CHAPTER 6

Configuring System MTU 69
  Finding Feature Information 69
  Information About the MTU 69
  System MTU Guidelines 69
  How to Configure MTU 70
    Configuring the System MTU 70
  Configuration Examples for System MTU 71
  Additional References for System MTU 71
  Feature Information for System MTU 72

CHAPTER 7

Configuring Boot Fast 73
Restrictions for EEE 95
Information About EEE 96
   EEE Overview 96
   Default EEE Configuration 96
How to Configure EEE 96
   Enabling or Disabling EEE 96
Monitoring EEE 97
Configuration Examples for Configuring EEE 98
Additional References 98
Feature History and Information for Configuring EEE 99

PART II

IP Multicast Routing 101

CHAPTER 11
Configuring IGMP Snooping and Multicast VLAN Registration 103
Finding Feature Information 103
Prerequisites for Configuring IGMP Snooping and MVR 103
   Prerequisites for IGMP Snooping 103
   Prerequisites for MVR 104
Restrictions for Configuring IGMP Snooping and MVR 104
   Restrictions for IGMP Snooping 104
   Restrictions for MVR 105
Information About IGMP Snooping and MVR 106
IGMP Snooping 106
   IGMP Versions 107
   Joining a Multicast Group 107
   Leaving a Multicast Group 108
   Immediate Leave 109
   IGMP Configurable-Leave Timer 109
   IGMP Report Suppression 109
   IGMP Snooping and Switch Stacks 110
   Default IGMP Snooping Configuration 110
Multicast VLAN Registration 110
   MVR and IGMP 111
   Modes of Operation 111
Default IPv6 ACL Configuration 184
Interaction with Other Features and Switches 184
Creating IPv6 ACL 184
Applying an IPv6 ACL to an Interface 188
Displaying IPv6 ACLs 189
Configuration Examples for IPv6 ACL 190
Example: Creating IPv6 ACL 190
Example: Applying IPv6 ACLs 190
Example: Displaying IPv6 ACLs 190

### CHAPTER 20 Configuring Flex Links and the MAC Address-Table Move Update Feature

- Finding Feature Information 333
- Restrictions for Configuring Flex Links and MAC Address-Table Move Update 333
- Information About Flex Links and MAC Address-Table Move Update 334

#### Flex Links 334

- Flex Links Configuration 334
- VLAN Flex Links Load Balancing and Support 335
- Multicast Fast Convergence with Flex Links Failover 335
  - Learning the Other Flex Links Port as the mrouter Port 335
- Generating IGMP Reports 336
- Leaking IGMP Reports 336
- MAC Address-Table Move Update 336
- Flex Links VLAN Load Balancing Configuration Guidelines 338
- MAC Address-Table Move Update Configuration Guidelines 338
- Default Flex Links and MAC Address-Table Move Update Configuration 338

#### How to Configure Flex Links and the MAC Address-Table Move Update Feature 338

- Configuring Flex Links 338
  - Configuring a Preemption Scheme for a Pair of Flex Links 339
- Configuring VLAN Load Balancing on Flex Links 340
- Configuring MAC Address-Table Move Update 341
  - Configuring a Switch to Obtain and Process MAC Address-Table Move Update Messages 342

#### Monitoring Flex Links, Multicast Fast Convergence, and MAC Address-Table Move Update 343

- Configuration Examples for Flex Links 343
  - Configuring Flex Links: Examples 343
  - Configuring VLAN Load Balancing on Flex Links: Examples 344
  - Configuring the MAC Address-Table Move Update: Examples 345
  - Configuring Multicast Fast Convergence with Flex Links Failover: Examples 345

#### Additional References for Flex Links and MAC Address-Table Move Update 348

- Feature Information for Flex Links and MAC Address-Table Move Update 349

### CHAPTER 21 Configuring UniDirectional Link Detection

- Finding Feature Information 351
- Restrictions for Configuring UDLD 351
Information About UDLD 352
Modes of Operation 352
Normal Mode 352
Aggressive Mode 352
Methods to Detect Unidirectional Links 353
Neighbor Database Maintenance 353
Event-Driven Detection and Echoing 353
UDLD Reset Options 354
Default UDLD Configuration 354
How to Configure UDLD 354
Enabling UDLD Globally 354
Enabling UDLD on an Interface 356
Monitoring and Maintaining UDLD 357
Additional References for UDLD 357
Feature Information for UDLD 358

PART V
Network Management 359

CHAPTER 22
Configuring Cisco IOS Configuration Engine 361
Prerequisites for Configuring the Configuration Engine 361
Restrictions for Configuring the Configuration Engine 361
Information About Configuring the Configuration Engine 362
Cisco Configuration Engine Software 362
Configuration Service 363
Event Service 363
NameSpace Mapper 363
Cisco Networking Services IDs and Device Hostnames 363
ConfigID 364
DeviceID 364
Hostname and DeviceID 364
Hostname, DeviceID, and ConfigID 364
Cisco IOS CNS Agents 365
Initial Configuration 365
Incremental (Partial) Configuration 366
SNMP Manager Functions 396
SNMP Agent Functions 396
SNMP Community Strings 397
SNMP MIB Variables Access 397
SNMP Notifications 398
SNMP ifIndex MIB Object Values 398
Default SNMP Configuration 399
SNMP Configuration Guidelines 399
How to Configure SNMP 400
Disabling the SNMP Agent 400
Configuring Community Strings 401
Configuring SNMP Groups and Users 404
Configuring SNMP Notifications 407
Setting the Agent Contact and Location Information 412
Limiting TFTP Servers Used Through SNMP 413
Monitoring SNMP Status 414
SNMP Examples 415
Additional References 416
Feature History and Information for Simple Network Management Protocol 417

CHAPTER 25

Configuring SPAN and RSPAN 419
Finding Feature Information 419
Prerequisites for SPAN and RSPAN 419
Restrictions for SPAN and RSPAN 420
Information About SPAN and RSPAN 421
SPAN and RSPAN 421
   Local SPAN 422
   Remote SPAN 423
SPAN and RSPAN Concepts and Terminology 424
SPAN and RSPAN Interaction with Other Features 430
SPAN and RSPAN and Device Stacks 431
Default SPAN and RSPAN Configuration 431
Configuration Guidelines 431
   SPAN Configuration Guidelines 431
CHAPTER 29 Configuring Auto-QoS

Finding Feature Information 599
Prerequisites for Auto-QoS 599
Restrictions for Auto-QoS 600
Information about Configuring Auto-QoS 600
Auto-QoS Overview 600
Auto-QoS Compact Overview 600
Generated Auto-QoS Configuration 600
VoIP Device Specifications 601
Enhanced Auto-QoS for Video, Trust, and Classification 602
Auto-QoS Configuration Migration 602
Auto-QoS Configuration Guidelines 603
Auto-QoS VoIP Considerations 603
Auto-QoS Enhanced Considerations 604
Effects of Auto-QoS on Running Configuration 604
Effects of Auto-QoS Compact on Running Configuration 604
How to Configure Auto-QoS 605
Configuring Auto-QoS 605
Enabling Auto-QoS 605
Enabling Auto-QoS Compact 607
Troubleshooting Auto-QoS 608
Monitoring Auto-QoS 608
Configuration Examples for Auto-QoS 609
Examples: Global Auto-QoS Configuration 609
Examples: Auto-QoS Generated Configuration for VoIP Devices 613
Examples: Auto-QoS Generated Configuration for VoIP Devices 615
Examples: Auto-QoS Generated Configuration For Enhanced Video, Trust, and Classify Devices 616
auto qos global compact 619
Where to Go Next for Auto-QoS 619
Additional References for Auto-QoS 619
Feature History and Information for Auto-QoS 620

PART IX  Routing 621

CHAPTER 30 Configuring IP Unicast Routing 623
Finding Feature Information 623
Information About Configuring IP Unicast Routing 623
Information About IP Routing 624
Types of Routing 624
IP Routing and Switch Stacks 624
Configuring IP Unicast Routing 626
Enabling IP Unicast Routing 626
Assigning IP Addresses to SVIs 627
Configuring Static Unicast Routes 629
Monitoring and Maintaining the IP Network 630

CHAPTER 31 Configuring IPv6 First Hop Security 631
Finding Feature Information 631
Prerequisites for First Hop Security in IPv6 631
Restrictions for First Hop Security in IPv6 632
Information about First Hop Security in IPv6 632
How to Configure an IPv6 Snooping Policy 635
  How to Attach an IPv6 Snooping Policy to an Interface 637
  How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface 638
How to Configure the IPv6 Binding Table Content 639
How to Configure an IPv6 Neighbor Discovery Inspection Policy 640
  How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface 642
  How to Attach an IPv6 Neighbor Discovery Inspection Policy to a Layer 2 EtherChannel Interface 643
How to Attach an IPv6 Neighbor Discovery Multicast Suppress Policy on a Device 644
How to Attach an IPv6 Neighbor Discovery Multicast Suppress Policy on an Interface 645
How to Attach an IPv6 Neighbor Discovery Multicast Suppress Policy to a Layer 2 EtherChannel Interface 646
How to Configure an IPv6 Router Advertisement Guard Policy 646
How to Attach an IPv6 Router Advertisement Guard Policy to an Interface 649
How to Attach an IPv6 Router Advertisement Guard Policy to a Layer 2 EtherChannel Interface 650
How to Configure an IPv6 DHCP Guard Policy 651
How to Attach an IPv6 DHCP Guard Policy to an Interface or a VLAN on an Interface 653
How to Attach an IPv6 DHCP Guard Policy to a Layer 2 EtherChannel Interface 654
How to Configure IPv6 Source Guard 655
How to Attach an IPv6 Source Guard Policy to an Interface 656
How to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface 657
How to Configure IPv6 Prefix Guard 658
How to Attach an IPv6 Prefix Guard Policy to an Interface 659
How to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface 660
Configuration Examples for IPv6 First Hop Security 660
Examples: How to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface 660
Examples: How to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface 661
Additional References 661

CHAPTER 32  Routing Information Protocol 663
   Prerequisites for RIP 663
   Restrictions for RIP 663
   Information About Routing Information Protocol 663
      RIP Overview 663
      RIP Routing Updates 664
      Authentication in RIP 664
      RIP Routing Metric 665
      RIP Versions 665
      Exchange of Routing Information 665
      Neighbor Router Authentication 666
      How to Configure Routing Information Protocol 667
CHAPTER 36

Configuring TACACS+ 699

Finding Feature Information 699
Prerequisites for TACACS+ 699
Restrictions for TACACS+ 700
Information About TACACS+ 701
TACACS+ and Switch Access 701
TACACS+ Overview 701
TACACS+ Operation 702
Method List 703
TACACS AV Pairs 703
TACACS Authentication and Authorization AV Pairs 703
TACACS Accounting AV Pairs 710
Configuring AAA Server Group Selection Based on DNIS 722
TACACS+ Configuration Options 724
TACACS+ Login Authentication 724
TACACS+ Authorization for Privileged EXEC Access and Network Services 724
TACACS+ Authentication 724
TACACS+ Authorization 724
TACACS+ Accounting 724
Default TACACS+ Configuration 725
Per VRF for TACACS Servers 725
How to Configure TACACS+ 725
Identifying the TACACS+ Server Host and Setting the Authentication Key 725

**Configuring Secure Shell** 895

- Finding Feature Information 895
- Prerequisites for Configuring Secure Shell 895
- Restrictions for Configuring Secure Shell 896
- Information about SSH 896
  - SSH and Switch Access 896
  - SSH Servers, Integrated Clients, and Supported Versions 897
  - RSA Authentication Support 897
  - SSL Configuration Guidelines 897
  - Secure Copy Protocol Overview 898
  - Secure Copy Protocol 898
  - How Secure Copy Works 898
  - Reverse Telnet 899
  - Reverse SSH 899
- How to Configure Secure Shell 899
  - Setting Up the Switch to Run SSH 899
  - Configuring the SSH Server 901
  - Invoking an SSH Client 902
  - Troubleshooting Tips 903
  - Configuring Reverse SSH for Console Access 903
  - Configuring Reverse SSH for Modem Access 905
  - Troubleshooting Reverse SSH on the Client 906
  - Troubleshooting Reverse SSH on the Server 907
  - Monitoring the SSH Configuration and Status 908
Configuring Secure Copy 908
Configuration Examples for Secure Shell 909
  Example: Secure Copy Configuration Using Local Authentication 909
  Example: SCP Server-Side Configuration Using Network-Based Authentication 910
  Example Reverse SSH Console Access 910
  Example Reverse SSH Modem Access 910
  Example: Monitoring the SSH Configuration and Status 911
Additional References for Secure Shell 911
Feature Information for Configuring Secure Shell 912

CHAPTER 47

Secure Shell Version 2 Support 913
Finding Feature Information 913
Information About Secure Shell Version 2 Support 913
  Secure Shell Version 2 913
  Secure Shell Version 2 Enhancements 914
  Secure Shell Version 2 Enhancements for RSA Keys 914
  SNMP Trap Generation 915
  SSH Keyboard Interactive Authentication 916
How to Configure Secure Shell Version 2 Support 917
  Configuring a Device for SSH Version 2 Using a Hostname and Domain Name 917
  Configuring a Device for SSH Version 2 Using RSA Key Pairs 918
  Configuring the Cisco SSH Server to Perform RSA-Based User Authentication 919
  Configuring the Cisco IOS SSH Client to Perform RSA-Based Server Authentication 921
  Starting an Encrypted Session with a Remote Device 923
  Enabling Secure Copy Protocol on the SSH Server 923
  Verifying the Status of the Secure Shell Connection 925
  Verifying the Secure Shell Status 926
  Monitoring and Maintaining Secure Shell Version 2 927
Configuration Examples for Secure Shell Version 2 Support 930
  Example: Configuring Secure Shell Version 2 930
  Example: Starting an Encrypted Session with a Remote Device 930
  Example: Configuring Server-Side SCP 930
  Example: Setting an SNMP Trap 931
  Examples: SSH Keyboard Interactive Authentication 931

- Registration Authorities 967
- How to Configure Certification Authority 967
  - Managing NVRAM Memory Usage 967
  - Configuring the Device Host Name and IP Domain Name 968
  - Generating an RSA Key Pair 968
  - Declaring a Certification Authority 969
  - Configuring a Root CA (Trusted Root) 971
  - Authenticating the CA 971
  - Requesting Signed Certificates 972
- Monitoring and Maintaining Certification Authority 973
  - Requesting a Certificate Revocation List 973
CHAPTER 51

Access Control List Overview   979
Finding Feature Information   979
Information About Access Control Lists   979
   Definition of an Access List   979
   Functions of an Access Control List   980
   Purpose of IP Access Lists   980
   Reasons to Configure ACLs   981
   Software Processing of an Access List   981
   Access List Rules   982
   Helpful Hints for Creating IP Access Lists   982
   IP Packet Fields You Can Filter to Control Access   983
   Source and Destination Addresses   984
   Wildcard Mask for Addresses in an Access List   984
   Access List Sequence Numbers   984
   ACL Supported Types   985
   Supported ACLs   985
      ACL Precedence   985
      Port ACLs   986
      Router ACLs   987
   Access Control Entries   987
      ACEs and Fragmented and Unfragmented Traffic   987
      ACEs and Fragmented and Unfragmented Traffic Examples   988

CHAPTER 52

Configuring IPv4 Access Control Lists   989
Finding Feature Information   989
Prerequisites for Configuring IPv4 Access Control Lists   989
Restrictions for Configuring IPv4 Access Control Lists   990
Information About Configuring IPv4 Access Control Lists   991
ACL Overview

Standard and Extended IPv4 ACLs
- IPv4 ACL Switch Unsupported Features
- Access List Numbers

Numbered Standard IPv4 ACLs
Numbered Extended IPv4 ACLs
Named IPv4 ACLs

Benefits of IP Access List Entry Sequence Numbering
Sequence Numbering Behavior

Including comments in ACLs

Hardware and Software Treatment of IP ACLs

Time Ranges for ACLs
IPv4 ACL Interface Considerations
- Apply an Access Control List to an Interface

ACL Logging

How to Configure ACLs

Configuring IPv4 ACLs
Creating a Numbered Standard ACL
Creating a Numbered Extended ACL
Creating Named Standard ACLs
Creating Extended Named ACLs

Configuring an Access Control Entry with Noncontiguous Ports
Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry

Sequencing Access-List Entries and Revising the Access List

Configuring Commented IP ACL Entries
Configuring Time Ranges for ACLs
Applying an IPv4 ACL to a Terminal Line
Applying an IPv4 ACL to an Interface

Monitoring IPv4 ACLs

Configuration Examples for ACLs
- ACLs in a Small Networked Office
- Example: Numbered ACLs
- Examples: Extended ACLs
- Examples: Named ACLs
Example: Configuring an Access Control Entry with Noncontiguous Ports 1020
Example: Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry 1020
Example Resequencing Entries in an Access List 1021
Example Adding an Entry with a Sequence Number 1022
Example Adding an Entry with No Sequence Number 1022
Examples: Configuring Commented IP ACL Entries 1022
Examples: Using Time Ranges with ACLs 1023
Examples: Time Range Applied to an IP ACL 1024
Examples: ACL Logging 1024
Examples: Troubleshooting ACLs 1025
Additional References 1026
Feature Information for IPv4 Access Control Lists 1027

CHAPTER 53 IPv6 Access Control Lists 1029
Finding Feature Information 1029
Prerequisites for IPv6 ACLs 1029
Restrictions for IPv6 ACLs 1030
Information About Configuring IPv6 ACLs 1030
  ACL Overview 1031
  IPv6 ACLs Overview 1031
Understanding IPv6 ACLs 1031
Interactions with Other Features and Switches 1032
Default Configuration for IPv6 ACLs 1032
Supported ACL Features 1033
IPv6 Port-Based Access Control List Support 1033
ACLs and Traffic Forwarding 1033
How to Configure IPv6 ACLs 1034
  Configuring IPv6 ACLs 1034
Attaching an IPv6 ACL to an Interface 1037
Monitoring IPv6 ACLs 1039
Configuring PACL Mode and Applying IPv6 PACL on an Interface 1039
Configuring IPv6 ACL Extensions for Hop by Hop Filtering 1040
Configuration Examples for IPv6 ACLs 1042
ACL Support for Filtering IP Options 1047
Finding Feature Information 1047
Prerequisites for ACL Support for Filtering IP Options 1047
Information About ACL Support for Filtering IP Options 1048
    IP Options 1048
    Benefits of Filtering IP Options 1048
    Benefits of Filtering on TCP Flags 1048
    TCP Flags 1049
How to Configure ACL Support for Filtering IP Options 1049
    Filtering Packets That Contain IP Options 1049
    Filtering Packets That Contain TCP Flags 1051
Configuration Examples for ACL Support for Filtering IP Options 1053
    Example: Filtering Packets That Contain IP Options 1053
    Example: Filtering Packets That Contain TCP Flags 1053
Additional References for ACL Support for Filtering IP Options 1053
Feature Information for Creating an IP Access List to Filter 1054

Statement 1071—Warning Definition  1957
Preface

This book describes configuration information and examples for Flexible NetFlow on the switch.

- Document Conventions, on page lxxix
- Obtaining Documentation and Submitting a Service Request, on page lxxxii

Document Conventions

This document uses the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^ or Ctrl</td>
<td>Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination ^D or Ctrl-D means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)</td>
</tr>
<tr>
<td>bold font</td>
<td>Commands and keywords and user-entered text appear in <strong>bold</strong> font.</td>
</tr>
<tr>
<td>Italic font</td>
<td>Document titles, new or emphasized terms, and arguments for which you supply values are in <em>italic</em> font.</td>
</tr>
<tr>
<td>Courier font</td>
<td>Terminal sessions and information the system displays appear in <strong>courier</strong> font.</td>
</tr>
<tr>
<td>Bold Courier font</td>
<td>Bold Courier font indicates text that the user must enter.</td>
</tr>
<tr>
<td>[x]</td>
<td>Elements in square brackets are optional.</td>
</tr>
<tr>
<td>...</td>
<td>An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.</td>
</tr>
<tr>
<td></td>
<td>A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
</tbody>
</table>
### Convention | Description
--- | ---
[x {y | z}] | Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.

string | A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.

<:> | Nonprinting characters such as passwords are in angle brackets.

[ ] | Default responses to system prompts are in square brackets.

!, # | An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

### Reader Alert Conventions
This document may use the following conventions for reader alerts:

- **Note**
  Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

- **Tip**
  Means the following information will help you solve a problem.

- **Caution**
  Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

- **Timesaver**
  Means the described action saves time. You can save time by performing the action described in the paragraph.

- **Warning**
  IMPORTANT SAFETY INSTRUCTIONS
  This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

SAVE THESE INSTRUCTIONS
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
CHAPTER 1

Using the Command-Line Interface

- Information About Using the Command-Line Interface, on page 1
- How to Use the CLI to Configure Features, on page 5

Information About Using the Command-Line Interface

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, an SSH, or by using the browser. When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as show commands, which show the current configuration status, and clear commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.
<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
<th>About This Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>Begin a session using Telnet, SSH, or console.</td>
<td>Switch&gt;</td>
<td>Enter <strong>logout</strong> or <strong>quit</strong>.</td>
<td>Use this mode to:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Change terminal settings.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Perform basic tests.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Display system information.</td>
</tr>
<tr>
<td>Privileged EXEC</td>
<td>While in user EXEC mode, enter the <strong>enable</strong> command.</td>
<td>Switch#</td>
<td>Enter <strong>disable</strong> to exit.</td>
<td>Use this mode to verify commands that you have entered. Use a password to protect access to this mode.</td>
</tr>
<tr>
<td>Global configuration</td>
<td>While in privileged EXEC mode, enter the <strong>configure</strong> command.</td>
<td>Switch(config)#</td>
<td>To exit to privileged EXEC mode, enter <strong>exit</strong> or <strong>end</strong>, or press <strong>Ctrl-Z</strong>.</td>
<td>Use this mode to configure parameters that apply to the entire switch.</td>
</tr>
<tr>
<td>VLAN configuration</td>
<td>While in global configuration mode, enter the <strong>vlan vlan-id</strong> command.</td>
<td>Switch(config-vlan)#</td>
<td></td>
<td>Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.</td>
</tr>
</tbody>
</table>
### Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the `show configuration` privileged EXEC command in an abbreviated form:

```
Switch# show conf
```

### No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

### CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.
### Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

#### Note

Only CLI or HTTP changes are logged.

### Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> help</td>
<td>Obtains a brief description of the help system in any command mode.</td>
</tr>
</tbody>
</table>

**Example:**

Switch# help
How to Use the CLI to Configure Features

Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>abbreviated-command-entry ?</td>
<td>Obtains a list of commands that begin with a particular character string.</td>

<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# cdp holdtime ? &lt;10-255&gt; Length of time (in sec) that receiver must keep this packet</td>
<td></td>
</tr>
</tbody>
</table>
**Recalling Commands**

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>terminal history [size number-of-lines]</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Switch# terminal history size 200</strong></td>
</tr>
</tbody>
</table>

Changes the number of command lines that the switch records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.

---

**Note**
The arrow keys function only on ANSI-compatible terminals such as VT100s.

---

**Disabling the Command History Feature**

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>terminal no history</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Switch# terminal no history</strong></td>
</tr>
</tbody>
</table>

Disables the feature during the current terminal session in privileged EXEC mode.
Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenable it.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.</td>
</tr>
<tr>
<td>terminal editing</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# terminal editing</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.</td>
</tr>
<tr>
<td>terminal no editing</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# terminal no editing</td>
<td></td>
</tr>
</tbody>
</table>

Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

The arrow keys function only on ANSI-compatible terminals such as VT100s.

Table 3: Editing Commands

<table>
<thead>
<tr>
<th>Editing Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-B or use the left arrow key</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>Ctrl-F or use the right arrow key</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Moves the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>Moves the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Esc B</td>
<td>Moves the cursor back one word.</td>
</tr>
<tr>
<td>Esc F</td>
<td>Moves the cursor forward one word.</td>
</tr>
<tr>
<td>Ctrl-T</td>
<td>Transposes the character to the left of the cursor with the character located at the cursor.</td>
</tr>
<tr>
<td>Delete or Backspace key</td>
<td>Erases the character to the left of the cursor.</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td>Deletes the character at the cursor.</td>
</tr>
<tr>
<td>Ctrl-K</td>
<td>Deletes all characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Ctrl-U or Ctrl-X</td>
<td>Deletes all characters from the cursor to the beginning of the command line.</td>
</tr>
</tbody>
</table>
Ctrl-W  Deletes the word to the left of the cursor.

Esc D  Deletes from the cursor to the end of the word.

Esc C  Capitalizes at the cursor.

Esc L  Changes the word at the cursor to lowercase.

Esc U  Capitalizes letters from the cursor to the end of the word.

Ctrl-V or Esc Q  Designates a particular keystroke as an executable command, perhaps as a shortcut.

Return key  Scrolls down a line or screen on displays that are longer than the terminal screen can display.

Note  The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including show command output. You can use the Return and Space bar keystrokes whenever you see the More prompt.

Space bar  Scrolls down one screen.

Ctrl-L or Ctrl-R  Redisplays the current command line if the switch suddenly sends a message to your screen.

**Editing Command Lines That Wrap**

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press Ctrl-B or the left arrow key repeatedly. You can also press Ctrl-A to immediately move to the beginning of the line.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-list</td>
<td>Displays the global configuration command entry that extends beyond one line.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35</td>
<td></td>
</tr>
<tr>
<td>$ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35</td>
<td></td>
</tr>
</tbody>
</table>

When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign ($) shows that the line has been scrolled to the left. Each time the
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>255.25 Switch(config)# $t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Switch(config)# $15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</td>
<td>cursor reaches the end of the line, the line is again shifted ten spaces to the left.</td>
</tr>
</tbody>
</table>

Step 2

**Ctrl-A**

**Example:**

Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.255.255.0 eq 45

Checks the complete syntax.

The dollar sign ($) appears at the end of the line to show that the line has been scrolled to the right.

Step 3

Return key

Execute the commands.

The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the `terminal width` privileged EXEC command to set the width of your terminal.

Use line wrapping with the command history feature to recall and modify previous complex command entries.

### Searching and Filtering Output of show and more Commands

You can search and filter the output for `show` and `more` commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`{show</td>
<td>more} command`</td>
</tr>
<tr>
<td>`{begin</td>
<td>include</td>
</tr>
</tbody>
</table>

**Example:**

Switch# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet1/0/1 is up, line protocol is down
GigabitEthernet1/0/2 is up, line protocol is up

### Accessing the CLI on a Switch Stack

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.
You manage the switch stack and the stack member interfaces through the stack master. You cannot manage stack members on an individual switch basis. You can connect to the stack master through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, use the `session standby ios` privileged EXEC command from the active switch to access the IOS console of the standby switch. To debug a specific stack member, use the `session switch stack-member-number` privileged EXEC command from the active switch to access the diagnostic shell of the stack member. For more information about these commands, see the switch command reference.

To debug a specific stack member, you can start a CLI session from the stack master by using the `session stack-member-number` privileged EXEC command. The stack member number is appended to the system prompt. For example, `Switch-2#` is the prompt for stack member 2 where the system prompt for the stack master is Switch. Only the `show` and `debug` commands are available in a CLI session to a specific stack member. You can also use the `remote command stack-member-number LINE` privileged EXEC command on the stack master to enable debugging on a member switch without first starting a session.

Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

Procedure

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.
  - The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
  - The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.
Accessing the CLI through Bluetooth

You can access the CLI through Bluetooth connectivity by pairing the switch to a computer.

Note

This feature is available on Cisco IOS Release 15.2(5)E2 and higher.

1. Connect a Bluetooth dongle to the USB port on your switch and power on the switch.

2. Turn on Bluetooth on your computer and discover the switch.

3. Pair the computer to the switch.

4. Connect to the switch as an access point.
   - If you are connecting from a Windows computer: Go to Devices & Printers, select the switch, click on the Connect Using tab and select Access point.
   - If you are connecting from a Mac computer: On the menu bar, click the Bluetooth icon, hover over the switch name, and click Connect to Network.

Once a connection is established, you can open a management window and configure the switch.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Interface Characteristics

Interface Types

This section describes the different types of interfaces supported by the switch. The rest of the chapter describes configuration procedures for physical interface characteristics.

Note

The stack ports on the rear of the stacking-capable switches are not Ethernet ports and cannot be configured.
Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN. VLANs can be formed with ports across the stack.

To configure VLANs, use the `vlan vlan-id` global configuration command to enter VLAN configuration mode. The VLAN configurations for normal-range VLANs (VLAN IDs 1 to 1005) are saved in the VLAN database. If VTP is version 1 or 2, to configure extended-range VLANs (VLAN IDs 1006 to 4094), you must first set VTP mode to transparent. Extended-range VLANs created in transparent mode are not added to the VLAN database but are saved in the switch running configuration. With VTP version 3, you can create extended-range VLANs in client or server mode. These VLANs are saved in the VLAN database.

In a switch stack, the VLAN database is downloaded to all switches in a stack, and all switches in the stack build the same VLAN database. The running configuration and the saved configuration are the same for all switches in a stack.

Add ports to a VLAN by using the `switchport` interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and, if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

Switch Ports

Switch ports are Layer 2-only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port or a trunk port. You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to set the switchport mode by negotiating with the port on the other end of the link. switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the `switchport` interface configuration commands.

Access Ports

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives a tagged packet (Inter-Switch Link [ISL] or IEEE 802.1Q tagged), the packet is dropped, and the source address is not learned.

The types of access ports supported are:

- Static access ports are manually assigned to a VLAN (or through a RADIUS server for use with IEEE 802.1x).
- VLAN membership of dynamic access ports is learned through incoming packets. By default, a dynamic access port is not a member of any VLAN, and forwarding to and from the port is enabled only when the VLAN membership of the port is discovered. Dynamic access ports on the switch are assigned to a
VLAN by a VLAN Membership Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch; the switch cannot be a VMPS server.

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.

**Trunk Ports**

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database.

The switch supports only IEEE 802.1Q trunk ports. An IEEE 802.1Q trunk port supports simultaneous tagged and untagged traffic. An IEEE 802.1Q trunk port is assigned a default port VLAN ID (PVID), and all untagged traffic travels on the port default PVID. All untagged traffic and tagged traffic with a NULL VLAN ID are assumed to belong to the port default PVID. A packet with a VLAN ID equal to the outgoing port default PVID is sent untagged. All other traffic is sent with a VLAN tag.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if VTP knows of the VLAN and if the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

**Switch Virtual Interfaces**

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing or bridging function in the system. You can associate only one SVI with a VLAN. You configure an SVI for a VLAN only to route between VLANs or to provide IP host connectivity to the switch. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote switch administration. Additional SVIs must be explicitly configured.

You cannot delete interface VLAN 1.

SVIs provide IP host connectivity only to the system. SVIs are created the first time that you enter the `vlan` interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address.

You can also use the interface range command to configure existing VLAN SVIs within the range. The commands entered under the interface range command are applied to all existing VLAN SVIs within the range. You can enter the command `interface range create vlan x - y` to create all VLANs in the specified range that do not already exist. When the VLAN interface is created, `interface range vlan id` can be used to configure the VLAN interface.

Although the switch stack or switch supports a total of 1005 VLANs and SVIs, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations.
When you create an SVI, it does not become active until it is associated with a physical port.

**SVI Autostate Exclude**

The line state of an SVI with multiple ports on a VLAN is in the *up* state when it meets these conditions:

- The VLAN exists and is active in the VLAN database on the switch
- The VLAN interface exists and is not administratively down.
- At least one Layer 2 (access or trunk) port exists, has a link in the *up* state on this VLAN, and is in the spanning-tree forwarding state on the VLAN.

---

**Note**

The protocol link state for VLAN interfaces come up when the first switchport belonging to the corresponding VLAN link comes up and is in STP forwarding state.

The default action, when a VLAN has multiple ports, is that the SVI goes down when all ports in the VLAN go down. You can use the SVI autostate exclude feature to configure a port so that it is not included in the SVI line-state up-or-down calculation. For example, if the only active port on the VLAN is a monitoring port, you might configure autostate exclude on that port so that the VLAN goes down when all other ports go down. When enabled on a port, **autostate exclude** applies to all VLANs that are enabled on that port.

The VLAN interface is brought up when one Layer 2 port in the VLAN has had time to converge (transition from STP listening-learning state to forwarding state). This prevents features such as routing protocols from using the VLAN interface as if it were fully operational and minimizes other problems, such as routing black holes.

**EtherChannel Port Groups**

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between switches or between switches and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port or multiple access ports into one logical access port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), and the Port Aggregation Protocol (PAgP), which operate only on physical ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 2 interfaces, use the **channel-group** interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together.

**Power over Ethernet Ports**

A PoE-capable switch port automatically supplies power to one of these connected devices if the switch senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

Using the Switch USB Ports

The switch has three USB ports on the front panel — a USB mini-Type B console port and two USB Type A ports.

USB Mini-Type B Console Port

The switch has the following console ports:

- USB mini-Type B console connection
- RJ-45 console port

Console output appears on devices connected to both ports, but console input is active on only one port at a time. By default, the USB connector takes precedence over the RJ-45 connector.

Note

Windows PCs require a driver for the USB port. See the hardware installation guide for driver installation instructions.

Use the supplied USB Type A-to-USB mini-Type B cable to connect a PC or other device to the switch. The connected device must include a terminal emulation application. When the switch detects a valid USB connection to a powered-on device that supports host functionality (such as a PC), input from the RJ-45 console is immediately disabled, and input from the USB console is enabled. Removing the USB connection immediately reenables input from the RJ-45 console connection. An LED on the switch shows which console connection is in use.

Console Port Change Logs

At software startup, a log shows whether the USB or the RJ-45 console is active. Each switch in a stack issues this log. Every switch always first displays the RJ-45 media type.

In the sample output, Switch 1 has a connected USB console cable. Because the bootloader did not change to the USB console, the first log from Switch 1 shows the RJ-45 console. A short time later, the console changes and the USB console log appears. Switch 2 and Switch 3 have connected RJ-45 console cables.

```
switch-stack-1
*Mar 1 00:01:00.171: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
*Mar 1 00:01:00.431: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.

switch-stack-2
*Mar 1 00:01:09.835: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.

switch-stack-3
*Mar 1 00:01:10.523: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

When the USB cable is removed or the PC de-activates the USB connection, the hardware automatically changes to the RJ-45 console interface:
You can configure the console type to always be RJ-45, and you can configure an inactivity timeout for the USB connector.

**USB Type A Ports**

The USB Type A ports provide access to external USB flash devices, also known as thumb drives or USB keys. The switch supports Cisco 64 MB, 256 MB, 512 MB, 1 GB, 4 GB, and 8 GB flash drives. You can use standard Cisco IOS command-line interface (CLI) commands to read, write, erase, and copy to or from the flash device. You can also configure the switch to boot from the USB flash drive.

For information about configuring the switch to boot from a USB flash drive, refer to the *Catalyst 2960-X Switch System Management Configuration Guide*.

For information about reading, writing, erasing, and copying files to or from the flash device, refer to the *Catalyst 2960-X Switch Managing Cisco IOS Image Files Configuration Guide*.

**Interface Connections**

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device.

In the following configuration example, when Host A in VLAN 20 sends data to Host B in VLAN 30, the data must go from Host A to the switch, to the router, back to the switch, and then to Host B.

*Figure 1: Connecting VLANs with the Switch*

With a standard Layer 2 switch, ports in different VLANs have to exchange information through a router.

**Interface Configuration Mode**

The switch supports these interface types:

- Physical ports—switch ports and routed ports
- VLANs—switch virtual interfaces
- Port channels—EtherChannel interfaces
You can also configure a range of interfaces.

To configure a physical interface (port), specify the interface type, module number, and switch port number, and enter interface configuration mode.

- **Type**—Gigabit Ethernet (gigabitethernet or gi) for 10/100/1000 Mb/s Ethernet ports, or small form-factor pluggable (SFP) module Gigabit Ethernet interfaces (gigabitethernet or gi).

- **Stack member number**—The number that identifies the switch within the stack. The range is 1 to 8 for a stack of Catalyst 2960-X switches, and 1 to 4 for a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches. The switch number is assigned the first time the switch initializes. The default switch number, before it is integrated into a switch stack, is 1. When a switch has been assigned a stack member number, it keeps that number until another is assigned to it.

You can use the switch port LEDs in Stack mode to identify the stack member number of a switch.

- **Module number**—The module or slot number on the switch (always 0).

- **Port number**—The interface number on the switch. The 10/100/1000 port numbers always begin at 1, starting with the far left port when facing the front of the switch, for example, gigabitethernet1/0/1 or gigabitethernet1/0/8. For a switch with 10/100/1000 ports and SFP module ports, SFP module ports are numbered consecutively following the 10/100/1000 ports.

You can identify physical interfaces by physically checking the interface location on the switch. You can also use the `show` privileged EXEC commands to display information about a specific interface or all the interfaces on the switch. The remainder of this chapter primarily provides physical interface configuration procedures.

These are examples of how to identify interfaces on a stacking-capable switch:

- To configure 10/100/1000 port 4 on a standalone switch, enter this command:

  ```
  Switch(config)# interface gigabitethernet1/0/4
  ```

- To configure 10/100/1000 port 4 on stack member 3, enter this command:

  ```
  Switch(config)# interface gigabitethernet1/0/4
  ```

**Default Ethernet Interface Configuration**

This table shows the Ethernet interface default configuration, including some features that apply only to Layer 2 interfaces.

Table 4: Default Layer 2 Ethernet Interface Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>

</tr>
</tbody>
</table>
### Interface and Hardware

#### Interface Speed and Duplex Mode

Ethernet interfaces on the switch operate at 10, 100, or 1000 Mb/s and in either full- or half-duplex mode. In full-duplex mode, two stations can send and receive traffic at the same time. Normally, 10-Mb/s ports operate in half-duplex mode, which means that stations can either receive or send traffic.

Switch models include Gigabit Ethernet (10/100/1000-Mb/s) ports and small form-factor pluggable (SFP) module slots supporting SFP modules.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1p priority-tagged traffic</td>
<td>Drop all packets tagged with VLAN 0.</td>
</tr>
<tr>
<td>VLAN trunking</td>
<td>Switchport mode dynamic auto (supports DTP).</td>
</tr>
<tr>
<td>Port enable state</td>
<td>All ports are enabled.</td>
</tr>
<tr>
<td>Port description</td>
<td>None defined.</td>
</tr>
<tr>
<td>Speed</td>
<td>Autonegotiate. (Not supported on the 10-Gigabit interfaces.)</td>
</tr>
<tr>
<td>Duplex mode</td>
<td>Autonegotiate. (Not supported on the 10-Gigabit interfaces.)</td>
</tr>
<tr>
<td>Flow control</td>
<td>Flow control is set to <strong>receive: off</strong>. It is always off for sent packets.</td>
</tr>
<tr>
<td>EtherChannel (PAgP)</td>
<td>Disabled on all Ethernet ports.</td>
</tr>
<tr>
<td>Port blocking (unknown multicast and</td>
<td>Disabled (not blocked).</td>
</tr>
<tr>
<td>unknown unicast traffic)</td>
<td></td>
</tr>
<tr>
<td>Broadcast, multicast, and unicast</td>
<td>Disabled.</td>
</tr>
<tr>
<td>storm control</td>
<td></td>
</tr>
<tr>
<td>Protected port</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Port security</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Port Fast</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Auto-MDIX</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Power over Ethernet (PoE)</td>
<td>Enabled (auto).</td>
</tr>
<tr>
<td>Keepalive messages</td>
<td>Disabled on SFP module ports; enabled on all other ports.</td>
</tr>
</tbody>
</table>

**Note** The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MIDX is enabled on the switch port.
**Speed and Duplex Configuration Guidelines**

When configuring an interface speed and duplex mode, note these guidelines:

- Do not disable Auto-Negotiation on PoE switches.

- Gigabit Ethernet (10/100/1000-Mb/s) ports support all speed options and all duplex options (auto, half, and full). However, Gigabit Ethernet ports operating at 1000 Mb/s do not support half-duplex mode.

- For SFP module ports, the speed and duplex CLI options change depending on the SFP module type:
  - The 1000BASE-\(\text{-x}\) (where \(\text{-x}\) is -BX, -CWDM, -LX, -SX, and -ZX) SFP module ports support the `nongotiate` keyword in the `speed` interface configuration command. Duplex options are not supported.
  - The 1000BASE-T SFP module ports support the same speed and duplex options as the 10/100/1000-Mb/s ports.

- If both ends of the line support autonegotiation, we highly recommend the default setting of `auto` negotiation.

- If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do not use the `auto` setting on the supported side.

- When STP is enabled and a port is reconfigured, the switch can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures.

- As best practice, we suggest configuring the speed and duplex options on a link to auto or to fixed on both the ends. If one side of the link is configured to auto and the other side is configured to fixed, the link will not be up and this is expected.

---

**IEEE 802.3x Flow Control**

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

**Note**

The switch ports can receive, but not send, pause frames.

You use the `flowcontrol` interface configuration command to set the interface’s ability to receive pause frames to `on`, `off`, or `desired`. The default state is `off`.

When set to `desired`, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.
These rules apply to flow control settings on the device:

- **receive on** (or **desired**): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.

- **receive off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

Note

For details on the command settings and the resulting flow control resolution on local and remote ports, see the `flowcontrol` interface configuration command in the command reference for this release.

## How to Configure Interface Characteristics

### Configuring Interfaces

These general instructions apply to all interface configuration processes.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface</td>
<td>Identifies the interface type, the switch number (only on stacking-capable switches), and the number of the connector.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)#</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

You do not need to add a space between the interface type and the interface number. For example, in the preceding line, you can specify either `gigabitethernet 1/0/1`, `gigabitethernet1/0/1`, `gi 1/0/1`, or `gi1/0/1`. 
### Adding a Description for an Interface

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Specifies the interface for which you are adding a description, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet 1/0/2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> description string</td>
<td>Adds a description (up to 240 characters) for an interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# description Connects to Marketing</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Range of Interfaces

To configure multiple interfaces with the same configuration parameters, use the `interface range` global configuration command. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface range {port-range</td>
<td>Unnecessary arguments not visible</td>
</tr>
<tr>
<td></td>
<td></td>
<td>macro \macro_name}</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface range macro</td>
<td></td>
</tr>
</tbody>
</table>

You can use the `interface range` command to configure up to five port ranges or a previously defined macro.

- **macro** variable is explained in the Configuring and Using Interface Range Macros, on page 27.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• In a comma-separated <code>port-range</code>, you must enter the interface type for each entry and enter spaces before and after the comma.</td>
<td></td>
</tr>
<tr>
<td>• In a hyphen-separated <code>port-range</code>, you do not need to re-enter the interface type, but you must enter a space before the hyphen.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

Use the normal configuration commands to apply the configuration parameters to all interfaces in the range. Each command is executed as it is entered.

| Step 4 | end | Returns to privileged EXEC mode. |
| Step 5 | `show interfaces [interface-id]` | Verifies the configuration of the interfaces in the range. |
| Step 6 | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |

### Configuring and Using Interface Range Macros

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface range macro** global configuration command string, you must use the **define interface-range** global configuration command to define the macro.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code> Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch&gt; enable</code></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Defines the interface-range macro, and save it in NVRAM.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>- The <code>macro_name</code> is a 32-character maximum character string.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>- A macro can contain up to five comma-separated interface ranges.</td>
</tr>
<tr>
<td><code>define interface-range macro_name interface-range</code></td>
<td>- Each <code>interface-range</code> must consist of the same port type.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Note: Before you can use the <code>macro</code> keyword in the <code>interface range</code> <code>macro</code> global configuration command string, you must use the <code>define interface-range</code> global configuration command to define the macro.</td>
</tr>
<tr>
<td><code>Switch(config)# define interface-range enet_list gigabitethernet 1/0/1 - 2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Selects the interface range to be configured using the values saved in the interface-range macro called <code>macro_name</code>.</td>
</tr>
<tr>
<td><code>interface range macro macro_name</code></td>
<td>You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# interface range macro enet_list</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Shows the defined interface range macro configuration.</td>
</tr>
<tr>
<td>`show running-config</td>
<td>include define`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>`Switch# show running-config</td>
<td>include define`</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring Ethernet Interfaces

Setting the Interface Speed and Duplex Parameters

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Step 1
**enables privileged EXEC mode.**

**Example:**
```
Switch> enable
```

### Step 2
**enters global configuration mode.**

**Example:**
```
Switch# configure terminal
```

### Step 3
**specifies the physical interface to be configured, and enter interface configuration mode.**

**Example:**
```
Switch(config)# interface gigabitethernet 1/0/3
```

### Step 4
**enter the appropriate speed parameter for the interface:**

- Enter **10, 100, 1000 2500, 5000, 10000**, or **10000** to set a specific speed for the interface.
- Enter **auto** to enable the interface to autonegotiate speed with the connected device. If you specify a speed and also set the auto keyword, the port autonegotiates only at the specified speeds.
- The **nonegotiate** keyword is available only for SFP module ports. SFP module ports operate only at 1000 Mb/s but can be configured to not negotiate if connected to a device that does not support autonegotiation.

**Example:**
```
Switch(config-if)# speed 10
```
### Configuring IEEE 802.3x Flow Control

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the physical interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring SVI Autostate Exclude

**Purpose**

- Enables privileged EXEC mode.
- Enters global configuration mode.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

---

**Interface and Hardware**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>interface interface-id</strong></td>
<td>Specifies a Layer 2 interface (physical port or port channel), and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# interface gigabitethernet1/0/2</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 4** | **switchport autostate exclude** | Excludes the access or trunk port when defining the status of an SVI line state (up or down) |
| **Example:** | Switch(config-if)# switchport autostate exclude | |

| **Step 5** | **end** | Returns to privileged EXEC mode. |
| **Example:** | Switch(config-if)# end | |

| **Step 6** | **show running config interface interface-id** | (Optional) Shows the running configuration. Verifies the configuration. |

| **Step 7** | **copy running-config startup-config** | (Optional) Saves your entries in the configuration file. |
| **Example:** | Switch# copy running-config startup-config | |
### Command or Action

Switch# configure terminal

<table>
<thead>
<tr>
<th>Step 3</th>
<th>interface {vlan vlan-id}</th>
<th>{gigabitethernetinterface-id}</th>
<th>{port-channel port-channel-number}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>shutdown</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# shutdown</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>no shutdown</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# no shutdown</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# end</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>show running-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# show running-config</td>
</tr>
</tbody>
</table>

### Configuring the Console Media Type

Follow these steps to set the console media type to RJ-45. If you configure the console as RJ-45, USB console operation is disabled, and input comes only through the RJ-45 connector.

This configuration applies to all switches in a stack.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
## Configuring the USB Inactivity Timeout

The configurable inactivity timeout reactivates the RJ-45 console port if the USB console port is activated but no input activity occurs on it for a specified time period. When the USB console port is deactivated due to a timeout, you can restore its operation by disconnecting and reconnecting the USB cable.

### Configuring the USB Inactivity Timeout

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

### Step 2

configure terminal

**Example:**

Switch# configure terminal

### Step 3

line console 0

**Example:**

Switch(config)# line console 0

### Step 4

media-type rj45

**Example:**

Switch(config-line)# media-type rj45

### Step 5

drop

**Example:**

Switch(config)# drop

### Step 6

copy running-config startup-config

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### Note

The configured inactivity timeout applies to all switches in a stack. However, a timeout on one switch does not cause a timeout on other switches in the stack.
## Monitoring Interface Characteristics

### Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces.

**Table 5: Show Commands for Interfaces**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces interface-number downshift module module-number</code></td>
<td>Displays the downshift status details of the specified interfaces and modules.</td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>show interfaces <em>interface-id</em> status [err-disabled]</td>
<td>Displays interface status or a list of interfaces in the error-disabled state.</td>
</tr>
<tr>
<td>show interfaces [interface-id] switchport</td>
<td>Displays administrative and operational status of switching (nonrouting) ports. You can use this command to find out if a port is in routing or in switching mode.</td>
</tr>
<tr>
<td>show interfaces [interface-id] description</td>
<td>Displays the description configured on an interface or all interfaces and the interface status.</td>
</tr>
<tr>
<td>show ip interface [interface-id]</td>
<td>Displays the usability status of all interfaces configured for IP routing or the specified interface.</td>
</tr>
<tr>
<td>show interface [interface-id] stats</td>
<td>Displays the input and output packets by the switching path for the interface.</td>
</tr>
<tr>
<td>show interfaces interface-id</td>
<td>(Optional) Displays speed and duplex on the interface.</td>
</tr>
<tr>
<td>show interfaces transceiver dom-supported-list</td>
<td>(Optional) Displays Digital Optical Monitoring (DOM) status on the connect SFP modules.</td>
</tr>
<tr>
<td>show interfaces transceiver properties</td>
<td>(Optional) Displays temperature, voltage, or amount of current on the interface.</td>
</tr>
<tr>
<td>show interfaces [interface-id] [transceiver properties</td>
<td>detail] module number</td>
</tr>
<tr>
<td>show running-config interface [interface-id]</td>
<td>Displays the running configuration in RAM for the interface.</td>
</tr>
<tr>
<td>show version</td>
<td>Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images.</td>
</tr>
<tr>
<td>show controllers ethernet-controller interface-id phy</td>
<td>Displays the operational state of the auto-MDIX feature on the interface.</td>
</tr>
</tbody>
</table>

### Clearing and Resetting Interfaces and Counters

**Table 6: Clear Commands for Interfaces**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear counters [interface-id]</td>
<td>Clears interface counters.</td>
</tr>
<tr>
<td>clear interface interface-id</td>
<td>Resets the hardware logic on an interface.</td>
</tr>
<tr>
<td>clear line [number</td>
<td>console 0</td>
</tr>
</tbody>
</table>
The clear counters privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the show interface privileged EXEC command.

Configuration Examples for Interface Characteristics

Configuring a Range of Interfaces: Examples

This example shows how to use the interface range global configuration command to set the speed to 100 Mb/s on ports 1 to 4 on switch 1:

Switch# configure terminal
Switch(config)# interface range gigabitethernet 1/0/1 - 4
Switch(config-if-range)# speed 100

This example shows how to add different interface type strings to the range to enable Gigabit Ethernet ports 1 to 3 and 10-Gigabit Ethernet ports 1 and 2 to receive flow-control pause frames:

Switch# configure terminal
Switch(config)# interface range gigabitethernet1/0/1 - 3 , tengigabitethernet1/1/1 - 2
Switch(config-if-range)# flowcontrol receive on

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

Configuring and Using Interface Range Macros: Examples

This example shows how to define an interface-range named enet_list to include ports 1 and 2 on switch 1 and to verify the macro configuration:

Switch# configure terminal
Switch(config)# define interface-range enet_list gigabitethernet 1/1/1 - 2
Switch(config)# end
Switch# show running-config | include define
define interface-range enet_list gigabitethernet 1/1/1 - 2

This example shows how to create a multiple-interface macro named macro1:

Switch# configure terminal
Switch(config)# define interface-range macro1 gigabitethernet1/1/1 - 2, gigabitethernet1/1/5 - 7, tengigabitethernet1/1/1 -2
Switch(config)# end

This example shows how to enter interface-range configuration mode for the interface-range macro enet_list:
This example shows how to delete the interface-range macro `enet_list` and to verify that it was deleted.

```plaintext
Switch# configure terminal
Switch(config)# no define interface-range enet_list
Switch(config)# end
Switch# show run | include define
```

### Setting Interface Speed and Duplex Mode: Example

This example shows how to set the interface speed to 100 Mb/s and the duplex mode to half on a 10/100/1000 Mb/s port:

```plaintext
Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/3
Switch(config-if)# speed 10
Switch(config-if)# duplex half
```

This example shows how to set the interface speed to 100 Mb/s on a 10/100/1000 Mb/s port:

```plaintext
Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/2
Switch(config-if)# speed 100
```

### Configuring the Console Media Type: Example

This example disables the USB console media type and enables the RJ-45 console media type.

```plaintext
Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# media-type rj45
```

This configuration terminates any active USB console media type in the stack. A log shows that this termination has occurred. This example shows that the console on switch 1 reverted to RJ-45.

```
*Mar 1 00:25:36.860: %USB_CONSOLE-6-CONFIG_DISABLE: Console media-type USB disabled by system configuration, media-type reverted to RJ45.
```

At this point no switches in the stack allow a USB console to have input. A log entry shows when a console cable is attached. If a USB console cable is connected to switch 2, it is prevented from providing input.

```
*Mar 1 00:34:27.498: %USB_CONSOLE-6-CONFIG_DISALLOW: Console media-type USB is disallowed by system configuration, media-type remains RJ45. (switch-stk-2)
```

This example reverses the previous configuration and immediately activates any USB console that is connected.

```plaintext
Switch# configure terminal
```
Switch(config)# line console 0
Switch(config-line)# no media-type rj45

Configuring the USB Inactivity Timeout: Example

This example configures the inactivity timeout to 30 minutes:

Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# usb-inactivity-timeout 30

To disable the configuration, use these commands:

Switch# configure terminal
Switch(config)# line console 0
Switch(config-line)# no usb-inactivity-timeout

If there is no (input) activity on a USB console port for the configured number of minutes, the inactivity timeout setting applies to the RJ-45 port, and a log shows this occurrence:

*Math 1 00:47:25.625: %USB_CONSOLE-6-INACTIVITY_DISABLE: Console media-type USB disabled due to inactivity, media-type reverted to RJ45.

At this point, the only way to reactivate the USB console port is to disconnect and reconnect the cable. When the USB cable on the switch has been disconnected and reconnected, a log similar to this appears:

*Math 1 00:48:28.640: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.

<td>This feature was introduced.</td>
</tr>
</tbody>
</table>

Downshift on mGig interfaces:
When port speed downshifting is enabled on an interface, the line rate automatically downgrades to a lower speed if the link quality is bad or if the link is continuously down. This feature was introduced.
Configuring Auto-MDIX

- Prerequisites for Auto-MDIX, on page 41
- Restrictions for Auto-MDIX, on page 41
- Information about Configuring Auto-MDIX, on page 41
- How to Configure Auto-MDIX, on page 42
- Example for Configuring Auto-MDIX, on page 43
- Additional References, on page 43
- Feature History and Information for Auto-MDIX, on page 44

Prerequisites for Auto-MDIX

Automatic medium-dependent interface crossover (auto-MDIX) is enabled by default. Auto-MDIX is supported on all 10/100/1000-Mb/s and on 10/100/1000BASE-TX small form-factor pluggable (SFP)-module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

Restrictions for Auto-MDIX

The switch might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the switch through a crossover cable. This is regardless of whether auto-MIDX is enabled on the switch port.

Information about Configuring Auto-MDIX

Auto-MDIX on an Interface

When automatic medium-dependent interface crossover (auto-MDIX) is enabled on an interface, the interface automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting switches without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other switches or repeaters. With auto-MDIX enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.
This table shows the link states that result from auto-MDIX settings and correct and incorrect cabling.

### How to Configure Auto-MDIX

#### Configuring Auto-MDIX on an Interface

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable  
Example:  
Switch> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Step 2 | configure terminal  
Example:  
Switch# configure terminal | Enters global configuration mode |
| Step 3 | interface interface-id  
Example:  
Switch(config)# interface gigabitethernet 1/0/1 | Specifies the physical interface to be configured, and enter interface configuration mode. |
| Step 4 | speed auto  
Example:  
Switch(config-if)# speed auto | Configures the interface to autonegotiate speed with the connected device. |
| Step 5 | duplex auto  
Example: | Configures the interface to autonegotiate duplex mode with the connected device. |
### Command or Action

**Switch(config-if)#** duplex auto

### Purpose

*Optional* Saves your entries in the configuration file.

### Example for Configuring Auto-MDIX

This example shows how to enable auto-MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# speed auto
Switch(config-if)# duplex auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

CHAPTER 4

Configuring Ethernet Management Port

• Finding Feature Information, on page 45
• Prerequisites for Ethernet Management Ports, on page 45
• Information about the Ethernet Management Port, on page 45
• How to Configure the Ethernet Management Port, on page 47
• Additional References, on page 48
• Feature Information for Ethernet Management Ports, on page 49

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Ethernet Management Ports

When connecting a PC to the Ethernet management port, you must first assign an IP address.

Information about the Ethernet Management Port

The Ethernet management port, also referred to as the Fa0 or fastethernet0 port, is a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management. When managing a switch stack, connect the PC to the Ethernet management port on a stack member.
Ethernet Management Port Direct Connection to a Switch

This figure displays how to connect the Ethernet management port to the PC for a switch or a standalone switch.

Ethernet Management Port Connection to Stack Switches using a Hub

In a stack with only stack switches, all the Ethernet management ports on the stack members are connected to a hub to which the PC is connected. The active link is from the Ethernet management port on the stack master through the hub, to the PC. If the active switch fails and a new active switch is elected, the active link is now from the Ethernet management port on the new active switch to the PC.

Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup (only in switch stacks)
- Network Assistant
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SMNP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
• Speed—10 Mb/s, 100 Mb/s, and autonegotiation
• Duplex mode—Full, half, and autonegotiation
• Loopback detection

• Cisco Discovery Protocol (CDP)
• DHCP relay agent
• IPv4 access control lists (ACLs)

Caution
Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the switch might fail.

How to Configure the Ethernet Management Port

Disabling and Enabling the Ethernet Management Port

Configuring LLDP, LLDP-MED, and Wired Location Service

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

LLDP, LLDP-MED, and Wired Location Service Overview

LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, switches, and controllers). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol
runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

LLDP Supported TLVs

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

LLDP and Cisco Switch Stacks

A switch stack appears as a single switch in the network. Therefore, LLDP discovers the switch stack, not the individual stack members.

LLDP and Cisco Medianet

When you configure LLDP or CDP location information on a per-port basis, remote devices can send Cisco Medianet location information to the switch. For information, go to http://www.cisco.com/en/US/docs/ios/netmgmt/configuration/guide/nm_cdp_discover.html.

LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management and location information. By default, all LLDP-MED TLVs are enabled.

LLDP-MED Supported TLVs

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV
  Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and has enabled.
- Network policy TLV
Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect to any switch, obtain its VLAN number, and then start communicating with the call control.

By defining a network-policy profile TLV, you can create a profile for voice and voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

• Power management TLV

Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows switches and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

LLDP-MED also supports an extended power TLV to advertise fine-grained power requirements, end-point power priority, and end-point and network connectivity-device power status. LLDP is enabled and power is applied to a port, the power TLV determines the actual power requirement of the endpoint device so that the system power budget can be adjusted accordingly. The switch processes the requests and either grants or denies power based on the current power budget. If the request is granted, the switch updates the power budget. If the request is denied, the switch turns off power to the port, generates a syslog message, and updates the power budget. If LLDP-MED is disabled or if the endpoint does not support the LLDP-MED power TLV, the initial allocation value is used throughout the duration of the connection.

You can change power settings by entering the power inline {auto [max max-wattage] | never | static [max max-wattage]} interface configuration command. By default the PoE interface is in auto mode; If no value is specified, the maximum is allowed (30 W).

• Inventory management TLV

Allows an endpoint to send detailed inventory information about itself to the switch, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

• Location TLV

Provides location information from the switch to the endpoint device. The location TLV can send this information:

  • Civic location information

    Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

  • ELIN location information

    Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

### Wired Location Service

The switch uses the location service feature to send location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint,
a wired endpoint, or a wired switch or controller. The switch notifies the MSE of device link up and link down events through the Network Mobility Services Protocol (NMSP) location and attachment notifications.

The MSE starts the NMSP connection to the switch, which opens a server port. When the MSE connects to the switch there are a set of message exchanges to establish version compatibility and service exchange information followed by location information synchronization. After connection, the switch periodically sends location and attachment notifications to the MSE. Any link up or link down events detected during an interval are aggregated and sent at the end of the interval.

When the switch determines the presence or absence of a device on a link-up or link-down event, it obtains the client-specific information such as the MAC address, IP address, and username. If the client is LLDP-MED- or CDP-capable, the switch obtains the serial number and UDI through the LLDP-MED location TLV or CDP.

Depending on the device capabilities, the switch obtains this client information at link up:

- Slot and port specified in port connection
- MAC address specified in the client MAC address
- IP address specified in port connection
- 802.1X username if applicable
- Device category is specified as a wired station
- State is specified as new
- Serial number, UDI
- Model number
- Time in seconds since the switch detected the association

Depending on the device capabilities, the switch obtains this client information at link down:

- Slot and port that was disconnected
- MAC address
- IP address
- 802.1X username if applicable
- Device category is specified as a wired station
- State is specified as delete
- Serial number, UDI
- Time in seconds since the switch detected the disassociation

When the switch shuts down, it sends an attachment notification with the state delete and the IP address before closing the NMSP connection to the MSE. The MSE interprets this notification as disassociation for all the wired clients associated with the switch.

If you change a location address on the switch, the switch sends an NMSP location notification message that identifies the affected ports and the changed address information.
Default LLDP Configuration

Table 8: Default LLDP Configuration

<table>
<thead>
<tr>
<th>Feature</th>

</tr>
<tr>
<td>LLDP med-tlv-select</td>
<td>Disabled to send all LLDP-MED TLVs. When LLDP is globally enabled, LLDP-MED-TLV is also enabled.</td>
</tr>
</tbody>
</table>

Restrictions for LLDP

• If the interface is configured as a tunnel port, LLDP is automatically disabled.

• If you first configure a network-policy profile on an interface, you cannot apply the `switchport voice vlan` command on the interface. If the `switchport voice vlan vlan-id` is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.

• You cannot configure static secure MAC addresses on an interface that has a network-policy profile.

How to Configure LLDP, LLDP-MED, and Wired Location Service

</tbody>
</table>
# Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to send and receive.

Steps 3 through 6 are optional and can be performed in any order.

## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
Example:  
Switch> enable |
| Step 2 | configure terminal | Enters global configuration mode.  
Example:  
Switch# configure terminal |
| Step 3 | lldp holdtime seconds | (Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.  
The range is 0 to 65535 seconds; the default is 120 seconds.  
Example:  
Switch(config)# lldp holdtime 120 |
| Step 4 | lldp reinit delay | (Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.  
The range is 2 to 5 seconds; the default is 2 seconds.  
Example:  
Switch(config)# lldp reinit 2 |
| Step 5 | lldp timer rate | (Optional) Sets the sending frequency of LLDP updates in seconds.  
The range is 5 to 65534 seconds; the default is 30 seconds.  
Example:  
Switch(config)# lldp timer 30 |
| Step 6 | lldp tlv-select | (Optional) Specifies the LLDP TLVs to send or receive.  
Example:  
Switch(config)# tlv-select |
## Configuring LLDP-MED TLVs

By default, the switch only sends LLDP packets until it receives LLDP-MED packets from the end device. It then sends LLDP packets with MED TLVs, as well. When the LLDP-MED entry has been aged out, it again only sends LLDP packets.

By using the `lldp` interface configuration command, you can configure the interface not to send the TLVs listed in the following table.

### Table 9: LLDP-MED TLVs

<table>
<thead>
<tr>
<th>LLDP-MED TLV</th>

<td>LLDP-MED location TLV</td>
</tr>
</tbody>
</table>

---

### Command or Action

**Step 7**

**interface interface-id**

**Example:**

Switch (config)# interface gigabitethernet 2/0/1

- **Purpose:** Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.

**Step 8**

**lldp med-tlv-select**

**Example:**

Switch (config-if)# lldp med-tlv-select inventory management

- **Purpose:** (Optional) Specifies the LLDP-MED TLVs to send or receive.

**Step 9**

**end**

**Example:**

Switch (config-if)# end

- **Purpose:** Returns to privileged EXEC mode.

**Step 10**

**show lldp**

**Example:**

Switch# show lldp

- **Purpose:** Verifies the configuration.

**Step 11**

**copy running-config startup-config**

**Example:**

Switch# copy running-config startup-config

- **Purpose:** (Optional) Saves your entries in the configuration file.
LLDP-MED TLV | Description
---|---
network-policy | LLDP-MED network policy TLV
power-management | LLDP-MED power management TLV

Follow these steps to enable a TLV on an interface:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example: Switch (config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> lldp med-tlv-select</td>
<td>Specifies the TLV to enable.</td>
</tr>
<tr>
<td>Example: Switch (config-if)# lldp med-tlv-select inventory management</td>

## Configuring Network-Policy TLV

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>network-policy profile profile number</td>
<td>Specifies the network-policy profile number, and enter network-policy configuration mode. The range is 1 to 4294967295.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# network-policy profile 1</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>{voice</td>
<td>voice-signaling} vlan [vlan-id {cos cvalue</td>
</tr>
<tr>
<td>Example:</td>
<td>{dot1p {cos cvalue</td>
<td>dscp dvalue}]</td>
</tr>
<tr>
<td>Example:</td>
<td>none</td>
<td>- voice-signaling—Specifies the voice-signaling application type.</td>
</tr>
<tr>
<td>Example:</td>
<td>untagged</td>
<td>- vlan—Specifies the native VLAN for voice traffic.</td>
</tr>
<tr>
<td>Example:</td>
<td>vlan 100 cos 4</td>
<td>- vlan-id—(Optional) Specifies the VLAN for voice traffic. The range is 1 to 4094.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>- cos cvalue—(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>- dscp dvalue—(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>- dot1p—(Optional) Configures the telephone to use IEEE 802.1p priority tagging and use VLAN 0 (the native VLAN).</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---

- **none**—(Optional) Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.
- **untagged**—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.
- **untagged**—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.

**Step 5**

`exit`  
**Example:**

```
Switch(config)# exit
```

Returns to global configuration mode.

**Step 6**

`interface interface-id`  
**Example:**

```
Switch (config)# interface gigabitethernet 2/0/1
```

Specifies the interface on which you are configuring a network-policy profile, and enter interface configuration mode.

**Step 7**

`network-policy profile number`  
**Example:**

```
Switch(config-if)# network-policy 1
```

Specifies the network-policy profile number.

**Step 8**

`lldp med-tlv-select network-policy`  
**Example:**

```
Switch(config-if)# lldp med-tlv-select network-policy
```

Specifies the network-policy TLV.

**Step 9**

`end`  
**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 10**

`show network-policy profile`  
**Example:**

```
Switch# show network-policy profile
```

Verifies the configuration.
Configuring Location TLV and Wired Location Service

Beginning in privileged EXEC mode, follow these steps to configure location information for an endpoint and to apply it to an interface.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | |
| location {admin-tag string | civic-location identifier {id | host} | elin-location string identifier id | custom-location identifier {id | host} | geo-location identifier {id | host} } | Specifies the location information for an endpoint. |
| Example: | |
| Switch(config)# location civic-location identifier 1 | |
| Switch(config-civic)# number 3550 | |
| Switch(config-civic)# primary-road-name "Cisco Way" | |
| Switch(config-civic)# city "San Jose" | |
| Switch(config-civic)# state CA | |
| Switch(config-civic)# building 19 | |
| Switch(config-civic)# room C6 | |
| Switch(config-civic)# county "Santa Clara" | |
| Switch(config-civic)# country US | |

<p>| <strong>Step 3</strong> | |
| exit | Returns to global configuration mode. |
| Example: | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-civic)# exit</td>
<td>Specifies the interface on which you are configuring the location information, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>

Step 4  
**interface interface-id**  
**Example:**  
`Switch (config)# interface gigabitethernet2/0/1`

Step 5  
location \{additional-location-information word | civic-location-id \{id | host\} | elin-location-id id | custom-location-id \{id | host\} | geo-location-id \{id | host\} \}

**Example:**  
`Switch(config-if)# location elin-location-id 1`

Step 6  
**end**  
**Example:**  
`Switch(config-if)# end`

Step 7  
Use one of the following:  
- show location admin-tag string  
- show location civic-location identifier id  
- show location elin-location identifier id  

**Example:**  
Verifies the configuration.
### Enabling Wired Location Service on the Switch

#### Before you begin

For wired location to function, you must first enter the `ip device tracking` global configuration command.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>`nmsp notification interval {attachment</td>
<td>location} interval-seconds`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# nmsp notification</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuration Examples for LLDP, LLDP-MED, and Wired Location Service

#### Configuring Network-Policy TLV: Examples

This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```
Switch# configure terminal
Switch(config)# network-policy 1
Switch(config-network-policy)# voice vlan 100 cos 4
Switch(config-network-policy)# exit
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# network-policy profile 1
Switch(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Switch(config-network-policy)# voice vlan dot1p cos 4
Switch(config-network-policy)# voice vlan dot1p dscp 34
```
## Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service

Commands for monitoring and maintaining LLDP, LLDP-MED, and wired location service.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear lldp counters</td>
<td>Resets the traffic counters to zero.</td>
</tr>
<tr>
<td>clear lldp table</td>
<td>Deletes the LLDP neighbor information table.</td>
</tr>
<tr>
<td>clear nmsp statistics</td>
<td>Clears the NMSp statistic counters.</td>
</tr>
<tr>
<td>show lldp</td>
<td>Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface.</td>
</tr>
<tr>
<td>show lldp entry entry-name</td>
<td>Displays information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.</td>
</tr>
<tr>
<td>show lldp interface [interface-id]</td>
<td>Displays information about interfaces with LLDP enabled. You can limit the display to a specific interface.</td>
</tr>
<tr>
<td>show lldp neighbors [interface-id] [detail]</td>
<td>Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID. You can limit the display to neighbors of a specific interface or expand the display for more detailed information.</td>
</tr>
<tr>
<td>show lldp traffic</td>
<td>Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.</td>
</tr>
<tr>
<td>show location admin-tag string</td>
<td>Displays the location information for the specified administrative tag or site.</td>
</tr>
<tr>
<td>show location civic-location identifier id</td>
<td>Displays the location information for a specific global civic location.</td>
</tr>
<tr>
<td>show location clin-location identifier id</td>
<td>Displays the location information for an emergency location</td>
</tr>
<tr>
<td>show network-policy profile</td>
<td>Displays the configured network-policy profiles.</td>
</tr>
<tr>
<td>show nmsp</td>
<td>Displays the NMSp information</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Configuring System MTU

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About the MTU

The default maximum transmission unit (MTU) size for frames received and transmitted on all interfaces is 1500 bytes. You can increase the MTU size for all interfaces operating at 10 or 100 Mb/s by using the `system mtu` global configuration command. You can increase the MTU size to support jumbo frames on all Gigabit Ethernet interfaces by using the `system mtu jumbo` global configuration command.

Note

The switch supports jumbo frames at CPU.

System MTU Guidelines

When configuring the system MTU values, follow these guidelines:
The default maximum transmission unit (MTU) size for frames received and transmitted on all interfaces is 1500 bytes. You can increase the MTU size for all interfaces operating at 10 or 100 Mb/s by using the `system mtu` global configuration command. You can increase the MTU size to support jumbo frames on all Gigabit Ethernet interfaces by using the `system mtu jumbo` global configuration command.

- Gigabit Ethernet ports are not affected by the `system mtu` command; 10/100 ports are not affected by the `system mtu jumbo` command. If you do not configure the `system mtu jumbo` command, the setting of the `system mtu` command applies to all Gigabit Ethernet interfaces.

### How to Configure MTU

#### Configuring the System MTU

Beginning in privileged EXEC mode, follow these steps to change the MTU size for all 10/100 or Gigabit Ethernet interfaces:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>system mtu</code> <code>bytes</code></td>
<td>(Optional) Change the MTU size for all interfaces on the switch stack that are operating at 10 or 100 Mb/s. The range is 1500 to 1998 bytes; the default is 1500 bytes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>system mtu 2500</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>system mtu jumbo</code> <code>bytes</code></td>
<td>(Optional) Changes the MTU size for all Gigabit Ethernet interfaces on the switch or the switch stack. The range is 1500 to 9198 bytes; the default is 1500 bytes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>system mtu jumbo7500</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>copy running-config startup-config</code></td>
<td>Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
**Configuration Examples for System MTU**

This example shows how to set the maximum packet size for a Gigabit Ethernet port to 7500 bytes:

```bash
Switch(config)# system mtu 7500
Switch(config)# system mtu jumbo 7500
Switch(config)# exit
```

If you enter a value that is outside the allowed range for the specific type of interface, the value is not accepted. This example shows the response when you try to set Gigabit Ethernet interfaces to an out-of-range number:

```bash
Switch(config)# system mtu jumbo 25000
```

% Invalid input detected at '^' marker.

CHAPTER 7

Configuring Boot Fast

- Finding Feature Information, on page 73
- Configuring Boot Fast on the switch, on page 73

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Boot Fast on the switch

This feature, when enabled, helps the switch to boot up fast. The Memory test is performed for a limited range, the switch skips File system check (FSCK) and skips Post test.

Note

When Fast boot is enabled, you can still run the POST tests manually from the command line interface, once the switch has booted up, using diagnostic start command.

Enabling Boot Fast

To enable the boot fast feature, perform the following steps:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
Disabling Boot Fast

To disable the boot fast feature, perform the following steps:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable   
  Example:  
  Switch> enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Step 2**
  configure terminal   
  Example:  
  Switch# configure terminal | Enters global configuration mode. |
| **Step 3**
  no boot fast   
  Example:  
  Switch(config)# no boot fast | Disables the boot fast feature. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Disabling Boot Fast
CHAPTER 8

Configuring PoE

• Finding Feature Information, on page 77
• Restrictions for PoE, on page 77
• Information about PoE, on page 77
• How to Configure PoE, on page 83
• Monitoring Power Status, on page 90
• Configuration Examples for Configuring PoE, on page 90
• Additional References, on page 91

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for PoE

Note

This feature is supported only on the LAN Base image.

Information about PoE

Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the switch senses that there is no power on the circuit:
• a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
• an IEEE 802.3af-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

Supported Protocols and Standards

The switch uses these protocols and standards to support PoE:

• CDP with power consumption—The powered device notifies the switch of the amount of power it is consuming. The switch does not reply to the power-consumption messages. The switch can only supply power to or remove power from the PoE port.

• Cisco intelligent power management—The powered device and the switch negotiate through power-negotiation CDP messages for an agreed-upon power-consumption level. The negotiation allows a high-power Cisco powered device, which consumes more than 7 W, to operate at its highest power mode. The powered device first boots up in low-power mode, consumes less than 7 W, and negotiates to obtain enough power to operate in high-power mode. The device changes to high-power mode only when it receives confirmation from the switch.

High-power devices can operate in low-power mode on switches that do not support power-negotiation CDP.

Cisco intelligent power management is backward-compatible with CDP with power consumption; the switch responds according to the CDP message that it receives. CDP is not supported on third-party powered devices; therefore, the switch uses the IEEE classification to determine the power usage of the device.

• IEEE 802.3af—The major features of this standard are powered-device discovery, power administration, disconnect detection, and optional powered-device power classification. For more information, see the standard.

Powered-Device Detection and Initial Power Allocation

The switch detects a Cisco pre-standard or an IEEE-compliant powered device when the PoE-capable port is in the no-shutdown state, PoE is enabled (the default), and the connected device is not being powered by an AC adaptor.

After device detection, the switch determines the device power requirements based on its type:

• The initial power allocation is the maximum amount of power that a powered device requires. The switch initially allocates this amount of power when it detects and powers the powered device. As the switch receives CDP messages from the powered device and as the powered device negotiates power levels with the switch through CDP power-negotiation messages, the initial power allocation might be adjusted.

• The switch classifies the detected IEEE device within a power consumption class. Based on the available power in the power budget, the switch determines if a port can be powered. Table 10: IEEE Power Classifications, on page 79 lists these levels.
Table 10: IEEE Power Classifications

<table>
<thead>
<tr>
<th>Class</th>
<th>Maximum Power Level Required from the Switch</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (class status unknown)</td>
<td>15.4 W</td>
</tr>
<tr>
<td>1</td>
<td>4 W</td>
</tr>
<tr>
<td>2</td>
<td>7 W</td>
</tr>
<tr>
<td>3</td>
<td>15.4 W</td>
</tr>
<tr>
<td>4</td>
<td>30 W (For IEEE 802.3at Type 2 powered devices)</td>
</tr>
</tbody>
</table>

The switch monitors and tracks requests for power and grants power only when it is available. The switch tracks its power budget (the amount of power available on the switch for PoE). The switch performs power-accounting calculations when a port is granted or denied power to keep the power budget up to date.

After power is applied to the port, the switch uses CDP to determine the CDP-specific power consumption requirement of the connected Cisco powered devices, which is the amount of power to allocate based on the CDP messages. The switch adjusts the power budget accordingly. This does not apply to third-party PoE devices. The switch processes a request and either grants or denies power. If the request is granted, the switch updates the power budget. If the request is denied, the switch ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. Powered devices can also negotiate with the switch for more power.

With PoE+, powered devices use IEEE 802.3at and LLDP power with media dependent interface (MDI) type, length, and value descriptions (TLVs), Power-via-MDI TLVs, for negotiating power up to 30 W. Cisco pre-standard devices and Cisco IEEE powered devices can use CDP or the IEEE 802.3at power-via-MDI power negotiation mechanism to request power levels up to 30 W.

