td>Use this mode to configure parameters for the Ethernet ports.</td>
</tr>
</tbody>
</table>
Using the Command-Line Interface

Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

**SUMMARY STEPS**

1. help
2. abbreviated-command-entry ?
3. abbreviated-command-entry <Tab>
4. ?
5. command ?
6. command keyword ?

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>help</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# help</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>abbreviated-command-entry ?</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# di? dir disable disconnect</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>abbreviated-command-entry &lt;Tab&gt;</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# sh conf&lt;tab&gt; Switch# show configuration</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

- **Step 4**: Lists all commands available for a particular command mode.
  
  **Example:**
  
  Switch> ?

- **Step 5**: Lists the associated keywords for a command.
  
  **Example:**
  
  Switch> show ?

- **Step 6**: Lists the associated arguments for a keyword.
  
  **Example:**
  
  Switch(config)# cdp holdtime ?

### Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the `show configuration` privileged EXEC command in an abbreviated form:

```
Switch# show conf
```

### No and default Forms of Commands

Almost every configuration command also has a `no` form. In general, use the `no` form to disable a feature or function or reverse the action of a command. For example, the `no shutdown` interface configuration command reverses the shutdown of an interface. Use the command without the keyword `no` to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a `default` form. The `default` form of a command returns the command setting to its default. Most commands are disabled by default, so the `default` form is the same as the `no` form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the `default` command enables the command and sets variables to their default values.

### CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.
Table 2: Common CLI Error Messages

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Meaning</th>
<th>How to Get Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Ambiguous command: “show con”</td>
<td>You did not enter enough characters for your switch to recognize the command.</td>
<td>Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Incomplete command.</td>
<td>You did not enter all the keywords or values required by this command.</td>
<td>Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Invalid input detected at ‘^’ marker.</td>
<td>You entered the command incorrectly. The caret (^) marks the point of the error.</td>
<td>Enter a question mark (?) to display all the commands that are available in this command mode. The possible keywords that you can enter with the command appear.</td>
</tr>
</tbody>
</table>

Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

Note

Only CLI or HTTP changes are logged.

How to Use the CLI to Configure Features

Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.
Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

**SUMMARY STEPS**

1. `terminal history [size number-of-lines]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>terminal history [size number-of-lines]</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# terminal history size 200</td>
</tr>
</tbody>
</table>

Changes the number of command lines that the switch records during the current terminal session in the privileged EXEC mode. You can configure the size from 0 through 256.

**Recalling Commands**

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

**SUMMARY STEPS**

1. Ctrl-P or use the up arrow key
2. Ctrl-N or use the down arrow key
3. show history

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Ctrl-P or use the up arrow key</td>
</tr>
<tr>
<td></td>
<td>Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Ctrl-N or use the down arrow key</td>
</tr>
<tr>
<td></td>
<td>Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show history</td>
<td>Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the <code>terminal history</code> global configuration command and the <code>history</code> line configuration command.</td>
</tr>
</tbody>
</table>

#### Example:

```
Switch# show history
```

### Step 3

**Disabling the Command History Feature**

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

#### SUMMARY STEPS

1. terminal no history

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminal no history</td>
<td>Disables the feature during the current terminal session in the privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it, and reenable it.

#### SUMMARY STEPS

1. terminal editing
2. terminal no editing

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>terminal editing</td>
<td>Reenables the enhanced editing mode for the current terminal session in the privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Enabling and Disabling Editing Features

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> terminal no editing</td>
<td>Disables the enhanced editing mode for the current terminal session in the privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Example:
Switch# terminal no editing

Editing Commands through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

---

**Note**
The arrow keys function only on ANSI-compatible terminals such as VT100s.

---

<table>
<thead>
<tr>
<th>Editing Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-B or use the left arrow key</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>Ctrl-F or use the right arrow key</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Moves the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>Moves the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Esc B</td>
<td>Moves the cursor back one word.</td>
</tr>
<tr>
<td>Esc F</td>
<td>Moves the cursor forward one word.</td>
</tr>
<tr>
<td>Ctrl-T</td>
<td>Transposes the character to the left of the cursor with the character located at the cursor.</td>
</tr>
<tr>
<td>Delete or Backspace key</td>
<td>Erases the character to the left of the cursor.</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td>Deletes the character at the cursor.</td>
</tr>
<tr>
<td>Ctrl-K</td>
<td>Deletes all characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Ctrl-U or Ctrl-X</td>
<td>Deletes all characters from the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-W</td>
<td>Deletes the word to the left of the cursor.</td>
</tr>
<tr>
<td>Keystroke</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Esc D</td>
<td>Deletes from the cursor to the end of the word.</td>
</tr>
<tr>
<td>Esc C</td>
<td>Capitalizes at the cursor.</td>
</tr>
<tr>
<td>Esc L</td>
<td>Changes the word at the cursor to lowercase.</td>
</tr>
<tr>
<td>Esc U</td>
<td>Capitalizes letters from the cursor to the end of the word.</td>
</tr>
<tr>
<td>Ctrl-V or Esc Q</td>
<td>Designates a particular keystroke as an executable command, perhaps as a shortcut.</td>
</tr>
</tbody>
</table>
| Return key        | Scrolls down a line or screen on displays that are longer than the terminal screen can display.  
|                   | **Note** The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including show command output. You can use the Return and Space bar keystrokes whenever you see the More prompt. |
| Space bar         | Scrolls down one screen.                              |
| Ctrl-L or Ctrl-R  | Redisplays the current command line if the switch suddenly sends a message to your screen. |

**Editing Command Lines That Wrap**

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press Ctrl-B or the left arrow key repeatedly. You can also press Ctrl-A to immediately move to the beginning of the line.

**Note**
The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extend beyond a single line on the screen.

**SUMMARY STEPS**

1. access-list
2. Ctrl-A
3. Return key
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> access-list</td>
<td>Displays the global configuration command entry that extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign ($) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.25 10.15.22.25 255.255.255.0 10.15.22.35 255.25 Switch(config)# $t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Switch(config)# $15.22.25 255.255.255.0 eq 45</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Ctrl-A</td>
<td>Checks the complete syntax. The dollar sign ($) appears at the end of the line to show that the line has been scrolled to the right.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.2$</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Return key</td>
<td>Execute the commands. The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the terminal width privileged EXEC command to set the width of your terminal. Use line wrapping with the command history feature to recall and modify previous complex command entries.</td>
</tr>
</tbody>
</table>

### Searching and Filtering Output of `show` and `more` Commands

You can search and filter the output for `show` and `more` commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

#### Summary Steps

1. `{show | more} command | {begin | include | exclude} regular-expression`  

#### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> `{show</td>
<td>more} command</td>
</tr>
</tbody>
</table>
Purpose

Command or Action | Purpose
--- | ---
**Example:**
Switch# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet1/0/1 is up, line protocol is down
GigabitEthernet1/0/2 is up, line protocol is up

Expressions are case sensitive. For example, if you enter `| exclude output`, the lines that contain `output` are not displayed, but the lines that contain `output` appear.

**Accessing the CLI through a Console Connection or through Telnet**

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.

- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.
  - The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
  - The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.
Information About Administering the Switch

System Time and Date Management

You can manage the system time and date on your switch using automatic configuration methods (RTC and NTP), or manual configuration methods.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- RTC
- NTP
- Manual configuration

The system clock can provide time to these services:
Real Time Clock

A real-time clock (RTC) keeps track of the current time on the switch. The switch is shipped to you with RTC set to GMT time until you reconfigure clocking parameters.

The benefits of an RTC are:

- RTC is battery-powered.
- System time is retained during power outage and at system reboot.

The RTC and NTP clocks are integrated on the switch. When NTP is enabled, the RTC time is periodically synchronized to the NTP clock to maintain accuracy.

Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP Stratum

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

NTP Associations

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping

- User show commands
- Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.
is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

**NTP Security**

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

**NTP Implementation**

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F, respectively.

*Figure 1: Typical NTP Network Configuration*
If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Version 4

NTP version 4 is implemented on the switch. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

System Name and Prompt

You configure the system name on the switch to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

Stack System Name and Prompt

If you are accessing a stack member through the stack master, you must use the `session stack-member-number` privileged EXEC command. The stack member number range is from 1 through 8. When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

Default System Name and Prompt Configuration

The default switch system name and prompt is `Switch`.

DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as `ping`, `telnet`, `connect`, and related Telnet support operations.
IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a com domain name, so its domain name is cisco.com. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as ftp.cisco.com.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

**Default DNS Settings**

**Table 4: Default DNS Settings**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

**Login Banners**

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

The MOTD and login banners are not configured.

**Default Banner Configuration**

The MOTD and login banners are not configured.

**MAC Address Table**

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.
The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**MAC Address Table Creation**

With multiple MAC addresses supported on all ports, you can connect any port on the switch to other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

**MAC Addresses and VLANs**

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

**MAC Addresses and Switch Stacks**

The MAC address tables on all stack members are synchronized. At any given time, each stack member has the same copy of the address tables for each VLAN. When an address ages out, the address is removed from the address tables on all stack members. When a switch joins a switch stack, that switch receives the addresses for each VLAN learned on the other stack members. When a stack member leaves the switch stack, the remaining stack members age out or remove all addresses learned by the former stack member.

**Default MAC Address Table Settings**

The following table shows the default settings for the MAC address table.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>
ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called address resolution.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the arpa keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

How to Administer the Switch

Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

---

**Note**

You must reconfigure this setting if you have manually configured the system clock before the stack master fails and a different stack member assumes the role of stack master.

