

## **Configuring IP Source Guard**

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- Finding Feature Information, on page 1
- Information About IP Source Guard, on page 1
- How to Configure IP Source Guard, on page 4
- Monitoring IP Source Guard, on page 7
- Additional References, on page 8

## **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="http://www.cisco.com/go/cfn">http://www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

### Information About IP Source Guard

### **IP Source Guard**

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address is the binding table is allowed, all other traffic is denied.

The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

### **IP Source Guard for Static Hosts**

Note

Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the **show ip device tracking all** EXEC command, the IP device tracking table displays the entries as ACTIVE.

Note

Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vender of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.

### **IP Source Guard Configuration Guidelines**

• You can configure static IP bindings only on nonrouted ports. If you enter the **ip source binding** *mac-address* **vlan** *vlan-id ip-address* **interface** *interface-id* global configuration command on a routed interface, this error message appears:

Static IP source binding can only be configured on switch port.

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled
  on the access VLAN for that interface.
- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

Note

If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

- If you enable IP source guard with source IP and MAC address filtering, DHCP snooping and port security must be enabled on the interface. You must also enter the ip dhcp snooping information option global configuration command and ensure that the DHCP server supports option 82. When IP source guard is enabled with MAC address filtering, the DHCP host MAC address is not learned until the host is granted a lease. When forwarding packets from the server to the host, DHCP snooping uses option-82 data to identify the host port.
- When configuring IP source guard on interfaces on which a private VLAN is configured, port security is not supported.ter
- You can enable this feature when 802.1x port-based authentication is enabled.
- If the number of ternary content addressable memory (TCAM) entries exceeds the maximum, the CPU
  usage increases.
- When you configure IP source guard smart logging, packets with a source address other than the specified
  address or an address learned by DHCP are denied, and the packet contents are sent to a NetFlow collector.
  If you configure this feature, make sure that smart logging is globally enabled.
- In a switch stack, if IP source guard is configured on a stack member interface and you remove the the configuration of that switch by entering the **no switch** stack-member-number **provision** global configuration command, the interface static bindings are removed from the binding table, but they are not removed from the running configuration. If you again provision the switch by entering the **switch** stack-member-number **provision** command, the binding is restored.

To remove the binding from the running configuration, you must disable IP source guard before entering the **no switch provision** command. The configuration is also removed if the switch reloads while the interface is removed from the binding table.

# **How to Configure IP Source Guard**

## **Enabling IP Source Guard**

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. interface interface-id
- 4. ip verify source [mac-check]
- **5.** Use one of the following:
  - ip verify source
  - ip verify source port-security
- 6. exit
- 7. ip source binding mac-address vlan vlan-id ip-address interface interface-id
- 8. end
- 9. show running-config
- 10. copy running-config startup-config

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if
	Example:	prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	interface interface-id	Specifies the interface to be configured, and enters interface
	Example:	configuration mode.
	Switch(config)# interface gigabitethernet 1/0/1	
Step 4	ip verify source [mac-check]	Enables IP source guard with source IP address filtering.
	Example:	(Optional) mac-check—Enables IP Source Guard with
	Switch(config-if)# ip verify source	source IP address and MAC address filtering.

	Command or Action	Purpose
Step 5	Use one of the following:	Enables IP source guard with source IP address filtering.
	<ul><li>ip verify source</li><li>ip verify source port-security</li></ul>	Enables IP source guard with source IP and MAC address filtering.
	<pre>Example: Switch(config-if) # ip verify source</pre>	When you enable both IP source guard and port security by using the <b>ip verify source port-security</b> interface configuration command, there are two caveats:  • The DHCP server must support option 82, or the
	Or Switch(config-if)# ip verify source port-security	client is not assigned an IP address
Step 6	exit	Returns to global configuration mode.
	Example:	
	Switch(config-if)# exit	
Step 7	ip source binding mac-address vlan vlan-id ip-address interface interface-id  Example:	Adds a static IP source binding.  Enter this command for each static binding.
	Switch(config)# ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1	
Step 8	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 9	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 10	copy running-config startup-config  Example:	(Optional) Saves your entries in the configuration file.
	Switch# copy running-config startup-config	

## **Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port**

You must configure the **ip device tracking maximum** *limit-number* interface configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. ip device tracking
- 4. interface interface-id
- 5. switchport mode access
- 6. switchport access vlan vlan-id
- 7. ip verify source[tracking] [mac-check]
- 8. ip device tracking maximum number
- 9. switchport port-security
- 10. switchport port-security maximum value
- **11**. end

### **DETAILED STEPS**

Command or Action	Purpose
enable	Enables privileged EXEC mode. Enter your password if
Example:	prompted.
Switch> enable	
configure terminal	Enters the global configuration mode.
Example:	
Switch# configure terminal	
ip device tracking	Turns on the IP host table, and globally enables IP device
Example:	tracking.
Switch(config)# ip device tracking	
interface interface-id	Enters interface configuration mode.
Example:	
Switch(config)# interface gigabitethernet 1/0/1	
	enable  Example:  Switch> enable  configure terminal  Example:  Switch# configure terminal  ip device tracking  Example:  Switch(config)# ip device tracking  interface interface-id  Example:

	Command or Action	Purpose	
Step 5	switchport mode access	Configures a port as access.	
	Example:		
	Switch(config-if)# switchport mode access		
Step 6	switchport access vlan vlan-id	Configures the VLAN for this port.	
	Example:		
	Switch(config-if)# switchport access vlan 10		
Step 7	ip verify source[tracking] [mac-check ]	Enables IP source guard with source IP address filtering.	
	<pre>Example: Switch(config-if)# ip verify source tracking mac-check</pre>	(Optional) <b>tracking</b> —Enables IP source guard for static hosts.	
		(Optional) mac-check—Enables MAC address filtering.	
		The command ip verify source tracking mac-checkenables IP source guard for static hosts with MAC address filtering.	
Step 8	ip device tracking maximum number  Example:	Establishes a maximum limit for the number of static IF that the IP device tracking table allows on the port. The range is 1 to 10. The maximum number is 10.	
	Switch(config-if)# ip device tracking maximum 8	Note You must configure the <b>ip device tracking maximum</b> <i>limit-number</i> interface configuration command.	
Step 9	switchport port-security	(Optional) Activate port security for this port.	
Step 10	switchport port-security maximum value	(Optional) Establish a maximum of MAC addresses for this port.	
Step 11	end	Returns to privileged EXEC mode.	
	Example:		
	Switch(config)# end		

# **Monitoring IP Source Guard**

Table 1: Privileged EXEC show Commands

Command	Purpose
	Displays the IP source guard configuration on the switch or on a specific interface.

Command	Purpose
show ip device tracking { all   interface interface-id   ip ip-address   mac imac-address}	Displays information about the entries in the IP device tracking table.

### **Table 2: Interface Configuration Commands**

Command	Purpose
ip verify source tracking	Verifies the data source.

For detailed information about the fields in these displays, see the command reference for this release.