Note

The initial allocation for Class 0, Class 3, and Class 4 powered devices is 15.4 W. When a device starts up and uses CDP or LLDP to send a request for more than 15.4 W, it can be allocated up to the maximum of 30 W.

Note

The CDP-specific power consumption requirement is referred to as the actual power consumption requirement in the software configuration guides and command references.

If the switch detects a fault caused by an undervoltage, overvoltage, overtemperature, oscillator-fault, or short-circuit condition, it turns off power to the port, generates a syslog message, and updates the power budget and LEDs.

The PoE feature operates the same whether or not the switch is a stack member. The power budget is per switch and independent of any other switch in the stack. Election of a new active switch does not affect PoE operation. The active switch keeps track of the PoE status for all switches and ports in the stack and includes the status in output displays.

Power Management Modes

The switch supports these PoE modes:
• **auto**—The switch automatically detects if the connected device requires power. If the switch discovers a powered device connected to the port and if the switch has enough power, it grants power, updates the power budget, turns on power to the port on a first-come, first-served basis, and updates the LEDs. For LED information, see the hardware installation guide.

If the switch has enough power for all the powered devices, they all come up. If enough power is available for all powered devices connected to the switch, power is turned on to all devices. If there is not enough available PoE, or if a device is disconnected and reconnected while other devices are waiting for power, it cannot be determined which devices are granted or are denied power.

If granting power would exceed the system power budget, the switch denies power, ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. After power has been denied, the switch periodically rechecks the power budget and continues to attempt to grant the request for power.

If a device being powered by the switch is then connected to wall power, the switch might continue to power the device. The switch might continue to report that it is still powering the device whether the device is being powered by the switch or receiving power from an AC power source.

If a powered device is removed, the switch automatically detects the disconnect and removes power from the port. You can connect a nonpowered device without damaging it.

You can specify the maximum wattage that is allowed on the port. If the IEEE class maximum wattage of the powered device is greater than the configured maximum value, the switch does not provide power to the port. If the switch powers a powered device, but the powered device later requests through CDP messages more than the configured maximum value, the switch removes power to the port. The power that was allocated to the powered device is reclaimed into the global power budget. If you do not specify a wattage, the switch delivers the maximum value. Use the **auto** setting on any PoE port. The auto mode is the default setting.

• **static**—The switch pre-allocates power to the port (even when no powered device is connected) and guarantees that power will be available for the port. The switch allocates the port configured maximum wattage, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed to be powered when it is connected to the static port. The port no longer participates in the first-come, first-served model.

However, if the powered-device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device is consuming more than the maximum wattage, the switch shuts down the powered device.

If you do not specify a wattage, the switch pre-allocates the maximum value. The switch powers the port only if it discovers a powered device. Use the **static** setting on a high-priority interface.

• **never**—The switch disables powered-device detection and never powers the PoE port even if an unpowered device is connected. Use this mode only when you want to make sure that power is never applied to a PoE-capable port, making the port a data-only port.

For most situations, the default configuration (auto mode) works well, providing plug-and-play operation. No further configuration is required. However, perform this task to configure a PoE port for a higher priority, to make it data only, or to specify a maximum wattage to disallow high-power powered devices on a port.

---

**Note**

If static power is configured for a port, do not configure 2-event classification. These two configurations will conflict with each other.
Power Monitoring and Power Policing

When policing of the real-time power consumption is enabled, the switch takes action when a powered device consumes more power than the maximum amount allocated, also referred to as the cutoff-power value.

When PoE is enabled, the switch senses the real-time power consumption of the powered device. The switch monitors the real-time power consumption of the connected powered device; this is called power monitoring or power sensing. The switch also polices the power usage with the power policing feature.

Power monitoring is backward-compatible with Cisco intelligent power management and CDP-based power consumption. It works with these features to ensure that the PoE port can supply power to the powered device.

The switch senses the real-time power consumption of the connected device as follows:

1. The switch monitors the real-time power consumption on individual ports.
2. The switch records the power consumption, including peak power usage. The switch reports the information through the CISCO-POWER-ETHERNET-EXT-MIB.
3. If power policing is enabled, the switch polices power usage by comparing the real-time power consumption to the maximum power allocated to the device. The maximum power consumption is also referred to as the cutoff power on a PoE port.

   If the device uses more than the maximum power allocation on the port, the switch can either turn off power to the port, or the switch can generate a syslog message and update the LEDs (the port LED is now blinking amber) while still providing power to the device based on the switch configuration. By default, power-usage policing is disabled on all PoE ports.

   If error recovery from the PoE error-disabled state is enabled, the switch automatically takes the PoE port out of the error-disabled state after the specified amount of time.

   If error recovery is disabled, you can manually re-enable the PoE port by using the shutdown and no shutdown interface configuration commands.

4. If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the PoE port, which could adversely affect the switch.

Maximum Power Allocation (Cutoff Power) on a PoE Port

When power policing is enabled, the switch determines one of the these values as the cutoff power on the PoE port in this order:

1. Manually when you set the user-defined power level that the switch budgets for the port by using the power inline consumption default wattage global or interface configuration command
2. Manually when you set the user-defined power level that limits the power allowed on the port by using the power inline auto max max-wattage or the power inline static max max-wattage interface configuration command
3. Automatically when the switch sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLDP power negotiation.

Use the first or second method in the previous list to manually configure the cutoff-power value by entering the power inline consumption default wattage or the power inline [auto | static max] max-wattage command.

You should use power inline consumption default wattage command to manually set the power level for a port only in situations where CDP/LLDP power negotiations are not supported.
If you do not manually configure the cutoff-power value, the switch automatically determines it by using CDP power negotiation or the device IEEE classification and LLDP power negotiation. If CDP or LLDP are not enabled, the default value of 30 W is applied. However without CDP or LLDP, the switch does not allow devices to consume more than 15.4 W of power because values from 15400 to 30000 mW are only allocated based on CDP or LLDP requests. If a powered device consumes more than 15.4 W without CDP or LLDP negotiation, the device might be in violation of the maximum current ($I_{max}$) limitation and might experience an I_cut fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the switch locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the switch is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the switch has locked on it, the switch does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

**Note**

Power Consumption Values

You can configure the initial power allocation and the maximum power allocation on a port. However, these values are only the configured values that determine when the switch should turn on or turn off power on the PoE port. The maximum power allocation is not the same as the actual power consumption of the powered device. The actual cutoff power value that the switch uses for power policing is not equal to the configured power value.

When power policing is enabled, the switch polices the power usage at the switch port, which is greater than the power consumption of the device. When you are manually set the maximum power allocation, you must consider the power loss over the cable from the switch port to the powered device. The cutoff power is the sum of the rated power consumption of the powered device and the worst-case power loss over the cable.

We recommend that you enable power policing when PoE is enabled on your switch. For example, if policing is disabled and you set the cutoff-power value by using the `power inline auto max 6300` interface configuration command, the configured maximum power allocation on the PoE port is 6.3 W (6300 mW). The switch provides power to the connected devices on the port if the device needs up to 6.3 W. If the CDP-power negotiated value or the IEEE classification value exceeds the configured cutoff value, the switch does not provide power to the connected device. After the switch turns on power on the PoE port, the switch does not police the real-time power consumption of the device, and the device can consume more power than the maximum allocated amount, which could adversely affect the switch and the devices connected to the other PoE ports.

Because the switch supports internal power supplies and the Cisco Redundant Power System 2300 (also referred to as the RPS 2300), the total amount of power available for the powered devices varies depending on the power supply configuration.
# How to Configure PoE

## Configuring a Power Management Mode on a PoE Port

> **Note**
>
> When you make PoE configuration changes, the port being configured drops power. Depending on the new configuration, the state of the other PoE ports, and the state of the power budget, the port might not be powered up again. For example, port 1 is in the auto and on state, and you configure it for static mode. The switch removes power from port 1, detects the powered device, and repowers the port. If port 1 is in the auto and on state and you configure it with a maximum wattage of 10 W, the switch removes power from the port and then redetects the powered device. The switch repowers the port only if the powered device is a class 1, class 2, or a Cisco-only powered device.

## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
<td>Specifies the physical port to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>power inline {auto [max max-wattage]</td>
<td>never</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# power inline auto</td>
<td>• auto—Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. This is the default setting.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• max max-wattage—Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• never—Disables device detection, and disable power to the port.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> If a port has a Cisco powered device connected to it, do not use the <code>power inline never</code> command to configure the port. A false link-up can occur, placing the port into the error-disabled state.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• <strong>static</strong>—Enables powered-device detection. Pre-allocate (reserve) power for a port before the switch discovers the powered device. The switch reserves power for this port even when no device is connected and guarantees that power will be provided upon device detection.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>The switch allocates power to a port configured in static mode before it allocates power to a port configured in auto mode.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**  
*end*  
**Example:**  
`Switch(config-if)# end`  
Returns to privileged EXEC mode.  

**Step 6**  
*show power inline [interface-id | module switch-number]*  
**Example:**  
`Switch# show power inline`  
Displays PoE status for a switch or a switch stack, for the specified interface, or for a specified stack member..  
The **module switch-number** keywords are supported only on stacking-capable switches.  

**Step 7**  
*copy running-config startup-config*  
**Example:**  
`Switch# copy running-config startup-config`  
(Optional) Saves your entries in the configuration file.  

**Fast POE**

**Fast PoE** - This feature remembers the last power drawn from a particular PSE port and switches on power the moment AC power is plugged in (within 15 to 20 seconds of switching on power) without waiting for IOS to boot up. When `poe-ha` is enabled on a particular port, the switch on a recovery after power failure, provides power to the connected endpoint devices within short duration before even the IOS forwarding starts up.  
This feature can be configured by the command `poe-ha`. If the user replaces the power device connected to a port when the switch is powered off, then this new device will get the power which the previous device was drawing.
Configuring Fast POE

To configure Fast POE, perform the following steps:

**Note**

You will need to configure the `poe-ha` command before connecting the PD, or you will need to manually shut/unshut the port after configuring `poe-ha`.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

Budgeting Power for Devices Connected to a PoE Port

When Cisco powered devices are connected to PoE ports, the switch uses Cisco Discovery Protocol (CDP) to determine the protocol-specific power consumption of the devices, and the switch adjusts the power budget accordingly. This does not apply to IEEE third-party powered devices. For these devices, when the switch grants a power request, the switch adjusts the power budget according to the powered-device IEEE classification.
If the powered device is a class 0 (class status unknown) or a class 3, the switch budgets 15,400 mW for the device, regardless of the CDP-specific amount of power needed. If the powered device reports a higher class than its CDP-specific consumption or does not support power classification (defaults to class 0), the switch can power fewer devices because it uses the IEEE class information to track the global power budget.

By using the `power inline consumption wattage` interface configuration command or the `power inline consumption default wattage` global configuration command, you can override the default power requirement specified by the IEEE classification. The difference between what is mandated by the IEEE classification and what is actually needed by the device is reclaimed into the global power budget for use by additional devices. You can then extend the switch power budget and use it more effectively.

---

**Caution**

You should carefully plan your switch power budget, enable the power monitoring feature, and make certain not to oversubscribe the power supply.

---

**Note**

When you manually configure the power budget, you must also consider the power loss over the cable between the switch and the powered device.

---

## Budgeting Power to All PoE ports

<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> power inline consumption wattage</td>
<td>Configures the power consumption of a powered device connected to a PoE port on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td>The range for each device is 4000 to 30000 mW (PoE+). The default is 30000 mW (PoE+).</td>
</tr>
<tr>
<td>Switch(config-if)# power inline consumption 5000</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Power Policing

By default, the switch monitors the real-time power consumption of connected powered devices. You can configure the switch to police the power usage. By default, policing is disabled.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
<td>Specifies the physical port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>power inline police [action {log</td>
<td>errdisable}]</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# power inline police</td>
<td>• <strong>power inline police</strong>—Shuts down the PoE port, turns off power to it, and puts it in the error-disabled state.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>exit</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# exit</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Enables error recovery from the PoE error-disabled state, and configures the PoE recover mechanism variables.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# errdisable detect cause inline-power</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# errdisable recovery cause inline-power</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# errdisable recovery interval interval 100</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# exit</td>
</tr>
</tbody>
</table>

### Note

You can enable error detection for the PoE error-disabled cause by using the **errdisable detect cause inline-power** global configuration command. You can also enable the timer to recover from the PoE error-disabled state by using the **errdisable recovery cause inline-power interval interval** global configuration command.

- **power inline police action**
  - **errdisable**—Turns off power to the port if the real-time power consumption exceeds the maximum power allocation on the port.

- **power inline police action**
  - **log**—Generates a syslog message while still providing power to the port.

If you do not enter the **action log** keywords, the default action shuts down the port and puts the port in the error-disabled state.
### Monitoring Power Status

**Table 11: Show Commands for Power Status**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show env power switch [switch-number]</code></td>
<td>(Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch. The range is 1 to , depending on the switch member numbers in the stack. These keywords are available only on stacking-capable switches.</td>
</tr>
<tr>
<td>`show power inline [interface-id</td>
<td>module switch-number]`</td>
</tr>
<tr>
<td><code>show power inline police</code></td>
<td>Displays the power policing data.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Configuring PoE

#### Budgeting Power: Example

When you enter one of the following commands,

- [no] `power inline consumption default wattage` global configuration command
- [no] `power inline consumption wattage` interface configuration command
this caution message appears:

%CAUTION: Interface Gi1/0/1: Misconfiguring the 'power inline consumption/ allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. It is recommended to enable power policing if the switch supports it. Refer to documentation.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about 2-event Classification

When a class 4 device gets detected, IOS allocates 30W without any CDP or LLDP negotiation. This means that even before the link comes up the class 4 power device gets 30W.

Also, on the hardware level the PSE does a 2-event classification which allows a class 4 PD to detect PSE capability of providing 30W from hardware, register itself and it can move up to PoE+ level without waiting for any CDP/LLDP packet exchange.

Once 2-event is enabled on a port, you need to manually shut/un-shut the port or connect the PD again to start the IEEE detection again. Power budget allocation for a class-4 device will be 30W if 2-event classification is enabled on the port, else it will be 15.4W.

Configuring 2-event Classification

To configure the switch for a 2-event Classification, perform the steps given below:
**Procedure**

<table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for EEE

EEE has the following restrictions:

• Changing the EEE configuration resets the interface because the device has to restart Layer 1 autonegotiation.

• You might want to enable the Link Layer Discovery Protocol (LLDP) for devices that require longer wakeup times before they are able to accept data on their receive paths. Doing so enables the device to negotiate for extended system wakeup times from the transmitting link partner.
Information About EEE

EEE Overview

Energy Efficient Ethernet (EEE) is an IEEE 802.3az standard that is designed to reduce power consumption in Ethernet networks during idle periods.

EEE can be enabled on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

Default EEE Configuration

EEE is enabled by default.

How to Configure EEE

You can enable or disable EEE on an interface that is connected to an EEE-capable link partner.

<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>power efficient-ethernet auto</td>
<td>Enables EEE on the specified interface. When EEE is enabled, the device advertises and autonegotiates EEE to its link partner.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# power efficient-ethernet auto</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 4**

- `no power efficient-ethernet auto`
  
  **Example:**
  
  Switch(config-if)# no power efficient-ethernet auto

  Disables EEE on the specified interface.

**Step 5**

- `end`
  
  **Example:**
  
  Switch(config-if)# end

  Returns to privileged EXEC mode.

**Step 6**

- `copy running-config startup-config`

  **Example:**
  
  Switch# copy running-config startup-config

  (Optional) Saves your entries in the configuration file.

### Monitoring EEE

#### Table 12: Commands for Displaying EEE Settings

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show eee capabilities interface interface-id</code></td>
<td>Displays EEE capabilities for the specified interface.</td>
</tr>
<tr>
<td><code>show eee status interface interface-id</code></td>
<td>Displays EEE status information for the specified interface.</td>
</tr>
<tr>
<td><code>show eee counters interface interface-id</code></td>
<td>Displays EEE counters for the specified interface.</td>
</tr>
</tbody>
</table>

Following are examples of the `show eee` commands

Switch#show eee capabilities interface gigabitEthernet2/0/1

Gi2/0/1

EEE(efficient-ethernet): yes (100-Tx and 1000T auto)
Link Partner : yes (100-Tx and 1000T auto)

ASIC/Interface : EEE Capable/EEE Enabled

Switch#show eee status interface gigabitEthernet2/0/1

Gi2/0/1 is up

EEE(efficient-ethernet): Operational
Rx LPI Status : Low Power
Tx LPI Status : Low Power
Wake Error Count : 0

ASIC EEE STATUS
Rx LPI Status : Receiving LPI
Tx LPI Status : Transmitting LPI
Link Fault Status : Link Up
Sync Status : Code group synchronization with data stream intact

Switch#show eee counters interface gigabitEthernet2/0/1

LP Active Tx Time (10us) : 66649648
LP Transitioning Tx : 462
LP Active Rx Time (10us) : 64911682
LP Transitioning Rx : 153

Examples for Catalyst Digital Building Series Switches

Switch#show eee capabilities interface gig1/0/1
Gi1/0/1
EEE(efficient-ethernet): yes (100-Tx and 1000T auto)
Link Partner : no

Switch#show eee status int gig1/0/1
Gi1/0/1 is up
EEE(efficient-ethernet): Disagreed
Rx LPI Status : None
Tx LPI Status : None
Wake Error Count : 0

Configuration Examples for Configuring EEE

This example shows how to enable EEE for an interface:

Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# power efficient-ethernet auto

This example shows how to disable EEE for an interface:

Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# no power efficient-ethernet auto

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring IGMP Snooping and MVR

Prerequisites for IGMP Snooping

Observe these guidelines when configuring the IGMP snooping querier:

- Configure the VLAN in global configuration mode.

- Configure an IP address on the VLAN interface. When enabled, the IGMP snooping querier uses the IP address as the query source address.
• If there is no IP address configured on the VLAN interface, the IGMP snooping querier tries to use the configured global IP address for the IGMP querier. If there is no global IP address specified, the IGMP querier tries to use the VLAN switch virtual interface (SVI) IP address (if one exists). If there is no SVI IP address, the switch uses the first available IP address configured on the switch. The first IP address available appears in the output of the `show ip interface` privileged EXEC command. The IGMP snooping querier does not generate an IGMP general query if it cannot find an available IP address on the switch.

• The IGMP snooping querier supports IGMP Versions 1 and 2.

• When administratively enabled, the IGMP snooping querier moves to the nonquerier state if it detects the presence of a multicast router in the network.

• When it is administratively enabled, the IGMP snooping querier moves to the operationally disabled state under these conditions:
  • IGMP snooping is disabled in the VLAN.
  • PIM is enabled on the SVI of the corresponding VLAN.

Prerequisites for MVR

The following are the prerequisites for Multicast VLAN Registration (MVR):

• To use MVR, the switch must be running the LAN Base image.

Restrictions for Configuring IGMP Snooping and MVR

Restrictions for IGMP Snooping

The following are the restrictions for IGMP snooping:

• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

• IGMPv3 join and leave messages are not supported on switches running IGMP filtering or Multicast VLAN registration (MVR).

• IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

• The IGMP configurable leave time is only supported on hosts running IGMP Version 2. IGMP version 2 is the default version for the switch.
The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.

- The IGMP throttling action restriction can be applied only to Layer 2 ports. You can use `ip igmp max-groups action replace` interface configuration command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

When the maximum group limitation is set to the default (no maximum), entering the `ip igmp max-groups action {deny | replace}` command has no effect.

If you configure the throttling action and set the maximum group limitation after an interface has added multicast entries to the forwarding table, the forwarding-table entries are either aged out or removed, depending on the throttling action.

- Setting the Maximum Number of IGMP Groups, on page 137
- Configuring the IGMP Throttling Action, on page 139
- IGMP Filtering and Throttling, on page 113

**Restrictions for MVR**

The following are restrictions for MVR:

- Only Layer 2 ports participate in MVR. You must configure ports as MVR receiver ports.
- Only one MVR multicast VLAN per switch or switch stack is supported.
- Receiver ports can only be access ports; they cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.
- The maximum number of multicast entries (MVR group addresses) that can be configured on a switch (that is, the maximum number of television channels that can be received) is 256.
- MVR multicast data received in the source VLAN and leaving from receiver ports has its time-to-live (TTL) decremented by 1 in the switch.
- Because MVR on the switch uses IP multicast addresses instead of MAC multicast addresses, alias IP multicast addresses are allowed on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).
- Do not configure MVR on private VLAN ports.
- MVR is not supported when multicast routing is enabled on a switch. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled, and you receive a warning message. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled, and you receive an error message.
- MVR data received on an MVR receiver port is not forwarded to MVR source ports.
- MVR does not support IGMPv3 messages.
The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

**Information About IGMP Snooping and MVR**

**IGMP Snooping**

Layer 2 switches can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN switch to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the switch receives an IGMP report from a host for a particular multicast group, the switch adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

For more information on IP multicast and IGMP, see RFC 1112 and RFC 2236.

The multicast router sends out periodic general queries to all VLANs. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry. The switch creates one entry per VLAN in the IGMP snooping IP multicast forwarding table for each group from which it receives an IGMP join request.

The switch supports IP multicast group-based bridging, instead of MAC-addressed based groups. With multicast MAC address-based groups, if an IP address being configured translates (aliases) to a previously configured MAC address or to any reserved multicast MAC addresses (in the range 224.0.0.xxx), the command fails. Because the switch uses IP multicast groups, there are no address aliasing issues.

The IP multicast groups learned through IGMP snooping are dynamic. However, you can statically configure multicast groups by using the `ip igmp snooping vlan vlan-id static ip_address interface interface-id` global configuration command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings.

You can configure an IGMP snooping querier to support IGMP snooping in subnets without multicast interfaces because the multicast traffic does not need to be routed.

If a port spanning-tree, a port group, or a VLAN ID change occurs, the IGMP snooping-learned multicast groups from this port on the VLAN are deleted.

These sections describe IGMP snooping characteristics:

**Related Topics**

- Example: Setting the IGMP Snooping Querier Source Address, on page 144
- Example: Setting the IGMP Snooping Querier Maximum Response Time, on page 144
IGMP Versions

The switch supports IGMP version 1, IGMP version 2, and IGMP version 3. These versions are interoperable on the switch. For example, if IGMP snooping is enabled and the querier's version is IGMPv2, and the switch receives an IGMPv3 report from a host, then the switch can forward the IGMPv3 report to the multicast router.

An IGMPv3 switch can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature.

Related Topics
Restrictions for IGMP Snooping, on page 104

Joining a Multicast Group

Figure 4: Initial IGMP Join Message

When a host connected to the switch wants to join an IP multicast group and it is an IGMP version 2 client, it sends an unsolicited IGMP join message, specifying the IP multicast group to join. Alternatively, when the switch receives a general query from the router, it forwards the query to all ports in the VLAN. IGMP version 1 or version 2 hosts wanting to join the multicast group respond by sending a join message to the switch. The switch CPU creates a multicast forwarding-table entry for the group if it is not already present. The CPU also adds the interface where the join message was received to the forwarding-table entry. The host associated with that interface receives multicast traffic for that multicast group.

Router A sends a general query to the switch, which forwards the query to ports 2 through 5, all of which are members of the same VLAN. Host 1 wants to join multicast group 224.1.2.3 and multicasts an IGMP membership report (IGMP join message) to the group. The switch CPU uses the information in the IGMP report to set up a forwarding-table entry that includes the port numbers connected to Host 1 and to the router.

Table 13: IGMP Snooping Forwarding Table

<table>
<thead>
<tr>
<th>Destination Address</th>
<th>Type of Packet</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.1.2.3</td>
<td>IGMP</td>
<td>1, 2</td>
</tr>
</tbody>
</table>
The switch hardware can distinguish IGMP information packets from other packets for the multicast group. The information in the table tells the switching engine to send frames addressed to the 224.1.2.3 multicast IP address that are not IGMP packets to the router and to the host that has joined the group.

**Figure 5: Second Host Joining a Multicast Group**

If another host (for example, Host 4) sends an unsolicited IGMP join message for the same group, the CPU receives that message and adds the port number of Host 4 to the forwarding table. Because the forwarding table directs IGMP messages only to the CPU, the message is not flooded to other ports on the switch. Any known multicast traffic is forwarded to the group and not to the CPU.

**Table 14: Updated IGMP Snooping Forwarding Table**

<table>
<thead>
<tr>
<th>Destination Address</th>
<th>Type of Packet</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.1.2.3</td>
<td>IGMP</td>
<td>1, 2, 5</td>
</tr>
</tbody>
</table>

- Example: Configuring a Host Staticaly to Join a Group, on page 143

**Leaving a Multicast Group**

The router sends periodic multicast general queries, and the switch forwards these queries through all ports in the VLAN. Interested hosts respond to the queries. If at least one host in the VLAN wants to receive multicast traffic, the router continues forwarding the multicast traffic to the VLAN. The switch forwards multicast group traffic only to those hosts listed in the forwarding table for that IP multicast group maintained by IGMP snooping.

When hosts want to leave a multicast group, they can silently leave, or they can send a leave message. When the switch receives a leave message from a host, it sends a group-specific query to learn if any other devices connected to that interface are interested in traffic for the specific multicast group. The switch then updates the forwarding table for that MAC group so that only those hosts interested in receiving multicast traffic for the group are listed in the forwarding table. If the router receives no reports from a VLAN, it removes the group for the VLAN from its IGMP cache.
Immediate Leave

The switch uses IGMP snooping Immediate Leave to remove from the forwarding table an interface that sends a leave message without the switch sending group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Immediate Leave ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are simultaneously in use.

Immediate Leave is only supported on IGMP version 2 hosts. IGMP version 2 is the default version for the switch.

**Note**
You should use the Immediate Leave feature only on VLANs where a single host is connected to each port. If Immediate Leave is enabled on VLANs where more than one host is connected to a port, some hosts may be dropped inadvertently.

**Related Topics**
- Enabling IGMP Immediate Leave, on page 120
- Example: Enabling IGMP Immediate Leave, on page 143

IGMP Configurable-Leave Timer

You can configure the time that the switch waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 32767 milliseconds.

**Related Topics**
- Configuring the IGMP Leave Timer, on page 122

IGMP Report Suppression

**Note**
IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP report suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers.

If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression, all IGMP reports are forwarded to the multicast routers.

**Related Topics**
- Disabling IGMP Report Suppression, on page 128
IGMP Snooping and Switch Stacks

IGMP snooping functions across the switch stack; that is, IGMP control information from one switch is distributed to all switches in the stack. Regardless of the stack member through which IGMP multicast data enters the stack, the data reaches the hosts that have registered for that group.

If a switch in the stack fails or is removed from the stack, only the members of the multicast group that are on that switch will not receive the multicast data. All other members of a multicast group on other switches in the stack continue to receive multicast data streams. However, multicast groups that are common for both Layer 2 and Layer 3 (IP multicast routing) might take longer to converge if the active switch is removed.

Default IGMP Snooping Configuration

Multicast VLAN Registration

Multicast VLAN Registration (MVR) is designed for applications using wide-scale deployment of multicast traffic across an Ethernet ring-based service-provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN. It allows the single multicast VLAN to be shared in the network while subscribers remain in separate VLANs. MVR provides the ability to continuously send multicast streams in the multicast VLAN, but to isolate the streams from the subscriber VLANs for bandwidth and security reasons.

These sections describe MVR:
MVR and IGMP

MVR can coexist with IGMP snooping on a switch.

Note

MVR assumes that subscriber ports subscribe and unsubscribe (join and leave) these multicast streams by sending out IGMP join and leave messages. These messages can originate from an IGMP version-2-compatible host with an Ethernet connection. Although MVR operates on the underlying method of IGMP snooping, the two features operate independently of each other. One can be enabled or disabled without affecting the behavior of the other feature. However, if IGMP snooping and MVR are both enabled, MVR reacts only to join and leave messages from multicast groups configured under MVR. Join and leave messages from all other multicast groups are managed by IGMP snooping.

The switch CPU identifies the MVR IP multicast streams and their associated IP multicast group in the switch forwarding table, intercepts the IGMP messages, and modifies the forwarding table to include or remove the subscriber as a receiver of the multicast stream, even though the receivers might be in a different VLAN from the source. This forwarding behavior selectively allows traffic to cross between different VLANs.

Modes of Operation

You can set the switch for compatible or dynamic mode of MVR operation:

- In compatible mode, multicast data received by MVR hosts is forwarded to all MVR data ports, regardless of MVR host membership on those ports. The multicast data is forwarded only to those receiver ports that MVR hosts have joined, either by IGMP reports or by MVR static configuration. IGMP reports received from MVR hosts are never forwarded from MVR data ports that were configured in the switch.

- In dynamic mode, multicast data received by MVR hosts on the switch is forwarded from only those MVR data and client ports that the MVR hosts have joined, either by IGMP reports or by MVR static configuration. Any IGMP reports received from MVR hosts are also forwarded from all the MVR data ports in the host. This eliminates using unnecessary bandwidth on MVR data port links, which occurs when the switch runs in compatible mode.

MVR and Switch Stacks

Only one MVR multicast VLAN per switch or switch stack is supported.

Receiver ports and source ports can be on different switches in a switch stack. Multicast data sent on the multicast VLAN is forwarded to all MVR receiver ports across the stack. When a new switch is added to a stack, by default it has no receiver ports.

If a switch fails or is removed from the stack, only those receiver ports belonging to that switch will not receive the multicast data. All other receiver ports on other switches continue to receive the multicast data.

MVR in a Multicast Television Application

In a multicast television application, a PC or a television with a set-top box can receive the multicast stream. Multiple set-top boxes or PCs can be connected to one subscriber port, which is a switch port configured as an MVR receiver port.
The following is an example configuration.

In this example configuration, DHCP assigns an IP address to the set-top box or the PC. When a subscriber selects a channel, the set-top box or PC sends an IGMP report to Switch A to join the appropriate multicast. If the IGMP report matches one of the configured IP multicast group addresses, the switch CPU modifies the hardware address table to include this receiver port and VLAN as a forwarding destination of the specified multicast stream when it is received from the multicast VLAN. Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports.

When a subscriber changes channels or turns off the television, the set-top box sends an IGMP leave message for the multicast stream. The switch CPU sends a MAC-based general query through the receiver port VLAN. If there is another set-top box in the VLAN still subscribing to this group, that set-top box must respond within the maximum response time specified in the query. If the CPU does not receive a response, it eliminates the receiver port as a forwarding destination for this group.

Without Immediate Leave, when the switch receives an IGMP leave message from a subscriber on a receiver port, it sends out an IGMP query on that port and waits for IGMP group membership reports. If no reports
are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency. Enable the Immediate-Leave feature only on receiver ports to which a single receiver device is connected.

MVR eliminates the need to duplicate television-channel multicast traffic for subscribers in each VLAN. Multicast traffic for all channels is only sent around the VLAN trunk once—only on the multicast VLAN. The IGMP leave and join messages are in the VLAN to which the subscriber port is assigned. These messages dynamically register for streams of multicast traffic in the multicast VLAN on the Layer 3 device. The access layer switch, Switch A, modifies the forwarding behavior to allow the traffic to be forwarded from the multicast VLAN to the subscriber port in a different VLAN, selectively allowing traffic to cross between two VLANs.

IGMP reports are sent to the same IP multicast group address as the multicast data. The Switch A CPU must capture all IGMP join and leave messages from receiver ports and forward them to the multicast VLAN of the source (uplink) port, based on the MVR mode.

### IGMP Filtering and Throttling

In some environments, for example, metropolitan or multiple-dwelling unit (MDU) installations, you might want to control the set of multicast groups to which a user on a switch port can belong. You can control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan. You might also want to limit the number of multicast groups to which a user on a switch port can belong.

With the IGMP filtering feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual switch ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a switch port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing. You can also set the maximum number of IGMP groups that a Layer 2 interface can join.

IGMP filtering controls only group-specific query and membership reports, including join and leave reports. It does not control general IGMP queries. IGMP filtering has no relationship with the function that directs
the forwarding of IP multicast traffic. The filtering feature operates in the same manner whether CGMP or MVR is used to forward the multicast traffic.

IGMP filtering applies only to the dynamic learning of IP multicast group addresses, not static configuration.

With the IGMP throttling feature, you can set the maximum number of IGMP groups that a Layer 2 interface can join. If the maximum number of IGMP groups is set, the IGMP snooping forwarding table contains the maximum number of entries, and the interface receives an IGMP join report, you can configure an interface to drop the IGMP report or to replace the randomly selected multicast entry with the received IGMP report.

Note

IGMPv3 join and leave messages are not supported on switches running IGMP filtering.

How to Configure IGMP Snooping and MVR

Enabling or Disabling IGMP Snooping on a Switch

When IGMP snooping is globally enabled or disabled, it is also enabled or disabled in all existing VLAN interfaces. IGMP snooping is enabled on all VLANs by default, but can be enabled and disabled on a per-VLAN basis.
Global IGMP snooping overrides the VLAN IGMP snooping. If global snooping is disabled, you cannot enable VLAN snooping. If global snooping is enabled, you can enable or disable VLAN snooping.

Follow these steps to globally enable IGMP snooping on the switch:

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 | configure terminal | Enters global configuration mode. |
| Example: |                  |         |
|        | Switch# configure terminal | |

| Step 3 | ip igmp snooping | Globally enables IGMP snooping in all existing VLAN interfaces. |
| Example: |                  | Note To globally disable IGMP snooping on all VLAN interfaces, use the `no ip igmp snooping` global configuration command. |
|        | Switch(config)# ip igmp snooping | |

| Step 4 | end | Returns to privileged EXEC mode. |
| Example: |      |         |
|        | Switch(config)# end | |

| Step 5 | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: |                                  |         |
|        | Switch# copy running-config startup-config | |

**Enabling or Disabling IGMP Snooping on a VLAN Interface**

Follow these steps to enable IGMP snooping on a VLAN interface:
### Setting the Snooping Method

Multicast-capable router ports are added to the forwarding table for every Layer 2 multicast entry. The switch learns of the ports through one of these methods:

- Snooping on IGMP queries, Protocol-Independent Multicast (PIM) packets, and Distance Vector Multicast Routing Protocol (DVMRP) packets.

#### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td><strong>Example:</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>

</tr>
</tbody>
</table>

**Related Topics**

Default IGMP Snooping Configuration, on page 110
• Listening to Cisco Group Management Protocol (CGMP) packets from other routers.
• Statically connecting to a multicast router port using the `ip igmp snooping mrouter` global configuration command.

You can configure the switch either to snoop on IGMP queries and PIM/DVMRP packets or to listen to CGMP self-join or proxy-join packets. By default, the switch snoops on PIM/DVMRP packets on all VLANs. To learn of multicast router ports through only CGMP packets, use the `ip igmp snooping vlan vlan-id mrouter learn cgmp` global configuration command. When this command is entered, the router listens to only CGMP self-join and CGMP proxy-join packets and to no other CGMP packets. To learn of multicast router ports through only PIM-DVMRP packets, use the `ip igmp snooping vlan vlan-id mrouter learn pim-dvmrp` global configuration command.

If you want to use CGMP as the learning method and no multicast routers in the VLAN are CGMP proxy-enabled, you must enter the `ip cgmp router-only` command to dynamically access the router.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
  Example:  
  `Switch> enable` |
| Step 2 | `configure terminal` | Enters global configuration mode.  
  Example:  
  `Switch# configure terminal` |
| Step 3 | `ip igmp snooping vlan vlan-id mrouter learn {cgmp | pim-dvmrp}` | Specifies the multicast router learning method:  
  - `cgmp`—Listens for CGMP packets. This method is useful for reducing control traffic.  
  - `pim-dvmrp`—Snoops on IGMP queries and PIM-DVMRP packets. This is the default.  
  Example:  
  `Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp` |
| Step 4 | `end` | Returns to privileged EXEC mode.  
  Example:  
  `Switch(config)# end` |
### Configuring a Multicast Router Port

Perform these steps to add a multicast router port (enable a static connection to a multicast router) on the switch.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>ip igmp snooping vlan vlan-id mrouter interface interface-id</code></td>
<td>Specifies the multicast router VLAN ID and the interface to the multicast router.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# ip igmp snooping vlan 5 mrouter interface gigabitethernet1/0/1</code></td>
<td>• The interface can be a physical interface or a port channel. The port-channel range is 1 to 128.</td>
</tr>
</tbody>
</table>

**Note**

Static connections to multicast routers are supported only on switch ports.
### Purpose

To remove a multicast router port from the VLAN, use the `no ip igmp snooping vlan vlan-id mrouter interface interface-id` global configuration command.

### Step 4

**Command:** end  
**Example:**  
```
Switch(config)# end
```

Returns to privileged EXEC mode.

### Step 5

**Command:** `show ip igmp snooping mrouter [vlan vlan-id]`  
**Example:**  
```
Switch# show ip igmp snooping mrouter vlan 5
```

Verifies that IGMP snooping is enabled on the VLAN interface.

### Step 6

**Command:** `copy running-config startup-config`  
**Example:**  
```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

### Related Topics

### Configuring a Host Statically to Join a Group

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure a host on an interface.

Follow these steps to add a Layer 2 port as a member of a multicast group:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>

#### Step 3

| ip igmp snooping vlan vlan-id static ip_address interface interface-id |
|--------------------------------|-----------------|

**Example:**

Switch(config)# ip igmp snooping vlan 105 static 230.0.0.1 interface gigabitethernet1/0/1

**Step 3**  
**Example:**

Switch(config)# ip igmp snooping vlan vlan-id static ip_address interface interface-id

**Note**

To remove the Layer 2 port from the multicast group, use the `no ip igmp snooping vlan vlan-id static mac-address interface interface-id` global configuration command.

### Step 4

| end |

**Example:**

Switch(config)# end

**Step 4**  
**Example:**

Switch(config)# end

**Note**

Returns to privileged EXEC mode.

### Step 5

<table>
<thead>
<tr>
<th>show ip igmp snooping groups</th>
</tr>
</thead>
</table>

**Example:**

Switch# show ip igmp snooping groups

**Step 5**  
**Example:**

Switch# show ip igmp snooping groups

**Note**

Verifies the member port and the IP address.

### Step 6

<table>
<thead>
<tr>
<th>copy running-config startup-config</th>
</tr>
</thead>
</table>

**Example:**

Switch# copy running-config startup-config

| (Optional) Saves your entries in the configuration file. |

**Step 6**  
**Example:**

Switch# copy running-config startup-config

**Note**

(Optional) Saves your entries in the configuration file.

**Enabling IGMP Immediate Leave**

When you enable IGMP Immediate Leave, the switch immediately removes a port when it detects an IGMP Version 2 leave message on that port. You should use the Immediate-Leave feature only when there is a single receiver present on every port in the VLAN.
Immediate Leave is supported only on IGMP Version 2 hosts. IGMP Version 2 is the default version for the switch.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>

## Configuring the IGMP Leave Timer

You can configure the leave time globally or on a per-VLAN basis. Follow these steps to enable the IGMP configurable-leave timer:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip igmp snooping last-member-query-interval time</td>
<td>Configures the IGMP leave timer globally. The range is 100 to 32767 milliseconds. The default leave time is 1000 milliseconds.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip igmp snooping last-member-query-interval 1000</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> To globally reset the IGMP leave timer to the default setting, use the no ip igmp snooping last-member-query-interval global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip igmp snooping vlan vlan-id last-member-query-interval time</td>
<td>(Optional) Configures the IGMP leave time on the VLAN interface. The range is 100 to 32767 milliseconds.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip igmp snooping vlan 210 last-member-query-interval 1000</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> Configuring the leave time on a VLAN overrides the globally configured timer.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> To remove the configured IGMP leave-time setting from the specified VLAN, use the no ip igmp snooping vlan vlan-id last-member-query-interval global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
**Steps to Configure IGMP Snooping**

<table>

**Configuring TCN-Related Commands**

**Controlling the Multicast Flooding Time After a TCN Event**

You can configure the number of general queries by which multicast data traffic is flooded after a topology change notification (TCN) event. If you set the TCN flood query count to 1 the flooding stops after receiving 1 general query. If you set the count to 7, the flooding continues until 7 general queries are received. Groups are relearned based on the general queries received during the TCN event.

Some examples of TCN events are when the client location is changed and the receiver is on same port that was blocked but is now forwarding, and when a port goes down without sending a leave message.

Follow these steps to configure the TCN flood query count:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable  
  Example:  
  Switch> enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** configure terminal  
  Example:  
  Switch# configure terminal | Enters global configuration mode. |
## Recovering from Flood Mode

When a topology change occurs, the spanning-tree root sends a special IGMP leave message (also known as global leave) with the group multicast address 0.0.0.0. However, you can enable the switch to send the global leave message whether it is the spanning-tree root or not. When the router receives this special leave, it immediately sends general queries, which expedite the process of recovering from the flood mode during the TCN event. Leaves are always sent if the switch is the spanning-tree root regardless of this configuration.

Follow these steps to enable sending of leave messages:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
Disabling Multicast Flooding During a TCN Event

When the switch receives a TCN, multicast traffic is flooded to all the ports until 2 general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, this flooding might exceed the capacity of the link and cause packet loss. Follow these steps to control TCN flooding:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>

### Configuring the IGMP Snooping Querier

Follow these steps to enable the IGMP snooping querier feature in a VLAN:
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>ip igmp snooping querier</code></td>
<td>Enables the IGMP snooping querier.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config)# ip igmp snooping querier</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>ip igmp snooping querier address ip_address</code></td>
<td>(Optional) Specifies an IP address for the IGMP snooping querier. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config)# ip igmp snooping querier address 172.16.24.1</code></td>
<td><strong>Note</strong> The IGMP snooping querier does not generate an IGMP general query if it cannot find an IP address on the switch.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>ip igmp snooping querier query-interval interval-count</code></td>
<td>(Optional) Sets the interval between IGMP queriers. The range is 1 to 18000 seconds.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config)# ip igmp snooping querier query-interval 30</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>`ip igmp snooping querier tcn query [count count</td>
<td>interval interval]`</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config)# ip igmp snooping querier tcn query interval 20</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>ip igmp snooping querier timer expiry timeout</code></td>
<td>(Optional) Sets the length of time until the IGMP querier expires. The range is 60 to 300 seconds.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Disabling IGMP Report Suppression

Follow these steps to disable IGMP report suppression:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Command or Action

**Example:**

```bash
Switch> enable
```

**Step 2**  
**Command:** `configure terminal`  
**Example:**

```bash
Switch# configure terminal
```

**Step 3**  
**Command:** `no ip igmp snooping report-suppression`  
**Example:**

```bash
Switch(config)# no ip igmp snooping report-suppression
```

**Step 4**  
**Command:** `end`  
**Example:**

```bash
Switch(config)# end
```

**Step 5**  
**Command:** `show ip igmp snooping`  
**Example:**

```bash
Switch# show ip igmp snooping
```

**Step 6**  
**Command:** `copy running-config startup-config`  
**Example:**

```bash
Switch# copy running-config startup-config
```

</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>mvr</td>
<td>Enables MVR on the switch.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch (config)# mvr</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>mvr group ip-address [count]</td>
<td>Configures an IP multicast address on the switch or use the count parameter to configure a contiguous series of MVR group addresses (the range for count is 1 to 256; the default is 1). Any multicast data sent to this address is sent to all source ports on the switch and all receiver ports that have elected to receive data on that multicast address. Each multicast address would correspond to one television channel.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# mvr group 228.1.23.4</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>mvr querytime value</td>
<td>(Optional) Defines the maximum time to wait for IGMP report memberships on a receiver</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

To return the switch to its default settings, use the `no mvr [mode | group ip-address | querytime | vlan]` global configuration commands.
### Purpose

Command or Action

Switch(config)# mvr querytime 10

**Purpose**

Port before removing the port from multicast group membership. The value is in units of tenths of a second. The range is 1 to 100, and the default is 5 tenths or one-half second.

**Step 6**

**mvr vlan vlan-id**

**Example:**

Switch(config)# mvr vlan 22

(Optional) Specifies the VLAN in which multicast data is received; all source ports must belong to this VLAN. The VLAN range is 1 to 1001 and 1006 to 4094. The default is VLAN 1.

**Step 7**

**mvr mode {dynamic | compatible}**

**Example:**

Switch(config)# mvr mode dynamic

(Optional) Specifies the MVR mode of operation:

- **dynamic**—Allows dynamic MVR membership on source ports.
- **compatible**—Is compatible with Catalyst 3500 XL and Catalyst 2900 XL switches and does not support IGMP dynamic joins on source ports.

The default is **compatible** mode.

**Note** To return the switch to its default settings, use the `no mvr [mode | group ip-address | querytime | vlan]` global configuration commands.

**Step 8**

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

**Step 9**

Use one of the following:

- **show mvr**
- **show mvr members**

**Example:**

Switch# show mvr

OR

Switch# show mvr members

Verifies the configuration.

**Step 10**

**copy running-config startup-config**

**Example:**

(Optional) Saves your entries in the configuration file.
### Configuring MVR Interfaces

Follow these steps to configure Layer 2 MVR interfaces:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>mvr</td>
<td>Enables MVR on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch (config)# mvr</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>interface interface-id</td>
<td>Specifies the Layer 2 port to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet1/0/2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>mvr type {source</td>
<td>receiver}</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# mvr type receiver</td>
<td></td>
</tr>
</tbody>
</table>

  • **source**—Configures uplink ports that receive and send multicast data as source ports. Subscribers cannot be directly connected to source ports. All source ports on a switch belong to the single multicast VLAN.

  • **receiver**—Configures a port as a receiver port if it is a subscriber port and should only receive multicast data. It does not receive data unless it becomes a member...
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>of the multicast group, either statically or by using IGMP leave and join messages. Receiver ports cannot belong to the multicast VLAN. The default configuration is as a non-MVR port. If you attempt to configure a non-MVR port with MVR characteristics, the operation fails.</td>
<td></td>
</tr>
<tr>
<td>To return the interface to its default settings, use the `no mvr [type</td>
<td>immediate</td>
</tr>
</tbody>
</table>

**Step 6**

<table>
<thead>
<tr>
<th>mvr vlan vlan-id group [ip-address]</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Statically configures a port to receive multicast traffic sent to the multicast VLAN and the IP multicast address. A port statically configured as a member of a group remains a member of the group until statically removed.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config-if)# mvr vlan 22 group 228.1.23.4
```

**Note** In compatible mode, this command applies to only receiver ports. In dynamic mode, it applies to receiver ports and source ports.

Receiver ports can also dynamically join multicast groups by using IGMP join and leave messages.

**Step 7**

<table>
<thead>
<tr>
<th>mvr immediate</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Enables the Immediate-Leave feature of MVR on the port.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config-if)# mvr immediate
```

**Note** This command applies to only receiver ports and should only be enabled on receiver ports to which a single receiver device is connected.

**Step 8**

<table>
<thead>
<tr>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# end
```

**Step 9**

<table>
<thead>
<tr>
<th>Use one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• show mvr</td>
</tr>
<tr>
<td>• show mvr interface</td>
</tr>
<tr>
<td>• show mvr members</td>
</tr>
<tr>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>Command or Action</td>
</tr>
<tr>
<td>---------------------------------------</td>
</tr>
<tr>
<td>Example:</td>
</tr>
<tr>
<td>Switch# show mvr interface</td>
</tr>
<tr>
<td>Port Type Status</td>
</tr>
<tr>
<td>Immediate Leave</td>
</tr>
<tr>
<td>Gi1/0/2 RECEIVER ACTIVE/DOWN ENABLED</td>
</tr>
</tbody>
</table>

**Step 10**

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

### Configuring IGMP Profiles

Follow these steps to create an IGMP profile:

This task is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

Enables privileged EXEC mode.

• Enter your password if prompted.

| **Step 2** configure terminal         | Enters global configuration mode.                                       |
| Example:                              |                                                                         |
| Switch# configure terminal            |                                                                         |

Enters global configuration mode.

| **Step 3** ip igmp profile profile number | Assigns a number to the profile you are configuring, and enters IGMP profile configuration mode. The profile number range is 1 to 4294967295. When you are in IGMP profile configuration mode, you can create the profile by using these commands:

• deny—Specifies that matching addresses are denied; this is the default.

• exit—Exits from igmp-profile configuration mode. |
<p>| Example:                              |                                                                         |
| Switch(config)# ip igmp profile 3     |                                                                         |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• no — Negates a command or returns to its defaults.</td>
<td></td>
</tr>
<tr>
<td>• permit — Specifies that matching addresses are permitted.</td>
<td></td>
</tr>
<tr>
<td>• range — Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with a start and an end address.</td>
<td></td>
</tr>
</tbody>
</table>

The default is for the switch to have no IGMP profiles configured.

**Note** To delete a profile, use the `no ip igmp profile profile number` global configuration command.

**Step 4**  
**permit | deny**  
*Example:*  
Switch(config-igmp-profile)# permit

(Optional) Sets the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.

**Step 5**  
**range ip multicast address**  
*Example:*  
Switch(config-igmp-profile)# range 229.9.9.0

Enters the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address.

You can use the `range` command multiple times to enter multiple addresses or ranges of addresses.

**Note** To delete an IP multicast address or range of IP multicast addresses, use the `no range ip multicast address` IGMP profile configuration command.

**Step 6**  
**end**  
*Example:*  
Switch(config)# end

Returns to privileged EXEC mode.

**Step 7**  
**show ip igmp profile profile number**  
*Example:*  
Switch# show ip igmp profile 3

Verifies the profile configuration.
Applying IGMP Profiles

To control access as defined in an IGMP profile, you have to apply the profile to the appropriate interfaces. You can apply IGMP profiles only to Layer 2 access ports; you cannot apply IGMP profiles to routed ports or SVIs. You cannot apply profiles to ports that belong to an EtherChannel port group. You can apply a profile to multiple interfaces, but each interface can have only one profile applied to it.

Follow these steps to apply an IGMP profile to a switch port:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Specifies the physical interface, and enters interface configuration mode. The interface must be a Layer 2 port that does not belong to an EtherChannel port group.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet1/0/1</td>
<td></td>
</tr>
</tbody>
</table>

**Related Topics**

Setting the Maximum Number of IGMP Groups

Follow these steps to set the maximum number of IGMP groups that a Layer 2 interface can join:

Before you begin

This restriction can be applied to Layer 2 ports only; you cannot set a maximum number of IGMP groups on routed ports or SVIs. You also can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

Related Topics

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**  
configure terminal  
**Example:**  
Switch# configure terminal  

Enters global configuration mode.

**Step 3**  
interface interface-id  
**Example:**  
Switch(config)# interface gigabitethernet1/0/2  

Specifies the interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or a EtherChannel interface.

**Step 4**  
ip igmp max-groups number  
**Example:**  
Switch(config-if)# ip igmp max-groups 20  

Sets the maximum number of IGMP groups that the interface can join. The range is 0 to 4294967294. The default is to have no maximum set.  

**Note**  
To remove the maximum group limitation and return to the default of no maximum, use the **no ip igmp max-groups** interface configuration command.

**Step 5**  
end  
**Example:**  
Switch(config)# end  

Returns to privileged EXEC mode.

**Step 6**  
show running-config interface interface-id  
**Example:**  
Switch# interface gigabitethernet1/0/1  

Verifies your entries.

**Step 7**  
copy running-config startup-config  
**Example:**  
Switch# copy running-config startup-config  

(Optional) Saves your entries in the configuration file.

**Related Topics**  
[IGMP Filtering and Throttling](page113)  
[Restrictions for IGMP Snooping](page104)
Configuring the IGMP Throttling Action

After you set the maximum number of IGMP groups that a Layer 2 interface can join, you can configure an interface to replace the existing group with the new group for which the IGMP report was received.

Follow these steps to configure the throttling action when the maximum number of entries is in the forwarding table:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>interface interface-id</td>
<td>Specifies the physical interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or an EtherChannel interface. The interface cannot be a trunk port.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet1/0/1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>ip igmp max-groups action {deny</td>
<td>replace}</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• deny—Drops the report. If you configure this throttling action, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out and the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# ip igmp max-groups action replace</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>switch replaces a randomly selected entry with the received IGMP report.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>To prevent the switch from removing the forwarding-table entries, you can configure the IGMP throttling action before an interface adds entries to the forwarding table.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>To return to the default action of dropping the report, use the <code>no ip igmp max-groups action</code> interface configuration command.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

**Step 6**

**Example:**

Switch# show running-config interface gigabitethernet1/0/1

Verifies your entries.

**Step 7**

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

**Monitoring IGMP Snooping and MVR**

**Monitoring IGMP Snooping Information**

You can display IGMP snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for IGMP snooping.
### Table 18: Commands for Displaying IGMP Snooping Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show ip igmp snooping [vlan vlan-id [detail]]</strong></td>
<td>Displays the snooping configuration information for all VLANs on the switch or for a specified VLAN. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>
| **show ip igmp snooping groups [count [dynamic [count] | user [count]]** | Displays multicast table information for the switch or about a specific parameter:  
  - **count**—Displays the total number of entries for the specified command options instead of the actual entries.  
  - **dynamic**—Displays entries learned through IGMP snooping.  
  - **user**—Displays only the user-configured multicast entries. |
| **show ip igmp snooping groups vlan vlan-id [ip_address | count | dynamic [count] | user [count]]** | Displays multicast table information for a multicast VLAN or about a specific parameter for the VLAN:  
  - **vlan-id**—The VLAN ID range is 1 to 1001 and 1006 to 4094.  
  - **count**—Displays the total number of entries for the specified command options instead of the actual entries.  
  - **dynamic**—Displays entries learned through IGMP snooping.  
  - **ip_address**—Displays characteristics of the multicast group with the specified group IP address.  
  - **user**—Displays only the user-configured multicast entries. |
| **show ip igmp snooping mrouter [vlan vlan-id]** | Displays information on dynamically learned and manually configured multicast router interfaces. **Note** When you enable IGMP snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces. (Optional) Enter the **vlan vlan-id** to display information for a particular VLAN. |
| **show ip igmp snooping querier [vlan vlan-id] detail** | Displays information about the IP address and receiving port of the most-recently received IGMP query message in the VLAN and the configuration and operational state of the IGMP snooping querier in the VLAN. |
Monitoring MVR

You can monitor MVR for the switch or for a specified interface by displaying the following MVR information.

Table 19: Commands for Displaying MVR Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mvr</td>
<td>Displays MVR status and values for the switch—whether MVR is enabled or disabled, the multicast VLAN, the maximum (256) and current (0 through 256) number of multicast groups, the query response time, and the MVR mode.</td>
</tr>
</tbody>
</table>
| show mvr interface [interface-id] [members [vlan vlan-id]] | Displays all MVR interfaces and their MVR configurations. When a specific interface is entered, displays this information:  
  • Type—Receiver or Source  
  • Status—One of these:  
    • Active means the port is part of a VLAN.  
    • Up/Down means that the port is forwarding or nonforwarding.  
    • Inactive means that the port is not part of any VLAN.  
    • Immediate Leave—Enabled or Disabled  
  If the members keyword is entered, displays all multicast group members on this port or, if a VLAN identification is entered, all multicast group members on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |
| show mvr members [ip-address]  | Displays all receiver and source ports that are members of any IP multicast group or the specified IP multicast group IP address. |
Table 20: Commands for Displaying IGMP Filtering and Throttling Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp profile [profile number]</code></td>
<td>Displays the specified IGMP profile or all the IGMP profiles defined on the switch.</td>
</tr>
<tr>
<td><code>show running-config [interface interface-id]</code></td>
<td>Displays the configuration of the specified interface or the configuration of all interfaces on the switch, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface.</td>
</tr>
</tbody>
</table>

Configuration Examples for IGMP Snooping and MVR

Example: Configuring IGMP Snooping Using CGMP Packets

This example shows how to configure IGMP snooping to use CGMP packets as the learning method:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp
Switch(config)# end
```

Example: Enabling a Static Connection to a Multicast Router

This example shows how to enable a static connection to a multicast router:

```
Switch configure terminal
Switch ip igmp snooping vlan 200 mrouter interface gigabitethernet1/0/2
Switch end
```

Related Topics
- Configuring a Multicast Router Port, on page 118

Example: Configuring a Host Statically to Join a Group

This example shows how to statically configure a host on a port:

```
Switch# configure terminal
Switch# ip igmp snooping vlan 105 static 0100.1212.0000 interface gigabitethernet1/0/1
Switch# end
```

Related Topics
- Configuring a Host Statically to Join a Group, on page 119
- Joining a Multicast Group, on page 107

Example: Enabling IGMP Immediate Leave

This example shows how to enable IGMP Immediate Leave on VLAN 130:
Example: Setting the IGMP Snooping Querier Source Address

This example shows how to set the IGMP snooping querier source address to 10.0.0.64:

Switch# configure terminal
Switch(config)# ip igmp snooping querier 10.0.0.64
Switch(config)# end

Related Topics
- Configuring the IGMP Snooping Querier, on page 126
- IGMP Snooping, on page 106

Example: Setting the IGMP Snooping Querier Maximum Response Time

This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

Switch# configure terminal
Switch(config)# ip igmp snooping querier query-interval 25
Switch(config)# end

Related Topics
- Configuring the IGMP Snooping Querier, on page 126
- IGMP Snooping, on page 106

Example: Setting the IGMP Snooping Querier Timeout

This example shows how to set the IGMP snooping querier timeout to 60 seconds:

Switch# configure terminal
Switch(config)# ip igmp snooping querier timeout expiry 60
Switch(config)# end

Related Topics
- Configuring the IGMP Snooping Querier, on page 126
- IGMP Snooping, on page 106

Example: Setting the IGMP Snooping Querier Feature

This example shows how to set the IGMP snooping querier feature to Version 2:

Switch# configure terminal
Switch(config)# no ip igmp snooping querier version 2
Switch(config)# end
Example: Configuring IGMP Profiles

This example shows how to create IGMP profile 4 allowing access to the single IP multicast address and how to verify the configuration. If the action was to deny (the default), it would not appear in the `show ip igmp profile` output display.

```
Switch(config)# ip igmp profile 4
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 229.9.9.0
Switch(config-igmp-profile)# end
Switch# show ip igmp profile 4
IGMP Profile 4
  permit
  range 229.9.9.0 229.9.9.0
```

Example: Applying IGMP Profile

This example shows how to apply IGMP profile 4 to a port:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip igmp filter 4
Switch(config-if)# end
```

Example: Setting the Maximum Number of IGMP Groups

This example shows how to limit to 25 the number of IGMP groups that a port can join:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)# end
```

Example: Configuring MVR Global Parameters

This example shows how to enable MVR, configure the group address, set the query time to 1 second (10 tenths), specify the MVR multicast VLAN as VLAN 22, and set the MVR mode as dynamic:

```
Switch(config)# mvr
Switch(config)# mvr group 228.1.23.4
Switch(config)# mvr querytime 10
Switch(config)# mvr vlan 22
Switch(config)# mvr mode dynamic
Switch(config)# end
```
Example: Configuring MVR Interfaces

This example shows how to configure a port as a receiver port, statically configure the port to receive multicast traffic sent to the multicast group address, configure Immediate Leave on the port, and verify the results:

```
Switch(config)# mvr
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# mvr type receiver
Switch(config-if)# mvr vlan 22 group 228.1.23.4
Switch(config-if)# mvr immediate
Switch(config-if)# end
Switch# show mvr interface
```

Port Type Status Immediate Leave

CHAPTER 12

Configuring MLD Snooping

This module contains details of configuring MLD snooping

• Finding Feature Information, on page 151
• Information About Configuring IPv6 MLD Snooping, on page 151
• How to Configure IPv6 MLD Snooping, on page 155
• Displaying MLD Snooping Information, on page 163
• Configuration Examples for Configuring MLD Snooping, on page 164

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IPv6 MLD Snooping

You can use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP Version 6 (IPv6) multicast data to clients and routers in a switched network on the switch. Unless otherwise noted, the term switch refers to a standalone switch and to a switch stack.

Note

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release or the Cisco IOS documentation referenced in the procedures.
Understanding MLD Snooping

In IP Version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on the links that are directly attached to the routers and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD Version 1 (MLDv1) is equivalent to IGMPv2, and MLD Version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol Version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

**Note**
The switch does not support MLDv2 enhanced snooping, which sets up IPv6 source and destination multicast address-based forwarding.

MLD snooping can be enabled or disabled globally or per VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

**MLD Messages**

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQs).
- Multicast Listener Reports are the equivalent of IGMPv2 reports
- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPV2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.
MLD Queries

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast group address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

**Note**

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 2960, 2960-S, 2960-C, 2960-X or 2960-CX switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

**Multicast Client Aging Robustness**

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

**Multicast Router Discovery**

Like IGMP snooping, MLD snooping performs multicast router discovery, with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If there are multiple routers on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).
- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.
- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether or not MLD snooping is enabled on the switch.
After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).

### MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address is entered in the VLAN MLD database. Then all IPv6 multicast traffic to the group within the VLAN is forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

### MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (which would be the case when there are multiple clients for a group on the same port) and a Done message is received on a port, an MASQ is generated on that port. The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the `ipv6 mld snooping last-listener-query count` global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If there are no reports sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the `ipv6 mld snooping last-listener-query-interval` global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

### Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the `ipv6 mld snooping tcn query solicit` global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the `ipv6 mld snooping tcn flood query count` global configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This is same as done in IGMP snooping.
MLD Snooping in Switch Stacks

The MLD IPv6 group address databases are maintained on all switches in the stack, regardless of which switch learns of an IPv6 multicast group. Report suppression and proxy reporting are done stack-wide. During the maximum response time, only one received report for a group is forwarded to the multicast routers, regardless of which switch the report arrives on.

The election of a new stack master does not affect the learning or bridging of IPv6 multicast data; bridging of IPv6 multicast data does not stop during a stack master re-election. When a new switch is added to the stack, it synchronizes the learned IPv6 multicast information from the stack master. Until the synchronization is complete, data ingress on the newly added switch is treated as unknown multicast data.

How to Configure IPv6 MLD Snooping

Default MLD Snooping Configuration

Table 21: Default MLD Snooping Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>

</tbody>
</table>
MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the `ipv6 mld snooping` global configuration command for the configuration to take effect.

- When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch.

- The maximum number of address entries allowed for the switch or switch stack is 1000.

Enabling or Disabling MLD Snooping on the Switch (CLI)

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. That is, MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis or for a range of VLANs, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

Beginning in privileged EXEC mode, follow these steps to globally enable MLD snooping on the switch:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  - `configure terminal`  
    - Example:  
      - `Switch# configure terminal`
| Enters global configuration mode. |
| **Step 2**
  - `ipv6 mld snooping`  
    - Example:  
      - `Switch(config)# ipv6 mld snooping`
| Enables MLD snooping on the switch. |
Enabling or Disabling MLD Snooping on a VLAN (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLD snooping on a VLAN.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 ipv6 mld snooping</td>
<td>Enables MLD snooping on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ipv6 mld snooping</td>
<td></td>
</tr>
<tr>
<td>Step 3 ipv6 mld snooping vlan vlan-id</td>
<td>Enables MLD snooping on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td>Example:</td>
<td>Note: MLD snooping must be globally enabled for VLAN snooping to be enabled.</td>
</tr>
<tr>
<td>Switch(config)# ipv6 mld snooping vlan 1</td>
<td></td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
**Configuring a Static Multicast Group**

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

To add a Layer 2 port as a member of a multicast group, perform this procedure:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| `configure terminal` | Enters global configuration mode. |
| **Example:**      |         |
| `Switch# configure terminal` | |

| **Step 3**        |         |
| `ipv6 mld snooping vlan vlan-id static ipv6_multicast_address interface interface-id` | Configures a multicast group with a Layer 2 port as a member of a multicast group: |
| **Example:**      |         |
| `Switch(config)# ipv6 mld snooping vlan 1 static 3333.0000.1111 interface gigabitethernet 0/1` | - `vlan-id` is the multicast group VLAN ID. The VLAN ID range is 1 to 1001 and 1006 to 4094. |
|                   | - `ipv6_multicast_address` is the 128-bit group IPv6 address. The address must be in the form specified in RFC 2373. |
|                   | - `interface-id` is the member port. It can be a physical interface or a port channel (1 to 48). |

| **Step 4**        |         |
| `end`             | Returns to privileged EXEC mode. |
| **Example:**      |         |
| `Switch(config)# end` | |

| **Step 5**        |         |
| Use one of the following: | Verifies the static member port and the IPv6 address. |
| - `show ipv6 mld snooping address` | |
**Purpose**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>show ipv6 mld snooping address vlan vlan-id</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show ipv6 mld snooping address</code> or</td>
<td></td>
</tr>
<tr>
<td><code>Switch# show ipv6 mld snooping vlan 1</code></td>
<td></td>
</tr>
</tbody>
</table>

## Configuring a Multicast Router Port (CLI)

**Note**

Static connections to multicast routers are supported only on switch ports.

Beginning in privileged EXEC mode, follow these steps to add a multicast router port to a VLAN:

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td><code>ipv6 mld snooping vlan vlan-id mrouter interface interface-id</code></td>
<td>Specifies the multicast router VLAN ID, and specify the interface to the multicast router.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# ipv6 mld snooping vlan 1 mrouter interface gigabitethernet 0/2</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td><code>show ipv6 mld snooping mrouter [ vlan vlan-id ]</code></td>
<td>Verifies that IPv6 MLD snooping is enabled on the VLAN interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch# show ipv6 mld snooping mrouter vlan 1</code></td>
<td></td>
</tr>
</tbody>
</table>
Enabling MLD Immediate Leave (CLI)

Beginning in privileged EXEC mode, follow these steps to enable MLDv1 Immediate Leave:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>ipv6 mld snooping vlan vlan-id immediate-leave</td>
<td>Enables MLD Immediate Leave on the VLAN interface.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# ipv6 mld snooping vlan 1 immediate-leave</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>show ipv6 mld snooping vlan vlan-id</td>
<td>Verifies that Immediate Leave is enabled on the VLAN interface.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# show ipv6 mld snooping vlan 1</td>
<td></td>
</tr>
</tbody>
</table>

Configuring MLD Snooping Queries (CLI)

Beginning in privileged EXEC mode, follow these steps to configure MLD snooping query characteristics for the switch or for a VLAN:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>ipv6 mld snooping robustness-variable value</td>
<td>(Optional) Sets the number of queries that are sent before switch will deletes a listener (port) that does not respond to a general query. The range is 1 to 3; the default is 2.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ipv6 mld snooping robustness-variable 3</td>
<td>(Optional) Sets the robustness variable on a VLAN basis, which determines the number of general queries that MLD snooping sends before aging out a multicast address when there is no MLD report response. The range is 1 to 3; the default is 0. When set to 0, the number used is the global robustness variable value.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv6 mld snooping vlan vlan-id robustness-variable value</td>
<td>(Optional) Sets the number of MASQs that the switch sends before aging out an MLD client. The range is 1 to 7; the default is 2. The queries are sent 1 second apart.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 mld snooping vlan 1 robustness-variable 3</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ipv6 mld snooping last-listener-query-count count</td>
<td>(Optional) Sets the last-listener query count on a VLAN basis. This value overrides the value configured globally. The range is 1 to 7; the default is 0. When set to 0, the global count value is used. Queries are sent 1 second apart.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 mld snooping last-listener-query-count 7</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ipv6 mld snooping vlan vlan-id last-listener-query-count count</td>
<td>(Optional) Sets the maximum response time that the switch waits after sending out a MASQ before deleting a port from the multicast group. The range is 100 to 32,768 thousands of a second. The default is 1000 (1 second).</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-count 7</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ipv6 mld snooping last-listener-query-interval interval</td>
<td>(Optional) Sets the last-listener query interval on a VLAN basis. This value overrides the value configured globally. The range is 0 to 32,768 thousands of a second. The default is 0. When set to 0, the global last-listener query interval is used.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 mld snooping last-listener-query-interval 2000</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> ipv6 mld snooping vlan vlan-id last-listener-query-interval interval</td>
<td>(Optional) Enables topology change notification (TCN) solicitation, which means that VLANs flood all IPv6 multicast traffic for the configured number of queries before sending multicast data to only those ports requesting to receive it. The default is for TCN to be disabled.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 2000</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Disabling MLD Listener Message Suppression (CLI)

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

Beginning in privileged EXEC mode, follow these steps to disable MLD listener message suppression:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Disable MLD message suppression.</td>
</tr>
<tr>
<td>no ipv6 mld snooping listener-message-suppression</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# no ipv6 mld snooping listener-message-suppression</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Verify that IPv6 MLD snooping report suppression is disabled.</td>
</tr>
<tr>
<td>show ipv6 mld snooping</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# show ipv6 mld snooping</td>
<td></td>
</tr>
</tbody>
</table>
Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display IPv6 group address multicast entries for a VLAN configured for MLD snooping.

Table 22: Commands for Displaying MLD Snooping Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ipv6 mld snooping</code></td>
<td>Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>show ipv6 mld snooping mrouter</code></td>
<td>Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces. (Optional) Enters <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>show ipv6 mld snooping querier</code></td>

Configuration Examples for Configuring MLD Snooping

Configuring a Static Multicast Group: Example

This example shows how to statically configure an IPv6 multicast group:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 2 static 3333.0000.1111 interface gigabitethernet1/0/1
Switch(config)# end
```

Configuring a Multicast Router Port: Example

This example shows how to add a multicast router port to VLAN 200:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet
0/2
Switch(config)# exit
```

Enabling MLD Immediate Leave: Example

This example shows how to enable MLD Immediate Leave on VLAN 130:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 130 immediate-leave
Switch(config)# exit
```

Configuring MLD Snooping Queries: Example

This example shows how to set the MLD snooping global robustness variable to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query count for a VLAN to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 last-listener-query-count 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query interval (maximum response time) to 2000 (2 seconds):
Switch# configure terminal
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# exit
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IPv6 Host Functions

This chapter describes how to configure IPv6 host functions on the Catalyst 2960, 2960-S, and 2960-C.

To use IPv6 Host Functions, the switch must be running the LAN Base image.

For information about configuring IPv6 Multicast Listener Discovery (MLD) snooping, see Configuring MLD Snooping.

To enable dual stack environments (supporting both IPv4 and IPv6) on a Catalyst 2960 switch, you must configure the switch to use the a dual IPv4 and IPv6 switch database management (SDM) template. See the "Dual IPv4 and IPv6 Protocol Stacks" section. This template is not required on Catalyst 2960-S switches.

For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS documentation referenced in the procedures.
Understanding IPv6

IPv4 users can move to IPv6 and receive services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For information about how Cisco Systems implements IPv6, go to:

For information about IPv6 and other features in this chapter

- See the Cisco IOS IPv6 Configuration Library.
- Use the Search field on Cisco.com to locate the Cisco IOS software documentation. For example, if you want information about static routes, you can enter Implementing Static Routes for IPv6 in the search field to learn about static routes.

IPv6 Addresses

The switch supports only IPv6 unicast addresses. It does not support site-local unicast addresses, or anycast addresses.

The IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons in the format: n:n:n:n:n:n:n:n. This is an example of an IPv6 address:
2031:0000:130F:0000:0000:09C0:080F:130B

For easier implementation, leading zeros in each field are optional. This is the same address without leading zeros:
2031:0:130F:0:0:9C0:080F:130B

You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only once in each address:
2031:0:130F::0:9C0:080F:130B

For more information about IPv6 address formats, address types, and the IPv6 packet header, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of Cisco IOS IPv6 Configuration Library on Cisco.com.

In the "Implementing Addressing and Basic Connectivity" chapter, these sections apply to the Catalyst 2960, 2960-S, 2960-C, 2960-X, 2960-CX and 3560-CX switches:

- IPv6 Address Formats
- IPv6 Address Type: Multicast
- IPv6 Address Output Display
- Simplified IPv6 Packet Header

Supported IPv6 Unicast Routing Features

These sections describe the IPv6 protocol features supported by the switch:
128-Bit Wide Unicast Addresses

The switch supports aggregatable global unicast addresses and link-local unicast addresses. It does not support site-local unicast addresses.

- Aggregatable global unicast addresses are IPv6 addresses from the aggregatable global unicast prefix. The address structure enables strict aggregation of routing prefixes and limits the number of routing table entries in the global routing table. These addresses are used on links that are aggregated through organizations and eventually to the Internet service provider.

These addresses are defined by a global routing prefix, a subnet ID, and an interface ID. Current global unicast address allocation uses the range of addresses that start with binary value 001 (2000::/3). Addresses with a prefix of 2000::/3(001) through E000::/3(111) must have 64-bit interface identifiers in the extended unique identifier (EUI)-64 format.

- Link local unicast addresses can be automatically configured on any interface by using the link-local prefix FE80::/10(1111111010) and the interface identifier in the modified EUI format. Link-local addresses are used in the neighbor discovery protocol (NDP) and the stateless autoconfiguration process. Nodes on a local link use link-local addresses and do not require globally unique addresses to communicate. IPv6 routers do not forward packets with link-local source or destination addresses to other links.

For more information, see the section about IPv6 unicast addresses in the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.

DNS for IPv6

IPv6 supports Domain Name System (DNS) record types in the DNS name-to-address and address-to-name lookup processes. The DNS AAAA resource record types support IPv6 addresses and are equivalent to an A address record in IPv4. The switch supports DNS resolution for IPv4 and IPv6.

ICMPv6

The Internet Control Message Protocol (ICMP) in IPv6 generates error messages, such as ICMP destination unreachable messages, to report errors during processing and other diagnostic functions. In IPv6, ICMP packets are also used in the neighbor discovery protocol and path MTU discovery.

Neighbor Discovery

The switch supports NDP for IPv6, a protocol running on top of ICMPv6, and static neighbor entries for IPv6 stations that do not support NDP. The IPv6 neighbor discovery process uses ICMP messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), to verify the reachability of the neighbor, and to keep track of neighboring routers.

The switch supports ICMPv6 redirect for routes with mask lengths less than 64 bits. ICMP redirect is not supported for host routes or for summarized routes with mask lengths greater than 64 bits.

Neighbor discovery throttling ensures that the switch CPU is not unnecessarily burdened while it is in the process of obtaining the next hop forwarding information to route an IPv6 packet. The switch drops any additional IPv6 packets whose next hop is the same neighbor that the switch is actively trying to resolve. This drop avoids further load on the CPU.

IPv6 Stateless Autoconfiguration and Duplicate Address Detection

The switch uses stateless autoconfiguration to manage link, subnet, and site addressing changes, such as management of host and mobile IP addresses. A host autonomously configures its own link-local address, and booting nodes send router solicitations to request router advertisements for configuring interfaces.
For more information about autoconfiguration and duplicate address detection, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of Cisco IOS IPv6 Configuration Library on Cisco.com.

IPv6 Applications

The switch has IPv6 support for these applications:

- Ping, traceroute, and Telnet
- Secure Shell (SSH) over an IPv6 transport
- HTTP server access over IPv6 transport
- DNS resolver for AAAA over IPv4 transport
- Cisco Discovery Protocol (CDP) support for IPv6 addresses

For more information about managing these applications, see the Cisco IOS IPv6 Configuration Library on Cisco.com.

Dual IPv4 and IPv6 Protocol Stacks

On a Catalyst 2960-X switch, you must use the dual IPv4 and IPv6 template to allocate ternary content addressable memory (TCAM) usage to both IPv4 and IPv6 protocols.

This figure shows a router forwarding both IPv4 and IPv6 traffic through the same interface, based on the IP packet and destination addresses.

*Figure 7: Dual IPv4 and IPv6 Support on an Interface*

Use the dual IPv4 and IPv6 switch database management (SDM) template to enable IPv6 routing dual stack environments (supporting both IPv4 and IPv6). For more information about the dual IPv4 and IPv6 SDM template, see Configuring SDM Templates.

The dual IPv4 and IPv6 templates allow the switch to be used in dual stack environments.

- If you try to configure IPv6 without first selecting a dual IPv4 and IPv6 template, a warning message appears.
- In IPv4-only environments, the switch routes IPv4 packets and applies IPv4 QoS and ACLs in hardware. IPv6 packets are not supported.
- In dual IPv4 and IPv6 environments, the switch applies IPv4 QoS and ACLs in hardware.
- IPv6 QoS and ACLs are not supported.
- If you do not plan to use IPv6, do not use the dual stack template because this template results in less hardware memory capacity for each resource.
For more information about IPv4 and IPv6 protocol stacks, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of Cisco IOS IPv6 Configuration Library on Cisco.com.

**SNMP and Syslog Over IPv6**

To support both IPv4 and IPv6, IPv6 network management requires both IPv6 and IPv4 transports. Syslog over IPv6 supports address data types for these transports.