---

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

**SUMMARY STEPS**

1. Use one of the following:
   - `clock set hh:mm:ss day month year`
   - `clock set hh:mm:ss month day year`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Sets the system clock using one of these formats:</strong></td>
</tr>
<tr>
<td>Use one of the following:</td>
<td><strong>Purpose:</strong></td>
</tr>
<tr>
<td>- clock set <code>hh:mm:ss day month year</code></td>
<td>- <code>hh:mm:ss</code>—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone.</td>
</tr>
<tr>
<td>- clock set <code>hh:mm:ss month day year</code></td>
<td>- <code>day</code>—Specifies the day by date in the month.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>- <code>month</code>—Specifies the month by name.</td>
</tr>
<tr>
<td><code>Switch# clock set 13:32:00 23 March 2013</code></td>
<td>- <code>year</code>—Specifies the year (no abbreviation).</td>
</tr>
</tbody>
</table>

### Configuring the Time Zone

### SUMMARY STEPS

1. configure terminal
2. clock timezone `zone hours-offset [minutes-offset]`
3. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Enters global configuration mode.</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td><strong>Purpose:</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Sets the time zone.</strong></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose:</strong></td>
</tr>
<tr>
<td>clock timezone <code>zone hours-offset [minutes-offset]</code></td>
<td><strong>zone</strong>—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>hours-offset</strong>—Enters the hours offset from UTC.</td>
</tr>
<tr>
<td><code>Switch(config)# clock timezone AST -3 30</code></td>
<td><strong>(Optional) minutes-offset</strong>—Enters the minutes offset from UTC. This available where the local time zone is a percentage of an hour different from UTC.</td>
</tr>
</tbody>
</table>
### Purpose

Command or Action | Purpose
---|---
Step 3 | end

**Example:**

```bash
Switch(config)# end
```

### Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

#### SUMMARY STEPS

1. configure terminal
2. clock summer-time zone date date month year hh:mm date month year hh:mm [offset]
3. clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
</tbody>
</table>

**Example:**

```bash
Switch# configure terminal
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>clock summer-time zone date date month year hh:mm date month year hh:mm [offset]</td>
</tr>
</tbody>
</table>

**Example:**

```bash
Switch(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]</td>
</tr>
</tbody>
</table>

**Example:**

```bash
Switch(config)# clock summer-time PDT recurring 10 March 2013 2:00 3
```

Configures summer time to start and end on specified days every year.

All times are relative to the local time zone. The start time is relative to standard time.

The end time is relative to summer time. Summer time is disabled by default. If you specify `clock summer-time zone recurring` without parameters, the summer time rules default to the United States rules.
Configuring a System Name

SUMMARY STEPS

1. configure terminal
2. hostname name
3. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

Example:

Switch# configure terminal
### Setting Up DNS

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

#### SUMMARY STEPS

1. `configure terminal`
2. `ip domain-name name`
3. `ip name-server server-address1 [server-address2 ... server-address6]`
4. `ip domain-lookup [nsap | source-interface interface]`
5. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

Example:

Switch# configure terminal
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip domain-name name</code></td>
<td>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name. At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip domain-name Cisco.com</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip name-server server-address1</code> [server-address2 ... server-address6]</td>
<td>Specifies the address of one or more name servers to use for name and address resolution. You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>`ip domain-lookup [nsap</td>
<td>source-interface interface]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip domain-lookup</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

**SUMMARY STEPS**

1. `configure terminal`
2. `banner motd message`
3. `end`
**Detailed Steps**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> banner motd c message c</td>
<td>Specifies the message of the day.</td>
</tr>
<tr>
<td>Example: Switch(config)# banner motd # This is a secure site. Only authorized users are allowed. For access, contact technical support.</td>
<td>c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. message—Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring a Login Banner**

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

**Summary Steps**

1. configure terminal
2. banner login c message c
3. end

**Detailed Steps**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>

</tbody>
</table>
Managing the MAC Address Table

Changing the Address Aging Time

SUMMARY STEPS

1. configure terminal
2. mac address-table aging-time [0 | 10-1000000] [routed-mac | vlan vlan-id]
3. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 mac address-table aging-time [0</td>
<td>10-1000000] [routed-mac</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# mac address-table</td>
<td></td>
</tr>
<tr>
<td>aging-time 500 vlan 2</td>
<td></td>
</tr>
</tbody>
</table>

The range is 10 to 1000000 seconds. The default is 300. You can also enter 0, which disables aging. Static address entries are never aged or removed from the table.

vlan-id—Valid IDs are 1 to 4094.
### Configuring MAC Address Change Notification Traps

**SUMMARY STEPS**

1. configure terminal
2. `snmp-server host host-addr community-string notification-type { informs | traps } {version {1 | 2c | 3}} {vrf vrf instance name}`
3. `snmp-server enable traps mac-notification change`
4. `mac address-table notification change`
5. `mac address-table notification change [interval value] [history-size value]`
6. `interface interface-id`
7. `snmp trap mac-notification change {added | removed}`
8. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
### Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Beginning in privileged EXEC mode, follow these steps to configure the switch to send MAC address-move notification traps to an NMS host:

**SUMMARY STEPS**

1. configure terminal
2. snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type
3. snmp-server enable traps mac-notification move
4. mac address-table notification mac-move
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server host host-addr {traps</td>
<td>informs} {version {1</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification</td>
<td></td>
</tr>
</tbody>
</table>

- **host-addr**—Specifies the name or address of the NMS.
- **traps** (the default)—Sends SNMP traps to the host.
- **informs**—Sends SNMP informs to the host.
- **version**—Specifies the SNMP version to support. Version 1, the default, is not available with informs.
- **community-string**—Specifies the string to send with the notification operation. Though you can set this string by using the **snmp-server host** command, we recommend that you...
Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

**SUMMARY STEPS**

1. configure terminal
2. snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type
3. snmp-server enable traps mac-notification threshold
4. mac address-table notification threshold
5. mac address-table notification threshold [limit percentage] | [interval time]
6. end
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server host host-addr {traps</td>
<td>informs} {version 1</td>
</tr>
</tbody>
</table>
| **Example:** Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification | \- host-addr—Specifies the name or address of the NMS. 
\- traps (the default)—Sends SNMP traps to the host. 
\- informs—Sends SNMP informs to the host. 
\- version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. 
\- community-string—Specifies the string to send with the notification operation. You can set this string by using the `snmp-server host` command, but we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command. 
\- notification-type—Uses the `mac-notification` keyword. |
| **Step 3** snmp-server enable traps mac-notification threshold | Enables MAC threshold notification traps to the NMS. |
| **Example:** Switch(config)# snmp-server enable traps mac-notification threshold | |
| **Step 4** mac address-table notification threshold | Enables the MAC address threshold notification feature. |
| **Example:** Switch(config)# mac address-table notification threshold | |
| **Step 5** mac address-table notification threshold [limit percentage] [interval time] | Enters the threshold value for the MAC address threshold usage monitoring. |
| **Example:** Switch(config)# mac address-table notification threshold interval 123 | \- (Optional) limit percentage—Specifies the percentage of the MAC address table use; valid values are from 1 to 100 percent. The default is 50 percent. 
\- (Optional) interval time—Specifies the time between notifications; valid values are greater than or equal to 120 seconds. The default is 120 seconds. |
Adding and Removing Static Address Entries

**SUMMARY STEPS**

1. configure terminal
2. mac address-table static mac-addr vlan vlan-id interface interface-id
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<tr>
<td>Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
</tbody>
</table>

• *mac-addr*—Specifies the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.

• *vlan-id*—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.

• *interface-id*—Specifies the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. For static multicast addresses, you can enter multiple interface IDs. For static unicast addresses, you can enter only one interface at a time, but you can enter the command multiple times with the same MAC address and VLAN ID.
Purpose

Command or Action  |  Purpose
--- | ---
Step 3  |  end

Example:

Switch(config)# end

Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-z to exit global configuration mode.

Configuring Unicast MAC Address Filtering

SUMMARY STEPS

1. configure terminal
2. mac address-table static mac-addr vlan vlan-id drop
3. end

DETAILED STEPS

<tr>
<td>Step 2</td>
<td>mac address-table static mac-addr vlan vlan-id drop</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop</td>
</tr>
</tbody>
</table>

Enables unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address.

- **mac-addr**—Specifies a source or destination unicast MAC address (48-bit). Packets with this MAC address are dropped.
- **vlan-id**—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.

Configuration Examples for Switch Administration

Example: Setting the System Clock

This example shows how to manually set the system clock:

```
Switch# clock set 13:32:00 23 July 2013
```

Examples: Configuring Summer Time

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
Switch(config)# clock summer-time PDT recurring PST date
10 March 2013 2:00 3 November 2013 2:00
```

This example shows how to set summer time start and end dates:

```
Switch(config)# clock summer-time PST date
20 March 2013 2:00 20 November 2013 2:00
```

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Switch(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Switch(config)#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 192.0.2.15
Trying 192.0.2.15...
Connected to 192.0.2.15.
Escape character is '^]'.
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
User Access Verification
Password:
```
Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

```plaintext
Switch(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
Switch(config)#
```

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```plaintext
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 123
Switch(config)# mac address-table notification change history-size 100
Switch(config)# interface gigabitethernet1/2/1
Switch(config-if)# snmp trap mac-notification change added
```

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

```plaintext
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```plaintext
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet1/1/1
```
**Example: Configuring Unicast MAC Address Filtering**

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

Performing Switch Setup Configuration

Switch setup configuration tasks include how to assign the IP address for your switch by using a variety of automatic and manual methods.

This chapter contains the following topics:

- Information About Performing Switch Setup Configuration, page 39
- How to Perform Switch Setup Configuration, page 50
- Monitoring Switch Setup Configuration, page 63
- Configuration Examples for Performing Switch Setup, page 64
- Additional References for Performing Switch Setup, page 66
- Feature History and Information For Performing Switch Setup Configuration, page 68

Information About Performing Switch Setup Configuration

Review the sections in this module before performing your initial switch configuration tasks that include IP address assignments and DHCP autoconfiguration.

Boot Process

To start your switch, you need to follow the procedures in the getting started guide or the hardware installation guide for installing and powering on the switch and setting up the initial switch configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The boot loader software performs the normal boot process and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
Loads a default operating system software image into memory and boots up the switch.

The boot loader provides access to the flash file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door operation provides enough access to the system so that if it is necessary, you can format the flash file system, reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.

Before you can assign switch information, make sure that you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match that of the switch console port settings:

- Baud rate default is 9600.
- Data bits default is 8.
- Stop bits default is 2 (minor).
- Parity settings default is none.

**Note**

If the data bits option is set to 8, set the parity option to none.

**Switches Information Assignment**

You can assign IP information through the switch setup program, through a DHCP server, or manually.

Use the switch setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the stack master or to any other stack member. You can still manage the stack through the same IP address even if you remove the stack master or any other stack member from the stack, provided there is IP connectivity.

**Note**

Stack members retain their IP address when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP address of the switch that you removed from the switch stack.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.
If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use the setup program described in the Boot Process section.

**Default Switch Information**

**DHCP-Based Autoconfiguration Overview**

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP client autoconfiguration, you need to configure a Trivial File Transfer Protocol (TFTP) server to fetch the configuration file. The DHCP client then applies the new configuration file to its running configuration.

**Note**

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)
We recommend a redundant connection between a switch stack and the DHCP, DNS, and TFTP servers. This is to help ensure that these servers remain accessible in case one of the connected stack members is removed from the switch stack.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

DHCP Client Request Process

When you boot up your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

![DHCP Client and Server Message Exchange](image)

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).
A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

The DHCP hostname option allows a group of switches to obtain hostnames and a standard configuration from the central management DHCP server. A client (switch) includes in its DCHPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the \texttt{hostname name} global configuration command is not configured or the \texttt{no hostname} global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the \texttt{ip address dhcp} interface configuration command. In this case, if the client receives the DCHP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

### DHCP-based Autoconfiguration and Image Update

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more switches in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new switch added to a network are synchronous with the network.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

#### Restrictions for DHCP-based Autoconfiguration

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.
- The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the \texttt{write memory} or \texttt{copy running-configuration startup-configuration} privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

#### DHCP Autoconfiguration

DHCP autoconfiguration downloads a configuration file to one or more switches in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the switch. It does not overwrite the bootup configuration saved in the flash, until you reload the switch.
DHCP Auto-Image Update

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more switches in your network. The switch (or switches) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

To enable a DHCP auto-image update on the switch, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the switch in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the switch, and the new image is downloaded and installed on the switch. When you reboot the switch, the configuration is stored in the saved configuration on the switch.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:

• You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.

• If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:
  ◦ IP address of the client (required)
  ◦ Subnet mask of the client (required)
  ◦ DNS server IP address (optional)
  ◦ Router IP address (default gateway address to be used by the switch) (required)

• If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
  ◦ TFTP server name (required)
  ◦ Boot filename (the name of the configuration file that the client needs) (recommended)
  ◦ Hostname (optional)

• Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

• If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the switch is not configured. If the router IP address or the TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

• The switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured.
Purpose of the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the switch’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
- The router-config or the ciscortr.cfg file (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the switch, or if it is to be accessed by the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.

Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database. The DNS server can be on the same LAN or on a different LAN from the switch. If it is on a different LAN, the switch must be able to access it through a router.

How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).
The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).

The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the network-confg or cisconet.cfg default configuration file. (If the network-confg file cannot be read, the switch reads the cisconet.cfg file.)

The default configuration file contains the hostnames-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the switch uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the switch uses the default Switch as its hostname.

After obtaining its hostname from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its hostname (hostname-confg or hostname.cfg, depending on whether network-confg or cisconet.cfg was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.

If the switch cannot read the network-confg, cisconet.cfg, or the hostname file, it reads the router-confg file. If the switch cannot read the router-confg file, it reads the ciscortr.cfg file.

Note: The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

How to Control Environment Variables

With a normally operating switch, you enter the boot loader mode only through the console connection. Unplug the switch power cord, then reconnect the power cord. Hold down the MODE button until you see the boot loader switch prompt.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader or any other software running on the system, functions. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, "") is a variable with a value. Many environment variables are predefined and have default values.
Environment variables store two kinds of data:

- Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.

- Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.

### Common Environment Variables

This table describes the function of the most common environment variables.

**Table 7: Common Environment Variables**

<table>

</table>
Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

**Table 8: Environment Variables for TFTP**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_ADDR</td>
<td>Specifies the MAC address of the switch.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> We recommend that you do not modify this variable.</td>
</tr>
<tr>
<td></td>
<td>However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP.</td>
</tr>
<tr>
<td>IP_ADDR</td>
<td>Specifies the IP address and the subnet mask for the associated IP subnet of the switch.</td>
</tr>
<tr>
<td>DEFAULT_ROUTER</td>
<td>Specifies the IP address and subnet mask of the default gateway.</td>
</tr>
</tbody>
</table>

Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).

**Note**

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The `reload` command halts the system. If the system is not set to manually boot up, it reboots itself.
If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.

How to Perform Switch Setup Configuration

Using DHCP to download a new image and a new configuration to a switch requires that you configure at least two switches. One switch acts as a DHCP and TFTP server and the second switch (client) is configured to download either a new configuration file or a new configuration file and a new image file.

Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing switch in the network so that it can support the autoconfiguration of a new switch.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip dhcp pool poolname`
3. `boot filename`
4. `network network-number mask prefix-length`
5. `default-router address`
6. `option 150 address`
7. `exit`
8. `tftp-server flash:filename.text`
9. `interface interface-id`
10. `no switchport`
11. `ip address address mask`
12. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
Switch# configure terminal
```
<table>

**Configuring DHCP Auto-Image Update (Configuration File and Image)**

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing switch to support the installation of a new switch.

**Before You Begin**

You must first create a text file (for example, autoinstall_dhcp) that will be uploaded to the switch. In the text file, put the name of the image that you want to download. This image (bundle) must be a bin file. This image (tar) must be a bin file.
### SUMMARY STEPS

1. `configure terminal`
2. `ip dhcp pool poolname`
3. `boot filename`
4. `network network-number mask prefix-length`
5. `default-router address`
6. `option 150 address`
7. `option 125 hex`
8. `copy tftp flash filename.txt`
9. `copy tftp flash imagename.bin`
10. `exit`
11. `tftp-server flash: config.text`
12. `tftp-server flash: imagename.bin`
13. `tftp-server flash: filename.txt`
14. `interface interface-id`
15. `no switchport`
16. `ip address address mask`
17. `end`
18. `copy running-config startup-config`

<tr>
<td></td>
<td>\textbf{Example:} Switch# show ip redirects</td>
<td></td>
</tr>
</tbody>
</table>
Configuring the NVRAM Buffer Size

The default NVRAM buffer size is 512 KB. In some cases, the configuration file might be too large to save to NVRAM. Typically, this occurs when you have many switches in a switch stack. You can configure the size of the NVRAM buffer to support larger configuration files. The new NVRAM buffer size is synced to all current and new member switches.

After you configure the NVRAM buffer size, reload the switch or switch stack.

When you add a switch to a stack and the NVRAM size differs, the new switch syncs with the stack and reloads automatically.

**SUMMARY STEPS**

1. `configure terminal`
2. `boot buffersize size`
3. `end`
4. `show boot`

Modifying the Switch Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

Before You Begin

Use a standalone switch for this task.

SUMMARY STEPS

1. configure terminal
2. boot config flash:/file-url
3. end
4. show boot
5. copy running-config startup-config

DETAILED STEPS

Examples: Displaying Software Install

This example displays software bootup in install mode:

switch# boot flash:/c2960x-universalk9-mz-150-2.EX/c2960x-universalk9-mz-150-2.EX.bin

Configuration Examples for Performing Switch Setup

Example: Configuring a Switch as a DHCP Server

Switch# configure terminal
Switch(config)# ip dhcp pool pool1
Switch(config)# network 10.10.10.0 255.255.255.0
Switch(config)# boot config-boot.text
Switch(config)# default-router 10.10.10.1
Switch(config)# option 150 10.10.10.1
Switch(config)# exit
Switch(config)# tftp-server flash:/config-boot.text
Switch(config)# interface gigabitethernet1/0/4
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end
Example: Configuring DHCP Auto-Image Update

Switch# configure terminal
Switch(config)# ip dhcp pool pool1
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# boot config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.10.1
Switch(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370
Switch(dhcp-config)# exit
Switch(config)# tftp-server flash:config-boot.text
Switch(config)# tftp-server flash:image_name
Switch(config)# tftp-server flash:boot-config.text
Switch(config)# tftp-server flash: autoinstall_dhcp
Switch(config)# interface gigabitethernet1/0/4
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end

Example: Configuring a Switch to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