SNMP and syslog over IPv6 provide these features:

- Support for both IPv4 and IPv6
- IPv6 transport for SNMP and to modify the SNMP agent to support traps for an IPv6 host
- SNMP- and syslog-related MIBs to support IPv6 addressing
- Configuration of IPv6 hosts as trap receivers

For support over IPv6, SNMP modifies the existing IP transport mapping to simultaneously support IPv4 and IPv6. These SNMP actions support IPv6 transport management:

- Opens User Datagram Protocol (UDP) SNMP socket with default settings
- Provides a new transport mechanism called SR_IPV6_TRANSPORT
- Sends SNMP notifications over IPv6 transport
- Supports SNMP-named access lists for IPv6 transport
- Supports SNMP proxy forwarding using IPv6 transport
- Verifies SNMP Manager feature works with IPv6 transport

For information on SNMP over IPv6, including configuration procedures, see the “Managing Cisco IOS Applications over IPv6” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.

For information about syslog over IPv6, including configuration procedures, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.

**HTTP(S) Over IPv6**

The HTTP client sends requests to both IPv4 and IPv6 HTTP servers, which respond to requests from both IPv4 and IPv6 HTTP clients. URLs with literal IPv6 addresses must be specified in hexadecimal using 16-bit values between colons.

The accept socket call chooses an IPv4 or IPv6 address family. The accept socket is either an IPv4 or IPv6 socket. The listening socket continues to listen for both IPv4 and IPv6 signals that indicate a connection. The IPv6 listening socket is bound to an IPv6 wildcard address.

The underlying TCP/IP stack supports a dual-stack environment. HTTP relies on the TCP/IP stack and the sockets for processing network-layer interactions.

Basic network connectivity (ping) must exist between the client and the server hosts before HTTP connections can be made.

For more information, see the “Managing Cisco IOS Applications over IPv6” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.
IPv6 and Switch Stacks

The switch supports IPv6 forwarding across the stack and IPv6 host functionality on the stack master. The stack master runs IPv6 host functionality and IPv6 applications.

While the new stack master is being elected and is resetting, the switch stack does not forward IPv6 packets. The stack MAC address changes, which also changes the IPv6 address. When you specify the stack IPv6 address with an extended unique identifier (EUI) by using the `ipv6 address ipv6-prefix/prefix length eui-64` interface configuration command, the address is based on the interface MAC address. See the "Configuring IPv6 Addressing and Enabling IPv6 Host" section.

If you configure the persistent MAC address feature on the stack and the stack master changes, the stack MAC address does not change for approximately 4 minutes. For more information, see the "Enabling Persistent MAC Address" section in "Managing Switch Stacks."

Default IPv6 Configuration

<td>None configured</td>
</tr>
</tbody>
</table>

Configuring IPv6 Addressing and Enabling IPv6 Routing

This section describes how to assign IPv6 addresses to individual Layer 3 interfaces and to globally forward IPv6 traffic on the switch.

Before configuring IPv6 on the switch, consider these guidelines:

- Be sure to select a dual IPv4 and IPv6 SDM template.
- In the `ipv6 address` interface configuration command, you must enter the `ipv6-address` and `ipv6-prefix` variables with the address specified in hexadecimal using 16-bit values between colons. The `prefix-length` variable (preceded by a slash `/`) is a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

To forward IPv6 traffic on an interface, you must configure a global IPv6 address on that interface. Configuring an IPv6 address on an interface automatically configures a link-local address and activates IPv6 for the interface. The configured interface automatically joins these required multicast groups for that link:

- solicited-node multicast group FF02::0:0:0:1:ff00::1/104 for each unicast address assigned to the interface (this address is used in the neighbor discovery process.)
- all-nodes link-local multicast group FF02::1
- all-routers link-local multicast group FF02::2

For more information about configuring IPv6 routing, see the “Implementing Addressing and Basic Connectivity for IPv6” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.
Beginning in privileged EXEC mode, follow these steps to assign an IPv6 address to a Layer 3 interface and enable IPv6 forwarding:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>sdm prefer dual-ipv4-and-ipv6 {default}</code></td>
<td>Selects an SDM template that supports IPv4 and IPv6.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>sdm prefer dual-ipv4-and-ipv6 default</code></td>
<td><em>default</em>—Sets the switch to the default template to balance system resources.</td>
</tr>
<tr>
<td>3</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>end</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>reload</code></td>
<td>Reloads the operating system.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch# <code>reload</code></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode after the switch reloads.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><code>interface interface-id</code></td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Use one of the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>ipv6 address ipv6-prefix/prefix-length eui-64</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>ipv6 address ipv6-address/prefix-length</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>ipv6 address ipv6-address link-local</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>ipv6 enable</code></td>
<td><em>Specifies a global IPv6 address with an extended unique identifier (EUI) in the low-order 64 bits of the IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address. This enables IPv6 processing on the interface.</em></td>
</tr>
</tbody>
</table>
### Configuring IPv6 ICMP Rate Limiting

ICMP rate limiting is enabled by default with a default interval between error messages of 100 milliseconds and a bucket size (maximum number of tokens to be stored in a bucket) of 10.

To change the ICMP rate-limiting parameters, perform this procedure:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64</td>
<td>• Manually configures an IPv6 address on the interface.</td>
</tr>
<tr>
<td>Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 link-local</td>
<td>• Specifies a link-local address on the interface to be used instead of the link-local address that is automatically configured when IPv6 is enabled on the interface. This command enables IPv6 processing on the interface.</td>
</tr>
<tr>
<td>Switch(config-if)# ipv6 enable</td>
<td>• Automatically configures an IPv6 link-local address on the interface, and enables the interface for IPv6 processing. The link-local address can only be used to communicate with nodes on the same link.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>exit</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>show ipv6 interface interface-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ipv6 icmp error-interval [bucketsize]</td>
<td>Configures the interval and bucket size for IPv6 ICMP error messages:</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ipv6 icmp error-interval 50 20</td>
<td>• <em>interval</em>—The interval (in milliseconds) between tokens being added to the bucket. The range is from 0 to 2,147,483,647 milliseconds.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <em>bucketsize</em>—(Optional) The maximum number of tokens stored in the bucket. The range is from 1 to 200.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>show ipv6 interface [interface-id]</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>

<td></td>
</tr>
<tr>
<td></td>
<td>Switch# show ipv6 interface gigabitethernet0/1</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Static Routing for IPv6 (CLI)

Before configuring a static IPv6 route, you must enable routing by using the `ip routing` global configuration command, enable the forwarding of IPv6 packets by using the `ipv6 unicast-routing` global configuration command, and enable IPv6 on at least one Layer 3 interface by configuring an IPv6 address on the interface.

For more information about configuring static IPv6 routing, see the “Implementing Static Routes for IPv6” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ipv6 route ipv6-prefix/prefix length {ipv6-address</td>
<td>interface-id [ipv6-address]} [administrative distance]</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130</td>
<td></td>
</tr>
</tbody>
</table>

- **ipv6-prefix**—The IPv6 network that is the destination of the static route. It can also be a hostname when static host routes are configured.
- **/prefix length**—The length of the IPv6 prefix. A decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.
- **ipv6-address**—The IPv6 address of the next hop that can be used to reach the specified network. The IPv6 address of the next hop need not be directly connected; recursion is done to find the IPv6 address of the directly connected next hop. The address must be in the form documented in RFC 2373, specified in hexadecimal using 16-bit values between colons.
- **interface-id**—Specifies direct static routes from point-to-point and broadcast interfaces. With point-to-point interfaces, there is no need to specify the IPv6 address of the next hop. With broadcast interfaces, you should always specify the IPv6 address of the next hop, or ensure that the specified prefix is assigned to the link, specifying a link-local address as the next hop. You can optionally specify the IPv6
### Table

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>addressofthenexthoptowhichpacketsaresent.</strong></td>
<td>You must specify an <em>interface-id</em> when using a link-local address as the next hop (the link-local next hop must also be an adjacent router).</td>
</tr>
</tbody>
</table>

- **Note**

  - *administrative distance*—(Optional) An administrative distance. The range is 1 to 254; the default value is 1, which gives static routes precedence over any other type of route except connected routes. To configure a floating static route, use an administrative distance greater than that of the dynamic routing protocol.

### Step 3

**end**

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

### Step 4

**Use one of the following:**

- **show ipv6 static** [ipv6-address | ipv6-prefix/prefix length] [interface interface-id] [detail] [recursive] [updated]
- **show ipv6 route static**

**Example:**

```
Switch# show ipv6 static 2001:0DB8::/32
interface gigabitethernet2/0/1
```

or

```
Switch# show ipv6 route static
```

Verifies your entries by displaying the contents of the IPv6 routing table.

- **interface interface-id**—(Optional)
  Displays only those static routes with the specified interface as an egress interface.

- **recursive**—(Optional) Displays only recursive static routes. The recursive keyword is mutually exclusive with the interface keyword, but it can be used with or without the IPv6 prefix included in the command syntax.

- **detail**—(Optional) Displays this additional information:
  - For valid recursive routes, the output path set, and maximum resolution depth.
  - For invalid routes, the reason why the route is not valid.

### Step 5

**copy running-config startup-config**

**Example:**

(Optional) Saves your entries in the configuration file.
## Displaying IPv6

For complete syntax and usage information on these commands, see the Cisco IOS command reference publications.

### Table 24: Command for Monitoring IPv6

<table>
<thead>

## Configuration Examples for IPv6 Unicast Routing

### Configuring IPv6 Addressing and Enabling IPv6 Routing: Example

This example shows how to enable IPv6 with both a link-local address and a global address based on the IPv6 prefix 2001:0DB8:c18:1::/64. The EUI-64 interface ID is used in the low-order 64 bits of both addresses. Output from the `show ipv6 interface` EXEC command is included to show how the interface ID (20B:46FF:FE2F:D940) is appended to the link-local prefix FE80::/64 of the interface.

```plaintext
Switch(config)# ipv6 unicast-routing
Switch(config)# interface gigabitethernet0/11
Switch(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
```
Switch(config-if)# end
Switch# show ipv6 interface gigabitethernet0/11
GigabitEthernet0/11 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
Global unicast address(es):
2001:0DB8:c18:1:20B:46FF:FE2F:D940, subnet is 2001:0DB8:c18:1::/64 [EUI]
Joined group address(es):
FF02::1
FF02::2
FF02::1:FF2F:D940
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
Hosts use stateless autoconfig for addresses.

Configuring IPv6 ICMP Rate Limiting: Example

This example shows how to configure an IPv6 ICMP error message interval of 50 milliseconds and a bucket size of 20 tokens.

Switch(config)# ipv6 icmp error-interval 50 20

Configuring Static Routing for IPv6: Example

This example shows how to configure a floating static route to an interface with an administrative distance of 130:

Switch(config)# ipv6 route 2001:0DB8::/32 gigabitethernet 1/0/1 130

Displaying IPv6: Example

This is an example of the output from the show ipv6 interface privileged EXEC command:

Switch# show ipv6 interface
Vlan1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
Global unicast address(es):
3FFE:0000:0:1:20B:46FF:FE2F:D940, subnet is 3FFE:0000:0:1::/64 [EUI]
Joined group address(es):
FF02::1
FF02::2
FF02::1:FF2F:D940
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds

Configuring IPv6 ACL

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IPv6 ACLs

You can filter IP version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic.

**Note**

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the `sdm prefer {default | dual-ipv4-and-ipv6}` global configuration command.

Understanding IPv6 ACLs

A switch image supports two types of IPv6 ACLs:
• IPv6 router ACLs - Supported on inbound or outbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. Applied to only IPv6 packets that are routed.

• IPv6 port ACLs - Supported on inbound traffic on Layer 2 interfaces only. Applied to all IPv6 packets entering the interface.

If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take affect.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface.

As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

• When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

• When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

### Supported ACL Features

IPv6 ACLs on the switch have these characteristics:

• Fragmented frames (the fragments keyword as in IPv4) are supported.

• The same statistics supported in IPv4 are supported for IPv6 ACLs.

• If the switch runs out of TCAM space, packets associated with the ACL label are forwarded to the CPU, and the ACLs are applied in software.

• Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.

• Logging is supported for router ACLs, but not for port ACLs.

### IPv6 ACL Limitations

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

• IPv6 source and destination addresses-ACL matching is supported only on prefixes from /0 to /64 and host addresses (/128) that are in the extended universal identifier (EUI)-64 format. The switch supports only these host addresses with no loss of information.
- aggregatable global unicast addresses
- link local addresses

• The switch does not support matching on these keywords: flowlabel, routing header, and undetermined-transport.

• The switch does not support reflexive ACLs (the reflect keyword).

• This release supports only port ACLs and router ACLs for IPv6; it does not support VLAN ACLs (VLAN maps).

• The switch does not apply MAC-based ACLs on IPv6 frames.

• You cannot apply IPv6 port ACLs to Layer 2 EtherChannels.

• The switch does not apply MAC-based ACLs on IPv6 frames.

• Output router ACLs and input port ACLs for IPv6 are supported only on Switches support only control plane (incoming) IPv6 ACLs.

• When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.

• If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

## Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

### Before you begin

Before configuring IPv6 ACLs, you must select one of the dual IPv4 and IPv6 SDM templates.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Create an IPv6 ACL, and enter IPv6 access list configuration mode.</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Configure the IPv6 ACL to block (deny) or pass (permit) traffic.</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.</td>
<td></td>
</tr>
</tbody>
</table>
Default IPv6 ACL Configuration

There are no IPv6 ACLs configured or applied.

Interaction with Other Features and Switches

• If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

• If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.

• You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

• You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.

• If the hardware memory is full, for any additional configured ACLs, packets are dropped to the CPU, and the ACLs are applied in software. When the hardware is full a message is printed to the console indicating the ACL has been unloaded and the packets will be dropped on the interface.

Note

Only packets of the same type as the ACL that could not be added (ipv4, ipv6, MAC) will be dropped on the interface.

Creating IPv6 ACL

Follow these steps to create an IPv6 ACL:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ipv6access-list access-list-name</code></td>
<td>Define an IPv6 access list name, and enter IPv6 access-list configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
ipv6 access-list access-list-name
```

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td>`{deny</td>
<td>permit} protocol`</td>
</tr>
</tbody>
</table>

- For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, stcp, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.

- The source-ipv6-prefix/prefix-length or destination-ipv6-prefix/prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

- Enter any as an abbreviation for the IPv6 prefix ::/0.

- For host source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.

- (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range.

- If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/prefix-length argument, it must match the destination port.

- (Optional) The port-number is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is ipv6.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter log to cause an logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter routing to specify that IPv6 packets be routed.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.</td>
<td></td>
</tr>
</tbody>
</table>

Step 5

{deny|permit} tcp

Example:

{deny | permit} tcp
{source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address}
{operator | port-number}
{destination-ipv6-prefix/prefix-length | any | hostdestination-ipv6-address}
{operator | port-number} [ack] [dscp value] [established] [fin]
{log} [log-input] [neq {port | protocol}]
[psh] {range | port | protocol}
[rst] [routing] [sequence value]
[syn] [time-range name] [urg]

(Optional) Define a TCP access list and the access conditions.

Enter tcp for Transmission Control Protocol. The parameters are the same as those described in Step 3, with these additional optional parameters:

- ack—Acknowledgment bit set.
- established—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.
- fin—Finished bit set; no more data from sender.
- neq {port | protocol}—Matches only packets that are not on a given port number.
- psh—Push function bit set.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• range {port</td>
</tr>
<tr>
<td></td>
<td>• rst—Reset bit set.</td>
</tr>
<tr>
<td></td>
<td>• syn—Synchronize bit set.</td>
</tr>
<tr>
<td></td>
<td>• urg—Urgent pointer bit set.</td>
</tr>
</tbody>
</table>

**Step 6**

{deny|permit} udp

**Example:**

```plaintext
(deny | permit) udp (source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address) [operator (port-number)] [destination-ipv6-prefix/prefix-length | any | hostdestination-ipv6-address] [operator [port-number]|[dscp value] [log][log-input] [neq (port |protocol)] [range (port |protocol)] [routing][sequence value][time-range name]
```

(Optional) Define a UDP access list and the access conditions.

Enter udp for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the operator [port] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.

**Step 7**

{deny|permit} icmp

**Example:**

```plaintext
(deny | permit) icmp (source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address) [operator [port-number]| (destination-ipv6-prefix/prefix-length | any | hostdestination-ipv6-address] [operator [port-number]] [icmp-type [icmp-code] [icmp-message] [dscpvalue] [log][log-input] [routing] [sequence value][time-range name]
```

(Optional) Define an ICMP access list and the access conditions.

Enter icmp for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 3a, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:

• icmp-type—Enter to filter by ICMP message type, a number from 0 to 255.

• icmp-code—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.

• icmp-message—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.

**Step 8**

end

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 9**

show ipv6 access-list

Verify the access list configuration.
Applying an IPv6 ACL to an Interface

This section describes how to apply IPv6 ACLs to network interfaces. You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode.</td>
</tr>
<tr>
<td>interface interface_id</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# interface interface-id</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 3**                         | If applying a router ACL, change the interface from Layer 2 mode (the default) to Layer 3 mode. |}
| no switchport                     |                                                                         |
| Example:                           |                                                                         |
| Switch# no switchport              |                                                                         |
| **Step 4**                         | Configure an IPv6 address on a Layer 3 interface (for router ACLs). This command is not required on Layer 2 interfaces or if the interface has already been configured with an explicit IPv6 address. |}
| ipv6 address ipv6_address          |                                                                         |
| Example:                           |                                                                         |
| Switch# ipv6 address ipv6-address  |                                                                         |
Purpose
Command or Action

Step 5
ipv6 traffic-filter access-list-name
Example:
Switch# ipv6 traffic-filter
access-list-name {in | out}

Apply the access list to incoming or outgoing traffic on the interface. The out keyword is not supported for Layer 2 interfaces (port ACLs).

Step 6
des
Example:
Switch(config)# end

Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Step 7
show running-config

Verify the access list configuration.

Step 8
copy running-config startup-config

(Optional) Saves your entries in the configuration file.

Displaying IPv6 ACLs

To display IPv6 ACLs, perform this procedure:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
</tbody>
</table>
| Example:
 Switch> enable |
| |
| Step 2 configure terminal | Enters global configuration mode. |
| Example:
 Switch# configure terminal |
| |
| Step 3 show access-list | Displays all access lists configured on the switch |
| Example:
 Switch# show access-lists |
| |
| Step 4 show ipv6 access-list acl_name | Displays all configured IPv6 access list or the access list specified by name. |
| Example:
 Switch# show ipv6 access-list (access-list-name) |
## Configuration Examples for IPv6 ACL

### Example: Creating IPv6 ACL

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

Logging is supported only on Layer 3 interfaces.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch (config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
```

### Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

```
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

### Example: Displaying IPv6 ACLs

This is an example of the output from the `show access-lists` privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch #show access-lists
Extended IP access list hello
10 permit ip any any
IPv6 access list ipv6
permit ipv6 any any sequence 10
```

This is an example of the output from the show ipv6 access-lists privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
permit tcp any any eq bgp (8 matches) sequence 10
permit tcp any any eq telnet (15 matches) sequence 20
permit udp any any sequence 30
IPv6 access list outbound
deny udp any any sequence 10
deny tcp any any eq telnet sequence 20
```

CHAPTER 15

Configuring Spanning Tree Protocol

This chapter describes how to configure the Spanning Tree Protocol (STP) on port-based VLANs on the Catalyst switches. The switch can use either the per-VLAN spanning-tree plus (PVST+) protocol based on the IEEE 802.1D standard and Cisco proprietary extensions, or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol based on the IEEE 802.1w standard. A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID.

- Finding Feature Information, on page 193
- Restrictions for STP, on page 193
- Information About Spanning Tree Protocol, on page 194
- How to Configure Spanning-Tree Features, on page 206
- Monitoring Spanning-Tree Status, on page 218
- Feature Information for STP, on page 218

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for STP

- An attempt to configure a switch as the root switch fails if the value necessary to be the root switch is less than 1.

- If your network consists of switches that support and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

- The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.
Information About Spanning Tree Protocol

Spanning Tree Protocol

Spanning Tree Protocol (STP) is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Switches might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one switch of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- **Root**—A forwarding port elected for the spanning-tree topology
- **Designated**—A forwarding port elected for every switched LAN segment
- **Alternate**—A blocked port providing an alternate path to the root bridge in the spanning tree
- **Backup**—A blocked port in a loopback configuration

The switch that has all of its ports as the designated role or as the backup role is the root switch. The switch that has at least one of its ports in the designated role is called the designated switch.

Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Switches send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The switches do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending switch and its ports, including switch and MAC addresses, switch priority, port priority, and path cost. Spanning tree uses this information to elect the root switch and root port for the switched network and the root port and designated port for each switched segment.

When two ports on a switch are part of a loop, the spanning-tree and path cost settings control which port is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of a port in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.

---

**Note**

By default, the switch sends keepalive messages (to ensure the connection is up) only on interfaces that do not have small form-factor pluggable (SFP) modules. You can change the default for an interface by entering the `[no] keepalive` interface configuration command with no keywords.
Spanning-Tree Topology and BPDUs

The stable, active spanning-tree topology of a switched network is controlled by these elements:

- The unique bridge ID (switch priority and MAC address) associated with each VLAN on each switch. In a switch stack, all switches use the same bridge ID for a given spanning-tree instance.
- The spanning-tree path cost to the root switch.
- The port identifier (port priority and MAC address) associated with each Layer 2 interface.

When the switches in a network are powered up, each functions as the root switch. Each switch sends a configuration BPDU through all of its ports. The BPDUs communicate and compute the spanning-tree topology. Each configuration BPDU contains this information:

- The unique bridge ID of the switch that the sending switch identifies as the root switch
- The spanning-tree path cost to the root
- The bridge ID of the sending switch
- Message age
- The identifier of the sending interface
- Values for the hello, forward delay, and max-age protocol timers

When a switch receives a configuration BPDU that contains superior information (lower bridge ID, lower path cost, and so forth), it stores the information for that port. If this BPDU is received on the root port of the switch, the switch also forwards it with an updated message to all attached LANs for which it is the designated switch.

If a switch receives a configuration BPDU that contains inferior information to that currently stored for that port, it discards the BPDU. If the switch is a designated switch for the LAN from which the inferior BPDU was received, it sends that LAN a BPDU containing the up-to-date information stored for that port. In this way, inferior information is discarded, and superior information is propagated on the network.

A BPDU exchange results in these actions:

- One switch in the network is elected as the root switch (the logical center of the spanning-tree topology in a switched network). See the figure following the bullets.

  For each VLAN, the switch with the highest switch priority (the lowest numerical priority value) is elected as the root switch. If all switches are configured with the default priority (32768), the switch with the lowest MAC address in the VLAN becomes the root switch. The switch priority value occupies the most significant bits of the bridge ID, as shown in the following figure.

- A root port is selected for each switch (except the root switch). This port provides the best path (lowest cost) when the switch forwards packets to the root switch.

- Only one outgoing port on the stack root switch is selected as the root port. The remaining switches in the stack become its designated switches (Switch 2 and Switch 3) as shown in the following figure.

- The shortest distance to the root switch is calculated for each switch based on the path cost.

- A designated switch for each LAN segment is selected. The designated switch incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.
If the **logging event spanning tree** command is configured on multiple interfaces and the topology changes, it may result in several logging messages and high CPU utilization. This may cause the switch to drop or delay the processing of STP BPDUs.

To prevent this behavior, remove the **logging event spanning tree** and **logging event status** commands or disable logging to the console.

---

### Figure 8: Spanning-Tree Port States in a Switch Stack

One stack member is elected as the stack root switch. The stack root switch contains the outgoing root port

![Diagram of spanning-tree port states in a switch stack]

All paths that are not needed to reach the root switch from anywhere in the switched network are placed in the spanning-tree blocking mode.

### Bridge ID, Device Priority, and Extended System ID

The IEEE 802.1D standard requires that each switch has an unique bridge identifier (bridge ID), which controls the selection of the root switch. Because each VLAN is considered as a different logical bridge with PVST+ and Rapid PVST+, the same switch must have a different bridge ID for each configured VLAN. Each VLAN on the switch has a unique 8-byte bridge ID. The 2 most-significant bytes are used for the switch priority, and the remaining 6 bytes are derived from the switch MAC address.

The switch supports the IEEE 802.1t spanning-tree extensions, and some of the bits previously used for the switch priority are now used as the VLAN identifier. The result is that fewer MAC addresses are reserved for
the switch, and a larger range of VLAN IDs can be supported, all while maintaining the uniqueness of the bridge ID.

The 2 bytes previously used for the switch priority are reallocated into a 4-bit priority value and a 12-bit extended system ID value equal to the VLAN ID.

**Table 25: Device Priority Value and Extended System ID**

<table>
<thead>
<tr>
<th>Priority Value</th>
<th>Extended System ID (Set Equal to the VLAN ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 16 Bit 15 Bit 14 Bit 13 Bit 12 Bit 11 Bit 10 Bit 9 Bit 8 Bit 7 Bit 6 Bit 5 Bit 4 Bit 3 Bit 2 Bit 1</td>
<td>32768 16384 8192 4096 2048 1024 512 256 128 64 32 16 8 4 2 1</td>
</tr>
</tbody>
</table>

Spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN. Because the switch stack appears as a single switch to the rest of the network, all switches in the stack use the same bridge ID for a given spanning tree. If the stack master fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the new stack master.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For example, when you change the switch priority value, you change the probability that the switch will be elected as the root switch. Configuring a higher value decreases the probability; a lower value increases the probability.

If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. 4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in the table.

**Port Priority Versus Path Cost**

If a loop occurs, spanning tree uses port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

The spanning-tree path cost default value is derived from the media speed of an interface. If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

If your switch is a member of a switch stack, you must assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last instead of adjusting its port priority. For details, see Related Topics.
Spanning-Tree Interface States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When an interface transitions directly from nonparticipation in the spanning-tree topology to the forwarding state, it can create temporary data loops. Interfaces must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for forwarded frames that have used the old topology.

Each Layer 2 interface on a switch using spanning tree exists in one of these states:

- **Blocking**—The interface does not participate in frame forwarding.
- **Listening**—The first transitional state after the blocking state when the spanning tree decides that the interface should participate in frame forwarding.
- **Learning**—The interface prepares to participate in frame forwarding.
- **Forwarding**—The interface forwards frames.
- **Disabled**—The interface is not participating in spanning tree because of a shutdown port, no link on the port, or no spanning-tree instance running on the port.

An interface moves through these states:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled
An interface moves through the states.

When you power up the switch, spanning tree is enabled by default, and every interface in the switch, VLAN, or network goes through the blocking state and the transitory states of listening and learning. Spanning tree stabilizes each interface at the forwarding or blocking state.

When the spanning-tree algorithm places a Layer 2 interface in the forwarding state, this process occurs:

1. The interface is in the listening state while spanning tree waits for protocol information to move the interface to the blocking state.
2. While spanning tree waits for the forward-delay timer to expire, it moves the interface to the learning state and resets the forward-delay timer.
3. In the learning state, the interface continues to block frame forwarding as the switch learns end-station location information for the forwarding database.
4. When the forward-delay timer expires, spanning tree moves the interface to the forwarding state, where both learning and frame forwarding are enabled.

**Blocking State**

A Layer 2 interface in the blocking state does not participate in frame forwarding. After initialization, a BPDU is sent to each switch interface. A switch initially functions as the root until it exchanges BPDUs with other switches. This exchange establishes which switch in the network is the root or root switch. If there is only one switch in the network, no exchange occurs, the forward-delay timer expires, and the interface moves to the listening state. An interface always enters the blocking state after switch initialization.

An interface in the blocking state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs
Listening State

The listening state is the first state a Layer 2 interface enters after the blocking state. The interface enters this state when the spanning tree decides that the interface should participate in frame forwarding.

An interface in the listening state performs these functions:

• Discards frames received on the interface
• Discards frames switched from another interface for forwarding
• Does not learn addresses
• Receives BPDUs

Learning State

A Layer 2 interface in the learning state prepares to participate in frame forwarding. The interface enters the learning state from the listening state.

An interface in the learning state performs these functions:

• Discards frames received on the interface
• Discards frames switched from another interface for forwarding
• Learns addresses
• Receives BPDUs

Forwarding State

A Layer 2 interface in the forwarding state forwards frames. The interface enters the forwarding state from the learning state.

An interface in the forwarding state performs these functions:

• Receives and forwards frames received on the interface
• Forwards frames switched from another interface
• Learns addresses
• Receives BPDUs

Disabled State

A Layer 2 interface in the disabled state does not participate in frame forwarding or in the spanning tree. An interface in the disabled state is nonoperational.

A disabled interface performs these functions:

• Discards frames received on the interface
• Discards frames switched from another interface for forwarding
• Does not learn addresses
• Does not receive BPDUs
How a Switch or Port Becomes the Root Switch or Root Port

If all switches in a network are enabled with default spanning-tree settings, the switch with the lowest MAC address becomes the root switch.

Figure 10: Spanning-Tree Topology

Switch A is elected as the root switch because the switch priority of all the switches is set to the default (32768) and Switch A has the lowest MAC address. However, because of traffic patterns, number of forwarding interfaces, or link types, Switch A might not be the ideal root switch. By increasing the priority (lowering the numerical value) of the ideal switch so that it becomes the root switch, you force a spanning-tree recalculation to form a new topology with the ideal switch as the root.

When the spanning-tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links to an interface that has a higher number than the root port can cause a root-port change. The goal is to make the fastest link the root port.

For example, assume that one port on Switch B is a Gigabit Ethernet link and that another port on Switch B (a 10/100 link) is the root port. Network traffic might be more efficient over the Gigabit Ethernet link. By changing the spanning-tree port priority on the Gigabit Ethernet port to a higher priority (lower numerical value) than the root port, the Gigabit Ethernet port becomes the new root port.

Configuring Port Priority, on page 211

Spanning Tree and Redundant Connectivity

Figure 11: Spanning Tree and Redundant Connectivity

You can create a redundant backbone with spanning tree by connecting two switch interfaces to another device or to two different devices. Spanning tree automatically disables one interface but enables it if the other one fails. If one link is high-speed and the other is low-speed, the low-speed link is always disabled. If the speeds
are the same, the port priority and port ID are added together, and spanning tree disables the link with the highest value.

You can also create redundant links between switches by using EtherChannel groups.

### Spanning-Tree Address Management

IEEE 802.1D specifies 17 multicast addresses, ranging from 0x00180C2000000 to 0x0180C2000010, to be used by different bridge protocols. These addresses are static addresses that cannot be removed.

Regardless of the spanning-tree state, each switch in the stack receives but does not forward packets destined for addresses between 0x0180C2000000 and 0x0180C20000F.

If spanning tree is enabled, the CPU on the switch or on each switch in the stack receives packets destined for 0x0180C2000000 and 0x0180C2000010. If spanning tree is disabled, the switch or each switch in the stack forwards those packets as unknown multicast addresses.

### Accelerated Aging to Retain Connectivity

The default for aging dynamic addresses is 5 minutes, the default setting of the `mac address-table aging-time` global configuration command. However, a spanning-tree reconfiguration can cause many station locations to change. Because these stations could be unreachable for 5 minutes or more during a reconfiguration, the address-aging time is accelerated so that station addresses can be dropped from the address table and then relearned. The accelerated aging is the same as the forward-delay parameter value (`spanning-tree vlan vlan-id forward-time seconds` global configuration command) when the spanning tree reconfigures.

Because each VLAN is a separate spanning-tree instance, the switch accelerates aging on a per-VLAN basis. A spanning-tree reconfiguration on one VLAN can cause the dynamic addresses learned on that VLAN to be subject to accelerated aging. Dynamic addresses on other VLANs can be unaffected and remain subject to the aging interval entered for the switch.

### Spanning-Tree Modes and Protocols

The switch supports these spanning-tree modes and protocols:
• PVST+—This spanning-tree mode is based on the IEEE 802.1D standard and Cisco proprietary extensions. The PVST+ runs on each VLAN on the switch up to the maximum supported, ensuring that each has a loop-free path through the network.

The PVST+ provides Layer 2 load-balancing for the VLAN on which it runs. You can create different logical topologies by using the VLANs on your network to ensure that all of your links are used but that no one link is oversubscribed. Each instance of PVST+ on a VLAN has a single root switch. This root switch propagates the spanning-tree information associated with that VLAN to all other switches in the network. Because each switch has the same information about the network, this process ensures that the network topology is maintained.

• Rapid PVST+—This spanning-tree mode is the same as PVST+ except that it uses a rapid convergence based on the IEEE 802.1w standard. Beginning from 15.2(4)E release, the STP default mode is Rapid PVST+. To provide rapid convergence, the Rapid PVST+ immediately deletes dynamically learned MAC address entries on a per-port basis upon receiving a topology change. By contrast, PVST+ uses a short aging time for dynamically learned MAC address entries.

Rapid PVST+ uses the same configuration as PVST+ (except where noted), and the switch needs only minimal extra configuration. The benefit of Rapid PVST+ is that you can migrate a large PVST+ install base to Rapid PVST+ without having to learn the complexities of the Multiple Spanning Tree Protocol (MSTP) configuration and without having to reprovision your network. In Rapid PVST+ mode, each VLAN runs its own spanning-tree instance up to the maximum supported.

• MSTP—This spanning-tree mode is based on the IEEE 802.1s standard. You can map multiple VLANs to the same spanning-tree instance, which reduces the number of spanning-tree instances required to support a large number of VLANs. The MSTP runs on top of the RSTP (based on IEEE 802.1w), which provides for rapid convergence of the spanning tree by eliminating the forward delay and by quickly transitioning root ports and designated ports to the forwarding state. In a switch stack, the cross-stack rapid transition (CSRT) feature performs the same function as RSTP. You cannot run MSTP without RSTP or CSRT.

Related Topics
Changing the Spanning-Tree Mode, on page 206

Supported Spanning-Tree Instances

In PVST+ or Rapid PVST+ mode, the switch or switch stack supports up to 128 spanning-tree instances.

In MSTP mode, the switch or switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

Spanning-Tree Interoperability and Backward Compatibility

In a mixed MSTP and PVST+ network, the common spanning-tree (CST) root must be inside the MST backbone, and a PVST+ switch cannot connect to multiple MST regions.

When a network contains switches running Rapid PVST+ and switches running PVST+, we recommend that the Rapid PVST+ switches and PVST+ switches be configured for different spanning-tree instances. In the
Rapid PVST+ spanning-tree instances, the root switch must be a Rapid PVST+ switch. In the PVST+ instances, the root switch must be a PVST+ switch. The PVST+ switches should be at the edge of the network.

All stack members run the same version of spanning tree (all PVST+, all Rapid PVST+, or all MSTP).

**STP and IEEE 802.1Q Trunks**

The IEEE 802.1Q standard for VLAN trunks imposes some limitations on the spanning-tree strategy for a network. The standard requires only one spanning-tree instance for all VLANs allowed on the trunks. However, in a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for each VLAN allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch uses PVST+ to provide spanning-tree interoperability. If Rapid PVST+ is enabled, the switch uses it instead of PVST+. The switch combines the spanning-tree instance of the IEEE 802.1Q VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch.

However, all PVST+ or Rapid PVST+ information is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

Rapid PVST+ is automatically enabled on IEEE 802.1Q trunks, and no user configuration is required. The external spanning-tree behavior on access ports and Inter-Switch Link (ISL) trunk ports is not affected by PVST+.

**VLAN-Bridge Spanning Tree**

Cisco VLAN-bridge spanning tree is used with the fallback bridging feature (bridge groups), which forwards non-IP protocols such as DECnet between two or more VLAN bridge domains or routed ports. The VLAN-bridge spanning tree allows the bridge groups to form a spanning tree on top of the individual VLAN spanning trees to prevent loops from forming if there are multiple connections among VLANs. It also prevents the individual spanning trees from the VLANs being bridged from collapsing into a single spanning tree.

To support VLAN-bridge spanning tree, some of the spanning-tree timers are increased. To use the fallback bridging feature, you must have the IP services feature set enabled on your switch.

**Spanning Tree and Switch Stacks**

When the switch stack is operating in PVST+ or Rapid PVST+ mode:
• A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the stack master.

• When a new switch joins the stack, it sets its bridge ID to the stack master bridge ID. If the newly added switch has the lowest ID and if the root path cost is the same among all stack members, the newly added switch becomes the stack root.

• When a stack member leaves the stack, spanning-tree reconvergence occurs within the stack (and possibly outside the stack). The remaining stack member with the lowest stack port ID becomes the stack root.

• If the stack master fails or leaves the stack, the stack members elect a new stack master, and all stack members change their bridge IDs of the spanning trees to the new master bridge ID.

• If the switch stack is the spanning-tree root and the stack master fails or leaves the stack, the stack members elect a new stack master, and a spanning-tree reconvergence occurs.

• If the switch stack is the spanning-tree root and the stack master fails or leaves the stack, the standby switch becomes the new active switch, bridge IDs remain the same, and a spanning-tree reconvergence might occur.

• If a neighboring switch external to the switch stack fails or is powered down, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of losing a switch in the active topology.

• If a new switch external to the switch stack is added to the network, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of adding a switch in the network.

How to Configure Spanning-Tree Features

Changing the Spanning-Tree Mode

The switch supports three spanning-tree modes: per-VLAN spanning tree plus (PVST+), Rapid PVST+, or multiple spanning tree protocol (MSTP). By default, the switch runs the Rapid PVST+ protocol.

If you want to enable a mode that is different from the default mode, this procedure is required.

Procedure

---

**Disabling Spanning Tree**

Spanning tree is enabled by default on VLAN 1 and on all newly created VLANs up to the spanning-tree limit. Disable spanning tree only if you are sure there are no loops in the network topology.

---

**Caution**

When spanning tree is disabled and loops are present in the topology, excessive traffic and indefinite packet duplication can drastically reduce network performance.

This procedure is optional.
### Configuring the Root Switch

To configure a switch as the root for the specified VLAN, use the `spanning-tree vlan vlan-id root` global configuration command to modify the switch priority from the default value (32768) to a significantly lower value. When you enter this command, the software checks the switch priority of the root switches for each VLAN. Because of the extended system ID support, the switch sets its own priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN.

Use the `diameter` keyword to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

This procedure is optional.

<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the `spanning-tree vlan vlan-id hello-time`, `spanning-tree vlan vlan-id forward-time`, and the `spanning-tree vlan vlan-id max-age` global configuration commands.

Configuring a Secondary Root Device

When you configure a switch as the secondary root, the switch priority is modified from the default value (32768) to 28672. With this priority, the switch is likely to become the root switch for the specified VLAN if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768, and therefore, are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the `spanning-tree vlan vlan-id root primary` global configuration command.

This procedure is optional.

Configuring Port Priority

Note
If your switch is a member of a switch stack, you must use the `spanning-tree [vlan vlan-id] cost cost` interface configuration command instead of the `spanning-tree [vlan vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

This procedure is optional.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>

</tbody>
</table>
| `Switch(config-if)# spanning-tree vlan 20-25 port-priority 0` | - For `priority`, the range is 0 to 240, in increments of 16; the default is 128. Valid values are 0, 16, 32, 48, 64, 80, 96, 112,
### Configuring Path Cost

This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1     | **enable**        | Enables privileged EXEC mode.  
  Example:  
  Switch> enable |  |
| 2     | **configure terminal** | Enters global configuration mode.  
  Example:  
  Switch# configure terminal |  |
| 3     | **interface interface-id** | Specifies an interface to configure, and enters interfae configuration mode. Valid interfaces include physical ports and port-channel logical interfaces (**port-channel** port-channel-number).  
  Example:  
  Switch(config)# interface gigabitethernet 1/0/1 |  |
| 4     | **spanning-tree cost** cost | Configures the cost for an interface.  
  Example:  
  Switch(config-if)# spanning-tree cost 250 |  |
Purpose

Command or Action

Step 5

spanning-tree vlan vlan-id cost cost

Example:

Switch(config-if)# spanning-tree vlan 10,12-15,20 cost 300

Purpose

Configures the cost for a VLAN.

Example:

If a loop occurs, spanning tree uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.

• For vlan-id, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.

• For cost, the range is 1 to 200000000; the default value is derived from the media speed of the interface.

Step 6

end

Example:

Switch(config-if)# end

Purpose

Returns to privileged EXEC mode.

The `show spanning-tree interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

Related Topics

`Port Priority Versus Path Cost`, on page 197

Configuring the Device Priority of a VLAN

You can configure the switch priority and make it more likely that a standalone switch or a switch in the stack will be chosen as the root switch.

Note

Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree vlan vlan-id root primary` and the `spanning-tree vlan vlan-id root secondary` global configuration commands to modify the switch priority.

This procedure is optional.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

• Enter your password if prompted.
### Configuring the Hello Time

The hello time is the time interval between configuration messages generated and sent by the root switch. This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  - enable
  - Example: `Switch> enable`

Enables privileged EXEC mode.

  - Enter your password if prompted.
### Configuring the Forwarding-Delay Time for a VLAN

This procedure is optional.

**Procedure**

<table>

</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures the forward time of a VLAN. The forwarding delay is the number of seconds an interface waits before changing from its spanning-tree learning and listening states to the forwarding state.</td>
</tr>
</tbody>
</table>

#### Configuring the Hello Time for a VLAN

**Purpose**

Configure the hello time of a VLAN. The hello time is the time interval between configuration spanning-tree vlan vlan-id hello-time seconds

**Example:**

```
Switch(config)# spanning-tree vlan 20-24 hello-time 3
```

- For `vlan-id`, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
- For `seconds`, the range is 1 to 10; the default is 2.

#### Configuring the Forwarding-Delay Time for a VLAN

`Step 2`

**Purpose**

Configures the forward time of a VLAN. The forwarding delay is the number of seconds an interface waits before changing from its spanning-tree learning and listening states to the forwarding state.

**Example:**

```
Switch(config)# spanning-tree vlan 20,25 forward-time 18
```

- For `vlan-id`, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen,
### Configuring the Maximum-Aging Time for a VLAN

This procedure is optional.

#### Procedure

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MSTP

- For two or more switches to be in the same multiple spanning tree (MST) region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.

- For two or more stacked switches to be in the same MST region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.

- For load-balancing across redundant paths in the network to work, all VLAN-to-instance mapping assignments must match; otherwise, all traffic flows on a single link. You can achieve load-balancing across a switch stack by manually configuring the path cost.

- For load-balancing between a per-VLAN spanning tree plus (PVST+) and an MST cloud or between a rapid-PVST+ and an MST cloud to work, all MST boundary ports must be forwarding. MST boundary ports are forwarding when the internal spanning tree (IST) master of the MST cloud is the root of the common spanning tree (CST). If the MST cloud consists of multiple MST regions, one of the MST
regions must contain the CST root, and all of the other MST regions must have a better path to the root contained within the MST cloud than a path through the PVST+ or rapid-PVST+ cloud. You might have to manually configure the switches in the clouds.

**Related Topics**

- MSTP Configuration Guidelines, on page 221
- Multiple Spanning-Tree Regions, on page 223

## Restrictions for MSTP

- The switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.
- PVST+, Rapid PVST+, and MSTP are supported, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run Rapid PVST+, or all VLANs run MSTP.)
- All stack members must run the same version of spanning tree (all PVST+, Rapid PVST+, or MSTP).
- VLAN Trunking Protocol (VTP) propagation of the MST configuration is not supported. However, you can manually configure the MST configuration (region name, revision number, and VLAN-to-instance mapping) on each switch within the MST region by using the command-line interface (CLI) or through the Simple Network Management Protocol (SNMP) support.
- Partitioning the network into a large number of regions is not recommended. However, if this situation is unavoidable, we recommend that you partition the switched LAN into smaller LANs interconnected by routers or non-Layer 2 devices.
- A region can have one member or multiple members with the same MST configuration; each member must be capable of processing rapid spanning tree protocol (RSTP) Bridge Protocol Data Units (BPDUs). There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.
- After configuring a switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the `spanning-tree mst hello-time`, `spanning-tree mst forward-time`, and the `spanning-tree mst max-age` global configuration commands.

Information About MSTP

**MSTP Configuration**

MSTP, which uses RSTP for rapid convergence, enables multiple VLANs to be grouped into and mapped to the same spanning-tree instance, reducing the number of spanning-tree instances needed to support a large number of VLANs. The MSTP provides for multiple forwarding paths for data traffic, enables load balancing, and reduces the number of spanning-tree instances required to support a large number of VLANs. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

---

**Note**

The multiple spanning-tree (MST) implementation is based on the IEEE 802.1s standard.

The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. This deployment provides the highly available network required in a service-provider environment.

When the switch is in the MST mode, the RSTP, which is based on IEEE 802.1w, is automatically enabled. The RSTP provides rapid convergence of the spanning tree through explicit handshaking that eliminates the IEEE 802.1D forwarding delay and quickly transitions root ports and designated ports to the forwarding state.

Both MSTP and RSTP improve the spanning-tree operation and maintain backward compatibility with equipment that is based on the (original) IEEE 802.1D spanning tree, with existing Cisco-proprietary Multiple Instance STP (MISTP), and with existing Cisco PVST+ and rapid per-VLAN spanning-tree plus (Rapid PVST+).

A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same switch ID.

**MSTP Configuration Guidelines**

- When you enable MST by using the `spanning-tree mode mst` global configuration command, RSTP is automatically enabled.

- For configuration guidelines about UplinkFast, BackboneFast, and cross-stack UplinkFast, see the relevant sections in the Related Topics section.

- When the switch is in MST mode, it uses the long path-cost calculation method (32 bits) to compute the path cost values. With the long path-cost calculation method, the following path cost values are supported:

<table>
<thead>
<tr>
<th>Speed</th>
<th>Path Cost Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Mb/s</td>
<td>2,000,000</td>
</tr>
<tr>
<td>100 Mb/s</td>
<td>200,000</td>
</tr>
<tr>
<td>1 Gb/s</td>
<td>20,000</td>
</tr>
</tbody>
</table>
### Root Switch

The switch maintains a spanning-tree instance for the group of VLANs mapped to it. A switch ID, consisting of the switch priority and the switch MAC address, is associated with each instance. For a group of VLANs, the switch with the lowest switch ID becomes the root switch.

When you configure a switch as the root, you modify the switch priority from the default value (32768) to a significantly lower value so that the switch becomes the root switch for the specified spanning-tree instance. When you enter this command, the switch checks the switch priorities of the root switches. Because of the extended system ID support, the switch sets its own priority for the specified instance to 24576 if this value will cause this switch to become the root for the specified spanning-tree instance.

If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value. For more information, select "Bridge ID, Switch Priority, and Extended System ID" link in Related Topics.

If your network consists of switches that support and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.

Use the `diameter` keyword, which is available only for MST instance 0, to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

**Multiple Spanning-Tree Regions**

For switches to participate in multiple spanning-tree (MST) instances, you must consistently configure the switches with the same MST configuration information. A collection of interconnected switches that have the same MST configuration comprises an MST region.

The MST configuration controls to which MST region each switch belongs. The configuration includes the name of the region, the revision number, and the MST VLAN-to-instance assignment map. You configure the switch for a region by specifying the MST region configuration on it. You can map VLANs to an MST instance, specify the region name, and set the revision number. For instructions and an example, select the "Specifying the MST Region Configuration and Enabling MSTP" link in Related Topics.

A region can have one or multiple members with the same MST configuration. Each member must be capable of processing RSTP bridge protocol data units (BPDUs). There is no limit to the number of MST regions in a network, but each region can support up to 65 spanning-tree instances. Instances can be identified by any number in the range from 0 to 4094. You can assign a VLAN to only one spanning-tree instance at a time.

**IST, CIST, and CST**

Unlike PVST+ and Rapid PVST+ in which all the spanning-tree instances are independent, the MSTP establishes and maintains two types of spanning trees:

- An internal spanning tree (IST), which is the spanning tree that runs in an MST region.

  Within each MST region, the MSTP maintains multiple spanning-tree instances. Instance 0 is a special instance for a region, known as the internal spanning tree (IST). All other MST instances are numbered from 1 to 4094.

  The IST is the only spanning-tree instance that sends and receives BPDUs. All of the other spanning-tree instance information is contained in M-records, which are encapsulated within MSTP BPDUs. Because the MSTP BPDU carries information for all instances, the number of BPDUs that need to be processed to support multiple spanning-tree instances is significantly reduced.

  All MST instances within the same region share the same protocol timers, but each MST instance has its own topology parameters, such as root switch ID, root path cost, and so forth. By default, all VLANs are assigned to the IST.

  An MST instance is local to the region; for example, MST instance 1 in region A is independent of MST instance 1 in region B, even if regions A and B are interconnected.

- A common and internal spanning tree (CIST), which is a collection of the ISTs in each MST region, and the common spanning tree (CST) that interconnects the MST regions and single spanning trees.
The spanning tree computed in a region appears as a subtree in the CST that encompasses the entire switched domain. The CIST is formed by the spanning-tree algorithm running among switches that support the IEEE 802.1w, IEEE 802.1s, and IEEE 802.1D standards. The CIST inside an MST region is the same as the CST outside a region.

Operations Within an MST Region

The IST connects all the MSTP switches in a region. When the IST converges, the root of the IST becomes the CIST regional root (called the IST master before the implementation of the IEEE 802.1s standard). It is the switch within the region with the lowest switch ID and path cost to the CIST root. The CIST regional root is also the CIST root if there is only one region in the network. If the CIST root is outside the region, one of the MSTP switches at the boundary of the region is selected as the CIST regional root.

When an MSTP switch initializes, it sends BPDUs claiming itself as the root of the CIST and the CIST regional root, with both of the path costs to the CIST root and to the CIST regional root set to zero. The switch also initializes all of its MST instances and claims to be the root for all of them. If the switch receives superior MST root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, it relinquishes its claim as the CIST regional root.

During initialization, a region might have many subregions, each with its own CIST regional root. As switches receive superior IST information, they leave their old subregions and join the new subregion that contains the true CIST regional root. All subregions shrink except for the one that contains the true CIST regional root.

For correct operation, all switches in the MST region must agree on the same CIST regional root. Therefore, any two switches in the region only synchronize their port roles for an MST instance if they converge to a common CIST regional root.

Related Topics
Illustration of MST Regions, on page 225

Operations Between MST Regions

If there are multiple regions or legacy IEEE 802.1D switches within the network, MSTP establishes and maintains the CST, which includes all MST regions and all legacy STP switches in the network. The MST instances combine with the IST at the boundary of the region to become the CST.

The IST connects all the MSTP switches in the region and appears as a subtree in the CIST that encompasses the entire switched domain. The root of the subtree is the CIST regional root. The MST region appears as a virtual switch to adjacent STP switches and MST regions.

Only the CST instance sends and receives BPDUs, and MST instances add their spanning-tree information into the BPDUs to interact with neighboring switches and compute the final spanning-tree topology. Because of this, the spanning-tree parameters related to BPDU transmission (for example, hello time, forward time, max-age, and max-hops) are configured only on the CST instance but affect all MST instances. Parameters related to the spanning-tree topology (for example, switch priority, port VLAN cost, and port VLAN priority) can be configured on both the CST instance and the MST instance.

MSTP switches use Version 3 RSTP BPDUs or IEEE 802.1D STP BPDUs to communicate with legacy IEEE 802.1D switches. MSTP switches use MSTP BPDUs to communicate with MSTP switches.

Related Topics
Illustration of MST Regions, on page 225
IEEE 802.1s Terminology

Some MST naming conventions used in Cisco’s prestandard implementation have been changed to identify some internal or regional parameters. These parameters are significant only within an MST region, as opposed to external parameters that are relevant to the whole network. Because the CIST is the only spanning-tree instance that spans the whole network, only the CIST parameters require the external rather than the internal or regional qualifiers.

- The CIST root is the root switch for the unique instance that spans the whole network, the CIST.
- The CIST external root path cost is the cost to the CIST root. This cost is left unchanged within an MST region. Remember that an MST region looks like a single switch for the CIST. The CIST external root path cost is the root path cost calculated between these virtual switches and switches that do not belong to any region.
- The CIST regional root was called the IST master in the prestandard implementation. If the CIST root is in the region, the CIST regional root is the CIST root. Otherwise, the CIST regional root is the closest switch to the CIST root in the region. The CIST regional root acts as a root switch for the IST.
- The CIST internal root path cost is the cost to the CIST regional root in a region. This cost is only relevant to the IST, instance 0.

Illustration of MST Regions

This figure displays three MST regions and a legacy IEEE 802.1D switch (D). The CIST regional root for region 1 (A) is also the CIST root. The CIST regional root for region 2 (B) and the CIST regional root for region 3 (C) are the roots for their respective subtrees within the CIST. The RSTP runs in all regions.
Hop Count

The IST and MST instances do not use the message-age and maximum-age information in the configuration BPDU to compute the spanning-tree topology. Instead, they use the path cost to the root and a hop-count mechanism similar to the IP time-to-live (TTL) mechanism.

By using the `spanning-tree mst max-hops` global configuration command, you can configure the maximum hops inside the region and apply it to the IST and all MST instances in that region. The hop count achieves the same result as the message-age information (triggers a reconfiguration). The root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the maximum value. When a switch receives this BPDU, it decrements the received remaining hop count by one and propagates this value as the remaining hop count in the BPDUs it generates. When the count reaches zero, the switch discards the BPDU and ages the information held for the port.

The message-age and maximum-age information in the RSTP portion of the BPDU remain the same throughout the region, and the same values are propagated by the region designated ports at the boundary.
Boundary Ports

In the Cisco prestandard implementation, a boundary port connects an MST region to a single spanning-tree region running RSTP, to a single spanning-tree region running PVST+ or rapid PVST+, or to another MST region with a different MST configuration. A boundary port also connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

There is no definition of a boundary port in the IEEE 802.1s standard. The IEEE 802.1Q-2002 standard identifies two kinds of messages that a port can receive:

- internal (coming from the same region)
- external (coming from another region)

When a message is internal, the CIST part is received by the CIST, and each MST instance receives its respective M-record.

When a message is external, it is received only by the CIST. If the CIST role is root or alternate, or if the external BPDU is a topology change, it could have an impact on the MST instances.

An MST region includes both switches and LANs. A segment belongs to the region of its designated port. Therefore, a port in a different region than the designated port for a segment is a boundary port. This definition allows two ports internal to a region to share a segment with a port belonging to a different region, creating the possibility of a port receiving both internal and external messages.

The primary change from the Cisco prestandard implementation is that a designated port is not defined as boundary, unless it is running in an STP-compatible mode.

---

**Note**

If there is a legacy STP switch on the segment, messages are always considered external.

The other change from the Cisco prestandard implementation is that the CIST regional root switch ID field is now inserted where an RSTP or legacy IEEE 802.1Q switch has the sender switch ID. The whole region performs like a single virtual switch by sending a consistent sender switch ID to neighboring switches. In this example, switch C would receive a BPDU with the same consistent sender switch ID of root, whether or not A or B is designated for the segment.

IEEE 802.1s Implementation

The Cisco implementation of the IEEE MST standard includes features required to meet the standard, as well as some of the desirable prestandard functionality that is not yet incorporated into the published standard.

Port Role Naming Change

The boundary role is no longer in the final MST standard, but this boundary concept is maintained in Cisco’s implementation. However, an MST instance port at a boundary of the region might not follow the state of the corresponding CIST port. Two boundary roles currently exist:

- The boundary port is the root port of the CIST regional root—When the CIST instance port is proposed and is in sync, it can send back an agreement and move to the forwarding state only after all the corresponding MSTI ports are in sync (and thus forwarding). The MSTI ports now have a special master role.
• The boundary port is not the root port of the CIST regional root—The MSTI ports follow the state and role of the CIST port. The standard provides less information, and it might be difficult to understand why an MSTI port can be alternately blocking when it receives no BPDUs (MRecords). In this case, although the boundary role no longer exists, the show commands identify a port as boundary in the type column of the output.

Interoperation Between Legacy and Standard Switches

Because automatic detection of prestandard switches can fail, you can use an interface configuration command to identify prestandard ports. A region cannot be formed between a standard and a prestandard switch, but they can interoperate by using the CIST. Only the capability of load-balancing over different instances is lost in that particular case. The CLI displays different flags depending on the port configuration when a port receives prestandard BPDUs. A syslog message also appears the first time a switch receives a prestandard BPDU on a port that has not been configured for prestandard BPDU transmission.

Figure 13: Standard and Prestandard Switch Interoperation

Assume that A is a standard switch and B a prestandard switch, both configured to be in the same region. A is the root switch for the CIST, and B has a root port (BX) on segment X and an alternate port (BY) on segment Y. If segment Y flaps, and the port on BY becomes the alternate before sending out a single prestandard BPDU, AY cannot detect that a prestandard switch is connected to Y and continues to send standard BPDUs. The port BY is fixed in a boundary, and no load balancing is possible between A and B. The same problem exists on segment X, but B might transmit topology changes.

We recommend that you minimize the interaction between standard and prestandard MST implementations.

Detecting Unidirectional Link Failure

This feature is not yet present in the IEEE MST standard, but it is included in this Cisco IOS release. The software checks the consistency of the port role and state in the received BPDUs to detect unidirectional link failures that could cause bridging loops.

When a designated port detects a conflict, it keeps its role, but reverts to the discarding state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.
Figure 14: Detecting Unidirectional Link Failure

This figure illustrates a unidirectional link failure that typically creates a bridging loop. Switch A is the root switch, and its BPDUs are lost on the link leading to switch B. RSTP and MST BPDU sends include the role and state of the sending port. With this information, switch A can detect that switch B does not react to the superior BPDUs it sends and that switch B is the designated, not root switch. As a result, switch A blocks (or keeps blocking) its port, which prevents the bridging loop.

MSTP and Switch Stacks

A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the stack master.

The stack master is the stack root when the stack is the root of the network and no root selection has been made within the stack.

If the switch stack is the spanning-tree root and the stack master fails or leaves the stack, the standby switch becomes the new active switch, bridge IDs remain the same, and a spanning-tree reconvergence might occur.

If a switch that does not support MSTP is added to a switch stack that does support MSTP or the reverse, the switch is put into a version mismatch state. If possible, the switch is automatically upgraded or downgraded to the same version of software that is running on the switch stack.

When a new switch joins the stack, it sets its switch ID to the switch ID. If the newly added switch has the lowest ID and if the root path cost is the same among all stack members, the newly added switch becomes the stack root. A topology change occurs if the newly added switch contains a better root port for the switch stack or a better designated port for the LAN connected to the stack. The newly added switch causes a topology change in the network if another switch connected to the newly added switch changes its root port or designated ports.

When a stack member leaves the stack, spanning-tree reconvergence occurs within the stack (and possibly outside the stack). The remaining stack member with the lowest stack port ID becomes the stack root.

If the stack master fails or leaves the stack, the stack members elect a new stack master, and all stack members change their switch IDs of the spanning trees to the new master switch ID.

Interoperability with IEEE 802.1D STP

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDU on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MSTP BPDU (Version 3) associated with a different region, or an RSTP BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDU because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch might also continue to assign a boundary role to a port when the
switch to which this switch is connected has joined the region. To restart the protocol migration process (force the renegotiation with neighboring switches), use the `clear spanning-tree detected-protocols` privileged EXEC command.

If all the legacy switches on the link are RSTP switches, they can process MSTP BPDUs as if they are RSTP BPDUs. Therefore, MSTP switches send either a Version 0 configuration and TCN BPDUs or Version 3 MSTP BPDUs on a boundary port. A boundary port connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

**RSTP Overview**

The RSTP takes advantage of point-to-point wiring and provides rapid convergence of the spanning tree. Reconfiguration of the spanning tree can occur in less than 1 second (in contrast to 50 seconds with the default settings in the IEEE 802.1D spanning tree).

**Port Roles and the Active Topology**

The RSTP provides rapid convergence of the spanning tree by assigning port roles and by learning the active topology. The RSTP builds upon the IEEE 802.1D STP to select the switch with the highest switch priority (lowest numerical priority value) as the root switch. The RSTP then assigns one of these port roles to individual ports:

- **Root port**—Provides the best path (lowest cost) when the switch forwards packets to the root switch.
- **Designated port**—Connects to the designated switch, which incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.
- **Alternate port**—Offers an alternate path toward the root switch to that provided by the current root port.
- **Backup port**—Acts as a backup for the path provided by a designated port toward the leaves of the spanning tree. A backup port can exist only when two ports are connected in a loopback by a point-to-point link or when a switch has two or more connections to a shared LAN segment.
- **Disabled port**—Has no role within the operation of the spanning tree.

A port with the root or a designated port role is included in the active topology. A port with the alternate or backup port role is excluded from the active topology.

In a stable topology with consistent port roles throughout the network, the RSTP ensures that every root port and designated port immediately transition to the forwarding state while all alternate and backup ports are always in the discarding state (equivalent to blocking in IEEE 802.1D). The port state controls the operation of the forwarding and learning processes.

To be consistent with Cisco STP implementations, this guide defines the port state as *blocking* instead of *discarding*. Designated ports start in the listening state.

### Rapid Convergence

The RSTP provides for rapid recovery of connectivity following the failure of a switch, a switch port, or a LAN. It provides rapid convergence for edge ports, new root ports, and ports connected through point-to-point links as follows:

- **Edge ports**—If you configure a port as an edge port on an RSTP switch by using the `spanning-tree portfast` interface configuration command, the edge port immediately transitions to the forwarding state. An edge port is the same as a Port Fast-enabled port, and you should enable it only on ports that connect to a single end station.

- **Root ports**—If the RSTP selects a new root port, it blocks the old root port and immediately transitions the new root port to the forwarding state.

- **Point-to-point links**—If you connect a port to another port through a point-to-point link and the local port becomes a designated port, it negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

*Figure 15: Proposal and Agreement Handshaking for Rapid Convergence*

Switch A is connected to Switch B through a point-to-point link, and all of the ports are in the blocking state. Assume that the priority of Switch A is a smaller numerical value than the priority of Switch B. Switch A sends a proposal message (a configuration BPDU with the proposal flag set) to Switch B, proposing itself as the designated switch.

After receiving the proposal message, Switch B selects as its new root port the port from which the proposal message was received, forces all nonedge ports to the blocking state, and sends an agreement message (a BPDU with the agreement flag set) through its new root port.

After receiving Switch B’s agreement message, Switch A also immediately transitions its designated port to the forwarding state. No loops in the network are formed because Switch B blocked all of its nonedge ports and because there is a point-to-point link between Switches A and B.

When Switch C is connected to Switch B, a similar set of handshaking messages are exchanged. Switch C selects the port connected to Switch B as its root port, and both ends immediately transition to the forwarding state. With each iteration of this handshaking process, one more switch joins the active topology. As the network converges, this proposal-agreement handshaking progresses from the root toward the leaves of the spanning tree.

In a switch stack, the cross-stack rapid transition (CSRT) feature ensures that a stack member receives acknowledgments from all stack members during the proposal-agreement handshaking before moving the port to the forwarding state. CSRT is automatically enabled when the switch is in MST mode.

The switch learns the link type from the port duplex mode: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. You can override
the default setting that is controlled by the duplex setting by using the spanning-tree link-type interface configuration command.

Synchronization of Port Roles

When the switch receives a proposal message on one of its ports and that port is selected as the new root port, the RSTP forces all other ports to synchronize with the new root information.

The switch is synchronized with superior root information received on the root port if all other ports are synchronized. An individual port on the switch is synchronized if

- That port is in the blocking state.
- It is an edge port (a port configured to be at the edge of the network).

If a designated port is in the forwarding state and is not configured as an edge port, it transitions to the blocking state when the RSTP forces it to synchronize with new root information. In general, when the RSTP forces a port to synchronize with root information and the port does not satisfy any of the above conditions, its port state is set to blocking.

**Figure 16: Sequence of Events During Rapid Convergence**

After ensuring that all of the ports are synchronized, the switch sends an agreement message to the designated switch corresponding to its root port. When the switches connected by a point-to-point link are in agreement
about their port roles, the RSTP immediately transitions the port states to forwarding.

Bridge Protocol Data Unit Format and Processing

The RSTP BPDU format is the same as the IEEE 802.1D BPDU format except that the protocol version is set to 2. A new 1-byte Version 1 Length field is set to zero, which means that no version 1 protocol information is present.

The sending switch sets the proposal flag in the RSTP BPDU to propose itself as the designated switch on that LAN. The port role in the proposal message is always set to the designated port.
The sending switch sets the agreement flag in the RSTP BPDU to accept the previous proposal. The port role in the agreement message is always set to the root port.

The RSTP does not have a separate topology change notification (TCN) BPDU. It uses the topology change (TC) flag to show the topology changes. However, for interoperability with IEEE 802.1D switches, the RSTP switch processes and generates TCN BPFDUs.

The learning and forwarding flags are set according to the state of the sending port.

**Processing Superior BPDU Information**

If a port receives superior root information (lower switch ID, lower path cost, and so forth) than currently stored for the port, the RSTP triggers a reconfiguration. If the port is proposed and is selected as the new root port, RSTP forces all the other ports to synchronize.

If the BPDU received is an RSTP BPDU with the proposal flag set, the switch sends an agreement message after all of the other ports are synchronized. If the BPDU is an IEEE 802.1D BPDU, the switch does not set the proposal flag and starts the forward-delay timer for the port. The new root port requires twice the forward-delay time to transition to the forwarding state.

If the superior information received on the port causes the port to become a backup or alternate port, RSTP sets the port to the blocking state but does not send the agreement message. The designated port continues sending BPFDUs with the proposal flag set until the forward-delay timer expires, at which time the port transitions to the forwarding state.

**Processing Inferior BPDU Information**

If a designated port receives an inferior BPDU (such as a higher switch ID or a higher path cost than currently stored for the port) with a designated port role, it immediately replies with its own information.

**Topology Changes**

This section describes the differences between the RSTP and the IEEE 802.1D in handling spanning-tree topology changes.

- **Detection**—Unlike IEEE 802.1D in which any transition between the blocking and the forwarding state causes a topology change, only transitions from the blocking to the forwarding state cause a topology change with RSTP (only an increase in connectivity is considered a topology change). State changes on an edge port do not cause a topology change. When an RSTP switch detects a topology change, it deletes the learned information on all of its nonedge ports except on those from which it received the TC notification.

- **Notification**—Unlike IEEE 802.1D, which uses TCN BPFDUs, the RSTP does not use them. However, for IEEE 802.1D interoperability, an RSTP switch processes and generates TCN BPFDUs.

- **Acknowledgement**—When an RSTP switch receives a TCN message on a designated port from an IEEE 802.1D switch, it replies with an IEEE 802.1D configuration BPDU with the TCA bit set. However, if the TC-while timer (the same as the topology-change timer in IEEE 802.1D) is active on a root port connected to an IEEE 802.1D switch and a configuration BPDU with the TCA bit set is received, the TC-while timer is reset. This behavior is only required to support IEEE 802.1D switches. The RSTP BPFDUs never have the TCA bit set.

- **Propagation**—When an RSTP switch receives a TC message from another switch through a designated or root port, it propagates the change to all of its nonedge, designated ports and to the root port (excluding
the port on which it is received). The switch starts the TC-while timer for all such ports and flushes the information learned on them.

- Protocol migration—For backward compatibility with IEEE 802.1D switches, RSTP selectively sends IEEE 802.1D configuration BPDUs and TCN BPDUs on a per-port basis.

When a port is initialized, the migrate-delay timer is started (specifies the minimum time during which RSTP BPDUs are sent), and RSTP BPDUs are sent. While this timer is active, the switch processes all BPDUs received on that port and ignores the protocol type.

If the switch receives an IEEE 802.1D BPDU after the port migration-delay timer has expired, it assumes that it is connected to an IEEE 802.1D switch and starts using only IEEE 802.1D BPDUs. However, if the RSTP switch is using IEEE 802.1D BPDUs on a port and receives an RSTP BPDU after the timer has expired, it restarts the timer and starts using RSTP BPDUs on that port.

### Protocol Migration Process

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or an RST BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

### About MST-to-PVST+ Interoperability (PVST+ Simulation)

The PVST+ simulation feature enables seamless interoperability between MST and Rapid PVST+. You can enable or disable this per port, or globally. PVST+ simulation is enabled by default.

However, you may want to control the connection between MST and Rapid PVST+ to protect against accidentally connecting an MST-enabled port to a Rapid PVST+-enabled port. Because Rapid PVST+ is the default STP mode, you may encounter many Rapid PVST+-enabled connections.

Disabling this feature causes the switch to stop the MST region from interacting with PVST+ regions. The MST-enabled port moves to a PVST peer inconsistent (blocking) state once it detects it is connected to a Rapid PVST+-enabled port. This port remains in the inconsistent state until the port stops receiving Shared Spanning Tree Protocol (SSTP) BPDUs, and then the port resumes the normal STP transition process.

You can for instance, disable PVST+ simulation, to prevent an incorrectly configured switch from connecting to a network where the STP mode is not MSTP (the default mode is PVST+).

Observe these guidelines when you configure MST switches (in the same region) to interact with PVST+ switches:

- Configure the root for all VLANs inside the MST region as shown in this example:

  ```
  Switch# show spanning-tree mst interface gigabitethernet 1/1
  GigabitEthernet1/1 of MST00 is root forwarding
  Edge port: no (trunk) port guard : none (default)
  Link type: point-to-point (auto) bpdu filter: disable (default)
  Boundary : boundary (PVST) bpdu guard : disable (default)
  Bpdus sent 10, received 310

**Related Topics**

- Supported Spanning-Tree Instances, on page 203
- Specifying the MST Region Configuration and Enabling MSTP, on page 239
The ports that belong to the MST switch at the boundary simulate PVST+ and send PVST+ BPDUs for all the VLANs.

If you enable loop guard on the PVST+ switches, the ports might change to a loop-inconsistent state when the MST switches change their configuration. To correct the loop-inconsistent state, you must disable and re-enable loop guard on that PVST+ switch.

- Do not locate the root for some or all of the VLANs inside the PVST+ side of the MST switch because when the MST switch at the boundary receives PVST+ BPDUs for all or some of the VLANs on its designated ports, root guard sets the port to the blocking state.

- When you connect a PVST+ switch to two different MST regions, the topology change from the PVST+ switch does not pass beyond the first MST region. In such a case, the topology changes are propagated only in the instance to which the VLAN is mapped. The topology change stays local to the first MST region, and the Cisco Access Manager (CAM) entries in the other region are not flushed. To make the topology change visible throughout other MST regions, you can map that VLAN to IST or connect the PVST+ switch to the two regions through access links.

- When you disable the PVST+ simulation, note that the PVST+ peer inconsistency can also occur while the port is already in other states of inconsistency. For example, the root bridge for all STP instances must all be in either the MST region or the Rapid PVST+ side. If the root bridge for all STP instances are not on one side or the other, the software moves the port into a PVST+ simulation-inconsistent state.

**Note**

We recommend that you put the root bridge for all STP instances in the MST region.

---

### About Detecting Unidirectional Link Failure

The dispute mechanism that detects unidirectional link failures is included in the IEEE 802.1D-2004 RSTP and IEEE 802.1Q-2005 MSTP standard, and requires no user configuration.

The switch checks the consistency of the port role and state in the BPDUs it receives, to detect unidirectional link failures that could cause bridging loops. When a designated port detects a conflict, it keeps its role, but reverts to a discarding (blocking) state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.

For example, in the figure below, Switch A is the root bridge and Switch B is the designated port. BPDUs from Switch A are lost on the link leading to switch B.

**Figure 17: Detecting Unidirectional Link Failure**

Since Rapid PVST+ (802.1w) and MST BPDUs include the role and state of the sending port, Switch A detects (from the inferior BPDU), that switch B does not react to the superior BPDUs it sends, because switch B has the role of a designated port and not the root bridge. As a result, switch A blocks (or keeps blocking) its port, thus preventing the bridging loop.
Note these guidelines and limitations relating to the dispute mechanism:

- It works only on switches running RSTP or MST (the dispute mechanism requires reading the role and state of the port initiating BPDUs).

- It may result in loss of connectivity. For example, in the figure below, Bridge A cannot transmit on the port it elected as a root port. As a result of this situation, there is loss of connectivity (r1 and r2 are designated, a1 is root and a2 is alternate. There is only a one way connectivity between A and R).

**Figure 18: Loss of Connectivity**

- It may cause permanent bridging loops on shared segments. For example, in the figure below, suppose that bridge R has the best priority, and that port b1 cannot receive any traffic from the shared segment 1 and sends inferior designated information on segment 1. Both r1 and a1 can detect this inconsistency. However, with the current dispute mechanism, only r1 will revert to discarding while the root port a1 opens a permanent loop. However, this problem does not occur in Layer 2 switched networks that are connected by point-to-point links.

**Figure 19: Bridging Loops on Shared Segments**
How to Configure MSTP Features

Specifying the MST Region Configuration and Enabling MSTP

For two or more switches to be in the same MST region, they must have the same VLAN-to-instance mapping, the same configuration revision number, and the same name.

A region can have one member or multiple members with the same MST configuration; each member must be capable of processing RSTP BPDUs. There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>spanning-tree mst configuration</td>
<td>Enters MST configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# spanning-tree mst configuration</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>instance instance-id vlan vlan-range</td>
<td>Maps VLANs to an MST instance.</td>
</tr>
<tr>
<td>Example:</td>
<td>• For <code>instance-id</code>, the range is 0 to 4094.</td>
</tr>
<tr>
<td></td>
<td>• For <code>vlan vlan-range</code>, the range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>When you map VLANs to an MST instance, the mapping is incremental, and the VLANs specified in the command are added to or removed from the VLANs that were previously mapped.</td>
</tr>
<tr>
<td></td>
<td>To specify a VLAN range, use a hyphen; for example, <code>instance 1 vlan 1-63</code> maps VLANs 1 through 63 to MST instance 1.</td>
</tr>
</tbody>
</table>
### Specifying the MST Region Configuration and Enabling MSTP

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>To specify a VLAN series, use a comma; for example, <strong>instance 1 vlan 10, 20, 30</strong> maps VLANs 10, 20, and 30 to MST instance 1.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**  
*name name*  
**Example:**  
Switch(config-mst)# name region1  
Specifies the configuration name. The `name` string has a maximum length of 32 characters and is case sensitive.

**Step 6**  
*revision version*  
**Example:**  
Switch(config-mst)# revision 1  
Specifies the configuration revision number. The range is 0 to 65535.

**Step 7**  
*show pending*  
**Example:**  
Switch(config-mst)# show pending  
Verifies your configuration by displaying the pending configuration.

**Step 8**  
*exit*  
**Example:**  
Switch(config-mst)# exit  
Applies all changes, and returns to global configuration mode.

**Step 9**  
*spanning-tree mode mst*  
**Example:**  
Switch(config)# spanning-tree mode mst  
Enables MSTP. RSTP is also enabled. Changing spanning-tree modes can disrupt traffic because all spanning-tree instances are stopped for the previous mode and restarted in the new mode. You cannot run both MSTP and PVST+ or both MSTP and Rapid PVST+ at the same time.

**Step 10**  
*end*  
**Example:**  
Switch(config)# end  
Returns to privileged EXEC mode.

<tr>
<td></td>
<td></td>
<td>instances separated by</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Secondary Root Switch

When you configure a switch with the extended system ID support as the secondary root, the switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified instance if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the `spanning-tree mst instance-id root primary` global configuration command.

This procedure is optional.

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# spanning-tree mst 0 root primary</code></td>
<td>a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</td>
</tr>
</tbody>
</table>

**Step 4**

Example:

```
Switch(config)# end
```

Returns to privileged EXEC mode.

### Configuring Port Priority

If a loop occurs, the MSTP uses the port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

**Note**
If the switch is a member of a switch stack, you must use the `spanning-tree mst [instance-id] cost cost` interface configuration command instead of the `spanning-tree mst [instance-id] port-priority priority` interface configuration command to select a port to put in the forwarding state. Assign lower cost values to ports that you want selected first and higher cost values to ports that you want selected last. For more information, see the path costs topic listed under Related Topics.

This procedure is optional.

**Before you begin**
A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.
## Configuring Port Priority

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
**Example:**  
Switch> `enable` |
| |  
**Example:**  
Switch> `enable` |
| Step 2 | `configure terminal` | Enters global configuration mode.  
**Example:**  
Switch# `configure terminal` |
| Step 3 | `interface interface-id` | Specifies an interface to configure, and enters interface configuration mode.  
**Example:**  
Switch(config)# `interface gigabitethernet 1/0/1` |
| Step 4 | `spanning-tree mst instance-id port-priority priority` | Configures port priority.  
**Example:**  
Switch(config-if)# `spanning-tree mst 0 port-priority 64` |
| Step 5 | `end` | Returns to privileged EXEC mode.  
**Example:**  
Switch(config-if)# `end` |

The `show spanning-tree mst interface interface-id` privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the `show running-config interface` privileged EXEC command to confirm the configuration.

**Related Topics**

- Specifying the MST Region Configuration and Enabling MSTP, on page 239

Configuring Path Cost

The MSTP path cost default value is derived from the media speed of an interface. If a loop occurs, the MSTP uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

This procedure is optional.

Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> spanning-tree mst instance-id cost cost</td>
<td>Configures the cost.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# spanning-tree mst 0 cost 17031970</td>
<td>If a loop occurs, the MSTP uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For instance-id, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</td>
</tr>
</tbody>
</table>
### Configuring the Switch Priority

Changing the priority of a switch makes it more likely to be chosen as the root switch whether it is a standalone switch or a switch in the stack.

**Note**

Exercise care when using this command. For normal network configurations, we recommend that you use the `spanning-tree mst instance-id root primary` and the `spanning-tree mst instance-id root secondary` global configuration commands to specify a switch as the root or secondary root switch. You should modify the switch priority only in circumstances where these commands do not work.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID used. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

The `show spanning-tree mst interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

#### Related Topics

Specifying the MST Region Configuration and Enabling MSTP, on page 239
Specifying the Link Type to Ensure Rapid Transitions

If you connect a port to another port through a point-to-point link and the local port becomes a designated port, the RSTP negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

By default, the link type is controlled from the duplex mode of the interface: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. If you have a half-duplex link physically connected point-to-point to a single port on a remote switch running MSTP, you can override the default setting of the link type and enable rapid transitions to the forwarding state.

This procedure is optional.

Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Designating the Neighbor Type

A topology could contain both prestandard and IEEE 802.1s standard compliant devices. By default, ports can automatically detect prestandard devices, but they can still receive both standard and prestandard BPDUs. When there is a mismatch between a device and its neighbor, only the CIST runs on the interface.

You can choose to set a port to send only prestandard BPDUs. The prestandard flag appears in all the `show` commands, even if the port is in STP compatibility mode.

This procedure is optional.

Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related Topics.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

| `Switch(config)# interface gigabitethernet 1/0/1` | |

| **Step 4**        |         |
| `spanning-tree mst pre-standard` | Specifies that the port can send only prestandard BPDUs. |
| Example:           |         |
| `Switch(config-if)# spanning-tree mst pre-standard` | |
Related Topics

Specify the MST Region Configuration and Enabling MSTP, on page 239

Restarting the Protocol Migration Process

This procedure restarts the protocol migration process and forces renegotiation with neighboring switches. It
reverts the switch to MST mode. It is needed when the switch no longer receives IEEE 802.1D BPDUs after
it has been receiving them.

Follow these steps to restart the protocol migration process (force the renegotiation with neighboring switches)
on the switch.

Before you begin

A multiple spanning tree (MST) must be specified and enabled on the switch. For instructions, see Related
Topics.

If you want to use the interface version of the command, you must also know the MST interface used. This
example uses GigabitEthernet1/0/1 as the interface because that was the interface set up by the instructions
listed under Related Topics.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

Enter one of the following commands:

- `clear spanning-tree detected-protocols`
- `clear spanning-tree detected-protocols interface interface-id`

**Example:**

`Switch# clear spanning-tree detected-protocols`

or

`Switch# clear spanning-tree detected-protocols interface gigabitethernet 1/0/1`

The switch reverts to the MSTP mode, and the protocol migration process restarts.
What to do next

This procedure may need to be repeated if the switch receives more legacy IEEE 802.1D configuration BP\DUs (BP\DUs with the protocol version set to 0).

Configuring PVST+ Simulation

PVST+ simulation is enabled by default. This means that all ports automatically interoperate with a connected device that is running in Rapid PVST+ mode. If you disabled the feature and want to re-configure it, refer to the following tasks.

To enable PVST+ simulation globally, perform this task:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| *enable*  
| Example:
| Switch> enable | Enables privileged EXEC mode.  
| | • Enter your password if prompted. |
| **Step 2**
| *configure terminal*  
| Example:
| Switch# configure terminal | Enters global configuration mode. |
| **Step 3**
| *spanning-tree mst simulate pvst global*  
| Example:
| Switch(config)# spanning-tree mst simulate pvst global | Enables PVST+ simulation globally.  
| | To prevent the switch from automatically interoperating with a connecting switch that is running Rapid PVST+, enter the no version of the command. |
| **Step 4**
| *end*  
| Example:
| Switch(config)# end | Returns to privileged EXEC mode. |

Enabling PVST+ Simulation on a Port

To enable PVST+ simulation on a port, perform this task:
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>

### Examples

**Examples: PVST+ Simulation**

This example shows how to prevent the switch from automatically interoperating with a connecting switch that is running Rapid PVST+:
Switch# configure terminal
Switch(config)# no spanning-tree mst simulate pvst global

This example shows how to prevent a port from automatically interoperating with a connecting device that is running Rapid PVST+:

Switch(config)# interface 1/0/1
Switch(config-if)# spanning-tree mst simulate pvst disable

The following sample output shows the system message you receive when a SSTP BPDU is received on a port and PVST+ simulation is disabled:

Message
SPANTREE_PVST_PEER_BLOCK: PVST BPDU detected on port %s [port number].

Severity
Critical

Explanation
A PVST+ peer was detected on the specified interface on the switch. PVST+ simulation feature is disabled, as a result of which the interface was moved to the spanning tree Blocking state.

Action
Identify the PVST+ switch from the network which might be configured incorrectly.

The following sample output shows the system message you receive when peer inconsistency on the interface is cleared:

Message
SPANTREE_PVST_PEER_UNBLOCK: Unblocking port %s [port number].

Severity
Critical

Explanation
The interface specified in the error message has been restored to normal spanning tree state.

Action
None.

This example shows the spanning tree status when port 1/0/1 has been configured to disable PVST+ simulation and is currently in the peer type inconsistent state:

Switch# show spanning-tree
VLAN0010
  Spanning tree enabled protocol mstp
  Root ID Priority 32778
  Address 0002.172c.f400
  This bridge is the root
Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
Bridge ID Priority 32778 (priority 32768 sys-id-ext 10)
Address 0002.172c.f400
Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
Aging Time 300

This example shows the interface details when PVST+ simulation is globally enabled, or the default configuration:

Switch# show spanning-tree interface1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is forwarding
Port path cost 4, Port priority 128, Port Identifier 128.297.
Designated root has priority 32769, address 0013.5f20.01c0
Designated bridge has priority 32769, address 0013.5f20.01c0
Designated port id is 128.297, designated path cost 0
Timers: message age 0, forward delay 0, hold 0
Number of transitions to forwarding state: 1
Link type is point-to-point by default
PVST Simulation is enabled by default
BPDU: sent 132, received 1

This example shows the interface details when PVST+ simulation is globally disabled:

Switch# show spanning-tree interface1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is forwarding
Port path cost 4, Port priority 128, Port Identifier 128.297.
Designated root has priority 32769, address 0013.5f20.01c0
Designated bridge has priority 32769, address 0013.5f20.01c0
Designated port id is 128.297, designated path cost 0
Timers: message age 0, forward delay 0, hold 0
Number of transitions to forwarding state: 1
Link type is point-to-point by default
PVST Simulation is disabled by default
BPDU: sent 132, received 1

This example shows the interface details when PVST+ simulation is explicitly enabled on the port:

Switch# show spanning-tree interface1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is forwarding
Port path cost 4, Port priority 128, Port Identifier 128.297.
Designated root has priority 32769, address 0013.5f20.01c0
Designated bridge has priority 32769, address 0013.5f20.01c0
Designated port id is 128.297, designated path cost 0
This example shows the interface details when the PVST+ simulation feature is disabled and a PVST Peer inconsistency has been detected on the port:

```
Switch# show spanning-tree interface1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is broken (PVST Peer Inconsistent)
    Port path cost 4, Port priority 128, Port Identifier 128.297.
    Designated root has priority 32769, address 0013.5f20.01c0
    Designated bridge has priority 32769, address 0013.5f20.01c0
    Designated port id is 128.297, designated path cost 0
    Timers: message age 0, forward delay 0, hold 0
    Number of transitions to forwarding state: 1
    Link type is point-to-point by default
    PVST Simulation is disabled
    BPDU: sent 132, received 1
```

### Examples: Detecting Unidirectional Link Failure

This example shows the spanning tree status when port 1/0/1 detail has been configured to disable PVST+ simulation and the port is currently in the peer type inconsistent state:

```
Switch# show spanning-tree
VLAN0010
    Spanning tree enabled protocol rstp
    Root ID    Priority 32778
        Address  0002.172c.f400
        This bridge is the root
    Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
    Bridge ID Priority 32778 (priority 32768 sys-id-ext 10)
        Address  0002.172c.f400
        Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
        Aging Time 300

    Interface    Role Sts Cost    Prio.Nbr Type
    -------------- ---- --- --------- -------- -------------------------
    Gi1/0/1      Desg BKN 4 128.270 P2p Dispute
```

This example shows the interface details when a dispute condition is detected:

```
Switch# show spanning-tree interface1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is designated blocking (dispute)
    Port path cost 4, Port priority 128, Port Identifier 128.297.
    Designated root has priority 32769, address 0013.5f20.01c0
    Designated bridge has priority 32769, address 0013.5f20.01c0
    Designated port id is 128.297, designated path cost 0
    Timers: message age 0, forward delay 0, hold 0
    Number of transitions to forwarding state: 1
    Link type is point-to-point by default
    BPDU: sent 132, received 1
```
Monitoring MST Configuration and Status

Configuring Optional Spanning-Tree Features

• Finding Feature Information, on page 261
• Restriction for Optional Spanning-Tree Features, on page 261
• Information About Optional Spanning-Tree Features, on page 262
• How to Configure Optional Spanning-Tree Features, on page 275
• Examples, on page 290
• Monitoring the Spanning-Tree Status, on page 292
• Feature Information for Optional Spanning-Tree Features, on page 293

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restriction for Optional Spanning-Tree Features

• PortFast minimizes the time that interfaces must wait for spanning tree to converge, so it is effective only when used on interfaces connected to end stations. If you enable PortFast on an interface connecting to another switch, you risk creating a spanning-tree loop.

Related Topics
   Enabling PortFast, on page 275
   PortFast, on page 262
Information About Optional Spanning-Tree Features

PortFast

PortFast immediately brings an interface configured as an access or trunk port to the forwarding state from a blocking state, bypassing the listening and learning states.

Figure 20: PortFast-Enabled Interfaces

You can use PortFast on interfaces connected to a single workstation or server to allow those devices to immediately connect to the network, rather than waiting for the spanning tree to converge. Interfaces connected to a single workstation or server should not receive bridge protocol data units (BPDUs). An interface with PortFast enabled goes through the normal cycle of spanning-tree status changes when the switch is restarted.

You can enable this feature by enabling it on either the interface or on all nontrunking ports.

Related Topics

- Enabling PortFast, on page 275
- Restriction for Optional Spanning-Tree Features, on page 261

BPDU Guard

The Bridge Protocol Data Unit (BPDU) guard feature can be globally enabled on the switch or can be enabled per port, but the feature operates with some differences.

When you enable BPDU guard at the global level on PortFast edge-enabled ports, spanning tree shuts down ports that are in a PortFast edge-operational state if any BPDU is received on them. In a valid configuration, PortFast edge-enabled ports do not receive BPDUs. Receiving a BPDU on a Port Fast edge-enabled port means an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the port in the error-disabled state. When this happens, the switch shuts down the entire port on which the violation occurred.

When you enable BPDU guard at the interface level on any port without also enabling the PortFast edge feature, and the port receives a BPDU, it is put in the error-disabled state.
The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

**Related Topics**

- Enabling BPDU Guard, on page 276

## BPDU Filtering

The BPDU filtering feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

Enabling BPDU filtering on PortFast edge-enabled interfaces at the global level keeps those interfaces that are in a PortFast edge-operational state from sending or receiving BPDUs. The interfaces still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these interfaces do not receive BPDUs. If a BPDU is received on a PortFast edge-enabled interface, the interface loses its PortFast edge-operational status, and BPDU filtering is disabled.

Enabling BPDU filtering on an interface without also enabling the PortFast edge feature keeps the interface from sending or receiving BPDUs.

---

**Caution**

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

---

You can enable the BPDU filtering feature for the entire switch or for an interface.

**Related Topics**

## UplinkFast

*Figure 21: Switches in a Hierarchical Network*

Switches in hierarchical networks can be grouped into backbone switches, distribution switches, and access switches. This complex network has distribution switches and access switches that each have at least one
redundant link that spanning tree blocks to prevent loops.

If a switch loses connectivity, it begins using the alternate paths as soon as the spanning tree selects a new root port. You can accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself by enabling UplinkFast. The root port transitions to the forwarding state immediately without going through the listening and learning states, as it would with the normal spanning-tree procedures.

When the spanning tree reconfigures the new root port, other interfaces flood the network with multicast packets, one for each address that was learned on the interface. You can limit these bursts of multicast traffic by reducing the max-update-rate parameter (the default for this parameter is 150 packets per second). However, if you enter zero, station-learning frames are not generated, so the spanning-tree topology converges more slowly after a loss of connectivity.

**Note**

UplinkFast is most useful in wiring-closet switches at the access or edge of the network. It is not appropriate for backbone devices. This feature might not be useful for other types of applications.

UplinkFast provides fast convergence after a direct link failure and achieves load-balancing between redundant Layer 2 links using uplink groups. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.
Figure 22: UplinkFast Example Before Direct Link Failure

This topology has no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in a blocking state.

Figure 23: UplinkFast Example After Direct Link Failure

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked interface on Switch C and transitions it to the forwarding state without going through the listening and learning states. This change takes approximately 1 to 5 seconds.

Cross-Stack UplinkFast

Cross-Stack UplinkFast (CSUF) provides a fast spanning-tree transition (fast convergence in less than 1 second under normal network conditions) across a switch stack. During the fast transition, an alternate redundant link on the switch stack is placed in the forwarding state without causing temporary spanning-tree loops or loss of connectivity to the backbone. With this feature, you can have a redundant and resilient network in some configurations. CSUF is automatically enabled when you enable the UplinkFast feature.

CSUF might not provide a fast transition all the time; in these cases, the normal spanning-tree transition occurs, completing in 30 to 40 seconds. For more information, see Related Topics.
How Cross-Stack UplinkFast Works

Cross-Stack UplinkFast (CSUF) ensures that one link in the stack is elected as the path to the root.

*Figure 24: Cross-Stack UplinkFast Topology*

The stack-root port on Switch 1 provides the path to the root of the spanning tree. The alternate stack-root ports on Switches 2 and 3 can provide an alternate path to the spanning-tree root if the current stack-root switch fails or if its link to the spanning-tree root fails.

Link 1, the root link, is in the spanning-tree forwarding state. Links 2 and 3 are alternate redundant links that are in the spanning-tree blocking state. If Switch 1 fails, if its stack-root port fails, or if Link 1 fails, CSUF selects either the alternate stack-root port on Switch 2 or Switch 3 and puts it into the forwarding state in less than 1 second.

When certain link loss or spanning-tree events occur (described in the following topic), the Fast Uplink Transition Protocol uses the neighbor list to send fast-transition requests to stack members.

The switch sending the fast-transition request needs to do a fast transition to the forwarding state of a port that it has chosen as the root port, and it must obtain an acknowledgment from each stack switch before performing the fast transition.
Each switch in the stack decides if the sending switch is a better choice than itself to be the stack root of this spanning-tree instance by comparing the root, cost, and bridge ID. If the sending switch is the best choice as the stack root, each switch in the stack returns an acknowledgment; otherwise, it sends a fast-transition request. The sending switch then has not received acknowledgments from all stack switches.

When acknowledgments are received from all stack switches, the Fast Uplink Transition Protocol on the sending switch immediately transitions its alternate stack-root port to the forwarding state. If acknowledgments from all stack switches are not obtained by the sending switch, the normal spanning-tree transitions (blocking, listening, learning, and forwarding) take place, and the spanning-tree topology converges at its normal rate (2 * forward-delay time + max-age time).

The Fast Uplink Transition Protocol is implemented on a per-VLAN basis and affects only one spanning-tree instance at a time.

**Related Topics**
- Enabling UplinkFast for Use with Redundant Links, on page 279
- Events That Cause Fast Convergence, on page 267

### Events That Cause Fast Convergence

Depending on the network event or failure, the CSUF fast convergence might or might not occur.

Fast convergence (less than 1 second under normal network conditions) occurs under these circumstances:

- The stack-root port link fails.
  
  If two switches in the stack have alternate paths to the root, only one of the switches performs the fast transition.

- The failed link, which connects the stack root to the spanning-tree root, recovers.

- A network reconfiguration causes a new stack-root switch to be selected.

- A network reconfiguration causes a new port on the current stack-root switch to be chosen as the stack-root port.

**Note**

The fast transition might not occur if multiple events occur simultaneously. For example, if a stack member is powered off, and at the same time, the link connecting the stack root to the spanning-tree root comes back up, the normal spanning-tree convergence occurs.

Normal spanning-tree convergence (30 to 40 seconds) occurs under these conditions:

- The stack-root switch is powered off, or the software failed.

- The stack-root switch, which was powered off or failed, is powered on.

- A new switch, which might become the stack root, is added to the stack.

**Related Topics**
- Enabling UplinkFast for Use with Redundant Links, on page 279
- Events That Cause Fast Convergence, on page 267
- UplinkFast, on page 263
**BackboneFast**

BackboneFast detects indirect failures in the core of the backbone. BackboneFast is a complementary technology to the UplinkFast feature, which responds to failures on links directly connected to access switches. BackboneFast optimizes the maximum-age timer, which controls the amount of time the switch stores protocol information received on an interface. When a switch receives an inferior BPDU from the designated port of another switch, the BPDU is a signal that the other switch might have lost its path to the root, and BackboneFast tries to find an alternate path to the root.

BackboneFast starts when a root port or blocked interface on a switch receives inferior BPDUs from its designated switch. An inferior BPDU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPDU, it means that a link to which the switch is not directly connected (an indirect link) has failed (that is, the designated switch has lost its connection to the root switch). Under spanning-tree rules, the switch ignores inferior BPDUs for the maximum aging time (default is 20 seconds).

The switch tries to find if it has an alternate path to the root switch. If the inferior BPDU arrives on a blocked interface, the root port and other blocked interfaces on the switch become alternate paths to the root switch. (Self-looped ports are not considered alternate paths to the root switch.) If the inferior BPDU arrives on the root port, all blocked interfaces become alternate paths to the root switch. If the inferior BPDU arrives on the root port and there are no blocked interfaces, the switch assumes that it has lost connectivity to the root switch, causes the maximum aging time on the root port to expire, and becomes the root switch according to normal spanning-tree rules.

If the switch has alternate paths to the root switch, it uses these alternate paths to send a root link query (RLQ) request. The switch sends the RLQ request on all alternate paths to learn if any stack member has an alternate root to the root switch and waits for an RLQ reply from other switches in the network and in the stack. The switch sends the RLQ request on all alternate paths and waits for an RLQ reply from other switches in the network.

When a stack member receives an RLQ reply from a nonstack member on a blocked interface and the reply is destined for another nonstacked switch, it forwards the reply packet, regardless of the spanning-tree interface state.

When a stack member receives an RLQ reply from a nonstack member and the response is destined for the stack, the stack member forwards the reply so that all the other stack members receive it.

If the switch discovers that it still has an alternate path to the root, it expires the maximum aging time on the interface that received the inferior BPDU. If all the alternate paths to the root switch indicate that the switch has lost connectivity to the root switch, the switch expires the maximum aging time on the interface that received the RLQ reply. If one or more alternate paths can still connect to the root switch, the switch makes all interfaces on which it received an inferior BPDU its designated ports and moves them from the blocking state (if they were in the blocking state), through the listening and learning states, and into the forwarding state.
This is an example topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that connects directly to Switch B is in the blocking state.

If link L1 fails, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, it detects the failure, elects itself the root, and begins sending BPDU's to Switch C, identifying itself as the root. When Switch C receives the inferior BPDU's from Switch B, Switch C assumes that an indirect failure has occurred. At that point, BackboneFast allows the blocked interface on Switch C to move immediately to the listening state without waiting for the maximum aging time for the interface to expire. BackboneFast then transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A. The root-switch election takes approximately 30 seconds, twice the Forward Delay time if the default Forward Delay time of 15 seconds is set. BackboneFast reconfigures the topology to account for the failure of link L1.

If a new switch is introduced into a shared-medium topology, BackboneFast is not activated because the inferior BPDU's did not come from the recognized designated switch (Switch B). The new switch begins sending inferior BPDU's that indicate it is the root switch. However, the other switches ignore these inferior
BPDUs, and the new switch learns that Switch B is the designated switch to Switch A, the root switch.

**EtherChannel Guard**

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the switch interfaces are configured in an EtherChannel, but the interfaces on the other device are not. A misconfiguration can also occur if the channel parameters are not the same at both ends of the EtherChannel.

If the switch detects a misconfiguration on the other device, EtherChannel guard places the switch interfaces in the error-disabled state, and displays an error message.

**Related Topics**
- Enabling EtherChannel Guard, on page 282

**Root Guard**

*Figure 28: Root Guard in a Service-Provider Network*

The Layer 2 network of a service provider (SP) can include many connections to switches that are not owned by the SP. In such a topology, the spanning tree can reconfigure itself and select a customer switch as the root switch. You can avoid this situation by enabling root guard on SP switch interfaces that connect to switches in your customer’s network. If spanning-tree calculations cause an interface in the customer network to be selected as the root port, root guard then places the interface in the root-inconsistent (blocked) state to prevent the customer’s switch from becoming the root switch or being in the path to the root.
If a switch outside the SP network becomes the root switch, the interface is blocked (root-inconsistent state), and spanning tree selects a new root switch. The customer’s switch does not become the root switch and is not in the path to the root.

If the switch is operating in multiple spanning-tree (MST) mode, root guard forces the interface to be a designated port. If a boundary port is blocked in an internal spanning-tree (IST) instance because of root guard, the interface also is blocked in all MST instances. A boundary port is an interface that connects to a LAN, the designated switch of which is either an IEEE 802.1D switch or a switch with a different MST region configuration.

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. VLANs can be grouped and mapped to an MST instance.

**Caution**

Misuse of the root guard feature can cause a loss of connectivity.

**Related Topics**

[Enabling Root Guard](#), on page 283

**Loop Guard**

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is enabled on the entire switched network. Loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in MST mode, BPDUs are not sent on nonboundary ports only if the interface is blocked by loop guard in all MST instances. On a boundary port, loop guard blocks the interface in all MST instances.
Related Topics

Enabling Loop Guard, on page 284

STP PortFast Port Types

You can configure a spanning tree port as an edge port, a network port, or a normal port. A port can be in only one of these states at a given time. The default spanning tree port type is normal. You can configure the port type either globally or per interface.

Depending on the type of device to which the interface is connected, you can configure a spanning tree port as one of these port types:

- A PortFast edge port—is connected to a Layer 2 host. This can be either an access port or an edge trunk port (*portfast edge trunk*). This type of port interface immediately transitions to the forwarding state, bypassing the listening and learning states. Use PortFast edge on Layer 2 access ports connected to a single workstation or server to allow those devices to connect to the network immediately, rather than waiting for spanning tree to converge.

  Even if the interface receives a bridge protocol data unit (BPDU), spanning tree does not place the port into the blocking state. Spanning tree sets the port’s operating state to *non-port fast* even if the configured state remains *port fast edge* and starts participating in the topology change.

    Note

    If you configure a port connected to a Layer 2 switch or bridge as an edge port, you might create a bridging loop.

- A PortFast network port—is connected only to a Layer 2 switch or bridge. Bridge Assurance is enabled only on PortFast network ports. For more information, refer to *Bridge Assurance*.

    Note

    If you configure a port that is connected to a Layer 2 host as a spanning tree network port, the port will automatically move into the blocking state.

- A PortFast normal port—is the default type of spanning tree port.

    Note

    Beginning with Cisco IOS Release 15.2(4)E, or IOS XE 3.8.0E, if you enter the *spanning-tree portfast* [trunk] command in the global or interface configuration mode, the system automatically saves it as *spanning-tree portfast edge* [trunk].

Related Topics

Enabling PortFast Port Types, on page 285

Bridge Assurance

You can use Bridge Assurance to help prevent looping conditions that are caused by unidirectional links (one-way traffic on a link or port), or a malfunction in a neighboring switch. Here a malfunction refers to a switch that is not able to run STP any more, while still forwarding traffic (a brain dead switch).
BPDUs are sent out on all operational network ports, including alternate and backup ports, for each hello time period. Bridge Assurance monitors the receipt of BPDUs on point-to-point links on all network ports. When a port does not receive BPDUs within the allotted hello time period, the port is put into a blocked state (the same as a port inconsistent state, which stops forwarding of frames). When the port resumes receipt of BPDUs, the port resumes normal spanning tree operations.

**Note**

Only Rapid PVST+ and MST spanning tree protocols support Bridge Assurance. PVST+ does not support Bridge Assurance.

The following example shows how Bridge Assurance protects your network from bridging loops. The following figure shows a network with normal STP topology.

*Figure 29: Network with Normal STP Topology*

The following figure demonstrates a potential network problem when the device fails (brain dead) and Bridge Assurance is not enabled on the network.

*Figure 30: Network Loop Due to a Malfunctioning Switch*

The following figure shows the network with Bridge Assurance enabled, and the STP topology progressing normally with bidirectional BDPUs issuing from every STP network port.
The following figure shows how the potential network problem shown in figure *Network Loop Due to a Malfunctioning Switch* does not occur when you have Bridge Assurance enabled on your network.

**Figure 32: Network Problem Averted with Bridge Assurance Enabled**

The system generates syslog messages when a port is block and unblocked. The following sample output shows the log that is generated for each of these states:

**BRIDGE_ASSURANCE_BLOCK**

Sep 17 09:48:16.249 PDT: %SPANTREE-2-BRIDGE_ASSURANCE_BLOCK: Bridge Assurance blocking port GigabitEthernet1/0/1 on VLAN0001.

**BRIDGE_ASSURANCE_UNBLOCK**

Sep 17 09:48:58.426 PDT: %SPANTREE-2-BRIDGE_ASSURANCE_UNBLOCK: Bridge Assurance unblocking port GigabitEthernet1/0/1 on VLAN0001.

Follow these guidelines when enabling Bridge Assurance:

- It can only be enabled or disabled globally.
- It applies to all operational network ports, including alternate and backup ports.
- Only Rapid PVST+ and MST spanning tree protocols support Bridge Assurance. PVST+ does not support Bridge Assurance.
For Bridge Assurance to work properly, it must be supported and configured on both ends of a point-to-point link. If the device on one side of the link has Bridge Assurance enabled and the device on the other side does not, the connecting port is blocked and in a Bridge Assurance inconsistent state. We recommend that you enable Bridge Assurance throughout your network.

To enable Bridge Assurance on a port, BPDU filtering and BPDU Guard must be disabled.

You can enable Bridge Assurance in conjunction with Loop Guard.

You can enable Bridge Assurance in conjunction with Root Guard. The latter is designed to provide a way to enforce the root bridge placement in the network.

Enabling Bridge Assurance, on page 289

How to Configure Optional Spanning-Tree Features

Enabling PortFast

An interface with the PortFast feature enabled is moved directly to the spanning-tree forwarding state without waiting for the standard forward-time delay.

If you enable the voice VLAN feature, the PortFast feature is automatically enabled. When you disable voice VLAN, the PortFast feature is not automatically disabled.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

Caution

Use PortFast only when connecting a single end station to an access or trunk port. Enabling this feature on an interface connected to a switch or hub could prevent spanning tree from detecting and disabling loops in your network, which could cause broadcast storms and address-learning problems.

This procedure is optional.

Procedure

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td>To enable PortFast on trunk ports, you must use the <code>spanning-tree portfast trunk</code> interface configuration command. The <code>spanning-tree portfast</code> command will not work on trunk ports. Make sure that there are no loops in the network between the trunk port and the workstation or server before you enable PortFast on a trunk port.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

You can use the `spanning-tree portfast default` global configuration command to globally enable the PortFast feature on all nontrunking ports.

**Related Topics**
- PortFast, on page 262
- Restriction for Optional Spanning-Tree Features, on page 261

**Enabling BPDU Guard**

You can enable the BPDU guard feature if your switch is running PVST+, Rapid PVST+, or MSTP.

**Caution**

Configure PortFast edge only on ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.
This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>

<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

### What to do next

To prevent the port from shutting down, you can use the `errdisable detect cause bpduguard shutdown vlan` global configuration command to shut down just the offending VLAN on the port where the violation occurred.

You also can use the `spanning-tree bpduguard enable` interface configuration command to enable BPDU guard on any port without also enabling the PortFast edge feature. When the port receives a BPDU, it is put it in the error-disabled state.

### Related Topics

- [BPDU Guard](#), on page 262
Enabling BPDU Filtering

You can also use the `spanning-tree bpdufilter enable` interface configuration command to enable BPDU filtering on any interface without also enabling the PortFast edge feature. This command prevents the interface from sending or receiving BPDUs.

**Caution**

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature if your switch is running PVST+, Rapid PVST+, or MSTP.

**Caution**

Configure PortFast edge only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | **enable**
| Example:          | Enables privileged EXEC mode. |
|                   | • Enter your password if prompted. |
| Switch> enable    | |
| **Step 2**        | **configure terminal**
| Example:          | Enters global configuration mode. |
| Switch# configure terminal |
| **Step 3**        | **spanning-tree portfast edge bpdufilter default**
| Example:          | Globally enables BPDU filtering. |
| Switch(config)# spanning-tree portfast edge bpdufilter default | By default, BPDU filtering is disabled. |
| **Step 4**        | **interface interface-id**
| Example:          | Specifies the interface connected to an end station, and enters interface configuration mode. |
| Switch(config)# interface gigabitethernet 1/0/2 |
| **Step 5**        | **spanning-tree portfast edge**
| Example:          | Enables the PortFast edge feature on the specified interface. |
### Enabling UplinkFast for Use with Redundant Links

**Note**
When you enable UplinkFast, it affects all VLANs on the switch or switch stack. You cannot configure UplinkFast on an individual VLAN.

You can configure the UplinkFast or the Cross-Stack UplinkFast (CSUF) feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Follow these steps to enable UplinkFast and CSUF.

**Before you begin**

UplinkFast cannot be enabled on VLANs that have been configured with a switch priority. To enable UplinkFast on a VLAN with switch priority configured, first restore the switch priority on the VLAN to the default value using the `no spanning-tree vlan vlan-id priority` global configuration command.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>spanning-tree uplinkfast [max-update-rate pkts-per-second]</code></td>
<td>Enables UplinkFast. (Optional) For <code>pkts-per-second</code>, the range is 0 to 32000 packets per second; the default is 150.</td>
</tr>
</tbody>
</table>
Disabling UplinkFast

This procedure is optional.

Follow these steps to disable UplinkFast and Cross-Stack UplinkFast (CSUF).

**Before you begin**

UplinkFast must be enabled.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduce the chance that a switch will become the root switch.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you enable the UplinkFast feature using these instructions, CSUF is automatically globally enabled on nonstack port interfaces.

**Related Topics**

- UplinkFast, on page 263
- How Cross-Stack UplinkFast Works, on page 266
- Cross-Stack UplinkFast, on page 265
- Events That Cause Fast Convergence, on page 267
Purpose

Command or Action | Purpose
---|---
**Step 2** | Enters global configuration mode.
- configure terminal
  `- Example:
    `Switch# configure terminal`

**Step 3** | Disables UplinkFast and CSUF on the switch and all of its VLANs.
- no spanning-tree uplinkfast
  `- Example:
    `Switch(config)# no spanning-tree uplinkfast`

**Step 4** | Returns to privileged EXEC mode.
- end
  `- Example:
    `Switch(config)# end`

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you disable the UplinkFast feature using these instructions, CSUF is automatically globally disabled on nonstack port interfaces.

### Enabling BackboneFast

You can enable BackboneFast to detect indirect link failures and to start the spanning-tree reconfiguration sooner.

You can configure the BackboneFast feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Follow these steps to enable BackboneFast on the switch.

### Before you begin

If you use BackboneFast, you must enable it on all switches in the network. BackboneFast is not supported on Token Ring VLANs. This feature is supported for use with third-party switches.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| - enable
  `- Example:
    `Switch> enable`
|   * Enter your password if prompted. |
Enabling EtherChannel Guard

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Follow these steps to enable EtherChannel Guard on the switch.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>spanning-tree etherchannel guard misconfig</td>
<td>Enables EtherChannel guard.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# spanning-tree etherchannel guard misconfig</td>
<td></td>
</tr>
</tbody>
</table>
Enabling Root Guard

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. Do not enable the root guard on interfaces to be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and are prevented from reaching the forwarding state.

Note

You cannot enable both root guard and loop guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Follow these steps to enable root guard on the switch.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
### Enabling Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network. Loop guard operates only on interfaces that are considered point-to-point by the spanning tree.

**Note**
You cannot enable both loop guard and root guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional. Follow these steps to enable loop guard on the switch.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enter one of the following commands:</td>
</tr>
<tr>
<td></td>
<td>• show spanning-tree active</td>
</tr>
<tr>
<td></td>
<td>• show spanning-tree mst</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# show spanning-tree active</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# show spanning-tree mst</td>
</tr>

### Configuring PortFast Edge on a Specified Interface

Interfaces configured as edge ports immediately transition to the forwarding state, without passing through the blocking or learning states, on linkup.

**Note**

Because the purpose of this type of port is to minimize the time that access ports must wait for spanning tree to converge, it is most effective when used on access ports. If you enable PortFast edge on a port connecting to another switch, you risk creating a spanning tree loop.

To configure an edge port on a specified interface, perform this task:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring PortFast Edge on a Specified Interface

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

#### Step 2

**configure terminal**

*Example:*

Switch# configure terminal

**Purpose:** Enters global configuration mode.

#### Step 3

**interface interface-id | port-channel port_channel_number**

*Example:*

Switch(config)# interface gigabitethernet 1/0/1 | port-channel port_channel_number

**Purpose:** Specifies an interface to configure.

#### Step 4

**spanning-tree portfast edge [trunk]**

*Example:*

Switch(config-if)# spanning-tree portfast trunk

**Purpose:** Enables edge behavior on a Layer 2 access port connected to an end workstation or server.

- (Optional) **trunk**—Enables edge behavior on a trunk port. Use this keyword if the link is a trunk. Use this command only on ports that are connected to end host devices that terminate VLANs and from which the port should never receive STP BPDUs. Such end host devices include workstations, servers, and ports on routers that are not configured to support bridging.

- Use the **no** version of the command to disable PortFast edge.

#### Step 5

**end**

*Example:*

Switch(config-if)# end

**Purpose:** Exits configuration mode.

#### Step 6

**show running interface interface-id | port-channel port_channel_number**

*Example:*

Switch# show running interface gigabitethernet 1/0/1 | port-channel port_channel_number

**Purpose:** Verifies the configuration.
Configuring a PortFast Network Port on a Specified Interface

Ports that are connected to Layer 2 switches and bridges can be configured as network ports.

Note
Bridge Assurance is enabled only on PortFast network ports. For more information, refer to Bridge Assurance.

To configure a port as a network port, perform this task.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>

Examples

Examples: Configuring PortFast Edge on a Specified Interface

This example shows how to enable edge behavior on GigabitEthernet interface 1/0/1:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# spanning-tree portfast edge
Switch(config-if)# end
```

This example shows how to verify the configuration:

```
Switch# show running-config interface gigabitethernet1/0/1
Building configuration...
Current configuration:
!
interface GigabitEthernet1/0/1
no ip address
switchport
switchport access vlan 200
switchport mode access
spanning-tree portfast edge
end
```

This example shows how you can display that port GigabitEthernet 1/0/1 is currently in the edge state:

```
Switch# show spanning-tree vlan 200
VLAN0200

Examples: Configuring a PortFast Network Port on a Specified Interface

This example shows how to configure GigabitEthernet interface 1/0/1 as a network port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# spanning-tree portfast network
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show running-config interface gigabitethernet1/0/1
Building configuration...
Current configuration:
```
Example: Configuring Bridge Assurance

This output shows port GigabitEthernet 1/0/1 has been configured as a network port and it is currently in the Bridge Assurance inconsistent state.

The output shows the port type as network and *BA_Inc, indicating that the port is in an inconsistent state.
The example shows the output for show spanning-tree summary.

```

Configuring EtherChannels

• Finding Feature Information, on page 295
• Restrictions for EtherChannels, on page 295
• Information About EtherChannels, on page 296
• How to Configure EtherChannels, on page 309
• Monitoring EtherChannel, PAgP, and LACP Status, on page 321
• Configuration Examples for Configuring EtherChannels, on page 322
• Additional References for EtherChannels, on page 325
• Feature Information for EtherChannels, on page 326

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for EtherChannels

• All ports in an EtherChannel must be assigned to the same VLAN or they must be configured as trunk ports.

• When the ports in an EtherChannel are configured as trunk ports, all the ports must be configured with the same mode (either Inter-Switch Link [ISL] or IEEE 802.1Q).

• Port Aggregation Protocol (PAgP) can be enabled only in single-switch EtherChannel configurations; PAgP cannot be enabled on cross-stack EtherChannels.
Information About EtherChannels

EtherChannel Overview

EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. You can use the EtherChannel to increase the bandwidth between the wiring closets and the data center, and you can deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention.

An EtherChannel consists of individual Ethernet links bundled into a single logical link.

Figure 33: Typical EtherChannel Configuration

The EtherChannel provides full-duplex bandwidth up to 8 Gb/s (Gigabit EtherChannel) or 80 Gb/s (10-Gigabit EtherChannel) between your switch and another switch or host.

Each EtherChannel can consist of up to eight compatibly configured Ethernet ports.

The LAN Lite feature set supports up to six EtherChannels. The LAN Base feature set supports up to 24 EtherChannels.

EtherChannel Modes

You can configure an EtherChannel in one of these modes: Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or On. Configure both ends of the EtherChannel in the same mode:

- When you configure one end of an EtherChannel in either PAgP or LACP mode, the system negotiates with the other end of the channel to determine which ports should become active. If the remote port cannot negotiate an EtherChannel, the local port is put into an independent state and continues to carry data traffic as would any other single link. The port configuration does not change, but the port does not participate in the EtherChannel.
• When you configure an EtherChannel in the on mode, no negotiations take place. The switch forces all compatible ports to become active in the EtherChannel. The other end of the channel (on the other switch) must also be configured in the on mode; otherwise, packet loss can occur.

**EtherChannel on Switches**

You can create an EtherChannel on a switch, on a single switch in the stack, or on multiple switches in the stack (known as cross-stack EtherChannel).

*Figure 34: Single-Switch EtherChannel*

*Figure 35: Cross-Stack EtherChannel*

**EtherChannel Link Failover**

If a link within an EtherChannel fails, traffic previously carried over that failed link moves to the remaining links within the EtherChannel. If traps are enabled on the switch, a trap is sent for a failure that identifies the
Channel Groups and Port-Channel Interfaces

An EtherChannel comprises a channel group and a port-channel interface. The channel group binds physical ports to the port-channel interface. Configuration changes applied to the port-channel interface apply to all the physical ports bound together in the channel group.

The **channel-group** command binds the physical port and the port-channel interface together. Each EtherChannel has a port-channel logical interface numbered from 1 to 24. This port-channel interface number corresponds to the one specified with the **channel-group** interface configuration command.

- With Layer 2 ports, use the **channel-group** interface configuration command to dynamically create the port-channel interface.

  You also can use the **interface port-channel port-channel-number** global configuration command to manually create the port-channel interface, but then you must use the **channel-group channel-group-number** command to bind the logical interface to a physical port. The **channel-group-number** can be the same as the **port-channel-number**, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

Port Aggregation Protocol

The Port Aggregation Protocol (PAgP) is a Cisco-proprietary protocol that can be run only on Cisco switches and on those switches licensed by vendors to support PAgP. PAgP facilitates the automatic creation of EtherChannels by exchanging PAgP packets between Ethernet ports. PAgP cannot be enabled on cross-stack EtherChannels.

By using PAgP, the switch or switch stack learns the identity of partners capable of supporting PAgP and the capabilities of each port. It then dynamically groups similarly configured ports (on a single switch in the stack) into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, PAgP groups the ports with the same speed,
duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, PAgP adds the group to the spanning tree as a single switch port.

**PAgP Modes**

PAgP modes specify whether a port can send PAgP packets, which start PAgP negotiations, or only respond to PAgP packets received.

**Table 36: EtherChannel PAgP Modes**

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This setting minimizes the transmission of PAgP packets. This mode is not supported when the EtherChannel members are from different switches in the switch stack (cross-stack EtherChannel).</td>
</tr>
<tr>
<td>desirable</td>
<td>Places a port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This mode is not supported when the EtherChannel members are from different switches in the switch stack (cross-stack EtherChannel).</td>
</tr>
</tbody>
</table>

Switch ports exchange PAgP packets only with partner ports configured in the **auto** or **desirable** modes. Ports configured in the **on** mode do not exchange PAgP packets.

Both the **auto** and **desirable** modes enable ports to negotiate with partner ports to form an EtherChannel based on criteria such as port speed, and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- A port in the **desirable** mode can form an EtherChannel with another port that is in the **desirable** or **auto** mode.
- A port in the **auto** mode can form an EtherChannel with another port in the **desirable** mode.

A port in the **auto** mode cannot form an EtherChannel with another port that is also in the **auto** mode because neither port starts PAgP negotiation.

**Silent Mode**

If your switch is connected to a partner that is PAgP-capable, you can configure the switch port for nonsilent operation by using the **non-silent** keyword. If you do not specify **non-silent** with the **auto** or **desirable** mode, silent mode is assumed.

Use the silent mode when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port connected to a silent partner prevents that switch port from ever becoming operational. However, the silent setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

**PAgP Learn Method and Priority**

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device
is an aggregate-port learner if it learns addresses by aggregate (logical) ports. The learn method must be configured the same at both ends of the link.

When a device and its partner are both aggregate-port learners, they learn the address on the logical port-channel. The device sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.

PAgP cannot automatically detect when the partner device is a physical learner and when the local device is an aggregate-port learner. Therefore, you must manually set the learning method on the local device to learn addresses by physical ports. You also must set the load-distribution method to source-based distribution, so that any given source MAC address is always sent on the same physical port.

You also can configure a single port within the group for all transmissions and use other ports for hot-standby. The unused ports in the group can be swapped into operation in just a few seconds if the selected single port loses hardware-signal detection. You can configure which port is always selected for packet transmission by changing its priority with the `pagp port-priority` interface configuration command. The higher the priority, the more likely that the port will be selected.

---

**Note**

The switch supports address learning only on aggregate ports even though the `physical-port` keyword is provided in the CLI. The `pagp learn-method` command and the `pagp port-priority` command have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner of the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the `pagp learn-method physical-port` interface configuration command. Set the load-distribution method based on the source MAC address by using the `port-channel load-balance src-mac` global configuration command. The switch then sends packets to the physical learner using the same port in the EtherChannel from which it learned the source address. Only use the `pagp learn-method` command in this situation.

---

**PAgP Interaction with Virtual Switches and Dual-Active Detection**

A virtual switch can be two or more core switches connected by virtual switch links (VSLs) that carry control and data traffic between them. One of the switches is in active mode. The others are in standby mode. For redundancy, remote switches are connected to the virtual switch by remote satellite links (RSLs).

If the VSL between two switches fails, one switch does not know the status of the other. Both switches could change to the active mode, causing a *dual-active situation* in the network with duplicate configurations (including duplicate IP addresses and bridge identifiers). The network might go down.

To prevent a dual-active situation, the core switches send PAgP protocol data units (PDUs) through the RSLs to the remote switches. The PAgP PDUs identify the active switch, and the remote switches forward the PDUs to core switches so that the core switches are in sync. If the active switch fails or resets, the standby switch takes over as the active switch. If the VSL goes down, one core switch knows the status of the other and does not change its state.

---

**PAgP Interaction with Other Features**

The Dynamic Trunking Protocol (DTP) and the Cisco Discovery Protocol (CDP) send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive PAgP protocol data units (PDUs) on the lowest numbered VLAN.
In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel.

PAgP sends and receives PAgP PDUs only from ports that are up and have PAgP enabled for the auto or desirable mode.

**Link Aggregation Control Protocol**

The LACP is defined in IEEE 802.3ad and enables Cisco switches to manage Ethernet channels between switches that conform to the IEEE 802.3ad protocol. LACP facilitates the automatic creation of EtherChannels by exchanging LACP packets between Ethernet ports.

By using LACP, the switch or switch stack learns the identity of partners capable of supporting LACP and the capabilities of each port. It then dynamically groups similarly configured ports into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, LACP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, LACP adds the group to the spanning tree as a single switch port.

The independent mode behavior of ports in a port channel is changed. With CSCtn96950, by default, standalone mode is enabled. When no response is received from an LACP peer, ports in the port channel are moved to suspended state.

**LACP Modes**

LACP modes specify whether a port can send LACP packets or only receive LACP packets.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>Places a port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.</td>
</tr>
<tr>
<td>passive</td>
<td>Places a port into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation. This setting minimizes the transmission of LACP packets.</td>
</tr>
</tbody>
</table>

Both the active and passive LACP modes enable ports to negotiate with partner ports to an EtherChannel based on criteria such as port speed, and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A port in the active mode can form an EtherChannel with another port that is in the active or passive mode.
- A port in the passive mode cannot form an EtherChannel with another port that is also in the passive mode because neither port starts LACP negotiation.
**LACP Interaction with Other Features**

The DTP and the CDP send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive LACP PDUs on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel.

LACP sends and receives LACP PDUs only from ports that are up and have LACP enabled for the active or passive mode.

**EtherChannel On Mode**

EtherChannel **on** mode can be used to manually configure an EtherChannel. The **on** mode forces a port to join an EtherChannel without negotiations. The **on** mode can be useful if the remote device does not support PAgP or LACP. In the **on** mode, a usable EtherChannel exists only when the switches at both ends of the link are configured in the **on** mode.

Ports that are configured in the **on** mode in the same channel group must have compatible port characteristics, such as speed and duplex. Ports that are not compatible are suspended, even though they are configured in the **on** mode.

---

**Caution**

You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

---

**Load-Balancing and Forwarding Methods**

EtherChannel balances the traffic load across the links in a channel by reducing part of the binary pattern formed from the addresses in the frame to a numerical value that selects one of the links in the channel. You can specify one of several different load-balancing modes, including load distribution based on MAC addresses, IP addresses, source addresses, destination addresses, or both source and destination addresses. The selected mode applies to all EtherChannels configured on the switch.

---

**Note**

Layer 3 Equal-cost multi path (ECMP) load balancing is based on source IP address, destination IP address, source port, destination port, and layer 4 protocol. Fragmented packets will be treated on two different links based on the algorithm calculated using these parameters. Any changes in one of these parameters will result in load balancing.

You configure the load-balancing and forwarding method by using the `port-channel load-balance` global configuration command.

**MAC Address Forwarding**

With source-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source-MAC address of the incoming packet. Therefore, to provide
load-balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel.

With destination-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the destination host’s MAC address of the incoming packet. Therefore, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

With source-and-destination MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on both the source and destination MAC addresses. This forwarding method, a combination source-MAC and destination-MAC address forwarding methods of load distribution, can be used if it is not clear whether source-MAC or destination-MAC address forwarding is better suited on a particular switch. With source-and-destination MAC-address forwarding, packets sent from host A to host B, host A to host C, and host C to host B could all use different ports in the channel.

**IP Address Forwarding**

With source-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the source-IP address of the incoming packet. To provide load balancing, packets from different IP addresses use different ports in the channel, and packets from the same IP address use the same port in the channel.

With destination-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the destination-IP address of the incoming packet. To provide load balancing, packets from the same IP source address sent to different IP destination addresses could be sent on different ports in the channel.

With source-and-destination IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on both the source and destination IP addresses of the incoming packet. This forwarding method, a combination of source-IP and destination-IP address-based forwarding, can be used if it is not clear whether source-IP or destination-IP address-based forwarding is better suited on a particular switch. In this method, packets sent from the IP address A to IP address B, from IP address A to IP address C, and from IP address C to IP address B could all use different ports in the channel.

**Load-Balancing Advantages**

Different load-balancing methods have different advantages, and the choice of a particular load-balancing method should be based on the position of the switch in the network and the kind of traffic that needs to be load-distributed.

**Figure 37: Load Distribution and Forwarding Methods**

In the following figure, an EtherChannel of four workstations communicates with a router. Because the router is a single MAC-address device, source-based forwarding on the switch EtherChannel ensures that the switch uses all available bandwidth to the router. The router is configured for destination-based forwarding because
the large number of workstations ensures that the traffic is evenly distributed from the router EtherChannel.

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination-MAC address always chooses the same link in the channel. Using source addresses or IP addresses might result in better load-balancing.

**EtherChannel Load Deferral Overview**

In an Instant Access system, the EtherChannel Load Deferral feature allows ports to be bundled into port channels, but prevents the assignment of group mask values to these ports. This prevents the traffic from being forwarded to new instant access stack members and reduce data loss following a stateful switchover (SSO).

Cisco Catalyst Instant Access creates a single network touch point and a single point of configuration across distribution and access layer switches. Instant Access enables the merging of physical distribution and access layer switches into a single logical entity with a single point of configuration, management, and troubleshooting. The following illustration represents a sample network where an Instant Access system interacts with a switch (Catalyst 2960-X Series Switches) that is connected via a port channel to stacked clients (Member 1 and Member 2).

When the EtherChannel Load Deferral feature is configured and a new Instant Access client stack member comes up, ports of this newly-joined stack member is bundled into the port channel. In the transition period, the data path is not fully established on the distribution switch (Catalyst 6000 Series Switches), and traffic originating from the access layer switch (Catalyst 2960-X Series Switches) reaches the non-established ports and the traffic gets lost.

When load share deferral is enabled on a port channel, the assignment of a member port’s load share is delayed for a period that is configured globally by the `port-channel load-defer` command. During the deferral period, the load share of a deferred member port is set to 0. In this state, the deferred port is capable of receiving data and control traffic, and of sending control traffic, but the port is prevented from sending data traffic to the virtual switching system (VSS). Upon expiration of the global deferral timer, the deferred member port exits the deferral state and the port assumes its normal configured load share.
Load share deferral is applied only if at least one member port of the port channel is currently active with a nonzero load share. If a port enabled for load share deferral is the first member bringing up the EtherChannel, the deferral feature does not apply and the port will forward traffic immediately.

This feature is enabled on a per port-channel basis; however, the load deferral timer is configured globally and not per port-channel. As a result, when a new port is bundled, the timer starts only if it is not already running. If some other ports are already deferred then the new port will be deferred only for the remaining amount of time.

The load deferral is stopped as soon as a member in one of the deferred port channels is unbundled. As a result, all the ports that were deferred is assigned a group-mask in the event of an unbundling during the deferral period.

---

Note

When you try to enable this feature on a stack member switch, the following message is displayed:

Load share deferral is supported only on stand-alone stack.

---

**EtherChannel and Switch Stacks**

If a stack member that has ports participating in an EtherChannel fails or leaves the stack, the active switch removes the failed stack member switch ports from the EtherChannel. The remaining ports of the EtherChannel, if any, continue to provide connectivity.

When a switch is added to an existing stack, the new switch receives the running configuration from the active switch and updates itself with the EtherChannel-related stack configuration. The stack member also receives the operational information (the list of ports that are up and are members of a channel).

When two stacks merge that have EtherChannels configured between them, self-looped ports result. Spanning tree detects this condition and acts accordingly. Any PAgP or LACP configuration on a winning switch stack is not affected, but the PAgP or LACP configuration on the losing switch stack is lost after the stack reboots.

For a mixed stack containing one or more Catalyst 2960-S switches, we recommend that you configure no more than six EtherChannels on the stack.

**Switch Stack and PAgP**

With PAgP, if the active switch fails or leaves the stack, the standby switch becomes the new active switch. The new active switch synchronizes the configuration of the stack members to that of the active switch. The PAgP configuration is not affected after an active switch change unless the EtherChannel has ports residing on the old active switch.

**Switch Stacks and LACP**

With LACP, the system ID uses the stack MAC address from the active switch, and if the active switch changes, the LACP system ID can change. If the LACP system ID changes, the entire EtherChannel will flap, and there will be an STP reconvergence. Use the `stack-mac persistent timer` command to control whether or not the stack MAC address changes during a active switch failover.
Default EtherChannel Configuration

The default EtherChannel configuration is described in this table.

EtherChannel Configuration Guidelines

If improperly configured, some EtherChannel ports are automatically disabled to avoid network loops and other problems. Follow these guidelines to avoid configuration problems:

- Do not try to configure more than 24 EtherChannels on the switch or switch stack.
- In a mixed switch stack that contains one or more Catalyst 2960-S switches, do not configure more than six EtherChannels on the switch stack.
- Configure a PAgP EtherChannel with up to eight Ethernet ports of the same type.
- Configure a LACP EtherChannel with up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.
- Configure all ports in an EtherChannel to operate at the same speeds and duplex modes.
- Enable all ports in an EtherChannel. A port in an EtherChannel that is disabled by using the `shutdown` interface configuration command is treated as a link failure, and its traffic is transferred to one of the remaining ports in the EtherChannel.
• When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, you must also make the changes to all ports in the group:
  • Allowed-VLAN list
  • Spanning-tree path cost for each VLAN
  • Spanning-tree port priority for each VLAN
  • Spanning-tree Port Fast setting

• Do not configure a port to be a member of more than one EtherChannel group.

• Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

• Do not configure a secure port as part of an EtherChannel or the reverse.

• Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x on an EtherChannel port, an error message appears, and IEEE 802.1x is not enabled.

• If EtherChannels are configured on switch interfaces, remove the EtherChannel configuration from the interfaces before globally enabling IEEE 802.1x on a switch by using the `dot1x system-auth-control` global configuration command.

• For cross-stack EtherChannel configurations, ensure that all ports targeted for the EtherChannel are either configured for LACP or are manually configured to be in the channel group using the `channel-group channel-group-number mode on` interface configuration command. The PAgP protocol is not supported on cross-stack EtherChannels.

Layer 2 EtherChannel Configuration Guidelines

When configuring Layer 2 EtherChannels, follow these guidelines:

• Assign all ports in the EtherChannel to the same VLAN, or configure them as trunks. Ports with different native VLANs cannot form an EtherChannel.

• An EtherChannel supports the same allowed range of VLANs on all the ports in a trunking Layer 2 EtherChannel. If the allowed range of VLANs is not the same, the ports do not form an EtherChannel even when PAgP is set to the `auto` or `desirable` mode.

• Ports with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.

Auto-LAG

The auto-LAG feature provides the ability to auto create EtherChannels on ports connected to a switch. By default, auto-LAG is disabled globally and is enabled on all port interfaces. The auto-LAG applies to a switch only when it is enabled globally.

On enabling auto-LAG globally, the following scenarios are possible:
• All port interfaces participate in creation of auto EtherChannels provided the partner port interfaces have EtherChannel configured on them. For more information, see the "The supported auto-LAG configurations between the actor and partner devices" table below.

• Ports that are already part of manual EtherChannels cannot participate in creation of auto EtherChannels.

• When auto-LAG is disabled on a port interface that is already a part of an auto created EtherChannel, the port interface will unbundle from the auto EtherChannel.

The following table shows the supported auto-LAG configurations between the actor and partner devices:

<table>
<thead>
<tr>
<th>Actor/Partner</th>
<th>Active</th>
<th>Passive</th>
<th>Auto</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Passive</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Auto</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

On disabling auto-LAG globally, all auto created Etherchannels become manual EtherChannels.

You cannot add any configurations in an existing auto created EtherChannel. To add, you should first convert it into a manual EtherChannel by executing the `port-channel<channel-number>persistent`.

**Note**

Auto-LAG uses the LACP protocol to create auto EtherChannel. Only one EtherChannel can be automatically created with the unique partner devices.

**Auto-LAG Configuration Guidelines**

Follow these guidelines when configuring the auto-LAG feature.

• When auto-LAG is enabled globally and on the port interface, and if you do not want the port interface to become a member of the auto EtherChannel, disable the auto-LAG on the port interface.

• A port interface will not bundle to an auto EtherChannel when it is already a member of a manual EtherChannel. To allow it to bundle with the auto EtherChannel, first unbundle the manual EtherChannel on the port interface.

• When auto-LAG is enabled and auto EtherChannel is created, you can create multiple EtherChannels manually with the same partner device. But by default, the port tries to create auto EtherChannel with the partner device.

• The auto-LAG is supported only on Layer 2 EtherChannel. It is not supported on Layer 3 interface and Layer 3 EtherChannel.

• The auto-LAG is supported on cross-stack EtherChannel.
How to Configure EtherChannels

After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical ports assigned to the port-channel interface, and configuration changes applied to the physical port affect only the port where you apply the configuration.

Configuring Layer 2 EtherChannels

You configure Layer 2 EtherChannels by assigning ports to a channel group with the `channel-group` interface configuration command. This command automatically creates the port-channel logical interface.

If you enabled PAgP on a port in the `auto` or `desirable` mode, you must reconfigure it for either the `on` mode or the LACP mode before adding this port to a cross-stack EtherChannel. PAgP does not support cross-stack EtherChannels.

### Procedure

<table>
<thead>

<td>Switch(config-if)# switchport access vlan 22</td>
<td></td>
</tr>
</tbody>
</table>
**Command or Action**  
channel-group *channel-group-number* mode  
{auto [non-silent] | desirable [non-silent] | on} | {active | passive}

**Purpose**  
Assigns the port to a channel group, and specifies the PAgP or the LACP mode.

For *channel-group-number*, the range is 1 to 24.

For *mode*, select one of these keywords:

- **auto** — Enables PAgP only if a PAgP device is detected. It places the port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This keyword is not supported when EtherChannel members are from different switches in the switch stack.

- **desirable** — Unconditionally enables PAgP. It places the port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This keyword is not supported when EtherChannel members are from different switches in the switch stack.

- **on** — Forcems the port to channel without PAgP or LACP. In the *on* mode, an EtherChannel exists only when a port group in the *on* mode is connected to another port group in the *on* mode.

- **non-silent** — (Optional) If your switch is connected to a partner that is PAgP-capable, configures the switch port for nonsilent operation when the port is in the *auto* or *desirable* mode. If you do not specify *non-silent*, silent is assumed. The silent setting is for connections to file servers or packet analyzers. This setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

- **active** — Enables LACP only if a LACP device is detected. It places the port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.

- **passive** — Enables LACP on the port and places it into a passive negotiating state in which the port responds to LACP packets.

---

**Example:**

Switch(config-if)# channel-group 5 mode auto

---

### Configuring Port Channel Load Deferral

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
| | Example:  
| | Switch> enable | |
| Step 2 | configure terminal | Enters global configuration mode.  
| | Example:  
| | Switch# configure terminal | |
| Step 3 | port-channel load-defer seconds | Configures the port load share deferral interval for all port channels.  
| | Example:  
| | Switch(config)# port-channel load-defer 60 | • seconds—The time interval during which load sharing is initially 0 for deferred port channels. The range is 1 to 1800 seconds; the default is 120 seconds |
| Step 4 | interface type number | Configures a port channel interface and enters interface configuration mode.  
| | Example:  
| | Switch(config)# interface port-channel 10 | |
| Step 5 | port-channel load-defer | Enables port load share deferral on the port channel.  
| | Example:  
| | Switch(config-if)# port-channel load-defer | |
| Step 6 | end | Exits interface configuration mode and returns to privileged EXEC mode.  
| | Example:  
| | Switch(config-if)# end | |
| Step 7 | show etherchannel channel-group port-channel | Displays port channel information.  
| | Example:  
| | Switch# show etherchannel 1 port-channel | |
**Purpose**

- **Command or Action**: `show platform pm group-masks`
- **Purpose**: Display EtherChannel group masks information.

**Example**

The following is sample output from the `show etherchannel channel-group port-channel` command. If the `channel-group` argument is not specified; the command displays information about all channel groups are displayed.

```
Switch# show etherchannel 1 port-channel

Port-channels in the group:
---------------------------------------------
Port-channel: Po1

-------------------------------
Age of the Port-channel   = 0d:00h:37m:08s
Logical slot/port         = 9/1   Number of ports = 0
GC                         = 0x00000000   HotStandBy port = null
Port state                = Port-channel Ag-Not-Inuse
Protocol                   = -
Port security             = Disabled
Load share deferral        = Enabled   defer period = 120 sec   time left = 0 sec
```

The following is sample output from the `show platform pm group-masks` command. Deferred ports have the group mask of 0xFFFF, when the defer timer is running.

```
Switch# show platform pm group-masks

--------------------------------------------------------------------
Etherchannel members and group masks table
Group #ports group frame-dist slot port mask interface index
--------------------------------------------------------------------

## Configuring the PAgP Learn Method and Priority

This task is optional.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface interface-id</code></td>
<td>Specifies the port for transmission, and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# interface gigabitethernet 1/0/2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>pagp learn-method physical-port</code></td>
<td>Selects the PAgP learning method.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# pagp learn-method physical port</td>
<td>By default, <em>aggregation-port learning</em> is selected, which means the switch sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives. Selects <em>physical-port</em> to connect with another switch that is a physical learner. Make sure to configure the <em>port-channel load-balance</em> global configuration command to <em>src-mac</em>. The learning method must be configured the same at both ends of the link.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>pagp port-priority priority</code></td>
<td>Assigns a priority so that the selected port is chosen for packet transmission. For <em>priority</em>, the range is 0 to 255. The default is 128. The higher the priority, the more likely that the port will be used for PAgP transmission.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# pagp port-priority 200</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>
Configuring LACP Hot-Standby Ports

When enabled, LACP tries to configure the maximum number of LACP-compatible ports in a channel, up to a maximum of 16 ports. Only eight LACP links can be active at one time. The software places any additional links in a hot-standby mode. If one of the active links becomes inactive, a link that is in the hot-standby mode becomes active in its place.

If you configure more than eight links for an EtherChannel group, the software automatically decides which of the hot-standby ports to make active based on the LACP priority. To every link between systems that operate LACP, the software assigns a unique priority made up of these elements (in priority order):

- LACP system priority
- System ID (the switch MAC address)
- LACP port priority
- Port number

In priority comparisons, numerically lower values have higher priority. The priority decides which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Determining which ports are active and which are hot standby is a two-step procedure. First the system with a numerically lower system priority and system ID is placed in charge of the decision. Next, that system decides which ports are active and which are hot standby, based on its values for port priority and port number. The port priority and port number values for the other system are not used.

You can change the default values of the LACP system priority and the LACP port priority to affect how the software selects active and standby links.

Configuring the LACP System Priority

You can configure the system priority for all the EtherChannels that are enabled for LACP by using the `lacp system-priority` global configuration command. You cannot configure a system priority for each LACP-configured channel. By changing this value from the default, you can affect how the software selects active and standby links.

You can use the `show etherchannel summary` privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

Follow these steps to configure the LACP system priority. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Example:</code></td>
<td></td>
</tr>
</tbody>
</table>
## Configuring the LACP Port Priority

By default, all ports use the same port priority. If the local system has a lower value for the system priority and the system ID than the remote system, you can affect which of the hot-standby links become active first by changing the port priority of LACP EtherChannel ports to a lower value than the default. The hot-standby ports that have lower port numbers become active in the channel first. You can use the `show etherchannel summary` privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

### Note

If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), all the ports that cannot be actively included in the EtherChannel are put in the hot-standby state and are used only if one of the channeled ports fails.

Follow these steps to configure the LACP port priority. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Step 3

- **lacp system-priority priority**

  **Example:**

  ```
  Switch(config)# lacp system-priority 32000
  ```

  The range is 1 to 65535. The default is 32768. The lower the value, the higher the system priority.

### Step 4

- `end`

  **Example:**

  ```
  Switch(config)# end
  ```

  Returns to privileged EXEC mode.
### Configuring the LACP Port Channel Min-Links Feature

You can specify the minimum number of active ports that must be in the link-up state and bundled in an EtherChannel for the port channel interface to transition to the link-up state. Using EtherChannel min-links, you can prevent low-bandwidth LACP EtherChannels from becoming active. Port channel min-links also cause LACP EtherChannels to become inactive if they have too few active member ports to supply the required minimum bandwidth.

To configure the minimum number of links that are required for a port channel. Perform the following tasks.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** | `configure terminal` | Enters global configuration mode. |
| **Step 3** | `interface port-channel channel-number` | Enters interface configuration mode for a port-channel.  
For `channel-number`, the range is 1 to 63. |
### Configuring LACP Fast Rate Timer

You can change the LACP timer rate to modify the duration of the LACP timeout. Use the `lacp rate` command to set the rate at which LACP control packets are received by an LACP-supported interface. You can change the timeout rate from the default rate (30 seconds) to the fast rate (1 second). This command is supported only on LACP-enabled interfaces.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>

<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> [no] port-channel auto</td>
<td>Enables the auto-LAG feature on a switch globally. Use the no form of</td>
</tr>
<tr>
<td>Example:</td>
<td>this command to disable the auto-LAG feature on the switch globally.</td>
</tr>
<tr>
<td>Switch(config)# port-channel auto</td>
<td><strong>Note</strong> By default, the auto-LAG feature is enabled on the port.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Auto-LAG on a Port Interface

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
*Example:*  
Switch> enable  
| | | • Enter your password if prompted.  
| **Step 2** | configure terminal | Enters global configuration mode.  
*Example:*  
Switch# configure terminal  
| | |  
| **Step 3** | interface interface-id | Specifies the port interface to be enabled for auto-LAG, and enters interface configuration mode.  
*Example:*  
Switch(config)# interface gigabitethernet 1/0/1  
| | |  
| **Step 4** | [no] channel-group auto | (Optional) Enables auto-LAG feature on individual port interface. Use the no form of this command to disable the auto-LAG feature on individual port interface.  
*Example:*  
Switch(config-if)# channel-group auto  
| | |  
| | | **Note** By default, the auto-LAG feature is enabled on the port.  
| **Step 5** | end | Returns to privileged EXEC mode.  
*Example:*  
Switch(config-if)# end  
| | |  
| **Step 6** | show etherchannel auto | Displays that EtherChannel is created automatically.  
*Example:*  
Switch# show etherchannel auto  

---

Display that EtherChannel is created automatically.

**Example:**

Switch( config )# end

---

Configuring Auto-LAG on a Port Interface

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 5** | show etherchannel auto | Displays that EtherChannel is created automatically.  
*Example:*  
Switch# show etherchannel auto  
| | |  

---

**Display that EtherChannel is created automatically.**

**Example:**

Switch( config )# end

---

Configuring Persistence with Auto-LAG

You use the persistence command to convert the auto created EtherChannel into a manual one and allow you to add configuration on the existing EtherChannel.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  **Example:**  
  Switch> enable |
| **Step 2** port-channel channel-number persistent | Converts the auto created EtherChannel into a manual one and allows you to add configuration on the EtherChannel.  
  **Example:**  
  Switch# port-channel 1 persistent |
| **Step 3** show etherchannel summary | Displays the EtherChannel information.  
  **Example:**  
  Switch# show etherchannel summary |

Monitoring EtherChannel, PAgP, and LACP Status

You can display EtherChannel, PAgP, and LACP status using the commands listed in this table.

### Table 40: Commands for Monitoring EtherChannel, PAgP, and LACP Status

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| clear lacp { channel-group-number counters | clears LACP channel-group information and traffic counters.  
  | counters } |
| clear pagp { channel-group-number counters | clears PAgP channel-group information and traffic counters.  
  | counters } |
| show etherchannel [ channel-group-number { detail | displays EtherChannel information in a brief, detailed,  
  | load-balance | port | port-channel | and one-line summary form. Also displays the  
  | protocol | summary | [detail | load-balance | port | port-channel |  
  | protocol | auto | summary ] } | protocol, port-channel, protocol, and Auto-LAG information. |
| show pagp [ channel-group-number ] { counters | displays PAgP information such as traffic  
  | internal | neighbor } | information, the internal PAgP configuration, and  
  | neighbors } | neighbor information. |
### Command Examples for Configuring EtherChannels

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show pagp [channel-group-number] dual-active</strong></td>
<td>Displays the dual-active detection status.</td>
</tr>
<tr>
<td>**show lacp [channel-group-number] {counters</td>
<td>internal</td>
</tr>
<tr>
<td><strong>show running-config</strong></td>
<td>Verifies your configuration entries.</td>
</tr>
<tr>
<td><strong>show etherchannel load-balance</strong></td>
<td>Displays the load balance or frame distribution scheme among ports in the port channel.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Configuring EtherChannels

#### Configuring Layer 2 EtherChannels: Examples

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable non-silent
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel. It uses LACP passive mode and assigns two ports on stack member 1 and one port on stack member 2 as static-access ports in VLAN 10 to channel 5:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode passive
Switch(config-if-range)# exit
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# switchport mode access
```
PoE or LACP negotiation errors may occur if you configure two ports from switch to the access point (AP). This scenario can be avoided if the port channel configuration is on the switch side. For more details, see the following example:

interface Port-channel1
  switchport access vlan 20
  switchport mode access
  switchport nonegotiate
  no port-channel standalone-disable
  spanning-tree portfast

Note
If the port reports LACP errors on port flap, you should include the following command as well: no errdisable detect cause pagp-flap

Example: Configuring Port Channel Load Deferral

Switch(config-if)# switchport access vlan 10
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# exit

Configuring Auto LAG: Examples

This example shows how to configure Auto-LAG on a switch

switch> enable
switch# configure terminal
switch (config)# port-channel auto
switch (config-if)# end

The following example shows the summary of EtherChannel that was created automatically.

switch# show etherchannel auto
Flags: D - down  P - bundled in port-channel
I - stand-alone  s - suspended
H - Hot-standby (LACP only)
R - Layer3  S - Layer2
U - in use  f - failed to allocate aggregator
M - not in use, minimum links not met
u - unsuitable for bundling
w - waiting to be aggregated
d - default port
A - formed by Auto LAG

Number of channel-groups in use: 1
Number of aggregators: 1

Group  Port-channel  Protocol  Ports
The following example shows the summary of auto EtherChannel after executing the `port-channel 1 persistent` command.

```
switch# port-channel 1 persistent
switch# show etherchannel summary
```

Flags: D - down  P - bundled in port-channel
I - stand-alone  s - suspended
H - Hot-standby (LACP only)
R - Layer3  S - Layer2
U - in use  f - failed to allocate aggregator
M - not in use, minimum links not met
u - unsuitable for bundling
w - waiting to be aggregated
d - default port
A - formed by Auto LAG

Number of channel-groups in use: 1
Number of aggregators: 1

```
Group Port-channel Protocol Ports
------+-------------+-----------+-----------------------------------------------
1 Po1(SU) LACP Gi1/0/45(P) Gi2/0/21(P) Gi3/0/21(P)
```

### Configuring LACP Port Channel Min-Links: Examples

This example shows how to configure LACP port-channel min-links:

```
switch > enable
switch# configure terminal
switch(config)# interface port-channel 5
switch(config-if)# port-channel min-links 3
switch# show etherchannel 25 summary
switch# end
```

When the minimum links requirement is not met in standalone switches, the port-channel is flagged and assigned SM/SN or RM/RN state.

```
switch# show etherchannel 5 summary
```

Flags: D - down  P - bundled in port-channel
I - stand-alone  s - suspended
H - Hot-standby (LACP only)
R - Layer3  S - Layer2
U - in use  N- not in use, no aggregation
f - failed to allocate aggregator
M - not in use, no aggregation due to minimum links not met
m- not in use, port not aggregated due to minimum links not met
u - unsuitable for bundling
w - waiting to be aggregated
d - default port

Number of channel-groups in use: 6
Number of aggregators: 6

```
Group Port-channel Protocol Ports
------+-------------+-----------+-----------------------------------------------
6 Po25(RM) LACP Gi1/3/1(D) Gi1/3/2(D) Gi2/2/25(D) Gi2/2/26(W)
```
Example: Configuring LACP Fast Rate Timer

This example shows you how to configure the LACP rate:

```plaintext
switch> enable
switch# configure terminal
switch(config)# interface gigabitEthernet 2/1
switch(config-if)# lACP rate fast
switch(config-if)# exit
switch(config)# end
switch#
```

The following is sample output from the `show lacp internal` command:

```plaintext
switch# show lacp internal
Flags: S - Device is requesting Slow LACPDU
F - Device is requesting Fast LACPDU
A - Device is in Active mode P - Device is in Passive mode
Channel group 25
LACP port Admin Oper Port Port
Port Flags State Priority Key Key Number State
Te1/49 FA bndl 32768 0x19 0x19 0x32 0x3F
Te1/50 FA bndl 32768 0x19 0x19 0x33 0x3F
Te1/51 FA bndl 32768 0x19 0x19 0x34 0x3F
Te1/52 FA bndl 32768 0x19 0x19 0x35 0x3F
```

The following is sample output from the `show lacp counters` command:

```plaintext
switch# show lacp counters
LACPDU Marker Marker Response LACPDU
Port Sent Recv Sent Recv Sent Recv Pkts Err
---------------------------------------------------------------------
Channel group: 24
Te1/1/27 2 2 0 0 0 0 0
Te2/1/25 2 2 0 0 0 0 0
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Link-State Tracking

• This feature is supported only on the LAN Base image.
• You can configure only two link-state groups per switch.
• An interface cannot be a member of more than one link-state group.
• An interface that is defined as an upstream interface in a link-state group cannot also be defined as a downstream interface in the link-state group.
• Do not enable link-state tracking on individual interfaces that will part of a downstream EtherChannel interface.

Related Topics
Understanding Link-State Tracking, on page 328
Understanding Link-State Tracking

Link-state tracking, also known as trunk failover, binds the link state of multiple interfaces. Link-state tracking can be with server NIC adapter teaming to provide redundancy in the network. When the server NIC adapters are configured in a primary or secondary relationship, and the link is lost on the primary interface, network connectivity is transparently changed to the secondary interface.

Note

An interface can be an aggregation of ports (an EtherChannel) or a single physical port in either access or trunk mode.

The configuration in this figure ensures that the network traffic flow is balanced.

*Figure 38: Typical Link-State Tracking Configuration*

- For links to switches and other network devices
  - Server 1 and server 2 use switch A for primary links and switch B for secondary links.
• Server 3 and server 4 use switch B for primary links and switch A for secondary links.

• Link-state group 1 on switch A
  • Switch A provides primary links to server 1 and server 2 through link-state group 1. Port 1 is connected to server 1, and port 2 is connected to server 2. Port 1 and port 2 are the downstream interfaces in link-state group 1.
  • Port 5 and port 6 are connected to distribution switch 1 through link-state group 1. Port 5 and port 6 are the upstream interfaces in link-state group 1.

• Link-state group 2 on switch A
  • Switch A provides secondary links to server 3 and server 4 through link-state group 2. Port 3 is connected to server 3, and port 4 is connected to server 4. Port 3 and port 4 are the downstream interfaces in link-state group 2.
  • Port 7 and port 8 are connected to distribution switch 2 through link-state group 2. Port 7 and port 8 are the upstream interfaces in link-state group 2.

• Link-state group 2 on switch B
  • Switch B provides primary links to server 3 and server 4 through link-state group 2. Port 3 is connected to server 3, and port 4 is connected to server 4. Port 3 and port 4 are the downstream interfaces in link-state group 2.
  • Port 5 and port 6 are connected to distribution switch 2 through link-state group 2. Port 5 and port 6 are the upstream interfaces in link-state group 2.

• Link-state group 1 on switch B
  • Switch B provides secondary links to server 1 and server 2 through link-state group 1. Port 1 is connected to server 1, and port 2 is connected to server 2. Port 1 and port 2 are the downstream interfaces in link-state group 1.
  • Port 7 and port 8 are connected to distribution switch 1 through link-state group 1. Port 7 and port 8 are the upstream interfaces in link-state group 1.

In a link-state group, the upstream ports can become unavailable or lose connectivity because the distribution switch or router fails, the cables are disconnected, or the link is lost. These are the interactions between the downstream and upstream interfaces when link-state tracking is enabled:
  • If any of the upstream interfaces are in the link-up state, the downstream interfaces can change to or remain in the link-up state.
  • If all of the upstream interfaces become unavailable, link-state tracking automatically puts the downstream interfaces in the error-disabled state. Connectivity to and from the servers is automatically changed from the primary server interface to the secondary server interface. For example, in the previous figure, if the upstream link for port 6 is lost, the link states of downstream ports 1 and 2 do not change. However, if the link for upstream port 5 is also lost, the link state of the downstream ports changes to the link-down state. Connectivity to server 1 and server 2 is then changed from link-state group 1 to link-state group 2. The downstream ports 3 and 4 do not change state because they are in link-group 2.
• If the link-state group is configured, link-state tracking is disabled, and the upstream interfaces lose connectivity, the link states of the downstream interfaces remain unchanged. The server does not recognize that upstream connectivity has been lost and does not failover to the secondary interface.

You can recover a downstream interface link-down condition by removing the failed downstream port from the link-state group. To recover multiple downstream interfaces, disable the link-state group.

Restrictions for Configuring Flex Links and MAC Address-Table Move Update

• This feature is supported only on the LAN Base image.
• Flex Links are supported only on Layer 2 ports and port channels.
• You can configure up to 16 backup links.
• You can configure only one Flex Links backup link for any active link, and it must be a different interface from the active interface.
• An interface can belong to only one Flex Links pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Links pair.

• Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.

• A backup link does not have to be the same type (Gigabit Ethernet or port channel) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.

• STP is disabled on Flex Links ports. A Flex Links port does not participate in STP, even if the VLANs present on the port are configured for STP. When STP is not enabled, be sure that there are no loops in the configured topology.

Information About Flex Links and MAC Address-Table Move Update

Flex Links

Flex Links are a pair of a Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP). Users can disable STP and still retain basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the switch. If the switch is running STP, Flex Links are not necessary because STP already provides link-level redundancy or backup.

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the Flex Links or backup link. On switches, the Flex Links can be on the same switch or on another switch in the stack. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link shuts down. At any given time, only one of the interfaces is in the linkup state and forwarding traffic. If the primary link shuts down, the standby link starts forwarding traffic. When the active link comes back up, it goes into standby mode and does not forward traffic. STP is disabled on Flex Links interfaces.

Flex Links Configuration

In the following figure, ports 1 and 2 on switch A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 goes down, port 2 comes up and starts forwarding traffic to switch C. When port 1 comes back up, it goes into standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also configure a preemption function, specifying the preferred port for forwarding traffic. For example, you can configure the Flex Links pair with preemption mode. In the scenario shown, when port 1 comes back up and has more bandwidth than port 2, port 1 begins forwarding traffic after 60 seconds. Port 2 becomes the standby port. You do this by entering the `switchport backup interface preemption mode bandwidth` and `switchport backup interface preemption delay` interface configuration commands.
If a primary (forwarding) link goes down, a trap notifies the network management stations. If the standby link goes down, a trap notifies the users.

Flex Links are supported only on Layer 2 ports and port channels, not on VLANs or on Layer 3 ports.

**VLAN Flex Links Load Balancing and Support**

VLAN Flex Links load balancing allows users to configure a Flex Links pair so that both ports simultaneously forward the traffic for some mutually exclusive VLANs. For example, if Flex Links ports are configured for 1 to 100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the rest on the other port. If one of the ports fail, the other active port forwards all the traffic. When the failed port comes back up, it resumes forwarding traffic in the preferred VLANs. In addition to providing the redundancy, this Flex Links pair can be used for load balancing. Flex Links VLAN load balancing does not impose any restrictions on uplink switches.

**Multicast Fast Convergence with Flex Links Failover**

Multicast fast convergence reduces the multicast traffic convergence time after a Flex Links failure. Multicast fast convergence is implemented by a combination of learning the backup link as an mrouter port, generating IGMP reports, and leaking IGMP reports.

**Learning the Other Flex Links Port as the mrouter Port**

In a typical multicast network, there is a querier for each VLAN. A switch deployed at the edge of a network has one of its Flex Links ports receiving queries. Flex Links ports are also always forwarding at any given time.

A port that receives queries is added as an mrouter port on the switch. An mrouter port is part of all the multicast groups learned by the switch. After a changeover, queries are received by the other Flex Links port.
The other Flex Links port is then learned as the mrouter port. After changeover, multicast traffic then flows through the other Flex Links port. To achieve faster convergence of traffic, both Flex Links ports are learned as mrouter ports whenever either Flex Links port is learned as the mrouter port. Both Flex Links ports are always part of multicast groups.

Although both Flex Links ports are part of the groups in normal operation mode, all traffic on the backup port is blocked. The normal multicast data flow is not affected by the addition of the backup port as an mrouter port. When the changeover happens, the backup port is unblocked, allowing the traffic to flow. In this case, the upstream multicast data flows as soon as the backup port is unblocked.

**Generating IGMP Reports**

When the backup link comes up after the changeover, the upstream new distribution switch does not start forwarding multicast data, because the port on the upstream router, which is connected to the blocked Flex Links port, is not part of any multicast group. The reports for the multicast groups were not forwarded by the downstream switch because the backup link is blocked. The data does not flow on this port, until it learns the multicast groups, which occurs only after it receives reports.

The reports are sent by hosts when a general query is received, and a general query is sent within 60 seconds in normal scenarios. When the backup link starts forwarding, to achieve faster convergence of multicast data, the downstream switch immediately sends proxy reports for all the learned groups on this port without waiting for a general query.

**Leaking IGMP Reports**

To achieve multicast traffic convergence with minimal loss, a redundant data path must be set up before the Flex Links active link goes down. This can be achieved by leaking only IGMP report packets on the Flex Links backup link. These leaked IGMP report messages are processed by upstream distribution routers, so multicast data traffic gets forwarded to the backup interface. Because all incoming traffic on the backup interface is dropped at the ingress of the access switch, no duplicate multicast traffic is received by the host. When the Flex Links active link fails, the access switch starts accepting traffic from the backup link immediately. The only disadvantage of this scheme is that it consumes bandwidth on the link between the distribution switches and on the backup link between the distribution and access switches. This feature is disabled by default and can be configured by using the `switchport backup interface interface-id multicast fast-convergence` command.

When this feature has been enabled at changeover, the switch does not generate the proxy reports on the backup port, which became the forwarding port.

**MAC Address-Table Move Update**

The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

*Figure 41: MAC Address-Table Move Update Example*

In the following figure, switch A is an access switch, and ports 1 and 2 on switch A are connected to uplink switches B and D through a Flex Links pair. Port 1 is forwarding traffic, and port 2 is in the backup state. Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC has been
learned on port 3 of switch C. Traffic from the server to the PC is forwarded from port 3 to port 1.

If the MAC address-table move update feature is not configured and port 1 goes down, port 2 starts forwarding traffic. However, for a short time, switch C keeps forwarding traffic from the server to the PC through port 3, and the PC does not get the traffic because port 1 is down. If switch C removes the MAC address of the PC on port 3 and relearns it on port 4, traffic can then be forwarded from the server to the PC through port 2.

If the MAC address-table move update feature is configured and enabled on the switches, and port 1 goes down, port 2 starts forwarding traffic from the PC to the server. The switch sends a MAC address-table move update packet from port 2. Switch C gets this packet on port 4 and immediately learns the MAC address of the PC on port 4, which reduces the reconvergence time.

You can configure the access switch, switch A, to send MAC address-table move update messages. You can also configure the uplink switches B, C, and D to get and process the MAC address-table move update messages. When switch C gets a MAC address-table move update message from switch A, switch C learns the MAC address of the PC on port 4. Switch C updates the MAC address table, including the forwarding table entry for the PC.

Switch A does not need to wait for the MAC address-table update. The switch detects a failure on port 1 and immediately starts forwarding server traffic from port 2, the new forwarding port. This change occurs in less than 100 milliseconds (ms). The PC is directly connected to switch A, and the connection status does not change. Switch A does not need to update the PC entry in the MAC address table.
Flex Links VLAN Load Balancing Configuration Guidelines

- For Flex Links VLAN load balancing, you must choose the preferred VLANs on the backup interface.
- You cannot configure a preemption mechanism and VLAN load balancing for the same Flex Links pair.

MAC Address-Table Move Update Configuration Guidelines

- You can enable and configure this feature on the access switch to send the MAC address-table move updates.
- You can enable and configure this feature on the uplink switches to get the MAC address-table move updates.

Default Flex Links and MAC Address-Table Move Update Configuration

- Flex Links is not configured, and there are no backup interfaces defined.
- The preemption mode is off.
- The preemption delay is 35 seconds.
- The MAC address-table move update feature is not configured on the switch.

How to Configure Flex Links and the MAC Address-Table Move Update Feature

Configuring Flex Links

</table>

Configuration Examples for Flex Links

Configuring Flex Links: Examples

This example shows how to verify the configuration after you configure an interface with a backup interface:

```
Switch# show interface switchport backup
Switch Backup Interface Pairs:
Active Interface Backup Interface State
---------------------------------------------------------------
GigabitEthernet1/0/1 GigabitEthernet1/0/2 Active Up/Backup Standby
```

This example shows how to verify the configuration after you configure the preemption mode as forced for a backup interface pair:

```
Switch# show interface switchport backup detail
Switch Backup Interface Pairs:

Active Interface Backup Interface State
---------------------------------------------------------------
GigabitEthernet1/0/1 GigabitEthernet1/0/2 Active Up/Backup Standby
Interface Pair : Gi1/0/1, Gi1/0/2
Preemption Mode : forced
Preemption Delay : 50 seconds
Bandwidth : 100000 Kbit (Gi1/0/1), 100000 Kbit (Gi1/0/2)
Mac Address Move Update Vlan : auto
```
Configuring VLAN Load Balancing on Flex Links: Examples

In the following example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```
Switch(config)# interface gigabitethernet 2/0/6
Switch(config-if)# switchport backup interface gigabitethernet 2/0/8 prefer vlan 60,100-120
```

When both interfaces are up, Gi2/0/8 forwards traffic for VLANs 60 and 100 to 120 and Gi2/0/6 forwards traffic for VLANs 1 to 50.

```
Switch# show interfaces switchport backup

Switch Backup Interface Pairs:
Active Interface    Backup Interface    State
GigabitEthernet2/0/6    GigabitEthernet2/0/8    Active Up/Backup Standby
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Links interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Links pair. In this example, if interface Gi2/0/6 goes down, Gi2/0/8 carries all VLANs of the Flex Links pair.