Switch# configure terminal
Switch(config)# boot host dhcp
Switch(config)# boot host retry timeout 300
Switch(config)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot^C
Switch(config)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
Config file: flash:/config.text
Private Config file: flash:/private-config.text
Enable Break: no
Manual Boot: no
HELPER path-list:
NVRAM/Config file
  buffer size: 32768
Timeout for Config Download: 300 seconds
Config Download via DHCP: enabled (next boot: enabled)

Switch#
Example: Configuring NVRAM Buffer Size

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# boot buffersize 600000
Switch(config)# end
Switch# show boot
BOOT path-list :
  Config file : flash:/config.text
  Private Config file : flash:/private-config.text
  Enable Break : no
  Manual Boot : no
  HELPER path-list :
    Auto upgrade : yes
  Auto upgrade path :
  NVRAM/Config file buffer size: 600000
  Timeout for Config Download: 300 seconds
  Config Download via DHCP: enabled (next boot: enabled)
```

Related Topics
Configuring the NVRAM Buffer Size, on page 59

Examples: Scheduling Software Image Reload

This example shows how to reload the software on the switch on the current day at 7:30 p.m:

```
Switch# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 2013 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]
```

This example shows how to reload the software on the switch at a future time:

```
Switch# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 2013 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]
```

Configuring SDM Templates

This chapter contains the following topics:

- Finding Feature Information, page 69
- Information About Configuring SDM Templates, page 69
- How to Configure SDM Templates, page 72
- Configuration Examples for Configuring SDM Templates, page 73
- Additional References for SDM Templates, page 75
- Feature History and Information for Configuring SDM Templates, page 76

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring SDM Templates

Restrictions for SDM Templates

The following are restrictions when using SDM templates:

- The default template is the only template supported on switches running the LAN Lite image.
- The LAN Base default template is used with switches in a homogeneous stack.
- The LAN Base routing template is supported only on switches running the LAN Base image.
- The LAN Base routing template is used with switches in a mixed stack.
The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

SDM Templates

You can use Switch Database Management (SDM) templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

To allocate ternary content addressable memory (TCAM) resources for different usages, the switch SDM templates prioritize system resources to optimize support for certain features. These templates are supported on your device:

- Default—The default template gives balance to all functions.
- LAN Base default—The LAN Base default template is to be used with switches in a homogeneous stack.
- LAN Base routing—The LAN Base routing template supports IPv4 unicast routes for static routing SVI configuration.

The LAN Base routing template prevents other features from using the memory allocated to unicast routing. Routing must be enabled on your switch before you can use the routing template.

For more information about homogeneous and mixed stacks, see the Catalyst 2960-X Switch Stacking Configuration Guide.

After you change the template and the system reboots, you can use the show sdm prefer privileged EXEC command to verify the new template configuration. If you enter the show sdm prefer command before you enter the reload privileged EXEC command, the show sdm prefer command shows the template currently in use and the template that becomes active after a reload.

Default and LAN Base Templates

- Default and LAN Base routing templates—Optimizes the resources in the switch to support feature level for no routed interfaces and 255 VLANs.
- LAN Base default—Optimizes the resources in the switch to support feature level for no routed interfaces and 1024 VLANs.

SDM Templates and Switch Stacks

All stack members use the same SDM template that is stored on the stack master. When a new switch is added to a stack, as with the switch configuration and VLAN database files, the SDM configuration that is stored on the stack master overrides the template configured on an individual switch.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition. You can use the show switch privileged EXEC command to see if any stack members are in SDM-mismatch mode.

How to Configure SDM Templates

Setting the SDM Template

**SUMMARY STEPS**

1. configure terminal
2. sdm prefer { default | lanbase-default | lanbase-routing }
3. end
4. reload

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the SDM template to be used on the switch. The keywords have these meanings:</td>
</tr>
<tr>
<td>sdm prefer { default</td>
<td>lanbase-default</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# sdm prefer lanbase-routing</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>default</strong> — The default template provides balance for all Layer 2, IPv4 and IPv6 functionality.</td>
</tr>
<tr>
<td></td>
<td><strong>lanbase-default</strong> — The LAN Base default template provides both IPv4 and IPv6 static routing functionality.</td>
</tr>
<tr>
<td></td>
<td><strong>lanbase-routing</strong> — The LAN Base routing templates provides both IPv4 and IPv6 static routing functionality.</td>
</tr>
</tbody>
</table>

Use the `no sdm prefer` command to set the switch to the default template, The default template balances the use of system resources.

**Step 3**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>reload</td>
<td>Reloading the operating system.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# reload</td>
<td></td>
</tr>
</tbody>
</table>

**Configuration Examples for Configuring SDM Templates**

**Examples: Displaying SDM Templates**

This is an example output showing the default template information.

```
Switch# show sdm prefer default
"default" template:
The selected template optimizes the resources in the switch to support this level of features for 0 routed interfaces and 255 VLANs.

number of unicast mac addresses: 8K
number of IPv4 IGMP groups + multicast routes: 0.375k
number of IPv4 unicast routes: 0
number of IPv6 multicast groups: 0.25K
number of directly-connected IPv6 addresses: 0.25K
number of indirect IPv6 unicast routes: 32
number of IPv4 policy based routing aces: 0
number of IPv4/MAC qos aces: 0.375K
number of IPv4/MAC security aces: 0.375K
number of IPv6 policy based routing aces: 0
number of IPv6 qos aces: 60
number of IPv6 security aces: 0.125K
```
This is an example output showing the LAN Base default template information.

```
Switch# show sdm prefer lanbase-default

"lanbase-default" template:
The selected template optimizes the resources in the switch to support this level of features for 0 routed interfaces and 1024 VLANs.

  number of unicast mac addresses: 16K
  number of IPv4 IGMP groups + multicast routes: 1K
  number of IPv4 unicast routes: 3K
    number of directly-connected IPv4 hosts: 2K
    number of indirect IPv4 routes: 1K
  number of IPv6 multicast groups: 1K
    number of directly-connected IPv6 addresses: 2K
  number of indirect IPv6 unicast routes: 1K
  number of IPv4 policy based routing aces: 0
  number of IPv4/MAC qos aces: 0.5K
  number of IPv4/MAC security aces: 0.625k
  number of IPv6 policy based routing aces: 0
  number of IPv6 qos aces: 0.5K
  number of IPv6 security aces: 0.625k

Switch#
```

This is an example output showing the LAN Base routing template information.

```
Switch# show sdm prefer lanbase-routing

"lanbase-routing" template:
The selected template optimizes the resources in the switch to support this level of features for 0 routed interfaces and 255 VLANs.

  number of unicast mac addresses: 4K
  number of IPv4 IGMP groups + multicast routes: 0.375k
  number of IPv4 unicast routes: 0.875k
    number of directly-connected IPv4 hosts: 0.875k
    number of indirect IPv4 routes: 80
  number of IPv6 multicast groups: 0.25K
    number of directly-connected IPv6 addresses: 0.75K
  number of indirect IPv6 unicast routes: 32
  number of IPv4 policy based routing aces: 0
  number of IPv4/MAC qos aces: 0.375k
  number of IPv4/MAC security aces: 0.375k
  number of IPv6 policy based routing aces: 0
  number of IPv6 qos aces: 0.125k
  number of IPv6 security aces: 0.25K

Switch#
```

Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

```
Switch(config)# sdm prefer lanbase-routing
Switch(config)# exit
Switch# reload
  Proceed with reload? [confirm]
```

CHAPTER 5

Configuring System Message Logs

This chapter contains the following topics:

• Information About Configuring System Message Logs, page 77
• How to Configure System Message Logs, page 80
• Monitoring and Maintaining System Message Logs, page 89
• Configuration Examples for System Message Logs, page 90
• Additional References for System Message Logs, page 91
• Feature History and Information For System Message Logs, page 92

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and `debug` privileged EXEC commands to a logging process. Stack members can trigger system messages. A stack member that generates a system message appends its hostname in the form of hostname-n, where n is a switch range from 1 to 8, and redirects the output to the logging process on the stack master. Though the stack master is a stack member, it does not append its hostname to system messages. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a
standalone switch, and in the case of a switch stack, on the stack master. If a standalone switch or the stack master fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port. In a switch stack, all stack member consoles provide the same console output.

Note

The syslog format is compatible with 4.3 BSD UNIX.

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- `seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)`
- `seq no:timestamp: %facility-severity-MNEMONIC:description`

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- `service sequence-numbers`
- `service timestamps log datetime`
- `service timestamps log datetime [localtime] [msec] [show-timezone]`
- `service timestamps log uptime`

Table 10: System Log Message Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seq no:</code></td>
<td>Stamps log messages with a sequence number only if the <code>service sequence-numbers</code> global configuration command is configured.</td>
</tr>
<tr>
<td><code>timestamp</code></td>
<td>Date and time of the message or event. This information appears only if the `service timestamps log datetime [datetime</td>
</tr>
<tr>
<td><code>mm/dd h h:mm:ss</code></td>
<td>or <code>hh:mm:ss</code> (short uptime) or <code>d h</code> (long uptime)</td>
</tr>
<tr>
<td><code>facility</code></td>
<td>The facility to which the message refers (for example, SNMP, SYS, and so forth).</td>
</tr>
</tbody>
</table>
### Default System Message Logging Settings

**Table 11: Default System Message Logging Settings**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>

</tr>
</tbody>
</table>
Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the `snmp-server enable trap` global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level `warning` and numerically lower levels are stored in the history table even if syslog traps are not enabled.

When the history table is full (it contains the maximum number of message entries specified with the `logging history size` global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, `emergencies` equal 1, not 0, and `critical` equals 3, not 2.

How to Configure System Message Logs

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `logging buffered [size]`
3. `logging host`
4. `logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]`
5. `end`
6. `terminal monitor`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
Switch# configure terminal
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the stack master. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes. If a standalone switch or the stack master fails, the log file is lost unless you previously saved it to flash memory. See Step 4.</td>
</tr>
<tr>
<td>logging buffered [size]</td>
<td>Note: Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should <em>not</em> be set to this amount.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging buffered 8192</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Logs messages to a UNIX syslog server host.</td>
</tr>
<tr>
<td>logging host</td>
<td>Host specifies the name or IP address of the host to be used as the syslog server. To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging host 125.1.1.100</td>
<td></td>

</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Logs messages to a nonconsole terminal during the current session.</td>
</tr>
<tr>
<td>terminal monitor</td>
<td>Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# terminal monitor</td>
<td></td>
</tr>
</tbody>
</table>
**Synchronizing Log Messages**

You can synchronize unsolicited messages and `debug` privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and `debug` command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and `debug` command output appear on the console after the prompt for user input is returned. Therefore, unsolicited messages and `debug` command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `line [console | vty] line-number [ending-line-number]`
3. `logging synchronous [level [severity-level | all] | limit number-of-buffers]`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the line to be configured for synchronous logging of messages.</td>
</tr>
<tr>
<td>`line [console</td>
<td>vty] line-number [ending-line-number]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>line console</code></td>
<td></td>
</tr>
</tbody>
</table>

Specifications:

- `console` — Specifies configurations that occur through the switch console port or the Ethernet management port.
- `line vty line-number` — Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15.

You can change the setting of all 16 vty lines at once by entering:

```
line vty 0 15
```

You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:

```
line vty 2
```

When you enter this command, the mode changes to line configuration.
### Configuring System Message Logs

| `Switch(config)# end`             |                                                                         |

### Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The `logging synchronous` global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return.

To reenable message logging after it has been disabled, use the `logging on` global configuration command. This task is optional.

### SUMMARY STEPS

1. configure terminal
2. no logging console
3. end
## DETAILED STEPS

</table>

### Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.

This task is optional.

### SUMMARY STEPS

1. configure terminal
2. Use one of these commands:
   - service timestamps log uptime
   - service timestamps log datetime[msec | localtime | show-timezone]
3. end
### DETAILED STEPS

### Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed. This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **service sequence-numbers**
3. **end**
### Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message. This task is optional.

#### SUMMARY STEPS

1. `configure terminal`
2. `logging console level`
3. `logging monitor level`
4. `logging trap level`
5. `end`

### Configuring System Message Logs

#### Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP. This task is optional.

**SUMMARY STEPS**

1. **configure terminal**
2. **logging history level**
3. **logging history size number**
4. **end**
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> logging history level</td>
<td>Changes the default level of syslog messages stored in the history file and sent to the SNMP server.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# logging history 3</td>
<td>By default, <strong>warnings</strong>, <strong>errors</strong>, <strong>critical</strong>, <strong>alerts</strong>, and <strong>emergencies</strong> messages are sent.</td>
</tr>
<tr>
<td><strong>Step 3</strong> logging history size number</td>
<td>Specifies the number of syslog messages that can be stored in the history table.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# logging history size 200</td>
<td>The default is to store one message. The range is 0 to 500 messages.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Logging Messages to a UNIX Syslog Daemon

This task is optional.

**Note**

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX `man syslogd` command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

**Before You Begin**

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.
SUMMARY STEPS

1. Add a line to the file /etc/syslog.conf.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** Add a line to the file /etc/syslog.conf. | - `local7`—Specifies the logging facility.  
- `debug`—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it. |
| **Example:**
local7.debug /usr/adm/logs/cisco.log | |
| **Step 2** Enter these commands at the UNIX shell prompt. | Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file. |
| **Example:**
$ touch /var/log/cisco.log  
$ chmod 666 /var/log/cisco.log | |
| **Step 3** Make sure the syslog daemon reads the new changes. | For more information, see the `man syslog.conf` and `man syslogd` commands on your UNIX system. |
| **Example:**
$ kill -HUP `cat /etc/syslog.pid` | |

Monitoring and Maintaining System Message Logs

Monitoring Configuration Archive Logs

Configuration Examples for System Message Logs

Example: Stacking System Message

This example shows a partial switch system message for stack master and a stack member (hostname Switch-2):

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed state to down
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) 18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

Example: Switch System Message

This example shows a partial switch system message on a switch:

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) 18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

Examples: Displaying Service Timestamps Log

This example shows part of a logging display with the service timestamps log datetime global configuration command enabled:

*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
This example shows part of a logging display with the service timestamps log uptime global configuration command enabled:

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)

This example shows part of a logging display with the sequence numbers enabled.

000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)

Configuring Online Diagnostics

This chapter contains the following topics:

- Information About Configuring Online Diagnostics, page 93
- How to Configure Online Diagnostics, page 94
- Monitoring and Maintaining Online Diagnostics, page 98
- Configuration Examples for Online Diagnostic Tests, page 98
- Additional References for Online Diagnostics, page 102
- Feature History and Information for Configuring Online Diagnostics, page 103

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the switch while the switch is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the switch is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.
After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the switch or switch stack and the diagnostic tests that have already run.

How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive }`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>**diagnostic start switch number test {name</td>
</tr>
</tbody>
</table>

Example:

```
Switch# diagnostic start switch 2 test basic
```

You can specify the tests by using one of these options:

- `name`—Enters the name of the test.
- `test-id`—Enters the ID number of the test.
- `test-id-range`—Enters the range of test IDs by using integers separated by a comma and a hyphen.
- `all`—Starts all of the tests.
- `basic`— Starts the basic test suite.
- `non-disruptive`—Starts the non-disruptive test suite.

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.
### Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the `no` form of this command to remove the scheduling.

### SUMMARY STEPS

1. configure terminal
2. diagnostic schedule switch number test {name | test-id | test-id-range | all | basic | non-disruptive } {daily | on mm dd yyyy hh:mm | weekly day-of-week hh:mm}

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> diagnostic schedule switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td>Example:</td>
<td>The <code>switch number</code> keyword is supported only on stacking switches. The range is from 1 to 8.</td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule switch 1 test 1-5 on July 3 2013 23:10</td>
<td>When specifying the tests to be scheduled, use these options:</td>
</tr>
<tr>
<td></td>
<td>• <code>name</code>—Name of the test that appears in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td></td>
<td>• <code>test-id</code>—ID number of the test that appears in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td></td>
<td>• <code>test-id-range</code>—ID numbers of the tests that appear in the <code>show diagnostic content</code> command output.</td>

<tr>
<td></td>
<td>• <code>all</code>—All test IDs.</td>
</tr>
<tr>
<td></td>
<td>• <code>basic</code>—Starts the basic on-demand diagnostic tests.</td>
</tr>
<tr>
<td></td>
<td>• <code>non-disruptive</code>—Starts the non-disruptive test suite.</td>
</tr>
<tr>
<td></td>
<td>You can schedule the tests as follows:</td>
</tr>
<tr>
<td></td>
<td>• Daily—Use the <code>daily hh:mm</code> parameter.</td>
</tr>
<tr>
<td></td>
<td>• Specific day and time—Use the <code>on mm dd yyyy hh:mm</code> parameter.</td>
</tr>
<tr>
<td></td>
<td>• Weekly—Use the <code>weekly day-of-week hh:mm</code> parameter.</td>
</tr>
</tbody>
</table>
Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a switch while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the switch to generate a syslog message because of a test failure, and enable a specific test.

By default, health monitoring is disabled, but the switch generates a syslog message when a test fails.

**SUMMARY STEPS**

1. `configure terminal`
2. `diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day`
3. `diagnostic monitor syslog`
4. `diagnostic monitor threshold switch number test {name | test-id | test-id-range | all} failure count count`
5. `diagnostic monitor switch number test {name | test-id | test-id-range | all}`
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures the health-monitoring interval of the specified tests.</td>
</tr>
<tr>
<td>`diagnostic monitor interval switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>The <em>switch number</em> keyword is supported only on stacking switches. The range is from 1 to 4.</td>
</tr>
<tr>
<td>Switch(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5</td>
<td>When specifying the tests, use one of these parameters:</td>
</tr>
<tr>
<td></td>
<td>• <em>name</em>—Name of the test that appears in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td></td>
<td>• <em>test-id</em>—ID number of the test that appears in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td></td>
<td>• <em>test-id-range</em>—ID numbers of the tests that appear in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td></td>
<td>• <em>all</em>—All of the diagnostic tests.</td>
</tr>
<tr>
<td></td>
<td>When specifying the interval, set these parameters:</td>
</tr>
<tr>
<td></td>
<td>• <em>hh:mm:ss</em>—Monitoring interval in hours, minutes, and seconds. The range for <em>hh</em> is 0 to 24, and the range for <em>mm</em> and <em>ss</em> is 0 to 60.</td>
</tr>
<tr>
<td></td>
<td>• <em>milliseconds</em>—Monitoring interval in milliseconds (ms). The range is from 0 to 999.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• day—Monitoring interval in the number of days. The range is from 0 to 20.</td>
</tr>
</tbody>
</table>

#### Step 3
**diagnostic monitor syslog**

**Example:**
```
Switch(config)# diagnostic monitor syslog
```

(Optional) Configures the switch to generate a syslog message when a health-monitoring test fails.

#### Step 4
**diagnostic monitor threshold switch number test \{name | test-id | test-id-range | all\} failure count count**

**Example:**
```
Switch(config)# diagnostic monitor threshold switch 2 test 1 failure count 20
```

(Optional) Sets the failure threshold for the health-monitoring tests.

The switch number keyword is supported only on stacking switches. The range is from 1 to 8.

When specifying the tests, use one of these parameters:

- • name—Name of the test that appears in the show diagnostic content command output.
- • test-id—ID number of the test that appears in the show diagnostic content command output.
- • test-id-range—ID numbers of the tests that appear in the show diagnostic content command output.
- • all—All of the diagnostic tests.

The range for the failure threshold count is 0 to 99.

#### Step 5
**diagnostic monitor switch number test \{name | test-id | test-id-range | all\}**

**Example:**
```
Switch(config)# diagnostic monitor switch 2 test 1
```

Enables the specified health-monitoring tests.

The switch number keyword is supported only on stacking switches. The range is from 1 to 9.

When specifying the tests, use one of these parameters:

- • name—Name of the test that appears in the show diagnostic content command output.
- • test-id—ID number of the test that appears in the show diagnostic content command output.
- • test-id-range—ID numbers of the tests that appear in the show diagnostic content command output.
- • all—All of the diagnostic tests.

#### Step 6
**end**

**Example:**
```
Switch(config)# end
```

Returns to privileged EXEC mode.
Monitoring and Maintaining Online Diagnostics

Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the switch or switch stack and check the test results by using the privileged EXEC `show` commands in this table:

**Table 12: Commands for Diagnostic Test Configuration and Results**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show diagnostic content switch [number</td>
<td>all]`</td>
</tr>
<tr>

<td>The `switch [number</td>
</tr>
<tr>
<td><code>show diagnostic post</code></td>
<td>Displays the POST results. (The output is the same as the <code>show post</code> command output.)</td>
</tr>
</tbody>
</table>

Configuration Examples for Online Diagnostic Tests

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.
SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive }`

DETAILED STEPS

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Switch(config)# diagnostic monitor interval switch 1 test TestPortAsicCam
```

Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
Switch(config)# diagnostic schedule test TestPortAsicCam on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```
Displaying Online Diagnostics: Examples

This example shows how to display the online diagnostic detailed information on a specific switch:

Switch# show diagnostic switch 1 detail

Switch 1: SerialNo :

Overall Diagnostic Result for Switch 1 : UNTESTED

Test results: (. = Pass, F = Fail, U = Untested)

1) TestPortAsicStackPortLoopback ---> U
   Error code ------------------> 3 (DIAG_SKIPPED)

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

This chapter contains the following topics:

- Information About Troubleshooting the Software Configuration, page 105
- How to Troubleshoot the Software Configuration, page 112
- Verifying Troubleshooting of the Software Configuration, page 127
- Scenarios for Troubleshooting the Software Configuration, page 130
- Configuration Examples for Troubleshooting Software, page 133
- Additional References for Troubleshooting Software Configuration, page 135
- Feature History and Information for Troubleshooting Software Configuration, page 136

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Related Topics

- Recovering from a Software Failure
Lost or Forgotten Password on a Switch

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

Note

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

Recovering from a Lost or Forgotten Password

Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- IEEE 802.3af-compliant powered device—The major features of this standard are powered-device discovery, power administration, disconnect detection, and optional powered-device power classification.
- IEEE 802.3at-compliant powered device—The PoE+ standard increases the maximum power that can be drawn by a powered device from 15.4 W per port to 30 W per port.

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the Catalyst 2960-X Switch Interface and Hardware Component Configuration Guide.

Related Topics

Scenarios to Troubleshoot Power over Ethernet (PoE), on page 130

Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE switch port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the shutdown interface configuration command, and then enter the no shutdown interface command. You can also configure automatic recovery on the switch to recover from the error-disabled state.
On a switch, the `errdisable recovery cause loopback` and the `errdisable recovery interval seconds` global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

**Monitoring PoE Port Status**

- `show controllers power inline` privileged EXEC command
- `show power inline` EXEC command
- `debug ilpower` privileged EXEC command

**Disabled Port Caused by False Link-Up**

If a Cisco powered device is connected to a port and you configure the port by using the `power inline never` interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the `shutdown` and the `no shutdown` interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the `power inline never` command.

**Ping**

The switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- **Normal response**—The normal response (hostname is alive) occurs in 1 to 10 seconds, depending on network traffic.
- **Destination does not respond**—If the host does not respond, a no-answer message is returned.
- **Unknown host**—If the host does not exist, an unknown host message is returned.
- **Destination unreachable**—If the default gateway cannot reach the specified network, a destination-unreachable message is returned.
- **Network or host unreachable**—If there is no entry in the route table for the host or network, a network or host unreachable message is returned.

**Related Topics**

- Executing Ping, on page 123
- Example: Pinging an IP Host, on page 133

**Layer 2 Traceroute**

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the switches in the path. When the switch detects
a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

**Layer 2 Traceroute Guidelines**

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
  
  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

- A switch is reachable from another switch when you can test connectivity by using the `ping` privileged EXEC command. All switches in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the `traceroute mac` or the `traceroute mac ip` privileged EXEC command on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.

- The `traceroute mac` command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

- The `traceroute mac ip` command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

  - If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.

  - If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

- This feature is not supported in Token Ring VLANs.
**IP Traceroute**

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your switches can participate as the source or destination of the **traceroute** privileged EXEC command and might or might not appear as a hop in the **traceroute** command output. If the switch is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate switches do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate switch is a multilayer switch that is routing a particular packet, this switch shows up as a hop in the traceroute output.

The **traceroute** privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP **port-unreachable** error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

**Related Topics**

- Executing IP Traceroute, on page 125
- Example: Performing a Traceroute to an IP Host, on page 133

**Time Domain Reflector Guidelines**

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported only on 10/100/1000 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.
If one of the twisted-pair wires is open, TDR can find the length at which the wire is open. Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a switch
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the switch reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the switch does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
- The link is a 10-megabit or a 100-megabit link.
- The cable is a stranded cable.
- The link partner is a Cisco IP Phone.
- The link partner is not IEEE 802.3 compliant.

### Debug Commands

**Caution**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

All `debug` commands are entered in privileged EXEC mode, and most `debug` commands take no arguments.

**Related Topics**

- Redirecting Debug and Error Message Output, on page 125
- Example: Enabling All System Diagnostics, on page 134

### Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the switch. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot switch problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the switch and small form-factor pluggable (SFP) modules. The switch stores this information in the flash memory:
- CLI commands—Record of the OBFL CLI commands that are entered on a standalone switch or a switch stack member.

- Environment data—Unique device identifier (UDI) information for a standalone switch or a stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.

- Message—Record of the hardware-related system messages generated by a standalone switch or a stack member.

- Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone switch or a stack member.

- Temperature—Temperature of a standalone switch or a stack member.

- Uptime data—Time when a standalone switch or a stack member starts, the reason the switch restarts, and the length of time the switch has been running since it last restarted.

- Voltage—System voltages of a standalone switch or a stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP). When the switch is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the switch fails, contact your Cisco technical support representative to find out how to retrieve the data.

**Related Topics**

- Configuring OBFL, on page 126
- Displaying OBFL Information

**Possible Symptoms of High CPU Utilization**

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests
How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Switch software can be corrupted during an upgrade by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses the Xmodem Protocol to recover from a corrupt or wrong image file. There are many software packages that support the Xmodem Protocol, and this procedure is largely dependent on the emulation software that you are using.

This recovery procedure requires that you have physical access to the switch.

Step 1
From your PC, download the software image tar file (image_filename.tar) from Cisco.com. The Cisco IOS image is stored as a bin file in a directory in the tar file. For information about locating the software image files on Cisco.com, see the release notes.

Step 2
Extract the bin file from the tar file. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using UNIX, follow these steps:

a) Display the contents of the tar file by using the tar -tvf image_filename.tar UNIX command.

Example:
unix-1% tar -tvf image_filename.tar

b) Locate the bin file, and extract it by using the tar -xvf image_filename.tar image_filename.bin UNIX command.

Example:
unix-1% tar -xvf image_filename.tar image_filename.bin
x c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin, 2928176 bytes, 5720 tape blocks

c) Verify that the bin file was extracted by using the ls -l image_filename.bin UNIX command.

Example:
unix-1% ls -l image_filename.bin
-rw-r--r-- 1 boba 2928176 Apr 21 12:01 c2960x-universalk9-mz.150-2.0.66.UCP.bin

Step 3
Connect your PC with terminal-emulation software supporting the Xmodem Protocol to the switch console port.

Step 4
Set the line speed on the emulation software to 9600 baud.

Step 5
Unplug the switch power cord.

Step 6
Press the Mode button, and at the same time reconnect the power cord to the switch. You can release the Mode button a second or two after the LED above port 1 goes off. Several lines of information about the software appear along with instructions.
Example:
The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software.

```
flash_init
load_helper
boot
```

**Step 7**
Initialize the flash file system.

**Step 8**
If you had set the console port speed to any speed other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

**Step 9**
Load any helper files.

```
switch: load_helper
```

**Step 10**
Start the file transfer by using the Xmodem Protocol.

```
switch: copy xmodem: flash: image_filename.bin
```

**Step 11**
After the Xmodem request appears, use the appropriate command on the terminal-emulation software to start the transfer and to copy the software image into flash memory.