```
Switch# show interfaces switchport backup

Switch Backup Interface Pairs:
Active Interface    Backup Interface    State
GigabitEthernet2/0/6    GigabitEthernet2/0/8    Active Down/Backup Up
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Links interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi2/0/6 comes up, VLANs preferred on this interface are blocked on the peer interface Gi2/0/8 and forwarded on Gi2/0/6.

```
Switch# show interfaces switchport backup

Switch Backup Interface Pairs:
Active Interface    Backup Interface    State
GigabitEthernet2/0/6    GigabitEthernet2/0/8    Active Up/Backup Standby
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

```
Switch# show interfaces switchport backup detail

Switch Backup Interface Pairs:
```

Active Interface       Backup Interface       State
------------------------------------------------------------------------
FastEthernet1/0/3      FastEthernet1/0/4       Active Down/Backup Up

Vlans Preferred on Active Interface: 1-2, 5-4094
Vlans Preferred on Backup Interface: 3-4
Preemption Mode : off
Bandwidth : 10000 Kbit (Fa1/0/3), 100000 Kbit (Fa1/0/4)
Mac Address Move Update Vlan : auto

Configuring the MAC Address-Table Move Update: Examples

This example shows how to verify the configuration after you configure an access switch to send MAC address-table move updates:

Switch# show mac address-table move update

Switch-ID : 010b.4630.1780
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 1023/8320
Default/Current settings: Rcv Off/On, Xmt Off/On
Max packets per min : Rcv 40, Xmt 60
Rcv packet count : 5
Rcv conforming packet count : 5
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : Po2
Rcv last src-mac-address : 000b.462d.c502
Rcv last switch-ID : 0403.fd6a.8700
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : None

Configuring Multicast Fast Convergence with Flex Links Failover: Examples

These are configuration examples for learning the other Flex Links port as the mrouter port when Flex Links is configured on GigabitEthernet1/0/11 and GigabitEthernet1/0/12, and output for the show interfaces switchport backup command:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface GigabitEthernet1/0/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport backup interface GigabitEthernet1/0/12
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet1/0/12
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# end
Switch# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet1/0/11 GigabitEthernet1/0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : Off
Bandwidth : 100000 Kbit (Gi1/0/11), 100000 Kbit (Gi1/0/12)
Mac Address Move Update Vlan : auto

This output shows a querier for VLANs 1 and 401, with their queries reaching the switch through
GigabitEthernet1/0/11:

Switch# show ip igmp snooping querier

Vlan IP Address IGMP Version Port
-----------------------------------------
1 1.1.1.1 v2 Gi1/0/11
401 41.41.41.1 v2 Gi1/0/11

This example is output for the show ip igmp snooping mrouter command for VLANs 1 and 401:

Switch# show ip igmp snooping mrouter

Vlan ports
-------- -------
1   Gi1/0/11(dynamic), Gi1/0/12(dynamic)
401 Gi1/0/11(dynamic), Gi1/0/12(dynamic)

Similarly, both Flex Links ports are part of learned groups. In this example, GigabitEthernet2/0/11 is a
receiver/host in VLAN 1, which is interested in two multicast groups:

Switch# show ip igmp snooping groups

Vlan Group Type Version Port List
-------------------------------------
1   228.1.5.1 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
1   228.1.5.2 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11

When a host responds to the general query, the switch forwards this report on all the mrouter ports. In this
example, when a host sends a report for the group 228.1.5.1, it is forwarded only on GigabitEthernet1/0/11,
because the backup port GigabitEthernet1/0/12 is blocked. When the active link, GigabitEthernet1/0/11, goes
down, the backup port, GigabitEthernet1/0/12, begins forwarding.

As soon as this port starts forwarding, the switch sends proxy reports for the groups 228.1.5.1 and 228.1.5.2
on behalf of the host. The upstream router learns the groups and starts forwarding multicast data. This is the
default behavior of Flex Links. This behavior changes when the user configures fast convergence using the
switchport backup interface gigabitEthernet 1/0/12 multicast fast-convergence command. This example
shows turning on this feature:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitEthernet 1/0/11
Switch(config-if)# switchport backup interface gigabitEthernet 1/0/12 multicast
fast-convergence
Switch(config-if)# exit
Switch# show interfaces switchport backup detail

Switch Backup Interface Pairs:
This output shows a querier for VLAN 1 and 401 with their queries reaching the switch through GigabitEthernet1/0/11:

Switch# show ip igmp snooping querier

Vlan | IP Address | IGMP Version | Port
---- | ---------- |-------------- |----
1   | 1.1.1.1    | v2           | Gi1/0/11
401 | 41.41.41.1 | v2           | Gi1/0/11

This is output for the `show ip igmp snooping mrouter` command for VLAN 1 and 401:

Switch# show ip igmp snooping mrouter

Vlan | ports
---- |----
1   | Gi1/0/11(dynamic), Gi1/0/12(dynamic)
401 | Gi1/0/11(dynamic), Gi1/0/12(dynamic)

Similarly, both the Flex Links ports are a part of the learned groups. In this example, GigabitEthernet2/0/11 is a receiver/host in VLAN 1, which is interested in two multicast groups:

Switch# show ip igmp snooping groups

Vlan | Group | Type | Version | Port List
---- |------ |------ |--------- |----------
1   | 228.1.5.1 | igmp | v2      | Gi1/0/11, Gi1/0/12, Gi2/0/11
1   | 228.1.5.2 | igmp | v2      | Gi1/0/11, Gi1/0/12, Gi2/0/11

Whenever a host responds to the general query, the switch forwards this report on all the mrouter ports. When you turn on this feature through the command-line port, and when a report is forwarded by the switch on GigabitEthernet1/0/11, it is also leaked to the backup port GigabitEthernet1/0/12. The upstream router learns the groups and starts forwarding multicast data, which is dropped at the ingress because GigabitEthernet1/0/12 is blocked. When the active link, GigabitEthernet1/0/11, goes down, the backup port, GigabitEthernet1/0/12, begins forwarding. You do not need to send any proxy reports as the multicast data is already being forwarded by the upstream router. By leaking reports to the backup port, a redundant multicast path has been set up, and the time taken for the multicast traffic convergence is very minimal.

CHAPTER 21

Configuring UniDirectional Link Detection

- Finding Feature Information, on page 351
- Restrictions for Configuring UDLD, on page 351
- Information About UDLD, on page 352
- How to Configure UDLD, on page 354
- Monitoring and Maintaining UDLD, on page 357
- Additional References for UDLD, on page 357
- Feature Information for UDLD, on page 358

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring UDLD

The following are restrictions for configuring UniDirectional Link Detection (UDLD):

- A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another switch.

- When configuring the mode (normal or aggressive), make sure that the same mode is configured on both sides of the link.

Caution

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.
Information About UDLD

UniDirectional Link Detection (UDLD) is a Layer 2 protocol that enables devices connected through fiber-optic or twisted-pair Ethernet cables to monitor the physical configuration of the cables and detect when a unidirectional link exists. All connected devices must support UDLD for the protocol to successfully identify and disable unidirectional links. When UDLD detects a unidirectional link, it disables the affected port and alerts you. Unidirectional links can cause a variety of problems, including spanning-tree topology loops.

Modes of Operation

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD can detect unidirectional links due to misconnected ports on fiber-optic connections. In aggressive mode, UDLD can also detect unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and to misconnected ports on fiber-optic links.

In normal and aggressive modes, UDLD works with the Layer 1 mechanisms to learn the physical status of a link. At Layer 1, autonegotiation takes care of physical signaling and fault detection. UDLD performs tasks that autonegotiation cannot perform, such as detecting the identities of neighbors and shutting down misconnected ports. When you enable both autonegotiation and UDLD, the Layer 1 and Layer 2 detections work together to prevent physical and logical unidirectional connections and the malfunctioning of other protocols.

A unidirectional link occurs whenever traffic sent by a local device is received by its neighbor but traffic from the neighbor is not received by the local device.

Normal Mode

In normal mode, UDLD detects a unidirectional link when fiber strands in a fiber-optic port are misconnected and the Layer 1 mechanisms do not detect this misconnection. If the ports are connected correctly but the traffic is one way, UDLD does not detect the unidirectional link because the Layer 1 mechanism, which is supposed to detect this condition, does not do so. In this case, the logical link is considered undetermined, and UDLD does not disable the port.

When UDLD is in normal mode, if one of the fiber strands in a pair is disconnected, as long as autonegotiation is active, the link does not stay up because the Layer 1 mechanisms detects a physical problem with the link. In this case, UDLD does not take any action and the logical link is considered undetermined.

Related Topics
- Enabling UDLD Globally, on page 354
- Enabling UDLD on an Interface, on page 356

Aggressive Mode

In aggressive mode, UDLD detects a unidirectional link by using the previous detection methods. UDLD in aggressive mode can also detect a unidirectional link on a point-to-point link on which no failure between the two devices is allowed. It can also detect a unidirectional link when one of these problems exists:

- On fiber-optic or twisted-pair links, one of the ports cannot send or receive traffic.
- On fiber-optic or twisted-pair links, one of the ports is down while the other is up.
- One of the fiber strands in the cable is disconnected.
In these cases, UDLD disables the affected port.

In a point-to-point link, UDLD hello packets can be considered as a heart beat whose presence guarantees the health of the link. Conversely, the loss of the heart beat means that the link must be shut down if it is not possible to reestablish a bidirectional link.

If both fiber strands in a cable are working normally from a Layer 1 perspective, UDLD in aggressive mode detects whether those fiber strands are connected correctly and whether traffic is flowing bidirectionally between the correct neighbors. This check cannot be performed by autonegotiation because autonegotiation operates at Layer 1.

- Enabling UDLD on an Interface, on page 356

## Methods to Detect Unidirectional Links

UDLD operates by using two methods:

- Neighbor database maintenance
- Event-driven detection and echoing

**Related Topics**
- Enabling UDLD Globally, on page 354
- Enabling UDLD on an Interface, on page 356

### Neighbor Database Maintenance

UDLD learns about other UDLD-capable neighbors by periodically sending a hello packet (also called an advertisement or probe) on every active port to keep each device informed about its neighbors.

When the switch receives a hello message, it caches the information until the age time (hold time or time-to-live) expires. If the switch receives a new hello message before an older cache entry ages, the switch replaces the older entry with the new one.

Whenever a port is disabled and UDLD is running, whenever UDLD is disabled on a port, or whenever the switch is reset, UDLD clears all existing cache entries for the ports affected by the configuration change. UDLD sends at least one message to inform the neighbors to flush the part of their caches affected by the status change. The message is intended to keep the caches synchronized.

### Event-Driven Detection and Echoing

UDLD relies on echoing as its detection operation. Whenever a UDLD device learns about a new neighbor or receives a resynchronization request from an out-of-sync neighbor, it restarts the detection window on its side of the connection and sends echo messages in reply. Because this behavior is the same on all UDLD neighbors, the sender of the echoes expects to receive an echo in reply.

If the detection window ends and no valid reply message is received, the link might shut down, depending on the UDLD mode. When UDLD is in normal mode, the link might be considered undetermined and might not be shut down. When UDLD is in aggressive mode, the link is considered unidirectional, and the port is disabled.

**Related Topics**
- Enabling UDLD Globally, on page 354
UDLD Reset Options

If an interface becomes disabled by UDLD, you can use one of the following options to reset UDLD:

- The `udld reset` interface configuration command.
- The `shutdown` interface configuration command followed by the `no shutdown` interface configuration command restarts the disabled port.
- The `no udld {aggressive | enable}` global configuration command followed by the `udld {aggressive | enable}` global configuration command reenables the disabled ports.
- The `no udld port` interface configuration command followed by the `udld port [aggressive]` interface configuration command reenables the disabled fiber-optic port.
- The `errdisable recovery cause udld` global configuration command enables the timer to automatically recover from the UDLD error-disabled state, and the `errdisable recovery interval interval` global configuration command specifies the time to recover from the UDLD error-disabled state.

</table>

| **Step 2** udld {aggressive | enable | message time message-timer-interval} | Specifies the UDLD mode of operation: |
|------------------------------------------|----------------------------------------|
| **Example:** | |
| Switch(config)# udld enable message time 10 | |

- **aggressive**—Enables UDLD in aggressive mode on all fiber-optic ports.
- **enable**—Enables UDLD in normal mode on all fiber-optic ports on the switch. UDLD is disabled by default.

An individual interface configuration overrides the setting of the `udld enable` global configuration command.

- **message time**
  - message-timer-interval—Configures the period of time between UDLD probe messages on ports that are in the advertisement phase and are detected to be bidirectional. The range is from 1 to 90 seconds; the default value is 15.

  **Note** This command affects fiber-optic ports only. Use the `udld interface configuration` command to enable UDLD on other port types.

  Use the **no** form of this command, to disable UDLD.

PART V

Network Management

- Configuring Cisco IOS Configuration Engine, on page 361
- Configuring the Cisco Discovery Protocol, on page 381
- Configuring Simple Network Management Protocol, on page 393
- Configuring SPAN and RSPAN, on page 419
Prerequisites for Configuring the Configuration Engine

- Obtain the name of the configuration engine instance to which you are connecting.
- Because the CNS uses both the event bus and the configuration server to provide configurations to devices, you must define both ConfigID and Device ID for each configured switch.
- All switches configured with the `cns config partial` global configuration command must access the event bus. The DeviceID, as originated on the switch, must match the DeviceID of the corresponding switch definition in the Cisco Configuration Engine. You must know the hostname of the event bus to which you are connecting.

Restrictions for Configuring the Configuration Engine

- Within the scope of a single instance of the configuration server, no two configured switches can share the same value for ConfigID.
- Within the scope of a single instance of the event bus, no two configured switches can share the same value for DeviceID.
Information About Configuring the Configuration Engine

Cisco Configuration Engine Software

The Cisco Configuration Engine is network management utility software that acts as a configuration service for automating the deployment and management of network devices and services. Each Cisco Configuration Engine manages a group of Cisco devices (switches and routers) and the services that they deliver, storing their configurations and delivering them as needed. The Cisco Configuration Engine automates initial configurations and configuration updates by generating device-specific configuration changes, sending them to the device, executing the configuration change, and logging the results.

The Cisco Configuration Engine supports standalone and server modes and has these Cisco Networking Services (CNS) components:

- Configuration service:
  - Web server
  - File manager
  - Namespace mapping server

- Event service (event gateway)

- Data service directory (data models and schema)

In standalone mode, the Cisco Configuration Engine supports an embedded directory service. In this mode, no external directory or other data store is required. In server mode, the Cisco Configuration Engine supports the use of a user-defined external directory.

Figure 42: Cisco Configuration Engine Architectural Overview
Configuration Service

The Configuration Service is the core component of the Cisco Configuration Engine. It consists of a Configuration Server that works with Cisco IOS CNS agents on the switch. The Configuration Service delivers device and service configurations to the switch for initial configuration and mass reconfiguration by logical groups. Switches receive their initial configuration from the Configuration Service when they start up on the network for the first time.

The Configuration Service uses the CNS Event Service to send and receive configuration change events and to send success and failure notifications.

The Configuration Server is a web server that uses configuration templates and the device-specific configuration information stored in the embedded (standalone mode) or remote (server mode) directory.

Configuration templates are text files containing static configuration information in the form of CLI commands. In the templates, variables are specified by using Lightweight Directory Access Protocol (LDAP) URLs that reference the device-specific configuration information stored in a directory.

The Cisco IOS agent can perform a syntax check on received configuration files and publish events to show the success or failure of the syntax check. The configuration agent can either apply configurations immediately or delay the application until receipt of a synchronization event from the configuration server.

Event Service

The Cisco Configuration Engine uses the Event Service for receipt and generation of configuration events. The Event Service consists of an event agent and an event gateway. The event agent is on the switch and facilitates the communication between the switch and the event gateway on the Cisco Configuration Engine.

The Event Service is a highly capable publish-and-subscribe communication method. The Event Service uses subject-based addressing to send messages to their destinations. Subject-based addressing conventions define a simple, uniform namespace for messages and their destinations.

NameSpace Mapper

The Cisco Configuration Engine includes the NameSpace Mapper (NSM) that provides a lookup service for managing logical groups of devices based on application, device or group ID, and event.

Cisco IOS devices recognize only event subject-names that match those configured in Cisco IOS software; for example, cisco.cns.config.load. You can use the namespace mapping service to designate events by using any desired naming convention. When you have populated your data store with your subject names, NSM changes your event subject-name strings to those known by Cisco IOS.

For a subscriber, when given a unique device ID and event, the namespace mapping service returns a set of events to which to subscribe. Similarly, for a publisher, when given a unique group ID, device ID, and event, the mapping service returns a set of events on which to publish.

Cisco Networking Services IDs and Device Hostnames

The Cisco Configuration Engine assumes that a unique identifier is associated with each configured switch. This unique identifier can take on multiple synonyms, where each synonym is unique within a particular namespace. The event service uses namespace content for subject-based addressing of messages.
The Cisco Configuration Engine intersects two namespaces, one for the event bus and the other for the configuration server. Within the scope of the configuration server namespace, the term ConfigID is the unique identifier for a device. Within the scope of the event bus namespace, the term DeviceID is the CNS unique identifier for a device.

**ConfigID**

Each configured switch has a unique ConfigID, which serves as the key into the Cisco Configuration Engine directory for the corresponding set of switch CLI attributes. The ConfigID defined on the switch must match the ConfigID for the corresponding switch definition on the Cisco Configuration Engine.

The ConfigID is fixed at startup time and cannot be changed until the device restarts, even if the switch hostname is reconfigured.

**DeviceID**

Each configured switch participating on the event bus has a unique DeviceID, which is analogous to the switch source address so that the switch can be targeted as a specific destination on the bus.

The origin of the DeviceID is defined by the Cisco IOS hostname of the switch. However, the DeviceID variable and its usage reside within the event gateway adjacent to the switch.

The logical Cisco IOS termination point on the event bus is embedded in the event gateway, which in turn functions as a proxy on behalf of the switch. The event gateway represents the switch and its corresponding DeviceID to the event bus.

The switch declares its hostname to the event gateway immediately after the successful connection to the event gateway. The event gateway couples the DeviceID value to the Cisco IOS hostname each time this connection is established. The event gateway retains this DeviceID value for the duration of its connection to the switch.

**Hostname and DeviceID**

The DeviceID is fixed at the time of the connection to the event gateway and does not change even when the switch hostname is reconfigured.

When changing the switch hostname on the switch, the only way to refresh the DeviceID is to break the connection between the switch and the event gateway. For instructions on refreshing DeviceIDs, see "Related Topics."

When the connection is reestablished, the switch sends its modified hostname to the event gateway. The event gateway redefines the DeviceID to the new value.

⚠️ **Caution**

When using the Cisco Configuration Engine user interface, you must first set the DeviceID field to the hostname value that the switch acquires after, not before, and you must reinitialize the configuration for your Cisco IOS CNS agent. Otherwise, subsequent partial configuration command operations may malfunction.

**Hostname, DeviceID, and ConfigID**

In standalone mode, when a hostname value is set for a switch, the configuration server uses the hostname as the DeviceID when an event is sent on hostname. If the hostname has not been set, the event is sent on the cn=<value> of the device.
In server mode, the hostname is not used. In this mode, the unique DeviceID attribute is always used for sending an event on the bus. If this attribute is not set, you cannot update the switch.

These and other associated attributes (tag value pairs) are set when you run Setup on the Cisco Configuration Engine.

Cisco IOS CNS Agents

The CNS event agent feature allows the switch to publish and subscribe to events on the event bus and works with the Cisco IOS CNS agent. These agents, embedded in the switch Cisco IOS software, allow the switch to be connected and automatically configured.

Initial Configuration

When the switch first comes up, it attempts to get an IP address by broadcasting a Dynamic Host Configuration Protocol (DHCP) request on the network. Assuming there is no DHCP server on the subnet, the distribution switch acts as a DHCP relay agent and forwards the request to the DHCP server. Upon receiving the request, the DHCP server assigns an IP address to the new switch and includes the Trivial File Transfer Protocol (TFTP) server Internet Protocol (IP) address, the path to the bootstrap configuration file, and the default gateway IP address in a unicast reply to the DHCP relay agent. The DHCP relay agent forwards the reply to the switch.

The switch automatically configures the assigned IP address on interface VLAN 1 (the default) and downloads the bootstrap configuration file from the TFTP server. Upon successful download of the bootstrap configuration file, the switch loads the file in its running configuration.

The Cisco IOS CNS agents initiate communication with the Configuration Engine by using the appropriate ConfigID and EventID. The Configuration Engine maps the Config ID to a template and downloads the full configuration file to the switch.

The following figure shows a sample network configuration for retrieving the initial bootstrap configuration file by using DHCP-based autoconfiguration.

Figure 43: Initial Configuration
Incremental (Partial) Configuration

After the network is running, new services can be added by using the Cisco IOS CNS agent. Incremental (partial) configurations can be sent to the switch. The actual configuration can be sent as an event payload by way of the event gateway (push operation) or as a signal event that triggers the switch to initiate a pull operation.

The switch can check the syntax of the configuration before applying it. If the syntax is correct, the switch applies the incremental configuration and publishes an event that signals success to the configuration server. If the switch does not apply the incremental configuration, it publishes an event showing an error status. When the switch has applied the incremental configuration, it can write it to nonvolatile random-access memory (NVRAM) or wait until signaled to do so.

Synchronized Configuration

When the switch receives a configuration, it can defer application of the configuration upon receipt of a write-signal event. The write-signal event tells the switch not to save the updated configuration into its NVRAM. The switch uses the updated configuration as its running configuration. This ensures that the switch configuration is synchronized with other network activities before saving the configuration in NVRAM for use at the next reboot.

Automated CNS Configuration

To enable automated CNS configuration of the switch, you must first complete the prerequisites listed in this topic. When you complete them, power on the switch. At the setup prompt, do nothing; the switch begins the initial configuration. When the full configuration file is loaded on your switch, you do not need to do anything else.

For more information on what happens during initial configuration, see "Related Topics."

How to Configure the Configuration Engine

Enabling the CNS Event Agent

Note

You must enable the CNS event agent on the switch before you enable the CNS configuration agent.

Follow these steps to enable the CNS event agent on the switch.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable Example: Switch> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Step 2** configure terminal Example: Switch# configure terminal | Enters global configuration mode. |
| **Step 3** cns event {hostname | ip-address} [port-number] [keepalive seconds retry-count] [failover-time seconds] [reconnect-time time] | Enables the event agent, and enters the gateway parameters.  
• For {hostname | ip-address}, enter either the hostname or the IP address of the event gateway. |

<table>
<thead>
<tr>
<th>Device</th>
<th>Required Configuration</th>
</tr>
</thead>
</table>
| TFTP server | • A bootstrap configuration file that includes the CNS configuration commands that enable the switch to communicate with the Configuration Engine  
• The switch configured to use either the switch MAC address or the serial number (instead of the default hostname) to generate the ConfigID and EventID  
• The CNS event agent configured to push the configuration file to the switch |
| CNS Configuration Engine | One or more templates for each type of device, with the ConfigID of the device mapped to the template. |

2 A DHCP Relay is needed only when the DHCP Server is on a different subnet from the client.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config)# cns event 10.180.1.27 keepalive 120 10` | - (Optional) For `port number`, enter the port number for the event gateway. The default port number is 11011.  
- (Optional) For `keepalive seconds`, enter how often the switch sends keepalive messages. For `retry-count`, enter the number of unanswered keepalive messages that the switch sends before the connection is terminated. The default for each is 0.  
- (Optional) For `failover-time seconds`, enter how long the switch waits for the primary gateway route after the route to the backup gateway is established.  
- (Optional) For `reconnect-time time`, enter the maximum time interval that the switch waits before trying to reconnect to the event gateway.  
- (Optional) Enter `backup` to show that this is the backup gateway. (If omitted, this is the primary gateway.) |

### Step 4

**end**

Example:

```
Switch(config)# end
```

Returns to privileged EXEC mode.

### Step 5

**show running-config**

Example:

```
Switch# show running-config
```

Verifies your entries.

### Step 6

**copy running-config startup-config**

Example:

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

Note: Though visible in the command-line help string, the `encrypt` and the `clock-timeout time` keywords are not supported.
What to do next

To verify information about the event agent, use the `show cns event connections` command in privileged EXEC mode.

To disable the CNS event agent, use the `no cns event { ip-address | hostname }` global configuration command.

Enabling the Cisco IOS CNS Agent

Follow these steps to enable the Cisco IOS CNS agent on the switch.

Before you begin

You must enable the CNS event agent on the switch before you enable this agent.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables the Cisco IOS CNS agent, and enters the configuration server parameters.</td>
</tr>
<tr>
<td>`cns config initial { hostname</td>
<td>ip-address } [port-number]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# cns config initial 10.180.1.27 10</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables the Cisco IOS CNS agent, and enters the configuration server parameters.</td>
</tr>
<tr>
<td>`cns config partial { hostname</td>
<td>ip-address } [port-number]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# cns config partial 10.180.1.27 10</code></td>
<td></td>
</tr>
</tbody>
</table>

This command enables the Cisco IOS CNS agent and initiates an initial configuration on the switch.
## Enabling an Initial Configuration for Cisco IOS CNS Agent

Follow these steps to enable the CNS configuration agent and initiate an initial configuration on the switch.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
  Example:  
  Switch> enable |  
  • Enter your password if prompted. |
| 2    | configure terminal| Enters global configuration mode.  
  Example:  
  Switch# configure terminal |

---

What to do next

You can now use the Cisco Configuration Engine to remotely send incremental configurations to the switch.
<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>

</thead>
<tbody>
<tr>
<td></td>
<td>Repeats Steps 3 to 4 to configure another CNS connect template.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>exit</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# exit</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>cns connect name [retries number] [retry-interval seconds] [sleep seconds] [timeout seconds]</strong></td>
<td>Enters CNS connect configuration mode, specifies the name of the CNS connect profile, and defines the profile parameters. The switch uses the CNS connect profile to connect to the Configuration Engine.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# cns connect dhcp</code></td>
<td></td>
</tr>
</tbody>
</table>

- Enter the **name** of the CNS connect profile.
- (Optional) For **retries number**, enter the number of connection retries. The range is 1 to 30. The default is 3.
- (Optional) For **retry-interval seconds**, enter the interval between successive connection attempts to the Configuration Engine. The range is 1 to 40 seconds. The default is 10 seconds.
- (Optional) For **sleep seconds**, enter the amount of time before which the first connection attempt occurs. The range is 0 to 250 seconds. The default is 0.
- (Optional) For **timeout seconds**, enter the amount of time after which the connection attempts end. The range is 10 to 2000 seconds. The default is 120.
### Command or Action

**Step 8**  
```
discover [controller controller-type | dlci [subinterface subinterface-number] | interface [interface-type] | line line-type}
```

**Example:**
```
Switch(config-cns-conn)# discover interface gigabitethernet
```

**Purpose**
Specifies the interface parameters in the CNS connect profile.

- For `controller controller-type`, enter the controller type.
- For `dlci`, enter the active data-link connection identifiers (DLCIs).
- (Optional) For `subinterface subinterface-number`, specify the point-to-point subinterface number that is used to search for active DLCIs.
- For `interface [interface-type]`, enter the type of interface.
- For `line line-type`, enter the line type.

**Step 9**  
```
template name [... name]
```

**Example:**
```
Switch(config-cns-conn)# template template-dhcp
```

**Purpose**
Specifies the list of CNS connect templates in the CNS connect profile to be applied to the switch configuration. You can specify more than one template.

**Step 10**
Repeat Steps 8 to 9 to specify more interface parameters and CNS connect templates in the CNS connect profile.

**Step 11**  
```
exit
```

**Example:**
```
Switch(config-cns-conn)# exit
```

**Purpose**
Returns to global configuration mode.

**Step 12**  
```
hostname name
```

**Example:**
```
Switch(config)# hostname device1
```

**Purpose**
Enters the hostname for the switch.

**Step 13**  
```
ip route network-number
```

**Example:**
```
RemoteSwitch(config)# ip route 172.28.129.22 255.255.255.255 11.11.11.1
```

**Purpose**
(Optional) Establishes a static route to the Configuration Engine whose IP address is `network-number`.

**Step 14**  
```
cns id [interface num] [dns-reverse] [ipaddress [mac-address]] [event] [image]
```

**Example:**
```
(cns id [hardware-serial | hostname | string string | udi] [event] [image] command.
```

(Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the `cns id [hardware-serial | hostname | string string | udi] [event] [image] command.`
### Command or Action

<table>
<thead>
<tr>
<th>Command/Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| RemoteSwitch(config)# cns id GigabitEthernet1/0/1 ipaddress | - For `interface num`, enter the type of interface. For example, ethernet, group-async, loopback, or virtual-template. This setting specifies from which interface the IP or MAC address should be retrieved to define the unique ID.  
- For `{dns-reverse | ipaddress | mac-address}`, enter `dns-reverse` to retrieve the hostname and assign it as the unique ID, enter `ipaddress` to use the IP address, or enter `mac-address` to use the MAC address as the unique ID.  
- (Optional) Enter `event` to set the ID to be the event-id value used to identify the switch.  
- (Optional) Enter `image` to set the ID to be the image-id value used to identify the switch.  

**Note** If both the `event` and `image` keywords are omitted, the image-id value is used to identify the switch. |

### Step 15

```
cns id {hardware-serial | hostname | string string | udi} [event] [image]
```

**Example:**

RemoteSwitch(config)# cns id hostname

(Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the `cns id interface num` `{dns-reverse | ipaddress | mac-address} [event] [image]` command.

- For `{hardware-serial | hostname | string string | udi}`, enter `hardware-serial` to set the switch serial number as the unique ID, enter `hostname` (the default) to select the switch hostname as the unique ID, enter an arbitrary text string for `string string` as the unique ID, or enter `udi` to set the unique device identifier (UDI) as the unique ID.

### Step 16

```
cns config initial {hostname | ip-address} [port-number] [event] [no-persist] [page page] [source ip-address] [syntax-check]
```

**Example:**

RemoteSwitch(config)# cns config initial 10.1.1.1 no-persist

Enables the Cisco IOS agent, and initiates an initial configuration.

- For `{hostname | ip-address}`, enter the hostname or the IP address of the configuration server.
### Enabling an Initial Configuration for Cisco IOS CNS Agent

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• (Optional) For <em>port-number</em>, enter the port number of the configuration server. The default port number is 80.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Enable <code>event</code> for configuration success, failure, or warning messages when the configuration is finished.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Enable <code>no-persist</code> to suppress the automatic writing to NVRAM of the configuration pulled as a result of entering the <code>cns config initial</code> global configuration command. If the <code>no-persist</code> keyword is not entered, using the <code>cns config initial</code> command causes the resultant configuration to be automatically written to NVRAM.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <em>page page</em>, enter the web page of the initial configuration. The default is <code>/Config/config/asp</code>.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Enter <code>source ip-address</code> to use for source IP address.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Enable <code>syntax-check</code> to check the syntax when this parameter is entered.</td>
</tr>
</tbody>
</table>

**Note** Though visible in the command-line help string, the `encrypt`, `status url`, and `inventory` keywords are not supported.

**Step 17**

`end`

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 18**

`show running-config`

**Example:**

```
Switch# show running-config
```

Verifies your entries.

**Step 19**

`copy running-config startup-config`

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.
What to do next

To verify information about the configuration agent, use the `show cns config connections` command in privileged EXEC mode.

To disable the CNS Cisco IOS agent, use the `no cns config initial { ip-address | hostname }` global configuration command.

**Refreshing DeviceIDs**

Follow these steps to refresh a DeviceID when changing the hostname on the switch.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
Example:  
Switch> enable |
| **Step 2** | show cns config connections | Displays whether the CNS event agent is connecting to the gateway, connected, or active, and the gateway used by the event agent, its IP address and port number.  
Example:  
Switch# show cns config connections |
| **Step 3** | Make sure that the CNS event agent is properly connected to the event gateway. | Examine the output of `show cns config connections` for the following:  
- Connection is active.  
- Connection is using the currently configured switch hostname. The DeviceID will be refreshed to correspond to the new hostname configuration using these instructions. |
| **Step 4** | show cns event connections | Displays the event connection information for your switch.  
Example:  
Switch# show cns event connections |
| **Step 5** | Record from the output of Step 4 the information for the currently connected connection listed below. You will be using the IP address and port number in subsequent steps of these instructions. |
| **Step 6** | configure terminal | Enters global configuration mode.  
Example: |
### Command or Action

<table>
<thead>
<tr>
<th>Switch# configure terminal</th>
<th>Purpose</th>
</tr>
</thead>
</table>

### Step 7

**no cns event ip-address port-number**

**Example:**

```
Switch(config)# no cns event 172.28.129.22 2012
```

 Specifies the IP address and port number that you recorded in Step 5 in this command.

This command breaks the connection between the switch and the event gateway. It is necessary to first break, then reestablish, this connection to refresh the DeviceID.

### Step 8

**cns event ip-address port-number**

**Example:**

```
Switch(config)# cns event 172.28.129.22 2012
```

Specifies the IP address and port number that you recorded in Step 5 in this command.

This command reestablishes the connection between the switch and the event gateway.

### Step 9

**end**

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

### Step 10

Make sure that you have reestablished the connection between the switch and the event connection by examining the output from `show cns event connections`.

### Step 11

**show running-config**

**Example:**

```
Switch# show running-config
```

Verifies your entries.

### Step 12

**copy running-config startup-config**

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

**Enabling a Partial Configuration for Cisco IOS CNS Agent**

Follow these steps to enable the Cisco IOS CNS agent and to initiate a partial configuration on the switch.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

- Enter your password if prompted.
## Command or Action

### Step 2

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# configure terminal
```

### Step 3

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>cns config partial</td>
<td>Enables the configuration agent, and initiates a partial configuration.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# cns config partial
```

- For `{ip-address | hostname}`, enter the IP address or the hostname of the configuration server.

- (Optional) For `port-number`, enter the port number of the configuration server. The default port number is 80.

- (Optional) Enter `source ip-address` to use for the source IP address.

**Note**

Though visible in the command-line help string, the `encrypt` keyword is not supported.

### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# end
```

### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# show running-config
```

### Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# copy running-config startup-config
```

### What to do next

To verify information about the configuration agent, use either the `show cns config stats` or the `show cns config outstanding` command in privileged EXEC mode.
To disable the Cisco IOS agent, use the `no cns config partial { ip-address | hostname }` global configuration command. To cancel a partial configuration, use the `cns config cancel` global configuration command.

## Monitoring CNS Configurations

### Table 44: CNS show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cns config connections</code></td>
<td>Displays the status of the CNS Cisco IOS CNS agent connections.</td>
</tr>
<tr>
<td>Switch# <code>show cns config connections</code></td>
<td></td>
</tr>
<tr>
<td><code>show cns config outstanding</code></td>
<td>Displays information about incremental (partial) CNS configurations that have started but are not yet completed.</td>
</tr>
<tr>
<td>Switch# <code>show cns config outstanding</code></td>
<td></td>
</tr>
<tr>
<td><code>show cns config stats</code></td>
<td>Displays statistics about the Cisco IOS CNS agent.</td>
</tr>
<tr>
<td>Switch# <code>show cns config stats</code></td>
<td></td>
</tr>
<tr>
<td><code>show cns event connections</code></td>
<td>Displays the status of the CNS event agent connections.</td>
</tr>
<tr>
<td>Switch# <code>show cns event connections</code></td>
<td></td>
</tr>
<tr>
<td><code>show cns event gateway</code></td>
<td>Displays the event gateway information for your switch.</td>
</tr>
<tr>
<td>Switch# <code>show cns event gateway</code></td>
<td></td>
</tr>
<tr>
<td><code>show cns event stats</code></td>
<td>Displays statistics about the CNS event agent.</td>
</tr>
<tr>
<td>Switch# <code>show cns event stats</code></td>
<td></td>
</tr>
<tr>
<td><code>show cns event subject</code></td>
<td>Displays a list of event agent subjects that are subscribed to by applications.</td>
</tr>
<tr>
<td>Switch# <code>show cns event subject</code></td>
<td></td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About CDP

CDP Overview

CDP is a device discovery protocol that runs over Layer 2 (the data-link layer) on all Cisco-manufactured devices (routers, bridges, access servers, controllers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With CDP, network management applications can learn the device type and the Simple Network Management Protocol (SNMP) agent address of neighboring devices running lower-layer, transparent protocols. This feature enables applications to send SNMP queries to neighboring devices.

CDP runs on all media that support Subnetwork Access Protocol (SNAP). Because CDP runs over the data-link layer only, two systems that support different network-layer protocols can learn about each other.

Each CDP-configured device sends periodic messages to a multicast address, advertising at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or holdtime information,
which is the length of time a receiving device holds CDP information before discarding it. Each device also
listens to the messages sent by other devices to learn about neighboring devices.

On the switch, CDP enables Network Assistant to display a graphical view of the network. The switch uses
CDP to find cluster candidates and maintain information about cluster members and other devices up to three
cluster-enabled devices away from the command switch by default.

Related Topics
- Configuring CDP Characteristics, on page 382
- Monitoring and Maintaining CDP, on page 389

CDP and Stacks

A switch stack appears as a single switch in the network. Therefore, CDP discovers the switch stack, not the
individual stack members. The switch stack sends CDP messages to neighboring network devices when there
are changes to the switch stack membership, such as stack members being added or removed.

Default CDP Configuration

This table shows the default CDP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDP global state</td>
<td>Enabled</td>
</tr>
<tr>
<td>CDP interface state</td>
<td>Enabled</td>
</tr>
<tr>
<td>CDP timer (packet update frequency)</td>
<td>60 seconds</td>
</tr>
<tr>
<td>CDP holdtime (before discarding)</td>
<td>180 seconds</td>
</tr>
<tr>
<td>CDP Version-2 advertisements</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

How to Configure CDP

Configuring CDP Characteristics

You can configure these CDP characteristics:

- Frequency of CDP updates
- Amount of time to hold the information before discarding it
- Whether or not to send Version-2 advertisements
Steps 3 through 5 are all optional and can be performed in any order.

Follow these steps to configure the CDP characteristics.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> cdp timer <code>seconds</code></td>
<td>(Optional) Sets the transmission frequency of CDP updates in seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>The range is 5 to 254; the default is 60 seconds.</td>
</tr>
<tr>
<td>Switch(config)# <code>cdp timer 20</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> cdp holdtime <code>seconds</code></td>
<td>(Optional) Specifies the amount of time a receiving device should hold the information sent by your device before discarding it.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>The range is 10 to 255 seconds; the default is 180 seconds.</td>
</tr>
<tr>
<td>Switch(config)# <code>cdp holdtime 60</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> cdp advertise-v2</td>
<td>(Optional) Configures CDP to send Version-2 advertisements.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>This is the default state.</td>
</tr>
<tr>
<td>Switch(config)# <code>cdp advertise-v2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>end</code></td>
<td></td>

<tr>
<td><strong>Step 7</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# <code>show running-config</code></td>
<td></td>
</tr>
</tbody>
</table>
### Disabling CDP

CDP is enabled by default. Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages. Disabling CDP can interrupt cluster discovery and device connectivity.

Follow these steps to disable the CDP device discovery capability.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>no cdp run</td>
<td>Disables CDP.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# no cdp run</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Enabling CDP

CDP is enabled by default.

**Note**
Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages. Disabling CDP can interrupt cluster discovery and device connectivity.

Follow these steps to enable CDP when it has been disabled.

**Before you begin**
CDP must be disabled, or it cannot be enabled.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Disabling Cisco Discovery Protocol on an Interface

Cisco Discovery Protocol is enabled by default on all supported interfaces to send and to receive Cisco Discovery Protocol information.

**Note**

Switch clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

---

#### Table: Command or Action and Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 2 | configure terminal | Enters global configuration mode.  
  **Example:**  
  Switch# configure terminal |
| Step 3 | cdp run | Enables CDP if it has been disabled.  
  **Example:**  
  Switch(config)# cdp run |
| Step 4 | end | Returns to privileged EXEC mode.  
  **Example:**  
  Switch(config)# end |
| Step 5 | show running-config | Verifies your entries.  
  **Example:**  
  Switch# show running-config |
| Step 6 | copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
  **Example:**  
  Switch# copy running-config startup-config |

### What to do next

Use the `show run all` command to show that CDP has been enabled. If you enter only `show run`, the enabling of CDP may not be displayed.

### Related Topics
- Default CDP Configuration, on page 382
- Disabling CDP, on page 384
Cisco Discovery Protocol bypass is not supported and may cause a port go into err-disabled state.

Follow these steps to disable Cisco Discovery Protocol on a port.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>

## Monitoring and Maintaining CDP

### Table 45: Commands for Displaying CDP Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear cdp counters</code></td>
<td>Resets the traffic counters to zero.</td>
</tr>
<tr>
<td><code>clear cdp table</code></td>
<td>Deletes the CDP table of information about neighbors.</td>
</tr>
<tr>
<td><code>show cdp</code></td>
<td>Displays global information, such as frequency of transmissions and the holdtime for packets being sent.</td>
</tr>
<tr>
<td><code>show cdp entry entry-name [version] [protocol]</code></td>
<td>Displays information about a specific neighbor. You can enter an asterisk (*) to display all CDP neighbors, or you can enter the name of the neighbor about which you want information. You can also limit the display to information about the protocols enabled on the specified neighbor or information about the version of software running on the device.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>show cdp interface [interface-id]</code></td>
<td>Displays information about interfaces where CDP is enabled. You can limit the display to the interface about which you want information.</td>
</tr>
<tr>
<td><code>show cdp neighbors [interface-id] [detail]</code></td>
<td>Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, platform, and port ID. You can limit the display to neighbors of a specific interface or expand the display to provide more detailed information.</td>
</tr>
<tr>
<td><code>show cdp traffic</code></td>
<td>Displays CDP counters, including the number of packets sent and received and checksum errors.</td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for SNMP

Supported SNMP Versions

This software release supports the following SNMP versions:

- SNMPv1—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- SNMPv2C replaces the Party-based Administrative and Security Framework of SNMPv2Classic with the community-string-based Administrative Framework of SNMPv2C while retaining the bulk retrieval and improved error handling of SNMPv2Classic. It has these features:
**SNMPv2**—Version 2 of the Simple Network Management Protocol, a Draft Internet Standard, defined in RFCs 1902 through 1907.

**SNMPv2C**—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.

**SNMPv3**—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:

- **Message integrity**—Ensures that a packet was not tampered with in transit.
- **Authentication**—Determines that the message is from a valid source.
- **Encryption**—Mixes the contents of a package to prevent it from being read by an unauthorized source.

To select encryption, enter the **priv** keyword.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent’s MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval function and more detailed error message reporting to management stations. The bulk retrieval function retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security method is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

The following table identifies characteristics and compares different combinations of security models and levels:

<table>
<thead>
<tr>
<th>Model</th>
<th>Level</th>
<th>Authentication</th>
<th>Encryption</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMPv1</td>
<td>noAuthNoPriv</td>
<td>Community string</td>
<td>No</td>
<td>Uses a community string match for authentication.</td>
</tr>
<tr>
<td>SNMPv2C</td>
<td>noAuthNoPriv</td>
<td>Community string</td>
<td>No</td>
<td>Uses a community string match for authentication.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>noAuthNoPriv</td>
<td>Username</td>
<td>No</td>
<td>Uses a username match for authentication.</td>
</tr>
<tr>
<td>Model</td>
<td>Level</td>
<td>Authentication</td>
<td>Encryption</td>
<td>Result</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>----------------------------------------------------</td>
<td>------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>authNoPriv</td>
<td>Message Digest 5 (MD5) or Secure Hash Algorithm (SHA)</td>
<td>No</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>authPriv</td>
<td>MD5 or SHA</td>
<td>Data Encryption Standard (DES) or Advanced Encryption Standard (AES)</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Allows specifying the User-based Security Model (USM) with these encryption algorithms: • DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard. • 3DES 168-bit encryption • AES 128-bit, 192-bit, or 256-bit encryption</td>
</tr>
</tbody>
</table>

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, SNMPv2C, or SNMPv3.

### Restrictions for SNMP

#### Version Restrictions

- SNMPv1 does not support informs.
Information About SNMP

SNMP Overview

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a management information base (MIB). The SNMP manager can be part of a network management system (NMS) such as Cisco Prime Infrastructure. The agent and MIB reside on the switch. To configure SNMP on the switch, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager’s requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a TCP connection, loss of connection to a neighbor, or other significant events.

SNMP Manager Functions

The SNMP manager uses information in the MIB to perform the operations described in the following table:

Table 47: SNMP Operations

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieves a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieves a value from a variable within a table.</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.</td>
</tr>
<tr>
<td>get-response</td>
<td>Replies to a get-request, get-next-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>set-request</td>
<td>Stores a value in a specific variable.</td>
</tr>
<tr>
<td>trap</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.</td>
</tr>
</tbody>
</table>

With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.

The get-bulk command only works with SNMPv2 or later.

SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.
• Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.

SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the switch, the community string definitions on the NMS must match at least one of the three community string definitions on the switch.

A community string can have one of the following attributes:

• Read-only (RO)—Gives all objects in the MIB except the community strings read access to authorized management stations, but does not allow write access.

• Read-write (RW)—Gives all objects in the MIB read and write access to authorized management stations, but does not allow access to the community strings.

• When a cluster is created, the command switch manages the exchange of messages among member switches and the SNMP application. The Network Assistant software appends the member switch number (@esN, where N is the switch number) to the first configured RW and RO community strings on the command switch and propagates them to the member switches.

  Configuring Community Strings, on page 401

SNMP MIB Variables Access

An example of an NMS is the Cisco Prime Infrastructure network management software. Cisco Prime Infrastructure 2.0 software uses the switch MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in the figure, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in get-request, get-next-request, and set-request format.
SNMP Notifications

SNMP allows the switch to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps or informs, or both. Use the `snmp-server host` command to specify whether to send SNMP notifications as traps or informs.

Note

SNMPv1 does not support informs.

Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be resent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the switch and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be resent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the switch is a concern and notification is not required, use traps.

SNMP ifIndex MIB Object Values

In an NMS, the IF-MIB generates and assigns an interface index (ifIndex) object value that is a unique number greater than zero to identify a physical or a logical interface. When the switch reboots or the switch software is upgraded, the switch uses this same value for the interface. For example, if the switch assigns a port 2 an ifIndex value of 10003, this value is the same after the switch reboots.

The switch uses one of the values in the following table to assign an ifIndex value to an interface:

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>ifIndex Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVI</td>
<td>1–4999</td>
</tr>
<tr>
<td>EtherChannel</td>
<td>5001–5048</td>
</tr>
</tbody>
</table>
### Default SNMP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP agent</td>
<td>Disabled</td>
</tr>
<tr>
<td>SNMP trap receiver</td>
<td>None configured.</td>
</tr>
<tr>
<td>SNMP traps</td>
<td>None enabled except the trap for TCP connections (tty).</td>
</tr>
<tr>
<td>SNMP version</td>
<td>If no version keyword is present, the default is Version 1.</td>
</tr>
<tr>
<td>SNMPv3 authentication</td>
<td>If no keyword is entered, the default is the noauth (noAuthNoPriv) security level.</td>
</tr>
<tr>
<td>SNMP notification type</td>
<td>If no type is specified, all notifications are sent.</td>
</tr>
</tbody>
</table>

7 This is the default when the switch starts and the startup configuration does not have any snmp-server global configuration commands.

### SNMP Configuration Guidelines

If the switch starts and the switch startup configuration has at least one snmp-server global configuration command, the SNMP agent is enabled.

An SNMP group is a table that maps SNMP users to SNMP views. An SNMP user is a member of an SNMP group. An SNMP host is the recipient of an SNMP trap operation. An SNMP engine ID is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The snmp-server host global configuration command auto-generates a notify view for the user and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group.

- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.

- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the snmp-server engineID global configuration command with the remote option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.
When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.

If a local user is not associated with a remote host, the switch does not send informs for the auth (authNoPriv) and the priv (authPriv) authentication levels.

Changing the value of the SNMP engine ID has significant results. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the snmp-server user username global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.

How to Configure SNMP

Disabling the SNMP Agent

The no snmp-server global configuration command disables all running versions (Version 1, Version 2C, and Version 3) of the SNMP agent on the device. You reenable all versions of the SNMP agent by the first snmp-server global configuration command that you enter. There is no Cisco IOS command specifically designated for enabling SNMP.

Follow these steps to disable the SNMP agent.

Before you begin
The SNMP Agent must be enabled before it can be disabled. The SNMP agent is enabled by the first snmp-server global configuration command entered on the device.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Community Strings

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the switch. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community

Follow these steps to configure a community string on the switch.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no snmp-server</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# enable
```

**Example:**

```
Switch(config)# no snmp-server
```

**Example:**

```
Switch(config)# end
```

**Example:**

```
Switch# show running-config
```

**Example:**

```
Switch# copy running-config startup-config
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

*Example:*

Switch# configure terminal

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>snmp-server community</strong> <em>string</em> { <em>view</em> [ <em>view-name</em> ] [ <em>ro</em></td>
<td><em>rw</em> ] [ <em>access-list-number</em> ] }</td>
</tr>
</tbody>
</table>

*Example:*

Switch(config)# snmp-server community comaccess ro 4

**Note**  The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.

- For *string*, specify a string that acts like a password and permits access to the SNMP protocol. You can configure one or more community strings of any length.

- (Optional) For *view*, specify the view record accessible to the community.

- (Optional) Specify either read-only (ro) if you want authorized management stations to retrieve MIB objects, or specify read-write (rw) if you want authorized management stations to retrieve and modify MIB objects. By default, the community string permits read-only access to all objects.

- (Optional) For *access-list-number*, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.

**Step 4**

**access-list** *access-list-number* { *deny* | *permit* } *source* { *source-wildcard* }

*Example:*

Switch(config)# access-list 4 deny any

(Optional) If you specified an IP standard access list number in Step 3, then create the list, repeating the command as many times as necessary.

- For *access-list-number*, enter the access list number specified in Step 3.

- The *deny* keyword denies access if the conditions are matched. The *permit* keyword permits access if the conditions are matched.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| • For source, enter the IP address of the SNMP managers that are permitted to use the community string to gain access to the agent.  
• (Optional) For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.  
Recall that the access list is always terminated by an implicit deny statement for everything. |

**Step 5**  
**Example:**  
`Switch(config)# end`  
Returns to privileged EXEC mode.

**Step 6**  
**Example:**  
`Switch# show running-config`  
Verifies your entries.

**Step 7**  
**Example:**  
`Switch# copy running-config startup-config`  
(Optional) Saves your entries in the configuration file.

**What to do next**  
To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).  
To remove a specific community string, use the `no snmp-server communitystring` global configuration command.  
You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch.  
You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

**Related Topics**  
[SNMP Community Strings](#), on page 397
# Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Follow these steps to configure SNMP groups and users on the switch.

## Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<td>Configures a name for either the local or remote copy of SNMP.</td>
</tr>
<tr>
<td>`snmp-server engineID { local engineid-string</td>
<td>remote ip-address [udp-port port-number] engineid-string }`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• The <code>engineid-string</code> is a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it has trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. The Step Example configures an engine ID of 123400000000000000000000.</td>
</tr>
<tr>
<td><code>Switch(config)# snmp-server engineID local 1234</code></td>
<td>• If you select <code>remote</code>, specify the <code>ip-address</code> of the device that contains the remote copy of SNMP and the optional User Datagram Protocol (UDP) port on the remote device. The default is 162.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures a new SNMP group on the remote device.</td>
</tr>
<tr>
<td>`snmp-server group group-name { v1</td>
<td>v2c</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>For <code>group-name</code>, specify the name of the group. Specify one of the following security models:</td>
</tr>
<tr>
<td><code>Switch(config)# snmp-server group public v2c access lmnop</code></td>
<td>• <code>v1</code> is the least secure of the possible security models.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>• <strong>v2c</strong> is the second least secure model. It allows transmission of informs and integers twice the normal width.</td>
</tr>
<tr>
<td></td>
<td>• <strong>v3</strong>, the most secure, requires you to select one of the following authentication levels:</td>
</tr>
<tr>
<td></td>
<td><strong>auth</strong>—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.</td>
</tr>
<tr>
<td></td>
<td><strong>noauth</strong>—Enables the noAuthNoPriv security level. This is the default if no keyword is specified.</td>
</tr>
<tr>
<td></td>
<td><strong>priv</strong>—Enables Data Encryption Standard (DES) packet encryption (also called privacy).</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <strong>read</strong> <strong>readview</strong> with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <strong>write</strong> <strong>writeview</strong> with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <strong>notify</strong> <strong>notifyview</strong> with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <strong>access</strong> <strong>access-list</strong> with a string (not to exceed 64 characters) that is the name of the access list.</td>
</tr>
</tbody>
</table>

**Step 5**

```
switch(config)# snmp-server user Pat public v2c
```

Adds a new user for an SNMP group.

The **username** is the name of the user on the host that connects to the agent.

The **group-name** is the name of the group to which the user is associated.

Enter **remote** to specify a remote SNMP entity to which the user belongs and the hostname or IP address of that entity with the optional UDP port number. The default is 162.

Enter the SNMP version number (**v1**, **v2c**, or **v3**). If you enter **v3**, you have these additional options:
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>encrypted</code> specifies that the password appears in encrypted format. This keyword is available only when the <code>v3</code> keyword is specified.</td>
<td></td>
</tr>
<tr>
<td>• <code>auth</code> is an authentication level setting session that can be either the HMAC-MD5-96 (<code>md5</code>) or the HMAC-SHA-96 (<code>sha</code>) authentication level and requires a password string <code>auth-password</code> (not to exceed 64 characters).</td>
<td></td>
</tr>
<tr>
<td>If you enter <code>v3</code> you can also configure a private (<code>priv</code>) encryption algorithm and password string <code>priv-password</code> using the following keywords (not to exceed 64 characters):</td>
<td></td>
</tr>
<tr>
<td>• <code>priv</code> specifies the User-based Security Model (USM).</td>
<td></td>
</tr>
<tr>
<td>• <code>des</code> specifies the use of the 56-bit DES algorithm.</td>
<td></td>
</tr>
<tr>
<td>• <code>3des</code> specifies the use of the 168-bit DES algorithm.</td>
<td></td>
</tr>
<tr>
<td>• <code>aes</code> specifies the use of the DES algorithm. You must select either 128-bit, 192-bit, or 256-bit encryption.</td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter <code>access access-list</code> with a string (not to exceed 64 characters) that is the name of the access list.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 7**

**Example:**

```
Switch# show running-config
```

Verifies your entries.

**Step 8**

**Example:**

```
Switch# copy running-config
```

(Optional) Saves your entries in the configuration file.
Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the switch generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Switches running this Cisco IOS release can have an unlimited number of trap managers.

Note

Many commands use the word traps in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword traps refers to traps, informs, or both. Use the snmp-server host global configuration command to specify whether to send SNMP notifications as traps or informs.

You can use the snmp-server host global configuration command for a specific host to receive the notification types listed in the following table. You can enable any or all of these traps and configure a trap manager to receive them.

Table 49: Device Notification Types

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridge</td>
<td>Generates STP bridge MIB traps.</td>
</tr>
<tr>
<td>cluster</td>
<td>Generates a trap when the cluster configuration changes.</td>
</tr>
<tr>
<td>config</td>
<td>Generates a trap for SNMP configuration changes.</td>
</tr>
<tr>
<td>copy-config</td>
<td>Generates a trap for SNMP copy configuration changes.</td>
</tr>
<tr>
<td>cpu threshold</td>
<td>Allow CPU-related traps.</td>
</tr>
<tr>
<td>entity</td>
<td>Generates a trap for SNMP entity changes.</td>
</tr>
<tr>
<td>envmon</td>
<td>Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, status, supply, temperature.</td>
</tr>
<tr>
<td>errdisable</td>
<td>Generates a trap for a port VLAN errdisabled. You can also set a maximum trap rate per minute. The range is from 0 to 10000; the default is 0, which means there is no rate limit.</td>
</tr>
<tr>
<td>flash</td>
<td>Generates SNMP FLASH notifications. In a switch stack, you can optionally enable notification for flash insertion or removal, which would cause a trap to be issued whenever a switch in the stack is removed or inserted (physical removal, power cycle, or reload).</td>
</tr>
<tr>
<td>Notification Type Keyword</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>

</tr>
<tr>
<td>msdp</td>
<td>Generates a trap for Multicast Source Discovery Protocol (MSDP) changes.</td>
</tr>
<tr>
<td>ospf</td>
<td>Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes.</td>
</tr>
<tr>
<td>pim</td>
<td>Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.</td>
</tr>
<tr>
<td>port-security</td>
<td>Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When you configure a trap by using the notification type <code>port-security</code>, configure the port security trap first, and then configure the port security trap rate:</td>
</tr>
</tbody>
</table>
|                          | 1. `snmp-server enable traps port-security`  
|                          | 2. `snmp-server enable traps port-security trap-rate rate` |
| ipsla                     | Generates a trap for the SNMP IP Service Level Agreements (SLAs). |
| snmp                      | Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down. |
| storm-control             | Generates a trap for SNMP storm-control. You can also set a maximum trap rate per minute. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence). |
| stpx                      | Generates SNMP STP Extended MIB traps. |
| syslog                    | Generates SNMP syslog traps. |
| tty                       | Generates a trap for TCP connections. This trap is enabled by default. |
| vlan-membership           | Generates a trap for SNMP VLAN membership changes. |
| vlancreate                | Generates SNMP VLAN created traps. |
| vlandelete                | Generates SNMP VLAN deleted traps. |
| vtp                       | Generates a trap for VLAN Trunking Protocol (VTP) changes. |

Follow these steps to configure the switch to send traps or informs to a host.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| **Example:**      |         |
| `Switch# configure terminal` |         |

| **Step 3**        | Specifies the engine ID for the remote host. |
| **Example:**      |         |
| `Switch(config)# snmp-server engineID remote 192.180.1.27 engineid-string` |         |

| **Step 4**        | Configures an SNMP user to be associated with the remote host created in Step 3. |
| **Note**          | You cannot configure a remote user for an address without first configuring the engine ID for the remote host. Otherwise, you receive an error message, and the command is not executed. |
| **Example:**      |         |
| `Switch(config)# snmp-server user Pat username group-name {remote host [udp-port port]} {v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password] }` |         |

| **Step 5**        | Configures an SNMP group. |
| **Example:**      |         |
| `Switch(config)# snmp-server group public group-name {v1 | v2c | v3 [auth | noauth | priv]} [read readview] [write writeview] [notify notifyview] [access access-list]` |         |

| **Step 6**        | Specifies the recipient of an SNMP trap operation. |
| **Example:**      |         |
| `Switch(config)# snmp-server host 203.0.113.1 comaccess snmp` |         |

For `host-addr`, specify the name or Internet address of the host (the targeted recipient).

(Optional) Specify `traps` (the default) to send SNMP traps to the host.

(Optional) Specify `informs` to send SNMP informs to the host.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>(Optional)</strong> Specify the SNMP version <em>(1, 2c, or 3)</em>. SNMPv1 does not support informs.</td>
<td></td>
</tr>
<tr>
<td><strong>(Optional)</strong> For Version 3, select authentication level <em>auth, noauth</em>, or <em>priv</em>.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> The <em>priv</em> keyword is available only when the cryptographic software image is installed.</td>
<td></td>
</tr>
<tr>
<td>For <em>community-string</em>, when version 1 or version 2c is specified, enter the password-like community string sent with the notification operation. When version 3 is specified, enter the SNMPv3 username.</td>
<td></td>
</tr>
<tr>
<td>The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.</td>
<td></td>
</tr>
<tr>
<td><strong>(Optional)</strong> For <em>notification-type</em>, use the keywords listed in the table above. If no type is specified, all notifications are sent.</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 7

**snmp-server enable traps** *notification-types*

**Example:**

```
Switch(config)# snmp-server enable traps
snmp
```

Enables the switch to send traps or informs and specifies the type of notifications to be sent. For a list of notification types, see the table above, or enter `snmp-server enable traps ?`.

To enable multiple types of traps, you must enter a separate `snmp-server enable traps` command for each trap type.

**Note** When you configure a trap by using the notification type *port-security*, configure the port security trap first, and then configure the port security trap rate:

1. `snmp-server enable traps port-security`
2. `snmp-server enable traps port-security trap-rate rate`

#### Step 8

**snmp-server trap-source** *interface-id*

**Example:**

```
Switch(config)# snmp-server trap-source
gigabitethernet 1/0/1
```

(Optional) Specifies the source interface, which provides the IP address for the trap message. This command also sets the source IP address for informs.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td><code>snmp-server queue-length length</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;Switch(config)# <code>snmp-server queue-length 20</code></td>
<td>(Optional) Establishes the message queue length for each trap host. The range is 1 to 5000; the default is 10.</td>
</tr>
<tr>
<td>10</td>
<td><code>snmp-server trap-timeout seconds</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;Switch(config)# <code>snmp-server trap-timeout 60</code></td>
<td>(Optional) Defines how often to resend trap messages. The range is 1 to 1000; the default is 30 seconds.</td>
</tr>
<tr>
<td>11</td>
<td><code>end</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;Switch(config)# <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>12</td>
<td><code>show running-config</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;Switch# <code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>13</td>
<td><code>copy running-config startup-config</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;Switch# <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**What to do next**

The `snmp-server host` command specifies which hosts receive the notifications. The `snmp-server enable traps` command globally enables the method for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an `snmp-server host informs` command for the host and globally enable informs by using the `snmp-server enable traps` command.

To remove the specified host from receiving traps, use the `no snmp-server host host` global configuration command. The `no snmp-server host` command with no keywords disables traps, but not informs, to the host. To disable informs, use the `no snmp-server host informs` global configuration command. To disable a specific trap type, use the `no snmp-server enable traps notification-types` global configuration command.

Setting the Agent Contact and Location Information

Follow these steps to set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
* Enter your password if prompted. |
| Example: | Switch> enable |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Switch# configure terminal |
| Step 3 | snmp-server contact text | Sets the system contact string. |
| Example: | Switch(config)# snmp-server contact Dial System Operator at beeper 21555 |
| Step 4 | snmp-server location text | Sets the system location string. |
| Example: | Switch(config)# snmp-server location Building 3/Room 222 |
| Step 5 | end | Returns to privileged EXEC mode. |
| Example: | Switch(config)# end |
| Step 6 | show running-config | Verifies your entries. |
| Example: | Switch# show running-config |
| Step 7 | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: | Switch# copy running-config startup-config |
Limiting TFTP Servers Used Through SNMP

Follow these steps to limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| configure terminal| Enters global configuration mode. |
| **Example:**      |         |
| Switch# configure terminal |

| **Step 3**        |         |
| snmp-server tftp-server-list access-list-number | Limits the TFTP servers used for configuration file copies through SNMP to the servers in the access list. |
| **Example:**      |         |
| Switch(config)# snmp-server tftp-server-list 44 |

| **Step 4**        |         |
| access-list access-list-number { deny | permit } source [source-wildcard] | Creates a standard access list, repeating the command as many times as necessary. |
| **Example:**      |         |
| Switch(config)# access-list 44 permit 10.1.1.2 |

The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.

For source, enter the IP address of the TFTP servers that can access the switch.

(Optional) For source-wildcard, enter the wildcard bits, in dotted decimal notation, to be applied to the source. Place ones in the bit positions that you want to ignore.

The access list is always terminated by an implicit deny statement for everything.

### Monitoring SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the `show snmp` privileged EXEC command. You also can use the other privileged EXEC commands listed in the table to display SNMP information.

#### Table 50: Commands for Displaying SNMP Information

<table>
<thead>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show snmp</td>
<td>Displays SNMP statistics.</td>
</tr>
<tr>
<td></td>
<td>Displays information on the local SNMP engine and all remote engines that have been configured on the device.</td>
</tr>
<tr>
<td>show snmp group</td>
<td>Displays information on each SNMP group on the network.</td>
</tr>
<tr>
<td>show snmp pending</td>
<td>Displays information on pending SNMP requests.</td>
</tr>
<tr>
<td>show snmp sessions</td>
<td>Displays information on the current SNMP sessions.</td>
</tr>
</tbody>
</table>
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show snmp user</td>
<td>Displays information on each SNMP user name in the SNMP users table.</td>
</tr>
</tbody>
</table>

**Note**

You must use this command to display SNMPv3 configuration information for auth | noauth | priv mode. This information is not displayed in the show running-config output.

### SNMP Examples

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string `public`. This configuration does not cause the switch to send any traps.

```
Switch(config)# snmp-server community public
```

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string `public`. The switch also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33 using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string `public` is sent with the traps.

```
Switch(config)# snmp-server community public
Switch(config)# snmp-server enable traps vtp
Switch(config)# snmp-server host 192.180.1.27 version 2c public
Switch(config)# snmp-server host 192.180.1.111 version 1 public
Switch(config)# snmp-server host 192.180.1.33 public
```

This example shows how to allow read-only access for all objects to members of access list 4 that use the `comaccess` community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host `cisco.com` using the community string `public`.

```
Switch(config)# snmp-server community comaccess ro 4
Switch(config)# snmp-server enable traps snmp authentication
Switch(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host `cisco.com`. The community string is restricted. The first line enables the switch to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous `snmp-server` host commands for the host `cisco.com`.

```
Switch(config)# snmp-server enable traps entity
Switch(config)# snmp-server host cisco.com restricted entity
```
This example shows how to enable the switch to send all traps to the host `myhost.cisco.com` using the community string `public`:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send `auth` (authNoPriv) authentication-level informs when the user enters global configuration mode:

```
Switch(config)# snmp-server engineID remote 192.180.1.27 00000000000100a1c0b4011b
Switch(config)# snmp-server group authgroup v3 auth
Switch(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
Switch(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server inform retries 0
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for SPAN and RSPAN

SPAN

- You can limit SPAN traffic to specific VLANs by using the `filter vlan` keyword. If a trunk port is being monitored, only traffic on the VLANs specified with this keyword is monitored. By default, all VLANs are monitored on a trunk port.

RSPAN

- We recommend that you configure an RSPAN VLAN before you configure an RSPAN source or a destination session.
Restrictions for SPAN and RSPAN

SPAN

The restrictions for SPAN are as follows:

- On each switch, you can configure 66 sessions. A maximum of 7 source sessions can be configured and the remaining sessions can be configured as RSPAN destinations sessions. A source session is either a local SPAN session or an RSPAN source session.

- For SPAN sources, you can monitor traffic for a single port or VLAN or a series or range of ports or VLANs for each session. You cannot mix source ports and source VLANs within a single SPAN session.

- The destination port cannot be a source port; a source port cannot be a destination port.

- You cannot have two SPAN sessions using the same destination port.

- When you configure a switch port as a SPAN destination port, it is no longer a normal switch port; only monitored traffic passes through the SPAN destination port.

- Entering SPAN configuration commands does not remove previously configured SPAN parameters. You must enter the `no monitor session {session_number | all | local | remote}` global configuration command to delete configured SPAN parameters.

- For local SPAN, outgoing packets through the SPAN destination port carry the original encapsulation headers—untagged, ISL, or IEEE 802.1Q—if the `encapsulation replicate` keywords are specified. If the keywords are not specified, the packets are sent in native form.

- You can configure a disabled port to be a source or destination port, but the SPAN function does not start until the destination port and at least one source port or source VLAN are enabled.

- You cannot mix source VLANs and filter VLANs within a single SPAN session.

Traffic monitoring in a SPAN session has the following restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.

- Wireshark does not capture egress packets when egress span is active.

- The switch supports up to four local SPAN or RSPAN source sessions. However if this switch is stacked with Catalyst 2960-S switches, you are limited to 2 local SPAN or RSPAN source sessions.

- You can run both a local SPAN and an RSPAN source session in the same switch or switch stack. The switch or switch stack supports a total of 66 source and RSPAN destination sessions.

- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.

- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per switch stack.

- SPAN sessions do not interfere with the normal operation of the switch. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.
• When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.

• You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.

• The switch does not support a combination of local SPAN and RSPAN in a single session.
  • An RSPAN source session cannot have a local destination port.
  • An RSPAN destination session cannot have a local source port.
  • An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same switch or switch stack.

RSPAN
The restrictions for RSPAN are as follows:
• RSPAN does not support BPDU packet monitoring or other Layer 2 switch protocols.
• The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that the VLAN remote-span feature is supported in all the participating switches.
• RSPAN VLANs are included as sources for port-based RSPAN sessions when source trunk ports have active RSPAN VLANs. RSPAN VLANs can also be sources in SPAN sessions. However, since the switch does not monitor spanned traffic, it does not support egress spanning of packets on any RSPAN VLAN identified as the destination of an RSPAN source session on the switch.
• CDP packets are not forwarded in RSPAN configured VLAN due to limitation in hardware. The workaround is to disable CDP on all the interfaces carrying RSPAN VLAN on the devices connected to the switch.
• If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN IDs that are lower than 1005.
• To use RSPAN, the switch must be running the LAN Base image.

Information About SPAN and RSPAN

SPAN and RSPAN
You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the switch or on another switch that has been connected to a network analyzer or other monitoring or security device. SPAN copies (or mirrors) traffic received or sent (or both) on source ports or source VLANs to a destination port for analysis. SPAN does not affect the switching of network traffic on the source ports or VLANs. You must dedicate the destination port for SPAN use. Except for traffic that is required for the SPAN or RSPAN session, destination ports do not receive or forward traffic.
Only traffic that enters or leaves source ports or traffic that enters or leaves source VLANs can be monitored by using SPAN; traffic routed to a source VLAN cannot be monitored. For example, if incoming traffic is being monitored, traffic that gets routed from another VLAN to the source VLAN cannot be monitored; however, traffic that is received on the source VLAN and routed to another VLAN can be monitored.

You can use the SPAN or RSPAN destination port to inject traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.

**Local SPAN**

Local SPAN supports a SPAN session entirely within one switch; all source ports or source VLANs and destination ports are in the same switch or switch stack. Local SPAN copies traffic from one or more source ports in any VLAN or from one or more VLANs to a destination port for analysis.

*Figure 45: Example of Local SPAN Configuration on a Single Device*

All traffic on port 5 (the source port) is mirrored to port 10 (the destination port). A network analyzer on port 10 receives all network traffic from port 5 without being physically attached to port 5.

*Figure 46: Example of Local SPAN Configuration on a Device Stack*

This is an example of a local SPAN in a switch stack, where the source and destination ports reside on different stack members.
Remote SPAN supports source ports, source VLANs, and destination ports on different switches (or different switch stacks), enabling remote monitoring of multiple switches across your network.

**Figure 47: Example of RSPAN Configuration**

The figure below shows source ports on Switch A and Switch B. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The RSPAN traffic from the source ports or VLANs is copied into the RSPAN VLAN and forwarded over trunk ports carrying the RSPAN VLAN to a destination session monitoring the RSPAN VLAN. Each RSPAN

SPAN and RSPAN Concepts and Terminology
  • SPAN Sessions
  • Monitored Traffic
  • Source Ports
  • Source VLANs
  • VLAN Filtering
  • Destination Port
  • RSPAN VLAN
SPAN Sessions

SPAN sessions (local or remote) allow you to monitor traffic on one or more ports, or one or more VLANs, and send the monitored traffic to one or more destination ports.

A local SPAN session is an association of a destination port with source ports or source VLANs, all on a single network device. Local SPAN does not have separate source and destination sessions. Local SPAN sessions gather a set of ingress and egress packets specified by the user and form them into a stream of SPAN data, which is directed to the destination port.

RSPAN consists of at least one RSPAN source session, an RSPAN VLAN, and at least one RSPAN destination session. You separately configure RSPAN source sessions and RSPAN destination sessions on different network devices. To configure an RSPAN source session on a device, you associate a set of source ports or source VLANs with an RSPAN VLAN. The output of this session is the stream of SPAN packets that are sent to the RSPAN VLAN. To configure an RSPAN destination session on another device, you associate the destination port with the RSPAN VLAN. The destination session collects all RSPAN VLAN traffic and sends it out the RSPAN destination port.

An RSPAN source session is very similar to a local SPAN session, except for where the packet stream is directed. In an RSPAN source session, SPAN packets are relabeled with the RSPAN VLAN ID and directed over normal trunk ports to the destination switch.

An RSPAN destination session takes all packets received on the RSPAN VLAN, strips off the VLAN tagging, and presents them on the destination port. The session presents a copy of all RSPAN VLAN packets (except Layer 2 control packets) to the user for analysis.

More than one source session and more than one destination session can be active in the same RSPAN VLAN. Intermediate switches also can separate the RSPAN source and destination sessions. These switches are unable to run RSPAN, but they must respond to the requirements of the RSPAN VLAN.

Traffic monitoring in a SPAN session has these restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.
- You can run both a local SPAN and an RSPAN source session in the same switch or switch stack. The switch or switch stack supports a total of 66 source and RSPAN destination sessions.
- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.
- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per switch stack.
- SPAN sessions do not interfere with the normal operation of the switch. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.
- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Therefore monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.
- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.
- The switch does not support a combination of local SPAN and RSPAN in a single session.
  - An RSPAN source session cannot have a local destination port.
• An RSPAN destination session cannot have a local source port.

• An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same switch or switch stack.

Creating a Local SPAN Session and Configuring Incoming Traffic, on page 435
Example: Configuring Local SPAN, on page 449

Monitored Traffic

SPAN sessions can monitor these traffic types:

• Receive (Rx) SPAN—Receive (or ingress) SPAN monitors as much as possible all of the packets received by the source interface or VLAN before any modification or processing is performed by the switch. A copy of each packet received by the source is sent to the destination port for that SPAN session.

Packets that are modified because of routing or Quality of Service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied before modification.

Features that can cause a packet to be dropped during receive processing have no effect on ingress SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input Access Control Lists (ACLs), ingress QoS policing, VLAN ACLs, and egress QoS policing.

• Transmit (Tx) SPAN—Transmit (or egress) SPAN monitors as much as possible all of the packets sent by the source interface after all modification and processing is performed by the switch. A copy of each packet sent by the source is sent to the destination port for that SPAN session. The copy is provided after the packet is modified.

Packets that are modified because of routing (for example, with modified time-to-live (TTL), MAC address, or QoS values) are duplicated (with the modifications) at the destination port.

Features that can cause a packet to be dropped during transmit processing also affect the duplicated copy for SPAN. These features include IP standard and extended output ACLs and egress QoS policing.

• Both—In a SPAN session, you can also monitor a port or VLAN for both received and sent packets. This is the default.

The default configuration for local SPAN session ports is to send all packets untagged. SPAN also does not normally monitor bridge protocol data unit (BPDU) packets and Layer 2 protocols, such as Cisco Discovery Protocol (CDP), VLAN Trunk Protocol (VTP), Dynamic Trunking Protocol (DTP), Spanning Tree Protocol (STP), and Port Aggregation Protocol (PAgP). However, when you enter the encapsulation replicate keywords when configuring a destination port, these changes occur:

• Packets are sent on the destination port with the same encapsulation (untagged or IEEE 802.1Q) that they had on the source port.

• Packets of all types, including BPDU and Layer 2 protocol packets, are monitored.

Therefore, a local SPAN session with encapsulation replicate enabled can have a mixture of untagged and IEEE 802.1Q tagged packets appear on the destination port.

Switch congestion can cause packets to be dropped at ingress source ports, egress source ports, or SPAN destination ports. In general, these characteristics are independent of one another. For example:
A packet might be forwarded normally but dropped from monitoring due to an oversubscribed SPAN destination port.

An ingress packet might be dropped from normal forwarding, but still appear on the SPAN destination port.

An egress packet dropped because of switch congestion is also dropped from egress SPAN.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the Rx monitor on port A and Tx monitor on port B. If a packet enters the switch through port A and is switched to port B, both incoming and outgoing packets are sent to the destination port. Both packets are the same unless a Layer 3 rewrite occurs, in which case the packets are different because of the packet modification.

**Source Ports**

A source port (also called a monitored port) is a switched or routed port that you monitor for network traffic analysis.

In a local SPAN session or RSPAN source session, you can monitor source ports or VLANs for traffic in one or both directions.

The switch supports any number of source ports (up to the maximum number of available ports on the switch) and any number of source VLANs (up to the maximum number of VLANs supported).

However, the switch supports a maximum of four sessions (two sessions if switch is in a stack with Catalyst 2960-S switches) (local or RSPAN) with source ports or VLANs. You cannot mix ports and VLANs in a single session.

A source port has these characteristics:

- It can be monitored in multiple SPAN sessions.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor.
- It can be any port type (for example, EtherChannel, Gigabit Ethernet, and so forth).
- For EtherChannel sources, you can monitor traffic for the entire EtherChannel or individually on a physical port as it participates in the port channel.
- It can be an access port, trunk port, routed port, or voice VLAN port.
- It cannot be a destination port.
- Source ports can be in the same or different VLANs.
- You can monitor multiple source ports in a single session.

**Source VLANs**

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs. The SPAN or RSPAN source interface in VSPAN is a VLAN ID, and traffic is monitored on all the ports for that VLAN.

VSPAN has these characteristics:

- All active ports in the source VLAN are included as source ports and can be monitored in either or both directions.
- On a given port, only traffic on the monitored VLAN is sent to the destination port.
• If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
• If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
• You cannot use filter VLANs in the same session with VLAN sources.
• You can monitor only Ethernet VLANs.

VLAN Filtering

When you monitor a trunk port as a source port, by default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering.
• VLAN filtering applies only to trunk ports or to voice VLAN ports.
• VLAN filtering applies only to port-based sessions and is not allowed in sessions with VLAN sources.
• When a VLAN filter list is specified, only those VLANs in the list are monitored on trunk ports or on voice VLAN access ports.
• SPAN traffic coming from other port types is not affected by VLAN filtering; that is, all VLANs are allowed on other ports.
• VLAN filtering affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic.

Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer.

A destination port has these characteristics:
• For a local SPAN session, the destination port must reside on the same switch or switch stack as the source port. For an RSPAN session, it is located on the switch containing the RSPAN destination session. There is no destination port on a switch or switch stack running only an RSPAN source session.
• When a port is configured as a SPAN destination port, the configuration overwrites the original port configuration. When the SPAN destination configuration is removed, the port reverts to its previous configuration. If a configuration change is made to the port while it is acting as a SPAN destination port, the change does not take effect until the SPAN destination configuration had been removed.

Note

When QoS is configured on the SPAN destination port, QoS takes effect immediately.

• If the port was in an EtherChannel group, it is removed from the group while it is a destination port. If it was a routed port, it is no longer a routed port.
• It can be any Ethernet physical port.
• It cannot be a secure port.
• It cannot be a source port.
• It can participate in only one SPAN session at a time (a destination port in one SPAN session cannot be a destination port for a second SPAN session).

• When it is active, incoming traffic is disabled. The port does not transmit any traffic except that required for the SPAN session. Incoming traffic is never learned or forwarded on a destination port.

• If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

• It does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).

• A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.

• The maximum number of destination ports in a switch or switch stack is 64.

Local SPAN and RSPAN destination ports function differently with VLAN tagging and encapsulation:

• For local SPAN, if the encapsulation replicate keywords are specified for the destination port, these packets appear with the original encapsulation (untagged, ISL, or IEEE 802.1Q). If these keywords are not specified, packets appear in the untagged format. Therefore, the output of a local SPAN session with encapsulation replicate enabled can contain a mixture of untagged, ISL, or IEEE 802.1Q-tagged packets.

• For RSPAN, the original VLAN ID is lost because it is overwritten by the RSPAN VLAN identification. Therefore, all packets appear on the destination port as untagged.

**RSPAN VLAN**

The RSPAN VLAN carries SPAN traffic between RSPAN source and destination sessions. RSPAN VLAN has these special characteristics:

• All traffic in the RSPAN VLAN is always flooded.

• No MAC address learning occurs on the RSPAN VLAN.

• RSPAN VLAN traffic only flows on trunk ports.

• RSPAN VLANs must be configured in VLAN configuration mode by using the remote-span VLAN configuration mode command.

• STP can run on RSPAN VLAN trunks but not on SPAN destination ports.

• An RSPAN VLAN cannot be a private-VLAN primary or secondary VLAN.

For VLANs 1 to 1005 that are visible to VLAN Trunking Protocol (VTP), the VLAN ID and its associated RSPAN characteristic are propagated by VTP. If you assign an RSPAN VLAN ID in the extended VLAN range (1006 to 4094), you must manually configure all intermediate switches.

It is normal to have multiple RSPAN VLANs in a network at the same time with each RSPAN VLAN defining a network-wide RSPAN session. That is, multiple RSPAN source sessions anywhere in the network can contribute packets to the RSPAN session. It is also possible to have multiple RSPAN destination sessions throughout the network, monitoring the same RSPAN VLAN and presenting traffic to the user. The RSPAN VLAN ID separates the sessions.

**Related Topics**

- Creating an RSPAN Destination Session, on page 444
SPAN and RSPAN Interaction with Other Features

SPAN interacts with these features:

- **Routing**—SPAN does not monitor routed traffic. VSPAN only monitors traffic that enters or exits the switch, not traffic that is routed between VLANs. For example, if a VLAN is being Rx-monitored and the switch routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and not received on the SPAN destination port.

- **STP**—A destination port does not participate in STP while its SPAN or RSPAN session is active. The destination port can participate in STP after the SPAN or RSPAN session is disabled. On a source port, SPAN does not affect the STP status. STP can be active on trunk ports carrying an RSPAN VLAN.

- **CDP**—A SPAN destination port does not participate in CDP while the SPAN session is active. After the SPAN session is disabled, the port again participates in CDP. Due to limitation in the ASIC, CDP packets are not dropped in RSPAN configured VLAN.

- **VTP**—You can use VTP to prune an RSPAN VLAN between switches.

- **VLAN and trunking**—You can modify VLAN membership or trunk settings for source or destination ports at any time. However, changes in VLAN membership or trunk settings for a destination port do not take effect until you remove the SPAN destination configuration. Changes in VLAN membership or trunk settings for a source port immediately take effect, and the respective SPAN sessions automatically adjust accordingly.

- **EtherChannel**—You can configure an EtherChannel group as a source port a SPAN destination port. When a group is configured as a SPAN source, the entire group is monitored.

  If a physical port is added to a monitored EtherChannel group, the new port is added to the SPAN source port list. If a port is removed from a monitored EtherChannel group, it is automatically removed from the source port list.

  A physical port that belongs to an EtherChannel group can be configured as a SPAN source port and still be a part of the EtherChannel. In this case, data from the physical port is monitored as it participates in the EtherChannel. However, if a physical port that belongs to an EtherChannel group is configured as a SPAN destination, it is removed from the group. After the port is removed from the SPAN session, it rejoins the EtherChannel group. Ports removed from an EtherChannel group remain members of the group, but they are in the inactive or suspended state.

  If a physical port that belongs to an EtherChannel group is a destination port and the EtherChannel group is a source, the port is removed from the EtherChannel group and from the list of monitored ports.

- **Multicast traffic** can be monitored. For egress and ingress port monitoring, only a single unedited packet is sent to the SPAN destination port. It does not reflect the number of times the multicast packet is sent.

- **A private-VLAN port** cannot be a SPAN destination port.

- **A secure port** cannot be a SPAN destination port.

  For SPAN sessions, do not enable port security on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable port security on any ports with monitored egress.
• An IEEE 802.1x port can be a SPAN source port. You can enable IEEE 802.1x on a port that is a SPAN destination port; however, IEEE 802.1x is disabled until the port is removed as a SPAN destination.

For SPAN sessions, do not enable IEEE 802.1x on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable IEEE 802.1x on any ports that are egress monitored.

**SPAN and RSPAN and Device Stacks**

Because the stack of switches represents one logical switch, local SPAN source ports and destination ports can be in different switches in the stack. Therefore, the addition or deletion of switches in the stack can affect a local SPAN session, as well as an RSPAN source or destination session. An active session can become inactive when a switch is removed from the stack or an inactive session can become active when a switch is added to the stack.

**Default SPAN and RSPAN Configuration**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPAN state (SPAN and RSPAN)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Source port traffic to monitor</td>
<td>Both received and sent traffic (both).</td>

<tr>
<td>Encapsulation type (destination port)</td>
<td>Native form (untagged packets).</td>
</tr>
<tr>
<td>Ingress forwarding (destination port)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>VLAN filtering</td>
<td>On a trunk interface used as a source port, all VLANs are monitored.</td>
</tr>
<tr>
<td>RSPAN VLANs</td>
<td>None configured.</td>
</tr>
</tbody>
</table>

**Configuration Guidelines**

**SPAN Configuration Guidelines**

• To remove a source or destination port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id} | destination interface interface-id` global configuration command or the `no monitor session session_number destination interface interface-id` global configuration command. For destination interfaces, the `encapsulation` options are ignored with the `no` form of the command.

• To monitor all VLANs on the trunk port, use the `no monitor session session_number filter` global configuration command.

**Related Topics**

- Creating a Local SPAN Session and Configuring Incoming Traffic, on page 435
- Example: Configuring Local SPAN, on page 449
RSPAN Configuration Guidelines

• All the SPAN configuration guidelines apply to RSPAN.

• As RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.

• You can apply an output ACL to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source switches.

• For RSPAN configuration, you can distribute the source ports and the destination ports across multiple switches in your network.

• Access ports (including voice VLAN ports) on the RSPAN VLAN are put in the inactive state.

• You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:
  • The same RSPAN VLAN is used for an RSPAN session in all the switches.
  • All participating switches support RSPAN.

How to Configure SPAN and RSPAN

Creating a Local SPAN Session

Follow these steps to create a SPAN session and specify the source (monitored) ports or VLANs and the destination (monitoring) ports.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> no monitor session {session_number</td>
<td>all</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# no monitor session all</td>
<td></td>
</tr>
</tbody>
</table>

### Step 4

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor session session_number source {interface interface-id</td>
<td>vlan vlan-id} [</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# monitor session 1 source interface gigabitethernet1/0/1</td>
<td></td>
</tr>
</tbody>
</table>

- **Note** A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session.

- (Optional) [ | ] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.

- (Optional) both | rx | tx—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic.

  - both—Monitors both received and sent traffic.
  - rx—Monitors received traffic.
  - tx—Monitors sent traffic.
### Creating a Local SPAN Session

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>

#### Step 5

**monitor session** `session_number` **destination**

{**interface** `interface-id` [, ] [**encapsulation** replicate]}

**Example:**

```bash
Switch(config)# monitor session 1
destination interface

gigabitethernet1/0/2 encapsulation replicate
```

- Specifies the SPAN session and the destination port (monitoring port). The port LED changes to amber when the configuration changes take effect. The LED returns to its original state (green) only after removing the SPAN destination configuration.

**Note**

- For local SPAN, you must use the same session number for the source and destination interfaces.

  - For `session_number`, specify the session number entered in step 4.
  - For `interface-id`, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.
  - (Optional) [, ]- Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.

(Optional) **encapsulation replicate** specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).

**Note**

You can use **monitor session** `session_number` **destination** command multiple times to configure multiple destination ports.

#### Step 6

**end**

**Example:**

```bash
Switch(config)# end
```

- Returns to privileged EXEC mode.

#### Step 7

**show running-config**

**Example:**

- Verifies your entries.
Creating a Local SPAN Session and Configuring Incoming Traffic

Follow these steps to create a SPAN session, to specify the source ports or VLANs and the destination ports, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show running-config</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 8 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Related Topics**
- Local SPAN, on page 422
- SPAN Sessions, on page 425
- SPAN Configuration Guidelines, on page 431
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Step 4</th>
<th><code>monitor session session_number source</code></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>`{interface interface-id</td>
</tr>
<tr>
<td></td>
<td>`[both</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# monitor session 2 source gigabitethernet1/0/1 rx</code></td>
</tr>
</tbody>
</table>

**Purpose**

Specifies the SPAN session and the source port (monitored port).

### Step 5

**Command or Action**

<table>
<thead>
<tr>
<th>Step 5</th>
<th><code>monitor session session_number destination</code></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>`{interface interface-id [,</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation replicate ingress dot1q vlan 6</code></td>
</tr>
</tbody>
</table>

**Purpose**

Specifies the SPAN session, the destination port, the packet encapsulation, and the ingress VLAN and encapsulation.

- For `session_number`, specify the session number entered in Step 4.
- For `interface-id`, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.
- (Optional) `, | -`—Specifies a series or range of interfaces. Enter a space before and after the comma or hyphen.
- (Optional) `encapsulation replicate` specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
- `ingress` enables forwarding of incoming traffic on the destination port and to specify the encapsulation type:
  - `dot1q vlan vlan-id`—Accepts incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
  - `untagged vlan vlan-id or vlan vlan-id`—Accepts incoming packets with untagged encapsulation type with the specified VLAN as the default VLAN.

### Step 6

**Command or Action**

<table>
<thead>
<tr>
<th>Step 6</th>
<th><code>end</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# end</code></td>
</tr>
</tbody>
</table>

**Purpose**

Returns to privileged EXEC mode.
Specifying VLANs to Filter

Follow these steps to limit SPAN source traffic to specific VLANs.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| configure terminal | Enters global configuration mode. |
| Example:          |         |
| Switch# configure terminal | |

| **Step 3**        |         |
| no monitor session {session_number | all | local | remote} | Removes any existing SPAN configuration for the session. |
| Example:          | • For session_number, the range is 1 to 66. |
| Switch{config)# no monitor session all | • all—Removes all SPAN sessions. |
|                   | • local—Removes all local sessions. |
|                   | • remote—Removes all remote SPAN sessions. |
### Specifying VLANs to Filter

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies the characteristics of the source port (monitored port) and SPAN session.</td>
</tr>
<tr>
<td><code>monitor session session_number source interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# monitor session 2 source interface gigabitethernet1/0/2 rx</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Limits the SPAN source traffic to specific VLANs.</td>
</tr>
<tr>
<td>`monitor session session_number filter vlan vlan-id [,</td>
<td>- ]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# monitor session 2 filter vlan 1 - 5 , 9</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Specifies the SPAN session and the destination port (monitoring port).</td>
</tr>
<tr>
<td>`monitor session session_number destination {interface interface-id [,</td>
<td>- ] [encapsulation replicate]}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# monitor session 2 destination interface gigabitethernet1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring a VLAN as an RSPAN VLAN

Follow these steps to create a new VLAN, then configure it to be the RSPAN VLAN for the RSPAN session.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> vlan vlan-id</td>
<td>Enters a VLAN ID to create a VLAN, or enters the VLAN ID of an existing VLAN, and enters VLAN configuration mode. The range is 2 to 1001 and 1006 to 4094. The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 through 1005 (reserved for Token Ring and FDDI VLANs).</td>
</tr>
<tr>
<td>Example: Switch(config)# vlan 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> remote-span</td>
<td>Configures the VLAN as an RSPAN VLAN.</td>
</tr>
<tr>
<td>Example: Switch(config-vlan)# remote-span</td>
<td></td>
</tr>
</tbody>
</table>
Creating an RSPAN Source Session

Follow these steps to create and start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

You must create the RSPAN VLAN in all switches that will participate in RSPAN. If the RSPAN VLAN-ID is in the normal range (lower than 1005) and VTP is enabled in the network, you can create the RSPAN VLAN in one switch, and VTP propagates it to the other switches in the VTP domain. For extended-range VLANs (greater than 1005), you must configure RSPAN VLAN on both source and destination switches and any intermediate switches.

Use VTP pruning to get an efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

To remove the remote SPAN characteristic from a VLAN and convert it back to a normal VLAN, use the `no remote-span` VLAN configuration command.

To remove a source port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command. To remove the RSPAN VLAN from the session, use the `no monitor session session_number destination remote vlan vlan-id`.

Creating an RSPAN Source Session

Follow these steps to create and start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-vlan)# end</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 6**                 |                                              |
| show running-config        | Verifies your entries.                       |
| Example:                   |                                              |
| Switch# show running-config|                                              |

| **Step 7**                 |                                              |
| copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example:                    |                                              |
| Switch# copy running-config startup-config |                                              |
### Command or Action | Purpose
--- | ---
**Step 2** configure terminal | Enters global configuration mode.
Example:
Switch# configure terminal

**Step 3** no monitor session {session_number | all | local | remote} | Removes any existing SPAN configuration for the session.
- For session_number, the range is 1 to 66.
- all—Removes all SPAN sessions.
- local—Removes all local sessions.
- remote—Removes all remote SPAN sessions.

Example:
Switch(config)# no monitor session 1

**Step 4** monitor session session_number source {interface interface-id | vlan vlan-id} [both | rx | tx] | Specifies the RSPAN session and the source port (monitored port).
- For session_number, the range is 1 to 66.
- Enter a source port or source VLAN for the RSPAN session:
  - For interface-id, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel port-channel-number). Valid port-channel numbers are 1 to 48.
  - For vlan-id, specifies the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN). A single session can include multiple sources (ports or VLANs), defined in a series of commands, but you cannot combine source ports and source VLANs in one session.
  - (Optional) [ , ]—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.
  - (Optional) both | rx | tx—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source...
Specifying VLANs to Filter

Follow these steps to configure the RSPAN source session to limit RSPAN source traffic to specific VLANs.

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface sends both sent and received traffic.</td>
<td></td>
</tr>
<tr>
<td>• both—Monitors both received and sent traffic.</td>
<td></td>
</tr>
<tr>
<td>• rx—Monitors received traffic.</td>
<td></td>
</tr>
<tr>
<td>• tx—Monitors sent traffic.</td>
<td></td>
</tr>
<tr>
<td>both—Monitors both received and sent traffic.</td>
<td></td>
</tr>
<tr>
<td>• rx—Monitors received traffic.</td>
<td></td>
</tr>
<tr>
<td>tx—Monitors sent traffic.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

**monitor session** *session_number* destination remote *vlan* *vlan-id*

**Example:**

Switch(config)# monitor session 1 destination remote vlan 100

Specifies the RSPAN session, the destination RSPAN VLAN, and the destination-port group.

- For *session_number*, enter the number defined in Step 4.
- For *vlan-id*, specify the source RSPAN VLAN to monitor.

### Step 6

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

### Step 7

**show running-config**

**Example:**

Switch# show running-config

Verifies your entries.

### Step 8

**copy running-config startup-config**

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### Creating an RSPAN Destination Session

You configure an RSPAN destination session on a different switch or switch stack; that is, not the switch or switch stack on which the source session was configured.

Follow these steps to define the RSPAN VLAN on that switch, to create an RSPAN destination session, and to specify the source RSPAN VLAN and the destination port.

#### Procedure

<table>
<thead>
<tr>

Monitoring SPAN and RSPAN Operations

The following table describes the command used to display SPAN and RSPAN operations configuration and results to monitor operations:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show monitor</td>
<td>Displays the current SPAN, RSPAN, FSPAN, or FRSPAN configuration.</td>
</tr>
</tbody>
</table>

SPAN and RSPAN Configuration Examples

Example: Configuring Local SPAN

This example shows how to set up SPAN session 1 for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is deleted, and then bidirectional traffic is mirrored from source Gigabit Ethernet port 1 to destination Gigabit Ethernet port 2, retaining the encapsulation method.

Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2
encapsulation replicate
Switch(config)# end

This example shows how to remove port 1 as a SPAN source for SPAN session 1:

Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# end

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1 source interface gigabitethernet1/0/1 rx

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination Gigabit Ethernet port 2. The configuration is then modified to also monitor all traffic on all ports belonging to VLAN 10.

Switch> enable
Switch# configure terminal
Examples: Creating an RSPAN VLAN

This example shows how to create the RSPAN VLAN 901:

```
Switch> enable
Switch# configure terminal
Switch(config)# vlan 901
Switch(config-vlan)# remote span
Switch(config-vlan)#
```

This example shows how to remove any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination as RSPAN VLAN 901:

```
Switch> enable
Switch# configure terminal
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 tx
Switch(config)# monitor session 1 source interface gigabitethernet1/0/2 rx
Switch(config)# monitor session 1 source interface port-channel 2
```

Switch(config)# monitor session 1 destination remote vlan 901
Switch(config)# end

This example shows how to remove any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 2, and send traffic for only VLANs 1 through 5 and 9 to destination RSPAN VLAN 902:

Switch# enable
Switch# configure terminal
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Switch(config)# monitor session 2 filter vlan 1 - 5, 9
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# end

This example shows how to configure VLAN 901 as the source remote VLAN and port 1 as the destination interface:

Switch# enable
Switch# configure terminal
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitethernet2/0/1
Switch(config)# end

This example shows how to configure VLAN 901 as the source remote VLAN in RSPAN session 2, to configure Gigabit Ethernet source port 2 as the destination interface, and to enable forwarding of incoming traffic on the interface with VLAN 6 as the default receiving VLAN:

Switch# enable
Switch# configure terminal
Switch(config)# monitor session 2 source remote vlan 901
Switch(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6
Switch(config)# end

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Flexible NetFlow

• Flexible NetFlow is supported on the Catalyst 2960-X Switch and the Catalyst 2960-XR Switch with a Cisco ONE for Access license. Catalyst 2960-XR is not stackable with the Catalyst 2960-X platform.

• One of the following must be enabled on your device and on any interfaces on which you want to enable Flexible NetFlow: Cisco Express Forwarding or distributed Cisco Express Forwarding.

• The targets for attaching a NetFlow monitor are the following:
  • Port—Monitor attachment is only supported on physical interfaces and not on logical interfaces, such as EtherChannels. The physical interface could be a routed port or a switched port.
  • VLAN—Monitor attachment is supported on VLAN interfaces only (SVI) and not on a Layer 2 VLAN.
• You are familiar with the Flexible NetFlow key fields as they are defined in the following commands:
  • match datalink—Datalink (layer2) fields
  • match ipv4—IPv4 fields
  • match ipv6—IPv6 fields
  • match transport—Transport layer fields

• You are familiar with the Flexible NetFlow non key fields as they are defined in the following commands:
  • collect counter—Counter fields
  • collect flow—Flow identifying fields
  • collect interface—Interface fields
  • collect timestamp—Timestamp fields
  • collect transport—Transport layer fields

Restrictions for Flexible NetFlow

The following restrictions apply to Flexible NetFlow and Flexible NetFlow Lite:

General Restrictions:
• InterSwitch Link (ISL) is not supported.
• Policy-based NetFlow is not supported.
• Cisco TrustSec monitoring is not supported.
• Access control lists (ACL)-based NetFlow is not supported.
• Only NetFlow Version 9 is supported for Flexible NetFlow exporter using the export-protocol command option.
• NetFlow Version 5 is not supported.

Flow Record Restrictions:
• When a flow monitor has configured the collect interface output command as the collect field in the flow record, the field will return a value of NULL when a flow gets created for any of the following addresses:
  • L2 broadcast and multicast
  • L3 broadcast and multicast
  • L2 unknown destination.

When a flow monitor has the collect interface output configured as the collect field in the flow record, the output interface is detected based on the destination IP address on the device. For the different flow monitors, you must configure the following commands:
- IPv4 flow monitor—Configure the **match ip destination address** command.
- IPv6 flow monitor—Configure the **match ipv6 destination address** command.
- Datalink flow monitor—Configure the **match datalink mac output** command.

- Predefined flow records are not supported.

Monitor Restrictions:
- Monitor attachment is only supported in the ingress direction.
- One monitor per interface is supported, although multiple exporters per interface are supported.
- Only permanent and normal cache is supported for the monitor; immediate cache is not supported.
- Changing any monitor parameter will not be supported when it is applied on any of the interfaces or VLANs.
- When both the port and VLANs have monitors attached, then VLAN monitor will overwrite the port monitor for traffic coming on the port.
- Flow monitor type and traffic type (type means IPv4, IPv6, and data link) should be same for the flows to be created.
- You cannot attach an IP and a port-based monitor to an interface. A 48-port device supports a maximum of 48 monitors (IP or port-based) and for 256 SVIs, you can configure up to 256 monitors (IP or port-based).
- When running the **show flow monitor** `flow_name` `cache` command, the device displays cache information from an earlier switch software version (Catalyst 2960-S) with all fields entered as zero. Ignore these fields, as they are inapplicable to the switch.

Sampler Restrictions:
- For both port and VLANs, a total of only 4 samplers (random or deterministic) are supported on the device.
- The sampling minimum rate for both modes is 1 out of 32 flows, and the sampling maximum rate for both modes is 1 out of 1022 flows.
- Use the **ip flow monitor** `monitor_name` `sampler sampler_name input` command to associate a sample with a monitor while attaching it to an interface.
- When you attach a monitor using a deterministic sampler, every attachment with the same sampler uses one new free sampler from the switch (hardware) out of the 4 available samplers. You are not allowed to attach a monitor with any sampler, beyond 4 attachments.
- When you attach a monitor using a random sampler, only the first attachment uses a new sampler from the switch (hardware). The remainder of all of the attachments using the same sampler, share the same sampler.
- Because of this behavior, when using a deterministic sampler, you can always make sure that the correct number of flows are sampled by comparing the sampling rate and what the device sends. If the same random sampler is used with multiple interfaces, flows from any interface can always be sampled, and flows from other interfaces can always be skipped.

Stacking Restrictions:
• Each device in a stack (hardware) can support the creation of a maximum of 16,000 flows at any time. But as the flows are periodically pushed to the software cache, the software cache can hold a much larger amount of flows (1048 Kb flows). From the hardware flow cache, every 20 seconds (termed as poll timer), 200 flows (termed as poll entries) are pushed to software.

• Use the remote command all show platform hulc-fnf poll command to report on the current NetFlow polling parameters of each switch.

• Use the show platform hulc-fnf poll command to report on the current NetFlow polling parameters of the master switch.

• Network flows and statistics are collected at the line rate.

Information About Flexible Netflow

Flexible NetFlow Overview

Flexible NetFlow uses flows to provide statistics for accounting, network monitoring, and network planning. A flow is a unidirectional stream of packets that arrives on a source interface and has the same values for the keys. A key is an identified value for a field within the packet. You create a flow using a flow record to define the unique keys for your flow.

The switch supports the Flexible NetFlow feature that enables enhanced network anomalies and security detection. Flexible NetFlow allows you to define an optimal flow record for a particular application by selecting the keys from a large collection of predefined fields. All key values must match for the packet to count in a given flow. A flow might gather other fields of interest, depending on the export record version that you configure. Flows are stored in the Flexible NetFlow cache.

You can export the data that Flexible NetFlow gathers for your flow by using an exporter and export this data to a remote system such as a Flexible NetFlow collector. The Flexible NetFlow collector can use an IPv4 address.

You define the size of the data that you want to collect for a flow using a monitor. The monitor combines the flow record and exporter with the Flexible NetFlow cache information.

Original NetFlow and Benefits of Flexible NetFlow

Flexible NetFlow allows the flow to be user defined. The benefits of Flexible NetFlow include:

• High-capacity flow recognition, including scalability and aggregation of flow information.

• Enhanced flow infrastructure for security monitoring and dDoS detection and identification.

• New information from packets to adapt flow information to a particular service or operation in the network. The flow information available will be customizable by Flexible NetFlow users.

• Extensive use of Cisco’s flexible and extensible NetFlow Version 9.

• A comprehensive IP accounting feature that can be used to replace many accounting features, such as IP accounting, Border Gateway Protocol (BGP) Policy Accounting, and persistent caches.
Flexible NetFlow allows you to understand network behavior with more efficiency, with specific flow information tailored for various services used in the network. The following are some example applications for a Flexible NetFlow feature:

- Flexible NetFlow enhances Cisco NetFlow as a security monitoring tool. For instance, new flow keys can be defined for packet length or MAC address, allowing users to search for a specific type of attack in the network.
- Flexible NetFlow allows you to quickly identify how much application traffic is being sent between hosts by specifically tracking TCP or UDP applications by the class of service (CoS) in the packets.
- The accounting of traffic entering a Multiprotocol Label Switching (MPLS) or IP core network and its destination for each next hop per class of service. This capability allows the building of an edge-to-edge traffic matrix.

The figure below is an example of how Flexible NetFlow might be deployed in a network.

**Figure 48: Typical Deployment for Flexible NetFlow**

---

**Flexible NetFlow Components**

Flexible NetFlow consists of components that can be used together in several variations to perform traffic analysis and data export. The user-defined flow records and the component structure of Flexible NetFlow facilitates the creation of various configurations for traffic analysis and data export on a networking device with a minimum number of configuration commands. Each flow monitor can have a unique combination of flow record, flow exporter, and cache type. If you change a parameter such as the destination IP address for a flow exporter, it is automatically changed for all the flow monitors that use the flow exporter. The same flow monitor can be used in conjunction with different flow samplers to sample the same type of network traffic at different rates on different interfaces. The following sections provide more information on Flexible NetFlow components:

**Flow Records**

In Flexible NetFlow a combination of key and nonkey fields is called a record. Flexible NetFlow records are assigned to Flexible NetFlow flow monitors to define the cache that is used for storing flow data.

A flow record defines the keys that Flexible NetFlow uses to identify packets in the flow, as well as other fields of interest that Flexible NetFlow gathers for the flow. You can define a flow record with any combination...
of keys and fields of interest. The switch supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 64-bit packet or byte counters. The switch enables the following match fields as the defaults when you create a flow record:

- match datalink—Layer 2 attributes
- match ipv4—IPv4 attributes
- match ipv6—IPv6 attributes
- match transport—Transport layer fields
- match wireless—Wireless fields

User-Defined Records

Flexible NetFlow enables you to define your own records for a Flexible NetFlow flow monitor cache by specifying the key and nonkey fields to customize the data collection to your specific requirements. When you define your own records for a Flexible NetFlow flow monitor cache, they are referred to as user-defined records. The values in nonkey fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a nonkey field does not create a new flow. In most cases the values for nonkey fields are taken from only the first packet in the flow. Flexible NetFlow enables you to capture counter values such as the number of bytes and packets in a flow as nonkey fields.

Flexible NetFlow adds a new Version 9 export format field type for the header and packet section types. Flexible NetFlow will communicate to the NetFlow collector the configured section sizes in the corresponding Version 9 export template fields. The payload sections will have a corresponding length field that can be used to collect the actual size of the collected section.

Flow Exporters

Flow exporters export the data in the flow monitor cache to a remote system, such as a server running NetFlow collector, for analysis and storage. Flow exporters are created as separate entities in the configuration. Flow exporters are assigned to flow monitors to provide data export capability for the flow monitors. You can create several flow exporters and assign them to one or more flow monitors to provide several export destinations. You can create one flow exporter and apply it to several flow monitors.

NetFlow Data Export Format Version 9

The basic output of NetFlow is a flow record. Several different formats for flow records have evolved as NetFlow has matured. The most recent evolution of the NetFlow export format is known as Version 9. The distinguishing feature of the NetFlow Version 9 export format is that it is template-based. Templates provide an extensible design to the record format, a feature that should allow future enhancements to NetFlow services without requiring concurrent changes to the basic flow-record format. Using templates provides several key benefits:

- Third-party business partners who produce applications that provide collector or display services for NetFlow do not have to recompile their applications each time a new NetFlow feature is added. Instead, they should be able to use an external data file that documents the known template formats.
- New features can be added to NetFlow quickly without breaking current implementations.
- NetFlow is “future-proofed” against new or developing protocols because the Version 9 format can be adapted to provide support for them.
The Version 9 export format consists of a packet header followed by one or more template flow or data flow sets. A template flow set provides a description of the fields that will be present in future data flow sets. These data flow sets may occur later within the same export packet or in subsequent export packets. Template flow and data flow sets can be intermingled within a single export packet, as illustrated in the figure below.

**Figure 49: Version 9 Export Packet**

NetFlow Version 9 will periodically export the template data so the NetFlow collector will understand what data is to be sent and also export the data flow set for the template. The key advantage to Flexible NetFlow is that the user configures a flow record, which is effectively converted to a Version 9 template and then forwarded to the collector. The figure below is a detailed example of the NetFlow Version 9 export format, including the header, template flow, and data flow sets.

**Figure 50: Detailed Example of the NetFlow Version 9 Export Format**

### Flow Monitors

Flow monitors are the Flexible NetFlow component that is applied to interfaces to perform network traffic monitoring.
Flow data is collected from the network traffic and added to the flow monitor cache during the monitoring process based on the key and nonkey fields in the flow record.

Flexible NetFlow can be used to perform different types of analysis on the same traffic. In the figure below, packet 1 is analyzed using a record designed for standard traffic analysis on the input interface and a record designed for security analysis on the output interface.

*Figure 51: Example of Using Two Flow Monitors to Analyze the Same Traffic*

The figure below shows a more complex example of how you can apply different types of flow monitors with custom records.

*Figure 52: Complex Example of Using Multiple Types of Flow Monitors with Custom Records*
### Normal

The default cache type is “normal”. In this mode, the entries in the cache are aged out according to the timeout active and timeout inactive settings. When a cache entry is aged out, it is removed from the cache and exported via any exporters configured.

### Flow Samplers

Flow samplers are created as separate components in a router’s configuration. Flow samplers are used to reduce the load on the device that is running Flexible NetFlow by limiting the number of packets that are selected for analysis.

Samplers use random sampling techniques (modes); that is, a randomly selected sampling position is used each time a sample is taken.

Flow sampling exchanges monitoring accuracy for router performance. When you apply a sampler to a flow monitor, the overhead load on the router of running the flow monitor is reduced because the number of packets that the flow monitor must analyze is reduced. The reduction in the number of packets that are analyzed by the flow monitor causes a corresponding reduction in the accuracy of the information stored in the flow monitor’s cache.

Samplers are combined with flow monitors when they are applied to an interface with the `ip flow monitor` command.

### Supported Flexible NetFlow Fields

The following tables provide a consolidated list of supported fields in Flexible NetFlow (FNF) for various traffic types and traffic direction.

**Note:**

If the packet has a VLAN field, then that length is not accounted for.

<table>
<thead>
<tr>
<th>Field</th>
<th>Layer 2 In</th>
<th>Layer 2 Out</th>
<th>IPv4 In</th>
<th>IPv4 Out</th>
<th>IPv6 In</th>
<th>IPv6 Out</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key or Collect Fields</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>If you apply a flow monitor in the input direction:</td>
</tr>
<tr>
<td>Interface input</td>
<td>Yes</td>
<td>—</td>
<td>Yes</td>
<td>—</td>
<td>Yes</td>
<td>—</td>
<td>• Use the <code>match</code> keyword and use the input interface as a key field.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Use the <code>collect</code> keyword and use the output interface as a collect field. This field will be present in the exported records but with a value of 0.</td>
</tr>
</tbody>
</table>

If you apply a flow monitor in the output direction:

- Use the `match` keyword and use the output interface as a key field.
- Use the `collect` keyword and use the input interface as a collect field. This field will be present in the exported records but with a value of 0.

</tbody>
</table>
How to Configure Flexible Netflow

To configure Flexible Netflow, follow these general steps:

1. Create a flow record by specifying keys and non-key fields to the flow.
2. Create an optional flow exporter by specifying the protocol and transport destination port, destination, and other parameters.
3. Create a flow monitor based on the flow record and flow exporter.
4. Create an optional sampler.
5. Apply the flow monitor to a Layer 2 port, Layer 3 port, or VLAN.

Creating a Flow Record

Perform this task to configure a customized flow record.

Customized flow records are used to analyze traffic data for a specific purpose. A customized flow record must have at least one match criterion for use as the key field and typically has at least one collect criterion for use as a nonkey field.

There are hundreds of possible permutations of customized flow records. This task shows the steps that are used to create one of the possible permutations. Modify the steps in this task as appropriate to create a customized flow record for your requirements.

Procedure

<td></td>
</tr>
</tbody>
</table>
Creating a Flow Exporter

You can create a flow export to define the export parameters for a flow.

---

**Note**

Each flow exporter supports only one destination. If you want to export the data to multiple destinations, you must configure multiple flow exporters and assign them to the flow monitor.

You can export to a destination using IPv4 address.

---

### Procedure

<table>

<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>**source { source type</td>
<td></td>
</tr>
</tbody>
</table>
| **Example:** | ```
Switch(config-flow-exporter)# source
gigabitEthernet1/0/1
```

| **Step 7** | **transport udp number** | (Optional) Specifies the UDP port to use to reach the NetFlow collector. The range is from 1 to 65536 |
| **Example:** | ```
Switch(config-flow-exporter)# transport
udp 200
```

| **Step 8** | **ttl seconds** | (Optional) Configures the time-to-live (TTL) value for datagrams sent by the exporter. The range is from 1 to 255 seconds. The default is 255. |
| **Example:** | ```
Switch(config-flow-exporter)# ttl 210
```

| **Step 9** | **export-protocol {netflow-v9}** | Specifies the version of the NetFlow export protocol used by the exporter. |
| **Example:** | ```
Switch(config-flow-exporter)# export-protocol netflow-v9
```

| **Step 10** | **end** | Returns to privileged EXEC mode. |
| **Example:** | ```
Switch(config-flow-record)# end
```

| **Step 11** | **show flow exporter [name record-name]** | (Optional) Displays information about NetFlow flow exporters. |
| **Example:** | ```
Switch# show flow exporter ExportTest
```

| **Step 12** | **copy running-config startup-config** | (Optional) Saves your entries in the configuration file. |
| **Example:** | ```
Switch# copy running-config startup-config
```

**What to do next**

Define a flow monitor based on the flow record and flow exporter.
Creating a Flow Monitor

Perform this required task to create a customized flow monitor.

Each flow monitor has a separate cache assigned to it. Each flow monitor requires a record to define the contents and layout of its cache entries. These record formats can be a user-defined format. An advanced user can create a customized format using the `flow record` command.

**Before you begin**

If you want to use a customized record, you must create the customized record before you can perform this task. If you want to add a flow exporter to the flow monitor for data export, you must create the exporter before you can complete this task.

---

**Note**

You must use the `no ip flow monitor` command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the `record` command on the flow monitor.

---

**Procedure**

<td>Switch# show running-config flow monitor FLOW_MONITOR-1</td>
<td></td>
</tr>
</tbody>
</table>
## Creating a Sampler

You can create a sampler to define the NetFlow sampling rate for a flow.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Creates a sampler and enters flow sampler configuration mode.</td>
</tr>
<tr>
<td><code>sampler name</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# sampler SampleTest</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Describes this flow record as a maximum 63-character string.</td>
</tr>
<tr>
<td><code>description string</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-flow-sampler)# description samples</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Defines the random sample mode.</td>
</tr>
<tr>
<td>`mode {deterministic {m}</td>
<td>random {m, n}}`</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-flow-sampler)# mode random 1 out-of 1022</td>
</tr>
</tbody>
</table>

Note the following when configuring a sampler to an interface:

- When you attach a monitor using deterministic sampler (for example, `s1`), every attachment with same sampler `s1` uses one new free sampler from the switch (hardware) out of 4 available samplers.
Therefore, beyond 4 attachments, you are not allowed to attach a monitor with any sampler.

- In contrast, when you attach a monitor using random sampler (for example-again, s1), only the first attachment uses a new sampler from the switch (hardware). The rest of all attachments using the same sampler s1, share the same sampler.

- Due to this behavior, when using a deterministic sampler, you can always make sure the correct number of flows are sampled by comparing the sampling rate and what the switch sends. If the same random sampler is used with multiple interfaces, flows from an interface can always be sampled, and the flows from other interfaces could be always skipped.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-flow-sampler)# end</td>
</tr>
</tbody>
</table>

Returns to privileged EXEC mode.

<table>
<thead>
<tr>
<th>Step 6</th>
<th>show sampler [name]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch show sample SampleTest</td>
</tr>
</tbody>
</table>

(Optional) Displays information about NetFlow samplers.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

What to do next
Apply the flow monitor to a source interface or a VLAN.

Applying a Flow to an Interface
You can apply a flow monitor and an optional sampler to an interface.
**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2** interface type

Example:

Switch(config)# interface GigabitEthernet1/0/1

Enters interface configuration mode and configures an interface.

Command parameters for the interface configuration include:

You cannot attach a NetFlow monitor to a port channel interface. If both service module interfaces are part of an EtherChannel, you should attach the monitor to both physical interfaces.

**Step 3** {ip flow monitor | ipv6 flow monitor} name

Example:

Switch(config-if)# ip flow monitor MonitorTest input

To monitor datalink L2 traffic flows, you would use `datalink flow monitor name sampler` interface command. This specific command associates a datalink L2 flow monitor and required sampler to the interface for input packets. When a datalink flow monitor is assigned to an interface or VLAN record, it only creates flows for non-IPv6 or non-IPv4 traffic.

**Note** Whenever you assign a flow monitor to an interface, you must configure a sampler. If the sampler is missing, you will receive an error message.

**Step 4** end

Example:

Switch(config-flow-monitor)# end

Returns to privileged EXEC mode.

**Step 5** show flow interface [interface-type number]

Example:

Switch# show flow interface

(Optional) Displays information about NetFlow on an interface.
### Configuring a Bridged NetFlow on a VLAN

You can apply a flow monitor and an optional sampler to a VLAN.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>

</table>
## Configuring Layer 2 NetFlow

You can define Layer 2 keys in Flexible NetFlow records that you can use to capture flows in Layer 2 interfaces.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>flow record <em>name</em></td>
<td>Enters flow record configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# flow record L2_record</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>match datalink {ethertype</td>
<td>mac {destination {address input}</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-flow-record)# match datalink mac source address input</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-flow-record)# match datalink mac destination address input</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>match { ipv4 {destination</td>
<td>protocol</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-flow-record)# match ipv4 protocol</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-flow-record)# match ipv4 tos</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-flow-record)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show flow record [name]</td>
<td>(Optional) Displays information about NetFlow on an interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# <code>show flow record</code></td>
<td><strong>Purpose</strong></td>
</tr>
</tbody>
</table>

**Step 7**

**Example:**

Switch# `copy running-config startup-config`

(Optional) Saves your entries in the configuration file.

---

## Monitoring Flexible NetFlow

The commands in the following table can be used to monitor Flexible NetFlow.

### Table 54: Flexible NetFlow Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show flow exporter [broker</td>
<td>export-ids</td>
</tr>
<tr>
<td><code>show flow exporter [name exporter-name]</code></td>
<td>Displays information about NetFlow flow exporters and statistics.</td>
</tr>
<tr>
<td><code>show flow interface</code></td>
<td>Displays information about NetFlow interfaces.</td>
</tr>
<tr>
<td><code>show flow monitor [name exporter-name]</code></td>
<td>Displays information about NetFlow flow monitors and statistics.</td>
</tr>
<tr>
<td><code>show flow monitor statistics</code></td>
<td>Displays the statistics for the flow monitor.</td>
</tr>
<tr>
<td>`show flow monitor cache format {table</td>
<td>record</td>
</tr>
<tr>
<td><code>show flow record [name record-name]</code></td>
<td>Displays information about NetFlow flow records.</td>
</tr>
<tr>
<td><code>show flow ssid</code></td>
<td>Displays NetFlow monitor installation status for a WLAN.</td>
</tr>
<tr>
<td>`show sampler [broker</td>
<td>name</td>
</tr>
<tr>
<td><code>show wlan wlan-name</code></td>
<td>Displays the WLAN configured on the device.</td>
</tr>
</tbody>
</table>
Configuration Examples for Flexible NetFlow

Example: Configuring a Flow

This example shows how to create a flow and apply it to an interface:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# flow export export1
Switch(config-flow-exporter)# destination 10.0.101.254
Switch(config-flow-exporter)# transport udp 2055
Switch(config-flow-exporter)# exit
Switch(config)# flow record record1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# match ipv4 protocol
Switch(config-flow-record)# match transport source-port
Switch(config-flow-record)# match transport destination-port
Switch(config-flow-record)# collect counter byte long
Switch(config-flow-record)# collect counter packet long
Switch(config-flow-record)# collect timestamp absolute first
Switch(config-flow-record)# collect timestamp absolute last
Switch(config-flow-record)# exit
Switch(config)# flow monitor monitor1
Switch(config-flow-monitor)# record record1
Switch(config-flow-monitor)# exporter export1
Switch(config-flow-monitor)# exit
Switch(config)# interface tenGigabitEthernet 1/0/1
Switch(config-if)# ip flow monitor monitor1 input
Switch(config-if)# end

Feature Information for Flexible NetFlow

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OpenFlow

The Prerequisites for OpenFlow are as follows:

- A Cisco device and its corresponding operating system that supports the installation of OpenFlow.

Refer to the corresponding release notes for information about which operating system release supports the features and necessary infrastructure.

Note: Release notes for Cisco Catalyst 2960X/XR Series Switches

- A controller installed on a connected server.
### Restrictions for OpenFlow

The Restrictions for OpenFlow are as listed below:

- OpenFlow supports only a subset of OpenFlow 1.3 functions. For more information, see the Cisco OpenFlow Feature Support section.

- You cannot configure more than one OpenFlow logical switch. The logical switch ID has a value of 1.

- OpenFlow hybrid model (ships-in-the-night) is supported. VLANs configured for OpenFlow logical switch ports should not overlap with regular device interfaces.

- The OpenFlow logical switch ports must not be configured in a mode other than trunk port.

- You cannot configure a bridge domain, Virtual LANs, virtual routing and forwarding (VRF) or port-channel interfaces on an OpenFlow logical switch. You can only configure physical interfaces.

- You cannot make additional configurations to an interface configured as a port of OpenFlow Logical Switch without removing the configuration as a port of OpenFlow Logical Switch.

- In stack scenarios, consisting of master / member switches, whenever the master switch goes down, all current configuration will exist in newly elected master switch. However, the flows have to program again from the controller.

- MIBs and XMLs are not supported.

- Cisco Catalyst 2960X/XR switch supports 1000 L2 flows with EtherType, 200 L2 flows without EtherType, and 500 L3 flows.

- A maximum of 48 ports can be assigned for Openflow operation.

- In general, the maximum sustained flow programming rate from the controller should not exceed 50 (added or deleted) flows per second. For flows that have more than 1 match criteria (more than input port + 1 match), the sustained controller programming rate should not exceed 40 flows per second.

- The maximum burst flow programming rate from the controller should not exceed 1000 flows, spaced by 30-second time intervals. A minimum of 30-second time interval should be maintained between addition or deletion of flows.

- The rate of PACKET_IN messages sent to the controller should be rate-limited to 300 packets per second, using configuration.

- Configuration Examples for OpenFlow, on page 499

Overview of OpenFlow

OpenFlow is a standard communications interface defined between the control and forwarding plane for direct access to and manipulation of the forwarding plane of network devices such as switches and routers from multiple vendors.

OpenFlow Switch Specification Version 1.0.1 (Wire Protocol 0x01), referred to as OpenFlow 1.0, and OpenFlow Switch Specification Version 1.3.0 (Wire Protocol 0x04), referred to as OpenFlow 1.3, are based on the concept of an Ethernet switch with an internal flow table and standardized interface to allow traffic flows on a device to be added or removed. OpenFlow 1.3 defines the communication channel between OpenFlow and controllers.

A generic OpenFlow controller will interact with an specialized OpenFlow agent that translates the OpenFlow configuration into IOS configurations and configures the data plane.

Support of OpenFlow on catalyst 2960X/XR is limited to only software forwarding (due to ASIC limitations). The software forwarding of flows will happen at the OpenFlow agent with support of 12 tuples matches consisting of single table with both L2 and L3 fields together. The match criteria can be match on all 12 tuple fields or any of the 12 tuple fields.

The corresponding actions to the matching criteria can be:

- Push / Pop of Vlan
- Output the packet to port
- Drop the packet
- Set/Decrement IP TTL value
- Modify of L2/L3/L4 fields of Ethernet frame

The Physical ports can be configured as OpenFlow ports or as normal port. The flows in the flow table will be installed based on the priority of the flow.

---

**Note**
Priority 0 flows are not supported.

Cisco supports a subset of OpenFlow 1.0 and OpenFlow 1.3 functions. A controller can be Extensible Network Controller (XNC) 1.0, or any controller compliant with OpenFlow 1.3.
OpenFlow Controller Operation

OpenFlow controller (referred to as controller) controls the switch and inserts flows with a subset of OpenFlow 1.3 and 1.0 match and action criteria through OpenFlow logical switch.

Cisco OpenFlow Feature Support

The following is a subset of OpenFlow 1.3 and OpenFlow 1.0 functions that are supported by OpenFlow.

Table 57: Cisco OpenFlow Feature Support

<table>
<thead>
<tr>
<th>Feature</th>
<th>Notes</th>
</tr>
</thead>
</table>
| Configuration of physical interfaces as OpenFlow logical switch ports | Bridge domain, Virtual LANs and Virtual Routing and Forwarding (VRF), and port-channel interfaces are not supported.  
Only L2 interfaces can be OpenFlow logical switch ports. |
| Supported OpenFlow message types            | Controller to switch:  
• Handshake  
• Switch Configuration  
• Modify State (Port Modification message is not supported)  
• Read State  
• Packet-Out  
• Barrier  
Asynchronous messages:  
• Packet-In  
• Flow Removed  
• Port Status  
• Error  
Symmetric messages:  
• Hello  
• Echo Request  
• Echo Reply  
• Vendor |
<table>
<thead>
<tr>
<th>Feature</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection to controllers</td>
<td>You can connect up to eight controllers. Connection to the controller through a management interface or a switched virtual interface (SVI) is supported. Connection via TCP and TLS is supported.</td>
</tr>
</tbody>
</table>
| Multiple actions            | If multiple actions are associated with a flow, they are processed in the order specified. The output action should be the last action in the action list. Any action after the output action is not supported, and can cause the flow to fail and return an error to the controller. Flows defined on the controller must follow these guidelines:  
  • The flow can have only one output action.  
  • Some action combinations which are not supported may be rejected at flow programming time.  
  • The flow should not have an output–to–controller action in combination with other rewrite actions. |
| Supported OpenFlow counters | Per Table—Active entries, packet lookups, and packet matches.  
  Per Flow—Received Packets, Received bytes, Duration (seconds), Duration (milliseconds).  
  Per Port—Received or transmitted packets, and bytes.  
  Per Controller—Flow addition, modification, deletion, error messages, echo requests or replies, barrier requests or replies, connection attempts, successful connections, packet in or packet out. |
| Default forwarding rule     | All packets that cannot be matched to programmed flows are dropped by default. You can configure sending unmatched packets to the controller. You can modify the default action taken on unmatched packets either using the default-miss command or by the controller. |
A minimum idle timeout of 14 seconds is supported for 700 flows and 48 ports. The statistics collection interval influences the minimum idle timeout. When the interval is set to 7 seconds, the timeout is a minimum of 14 seconds. 700 flows are supported with the 14-second idle timeout. When using an idle timeout of less than 25 seconds, the number of L3 flows should be limited to 700.

### Supported Match and Actions and Pipelines

## Configuring OpenFlow

To configure OpenFlow logical switch and the IP address of a controller, perform this task:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
  * Example:  
    Switch> enable  
  * Enter your password if prompted. |
| **Step 2** | configure terminal | Enters global configuration mode.  
  * Example:  
    Switch# configure terminal |
| **Step 3** | feature openflow | Enables Open Flow Agent support on the switch.  
  * Example:  
    Switch(config)# feature openflow |
| **Step 4** | openflow | Enables Open Flow Agent support on the switch.  
  * Example:  
    Switch(config)# openflow |
| **Step 5** | switch logical-switch-id pipeline logical-id | Specifies an ID for a logical switch that is used for OpenFlow switching and enters logical switch configuration mode.  
  * Example:  
    Switch(config-ofa-switch)# switch 1 pipeline 1  
  * The only logical switch ID supported is 1.  
  * Configures a pipeline.  
  * This step is mandatory for a logical switch configuration. The only pipeline ID supported is 1. |
<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> datapath-id <em>datapath-id</em></td>
<td>Configures a unique datapath ID for the switch. This step is mandatory for a logical switch configuration. Enter a 64-bit hexadecimal value.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> tls trust-point local <em>local-trust-point</em> remote <em>remote-trust-point</em></td>
<td>(Optional) Specifies the local and remote TLS trustpoints to be used for the controller connection.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> probe-interval <em>probe-interval</em></td>
<td>(Optional) Configures the interval (in seconds) at which the controller is probed. After the configured interval of time passes, if the switch has not received any messages from the controller, the switch sends an echo request (echo_request) to the controller. It should normally receive an echo reply (echo_reply). If no message is seen for the duration of another probe interval, the switch presumes that the controller is down and disconnects the controller connection. The switch tries to reconnect periodically. The default value is 5 seconds; the range is from 5 to 65535 seconds.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> rate-limit packet_in <em>controllet-packet-rate burst maximum-packets-to-controller</em></td>
<td>(Optional) Configures the maximum packet rate sent to the controller and the maximum packets burst sent to the controller in a second. The default value is zero, that is, an indefinite packet rate and packet burst is permitted. This rate limit is for OpenFlow. It is not related to the rate limit of the device (data plane) configured by COPP.</td>
<td></td>
</tr>
<tr>
<td>Step 15</td>
<td><strong>Command or Action</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>---------</td>
<td>---------------------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td><code>max-backoff backoff-timer</code></td>
<td>(Optional) Configures the duration (in seconds) for which the device must wait before attempting to initiate a connection with the controller. The device initially tries to initiate connection frequently, as the number of unsuccessful attempts increases, the device tries less frequently, that is, the waiting period between attempts also increases. The backoff timer configures the maximum period that the device waits in-between each retry. The default value is 8 seconds; the range is from 1 to 65535 seconds.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-ofa-switch)# max-backoff 8</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>logging flow-mod</code></td>
<td>(Optional) Enables logging of flow changes, including addition, deletion, and modification of flows. Logging of flow changes is a CPU intensive activity and should not be enabled for a large number of flows. Logging of flow changes is disabled by default. Flow changes are logged in syslog and can be viewed using the <code>show logging</code> command.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-ofa-switch)# logging flow-mod</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>statistics collection-interval interval</code></td>
<td>Configures the statistics collection interval (in seconds) for all configured flows of OpenFlow. Observe these guidelines:</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-ofa-switch)# statistics collection-interval 7</code></td>
<td>• The default interval value is 7 seconds.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The minimum interval is 7 seconds; the maximum is 82 seconds.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• You can also specify a value of 0, this disables statistics collection.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Flows with an idle timeout value less than 2 * interval are rejected.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Configured interval value is displayed in the output of the <code>show openflow switch 1</code> command.</td>
</tr>
<tr>
<td>Step 18</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-ofa-switch)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
### Monitoring OpenFlow

You can monitor OpenFlow parameters using the following commands:

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show openflow switch switch-id</code></td>
<td>Displays information related to OpenFlow on the logical switch.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id controllers [ stats ]</code></td>
<td>Displays information related to the connection status between an OpenFlow logical switch and connected Controllers.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id ports</code></td>
<td>Displays the mapping between physical device interfaces and ports of OpenFlow logical switch.</td>
</tr>
<tr>
<td><code>show openflow switch-id flows</code></td>
<td>Displays flows defined for the device by controllers.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id stats</code></td>
<td>Displays send and receive statistics for each port defined for an OpenFlow logical switch.</td>
</tr>
<tr>
<td>`show running-config</td>
<td>section openflow`</td>
</tr>
<tr>
<td><code>show openflow hardware capabilities</code></td>
<td>Displays OpenFlow hardware configurations.</td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for QoS

Before configuring standard QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. For example, is the traffic on your network bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.
QoS ACL Guidelines

Follow these guidelines when configuring QoS with access control lists (ACLs):

• It is not possible to match IP fragments against configured IP extended ACLs to enforce QoS. IP fragments are sent as best-effort. IP fragments are denoted by fields in the IP header.

• Only one ACL per class map and only one **match** class-map configuration command per class map are supported. The ACL can have multiple ACEs, which match fields against the contents of the packet.

• A trust statement in a policy map requires multiple hardware entries per ACL line. If an input service policy map contains a trust statement in an ACL, the access list might be too large to fit into the available QoS hardware memory, and an error can occur when you apply the policy map to a port. Whenever possible, you should minimize the number of lines is a QoS ACL.

Policing Guidelines

**Note**

To use policing, the switch must be running the LAN Base image.

• The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for system internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries.

You cannot reserve policers per port; there is no guarantee that a port will be assigned to any policer.

• Only one policer is applied to a packet on an ingress port. Only the average rate and committed burst parameters are configurable.

• On a port configured for QoS, all traffic received through the port is classified, policed, and marked according to the policy map attached to the port. On a trunk port configured for QoS, traffic in all VLANs received through the port is classified, policed, and marked according to the policy map attached to the port.

• If you have EtherChannel ports configured on your switch, you must configure QoS classification, policing, mapping, and queueing on the individual physical ports that comprise the EtherChannel. You must decide whether the QoS configuration should match on all ports in the EtherChannel.

• If you need to modify a policy map of an existing QoS policy, first remove the policy map from all interfaces, and then modify or copy the policy map. After you finish the modification, apply the modified policy map to the interfaces. If you do not first remove the policy map from all interfaces, high CPU usage can occur, which, in turn, can cause the console to pause for a very long time.

General QoS Guidelines

These are the general QoS guidelines:

• You configure QoS only on physical ports; there is no support for it at the VLAN level.

• Control traffic (such as spanning-tree bridge protocol data units [BPDUs] and routing update packets) received by the switch are subject to all ingress QoS processing.
• You are likely to lose data when you change queue settings; therefore, try to make changes when traffic is at a minimum.

• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

## Restrictions for QoS

The following are the restrictions for QoS:

• To use these features, the switch must be running the LAN Base image: stacking, DSCP, auto-QoS, trusted boundary, policing, marking, mapping tables, and weighted tail drop.

• Ingress queueing is not supported.

• The switch supports 4 default egress queues, with the option to enable an additional 4 egress queues for a total of 8. This option is only available on a standalone switch running the LAN Base image.

• We recommend that you do not enable 8 egress queues by using the `mls qos srr-queue output queues 8` command, when running the following features in your configuration:
  
  • Auto-QoS
  • Auto SmartPort
  • EnergyWise

Running these features with 8 egress queue enabled in a single configuration is not supported on the switch.

• You can configure QoS only on physical ports. VLAN-based QoS is not supported. You configure the QoS settings, such as classification, queueing, and scheduling, and apply the policy map to a port. When configuring QoS on a physical port, you apply a nonhierarchical policy map to a port.

• If the switch is running the LAN Lite image you can:
  
  • Configure ACLs, but you cannot attach them to physical interfaces. You can attach them to VLAN interfaces to filter traffic to the CPU.
  • Enable only cos trust at interface level.
  • Enable SRR shaping and sharing at interface level.
  • Enable Priority queueing at interface level.
  • Enable or disable `mls qos rewrite ip dscp`.

• The switch must be running the LAN Base image to use the following QoS features:
  
  • Policy maps
  • Policing and marking
  • Mapping tables
Information About QoS

QoS Implementation

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use congestion-management and congestion-avoidance techniques to provide preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

The QoS implementation is based on the Differentiated Services (Diff-Serv) architecture, a standard from the Internet Engineering Task Force (IETF). This architecture specifies that each packet is classified upon entry into the network.

The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (ToS) field to carry the classification (class) information. Classification can also be carried in the Layer 2 frame.
Figure 53: QoS Classification Layers in Frames and Packets

The special bits in the Layer 2 frame or a Layer 3 packet are shown in the following:

### Layer 2 Frame Prioritization Bits

Layer 2 ISL Frame
- **ISL header** (26 bytes)
- **Encapsulated frame** (24.5 KB)
- **FCS** (4 bytes)

The 3 bits used for CoS are shown in the figure.

Layer 2 802.1Q and 802.1p Frame
- **Preamble**
- **Start frame delimiter**
- **DA**
- **SA**
- **Tag**
- **PT**
- **Data**
- **FCS**

The 3 bits used for CoS (user priority) are shown in the figure.

### Layer 3 Packet Prioritization Bits

Layer 3 IPv4 Packet
- **Version**
- **ToS** (1 byte)
- **Len**
- **ID**
- **Offset**
- **TTL**
- **Proto**
- **FCS**
- **IP-SA**
- **IP-DA**
- **Data**

The IP precedence or DSCP is shown in the figure.

Layer 3 IPv6 Packet
- **Version**
- **Traffic class** (1 byte)
- **Flow label**
- **Payload length**
- **Next header**
- **Hop limit**
- **Source address**
- **Dest. address**

The IP precedence or DSCP is shown in the figure.

### Layer 2 Frame Prioritization Bits

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On ports configured as Layer 2 ISL trunks, all traffic is in ISL frames.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On ports configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

Other frame types cannot carry Layer 2 CoS values.

Layer 2 CoS values range from 0 for low priority to 7 for high priority.

### Layer 3 Packet Prioritization Bits

Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.

IP precedence values range from 0 to 7. DSCP values range from 0 to 63.
End-to-End QoS Solution Using Classification

All switches and routers that access the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to occur closer to the edge of the network, so that the core switches and routers are not overloaded with this task.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the Diff-Serv architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple task or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control that you need over incoming and outgoing traffic.

QoS Basic Model

To implement QoS, the switch must distinguish packets or flows from one another (classify), assign a label to indicate the given quality of service as the packets move through the switch, make the packets comply with the configured resource usage limits (police and mark), and provide different treatment (queue and schedule) in all situations where resource contention exists. The switch also needs to ensure that traffic sent from it meets a specific traffic profile (shape).

Figure 54: QoS Basic Wired Model

Actions at Ingress Port

Actions at the ingress port include classifying traffic, policing, marking, and scheduling:

- Classifying a distinct path for a packet by associating it with a QoS label. The switch maps the CoS or DSCP in the packet to a QoS label to distinguish one kind of traffic from another. The QoS label that is generated identifies all future QoS actions to be performed on this packet.

- Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.
• Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, marking down the QoS label in the packet, or dropping the packet).

Note
Queueing and scheduling are only supported at egress and not at ingress on the switch.

Actions at Egress Port

Actions at the egress port include queueing and scheduling:
• Queueing evaluates the QoS packet label and the corresponding DSCP or CoS value before selecting which of the four egress queues to use. Because congestion can occur when multiple ingress ports simultaneously send data to an egress port, WTD differentiates traffic classes and subjects the packets to different thresholds based on the QoS label. If the threshold is exceeded, the packet is dropped.
• Scheduling services the four egress queues based on their configured SRR shared or shaped weights. One of the queues (queue 1) can be the expedited queue, which is serviced until empty before the other queues are serviced.

Classification Overview

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled only if QoS is globally enabled on the switch. By default, QoS is globally disabled, so no classification occurs.

During classification, the switch performs a lookup and assigns a QoS label to the packet. The QoS label identifies all QoS actions to be performed on the packet and from which queue the packet is sent.

The QoS label is based on the DSCP or the CoS value in the packet and decides the queuing and scheduling actions to perform on the packet. The label is mapped according to the trust setting and the packet type as shown in the Classification Flowchart.

You specify which fields in the frame or packet that you want to use to classify incoming traffic.

Non-IP Traffic Classification

The following table describes the non-IP traffic classification options for your QoS configuration.

Table 59: Non-IP Traffic Classifications

<table>
<thead>
<tr>
<th>Non-IP Traffic Classification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trust the CoS value</td>
<td>Trust the CoS value in the incoming frame (configure the port to trust CoS), and then use the configurable CoS-to-DSCP map to generate a DSCP value for the packet. Layer 2 ISL frame headers carry the CoS value in the 3 least-significant bits of the 1-byte User field. Layer 2 802.1Q frame headers carry the CoS value in the 3 most-significant bits of the Tag Control Information field. CoS values range from 0 for low priority to 7 for high priority.</td>
</tr>
</tbody>
</table>
IP Traffic Classification

The following table describes the IP traffic classification options for your QoS configuration.

Table 60: IP Traffic Classifications

<table>
<thead>
<tr>
<th>IP Traffic Classification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trust the DSCP value</td>
<td>Trust the DSCP value in the incoming packet (configure the port to trust DSCP), and assign the same DSCP value to the packet. The IETF defines the 6 most-significant bits of the 1-byte ToS field as the DSCP. The priority represented by a particular DSCP value is configurable. DSCP values range from 0 to 63. You can also classify IP traffic based on IPv6 DSCP. For ports that are on the boundary between two QoS administrative domains, you can modify the DSCP to another value by using the configurable DSCP-to-DSCP-mutation map.</td>
</tr>
<tr>
<td>Trust the IP precedence value</td>
<td>Trust the IP precedence value in the incoming packet (configure the port to trust IP precedence), and generate a DSCP value for the packet by using the configurable IP-precedence-to-DSCP map. The IP Version 4 specification defines the 3 most-significant bits of the 1-byte ToS field as the IP precedence. IP precedence values range from 0 for low priority to 7 for high priority. You can also classify IP traffic based on IPv6 precedence.</td>
</tr>
<tr>
<td>Trust the CoS value</td>
<td>Trust the CoS value (if present) in the incoming packet, and generate a DSCP value for the packet by using the CoS-to-DSCP map. If the CoS value is not present, use the default port CoS value.</td>
</tr>
<tr>
<td><strong>IP Traffic Classification</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>IP standard or an extended ACL</td>
<td>Perform the classification based on a configured IP standard or an extended ACL, which examines various fields in the IP header. If no ACL is configured, the packet is assigned 0 as the DSCP and CoS values, which means best-effort traffic. Otherwise, the policy-map action specifies a DSCP or CoS value to assign to the incoming frame.</td>
</tr>
<tr>
<td>Override configured CoS</td>
<td>Override the configured CoS of incoming packets, and apply the default port CoS value to them. For IPv6 packets, the DSCP value is rewritten by using the CoS-to-DSCP map and by using the default CoS of the port. You can do this for both IPv4 and IPv6 traffic.</td>
</tr>
</tbody>
</table>

After classification, the packet is sent to the policing and marking stages.
Access Control Lists

You can use IP standard, IP extended, or Layer 2 MAC ACLs to define a group of packets with the same characteristics (class). You can also classify IP traffic based on IPv6 ACLs.

In the QoS context, the permit and deny actions in the access control entries (ACEs) have different meanings from security ACLs:
• If a match with a permit action is encountered (first-match principle), the specified QoS-related action is taken.

• If a match with a deny action is encountered, the ACL being processed is skipped, and the next ACL is processed.

• If no match with a permit action is encountered and all the ACEs have been examined, no QoS processing occurs on the packet, and the switch offers best-effort service to the packet.

• If multiple ACLs are configured on a port, the lookup stops after the packet matches the first ACL with a permit action, and QoS processing begins.

Note  When creating an access list, note that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

After a traffic class has been defined with the ACL, you can attach a policy to it. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate-limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the `access-list` global configuration command; you implement Layer 2 MAC ACLs to classify non-IP traffic by using the `mac access-list extended` global configuration command.

Classification Based on Class Maps and Policy Maps

To use policy maps, the switch must be running the LAN Base image.

A class map is a mechanism that you use to name a specific traffic flow (or class) and to isolate it from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it. The criteria can include matching the access group defined by the ACL or matching a specific list of DSCP or IP precedence values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you further classify it through the use of a policy map.

A policy map specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; or specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile. Before a policy map can be effective, you must attach it to a port.

You create a class map by using the `class-map` global configuration command or the `class` policy-map configuration command. You should use the `class-map` command when the map is shared among many ports. When you enter the `class-map` command, the switch enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the `match` class-map configuration command.

You can configure a default class by using the `class class-default` policy-map configuration command. Unclassified traffic (traffic specified in the other traffic classes configured on the policy-map) is treated as default traffic.

You create and name a policy map by using the `policy-map` global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the `class`, `trust`, or `set` policy-map configuration and policy-map class configuration commands.
Policing and Marking Overview

After a packet is classified and has a DSCP-based or CoS-based QoS label assigned to it, the policing and marking process can begin.

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are out of profile or nonconforming. Each policer decides on a packet-by-packet basis whether the packet is in or out of profile and specifies the actions on the packet. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or modifying (marking down) the assigned DSCP of the packet and allowing the packet to pass through. The configurable policed-DSCP map provides the packet with a new DSCP-based QoS label. Marked-down packets use the same queues as the original QoS label to prevent packets in a flow from getting out of order.

All traffic, regardless of whether it is bridged or routed, is subjected to a policer, if one is configured. As a result, bridged packets might be dropped or might have their DSCP or CoS fields modified when they are policed and marked.

You can configure policing on a physical port. After you configure the policy map and policing actions, attach the policy to a port by using the service-policy interface configuration command.

Physical Port Policing

In policy maps on physical ports, you can create the following types of policers:

- Individual—QoS applies the bandwidth limits specified in the policer separately to each matched traffic class. You configure this type of policer within a policy map by using the police policy-map class configuration command.

- Aggregate—QoS applies the bandwidth limits specified in an aggregate policer cumulatively to all matched traffic flows. You configure this type of policer by specifying the aggregate policer name within a policy map by using the police aggregate policy-map class configuration command. You specify the bandwidth limits of the policer by using the mls qos aggregate-policer global configuration command. In this way, the aggregate policer is shared by multiple classes of traffic within a policy map.

Policing uses a token-bucket algorithm. As each frame is received by the switch, a token is added to the bucket. The bucket has a hole in it and leaks at a rate that you specify as the average traffic rate in bits per second. Each time a token is added to the bucket, the switch verifies that there is enough room in the bucket. If there is not enough room, the packet is marked as nonconforming, and the specified policer action is taken (dropped or marked down).

How quickly the bucket fills is a function of the bucket depth (burst-byte), the rate at which the tokens are removed (rate-bps), and the duration of the burst above the average rate. The size of the bucket imposes an upper limit on the burst length and limits the number of frames that can be transmitted back-to-back. If the burst is short, the bucket does not overflow, and no action is taken against the traffic flow. However, if a burst is long and at a higher rate, the bucket overflows, and the policing actions are taken against the frames in that burst.
You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the burst-byte option of the `police` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the `rate-bps` option of the `police` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command.

*Figure 56: Policing and Marking Flowchart on Physical Ports*

**Mapping Tables Overview**

During QoS processing, the switch represents the priority of all traffic (including non-IP traffic) with a QoS label based on the DSCP or CoS value from the classification stage.
The following table describes QoS processing and mapping tables.

### QoS Processing and Mapping Tables

<table>
<thead>
<tr>
<th>QoS Processing Stage</th>
<th>Mapping Table Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Classification</strong></td>
<td>During the classification stage, QoS uses configurable mapping tables to derive a corresponding DSCP or CoS value from a received CoS, DSCP, or IP precedence value. These maps include the CoS-to-DSCP map and the IP-precedence-to-DSCP map. You configure these maps by using the <code>mls qos map cos-dscp</code> and the <code>mls qos map ip-prec-dscp</code> global configuration commands. On an ingress port configured in the DSCP-trusted state, if the DSCP values are different between the QoS domains, you can apply the configurable DSCP-to-DSCP-mutation map to the port that is on the boundary between the two QoS domains. You configure this map by using the <code>mls qos map dscp-mutation</code> global configuration command.</td>
</tr>
<tr>
<td><strong>Policing</strong></td>
<td>During policing stage, QoS can assign another DSCP value to an IP or a non-IP packet (if the packet is out of profile and the policer specifies a marked-down value). This configurable map is called the policed-DSCP map. You configure this map by using the <code>mls qos map policed-dscp</code> global configuration command.</td>
</tr>
<tr>
<td><strong>Pre-scheduling</strong></td>
<td>Before the traffic reaches the scheduling stage, QoS stores the packet in an egress queue according to the QoS label. The QoS label is based on the DSCP or the CoS value in the packet and selects the queue through the DSCP output queue threshold maps or through the CoS output queue threshold maps. In addition to an egress queue, the QOS label also identifies the WTD threshold value. You configure these maps by using the <code>mls qos srr-queue { output } dscp-map</code> and the <code>mls qos srr-queue { output } cos-map</code> global configuration commands.</td>
</tr>
</tbody>
</table>

The CoS-to-DSCP, DSCP-to-CoS, and the IP-precedence-to-DSCP maps have default values that might or might not be appropriate for your network.

The default DSCP-to-DSCP-mutation map and the default policed-DSCP map are null maps; they map an incoming DSCP value to the same DSCP value. The DSCP-to-DSCP-mutation map is the only map you apply to a specific port. All other maps apply to the entire switch.

### Queueing and Scheduling Overview

The switch has queues at specific points to help prevent congestion.
The switch supports 4 egress queues by default and there is an option to enable a total of 8 egress queues. The 8 egress queue configuration is only supported on a standalone switch.

Weighted Tail Drop

Egress queues use an enhanced version of the tail-drop congestion-avoidance mechanism called weighted tail drop (WTD). WTD is implemented on queues to manage the queue lengths and to provide drop precedences for different traffic classifications.

As a frame is enqueued to a particular queue, WTD uses the frame’s assigned QoS label to subject it to different thresholds. If the threshold is exceeded for that QoS label (the space available in the destination queue is less than the size of the frame), the switch drops the frame.

Each queue has three threshold values. The QoS label determines which of the three threshold values is subjected to the frame. Of the three thresholds, two are configurable (explicit) and one is not (implicit).

Figure 58: WTD and Queue Operation

The following figure shows an example of WTD operating on a queue whose size is 1000 frames. Three drop percentages are configured: 40 percent (400 frames), 60 percent (600 frames), and 100 percent (1000 frames). These percentages indicate that up to 400 frames can be queued at the 40-percent threshold, up to 600 frames at the 60-percent threshold, and up to 1000 frames at the 100-percent threshold.

In the example, CoS values 6 and 7 have a greater importance than the other CoS values, and they are assigned to the 100-percent drop threshold (queue-full state). CoS values 4 and 5 are assigned to the 60-percent threshold, and CoS values 0 to 3 are assigned to the 40-percent threshold.
Suppose the queue is already filled with 600 frames, and a new frame arrives. It contains CoS values 4 and 5 and is subjected to the 60-percent threshold. If this frame is added to the queue, the threshold will be exceeded, so the switch drops it.

**SRR Shaping and Sharing**

Egress queues are serviced by shaped round robin (SRR), which controls the rate at which packets are sent. On the egress queues, SRR sends packets to the egress port.

You can configure SRR on egress queues for sharing or for shaping.

In shaped mode, the egress queues are guaranteed a percentage of the bandwidth, and they are rate-limited to that amount. Shaped traffic does not use more than the allocated bandwidth even if the link is idle. Shaping provides a more even flow of traffic over time and reduces the peaks and valleys of bursty traffic. With shaping, the absolute value of each weight is used to compute the bandwidth available for the queues.

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue is empty and no longer requires a share of the link, the remaining queues can expand into the unused bandwidth and share it among them. With sharing, the ratio of the weights controls the frequency of dequeuing; the absolute values are meaningless. Shaping and sharing is configured per interface. Each interface can be uniquely configured.

**Queueing and Scheduling on Ingress Queues**

*Figure 59: Queueing and Scheduling Flowchart for Ingress Ports on Catalyst 3750-E and 3750-X Switches*

The following figure shows queueing and scheduling flowcharts for ingress ports on Catalyst 3750-E and...
The following figure shows queueing and scheduling flowcharts for ingress ports on Catalyst 3560-E and 3560-X switches.

Figure 60: Queueing and Scheduling Flowchart for Ingress Ports on Catalyst 3560-E and 3560-X Switches

- **Start**
  - Read QoS label (DSCP or CoS value).
  - Determine ingress queue number, buffer allocation, and WTD thresholds.
  - Are thresholds being exceeded? (Yes/No)
  - Queue the packet. Service the queue according to the SRR weights.
  - Send packet to the internal ring.
  - Drop packet.

---

**Note**

SRR services the priority queue for its configured share before servicing the other queue.

**Configurable Ingress Queue Types**

The switch supports two configurable ingress queue types, which are serviced by SRR in shared mode only.

---

**Note**

The switch also uses two nonconfigurable queues for traffic that are essential for proper network and stack operation.
The following table describes the two configurable ingress queues.

**Table 62: Configurable Ingress Queue Types**

<table>
<thead>
<tr>
<th>Queue Type</th>
<th>Function</th>
</tr>
</thead>
</table>
| Normal     | User traffic that is considered to be normal priority. You can configure three different thresholds to differentiate among the flows. Use the following global configuration commands:  
  - `mls qos srr-queue input threshold`  
  - `mls qos srr-queue input dscp-map`  
  - `mls qos srr-queue input cos-map` |
| Expedite   | High-priority user traffic such as differentiated services (DF) expedited forwarding or voice traffic. You can configure the bandwidth required for this traffic as a percentage of the total traffic or total stack traffic on the switches by using the `mls qos srr-queue input priority-queue` global configuration command. The expedite queue has guaranteed bandwidth. |

You assign each packet that flows through the switch to a queue and to a threshold. Specifically, you map DSCP or CoS values to an ingress queue and map DSCP or CoS values to a threshold ID. You use the `mls qos srr-queue input dscp-map queue queue-id {dscp1...dscp8 | threshold threshold-id dscp1...dscp8}` or the `mls qos srr-queue input cos-map queue queue-id {cos1...cos8 | threshold threshold-id cos1...cos8}` global configuration command. You can display the DSCP input queue threshold map and the CoS input queue threshold map by using the `show mls qos maps privileged` EXEC command.

**WTD Thresholds**

The queues use WTD to support distinct drop percentages for different traffic classes. Each queue has three drop thresholds: two configurable (explicit) WTD thresholds and one nonconfigurable (implicit) threshold preset to the queue-full state.

You assign the two explicit WTD threshold percentages for threshold ID 1 and ID 2 to the ingress queues by using the `mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2` global configuration command. Each threshold value is a percentage of the total number of allocated buffers for the queue. The drop threshold for threshold ID 3 is preset to the queue-full state, and you cannot modify it.

**Buffer and Bandwidth Allocation**

You define the ratio (allocate the amount of space) with which to divide the ingress buffers between the two queues (normal and expedite) by using the `mls qos srr-queue input bandwidth weight1 weight2` global configuration command. The buffer allocation together with the bandwidth allocation control how much data can be buffered and sent before packets are dropped. You allocate bandwidth as a percentage by using the `mls qos srr-queue input bandwidth weight1 weight2` global configuration command. The ratio of the weights is the ratio of the frequency in which the SRR scheduler sends packets from each queue.
Priority Queueing

You can configure one ingress queue as the priority queue by using the `mls qos srr-queue input priority-queue queue-id bandwidth weight` global configuration command. The priority queue should be used for traffic (such as voice) that requires guaranteed delivery because this queue is guaranteed part of the bandwidth regardless of the load on the stack or internal ring.

SRR services the priority queue for its configured weight as specified by the `bandwidth` keyword in the `mls qos srr-queue input priority-queue queue-id bandwidth weight` global configuration command. Then, SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the `mls qos srr-queue input bandwidth weight1 weight2` global configuration command.

You can combine the above commands to prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues, by allocating a large queue size or by servicing the queue more frequently, and by adjusting queue thresholds so that packets with lower priorities are dropped.

Queueing and Scheduling on Egress Queues

The following figure shows queueing and scheduling flowcharts for egress ports on the switch.
If the expedite queue is enabled, SRR services it until it is empty before servicing the other three queues.

**Egress Expedite Queue**

Each port supports four egress queues, one of which (queue 1) can be the egress expedite queue. These queues are assigned to a queue-set. All traffic exiting the switch flows through one of these four queues and is subjected to a threshold based on the QoS label assigned to the packet.
If the expedite queue is enabled, SRR services it until it is empty before servicing the other three queues.

**Egress Queue Buffer Allocation**

The following figure shows the egress queue buffer.

*Figure 62: Egress Queue Buffer Allocation*

The buffer space is divided between the common pool and the reserved pool. The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to control whether to grant buffer space to a requesting queue. The switch detects whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

**Buffer and Memory Allocation**

You guarantee the availability of buffers, set drop thresholds, and configure the maximum memory allocation for a queue-set by using the `mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold` global configuration command. Each threshold value is a percentage of the queue’s allocated memory, which you specify by using the `mls qos queue-set output qset-id buffers allocation1 ... allocation4` global configuration command. The sum of all the allocated buffers represents the reserved pool, and the remaining buffers are part of the common pool.

Through buffer allocation, you can ensure that high-priority traffic is buffered. For example, if the buffer space is 400, you can allocate 70 percent of it to queue 1 and 10 percent to queues 2 through 4. Queue 1 then has 280 buffers allocated to it, and queues 2 through 4 each have 40 buffers allocated to them.

You can guarantee that the allocated buffers are reserved for a specific queue in a queue-set. For example, if there are 100 buffers for a queue, you can reserve 50 percent (50 buffers). The switch returns the remaining 50 buffers to the common pool. You also can enable a queue in the full condition to obtain more buffers than are reserved for it by setting a maximum threshold. The switch can allocate the needed buffers from the common pool if the common pool is not empty.
The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos srr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds and buffers for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

**Queues and WTD Thresholds**

You can assign each packet that flows through the switch to a queue and to a threshold. Specifically, you map DSCP or CoS values to an egress queue and map DSCP or CoS values to a threshold ID. You use the `mls qos srr-queue output dscp-map queue queue-id {dscp1...dscp8 | threshold threshold-id dscp1...dscp8}` or the `mls qos srr-queue output cos-map queue queue-id {cos1...cos8 | threshold threshold-id cos1...cos8}` global configuration command. You can display the DSCP output queue threshold map and the CoS output queue threshold map by using the `show mls qos maps` privileged EXEC command.

The queues use WTD to support distinct drop percentages for different traffic classes. Each queue has three drop thresholds: two configurable (explicit) WTD thresholds and one nonconfigurable (implicit) threshold preset to the queue-full state. You assign the two WTD threshold percentages for threshold ID 1 and ID 2. The drop threshold for threshold ID 3 is preset to the queue-full state, and you cannot modify it. You map a port to queue-set by using the `queue-set qset-id` interface configuration command. Modify the queue-set configuration to change the WTD threshold percentages.

**Shaped or Shared Mode**

SRR services each queue-set in shared or shaped mode. You map a port to a queue-set by using the `queue-set qset-id` interface configuration command. You assign shared or shaped weights to the port by using the `srr-queue bandwidth share weight1 weight2 weight3 weight4` or the `srr-queue bandwidth shape weight1 weight2 weight3 weight4` interface configuration command.

The buffer allocation together with the SRR weight ratios control how much data can be buffered and sent before packets are dropped. The weight ratio is the ratio of the frequency in which the SRR scheduler sends packets from each queue.

All four queues participate in the SRR unless the expedite queue is enabled, in which case the first bandwidth weight is ignored and is not used in the ratio calculation. The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced. You enable the expedite queue by using the `priority-queue out` interface configuration command.

You can combine the commands described in this section to prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues, by allocating a large queue size or by servicing the queue more frequently, and by adjusting queue thresholds so that packets with lower priorities are dropped.
The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos sr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds, buffers, bandwidth share weights, and bandwidth shape weights for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

Packet Modification

A packet is classified, policed, and queued to provide QoS. The following packet modifications can occur during the process to provide QoS:

- For IP and non-IP packets, classification involves assigning a QoS label to a packet based on the DSCP or CoS of the received packet. However, the packet is not modified at this stage; only an indication of the assigned DSCP or CoS value is carried along.

- During policing, IP and non-IP packets can have another DSCP assigned to them (if they are out of profile and the policer specifies a markdown DSCP). Once again, the DSCP in the packet is not modified, but an indication of the marked-down value is carried along. For IP packets, the packet modification occurs at a later stage; for non-IP packets the DSCP is converted to CoS and used for queueing and scheduling decisions.

- Depending on the QoS label assigned to a frame and the mutation chosen, the DSCP and CoS values of the frame are rewritten. If you do not configure a table map and if you configure the port to trust the DSCP of the incoming frame, the DSCP value in the frame is not changed, but the CoS is rewritten according to the DSCP-to-CoS map. If you configure the port to trust the CoS of the incoming frame and it is an IP packet, the CoS value in the frame is not changed, but the DSCP might be changed according to the CoS-to-DSCP map.

  The input mutation causes the DSCP to be rewritten depending on the new value of DSCP chosen. The set action in a policy map also causes the DSCP to be rewritten.

Standard QoS Default Configuration

Standard QoS is disabled by default.

When QoS is disabled, there is no concept of trusted or untrusted ports because the packets are not modified. The CoS, DSCP, and IP precedence values in the packet are not changed.

Traffic is switched in pass-through mode. The packets are switched without any rewrites and classified as best effort without any policing.

When QoS is enabled using the `mls qos` global configuration command and all other QoS settings are at their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted.
Default Ingress Queue Configuration

The following tables describe the default ingress queue configurations.

The following table shows the default ingress queue configuration when QoS is enabled. For the bandwidth allocation feature, bandwidth is equally shared between the queues. SRR sends packets in shared mode only. Queue 2 is the priority queue. SRR services the priority queue for its configured share before servicing the other queue.

Default Egress Queue Configuration

The following tables describe the default egress queue configurations.
The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos srr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds and buffers for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

The following table shows the default egress queue configuration for each queue-set when QoS is enabled. All ports are mapped to queue-set 1. The port bandwidth limit is set to 100 percent and rate unlimited. Note that for the SRR shaped weights (absolute) feature, a shaped weight of zero indicates that the queue is operating in shared mode. Note that for the SRR shared weights feature, one quarter of the bandwidth is allocated to each queue.

**Default Mapping Table Configuration**

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value (no markdown).
DSCP Maps

Default CoS-to-DSCP Map

When DSCP transparency mode is disabled, the DSCP values are derived from CoS as per the following table. If these values are not appropriate for your network, you need to modify them.

Note: The DSCP transparency mode is disabled by default. If it is enabled (no mls qos rewrite ip dscp interface configuration command), DSCP rewrite will not happen.

Table 72: Default CoS-to-DSCP Map

<table>
<thead>
<tr>
<th>CoS Value</th>

Default IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic. The following table shows the default IP-precedence-to-DSCP map. If these values are not appropriate for your network, you need to modify them.

**How to Configure QoS**

**Enabling QoS Globally**

By default, QoS is disabled on the switch.

The following procedure to enable QoS globally is required.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 mls qos</td>
<td>Enables QoS globally.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Enabling VLAN-Based QoS on Physical Ports

By default, VLAN-based QoS is disabled on all physical switch ports. You can enable VLAN-based QoS on a switch port.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the physical port, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> mls qos vlan-based</td>
<td>Enables VLAN-based QoS on the port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config-if)# mls qos vlan-based</code></td>
<td><strong>Note</strong> Use the <code>no mls qos vlan-based</code> interface configuration command to disable VLAN-based QoS on the physical port.</td>
</tr>
</tbody>
</table>

#### Step 4

**Example:**