**Step 12**
Boot the newly downloaded Cisco IOS image.

```
switch: boot flash: image_filename.bin
```

**Step 13**
Use the `archive download-sw` privileged EXEC command to download the software image to the switch or to the switch stack.

**Step 14**
Use the `reload` privileged EXEC command to restart the switch and to verify that the new software image is operating properly.

**Step 15**
Delete the `flash:image_filename.bin` file from the switch.

---

**Recovering from a Lost or Forgotten Password**

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.
On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

You enable or disable password recovery by using the `service password-recovery` global configuration command. When you enter the `service password-recovery` or `no service password-recovery` command on the stack master. It is propagated throughout the stack and applied to all switches in the stack.

The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

---

**Step 1**
Connect a terminal or PC to the switch.

- Connect a terminal or a PC with terminal-emulation software to the switch console port. If you are recovering the password for a switch stack, connect to the console port of the stack master.
  
  Or

- Connect a PC to the Ethernet management port. If you are recovering the password for a switch stack, connect to the Ethernet management port of a stack member.

**Step 2**
Set the line speed on the emulation software to 9600 baud.

**Step 3**
On a switch, power off the standalone switch or the entire switch stack. On a switch, power off the switch.

**Step 4**
Reconnect the power cord to the or the stack master. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid, then release the **Mode** button.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.

- If you see a message that begins with this statement:
  
  The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system
  
  proceed to the "Procedure with Password Recovery Enabled" section, and follow the steps.

- If you see a message that begins with this statement:
  
  The password-recovery mechanism has been triggered, but is currently disabled.

  proceed to the "Procedure with Password Recovery Disabled" section, and follow the steps.

**Step 5**
After recovering the password, reload the switch or the stack master.

On a switch:

```
Switch> reload
Proceed with reload? [confirm] y
```
On the switch or stack master:

Switch> reload slot <stack-master-member-number>
Proceed with reload? [confirm] y

Step 6
Power on the remaining switches in the stack.

Procedure with Password Recovery Enabled

If the password-recovery operation is enabled, this message appears:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software:

flash_init
load_helper
boot

Step 1
Initialize the flash file system.
Switch: flash_init

Step 2
If you had set the console port speed to any number other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

Step 3
Load any helper files.
Switch: load_helper

Step 4
Display the contents of flash memory.
Switch: dir: flash:
Directory of flash:
    11 -rwx 5825 Mar 01 2013 22:31:59 config.text

16128000 bytes total (10003456 bytes free)

Step 5
Rename the configuration file to config.text.old
This file contains the password definition.
Switch: rename flash: config.text flash: config.text.old

Step 6
Boot up the system.
Switch: boot
You are prompted to start the setup program. Enter N at the prompt.
Continue with the configuration dialog?? [yes/no]: No
Step 7  At the switch prompt, enter privileged EXEC mode.
Switch> enable
Switch#  

Step 8  Rename the configuration file to its original name.
Switch# rename flash: config.text.old flash: config.text

Note Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. Failure to follow this step can result in a lost configuration depending on how your switch is set up.

Step 9  Copy the configuration file into memory
Switch# copy flash: config.text system: running-config
Source filename [config.text]?
Destination filename [running-config]?

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

Step 10 Enter global configuration mode.
Switch# configure terminal

Step 11 Change the password.
Switch(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 12 Return to privileged EXEC mode.
Switch(config)# exit
Switch#  

Step 13 Write the running configuration to the startup configuration file.
Switch# copy running-config startup-config

The new password is now in the startup configuration.

Note This procedure is likely to leave your switch virtual interface in a shutdown state. You can see which interface is in this state by entering the show running-config privileged EXEC command. To reenable the interface, enter the interface vlan vlan-id global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the no shutdown command.

Step 14 Boot the switch with the packages.conf file from flash.
Switch: boot flash:packages.conf

Step 15 Reload the switch stack.
Switch# reload
Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

Caution

Returning the switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup switch and VLAN configuration files.

- If you enter n (no), the normal boot process continues as if the Mode button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue........

- If you enter y (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

---

Step 1

Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? Y

Step 2

Load any helper files:

Switch: load_helper

Step 3

Display the contents of flash memory:

Switch: dir flash:

The switch file system appears.

Directory of flash:
  13 drwx  192 Mar 01 2013 22:30:48 c2960x-universalk9-mz.150-2.0.63.UCF.bin
  16128000 bytes total (10003456 bytes free)

Step 4

Boot up the system:

Switch: boot
You are prompted to start the setup program. To continue with password recovery, enter `N` at the prompt:

Continue with the configuration dialog? [yes/no]: N

**Step 5**  At the switch prompt, enter privileged EXEC mode:

```
Switch> enable
```

**Step 6**  Enter global configuration mode:

```
Switch# configure terminal
```

**Step 7**  Change the password:

```
Switch(config)# enable secret password
```

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 8**  Return to privileged EXEC mode:

```
Switch(config)# exit
Switch#
```

**Note**  Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. The stacking feature is supported on switches running the LAN Base image.

**Step 9**  Write the running configuration to the startup configuration file:

```
Switch# copy running-config startup-config
```

The new password is now in the startup configuration.

**Note**  This procedure can put virtual interface in a shutdown state. You can see which interface is in this state by entering the `show running-config` privileged EXEC command. To reenable the interface, enter the `interface vlan vlan-id` global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the `no shutdown` command.

**Step 10**  You must now reconfigure the switch. If the system administrator has the backup switch and VLAN configuration files available, you should use those.

---

### Recovering from a Command Switch Failure

This section describes how to recover from a failed command switch. You can configure a redundant command switch group by using the Hot Standby Router Protocol (HSRP).

If you have not configured a standby command switch, and your command switch loses power or fails in some other way, management contact with the member switches is lost, and you must install a new command switch. However, connectivity between switches that are still connected is not affected, and the member switches forward packets as usual. You can manage the members as standalone switches through the console port, or, if they have IP addresses, through the other management interfaces.
You can prepare for a command switch failure by assigning an IP address to a member switch or another switch that is command-capable, making a note of the command-switch password, and cabling your cluster to provide redundant connectivity between the member switches and the replacement command switch. These sections describe two solutions for replacing a failed command switch:

- Replacing a Failed Command Switch with a Cluster Member
- Replacing a Failed Command Switch with Another Switch

These recovery procedures require that you have physical access to the switch. For information on command-capable switches, see the release notes.

**Replacing a Failed Command Switch with a Cluster Member**

To replace a failed command switch with a command-capable member in the same cluster, follow these steps:

**Step 1** Disconnect the command switch from the member switches, and physically remove it from the cluster.

**Step 2** Insert the member switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 3** Start a CLI session on the new command switch.

You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see *Catalyst 2960-X Switch Hardware Installation Guide*.

**Step 4** At the switch prompt, enter privileged EXEC mode.

Example:
```
Switch> enable
Switch#
```

**Step 5** Enter the password of the failed command switch.

**Step 6** Enter global configuration mode.

Example:
```
Switch# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

**Step 7** Remove the member switch from the cluster.

Example:
```
Switch(config)# no cluster commander-address
```

**Step 8** Return to privileged EXEC mode.

Example:
```
Switch(config)# end
Switch#
```

**Step 9** Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter setup, and press Return.

Example:
```
Switch# setup
```
--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.
Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.
Would you like to enter basic management setup? [yes/no]:

**Step 10** Enter Y at the first prompt.

**Example:**
The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y
or
Configuring global parameters:

If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

**Step 11** Respond to the questions in the setup program.
When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

**Step 12** When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

**Step 13** When prompted, make sure to enable the switch as the cluster command switch, and press Return.

**Step 14** When prompted, assign a name to the cluster, and press Return.
The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 15** After the initial configuration displays, verify that the addresses are correct.

**Step 16** If the displayed information is correct, enter Y, and press Return.
If this information is not correct, enter N, press Return, and begin again at Step 9.

**Step 17** Start your browser, and enter the IP address of the new command switch.

**Step 18** From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.

---

**Replacing a Failed Command Switch with Another Switch**

To replace a failed command switch with a switch that is command-capable but not part of the cluster, follow these steps:

**Step 1** Insert the new switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 2** You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.

**Step 3** At the switch prompt, enter privileged EXEC mode.
Step 4 Enter the password of the failed command switch.

Step 5 Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter `setup`, and press `Return`.

Example:

```
Switch# setup
--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
```

Step 6 Enter `Y` at the first prompt.

Example:

```
The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y
```

or

```
Configuring global parameters:
```

Step 7 Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use `-n`, where `n` is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

Step 8 When prompted for the `enable secret` and `enable` passwords, enter the passwords of the failed command switch again.

Step 9 When prompted, make sure to enable the switch as the cluster command switch, and press `Return`.

Step 10 When prompted, assign a name to the cluster, and press `Return`. The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

Step 11 After the initial configuration displays, verify that the addresses are correct.

Step 12 If the displayed information is correct, enter `Y`, and press `Return`. If this information is not correct, enter `N`, press `Return`, and begin again at Step 9.

Step 13 Start your browser, and enter the IP address of the new command switch.

Step 14 From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.
Preventing Switch Stack Problems

To prevent switch stack problems, you should do the following:

- Make sure that the switches that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the "Switch Installation" chapter in the hardware installation guide.

- After adding or removing stack members, make sure that the switch stack is operating at full bandwidth (32 Gb/s). Press the Mode button on a stack member until the Stack mode LED is on. The last two port LEDs on the switch should be green. Depending on the switch model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.

- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

- Manually assigning stack member numbers according to the placement of the switches in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the switches have manually assigned numbers if you add, remove, or rearrange switches later. Use the `switch current-stack-member-number renumber new-stack-member-number` global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new switch functions with the exact same configuration as the replaced switch. This is also assuming the new switch is using the same member number as the replaced switch.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.
3. Power on the switches.

Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the switch settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.

- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:
Let both ports autonegotiate both speed and duplex.

Manually set the speed and duplex parameters for the ports on both ends of the connection.

**Note**
If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

**Troubleshooting SFP Module Security and Identification**

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the switch, the switch software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

**Note**
The security error message references the GBIC_SECURITY facility. The switch supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the switch, and replace it with a Cisco module. After inserting a Cisco SFP module, use the `errdisable recovery cause gbic-invalid` global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the switch brings the interface out of the error-disabled state and retries the operation.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

**Monitoring SFP Module Status**

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module.

**Executing Ping**

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all switches.
Though other protocol keywords are available with the **ping** command, they are not supported in this release.

Use this command to ping another device on the network from the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ping ip host</td>
<td>address`</td>
</tr>
<tr>
<td><code>Switch# ping 172.20.52.3</code></td>
<td></td>
</tr>
</tbody>
</table>

### Related Topics
- Ping, on page 107
- Example: Pinging an IP Host, on page 133

### Monitoring Temperature

The switch monitors the temperature conditions and uses the temperature information to control the fans.

Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the switch (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds.

### Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device.

**Table 13: Monitoring the Physical Path**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tracetroute mac [interface interface-id]</code></td>
<td>Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.</td>
</tr>
<tr>
<td><code>{source-mac-address} [interface interface-id]</code></td>
<td></td>
</tr>
<tr>
<td><code>{destination-mac-address} [vlan vlan-id]</code></td>
<td></td>
</tr>
<tr>
<td><code>[detail]</code></td>
<td></td>
</tr>
<tr>
<td><code>tracetroute mac ip</code></td>
<td>Displays the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname.</td>
</tr>
<tr>
<td>`{source-ip-address</td>
<td>source-hostname} `{destination-ip-address</td>
</tr>
</tbody>
</table>
Executing IP Traceroute

Though other protocol keywords are available with the `traceroute` privileged EXEC command, they are not supported in this release.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>traceroute ip host</code></td>
<td>Traces the path that packets take through the network.</td>
</tr>
</tbody>
</table>

```
Switch# traceroute ip 192.51.100.1
```

Related Topics

- IP Traceroute, on page 109
- Example: Performing a Traceroute to an IP Host, on page 133

Running TDR and Displaying the Results

When you run TDR on an interface, you can run it on the stack master or a stack member.

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command.

To display the results, enter the `show cable-diagnostic tdr interface interface-id` privileged EXEC command.

Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

Related Topics

- Debug Commands, on page 110
Using the show platform forward Command

The output from the `show platform forward` privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the switch application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Configuring OBFL

| Caution | We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory. |

- To enable OBFL, use the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command. On switches, the range for `switch-number` is from 1 to 9. Use the `message level level` parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.

- To copy the OBFL data to the local network or a specific file system, use the `copy onboard switch switch-number url url-destination` privileged EXEC command.

- To disable OBFL, use the `no hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the `clear onboard switch switch-number` privileged EXEC command.

- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

- You can enable or disable OBFL on a member switch from the stack master.

## Verifying Troubleshooting of the Software Configuration

### Displaying OBFL Information

**Table 14: Commands for Displaying OBFL Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `show logging onboard [module[switch-number ] ] clilog`  
  Switch# show logging onboard 1 clilog        | Displays the OBFL CLI commands that were entered on a standalone switch or the specified stack members.                              |
| `show logging onboard [module[switch-number ] ] environment`  
  Switch# show logging onboard 1 environment   | Displays the UDI information for a standalone switch or the specified stack members and for all the connected FRU devices: the PID, the VID, and the serial number. |
| `show logging onboard [module[switch-number ] ] message`  
  Switch# show logging onboard 1 message       | Displays the hardware-related messages generated by a standalone switch or the specified stack members.                           |
| `show logging onboard [module[switch-number ] ] poe`  
  Switch# show logging onboard 1 poe           | Displays the power consumption of PoE ports on a standalone switch or the specified stack members.                              |
| `show logging onboard [module[switch-number ] ] temperature`  
  Switch# show logging onboard 1 temperature   | Displays the temperature of a standalone switch or the specified switch stack members.                                           |
| `show logging onboard [module[switch-number ] ] uptime`  
  Switch# show logging onboard 1 uptime        | Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch or specified stack members have been running since they last restarted. |
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show logging onboard [module[switch-number ]] voltage</code></td>
<td>Displays the system voltages of a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 voltage</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] continuous</code></td>
<td>Displays the data in the continuous file.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 continuous</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] detail</code></td>
<td>Displays both the continuous and summary data.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 detail</td>

<tr>
<td><code>show logging onboard [module[switch-number ]] end hh:mm:ss</code></td>
<td>Displays end time and date on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 end 13:00:15 jul 2013</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]]</code></td>
<td>Displays OBFL information about the specified switches in the system.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] raw</code></td>
<td>Displays the raw information on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 raw</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] start</code></td>
<td>Displays the start time and date on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 start 13:00:10 jul 2013</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] status</code></td>
<td>Displays status information on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 status</td>
<td></td>
</tr>
<tr>
<td><code>show logging onboard [module[switch-number ]] summary</code></td>
<td>Displays both the data in the summary file.</td>
</tr>
<tr>
<td>Switch# show logging onboard 1 summary</td>
<td></td>
</tr>
</tbody>
</table>

For more information, see the *Catalyst 2960-X Switch System Management Command Reference*.

**Example: Verifying the Problem and Cause for High CPU Utilization**

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```
Switch# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42291613  752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
```
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...<output truncated>

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

### Table 15: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on &quot;Analyzing Network Traffic.&quot;</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts.</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on &quot;Debugging Active Processes.&quot;</td>
</tr>
</tbody>
</table>
Scenarios for Troubleshooting the Software Configuration

Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 16: Power over Ethernet Troubleshooting Scenarios

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
</table>
| Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports. | Verify that the powered device works on another PoE port. Use the `show run`, `show interface status`, or `show power inline detail` user EXEC commands to verify that the port is not shut down or error-disabled. **Note** Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional. Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host. Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters. Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on. If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the `show inline power` and `show inline power detail` commands to verify the amount of available power.
<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>No PoE on all ports or a group of ports. Trouble is on all switch ports. Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</td>
<td>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch. If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch. Use the <code>show log</code> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes. If there are no alarms, use the <code>show interface status</code> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <code>shut</code> and <code>no shut</code> interface configuration commands to reenable the ports. Use the <code>show env power</code> and <code>show power inline</code> privileged EXEC commands to review the PoE status and power budget (available PoE). Review the running configuration to verify that <code>power inline never</code> is not configured on the ports. Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <code>shut</code> and <code>no shut</code> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected. Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port. Use the <code>show power inline</code> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on. If a powered device can power on when only one powered device is connected to the switch, enter the <code>shut</code> and <code>no shut</code> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <code>show interface status</code> and <code>show power inline</code> privileged EXEC commands to monitor inline power statistics and port status. If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</td>
</tr>
</tbody>
</table>
### Symptom or Problem

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IP Phone disconnects or resets. After working normally, a Cisco phone or wireless access point intermittently reloads or disconnects from PoE.</td>
<td>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads. Verify that the cable length is not more than 100 meters from the switch port to the powered device. Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs. Notice whether any error messages appear at the same time a disconnect occurs. Use the <code>show log</code> privileged EXEC command to review error messages. Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.) Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</td>
</tr>
<tr>
<td>Non-Cisco powered device does not work on Cisco PoE switch. A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</td>
<td>Use the <code>show power inline</code> command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it. Use the <code>show interface status</code> command to verify that the switch detects the connected powered device. Use the <code>show log</code> command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or <code>inrush</code>) current that exceeds a current-limit threshold for the port.</td>
</tr>

Configuration Examples for Troubleshooting Software

Example: Pinging an IP Host

This example shows how to ping an IP host:

Switch# ping 172.20.52.3

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:
!!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
Switch#

Table 17: Ping Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>C</td>
<td>A congestion experienced packet was received.</td>
</tr>
<tr>
<td>I</td>
<td>User interrupted test.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

To end a ping session, enter the escape sequence (Ctrl-^ X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

Example: Performing a Traceroute to an IP Host

This example shows how to perform a traceroute to an IP host:

Switch# traceroute ip 192.0.2.10

Type escape sequence to abort.
Tracing the route to 192.0.2.10
The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

**Table 18: Traceroute Output Display Characters**

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>The probe timed out.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>A</td>
<td>Administratively unreachable. Usually, this output means that an access list is blocking traffic.</td>
</tr>
<tr>
<td>H</td>
<td>Host unreachable.</td>
</tr>
<tr>
<td>N</td>
<td>Network unreachable.</td>
</tr>
<tr>
<td>P</td>
<td>Protocol unreachable.</td>
</tr>
<tr>
<td>Q</td>
<td>Source quench.</td>
</tr>
<tr>
<td>U</td>
<td>Port unreachable.</td>
</tr>
</tbody>
</table>

To end a trace in progress, enter the escape sequence (Ctrl-^ X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

### Example: Enabling All System Diagnostics

⚠️ **Caution**

Because debugging output takes priority over other network traffic, and because the debug all privileged EXEC command generates more output than any other debug command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific debug commands.
This command disables all-system diagnostics:

```
Switch# debug all
```

The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.