```
switch(config-if)# end
```

- Returns to privileged EXEC mode.

#### Step 5

**Example:**

```
switch# show mls qos interface
gigabitetherent 1/0/1
```

- Verifies if VLAN-based QoS is enabled on the physical port.

#### Step 6

**Example:**

```
switch# copy running-config startup-config
```

- (Optional) Saves your entries in the configuration file.

---

## Configuring Classification Using Port Trust States

These sections describe how to classify incoming traffic by using port trust states.

### Configuring the Trust State on Ports Within the QoS Domain

Packets entering a QoS domain are classified at the edge of the QoS domain. When the packets are classified at the edge, the switch port within the QoS domain can be configured to one of the trusted states because there is no need to classify the packets at every switch within the QoS domain.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;code&gt;Switch# configure terminal&lt;/code&gt;</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;code&gt;Switch(config)# interface gigabitethernet 1/0/2&lt;/code&gt;</td>
<td>Specifies the port to be trusted, and enters interface configuration mode. Valid interfaces are physical ports.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>**mls qos trust [cos</td>
<td>dscp</td>
</tr>
</tbody>
</table>

</tbody>
</table>

(Optional) Saves your entries in the configuration file.

---

**Configuring the CoS Value for an Interface**

QoS assigns the CoS value specified with the **mls qos cos** interface configuration command to untagged frames received on trusted and untrusted ports.
Beginning in privileged EXEC mode, follow these steps to define the default CoS value of a port or to assign the default CoS to all incoming packets on the port.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>interface interface-id</code></td>
<td>Specifies the port to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>interface gigabitethernet 1/1/1</code></td>
<td>Valid interfaces include physical ports.</td>
</tr>
<tr>
<td>3</td>
<td>`mls qos cos {default-cos</td>
<td>override}`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config-if)# <code>mls qos cos override</code></td>
<td></td>
</tr>
</tbody>
</table>

- For `default-cos`, specify a default CoS value to be assigned to a port. If the packet is untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7. The default is 0.

- Use the `override` keyword to override the previously configured trust state of the incoming packet and to apply the default port CoS value to the port on all incoming packets. By default, CoS override is disabled.

Use the `override` keyword when all incoming packets on specified ports deserve higher or lower priority than packets entering from other ports. Even if a port was previously set to trust DSCP, CoS, or IP precedence, this command overrides the previously configured trust state, and all the incoming CoS values are assigned the default CoS value configured with this command. If an incoming packet is tagged, the CoS value of the packet is modified with the default CoS of the port at the ingress port.

**Note** To return to the default setting, use the `no mls qos cos {default-cos | override}` interface configuration command.
### Configuring a Trusted Boundary to Ensure Port Security

In a typical network, you connect a Cisco IP Phone to a switch port and cascade devices that generate data packets from the back of the telephone. The Cisco IP Phone guarantees the voice quality through a shared data link by marking the CoS level of the voice packets as high priority (CoS = 5) and by marking the data packets as low priority (CoS = 0). Traffic sent from the telephone to the switch is typically marked with a tag that uses the 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which is the priority of the packet.

For most Cisco IP Phone configurations, the traffic sent from the telephone to the switch should be trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the `mls qos trust cos` interface configuration command, you configure the switch port to which the telephone is connected to trust the CoS labels of all traffic received on that port. Use the `mls qos trust dscp` interface configuration command to configure a routed port to which the telephone is connected to trust the DSCP labels of all traffic received on that port.

With the trusted setting, you also can use the trusted boundary feature to prevent misuse of a high-priority queue if a user bypasses the telephone and connects the PC directly to the switch. Without trusted boundary, the CoS labels generated by the PC are trusted by the switch (because of the trusted CoS setting). By contrast, trusted boundary uses CDP to detect the presence of a Cisco IP Phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port. If the telephone is not detected, the trusted boundary feature disables the trusted setting on the switch port and prevents misuse of a high-priority queue. Note that the trusted boundary feature is not effective if the PC and Cisco IP Phone are connected to a hub that is connected to the switch.

In some situations, you can prevent a PC connected to the Cisco IP Phone from taking advantage of a high-priority data queue. You can use the `switchport priority extend cos` interface configuration command to configure the telephone through the switch CLI to override the priority of the traffic received from the PC.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables CDP globally. By default, CDP is enabled.</td>
</tr>
<tr>
<td><code>cdp run</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# cdp run</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the port connected to the Cisco IP Phone, and enters interface configuration mode. Valid interfaces include physical ports.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# interface gigabitethernet 2/1/1</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables CDP on the port. By default, CDP is enabled.</td>
</tr>
<tr>
<td><code>cdp enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# cdp enable</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Configures the switch port to trust the CoS value in traffic received from the Cisco IP Phone. Or Configures the routed port to trust the DSCP value in traffic received from the Cisco IP Phone. By default, the port is not trusted.</td>
</tr>
<tr>
<td>Use one of the following:</td>
<td></td>
</tr>
<tr>
<td>• <code>mls qos trust cos</code></td>
<td></td>
</tr>
<tr>
<td>• <code>mls qos trust dscp</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# mls qos trust cos</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Specifies that the Cisco IP Phone is a trusted device. You cannot enable both trusted boundary and auto-QoS (auto qos voip interface configuration command) at the same time; they are mutually exclusive.</td>
</tr>
<tr>
<td><code>mls qos trust device cisco-phone</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# mls qos trust device cisco-phone</td>
</tr>
</tbody>
</table>

**Note** To disable the trusted boundary feature, use the `no mls qos trust device` interface configuration command.
Enabling DSCP Transparency Mode

The switch supports the DSCP transparency feature. It affects only the DSCP field of a packet at egress. By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

If DSCP transparency is enabled by using the `no mls qos rewrite ip dscp` command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet, which the switch uses to generate a class of service (CoS) value that represents the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables QoS globally.</td>
</tr>
<tr>
<td><code>mls qos</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# mls qos</code></td>
<td></td>
</tr>
</tbody>
</table>
DSCP Transparency Mode

To configure the switch to modify the DSCP value based on the trust setting or on an ACL by disabling DSCP transparency, use the `mls qos rewrite ip dscp` global configuration command.

If you disable QoS by using the `no mls qos` global configuration command, the CoS and DSCP values are not changed (the default QoS setting).

If you enter the `no mls qos rewrite ip dscp` global configuration command to enable DSCP transparency and then enter the `mls qos trust [cos | dscp]` interface configuration command, DSCP transparency is still enabled.

Configuring the DSCP Trust State on a Port Bordering Another QoS Domain

If you are administering two separate QoS domains between which you want to implement QoS features for IP traffic, you can configure the switch ports bordering the domains to a DSCP-trusted state. The receiving port accepts the DSCP-trusted value and avoids the classification stage of QoS. If the two domains use different DSCP values, you can configure the DSCP-to-DSCP-mutation map to translate a set of DSCP values to match the definition in the other domain.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><strong>configure terminal</strong>&lt;br&gt;Example:&lt;br&gt;Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>mls qos map dscp-mutation</strong>&lt;br&gt;<em>dscp-mutation-name in-dscp to out-dscp</em>&lt;br&gt;Example:&lt;br&gt;Switch(config)# mls qos map dscp-mutation gigabitethernet1/0/2-mutation 10 11 12 13 to 30</td>
<td>Modifies the DSCP-to-DSCP-mutation map. The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>interface interface-id</strong>&lt;br&gt;Example:&lt;br&gt;Switch(config)# interface</td>
<td>Specifies the port to be trusted, and enter interface configuration mode. Valid interfaces include physical ports.</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to configure the DSCP-trusted state on a port and modify the DSCP-to-DSCP-mutation map. To ensure a consistent mapping strategy across both QoS domains, you must perform this procedure on the ports in both domains.

![Figure 64: DSCP-Trusted State on a Port Bordering Another QoS Domain](image)
### Purpose of Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>gigabitethernet1/0/2</td>
<td>Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted.</td>
</tr>
</tbody>
</table>

#### Step 4

**mls qos trust dscp**

**Example:**

```
Switch(config-if)# mls qos trust dscp
```

**Purpose:** Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted.

**Note:** To return a port to its non-trusted state, use the `no mls qos trust` interface configuration command.

#### Step 5

**mls qos dscp-mutation dscp-mutation-name**

**Example:**

```
Switch(config-if)# mls qos dscp-mutation
gigabitethernet1/0/2-mutation
```

**Purpose:** Applies the map to the specified ingress DSCP-trusted port.

**Example:**

```
Step 5  mls qos dscp-mutation dscp-mutation-name

Example:

Switch(config-if)# mls qos dscp-mutation
gigabitethernet1/0/2-mutation
```

**Purpose:** Applies the map to the specified ingress DSCP-trusted port.

For `dscp-mutation-name`, specify the mutation map name created in Step 2.

You can configure multiple DSCP-to-DSCP-mutation maps on an ingress port.

**Note:** To return to the default DSCP-to-DSCP-mutation map values, use the `no mls qos map dscp-mutation dscp-mutation-name` global configuration command.

#### Step 6

**end**

**Example:**

```
Switch(config-if)# end
```

**Purpose:** Returns to privileged EXEC mode.

#### Step 7

**show mls qos maps dscp-mutation**

**Example:**

```
Switch# show mls qos maps dscp-mutation
```

**Purpose:** Verifies your entries.

#### Step 8

**copy running-config startup-config**

**Example:**

```
Switch# copy running-config startup-config
```

**Purpose:** (Optional) Saves your entries in the configuration file.

**Note:** To return a port to its non-trusted state, use the `no mls qos trust interface` configuration command.
To return to the default DSCP-to-DSCP-mutation map values, use the `no mls qos map dscp-mutation dscp-mutation-name` global configuration command.
Configuring a QoS Policy

Configuring a QoS policy typically requires the following tasks:

- Classifying traffic into classes
- Configuring policies applied to those traffic classes
- Attaching policies to ports

These sections describe how to classify, police, and mark traffic. Depending on your network configuration, you must perform one or more of the modules in this section.

Classifying Traffic by Using ACLs

You can classify IP traffic by using IPv4 standard ACLs, IPv4 extended ACLs, or IPv6 ACLs.
You can classify non-IP traffic by using Layer 2 MAC ACLs.

Creating an IP Standard ACL for IPv4 Traffic

Before you begin

Before you perform this task, determine which access lists you will be using for your QoS configuration.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# access-list 1 permit 192.2.255.0 1.1.1.255</td>
<td></td>
</tr>
</tbody>
</table>

- For `access-list-number`, enter the access list number. The range is 1 to 99 and 1300 to 1999.
- Use the `permit` keyword to permit a certain type of traffic if the conditions are matched. Use the `deny` keyword to deny a certain type of traffic if conditions are matched.
- For `source`, enter the network or host from which the packet is being sent. You can use the `any` keyword as an abbreviation for 0.0.0.0 255.255.255.255.
- (Optional) For `source-wildcard`, enter the wildcard bits in dotted decimal notation to
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>be applied to the source. Place ones in the bit positions that you want to ignore.</td>
<td></td>
</tr>
<tr>
<td>When you create an access list, remember that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> To delete an access list, use the <code>no access-list access-list-number</code> global configuration command.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 3

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# end
```

### Step 4

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show access-lists</code></td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# show access-lists
```

### Step 5

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# copy running-config startup-config
```

---

### Creating an IP Extended ACL for IPv4 Traffic

**Before you begin**

Before you perform this task, determine which access lists you will be using for your QoS configuration.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# configure terminal
```

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} protocol source source-wildcard destination destination-wildcard`</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# access-list 5 permit tcp 10.1.1.0 0.0.0.255 20.20.20.20 0.0.0.0
```

---
### Command or Action

**Example:**

Switch(config)# access-list 100 permit ip any any dscp 32

- For `access-list-number`, enter the access list number. The range is 100 to 199 and 2000 to 2699.
- Use the `permit` keyword to permit a certain type of traffic if the conditions are matched. Use the `deny` keyword to deny a certain type of traffic if conditions are matched.
- For `protocol`, enter the name or number of an IP protocol. Use the question mark (?) to see a list of available protocol keywords.
- For `source`, enter the network or host from which the packet is being sent. You specify this by using dotted decimal notation, by using the `any` keyword as an abbreviation for `source 0.0.0.0 source-wildcard 255.255.255.255`, or by using the `host` keyword for `source 0.0.0.0`.
- For `source-wildcard`, enter the wildcard bits by placing ones in the bit positions that you want to ignore. You specify the wildcard by using dotted decimal notation, by using the `any` keyword as an abbreviation for `source 0.0.0.0 source-wildcard 255.255.255.255`, or by using the `host` keyword for `source 0.0.0.0`.
- For `destination`, enter the network or host to which the packet is being sent. You have the same options for specifying the `destination` and `destination-wildcard` as those described by `source` and `source-wildcard`.

When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

**Note** To delete an access list, use the `no access-list access-list-number` global configuration command.

### Creating an IPv6 ACL for IPv6 Traffic

#### Before you begin

Before you perform this task, determine which access lists you will be using for your QoS configuration.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ipv6 access-list access-list-name</td>
<td>Creates an IPv6 ACL and enters IPv6 access-list configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ipv6 access-list ipv6_Name_ACL</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> {deny</td>
<td>permit} protocol {source-ipv6-prefix/prefix-length</td>
</tr>
</tbody>
</table>
**Command or Action**

```
Switch(config-ipv6-acl)##
permit ip host 10::1 host 11::2 host
```

**Purpose**

- the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

- **Enter any** as an abbreviation for the IPv6 prefix ::/0.

- **For host source-ipv6-address or destination-ipv6-address**, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.

- **(Optional) For operator**, specify an operand that compares the source or destination ports of the specified protocol. Operands are **lt** (less than), **gt** (greater than), **eq** (equal), **neq** (not equal), and **range**.

  If the operator follows the `source-ipv6-prefix/prefix-length` argument, it must match the source port. If the operator follows the `destination-ipv6-prefix/prefix-length` argument, it must match the destination port.

- **(Optional) The port-number** is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.

- **(Optional) Enter dscp value** to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

- **(Optional) Enter fragments** to check noninitial fragments. This keyword is visible only if the protocol is IPv6.

- **(Optional) Enter log** to cause a logging message to be sent to the console about the packet that matches the entry. Enter **log-input** to include the input interface in the log entry. Logging is supported only for router ACLs.
## Creating a Layer 2 MAC ACL for Non-IP Traffic

### Before you begin
Before you perform this task, determine that Layer 2 MAC access lists are required for your QoS configuration.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>mac access-list extended name</code></td>
<td>Creates a Layer 2 MAC ACL by specifying the name of the list.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# mac access-list extended name</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>---------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# mac access-list extended maclist1</code></td>
<td>After entering this command, the mode changes to extended MAC ACL configuration.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> - To delete an access list, use the <code>no mac access-list extended</code></td>
<td>access-list-name            global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `{permit</td>
<td>deny} {host src-MAC-addr mask</td>
<td>any</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-ext-macl)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-ext-macl)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config-ext-macl)# end
```
## Classifying Traffic by Using Class Maps

You use the `class-map` global configuration command to name and to isolate a specific traffic flow (or class) from all other traffic. The class map defines the criteria to use to match against a specific traffic flow to further classify it. Match statements can include criteria such as an ACL, IP precedence values, or DSCP values. The match criterion is defined with one match statement entered within the class-map configuration mode.

### Procedure

<table>
<thead>
<tr>
<th>Step 1: Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

### Example:

<table>
<thead>
<tr>
<th>Step 1: Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2: Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]`</td>
</tr>
</tbody>
</table>

When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

### Note

You can also create class maps during policy map creation by using the `class` policy-map configuration command.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>destination-ipv6-address</code> [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]</td>
<td><strong>Step 3</strong> class-map [match-all</td>
</tr>
</tbody>
</table>
| • `mac access-list extended name {permit | deny} {host src-MAC-addr mask | any | host dst-MAC-addr | dst-MAC-addr mask} [type mask]` | **Example:**

```
Switch(config)# access-list 103 permit any
dscp 10
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`match {access-group acl-index-or-name</td>
<td>ip dscp dscp-list</td>
</tr>
</tbody>
</table>
| **Example:**

```
Switch(config-cmap)# match ip dscp 10 11
```

### Example:

```
Switch(config)# access-list 103 permit any
dscp 10
```

- **Create a class map, and enters the class-map configuration mode.**

By default, no class maps are defined.

- **Step 3** class-map [match-all | match-any] class-map-name

**Example:**

```
Switch(config)# class-map class1
```

- **Step 4** match {access-group acl-index-or-name | ip dscp dscp-list | ip precedence ip-precedence-list}

**Example:**

```
Switch(config-cmap)# match ip dscp 10 11
```

- **Define the match criterion to classify traffic.**

By default, no match criterion is defined.

- **Step 4** match {access-group acl-index-or-name | ip dscp dscp-list | ip precedence ip-precedence-list}

**Example:**

```
Switch(config-cmap)# match ip dscp 10 11
```

- **Define the match criterion to classify traffic.**

By default, no match criterion is defined.

- **Step 4** match {access-group acl-index-or-name | ip dscp dscp-list | ip precedence ip-precedence-list}

**Example:**

```
Switch(config-cmap)# match ip dscp 10 11
```

- **Define the match criterion to classify traffic.**

By default, no match criterion is defined.

- **Step 4** match {access-group acl-index-or-name | ip dscp dscp-list | ip precedence ip-precedence-list}

**Example:**

```
Switch(config-cmap)# match ip dscp 10 11
```

- **Define the match criterion to classify traffic.**

By default, no match criterion is defined.
### Command or Action | Purpose
--- | ---
- To filter IPv6 traffic with the **match access-group** command, create an IPv6 ACL, as described in Step 2.
- For **ip dscp dscp-list**, enter a list of up to eight IP DSCP values to match against incoming packets. Separate each value with a space. The range is 0 to 63.
- For **ip precedence ip-precedence-list**, enter a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7.

**Note** To remove a match criterion, use the **no match {access-group acl-index-or-name | ip dscp | ip precedence}** class-map configuration command.

**Step 5** | **Example:**
--- | ---
end | Switch(config-cmap)# **end**

**Step 6** | **Example:**
--- | ---
show class-map | Switch# **show class-map**

**Step 7** | **Example:**
--- | ---
copy running-config startup-config | Switch# **copy-running-config startup-config**

### Classifying Traffic by Using Class Maps and Filtering IPv6 Traffic

IPv6 QoS is not supported on switches running the LAN base feature set.

To apply the primary match criteria to only IPv4 traffic, use the **match protocol** command with the **ip** keyword.

To apply the primary match criteria to only IPv6 traffic, use the **match protocol** command with the **ipv6** keyword.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
**Example:**  
Switch# configure terminal | Enters global configuration mode. |
| **Step 2** | class-map {match-all} class-map-name  
**Example:**  
Switch(config)# class-map cm-1 | Creates a class map, and enters class-map configuration mode.  
By default, no class maps are defined.  
When you use the `match protocol` command, only the `match-all` keyword is supported.  
• For `class-map-name`, specify the name of the class map.  
If neither the `match-all` or `match-any` keyword is specified, the default is `match-all`.  
**Note** To delete an existing class map, use the `no class-map [match-all | match-any] class-map-name` global configuration command. |
| **Step 3** | match protocol [ip | ipv6]  
**Example:**  
Switch(config-cmap)# match protocol ip | (Optional) Specifies the IP protocol to which the class map applies:  
• Use the argument `ip` to specify IPv4 traffic and `ipv6` to specify IPv6 traffic.  
• When you use the `match protocol` command, only the `match-all` keyword is supported for the `class-map` command. |
| **Step 4** | match [ip dscp dscp-list | ip precedence ip-precedence-list]  
**Example:**  
Switch(config-cmap)# match ip dscp 10 | Defines the match criterion to classify traffic.  
By default, no match criterion is defined.  
• For `ip dscp dscp-list`, enter a list of up to eight IP DSCP values to match against incoming packets. Separate each value with a space. The range is 0 to 63.  
• For `ip precedence ip-precedence-list`, enter a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. |
### Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps

You can configure a policy map on a physical port that specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; and specifying the traffic bandwidth limitations for each matched traffic class (policer) and the action to take when the traffic is out of profile (marking).

A policy map also has these characteristics:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A policy map can contain a predefined default traffic class explicitly placed at the end of the map.
- A separate policy-map class can exist for each type of traffic received through a port.

Follow these guidelines when configuring policy maps on physical ports:

- You can attach only one policy map per ingress port.
- If you configure the IP-precedence-to-DSCP map by using the `mls qos map ip-prec-dscp dscp1...dscp8` global configuration command, the settings only affect packets on ingress interfaces that are configured to trust the IP precedence value. In a policy map, if you set the packet IP precedence value to a new value by using the `set ip precedence new-precedence` policy-map class configuration command, the egress DSCP value is not affected by the IP-precedence-to-DSCP map. If you want the egress DSCP value to be different than the ingress value, use the `set dscp new-dscp` policy-map class configuration command.
- If you enter or have used the `set ip dscp` command, the switch changes this command to `set dscp` in its configuration.

- You can use the `set ip precedence` or the `set precedence` policy-map class configuration command to change the packet IP precedence value. This setting appears as set ip precedence in the switch configuration.

- A policy-map and a port trust state can both run on a physical interface. The policy-map is applied before the port trust state.

- When you configure a default traffic class by using the `class class-default` policy-map configuration command, unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as the default traffic class (`class-default`).

<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>exceed-action drop</td>
<td>Use the exceed-action policed-dscp-transmit keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet.</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>To remove an existing policer, use the no police rate-bps burst-byte [exceed-action {drop</td>
<td>policed-dscp-transmit}] policy-map configuration command.</td>
</tr>
</tbody>
</table>

**Step 8**

**Example:**

Switch(config-pmap-c)# exit

Returns to policy map configuration mode.

**Step 9**

**Example:**

Switch(config-pmap)# exit

Returns to global configuration mode.

**Step 10**

**Example:**

Switch(config)# interface gigabitethernet 2/0/1

Specifies the port to attach to the policy map, and enters interface configuration mode.

Valid interfaces include physical ports.

**Step 11**

**Example:**

Switch(config-if)# service-policy input flowit

Specifies the policy-map name, and applies it to an ingress port.

Only one policy map per ingress port is supported.

**Note** To remove the policy map and port association, use the no service-policy input policy-map-name interface configuration command.

**Step 12**

**Example:**

Switch(config-if)# end

Returns to privileged EXEC mode.
Classifying, Policing, and Marking Traffic by Using Aggregate Policers

By using an aggregate policer, you can create a policer that is shared by multiple traffic classes within the same policy map. However, you cannot use the aggregate policer across different policy maps or ports.

You can configure aggregate policers only in nonhierarchical policy maps on physical ports.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Defines the policer parameters that can be applied to multiple traffic classes within the same policy map.</td>
</tr>
<tr>
<td>mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action {drop</td>
<td>policed-dscp-transmit}</td>
</tr>
<tr>
<td>Example:</td>
<td>• For aggregate-policer-name, specify the name of the aggregate policer.</td>
</tr>
<tr>
<td>Switch(config)# mls qos aggregate-policer transmit 48000 8000 exceed-action policed-dscp-transmit</td>
<td>• For rate-bps, specify average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.</td>
</tr>
<tr>
<td></td>
<td>• For burst-byte, specify the normal burst size in bytes. The range is 8000 to 1000000.</td>
</tr>
<tr>
<td></td>
<td>• Specifies the action to take when the rates are exceeded. Use the exceed-action drop keywords to drop the packet. Use the exceed-action policed-dscp-transmit</td>
</tr>
</tbody>
</table>
### Purpose

The purpose of the commands is to mark the DSCP value of packets, classify traffic, and apply policies to interface.

### Command or Action

| Step 3 | `class-map [match-all | match-any] class-map-name` |
|--------|--------------------------------------------------|
| Example: |
| Switch(config)# `class-map ipclass1` |

### Purpose

The purpose of Step 3 is to create a class map to classify traffic as necessary.

### Command or Action

<table>
<thead>
<tr>
<th>Step 4</th>
<th><code>policy-map policy-map-name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-cmap)# <code>policy-map aggflow1</code></td>
<td></td>
</tr>
</tbody>
</table>

### Purpose

The purpose of Step 4 is to create a policy map by entering the policy map name, and entering policy-map configuration mode.

### Command or Action

| Step 5 | `class [class-map-name | class-default]` |
|--------|----------------------------------------|
| Example: |
| Switch(config-cmap-p)# `class ipclass1` |

### Purpose

The purpose of Step 5 is to define a traffic classification, and enter policy-map class configuration mode.

### Command or Action

<table>
<thead>
<tr>
<th>Step 6</th>
<th><code>police aggregate aggregate-policer-name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(configure-cmap-p)# <code>police aggregate transmit1</code></td>
<td></td>
</tr>
</tbody>
</table>

### Purpose

The purpose of Step 6 is to apply an aggregate policer to multiple classes in the same policy map.

For `aggregate-policer-name`, enter the name specified in Step 2.

To remove the specified aggregate policer from a policy map, use the `no police aggregate aggregate-policer-name` policy map configuration command. To delete an aggregate policer and its parameters, use the `no mls qos aggregate-policer aggregate-policer-name` global configuration command.

### Command or Action

<table>
<thead>
<tr>
<th>Step 7</th>
<th><code>exit</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(configure-cmap-p)# <code>exit</code></td>
<td></td>
</tr>
</tbody>
</table>

### Purpose

The purpose of Step 7 is to return to global configuration mode.

### Command or Action

<table>
<thead>
<tr>
<th>Step 8</th>
<th><code>interface interface-id</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>interface gigabitethernet 2/0/1</code></td>
<td></td>
</tr>
</tbody>
</table>

### Purpose

The purpose of Step 8 is to specify the port to attach to the policy map, and enter interface configuration mode.

Valid interfaces include physical ports.
### Configuring DSCP Maps

#### Configuring the CoS-to-DSCP Map

You use the CoS-to-DSCP map to map CoS values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Beginning in privileged EXEC mode, follow these steps to modify the CoS-to-DSCP map. This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mls qos map cos-dscp dscp1...dscp8</td>
</tr>
</tbody>
</table>
### Configuring the IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Beginning in privileged EXEC mode, follow these steps to modify the IP-precedence-to-DSCP map. This procedure is optional.

### Configuring the Policed-DSCP Map

You use the policed-DSCP map to mark down a DSCP value to a new value as the result of a policing and marking action.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

Beginning in privileged EXEC mode, follow these steps to modify the policed-DSCP map. This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> mls qos map policed-dscp dscp-list to mark-down-dscp</td>
<td>Modifies the policed-DSCP map.</td>
</tr>
</tbody>
</table>

---

### Purpose

For `dscp1...dscp8`, enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space.

The DSCP range is 0 to 63.

**Note**

To return to the default map, use the `no mls qos ip-prec-dscp` global configuration command.

---

### Step 3

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

---

### Step 4

**show mls qos maps ip-prec-dscp**

**Example:**

Switch# show mls qos maps ip-prec-dscp

Verifies your entries.

---

### Step 5

**copy running-config startup-config**

**Example:**

Switch# copy-running-config startup-config

(Optional) Saves your entries in the configuration file.
### Configuring the DSCP-to-CoS Map

You use the DSCP-to-CoS map to generate a CoS value, which is used to select one of the four egress queues. Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-CoS map. This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

### Configuring the DSCP-to-DSCP-Mutation Map

If two QoS domains have different DSCP definitions, use the DSCP-to-DSCP-mutation map to translate one set of DSCP values to match the definition of another domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a QoS administrative domain.

With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS applies the new value to the packet. The switch sends the packet out the port with the new DSCP value.

You can configure multiple DSCP-to-DSCP-mutation maps on an ingress port. The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-DSCP-mutation map. This procedure is optional.

#### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch# mls qos map dscp-cos 0 8 16 24 32 40 48 50 to 0` | • For `dscp-list`, enter up to eight DSCP values separated by spaces. Then enter the `to` keyword.  
  • For `cos`, enter the CoS value to which the DSCP values correspond.  
  The DSCP range is 0 to 63; the CoS range is 0 to 7.  
  **Note** To return to the default map, use the `no mls qos dscp-cos` global configuration command. |

#### Step 3

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

#### Step 4

**Example:**

Switch# show mls qos maps dscp-to-cos

Verifies your entries.

#### Step 5

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>mls qos map dscp-mutation dscp-mutation-name in-dscp to out-dscp</td>
<td>Modifies the DSCP-to-DSCP-mutation map.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
|       | Switch(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 0 | ・For dscp-mutation-name, enter the mutation map name. You can create more than one map by specifying a new name.  
・For in-dscp, enter up to eight DSCP values separated by spaces. Then enter the to keyword.  
・For out-dscp, enter a single DSCP value.  
The DSCP range is 0 to 63. |
| Note | To return to the default map, use the no mls qos dscp-mutation dscp-mutation-name global configuration command. | |
| Step 3 | interface interface-id | Specifies the port to which to attach the map, and enters interface configuration mode. |
|       | Example: | |
|       | Switch(config)# interface gigabitethernet1/0/1 | Valid interfaces include physical ports. |
| Step 4 | mls qos trust dscp | Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted. |
|       | Example: | |
|       | Switch(config-if)# mls qos trust dscp | |
| Step 5 | mls qos dscp-mutation dscp-mutation-name | Applies the map to the specified ingress DSCP-trusted port.  
For dscp-mutation-name, enter the mutation map name specified in Step 2. |
|       | Example: | |
|       | Switch(config-if)# mls qos dscp-mutation mutation1 | |
| Step 6 | end | Returns to privileged EXEC mode. |
|       | Example: | |
### Configuring Ingress Queue Characteristics

Depending on the complexity of your network and your QoS solution, you might need to perform all of the tasks in the next modules. You need to make decisions about these characteristics:

- Which packets are assigned (by DSCP or CoS value) to each queue?
- What drop percentage thresholds apply to each queue, and which CoS or DSCP values map to each threshold?
- How much of the available buffer space is allocated between the queues?
- How much of the available bandwidth is allocated between the queues?
- Is there traffic (such as voice) that should be given high priority?

### Configuration Guidelines

Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:

- If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.
- If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.
- If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services this queue in shared mode.

### Mapping DSCP or CoS Values to an Ingress Queue and Setting WTD Thresholds

You can prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues and adjusting the queue thresholds so that packets with lower priorities are dropped.
Beginning in privileged EXEC mode, follow these steps to map DSCP or CoS values to an ingress queue and to set WTD thresholds. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Use one of the following:</td>
<td>Maps DSCP or CoS values to an ingress queue and to a threshold ID. By default, DSCP values 0–39 and 48–63 are mapped to queue 1 and threshold 1. DSCP values 40–47 are mapped to queue 2 and threshold 1. By default, CoS values 0–4, 6, and 7 are mapped to queue 1 and threshold 1. CoS value 5 is mapped to queue 2 and threshold 1.</td>
</tr>
<tr>
<td></td>
<td>• <code>mls qos srr-queue input dscp-map queue queue-id threshold threshold-id dscp1...dscp8</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>mls qos srr-queue input cos-map queue queue-id threshold threshold-id cos1...cos8</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 2 20 21 22 23 24 25 26</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2</code></td>
<td>Assigns the two WTD threshold percentages for (threshold 1 and 2) to an ingress queue. The default, both thresholds are set to 100 percent.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# mls qos srr-queue input threshold 1 50 70</td>
<td>Each threshold value is a percentage of the total number of queue descriptors allocated for the queue.</td>
</tr>
</tbody>
</table>
### Allocating Buffer Space Between the Ingress Queues

You define the ratio (allocate the amount of space) with which to divide the ingress buffers between the two queues. The buffer and the bandwidth allocation control how much data can be buffered before packets are dropped.

Beginning in privileged EXEC mode, follow these steps to allocate the buffers between the ingress queues. This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

To return to the default CoS input queue threshold map or the default DSCP input queue threshold map, use the `no mls qos srr-queue input cos-map` or the `no mls qos srr-queue input dscp-map` global configuration command. To return to the default WTD threshold percentages, use the `no mls qos srr-queue input threshold queue-id` global configuration command.

### Allocating Buffer Space Between the Ingress Queues

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong></td>
</tr>
</tbody>
</table>

Verifies your entries.

The DSCP input queue threshold map appears as a matrix. The d1 column specifies the most-significant digit of the DSCP number; the d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID; for example, queue 2 and threshold 1 (02-01).

The CoS input queue threshold map shows the CoS value in the top row and the corresponding queue ID and threshold ID in the second row; for example, queue 2 and threshold 2 (2-2).

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>show mls qos maps</strong></td>
</tr>
</tbody>
</table>

Example:

```
Switch# show mls qos maps
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

Example:

```
Switch# copy running-config startup-config
```

Enters global configuration mode.
### Allocating Bandwidth Between the Ingress Queues

You need to specify how much of the available bandwidth is allocated between the ingress queues. The ratio of the weights is the ratio of the frequency in which the SRR scheduler sends packets from each queue. The bandwidth and the buffer allocation control how much data can be buffered before packets are dropped. On ingress queues, SRR operates only in shared mode.

#### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Allocated the buffers between the ingress queues By default 90 percent of the buffers are allocated to queue 1, and 10 percent of the buffers are allocated to queue 2. For <code>percentage1</code> <code>percentage2</code>, the range is 0 to 100. Separate each value with a space. You should allocate the buffers so that the queues can handle any incoming bursty traffic.</td>
</tr>
</tbody>
</table>
| `Step 2 mls qos srr-queue input buffers percentage1 percentage2` | **Example:**

```
Switch(config)# mls qos srr-queue input buffers 60 40
```

| Step 3 end | **Example:**

```
Switch(config)# end
```

<table>
<thead>
<tr>
<th>Step 4 Use one of the following:</th>
<th>Verifies your entries.</th>
</tr>
</thead>
</table>
| • `show mls qos interface buffer` | **Example:**

```
Switch# show mls qos interface buffer
```
| or | `show mls qos input-queue` |
| Switch# `show mls qos input-queue` | |

| Step 5 `copy running-config startup-config` | *(Optional) Saves your entries in the configuration file.*

**Example:**

```
Switch# copy-running-config startup-config
```

To return to the default setting, use the `no mls qos srr-queue input buffers` global configuration command.

---

**Note**

SRR bandwidth limit works in both mls qos enabled and disabled states.
Beginning in privileged EXEC mode, follow these steps to allocate bandwidth between the ingress queues. This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>mls qos srr-queue input bandwidth weight1 weight2</code></td>
<td>Assigns shared round robin weights to the ingress queues. The default setting for <code>weight1</code> and <code>weight2</code> is 4 (1/2 of the bandwidth is equally shared between the two queues). For <code>weight1</code> and <code>weight2</code>, the range is 1 to 100. Separate each value with a space. SRR services the priority queue for its configured weight as specified by the <code>bandwidth</code> keyword in the <code>mls qos srr-queue input priority-queue queue-id bandwidth weight</code> global configuration command. Then, SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the <code>mls qos srr-queue input bandwidth weight1 weight2</code> global configuration command.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>mls qos srr-queue input bandwidth 25 75</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>end</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Use one of the following: • <code>show mls qos interface queueing</code> • <code>show mls qos input-queue</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch# <code>show mls qos interface queueing</code> or Switch# <code>show mls qos input-queue</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring Egress Queue Characteristics

Depending on the complexity of your network and your QoS solution, you might need to perform all of the tasks in the following modules. You need to make decisions about these characteristics:

- Which packets are mapped by DSCP or CoS value to each queue and threshold ID?
- What drop percentage thresholds apply to the queue-set (four egress queues per port), and how much reserved and maximum memory is needed for the traffic type?
- How much of the fixed buffer space is allocated to the queue-set?
- Does the bandwidth of the port need to be rate limited?
- How often should the egress queues be serviced and which technique (shaped, shared, or both) should be used?

Configuration Guidelines

Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:

- If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.
- If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.
- If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services this queue in shared mode.

Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue-Set

You can guarantee the availability of buffers, set WTD thresholds, and configure the maximum allocation for a queue-set by using the `mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold` global configuration command.

Each threshold value is a percentage of the queue’s allocated buffers, which you specify by using the `mls qos queue-set output qset-id buffers allocation1 ... allocation4` global configuration command. The queues use WTD to support distinct drop percentages for different traffic classes.
The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos srr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds, buffers, bandwidth share weights, and bandwidth shape weights for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to configure the memory allocation and to drop thresholds for a queue-set. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | (Optional) The switch supports 4 egress queues by default, although you can enable a total of 8 egress queues. Use the optional `mls qos srr-queue output queues 8` command to enable the additional 4 egress queues. |
| `mls qos srr-queue output queues 8` | |
| **Example:** | |
| Switch(config)# mls qos srr-queue output queues 8 | |

Once 8 queue support is enabled, you can then proceed to configure the additional 4 queues. Any existing egress queue configuration commands are then modified to support the additional queue parameters. 

**Note** The option to enable 8 queues is only available on a standalone switch.

| **Step 3** | Allocates buffers to a queue set. |
| `mls qos queue-set output qset-id buffers allocation1 ... allocation8` | |
| **Example:** | |
| Switch(config)# mls qos queue-set output 2 buffers 40 20 20 20 10 10 10 10 | |

By default, all allocation values are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of the buffer space. When eight egress queues are configured, then by default 30 percent of the total buffer space is allocated to queue 2 and 10 percent (each) to queues 1, 3, 4, 5, 6, 7, and 8.

If you enabled 8 egress queues as described in Step 2 above, then the following applies:
### QoS Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue-Set

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• For qset-id, enter the ID of the queue set. The range is 1 to 2. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port.</td>
<td></td>
</tr>
<tr>
<td>• For allocation1 ... allocation8, specify eight percentages, one for each queue in the queue set. For allocation1, allocation3, and allocation4 to allocation8, the range is 0 to 99. For allocation2, the range is 1 to 100 (including the CPU buffer).</td>
<td></td>
</tr>
<tr>
<td>Allocate buffers according to the importance of the traffic; for example, give a large percentage of the buffer to the queue with the highest-priority traffic.</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>To return to the default setting, use the no mls qos queue-set output qset-id buffers global configuration command.</td>
</tr>
</tbody>
</table>

### Step 4

| mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold |
| Example: |
| Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200 |

Configures the WTD thresholds, guarantee the availability of buffers, and configure the maximum memory allocation for the queue-set (four egress queues per port).

By default, the WTD thresholds for queues 1, 3, and 4 are set to 100 percent. The thresholds for queue 2 are set to 200 percent. The reserved thresholds for queues 1, 2, 3, and 4 are set to 50 percent. The maximum thresholds for all queues are set to 400 percent by default.

If you enabled 8 egress queues as described in Step 2 above, then the following applies:

• For qset-id, enter the ID of the queue-set specified in Step 2. The range is 1 to 2.

• For queue-id, enter the specific queue in the queue set on which the command is performed. The queue-id range is 1-4 by default and 1-8 when 8 queues are enabled.

• For drop-threshold1 drop-threshold2, specify the two WTD thresholds expressed as a percentage of the queue’s allocated memory. The range is 1 to 3200 percent.

• For reserved-threshold, enter the amount of memory to be guaranteed (reserved) for
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **interface interface-id**  
**Example:**  
Switch(config)# interface gigabitethernet1/0/1 | Specifies the port of the outbound traffic, and enter interface configuration mode. |
| **queue-set qset-id**  
**Example:**  
Switch(config-id)# queue-set 2 | Maps the port to a queue-set.  
For `qset-id`, enter the ID of the queue-set specified in Step 2. The range is 1 to 2. The default is 1. |
| **end**  
**Example:**  
Switch(config-id)# end | Returns to privileged EXEC mode. |
| **show mls qos interface [interface-id] buffers**  
**Example:**  
Switch# show mls qos interface buffers | Verifies your entries. |
| **copy running-config startup-config**  
**Example:**  
Switch# copy-running-config startup-config | (Optional) Saves your entries in the configuration file.  
To return to the default setting, use the `no mls qos queue-set output qset-id buffers` global configuration command. To return to the default WTD threshold percentages, use the `no mls qos queue-set output qset-id threshold` global configuration command. |

Note: To return to the default WTD threshold percentages, use the `no mls qos queue-set output qset-id threshold [queue-id]` global configuration command.

- For *maximum-threshold*, enable a queue in the full condition to obtain more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped if the common pool is not empty. The range is 1 to 3200 percent.

The queue expressed as a percentage of the allocated memory. The range is 1 to 100 percent.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue-set output qset-id threshold [queue-id]</td>
<td>global configuration command.</td>
</tr>
</tbody>
</table>

**Mapping DSCP or CoS Values to an Egress Queue and to a Threshold ID**

You can prioritize traffic by placing packets with particular DSCPs or costs of service into certain queues and adjusting the queue thresholds so that packets with lower priorities are dropped.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to map DSCP or CoS values to an egress queue and to a threshold ID. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Maps DSCP or CoS values to an egress queue and to a threshold ID.</td>
</tr>
<tr>
<td>Use one of the following:</td>
<td></td>
</tr>
<tr>
<td>• mls qos srr-queue output dscp-map queue queue-id threshold threshold-id dscp1...dscp8</td>
<td></td>
</tr>
<tr>
<td>• mls qos srr-queue output cos-map queue queue-id threshold threshold-id cos1...cos8</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 2 10 11</td>
<td></td>
</tr>
</tbody>
</table>

- **For queue-id**, the range is 1 to 4.

**Note**

If you enabled 8 egress queues using the `mls qos srr-queue output queues 8` global configuration command, then the `queue-id` range would be from 1 to 8.
### Mapping DSCP or CoS Values to an Egress Queue and to a Threshold ID

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mls qos srr-queue output cos-map queue queue-id threshold threshold-id cos1...cos8</td>
<td>Maps CoS values to an egress queue and to a threshold ID. By default, CoS values 0 and 1 are mapped to queue 2 and threshold 1. CoS values 2 and 3 are mapped to queue 3 and threshold 1. CoS values 4, 6, and 7 are mapped to queue 4 and threshold 1. CoS value 5 is mapped to queue 1 and threshold 1.</td>
</tr>
</tbody>
</table>

**Example:**
```
Switch(config)# mls qos srr-queue output cos-map queue
    cos-map queue 3 threshold 1 2 3
```

### Notes
- For `threshold-id`, the range is 1 to 3. The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
- For `dscp1...dscp8`, enter up to eight values, and separate each value with a space. The range is 0 to 63.
- For `cos1...cos8`, enter up to eight values, and separate each value with a space. The range is 0 to 7.

**Note** To return to the default DSCP output queue threshold map or the default CoS output queue threshold map, use the **no mls qos srr-queue output dscp-map** or the **no mls qos srr-queue output cos-map** global configuration command.

### Step 4
**end**

**Example:**
```
```

**Note** To return to the default CoS output queue threshold map, use the **no mls qos srr-queue output cos-map** global configuration command.

**Returns to privileged EXEC mode.**
**Configuring SRR Shaped Weights on Egress Queues**

You can specify how much of the available bandwidth is allocated to each queue. The ratio of the weights is the ratio of frequency in which the SRR scheduler sends packets from each queue.

You can configure the egress queues for shaped or shared weights, or both. Use shaping to smooth bursty traffic or to provide a smoother output over time.

Beginning in privileged EXEC mode, follow these steps to assign the shaped weights and to enable bandwidth shaping on the four egress queues mapped to a port. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>

<td>Switch# interface interface-id</td>
<td></td>
</tr>
</tbody>
</table>

---

### Command or Action

- **Switch(config)# end**

**Purpose**

- Verifies your entries.

**Example:**

- `Switch# show mls qos maps`

The DSCP output queue threshold map appears as a matrix. The d1 column specifies the most-significant digit of the DSCP number; the d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID; for example, queue 2 and threshold 1 (02-01).

The CoS output queue threshold map shows the CoS value in the top row and the corresponding queue ID and threshold ID in the second row; for example, queue 2 and threshold 2 (2-2).

- **Step 6**

  - `copy running-config startup-config`

  **Example:**

  - `Switch# copy-running-config startup-config`

  **Purpose**

  - (Optional) Saves your entries in the configuration file.

  To return to the default DSCP output queue threshold map or the default CoS output queue threshold map, use the `no mls qos srr-queue output dscp-map` or the `no mls qos srr-queue output cos-map` global configuration command.
### Command or Action

```
Switch(config)# interface gigabitethernet2/0/1
```

### Purpose

Assigns SRR weights to the egress queues. By default, weight1 is set to 25; weight2, weight3, and weight4 are set to 0, and these queues are in shared mode.

**Step 3**

```
srr-queue bandwidth shape weight1 weight2 weight3 weight4
```

**Example:**

```
Switch(config-if)# srr-queue bandwidth shape 8 0 0 0
```

For weight1 weight2 weight3 weight4, enter the weights to control the percentage of the port that is shaped. The inverse ratio (1/weight) controls the shaping bandwidth for this queue. Separate each value with a space. The range is 0 to 65535.

If you configure a weight of 0, the corresponding queue operates in shared mode. The weight specified with the `srr-queue bandwidth shape` command is ignored, and the weights specified with the `srr-queue bandwidth share` interface configuration command for a queue come into effect. When configuring queues in the same queue-set for both shaping and sharing, make sure that you configure the lowest number queue for shaping. The shaped mode overrides the shared mode.

To return to the default setting, use the `no srr-queue bandwidth shape` interface configuration command.

**Note** If you enabled 8 egress queues using the `mls qos srr-queue output queues 8` global configuration command, then you would be able to assign SRR weights to a total of 8 queues.

### Command or Action

```
end
```

**Example:**

```
Switch(config-if)# end
```

### Purpose

Returns to privileged EXEC mode.

**Step 5**

```
show mls qos interface interface-id queueing
```

**Example:**

```
Switch# show mls qos interface interface-id queueing
```

Verifies your entries.
Configuring SRR Shared Weights on Egress Queues

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue empties and does not require a share of the link, the remaining queues can expand into the unused bandwidth and share it among them. With sharing, the ratio of the weights controls the frequency of dequeuing; the absolute values are meaningless.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port. This procedure is optional.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

### Configuring the Egress Expedite Queue

You can ensure that certain packets have priority over all others by queuing them in the egress expedite queue. SRR services this queue until it is empty before servicing the other queues.

Beginning in privileged EXEC mode, follow these steps to enable the egress expedite queue. This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>

</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Switch# copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file. To disable the egress expedite queue, use the <strong>no priority-queue out</strong> interface configuration command.</td>
</tr>
</tbody>
</table>
Limiting the Bandwidth on an Egress Interface

You can limit the bandwidth on an egress port. For example, if a customer pays only for a small percentage of a high-speed link, you can limit the bandwidth to that amount.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to limit the bandwidth on an egress port. This procedure is optional.

<tr>
<td>`show mls qos interface [interface-id] [buffers</td>
<td>policers</td>
</tr>
<tr>
<td><code>show mls qos queue-set [qset-id]</code></td>
<td>Displays QoS settings for the egress queues.</td>
</tr>
<tr>
<td><code>show policy-map [policy-map-name [class class-map-name]]</code></td>
<td>Displays QoS policy maps, which define classification criteria for incoming traffic. Do not use the <code>show policy-map interface</code> privileged EXEC command to display classification information for incoming traffic. The <code>control-plane</code> and <code>interface</code> keywords are not supported, and the statistics shown in the display should be ignored.</td>
</tr>
<tr>
<td>`show running-config</td>
<td>include rewrite`</td>
</tr>
</tbody>
</table>
**Configuration Examples for QoS**

**Example: Configuring Port to the DSCP- Trusted State and Modifying the DSCP-to-DSCP-Mutation Map**

This example shows how to configure a port to the DSCP-trusted state and to modify the DSCP-to-DSCP-mutation map (named `gi1/0/2-mutation`) so that incoming DSCP values 10 to 13 are mapped to DSCP 30:

```plaintext
Switch(config)# mls qos map dscp-mutation gigabitethernet1/0/2-mutation 10 11 12 13 to 30
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# mls qos trust dscp
Switch(config-if)# mls qos dscp-mutation gigabitethernet1/0/2-mutation
Switch(config-if)# end
```

**Examples: Classifying Traffic by Using ACLs**

This example shows how to allow access for only those hosts on the three specified networks. The wildcard bits apply to the host portions of the network addresses. Any host with a source address that does not match the access list statements is rejected.

```plaintext
Switch(config)# access-list 1 permit 192.5.255.0 0.0.0.255
Switch(config)# access-list 1 permit 128.88.0.0 0.0.255.255
Switch(config)# access-list 1 permit 36.0.0.0 0.0.0.255
! (Note: all other access implicitly denied)
```

This example shows how to create an ACL that permits IP traffic from any source to any destination that has the DSCP value set to 32:

```plaintext
Switch(config)# access-list 100 permit ip any any dscp 32
```

This example shows how to create an ACL that permits IP traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:

```plaintext
Switch(config)# access-list 100 permit ip host 10.1.1.1 host 10.1.1.2 precedence 5
```

This example shows how to create an ACL that permits PIM traffic from any source to a destination group address of 224.0.0.2 with a DSCP set to 32:

```plaintext
Switch(config)# access-list 102 permit pim any 224.0.0.2 dscp 32
```

This example shows how to create an ACL that permits IPv6 traffic from any source to any destination that has the DSCP value set to 32:
Switch(config)# ipv6 access-list 100 permit ip any any dscp 32

This example shows how to create an ACL that permits IPv6 traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:

Switch(config)# ipv6 access-list ipv6_Name_ACL permit ip host 10::1 host 10.1.1.2 precedence 5

This example shows how to create a Layer 2 MAC ACL with two permit statements. The first statement allows traffic from the host with MAC address 0001.0000.0001 to the host with MAC address 0002.0000.0001. The second statement allows only Ethertype XNS-IDP traffic from the host with MAC address 0001.0000.0002 to the host with MAC address 0002.0000.0002.

Switch(config)# mac access-list extended maclist1
Switch(config-ext-macl)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Switch(config-ext-macl)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
! (Note: all other access implicitly denied)

Examples: Classifying Traffic by Using Class Maps

This example shows how to configure the class map called class1. The class1 has one match criterion, which is access list 103. It permits traffic from any host to any destination that matches a DSCP value of 10.

Switch(config)# access-list 103 permit ip any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# end
Switch#

This example shows how to create a class map called class2, which matches incoming traffic with DSCP values of 10, 11, and 12.

Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# end
Switch#

This example shows how to create a class map called class3, which matches incoming traffic with IP-precedence values of 5, 6, and 7:

Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# end
Switch#

This example shows how to configure a class map to match IP DSCP and IPv6:

Switch(config)# Class-map cm-1
Switch(config-cmap)# match ip dscp 10
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch(config)# Class-map cm-2
Switch(config-cmap)# match ip dscp 20
Switch(config-cmap)# match protocol ip
Switch(config-cmap)# exit
Switch(config)# Policy-map pm1
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-2
Switch(config-pmap-c)# set dscp 6
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface G1/0/1
Switch(config-if)# service-policy input pm1

This example shows how to configure a class map that applies to both IPv4 and IPv6 traffic:

Switch(config)# ip access-list 101 permit ip any any
Switch(config)# ipv6 access-list ipv6-any permit ip any any
Switch(config)# Class-map cm-1
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# Policy-map pm1
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config)# interface G0/1
Switch(config-if)# switch mode access
Switch(config-if)# service-policy input pm1

Examples: Classifying, Policing, and Marking Traffic on Physical Ports Using Policy Maps

This example shows how to create a policy map and attach it to an ingress port. In the configuration, the IP standard ACL permits traffic from network 10.1.0.0. For traffic matching this classification, the DSCP value in the incoming packet is trusted. If the matched traffic exceeds an average traffic rate of 48000 b/s and a normal burst size of 8000 bytes, its DSCP is marked down (based on the policed-DSCP map) and sent:

Switch(config)# access-list 1 permit 10.1.0.0 0.0.255.255
Switch(config)# class-map ipclass1
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map flow1t
Switch(config-pmap)# class ipclass1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# service-policy input flow1t

This example shows how to create a Layer 2 MAC ACL with two permit statements and attach it to an ingress port. The first permit statement allows traffic from the host with MAC address 0001.0000.0001 destined for the host with MAC address 0002.0000.0001. The second permit statement allows only Ethertype XNS-IDP traffic from the host with MAC address 0001.0000.0002 destined for the host with MAC address 0002.0000.0002.

Switch(config)# mac access-list extended maclist1
Switch(config-ext-mac)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Switch(config-ext-mac)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
Switch(config-ext-mac)# exit
Switch(config)# mac access-list extended maclist2
Switch(config-ext-mac)# permit 0001.0000.0003 0.0.0 0002.0000.0003 0.0.0
Switch(config-ext-mac)# permit 0001.0000.0004 0.0.0 0002.0000.0004 0.0.0 aarp
Switch(config-ext-mac)# exit
Switch(config)# class-map macclass1
Switch(config-cmap)# match access-group maclist1
Switch(config-cmap)# exit
Switch(config)# policy-map macpolicy1
Switch(config-pmap)# class macclass1
Switch(config-pmap-c)# set dscp 63
Switch(config-pmap-c)# exit
Switch(config)# class-map macclass2 maclist2
Switch(config-cmap)# class-map macclass1
Switch(config-cmap-c)# set dscp 45
Switch(config-cmap-c)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# service-policy input macpolicy1

This example shows how to create a class map that applies to both IPv4 and IPv6 traffic with the default class applied to unclassified traffic:

Switch(config)# ip access-list 101 permit ip any any
Switch(config)# ipv6 access-list ipv6-any permit ip any any
Switch(config)# class-map cm-1
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# class-map cm-2
Switch(config-cmap)# match access-group name ipv6-any
Switch(config-cmap)# exit
Switch(config)# policy-map pml
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-2
Switch(config-pmap-c)# set dscp 6
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# exit
Switch(config)# interface G0/1
Switch(config-if)# switch mode access
Switch(config-if)# service-policy input pml
Examples: Classifying, Policing, and Marking Traffic by Using Aggregate Policers

This example shows how to create an aggregate policer and attach it to multiple classes within a policy map. In the configuration, the IP ACLs permit traffic from network 10.1.0.0 and from host 11.3.1.1. For traffic coming from network 10.1.0.0, the DSCP in the incoming packets is trusted. For traffic coming from host 11.3.1.1, the DSCP in the packet is changed to 56. The traffic rate from the 10.1.0.0 network and from host 11.3.1.1 is policed. If the traffic exceeds an average rate of 48000 b/s and a normal burst size of 8000 bytes, its DSCP is marked down (based on the policed-DSCP map) and sent. The policy map is attached to an ingress port.

Switch(config)# access-list 1 permit 10.1.0.0 0.0.255.255
Switch(config)# access-list 2 permit 11.3.1.1
Switch(config)# mls qos aggregate-police transmit1 48000 8000 exceed-action policed-dscp-transmit
Switch(config)# class-map ipclass1
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# class-map ipclass2
Switch(config-cmap)# match access-group 2
Switch(config-cmap)# exit
Switch(config)# policy-map aggflow1
Switch(config-pmap)# class ipclass1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police aggregate transmit1
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class ipclass2
Switch(config-pmap-c)# set dscp 56
Switch(config-pmap-c)# police aggregate transmit1
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class class-default
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# service-policy input aggflow1
Switch(config-if)# exit

Examples: Configuring DSCP Maps

This example shows how to modify and display the CoS-to-DSCP map:

Switch(config)# mls qos map cos-dscp 10 15 20 25 30 35 40 45
Switch(config)# end
Switch# show mls qos maps cos-dscp

Cos-dscp map:
    cos: 0 1 2 3 4 5 6 7
    ---------------------
    dscp: 10 15 20 25 30 35 40 45

This example shows how to modify and display the IP-precedence-to-DSCP map:

Switch(config)# mls qos map ip-prec-dscp 10 15 20 25 30 35 40 45
**Examples: Configuring DSCP Maps**

Switch(config)# end
Switch# show mls qos maps ip-prec-dscp

IpPrecedence-dscp map:
  ipprec: 0 1 2 3 4 5 6 7
  --------------------------------
  dscp: 10 15 20 25 30 35 40 45

This example shows how to map DSCP 50 to 57 to a marked-down DSCP value of 0:

Switch(config)# mls qos map policed-dscp 50 51 52 53 54 55 56 57 to 0
Switch(config)# end
Switch# show mls qos maps policed-dscp
Policed-dscp map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
  ---------------------------------------
  0 : 00 01 02 03 04 05 06 07 08 09
  1 : 10 11 12 13 14 15 16 17 18 19
  2 : 20 21 22 23 24 25 26 27 28 29
  3 : 30 31 32 33 34 35 36 37 38 39
  4 : 40 41 42 43 44 45 46 47 48 49
  5 : 00 00 00 00 00 00 00 00 00 00
  6 : 60 61 62 63

**Note**

In this policed-DSCP map, the marked-down DSCP values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the marked-down value. For example, an original DSCP value of 53 corresponds to a marked-down DSCP value of 0.

This example shows how to map DSCP values 0, 8, 16, 24, 32, 40, 48, and 50 to CoS value 0 and to display the map:

Switch(config)# mls qos map dscp-cos 0 8 16 24 32 40 48 50 to 0
Switch(config)# end
Switch# show mls qos maps dscp-cos
Dscp-cos map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
  ---------------------------------------
  0 : 00 00 00 00 00 00 00 00 00 00
  1 : 01 01 01 01 01 01 01 01 01 01
  2 : 02 02 02 02 02 02 02 02 02 02
  3 : 03 03 03 03 03 03 03 03 03 03
  4 : 04 04 04 04 04 04 04 04 04 04
  5 : 05 05 05 05 05 05 05 05 05 05
  6 : 06 06 06 06 06 06 06 06 06 06
  7 : 07 07 07 07 07 07 07 07 07 07
  8 : 08 08 08 08 08 08 08 08 08 08
  9 : 09 09 09 09 09 09 09 09 09 09

**Note**

In the above DSCP-to-CoS map, the CoS values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the DSCP; the d2 row specifies the least-significant digit of the DSCP. The intersection of the d1 and d2 values provides the CoS value. For example, in the DSCP-to-CoS map, a DSCP value of 08 corresponds to a CoS value of 0.
This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remains as specified in the null map):

```
Switch(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 0
Switch(config)# mls qos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls qos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls qos map dscp-mutation mutation1 30 31 32 33 34 to 30
```

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mls qos trust dscp
Switch(config-if)# mls qos dscp-mutation mutation1
Switch(config-if)# end

Switch# show mls qos maps dscp-mutation mutation1

<table>
<thead>
<tr>
<th>Dscp-dscp mutation map:</th>
</tr>
</thead>
<tbody>
<tr>
<td>mutation1:</td>
</tr>
<tr>
<td>d1 : d2</td>
</tr>
<tr>
<td>------------------------</td>
</tr>
<tr>
<td>0 : 00 00 00 00 00 00 00 00 10 10</td>
</tr>
<tr>
<td>1 : 10 10 10 14 15 16 17 18 19</td>
</tr>
<tr>
<td>2 : 20 20 20 23 24 25 26 27 28 29</td>
</tr>
<tr>
<td>3 : 30 30 30 30 35 36 37 38 39</td>
</tr>
<tr>
<td>4 : 40 41 42 43 44 45 46 47 48 49</td>
</tr>
<tr>
<td>5 : 50 51 52 53 54 55 56 57 58 59</td>
</tr>
<tr>
<td>6 : 60 61 62 63</td>
</tr>
</tbody>
</table>

In the above DSCP-to-DSCP-mutation map, the mutated values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the mutated value. For example, a DSCP value of 12 corresponds to a mutated value of 10.

### Examples: Configuring Ingress Queue Characteristics

This example shows how to map DSCP values 0 to 6 to ingress queue 1 and to threshold 1 with a drop threshold of 50 percent. It maps DSCP values 20 to 26 to ingress queue 1 and to threshold 2 with a drop threshold of 70 percent:

```
Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 1 0 1 2 3 4 5 6
Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 2 20 21 22 23 24 25 26
Switch(config)# mls qos srr-queue input threshold 1 50 70
```

In this example, the DSCP values (0 to 6) are assigned the WTD threshold of 50 percent and will be dropped sooner than the DSCP values (20 to 26) assigned to the WTD threshold of 70 percent.

This example shows how to allocate 60 percent of the buffer space to ingress queue 1 and 40 percent of the buffer space to ingress queue 2:

```
Switch(config)# mls qos srr-queue input buffers 60 40
```

This example shows how to assign the ingress bandwidth to the queues. Priority queueing is disabled, and the shared bandwidth ratio allocated to queue 1 is 25/(25+75) and to queue 2 is 75/(25+75):

```
Switch(config)# mls qos srr-queue input buffers 60 40
```
Switch(config)# mls qos srr-queue input priority-queue 2 bandwidth 0
Switch(config)# mls qos srr-queue input bandwidth 25 75

This example shows how to assign the ingress bandwidths to the queues. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratios allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls qos srr-queue input priority-queue 1 bandwidth 10
Switch(config)# mls qos srr-queue input bandwidth 4 4

**Examples: Configuring Egress Queue Characteristics**

This example shows how to map DSCP values 10 and 11 to egress queue 1 and to threshold 2:

Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 2 10 11

This example shows how to configure bandwidth shaping on queue 1. Because the weight ratios for queues 2, 3, and 4 are set to 0, these queues operate in shared mode. The bandwidth weight for queue 1 is 1/8, which is 12.5 percent:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth shape 8 0 0 0

This example shows how to configure the weight ratio of the SRR scheduler running on an egress port. Four queues are used, and the bandwidth ratio allocated for each queue in shared mode is 1/(1+2+3+4), 2/(1+2+3+4), 3/(1+2+3+4), and 4/(1+2+3+4), which is 10 percent, 20 percent, 30 percent, and 40 percent for queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth of queue 1, twice the bandwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth share 1 2 3 4

This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# priority-queue out
Switch(config-if)# end

This example shows how to limit the bandwidth on a port to 80 percent:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth limit 80
When you configure this command to 80 percent, the port is idle 20 percent of the time. The line rate drops to 80 percent of the connected speed, which is 800 Mb/s. These values are not exact because the hardware adjusts the line rate in increments of six.

Where to Go Next

Review the auto-QoS documentation to see if you can use these automated capabilities for your QoS configuration.

Configuring Auto-QoS

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Auto-QoS

Before configuring standard QoS or auto-QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. Is the traffic bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.
Restrictions for Auto-QoS

The following are restrictions for automatic QoS (auto-QoS):

- Auto-QoS (and enhanced auto-QoS) is not supported on switches running the LAN Lite image.

Information about Configuring Auto-QoS

Auto-QoS Overview

You can use the auto-QoS feature to simplify the deployment of QoS features. Auto-QoS determines the network design and enables QoS configurations so that the switch can prioritize different traffic flows. It uses the egress queues instead of using the default (disabled) QoS behavior. The switch offers best-effort service to each packet, regardless of the packet contents or size, and sends it from a single queue.

When you enable auto-QoS, it automatically classifies traffic based on the traffic type and ingress packet label. The switch uses the classification results to choose the appropriate egress queue.

You can use auto-QoS commands to identify ports connected to the following Cisco devices:

- Cisco IP Phones
- Devices running the Cisco SoftPhone application
- Cisco TelePresence
- Cisco IP Camera
- Cisco digital media player

You also use the auto-QoS commands to identify ports that receive trusted traffic through an uplink. Auto-QoS then performs these functions:

- Detects the presence or absence of auto-QoS devices through conditional trusted interfaces.
- Configures QoS classification
- Configures egress queues

Auto-QoS Compact Overview

When you enter an auto-QoS command, the switch displays all the generated commands as if the commands were entered from the CLI. You can use the auto-QoS compact feature to hide the auto-QoS generated commands from the running configuration. This would make it easier to comprehend the running-configuration and also help to increase efficient usage of memory.

Generated Auto-QoS Configuration

By default, auto-QoS is disabled on all ports. Packets are not modified—the CoS, DSCP and IP precedence values in the packet are not changed.
When you enable the auto-QoS feature on the first port of the interface:

- Ingress packet label is used to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

- QoS is globally enabled (mls qos global configuration command), and other global configuration commands are automatically generated. (See Examples: Global Auto-QoS Configuration, on page 609).

- Switch enables the trusted boundary feature and uses the Cisco Discovery Protocol (CDP) to detect the presence of a supported device.

- Policing is used to determine whether a packet is in or out of profile and specifies the action on the packet.

**VoIP Device Specifics**

The following activities occur when you issue these auto-QoS commands on a port:

- When you enter the `auto qos voip cisco-phone` command on a port at the network edge connected to a Cisco IP Phone, the switch enables the trusted boundary feature. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. When there is no Cisco IP Phone, the ingress classification is set to not trust the QoS label in the packet. The policing is applied to the traffic matching the policy-map classification before the switch enables the trust boundary feature.

- When you enter the `auto qos voip cisco-softphone` interface configuration command on a port at the network edge that is connected to a device running the Cisco SoftPhone, the switch uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0.

- When you enter the `auto qos voip trust` interface configuration command on a port connected to the network interior, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices).

### Table 76: Traffic Types, Packet Labels, and Queues

- When you enable auto-QoS by using the `auto qos voip cisco-phone`, the `auto qos voip cisco-softphone`, or the `auto qos voip trust` interface configuration command, the switch automatically generates a QoS configuration based on the traffic type and ingress packet label and applies the commands listed in Examples: Global Auto-QoS Configuration, on page 609 to the port.

**Enhanced Auto-QoS for Video, Trust, and Classification**

Auto-QoS is enhanced to support video. Automatic configurations are generated that classify and trust traffic from Cisco TelePresence systems and Cisco IP cameras.

**Auto-QoS Configuration Migration**

Auto-QoS configuration migration from legacy auto-QoS to enhanced auto-QoS occurs when:

- A switch is booted with a 12.2(55)SE image and QoS is not enabled.
  - Any video or voice trust configuration on the interface automatically generates enhanced auto-QoS commands.
- A switch is enabled with QoS, these guidelines take effect:
  - If you configure the interface for conditional trust on a voice device, only the legacy auto-QoS VoIP configuration is generated.
• If you configure the interface for conditional trust on a video device, the enhanced auto-QoS configuration is generated.

• If you configure the interface with classification or conditional trust based on the new interface auto-QoS commands, enhanced auto-QoS configuration is generated.

• Auto-QoS migration happens after a new device is connected when the `auto qos srnd4` global configuration command is enabled.

---

**Note**

If an interface previously configured with legacy auto-QoS migrates to enhanced auto-QoS, voice commands and configuration are updated to match the new global QoS commands.

Auto-QoS configuration migration from enhanced auto-QoS to legacy auto-QoS can occur only when you disable all existing auto-QoS configurations from the interface.

---

**Auto-QoS Configuration Guidelines**

Before configuring auto-QoS, you should be aware of this information:

• After auto-QoS is enabled, do not modify a policy map that includes `AutoQoS` in its name. If you need to modify the policy map, make a copy of it, and change the copied policy map. To use this new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map to the interface.

• To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. If necessary, you can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed.

• You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

• By default, the CDP is enabled on all ports. For auto-QoS to function properly, do not disable CDP.

---

**Auto-QoS VoIP Considerations**

Before configuring auto-QoS for VoIP, you should be aware of this information:

• Auto-QoS configures the switch for VoIP with Cisco IP Phones on nonrouted and routed ports. Auto-QoS also configures the switch for VoIP with devices running the Cisco SoftPhone application.

---

**Note**

When a device running Cisco SoftPhone is connected to a nonrouted or routed port, the switch supports only one Cisco SoftPhone application per port.

• When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

• This release supports only Cisco IP SoftPhone Version 1.3(3) or later.

• Connected devices must use Cisco Call Manager Version 4 or later.
Auto-QoS Enhanced Considerations

Auto-QoS is enhanced to support video. Automatic configurations are generated that classify and trust traffic from Cisco TelePresence systems and Cisco IP cameras.

Before configuring auto-QoS enhanced, you should be aware of this information:

- The `auto qos srnd4` global configuration command is generated as a result of enhanced auto-QoS configuration.

Effects of Auto-QoS on Running Configuration

When auto-QoS is enabled, the `auto qos` interface configuration commands and the generated global configuration are added to the running configuration.

The switch applies the auto-QoS-generated commands as if the commands were entered from the CLI. An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions may occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands are not applied, the previous running configuration is restored.

Effects of Auto-QoS Compact on Running Configuration

If auto-QoS compact is enabled:

- Only the auto-QoS commands entered from the CLI are displayed in running-config.
- The generated global and interface configurations are hidden.
- When you save the configuration, only the auto-qos commands you have entered are saved (and not the hidden configuration).
- When you reload the switch, the system detects and re-executes the saved auto-QoS commands and the AutoQoS SRND4.0 compliant config-set is generated.

Note

Do not make changes to the auto-QoS-generated commands when auto-QoS compact is enabled, because user-modifications are overridden when the switch reverts.

When auto-qos global compact is enabled:

- `show derived-config` command can be used to view hidden AQC derived commands.
- AQC commands will not be stored to memory. They will be regenerated every time the switch is reloaded.
- When compaction is enabled, auto-qos generated commands should not be modified.
- If the interface is configured with auto-QoS and if AQC needs to be disabled, auto-qos should be disabled at interface level first.
## How to Configure Auto-QoS

### Configuring Auto-QoS

#### Enabling Auto-QoS

For optimum QoS performance, enable auto-QoS on all the devices in your network.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface interface-id</code></td>
<td>Specifies the port that is connected to a video device or the uplink port that is connected to another trusted switch or router in the network interior, and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# interface gigabitethernet 3/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Use one of the following:</td>
<td>Enables auto-QoS for VoIP.</td>
</tr>
<tr>
<td></td>
<td>• `auto qos voip {cisco-phone</td>
<td>cisco-softphone</td>
</tr>
<tr>
<td></td>
<td>• `auto qos video {cts</td>
<td>ip-camera</td>
</tr>
<tr>
<td></td>
<td>• <code>auto qos classify [police]</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• `auto qos trust {cos</td>
<td>dscp}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-if)# auto qos trust dscp</code></td>
<td></td>
</tr>
</tbody>
</table>

- **cisco-phone**—If the port is connected to a Cisco IP Phone, the QoS labels of incoming packets are trusted only when the telephone is detected.
- **cisco-softphone**—The port is connected to device running the Cisco SoftPhone feature.
- **trust**—The uplink port is connected to a trusted switch or router, and the VoIP traffic classification in the ingress packet is trusted.

Enables auto-QoS for a video device.

- **cts**—A port connected to a Cisco Telepresence system.
- **ip-camera**—A port connected to a Cisco video surveillance camera.
- **media-player**—A port connected to a CDP-capable Cisco digital media player.
### Enabling Auto-QoS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>QoS labels of incoming packets are trusted only when the system is detected. Enables auto-QoS for classification.</td>
<td></td>
</tr>
<tr>
<td>▪ <strong>police</strong>—Policing is set up by defining the QoS policy maps and applying them to ports (port-based QoS). Enables auto-QoS for trusted interfaces.</td>
<td></td>
</tr>
<tr>

Enabling Auto-Qos Compact

To enable auto-Qos compact, enter this command:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `configure terminal`        | Enters global configuration mode.                                       |
| Example:
| `Switch# configure terminal`|                                                                         |
| **Step 2**
| `auto qos global compact`   | Enables auto-Qos compact and generates (hidden) the global configurations for auto-QoS. |
| Example:
| `Switch(config)# auto qos global compact` | You can then enter the auto-QoS command you want to configure in the interface configuration mode and the interface commands that the system generates are also hidden. |
|                              | To display the auto-QoS configuration that has been applied, use these the privileged EXEC commands: | These commands will have keyword "AutoQos-". |
|                              | • show derived-config                                                 |                                                 |
|                              | • show policy-map                                                     |                                                 |
|                              | • show access-list                                                    |                                                 |
|                              | • show class-map                                                     |                                                 |
|                              | • show table-map                                                     |                                                 |
|                              | • show auto-qos                                                      |                                                 |
|                              | • show policy-map interface                                          |                                                 |
|                              | • show ip access-list                                                |                                                 |

Verifies your entries.
This command displays the auto-QoS command on the interface on which auto-QoS was enabled. You can use the `show running-config privileged EXEC command to display the auto-QoS configuration and the user modifications.
What to do next

To disable auto-QoS compact, remove auto-Qos instances from all interfaces by entering the no form of the corresponding auto-QoS commands and then enter the no auto qos global compact global configuration command.

Troubleshooting Auto-QoS

To troubleshoot auto-QoS, use the debug auto qos privileged EXEC command. For more information, see the debug auto qos command in the command reference for this release.

To disable auto-QoS on a port, use the no form of the auto qos command interface configuration command, such as no auto qos voip. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the no auto qos voip command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Monitoring Auto-QoS

Table 79: Commands for Monitoring Auto-QoS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show auto qos [interface [interface-type]]</td>

Configuration Examples for Auto-QoS

Examples: Global Auto-QoS Configuration

The following table describes the automatically generated commands for auto-QoS and enhanced auto-QoS by the switch.

Table 80: Generated Auto-QoS Configuration

| Description                                                                 | Automatically Generated Command {voip}                                                                 | Enhanced Automatically Generated Command {Video|Trust|Classify} |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| The switch automatically enables standard QoS and configures the           | Switch(config)# mls qos                                                                             | Switch(config)# mls qos                                   |
| CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value).      | Switch(config)# mls qos map cos-dscp 0 8 16 26 32 46 48 56                                             | Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56 |

show running-config

Displays information about the QoS configuration that might be affected by auto-QoS.

You can compare the show auto qos and the show running-config command output to identify the user-defined QoS settings.
| Description | Automatically Generated Command {voip} | Enhanced Automatically Generated Command {Video|Trust|Classify} |
|-------------|----------------------------------|---------------------------------------------------|
| The switch automatically maps CoS values to an egress queue and to a threshold ID. | Switch(config)# no mls qos srr-queue output cos-map Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 3 5 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 3 6 7 Switch(config)# mls qos srr-queue output cos-map queue 3 threshold 3 2 4 Switch(config)# mls qos srr-queue output cos-map queue 4 threshold 2 1 Switch(config)# mls qos srr-queue output cos-map queue 4 threshold 3 0 | Switch(config)# no mls qos srr-queue output cos-map Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 3 4 5 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 3 6 7 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 1 2 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 2 3 Switch(config)# mls qos srr-queue output cos-map queue 3 threshold 3 0 Switch(config)# mls qos srr-queue output cos-map queue 4 threshold 3 1 |
| Description | Automatically Generated Command (voip) | Enhanced Automatically Generated Command (Video|Trust|Classify) |
|-------------|---------------------------------------|----------------------------------|
| The switch automatically maps DSCP values to an egress queue and to a threshold ID. | Switch(config)# no mls qos srr-queue output dscp-map Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 3 40 41 42 43 44 45 46 47 | Switch(config)# no mls qos srr-queue output dscp-map Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 3 32 33 40 41 42 43 44 45 46 47 |

Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 24 25 26 27 28 29 30 31 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 17 18 19 20 21 22 23 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 24 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 48 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 24 25 26 27 28 29 30 31 34 35 36 37 38 39 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 56 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 56 |

Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 16 17 18 19 20 21 22 23 Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 32 33 34 35 36 37 38 39 Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 16 17 18 19 20 21 22 23 Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 32 33 34 35 36 37 38 39 |

Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 9 10 11 12 13 14 15 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 9 10 11 12 13 14 15 |
The switch automatically configures the egress queue buffer sizes. It configures the bandwidth and the SRR mode (shaped or shared) on the egress queues mapped to the port.

| Description | Automatically Generated Command {voip} | Enhanced Automatically Generated Command {Video|Trust|Classify} |
|-------------|----------------------------------------|----------------------------------------------------------|
|             | Switch(config)# mls qos queue-set output 1 threshold 1 138 138 92 138 | Switch(config)# mls qos queue-set output 1 threshold 2 100 100 50 200 |
|             | Switch(config)# mls qos queue-set output 1 threshold 2 138 138 92 400 | Switch(config)# mls qos queue-set output 1 threshold 2 125 125 100 400 |
|             | Switch(config)# mls qos queue-set output 1 threshold 3 36 77 100 318 | Switch(config)# mls qos queue-set output 1 threshold 3 100 100 100 400 |
|             | Switch(config)# mls qos queue-set output 1 threshold 4 20 50 67 400 | Switch(config)# mls qos queue-set output 1 threshold 4 60 150 50 200 |

Switch(config)# mls qos queue-set output 2 buffers 16 6 17 61  
Switch(config-if)# priority-que out  
Switch(config-if)# srr-queue bandwidth share 10 10 60 20 |

If you entered the `auto qos voip cisco-phone` command, the switch automatically enables the trusted boundary feature, which uses the CDP to detect the presence or absence of a Cisco IP Phone (as shown below).

```
Switch(config-if)# mls qos trust device cisco-phone
```

If you entered the `auto qos voip cisco-softphone` command, the switch automatically creates class maps and policy maps (as shown below).

```
Switch(config)# mls qos map policed-dscp 24 26 46 to 0  
Switch(config)# class-map match-all AutoQoS-VoIP-RTP-Trust  
Switch(config-cmap)# match ip dscp ef  
Switch(config)# class-map match-all AutoQoS-VoIP-Control-Trust  
Switch(config-cmap)# match ip dscp cs3 af31  
Switch(config)# policy-map AutoQoS-Policy-SofPhone  
Switch(config-pmap)# class AutoQoS-VoIP-RTP-Trust  
Switch(config-pmap-c)# set dscp ef  
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit  
Switch(config-pmap-c)# class AutoQoS-VoIP-Control-Trust  
Switch(config-pmap-c)# set dscp cs3  
Switch(config-pmap-c)# police 32000 8000 exceed-action policed-dscp-transmit
```

After creating the class maps and policy maps, the switch automatically applies the policy map called `AutoQoS-Policy-SofPhone` to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled (as shown below).

```
Switch(config-if)# service-policy input AutoQoS-Policy-SofPhone
```
Examples: Auto-QoS Generated Configuration for VoIP Devices

If you entered the `auto qos voip cisco-phone` command, the switch automatically enables the trusted boundary feature, which uses the CDP to detect the presence or absence of a Cisco IP Phone.

Switch(config-if)# mls qos trust device cisco-phone

If you entered the `auto qos voip cisco-softphone` command, the switch automatically creates class maps and policy maps.

Switch(config)# mls qos map policed-dscp 24 26 46 to 0
Switch(config)# class-map match-all AutoQoS-VoIP-RTP-Trust
Switch(config-cmap)# match ip dscp ef
Switch(config-cmap)# class-map match-all AutoQoS-VoIP-Control-Trust
Switch(config-cmap)# match ip dscp cs3 af31
Switch(config)# policy-map AutoQoS-Police-SoftPhone
Switch(config-pmap)# class AutoQoS-VoIP-RTP-Trust
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit

After creating the class maps and policy maps, the switch automatically applies the policy map called `AutoQoS-Police-SoftPhone` to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.

Switch(config-if)# service-policy input AutoQoS-Police-SoftPhone

If you entered the `auto qos voip cisco-phone` command, the switch automatically creates class maps and policy maps.

Switch(config-if)# mls qos trust device cisco-phone

If you entered the `auto qos voip cisco-softphone` command, the switch automatically creates class maps and policy maps.

Switch(config)# mls qos map policed-dscp 24 26 46 to 0
Switch(config)# class-map match-all AutoQoS-VoIP-RTP-Trust
Switch(config-cmap)# match ip dscp ef
Switch(config-cmap)# class-map match-all AutoQoS-VoIP-Control-Trust
Switch(config-cmap)# match ip dscp cs3 af31
Switch(config)# policy-map AutoQoS-Police-CiscoPhone
Switch(config-pmap)# class AutoQoS-VoIP-RTP-Trust
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit

After creating the class maps and policy maps, the switch automatically applies the policy map called `AutoQoS-Police-CiscoPhone` to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.
Examples: Auto-QoS Generated Configuration For Enhanced Video, Trust, and Classify Devices

If you entered the following enhanced auto-QoS commands, the switch configures a CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value):

- auto qos video cts
- auto qos video ip-camera
- auto qos video media-player
- auto qos trust
- auto qos trust cos
- auto qos trust dscp

The following command is initiated after entering one of the above auto-QoS commands:

Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56

Note

No class maps and policy maps are configured.

If you entered the auto qos classify command, the switch automatically creates class maps and policy maps (as shown below).

Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_MULTIENHANCED_CONF_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-MULTIENHANCED-CONF
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Switch(config)# class-map match-all AUTOQOS_TRANSACTION_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-TRANSACTIONAL-DATA
Switch(config)# class-map match-all AUTOQOS_SIGNALING_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SIGNALING
Switch(config)# class-map match-all AUTOQOS_BULK_DATA_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-BULK-DATA
Switch(config)# class-map match-all AUTOQOS_SCAVANGER_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SCAVANGER
Switch(config)# policy-map AUTOQOS-SRND4-CLASSIFY-POLICY
Switch(config-pmap)# class AUTOQOS_MULTIENHANCED_CONF_CLASS
Switch(config-pmap-c)# set dscp af41
Switch(config-pmap-c)# class AUTOQOS_BULK_DATA_CLASS
Switch(config-pmap-c)# set dscp af11
Switch(config-pmap-c)# class AUTOQOS_TRANSACTION_CLASS
Switch(config-pmap-c)# set dscp af21
Switch(config-pmap-c)# class AUTOQOS_SCAVANGER_CLASS
Switch(config-pmap-c)# set dscp cs1
Switch(config-pmap)# class AUTOQOS_SIGNALING_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
Switch(config-if)# service-policy input AUTOQOS-SRND4-CLASSIFY-POLICY

If you entered the auto qos classify police command, the switch automatically creates class maps and policy maps (as shown below).

Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_MULTIENHANCED_CONF_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-MULTIENHANCED-CONF
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Switch(config)# class-map match-all AUTOQOS_TRANSACTION_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-TRANSACTIONAL-DATA
Switch(config)# class-map match-all AUTOQOS_SIGNALING_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SIGNALING
Switch(config)# class-map match-all AUTOQOS_BULK_DATA_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-BULK-DATA
Switch(config)# class-map match-all AUTOQOS_SCAVANGER_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SCAVANGER
Switch(config)# policy-map AUTOQOS-SRND4-CLASSIFY-POLICE-POLICY
Switch(config-pmap)# class AUTOQOS_MULTIENHANCED_CONF_CLASS
Switch(config-pmap-c)# set dscp af41
Switch(config-pmap-c)# police 5000000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_BULK_DATA_CLASS
Switch(config-pmap-c)# set dscp af11
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_TRANSACTION_CLASS
Switch(config-pmap-c)# set dscp af21
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_SCAVANGER_CLASS
Switch(config-pmap-c)# set dscp cs1
Switch(config-pmap-c)# police 10000000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_SIGNALING_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 320000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit

This is the enhanced configuration for the auto qos voip cisco-phone command:

Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_VOIP_DATA_CLASS
Switch(config-cmap)# match ip dscp ef
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Switch(config)# class-map match-all AUTOQOS_VOIP_SIGNAL_CLASS
Switch(config-cmap)# match ip dscp cs3
Switch(config)# policy-map AUTOQOS-SRND4-CISCOPHONE-POLICY
Switch(config-pmap)# class AUTOQOS_VOIP_DATA_CLASS
Switch(config-pmap-c)# set dscp ef
This is the enhanced configuration for the `auto qos voip cisco-softphone` command:
The following is an example of the `auto qos global compact` command.

```
Switch# configure terminal
Switch(config)# auto qos global compact
Switch(config)# interface GigabitEthernet1/2
Switch(config-if)# auto qos voip cisco-phone
```

```
Switch# show auto-qos
GigabitEthernet1/2
auto qos voip cisco-phone
```

```
Switch# show running-config interface GigabitEthernet 1/0/2
interface GigabitEthernet1/0/2
auto qos voip cisco-phone
end
```

Routing

- Configuring IP Unicast Routing, on page 623
- Configuring IPv6 First Hop Security, on page 631
- Routing Information Protocol, on page 663
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IP Unicast Routing

This module describes how to configure IP Version 4 (IPv4) unicast routing on the switch.

A switch stack operates and appears as a single router to the rest of the routers in the network.

Note

In addition to IPv4 traffic, you can also enable IP Version 6 (IPv6) unicast routing and configure interfaces to forward IPv6 traffic.
Information About IP Routing

In some network environments, VLANs are associated with individual networks or subnetworks. In an IP network, each subnetwork is mapped to an individual VLAN. Configuring VLANs helps control the size of the broadcast domain and keeps local traffic local. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

Figure 65: Routing Topology Example

This figure shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router has an interface in each VLAN.

When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

Types of Routing

Routers and Layer 3 switches can route packets in these ways:

- By using default routing
- By using preprogrammed static routes for the traffic
- By dynamically calculating routes by using a routing protocol

The switch supports static routes and default routes. It does not support routing protocols.

IP Routing and Switch Stacks

A switch stack appears to the network as a single switch, regardless of which switch in the stack is connected to a routing peer.

The active switch performs these functions:

- It initializes and configures the routing protocols.
- It sends routing protocol messages and updates to other routers.
- It processes routing protocol messages and updates received from peer routers.
• It generates, maintains, and distributes the distributed Cisco Express Forwarding (dCEF) database to all
stack members. The routes are programmed on all switches in the stack bases on this database.

• The MAC address of the active switch is used as the router MAC address for the whole stack, and all
outside devices use this address to send IP packets to the stack.

• All IP packets that require software forwarding or processing go through the CPU of the active switch.

Stack members perform these functions:

• They act as routing standby switches, ready to take over in case they are elected as the new active switch
if the active switch fails.

• They program the routes into hardware.

If a active switch fails, the stack detects that the active switch is down and elects one of the stack members
to be the new active switch. During this period, except for a momentary interruption, the hardware continues
to forward packets with no active protocols.

However, even though the switch stack maintains the hardware identification after a failure, the routing
protocols on the router neighbors might flap during the brief interruption before the active switch restarts.
Routing protocols such as OSPF and EIGRP need to recognize neighbor transitions.

Upon election, the new active switch performs these functions:

• It starts generating, receiving, and processing routing updates.

• It builds routing tables, generates the CEF database, and distributes it to stack members.

• It uses its MAC address as the router MAC address. To notify its network peers of the new MAC address,
it periodically (every few seconds for 5 minutes) sends a gratuitous ARP reply with the new router MAC
address.

  Note  If you configure the persistent MAC address feature on the stack and the active
switch changes, the stack MAC address does not change for the configured time
period. If the previous active switch rejoins the stack as a member switch during
that time period, the stack MAC address remains the MAC address of the previous
active switch.

• It attempts to determine the reachability of every proxy ARP entry by sending an ARP request to the
proxy ARP IP address and receiving an ARP reply. For each reachable proxy ARP IP address, it generates
a gratuitous ARP reply with the new router MAC address. This process is repeated for 5 minutes after a
new active switch election.

  Caution  Partitioning of the switch stack into two or more stacks might lead to undesirable
behavior in the network.

If the switch is reloaded, then all the ports on that switch go down and there is a loss of traffic for the interfaces
involved in routing.
Configuring IP Unicast Routing

By default, IP routing is disabled on the switch. For detailed IP routing configuration information, see the Cisco IOS IP Configuration Guide, Release 12.2 from the Cisco.com page under Documentation > Cisco IOS Software Releases > 12.2 Mainline > Configuration Guides.

In these procedures, the specified interface must be a switch virtual interface (SVI)-a VLAN interface created by using the `interface vlan vlan_id` global configuration command and by default a Layer 3 interface. All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them. See the Assigning IP Addresses to SVIs section.

Note

The switch supports 16 static routes (including user-configured routes and the default route) and any directly connected routes and default routes for the management interface. You can use the "lanbase-default" SDM template to configure the static routes. The switch can have an IP address assigned to each SVI. Before enabling routing, enter the `sdm prefer lanbase-routing` global configuration command and reload the switch.

Procedures for configuring routing:

- To support VLAN interfaces, create and configure VLANs on the switch or switch stack, and assign VLAN membership to Layer 2 interfaces. For more information, see chapter: Configuring VLANs.

- Configure Layer 3 interfaces (SVIs).

- Enable IP routing on the switch.

- Assign IP addresses to the Layer 3 interfaces.

- Configure static routes.

Enabling IP Unicast Routing

By default, the Switch is in Layer 2 switching mode and IP routing is disabled. To use the Layer 3 capabilities of the Switch, you must enable IP routing.

Procedure

<table>
<thead>
<tr>

<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Assigning IP Addresses to SVIs

To configure IP routing, you need to assign IP addresses to Layer 3 network interfaces. This enables communication with the hosts of those interfaces that use IP. IP routing is disabled by default, and no IP addresses are assigned to SVIs.

An IP address identifies a location to which IP packets can be sent. Some IP addresses are reserved for special uses and cannot be used for host, subnet, or network addresses. RFC 1166, “Internet Numbers,” contains the official description of IP addresses.

An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

Follow these steps to assign an IP address and a network mask to an SVI:

#### Procedure

</table>
## Configuring Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Follow these steps to configure a static route:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Step 1

Enables privileged EXEC mode.

**Example:**

Switch> enable

### Step 2

Enters global configuration mode.

**Example:**

Switch# configure terminal

### Step 3

Establish a static route.

**Example:**

Switch(config)# ip route prefix mask gigabitethernet 1/0/4

### Step 4

Returns to privileged EXEC mode.

**Example:**

Switch(config)# end

### Step 5

Displays the current state of the routing table to verify the configuration.

**Example:**

Switch# show ip route

### Step 6

(Optional) Saves your entries in the configuration file.

**Example:**

Switch# copy running-config startup-config
Purpose
Command or Action
Switch# copy running-config
startup-config

What to do next

Use the no ip route prefix mask {address|interface} global configuration command to remove a static route. The switch retains static routes until you remove them.

Monitoring and Maintaining the IP Network

You can remove all contents of a particular cache, table, or database. You can also display specific statistics.

Table 82: Commands to Clear IP Routes or Display Route Status

<table>

<td>show ip route [address [mask] [longer-prefixes]]</td>
<td>Displays the current state of the routing table.</td>
</tr>
<tr>
<td>show ip route summary</td>
<td>Displays the current state of the routing table in summary form.</td>
</tr>
<tr>
<td>show platform ip unicast</td>
<td>Displays platform-dependent IP unicast information.</td>
</tr>
</tbody>
</table>
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for First Hop Security in IPv6

• You have configured the necessary IPv6 enabled SDM template.

• You should be familiar with the IPv6 neighbor discovery feature.
Restrictions for First Hop Security in IPv6

- The following restrictions apply when applying FHS policies to EtherChannel interfaces (Port Channels):
  - A physical port with an FHS policy attached cannot join an EtherChannel group.
  - An FHS policy cannot be attached to a physical port when it is a member of an EtherChannel group.

- By default, a snooping policy has a security-level of guard. When such a snooping policy is configured on an access switch, external IPv6 Router Advertisement (RA) or Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server packets are blocked, even though the uplink port facing the router or DHCP server/relay is configured as a trusted port. To allow IPv6 RA or DHCPv6 server messages, do the following:
  - Apply an IPv6 RA-guard policy (for RA) or IPv6 DHCP-guard policy (for DHCP server messages) on the uplink port.
  - Configure a snooping policy with a lower security-level, for example glean or inspect. However; configuring a lower security level is not recommended with such a snooping policy, because benefits of First Hop security features are not effective.

Information about First Hop Security in IPv6

First Hop Security in IPv6 (FHS IPv6) is a set of IPv6 security features, the policies of which can be attached to a physical interface, an EtherChannel interface, or a VLAN. An IPv6 software policy database service stores and accesses these policies. When a policy is configured or modified, the attributes of the policy are stored or updated in the software policy database, then applied as was specified. The following IPv6 policies are currently supported:

- IPv6 FHS Binding Table Content—A database table of IPv6 neighbors connected to the switch is created from information sources such as Neighbor Discovery (ND) protocol snooping. This database, or binding, table is used by various IPv6 guard features (such as IPv6 ND Inspection) to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.

- IPv6 Neighbor Discovery Inspection—IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database and IPv6 neighbor discovery messages that do not conform are dropped. An ND message is considered trustworthy if its IPv6-to-Media Access Control (MAC) mapping is verifiable.

  This feature mitigates some of the inherent vulnerabilities of the ND mechanism, such as attacks on DAD, address resolution, router discovery, and the neighbor cache.

- IPv6 Router Advertisement Guard—The IPv6 Router Advertisement (RA) guard feature enables the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network switch platform. RAs are used by routers to announce themselves on the link. The RA Guard feature
analyzes the RAs and filters out bogus RAs sent by unauthorized routers. In host mode, all router advertisement and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. Once the Layer 2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

- IPv6 DHCP Guard—The IPv6 DHCP Guard feature blocks reply and advertisement messages that come from unauthorized DHCPv6 servers and relay agents. IPv6 DHCP guard can prevent forged messages from being entered in the binding table and block DHCPv6 server messages when they are received on ports that are not explicitly configured as facing a DHCPv6 server or DHCP relay. To use this feature, configure a policy and attach it to an interface or a VLAN. To debug DHCP guard packets, use the `debug ipv6 snooping dhcp-guard` privileged EXEC command.

- IPv6 Source Guard—Like IPv4 Source Guard, IPv6 Source Guard validates the source address or prefix to prevent source address spoofing.

A source guard programs the hardware to allow or deny traffic based on source or destination addresses. It deals exclusively with data packet traffic.

The IPv6 source guard feature provides the ability to use the IPv6 binding table to install PACLs to prevent a host from sending packets with an invalid IPv6 source address.

To debug source-guard packets, use the `debug ipv6 snooping source-guard` privileged EXEC command.

---

**Note** The IPv6 PACL feature is supported only in the ingress direction; it is not supported in the egress direction.

The following restrictions apply:

- An FHS policy cannot be attached to an physical port when it is a member of an EtherChannel group.

- When IPv6 source guard is enabled on a switch port, NDP or DHCP snooping must be enabled on the interface to which the switch port belongs. Otherwise, all data traffic from this port will be blocked.

- An IPv6 source guard policy cannot be attached to a VLAN. It is supported only at the interface level.

- When you configure IPv4 and IPv6 source guard together on an interface, it is recommended to use `ip verify source mac-check` instead of `ip verify source`. IPv4 connectivity on a given port might break due to two different filtering rules set — one for IPv4 (IP-filter) and the other for IPv6 (IP-MAC filter).

- You cannot use IPv6 Source Guard and Prefix Guard together. When you attach the policy to an interface, it should be "validate address" or "validate prefix" but not both.

- PVLAN and Source/Prefix Guard cannot be applied together.

For more information on IPv6 Source Guard, see the [IPv6 Source Guard] chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.
• IPv6 Prefix Guard—The IPv6 prefix guard feature works within the IPv6 source guard feature, to enable the device to deny traffic originated from non-topologically correct addresses. IPv6 prefix guard is often used when IPv6 prefixes are delegated to devices (for example, home gateways) using DHCP prefix delegation. The feature discovers ranges of addresses assigned to the link and blocks any traffic sourced with an address outside this range.

For more information on IPv6 Prefix Guard, see the IPv6 Prefix Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

• IPv6 Destination Guard—The IPv6 destination guard feature works with IPv6 neighbor discovery to ensure that the device performs address resolution only for those addresses that are known to be active on the link. It relies on the address glean functionality to populate all destinations active on the link into the binding table and then blocks resolutions before they happen when the destination is not found in the binding table.

Note
IPv6 Destination Guard is recommended only on Layer 3. It is not recommended on Layer2.

For more information about IPv6 Destination Guard, see the IPv6 Destination Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

• IPv6 Neighbor Discovery Multicast Suppress—The IPv6 Neighbor Discovery multicast suppress feature is an IPv6 snooping feature that runs on a switch or a wireless controller and is used to reduce the amount of control traffic necessary for proper link operations.

• DHCPv6 Relay—Lightweight DHCPv6 Relay Agent—The DHCPv6 Relay—Lightweight DHCPv6 Relay Agent feature allows relay agent information to be inserted by an access node that performs a link-layer bridging (non-routing) function. Lightweight DHCPv6 Relay Agent (LDRA) functionality can be implemented in existing access nodes, such as DSL access multiplexers (DSLAMs) and Ethernet switches, that do not support IPv6 control or routing functions. LDRA is used to insert relay-agent options in DHCP version 6 (DHCPv6) message exchanges primarily to identify client-facing interfaces. LDRA functionality can be enabled on an interface and on a VLAN.

Note
If an LDRA device is directly connected to a client, the interface must have the pool configuration to fetch the specific subnet or link information at the server side. In this case, if the LDRA device is present in different subnets or links, the server may not be able to fetch the correct subnet. You can now configure the pool name in the interface so as to choose the proper subnet or link for the client.

For more information about DHCPv6 Relay, See the DHCPv6 Relay—Lightweight DHCPv6 Relay Agent section of the IP Addressing: DHCP Configuration Guide, Cisco IOS Release 15.1SG.

<tr>
<td></td>
<td>[seconds</td>
<td>infinite]</td>
</tr>
<tr>
<td></td>
<td>[enable [reachable-lifetime</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[seconds</td>
<td>infinite} }</td>
</tr>
<tr>
<td></td>
<td>[trusted-port }</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch (config-ipv6-snooping) # security-level inspect</td>
<td></td>
</tr>
<tr>
<td></td>
<td>switch]—Specifies the role of the device attached to the port. Default is node.</td>
<td></td>
</tr>
</tbody>
</table>
### How to Configure an IPv6 Snooping Policy

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Example: Switch(config-ipv6-snooping)# trusted-port | • (Optional) **limit address-count**<br> *value*—Limits the number of addresses allowed per target.  

• (Optional) **no**—Negates a command or sets it to defaults.  

• (Optional) **protocol** `{dhcp | ndp}`—Specifies which protocol should be redirected to the snooping feature for analysis. The default is **dhcp** and **ndp**. To change the default, use the **no protocol** command.  

• (Optional) **security-level** `{glean | guard | inspect}`—Specifies the level of security enforced by the feature. Default is **guard**.  
  
  **glean**—Gleans addresses from messages and populates the binding table without any verification.  
  
  **guard**—Gleans addresses and inspects messages. In addition, it rejects RA and DHCP server messages. This is the default option.  
  
  **inspect**—Gleans addresses, validates messages for consistency and conformance, and enforces address ownership.  

• (Optional) **tracking** `{disable | enable}`—Overrides the default tracking behavior and specifies a tracking option.  

• (Optional) **trusted-port**—Sets up a trusted port. It disables the guard on applicable targets. Bindings learned through a trusted port have preference over bindings learned through any other port. A trusted port is given preference in case of a collision while making an entry in the table. |

---

**Step 4**  
**Example:**  
Switch(config-ipv6-snooping)# **exit**  
Exits configuration modes to Privileged EXEC mode.  

**Step 5**  
**Example:**  
**show ipv6 snooping policy** **policy-name**  
Displays the snooping policy configuration.
### How to Attach an IPv6 Snooping Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an interface or VLAN:

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface Interface_type stack/module/port</code></td>
<td>Specifies an interface type and identifier; enters the interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# interface gigabitethernet 1/1/4</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>switchport</code></td>
<td>Enters the Switchport mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-if)# switchport</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note**: To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the `switchport` interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration. The command prompt displays as (config-if)# in Switchport configuration mode.
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td>ipv6 snooping [attach-policy policy_name [vlan {vlan_id</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config-if)# ipv6 snooping

or

Switch(config-if)# ipv6 snooping attach-policy example_policy

or

Switch(config-if)# ipv6 snooping vlan 111,112

or

Switch(config-if)# ipv6 snooping attach-policy example_policy vlan 111,112

**Purpose**

Attaches a custom ipv6 snooping policy to the interface or the specified VLANs on the interface. To attach the default policy to the interface, use the `ipv6 snooping` command with the `attach-policy` keyword. To attach the default policy to VLANs on the interface, use the `ipv6 snooping vlan` command. The default policy is, security-level `guard`, device-role `node`, protocol `ndp` and `dhcp`.

### Step 5

**Command or Action**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td>do show running-config</td>
</tr>
</tbody>
</table>

**Example:**

Switch#(config-if)# do show running-config

**Purpose**

Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.

## How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an EtherChannel interface or VLAN:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

Switch# configure terminal

### Step 2

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 interface range Interface_name</td>
<td>Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config)# interface range Po11
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tip: Enter the <code>do show interfaces summary</code> command for quick reference to interface names and types.</td>
</tr>
</tbody>
</table>

**Step 3**

```plaintext
ipv6 snooping [attach-policy policy_name [vlan vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all]] | vlan [vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all] ]
```

**Example:**

```
Switch(config-if-range)# ipv6 snooping attach-policy example_policy
```

**Step 4**

```plaintext
do show running-config interface portchannel_interface_name
```

**Example:**

```
Switch#(config-if-range)# do show running-config int po11
```

### How to Configure the IPv6 Binding Table Content

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# configure terminal
```
How to Configure an IPv6 Neighbor Discovery Inspection Policy

How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

---

**Command or Action**

**Step 2**

```
[no] ipv6 neighbor binding [vlan vlan-id
{ipv6-address interface interface_type
stack/module/port hw_address
[reachable-lifetimevalue [seconds | default | infinite] | [tracking] [default | disable] |
reachable-lifetimevalue [seconds | default | infinite] | [enable [reachable-lifetimevalue
[seconds | default | infinite] | [retry-interval
{seconds | default | infinite} | [tracking
{default | disable} |
reachable-lifetimevalue
[seconds | default | infinite] ] ]
```

**Example:**

```
Switch(config)# ipv6 neighbor binding
```

**Purpose**

Adds a static entry to the binding table database.

**Step 3**

```
[no] ipv6 neighbor binding max-entries
number [mac-limit number] [port-limit number
[mac-limit number] | vlan-limit number [|
mac-limit number] | [port-limit number
[mac-limit number] ] ]
```

**Example:**

```
Switch(config)# ipv6 neighbor binding
max-entries 30000
```

**Purpose**

Specifies the maximum number of entries that are allowed to be inserted in the binding table cache.

**Step 4**

```
ipv6 neighbor binding logging
```

**Example:**

```
Switch(config)# ipv6 neighbor binding
logging
```

**Purpose**

Enables the logging of binding table main events.

**Step 5**

```
exit
```

**Example:**

```
Switch(config)# exit
```

**Purpose**

Exits global configuration mode, and places the router in privileged EXEC mode.

**Step 6**

```
show ipv6 neighbor binding
```

**Example:**

```
Switch# show ipv6 neighbor binding
```

**Purpose**

Displays contents of a binding table.

**How to Configure an IPv6 Neighbor Discovery Inspection Policy**

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
**Example:** Switch# configure terminal | Enters the global configuration mode. |
| **Step 2** | [no]ipv6 nd inspection policy *policy-name*  
**Example:** Switch(config)# ipv6 nd inspection policy example_policy | Specifies the ND inspection policy name and enters ND Inspection Policy configuration mode. |
| **Step 3** | device-role {host | monitor | router | switch}  
**Example:** Switch(config-nd-inspection)# device-role switch | Specifies the role of the device attached to the port. The default is **host**. |
| **Step 4** | drop-unsecure  
**Example:** Switch(config-nd-inspection)# drop-unsecure | Drops messages with no or invalid options or an invalid signature. |
| **Step 5** | limit address-count *value*  
**Example:** Switch(config-nd-inspection)# limit address-count 1000 | Enter 1–10,000. |
| **Step 6** | sec-level minimum *value*  
**Example:** Switch(config-nd-inspection)# limit address-count 1000 | Specifies the minimum security level parameter value when Cryptographically Generated Address (CGA) options are used. |
| **Step 7** | tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}]}  
**Example:** Switch(config-nd-inspection)# tracking disable stale-lifetime infinite | Overrides the default tracking policy on a port. |
| **Step 8** | trusted-port  
**Example:** Switch(config-nd-inspection)# trusted-port | Configures a port to become a trusted port. |
| **Step 9** | validate source-mac  
**Example:** Switch(config-nd-inspection)# validate source-mac | Checks the source media access control (MAC) address against the link-layer address. |
### How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to an interface or VLANs on an interface:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface Interface_type stack/module/port</td>
<td>Specifies an interface type and identifier; enters the interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# interface gigabitethernet 1/1/4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ipv6 nd inspection [attach-policy policy_name [vlan vlan_ids</td>
<td>attaches the Neighbor Discovery Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the attach-policy option is not used.</td>
</tr>
<tr>
<td></td>
<td>add vlan_ids</td>
<td>except vlan_ids [none</td>
</tr>
</tbody>
</table>

| **Example:** | Switch#(config-if-range)# do show running-config int Po11 | |
How to Configure an IPv6 DHCP Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 DHCP (DHCPv6) Guard policy:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>[no]ipv6 dhcp guard policy policy-name</code></td>
<td>Specifies the DHCPv6 Guard policy name and enters DHCPv6 Guard Policy configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# ipv6 dhcp guard policy example_policy</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`[no]device-role {client</td>
<td>server}`</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config-dhcp-guard)# device-role server</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>client</code>—Default value, specifies that the attached device is a client. Server messages are dropped on this port.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>server</code>—Specifies that the attached device is a DHCPv6 server. Server messages are allowed on this port.</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>[no] match server access-list ipv6-access-list-name</code></td>
<td>(Optional). Enables verification that the advertised DHCPv6 server or relay address is from an authorized server access list (The destination address in the access list is 'any'). If not configured, this check will be bypassed. An empty access list is treated as a permit all.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# ipv6 access-list my_acls Switch(config-ipv6-acl)# permit host FE80::ABBB:CCFF:FE01:F700 any ;;configure DHCPv6 Guard to match approved access list. Switch(config-dhcp-guard)# match server access-list my_acls</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>[no] match reply prefix-list ipv6-prefix-list-name</code></td>
<td>(Optional) Enables verification of the advertised prefixes in DHCPv6 reply messages from the configured authorized prefix list. If not</td>
</tr>
</tbody>
</table>
### How to Configure an IPv6 DHCP Guard Policy

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>;; Assume a preconfigured IPv6 prefix list as follows: Switch(config)# ipv6 prefix-list my_prefix permit 2001:0DB8::/64 le 128 ;; Configure DHCPv6 Guard to match prefix Switch(config-dhcp-guard)# match reply prefix-list my_prefix</td>
<td>configured, this check will be bypassed. An empty prefix list is treated as a permit.</td>
</tr>
</tbody>
</table>

**Step 6**

[no] preference { max limit | min limit }  
**Example:**  
Switch(config-dhcp-guard)# preference max 250  
Switch(config-dhcp-guard)# preference min 150  

Configure max and min when device-role is server to filter DHCPv6 server advertisements by the server preference value. The defaults permit all advertisements.  
**max limit**—(0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is less than the specified limit. Default is 0. If not specified, this check will be bypassed.  
**min limit**—(0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is greater than the specified limit. Default is 0. If not specified, this check will be bypassed.

**Step 7**

[no] trusted-port  
**Example:**  
Switch(config-dhcp-guard)# trusted-port  

(Optional) trusted-port—Sets the port to a trusted mode. No further policing takes place on the port.  
**Note**  
If you configure a trusted port then the device-role option is not available.

**Step 8**

default {device-role | trusted-port}  
**Example:**  
Switch(config-dhcp-guard)# default device-role  

(Optional) default—Sets a command to its defaults.

**Step 9**

do show ipv6 dhcp guard policy policy_name  
**Example:**  
Switch(config-dhcp-guard)# do show ipv6 dhcp guard policy example_policy  

(Optional) Displays the configuration of the IPv6 DHCP guard policy without leaving the configuration submode. Omitting the policy_name variable displays all DHCPv6 policies.

**Example of DHCPv6 Guard Configuration**

```conf
enable
configure terminal
ipv6 access-list acl1
   permit host FE80::A8BB:CCFF:FE01:F700 any
ipv6 prefix-list abc permit 2001:0DB8::/64 le 128
```
ipv6 dhcp guard policy poll
device-role server
match server access-list acl1
match reply prefix-list abc
preference min 0
preference max 255
trusted-port
interface GigabitEthernet 0/2/0
switchport
ipv6 dhcp guard attach-policy poll vlan add 1
ipv6 dhcp guard attach-policy poll
show ipv6 dhcp guard policy poll

Routing Information Protocol

RIP is a commonly used routing protocol in small to medium TCP/IP networks. Routing Information Protocol (RIP) is a stable protocol that uses a distance-vector algorithm to calculate routes.

This module describes how to configure RIP.

- Prerequisites for RIP, on page 663
- Restrictions for RIP, on page 663
- Information About Routing Information Protocol, on page 663
- How to Configure Routing Information Protocol, on page 667
- Configuration Examples for Routing Information Protocol, on page 670
- Additional References for RIP, on page 670
- Feature Information for RIP, on page 671

Prerequisites for RIP

You must configure `ip routing` command before you configure RIP.

Restrictions for RIP

Routing Information Protocol (RIP) uses hop count as the metric to rate the value of different routes. The hop count is the number of devices that can be traversed in a route. A directly connected network has a metric of zero; an unreachable network has a metric of 16. This limited metric range makes RIP unsuitable for large networks.

Information About Routing Information Protocol

RIP Overview

The Routing Information Protocol (RIP) Version 1 uses broadcast UDP data packets, and RIPv2 uses multicast packets to exchange the routing information. Cisco software sends routing information updates every 30 seconds, which is termed advertising. If a device does not receive an update from another device for 180
seconds or more, the receiving device marks the routes served by the nonupdating device as unusable. If there is still no update after 240 seconds, the device removes all routing table entries for the nonupdating device.

A device that is running RIP can receive a default network via an update from another device that is running RIP, or the device can source the default network using RIP. In both cases, the default network is advertised through RIP to other RIP neighbors.

The Cisco implementation of RIP Version 2 (RIPv2) supports plain text and message digest algorithm 5 (MD5) authentication, route summarization, classless interdomain routing (CIDR), and variable-length subnet masks (VLSMs).

RIP Routing Updates

The Routing Information Protocol (RIP) sends routing-update messages at regular intervals and when the network topology changes. When a device receives a RIP routing update that includes changes to an entry, the device updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP devices maintain only the best route (the route with the lowest metric value) to a destination. After updating its routing table, the device immediately begins transmitting RIP routing updates to inform other network devices of the change. These updates are sent independently of the regularly scheduled updates that RIP devices send.

Authentication in RIP

The Cisco implementation of the Routing Information Protocol (RIP) Version 2 (RIPv2) supports authentication, key management, route summarization, classless interdomain routing (CIDR), and variable-length subnet masks (VLSMs).

By default, the software receives RIPv1 packets, but sends only RIPv1 packets. You can configure the software to receive and send only RIPv1 packets. Alternatively, you can configure the software to receive and send only RIPv2 packets. To override the default behavior, you can configure the RIPv2 version that an interface sends. Similarly, you can also control how packets received from an interface are processed.

RIPv1 does not support authentication. If you are sending and receiving RIPv1 packets, you can enable RIPv1 authentication on an interface.

The key chain determines the set of keys that can be used on the interface. Authentication, including default authentication, is performed on that interface only if a key chain is configured.

Cisco supports two modes of authentication on an interface on which RIP is enabled: plain-text authentication and message digest algorithm 5 (MD5) authentication. Plain-text authentication is the default authentication in every RIPv2 packet.

---

**Note**

Do not use plain text authentication in RIP packets for security purposes, because the unencrypted authentication key is sent in every RIPv2 packet. Use plain-text authentication when security is not an issue; for example, you can use plain-text authentication to ensure that misconfigured hosts do not participate in routing.
RIP Routing Metric

The Routing Information Protocol (RIP) uses a single routing metric to measure the distance between the source and the destination network. Each hop in a path from the source to the destination is assigned a hop-count value, which is typically 1. When a device receives a routing update that contains a new or changed destination network entry, the device adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop. If an interface network is not specified in the routing table, it will not be advertised in any RIP update.

RIP Versions

The original version of Routing Information Protocol (RIP), is known as RIP Version 1 (RIPv1). The specification of the RIP, defined in RFC 1058, uses classful routing. Periodic routing updates do not support variable length subnet masks (VLSM) because periodic routing updates do not contain subnet information. All subnets in a network class must be of the same size. Because RIP, as per RFC 1058, does not support VLSM, it is not possible to have subnets of varying sizes inside the same network class. This limitation makes RIP vulnerable to attacks.

To rectify the deficiencies of the original RIP specification, RIP Version 2 (RIPv2), as described in RFC 2453, was developed. RIPv2 has the ability to carry subnet information; thus, it supports Classless Inter-Domain Routing (CIDR).

Exchange of Routing Information

Routing Information Protocol (RIP) is normally a broadcast protocol, and for RIP routing updates to reach nonbroadcast networks, you must configure the Cisco software to permit this exchange of routing information.

To control the set of interfaces with which you want to exchange routing updates, you can disable the sending of routing updates on specified interfaces by configuring the `passive-interface` router configuration command.

You can use an offset list to increase increasing incoming and outgoing metrics to routes learned via RIP. Optionally, you can limit the offset list with either an access list or an interface.

Routing protocols use several timers that determine variables such as the frequency of routing updates, the length of time before a route becomes invalid, and other parameters. You can adjust these timers to tune routing protocol performance to better suit your internetwork needs. You can make the following timer adjustments:

- The rate (time, in seconds, between updates) at which routing updates are sent
- The interval of time, in seconds, after which a route is declared invalid
- The interval, in seconds, during which routing information about better paths is suppressed
- The amount of time, in seconds, that must pass before a route is removed from the routing table
- The amount of time for which routing updates will be postponed

You can adjust the IP routing support in the Cisco software to enable faster convergence of various IP routing algorithms, and hence, cause quicker fallback to redundant devices. The total effect is to minimize disruptions to end users of the network in situations where quick recovery is essential.

In addition, an address family can have timers that explicitly apply to that address family (or Virtual Routing and Forwarding [VRF]) instance. The `timers-basic` command must be specified for an address family or the
system defaults for the `timers-basic` command are used regardless of the timer that is configured for RIP routing. The VRF does not inherit the timer values from the base RIP configuration. The VRF will always use the system default timers unless the timers are explicitly changed using the `timers-basic` command.

**Neighbor Router Authentication**

You can prevent your router from receiving fraudulent route updates by configuring neighbor router authentication. When configured, neighbor authentication occurs whenever routing updates are exchanged between neighbor routers. This authentication ensures that a router receives reliable routing information from a trusted source.

Without neighbor authentication, unauthorized or deliberately malicious routing updates could compromise the security of your network traffic. A security compromise could occur if an unfriendly party diverts or analyzes your network traffic. For example, an unauthorized router could send a fictitious routing update to convince your router to send traffic to an incorrect destination. This diverted traffic could be analyzed to learn confidential information about your organization or merely used to disrupt your organization’s ability to effectively communicate using the network. Neighbor authentication prevents any such fraudulent route updates from being received by your router.

When neighbor authentication has been configured on a router, the router authenticates the source of each routing update packet that it receives. This is accomplished by the exchange of an authenticating key (sometimes referred to as a password) that is known to both the sending and the receiving router.

There are two types of neighbor authentication used: plain text authentication and Message Digest Algorithm Version 5 (MD5) authentication. Both forms work in the same way, with the exception that MD5 sends a "message digest" instead of the authenticating key itself. The message digest is created using the key and a message, but the key itself is not sent, preventing it from being read while it is being transmitted. Plain text authentication sends the authenticating key itself over the wire.

---

*Note*

Note that plain text authentication is not recommended for use as part of your security strategy. Its primary use is to avoid accidental changes to the routing infrastructure. Using MD5 authentication, however, is a recommended security practice.

In plain text authentication, each participating neighbor router must share an authenticating key. This key is specified at each router during configuration. Multiple keys can be specified with some protocols; each key must then be identified by a key number.

In general, when a routing update is sent, the following authentication sequence occurs:

1. A router sends a routing update with a key and the corresponding key number to the neighbor router. In protocols that can have only one key, the key number is always zero. The receiving (neighbor) router checks the received key against the same key stored in its own memory.

2. If the two keys match, the receiving router accepts the routing update packet. If the two keys do not match, the routing update packet is rejected.

MD5 authentication works similarly to plain text authentication, except that the key is never sent over the wire. Instead, the router uses the MD5 algorithm to produce a "message digest" of the key (also called a "hash"). The message digest is then sent instead of the key itself. This ensures that nobody can eavesdrop on the line and learn keys during transmission.
Another form of neighbor router authentication is to configure key management using key chains. When you configure a key chain, you specify a series of keys with lifetimes, and the Cisco IOS software rotates through each of these keys. This decreases the likelihood that keys will be compromised.

Configuration Examples for Routing Information Protocol

Example: Enabling RIP and Configuring RIP Parameters

Device> enable
Device# configure terminal
Device(config)# router rip
Device(config-router)# network 10.1.1.0
Device(config-router)# neighbor 10.1.1.2
Device(config-router)# auto-summary
Device(config-router)# offset-list 98 in 1 GigabitEthernet 1/0
Device(config-router)# timers basic 1 2 3 4
Device(config-router)# maximum-paths 16
Device(config-router)# distance 85 192.168.10.0/24
Device(config-router)# end

Example: Specifying a RIP Version and Enabling Authentication

Device> enable
Device# configure terminal
Device(config)# router rip
Device(config-router)# version 2
Device(config-router)# exit
Device(config)# interface GigabitEthernet 0/0
Device(config-if)# ip rip send version 2
Device(config-if)# ip rip receive version 2
Device(config-if)# ip rip authentication key-chain chainname
Device(config-if)# ip rip authentication mode md5
Device(config-if)# end

Security Features Overview

The switch supports a LAN base image or a LAN lite image with a reduced feature set, depending on switch hardware. The security features are as follows:

- **IPv6 First Hop Security**—A suite of security features to be applied at the first hop switch to protect against vulnerabilities inherent in IPv6 networks. These include, Binding Integrity Guard (Binding Table), Router Advertisement Guard (RA Guard), DHCP Guard, IPv6 Neighbor Discovery Inspection (ND Guard), and IPv6 Source Guard.

  This feature is not supported on LanLite images on Catalyst 2960-X Series Switches.

- **Web Authentication**—Allows a supplicant (client) that does not support IEEE 802.1x functionality to be authenticated using a web browser.

- **Local Web Authentication Banner**—A custom banner or an image file displayed at a web authentication login screen.

- **IEEE 802.1x Authentication with ACLs and the RADIUS Filter-Id Attribute**

- **Password-protected access** (read-only and read-write access) to management interfaces (device manager, Network Assistant, and the CLI) for protection against unauthorized configuration changes

- **Multilevel security** for a choice of security level, notification, and resulting actions

- **Static MAC addressing** for ensuring security

- **Protected port option** for restricting the forwarding of traffic to designated ports on the same switch

- **Port security option** for limiting and identifying MAC addresses of the stations allowed to access the port

- **VLAN aware port security option** to shut down the VLAN on the port when a violation occurs, instead of shutting down the entire port.

- **Port security aging** to set the aging time for secure addresses on a port.
• Protocol storm protection to control the rate of incoming protocol traffic to a switch by dropping packets that exceed a specified ingress rate.

• BPDU guard for shutting down a Port Fast-configured port when an invalid configuration occurs.

• Standard and extended IP access control lists (ACLs) for defining inbound security policies on Layer 2 interfaces (port ACLs).

• Extended MAC access control lists for defining security policies in the inbound direction on Layer 2 interfaces.

• Source and destination MAC-based ACLs for filtering non-IP traffic.

• DHCP snooping to filter untrusted DHCP messages between untrusted hosts and DHCP servers.

• IP source guard to restrict traffic on nonrouted interfaces by filtering traffic based on the DHCP snooping database and IP source bindings.

• Dynamic ARP inspection to prevent malicious attacks on the switch by not relaying invalid ARP requests and responses to other ports in the same VLAN.

This feature is not supported on LanLite images on Catalyst 2960-X Series Switches.

• IEEE 802.1x port-based authentication to prevent unauthorized devices (clients) from gaining access to the network. These 802.1x features are supported:
  • Support for single-host, multi-host, multi-auth, and multi-domain-auth modes.
  • Multidomain authentication (MDA) to allow both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), to independently authenticate on the same IEEE 802.1x-enabled switch port.
  • Dynamic voice virtual LAN (VLAN) for MDA to allow a dynamic voice VLAN on an MDA-enabled port.
  • VLAN assignment for restricting 802.1x-authenticated users to a specified VLAN.
  • Support for VLAN assignment on a port configured for multi-auth mode. The RADIUS server assigns a VLAN to the first host to authenticate on the port, and subsequent hosts use the same VLAN. Voice VLAN assignment is supported for one IP phone.
  • Port security for controlling access to 802.1x ports.
  • Voice VLAN to permit a Cisco IP Phone to access the voice VLAN regardless of the authorized or unauthorized state of the port.
  • IP phone detection enhancement to detect and recognize a Cisco IP phone.
  • Guest VLAN to provide limited services to non-802.1x-compliant users.
  • Restricted VLAN to provide limited services to users who are 802.1x compliant, but do not have the credentials to authenticate via the standard 802.1x processes.
  • 802.1x accounting to track network usage.
  • 802.1x with wake-on-LAN to allow dormant PCs to be powered on based on the receipt of a specific Ethernet frame.
  • 802.1x readiness check to determine the readiness of connected end hosts before configuring IEEE 802.1x on the switch.
• Voice aware 802.1x security to apply traffic violation actions only on the VLAN on which a security violation occurs.

• MAC authentication bypass (MAB) to authorize clients based on the client MAC address.

• Network Admission Control (NAC) Layer 2 802.1x validation of the antivirus condition or posture of endpoint systems or clients before granting the devices network access.

  

  **Note**
  NAC is not supported on LanLite images.

• Network Edge Access Topology (NEAT) with 802.1X switch supplicant, host authorization with CISP, and auto enablement to authenticate a switch outside a wiring closet as a supplicant to another switch.

  

  **Note**
  NEAT is not supported on LanLite images.

• IEEE 802.1x with open access to allow a host to access the network before being authenticated.

  

  **Note**
  This feature is not supported on LanLite images.

• IEEE 802.1x authentication with downloadable ACLs and redirect URLs to allow per-user ACL downloads from a Cisco Secure ACS server to an authenticated switch.

• Support for dynamic creation or attachment of an auth-default ACL on a port that has no configured static ACLs.

  

  **Note**
  This feature is not supported on LanLite images.

• Flexible-authentication sequencing to configure the order of the authentication methods that a port tries when authenticating a new host.

• Multiple-user authentication to allow more than one host to authenticate on an 802.1x-enabled port.

• TACACS+, a proprietary feature for managing network security through a TACACS server for both IPv4 and IPv6.

• RADIUS for verifying the identity of, granting access to, and tracking the actions of remote users through authentication, authorization, and accounting (AAA) services for both IPv4 and IPv6.

• Enhancements to RADIUS, TACACS+, and SSH to function over IPv6.

• Secure Socket Layer (SSL) Version 3.0 support for the HTTP 1.1 server authentication, encryption, and message integrity and HTTP client authentication to allow secure HTTP communications (requires the cryptographic version of the software).

• IEEE 802.1x Authentication with ACLs and the RADIUS Filter-Id Attribute.
• Support for IP source guard on static hosts.

• RADIUS Change of Authorization (CoA) to change the attributes of a certain session after it is authenticated. When there is a change in policy for a user or user group in AAA, administrators can send the RADIUS CoA packets from the AAA server, such as Cisco Identity Services Engine, or Cisco Secure ACS to reinitialize authentication, and apply to the new policies.

• IEEE 802.1x User Distribution to allow deployments with multiple VLANs (for a group of users) to improve scalability of the network by load balancing users across different VLANs. Authorized users are assigned to the least populated VLAN in the group, assigned by RADIUS server.

  Note: This feature is not supported on LanLite images.

• Support for critical VLAN—multi-host/multi-auth enabled ports are placed in a critical VLAN in order to permit access to critical resources if AAA server becomes unreachable.

  Note: This feature is not supported on LanLite images.

• Support for Network Edge Access Topology (NEAT) to change the port host mode and to apply a standard port configuration on the authenticator switch port.

• VLAN-ID based MAC authentication to use the combined VLAN and MAC address information for user authentication to prevent network access from unauthorized VLANs.

• MAC move to allow hosts (including the hosts connected behind an IP phone) to move across ports within the same switch without any restrictions to enable mobility. With MAC move, the switch treats the reappearance of the same MAC address on another port in the same way as a completely new MAC address.

• Support for 3DES and AES with version 3 of the Simple Network Management Protocol (SNMPv3). This release adds support for the 168-bit Triple Data Encryption Standard (3DES) and the 128-bit, 192-bit, and 256-bit Advanced Encryption Standard (AES) encryption algorithms to SNMPv3.

• Support for Cisco TrustSec SXP protocol. This feature is not supported on LanLite images.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Preventing Unauthorized Access

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.

- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

- If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.
You can also enable the login enhancements feature, which logs both failed and unsuccessful login attempts. Login enhancements can also be configured to block future login attempts after a set number of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements documentation.

Restrictions for Controlling Switch Access with Passwords and Privileges

The following are the restrictions for controlling switch access with passwords and privileges:

- Disabling password recovery will not work if you have set the switch to boot up manually by using the `boot manual` global configuration command. This command produces the boot loader prompt (`switch:`) after the switch is power cycled.

Information About Passwords and Privilege Levels

Default Password and Privilege Level Configuration

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

<table>
<thead>
<tr>
<th>Table 84: Default Password and Privilege Levels</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Feature</strong></td>
</tr>
<tr>
<td>Enable password and privilege level</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
</tr>
<tr>
<td>Line password</td>
</tr>
</tbody>
</table>

Additional Password Security

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the `enable password` or `enable secret` global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the `enable secret` command because it uses an improved encryption algorithm.

If you configure the `enable secret` command, it takes precedence over the `enable password` command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

**Related Topics**
- Protecting Enable and Enable Secret Passwords with Encryption, on page 687
- Example: Protecting Enable and Enable Secret Passwords with Encryption, on page 697

Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set
the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the `service password-recovery` global configuration command.

- Disabling Password Recovery, on page 689
- Restrictions for Controlling Switch Access with Passwords and Privileges, on page 683

Terminal Line Telnet Configuration

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line.

Related Topics
- Setting a Telnet Password for a Terminal Line, on page 690
- Example: Setting a Telnet Password for a Terminal Line, on page 697

Username and Password Pairs

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

Related Topics
- Configuring Username and Password Pairs, on page 692

Privilege Levels

Cisco switches (and other devices) use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privileged levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

Privilege Levels on Lines

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the
higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the `clear line` command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the `configure` command, you can assign it level 3 security and distribute that password to a more restricted group of users.

**Command Privilege Levels**

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the `show ip traffic` command to level 15, the `show` commands and `show ip` commands are automatically set to privilege level 15 unless you set them individually to different levels.

---

**How to Control Switch Access with Passwords and Privilege Levels**

**Setting or Changing a Static Enable Password**

The enable password controls access to the privileged EXEC mode. Follow these steps to set or change a static enable password:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`         | Enables privileged EXEC mode.  
• Enter your password if prompted.  
   **Example:**  
   ```bash
   Switch> enable
   ``` |
| 2    | `configure terminal` | Enters global configuration mode.  
   **Example:**  
   ```bash
   Switch# configure terminal
   ``` |
| 3    | `enable password` `password` | Defines a new password or changes an existing password for access to privileged EXEC mode.  
By default, no password is defined.  
   **Example:**  
   ```bash
   Switch(config)# enable password secret321
   ``` |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Purpose**      | For *password*, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this:  
  1. Enter *abc*.  
  2. Enter Ctrl-v.  
  3. Enter ?123.  
When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter abc?123 at the password prompt. |
| **Step 4**       | end     |
| Example:         | Returns to privileged EXEC mode. |
| *Switch(config)# end* |
| **Step 5**       | show running-config |
| Example:         | Verifies your entries. |
| *Switch# show running-config* |
| **Step 6**       | copy running-config startup-config |
| Example:         | (Optional) Saves your entries in the configuration file. |
| *Switch# copy running-config startup-config* |

**Protecting Enable and Enable Secret Passwords with Encryption**

Follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:
## Protecting Enable and Enable Secret Passwords with Encryption

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Use one of the following:</td>
<td>• Defines a new password or changes an existing password for access to privileged EXEC mode.</td>
</tr>
<tr>
<td>• enable password [level level] {password encryption-type encrypted-password}</td>
<td>• Defines a secret password, which is saved using a nonreversible encryption method.</td>
</tr>
<tr>
<td>• enable secret [level level] {password encryption-type encrypted-password}</td>
<td>• (Optional) For level, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# enable password example102</td>
<td>• For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
<tr>
<td>or Switch(config)# enable secret level 1 password secret123sample</td>
<td>• (Optional) For encryption-type, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password that you copy from another switch configuration.</td>
</tr>
<tr>
<td><strong>Note</strong> If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method.</td>
<td></td>
</tr>
</tbody>
</table>
Disabling Password Recovery

Follow these steps to disable password recovery to protect the security of your switch:

**Before you begin**

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Setting a Telnet Password for a Terminal Line

Beginning in user EXEC mode, follow these steps to set a Telnet password for the connected terminal line:

#### Before you begin

- Attach a PC or workstation with emulation software to the switch console port, or attach a PC to the Ethernet management port.
- The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>system disable password recovery switch {all</td>
<td>&lt;1-9&gt;}</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# system disable password recovery switch all</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### What to do next

To remove `disable password recovery`, use the `no system disable password recovery switch all` global configuration command.

  - Switch> enable
  - Switch# configure terminal
  - Switch(config)# line vty 0 15
  - Switch(config-line)# password abcxyz543
  - Switch(config-line)# end
  - Switch# show running-config
  - Switch# copy running-config startup-config
# Configuring Username and Password Pairs

Follow these steps to configure username and password pairs:

## Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>username name [privilege level] {password encryption-type password}</td>
<td>Sets the username, privilege level, and password for each user.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# username adamsample privilege 1 password secret456</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# username 111111111111 mac attribute</td>
<td></td>
</tr>
</tbody>
</table>

- For **name**, specify the user ID as one word or the MAC address. Spaces and quotation marks are not allowed.
- You can configure a maximum of 12000 clients each, for both username and MAC filter.
- (Optional) For **level**, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.
- For **encryption-type**, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.
- For **password**, specify the password the user must enter to gain access to the Switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the **username** command.
### Setting the Privilege Level for a Command

Follow these steps to set the privilege level for a command:

#### Procedure

</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
### Logging into and Exiting a Privilege Level

Beginning in user EXEC mode, follow these steps to log into a specified privilege level and exit a specified privilege level.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
</tbody>
</table>
| ```
Switch# enable level
Example:
Switch> enable 15
``` | Logs in to a specified privilege level. Following the example, Level 15 is privileged EXEC mode. For `level`, the range is 0 to 15. |
| **Step 2**        |         |
| ```
Switch# disable level
Example:
Switch# disable 1
``` | Exits to a specified privilege level. Following the example, Level 1 is user EXEC mode. For `level`, the range is 0 to 15. |

Configuring TACACS+

TACACS+ is a security application that provides centralized validation of users attempting to gain access to a router or network access server. TACACS+ provides detailed accounting information and flexible administrative control over authentication and authorization processes. TACACS+ is facilitated through authentication, authorization and accounting (AAA) and can be enabled only through AAA commands.

- Finding Feature Information, on page 699
- Prerequisites for TACACS+, on page 699
- Restrictions for TACACS+, on page 700
- Information About TACACS+, on page 701
- How to Configure TACACS+, on page 725
- Configuration Examples for TACACS+, on page 735
- Additional References for TACACS+, on page 738
- Feature Information for TACACS+, on page 739

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for TACACS+

The following are the prerequisites for set up and configuration of switch access with TACACS+ (must be performed in the order presented):

1. Configure the switches with the TACACS+ server addresses.
2. Set an authentication key.
3. Configure the key from Step 2 on the TACACS+ servers.
4. Enable authentication, authorization, and accounting (AAA).
5. Create a login authentication method list.
6. Apply the list to the terminal lines.
7. Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:

• You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.
• We recommend a redundant connection between a switch stack and the TACACS+ server. This is to help ensure that the TACACS+ server remains accessible in case one of the connected stack members is removed from the switch stack.
• You need a system running the TACACS+ daemon software to use TACACS+ on your switch.
• To use TACACS+, it must be enabled.
• Authorization must be enabled on the switch to be used.
• Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.
• To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the `aaa new-model` command.
• At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting.
• The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.
• Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
• Use the local database if authentication was not performed by using TACACS+.

**Restrictions for TACACS+**

TACACS+ can be enabled only through AAA commands.
Information About TACACS+

TACACS+ and Switch Access

This section describes TACACS+. TACACS+ provides detailed accounting information and flexible administrative control over the authentication and authorization processes. It is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

Related Topics
Preventing Unauthorized Access, on page 681

TACACS+ Overview

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—individually. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers.

Figure 66: Typical TACACS+ Network Configuration

TACACS+, administered through the AAA security services, can provide these services:

- Authentication—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.
The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security auditor to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

**TACACS+ Operation**

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

   TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   - **ACCEPT**—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   - **REJECT**—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   - **ERROR**—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   - **CONTINUE**—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
Method List

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

TACACS AV Pairs

The network access server implements TACACS+ authorization and accounting functions by transmitting and receiving TACACS+ attribute-value (AV) pairs for each user session.

TACACS Authentication and Authorization AV Pairs

The following table lists and describes the supported TACACS+ authentication and authorization AV pairs and specifies the Cisco IOS release in which they are implemented.

<table>
<thead>
<tr>

</tbody>
</table>
| port-type         | Indicates the type of physical port the network access server is using to authenticate the user. Physical ports are indicated by a numeric value as follows: • 0: Asynchronous  
• 1: Synchronous  
• 2: ISDN-Synchronous  
• 3: ISDN-Asynchronous (V.120)  
• 4: ISDN-Asynchronous (V.110)  
• 5: Virtual Used with service=any and protocol=aaa.                                                                                                                                >| no   | no   | no   | no   | yes  | yes  | yes  |
<p>| ppp-vj-slot-       | Instructs the Cisco router not to use slot compression when sending VJ-compressed packets over a PPP link.                                                                                                                                                                                                                                      | no   | no   | no   | yes  | yes  | yes  | yes  |
| compression       |                                                                                                                                                                                                                                                                                                                                               |      |      |      |      |      |      |      |
| priv-lvl=x        | Privilege level to be assigned for the EXEC. Used with service=shell. Privilege levels range from 0 to 15, with 15 being the highest.                                                                                                                                                                                                             | yes  | yes  | yes  | yes  | yes  | yes  | yes  |
| protocol=x        | A protocol that is a subset of a service. An example would be any PPP NCP. Currently known values are lcp, ip, ipx, atalk, vines, lat, xremote, tn3270, telnet, rlogin, pad, vpdn, osicp, deccp, ccpp, cdcp, bridging, xns, nbf, bap, multilink, and unknown.                                                                                                                                                    | yes  | yes  | yes  | yes  | yes  | yes  | yes  |
| proxyacl#&lt;n&gt;      | Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces. Used with the service=shell and protocol=exec.                                                                                                                       | no   | no   | no   | no   | no   | yes  | yes  |
| route             | Specifies a route to be applied to an interface. Used with service=slip, service=ppp, and protocol=ip. During network authorization, the route attribute can be used to specify a per-user static route, to be installed by TACACS+ as follows: route=&quot;dst_address mask [gateway]&quot; This indicates a temporary static route that is to be applied. The dst_address, mask, and gateway are expected to be in the usual dotted-decimal notation, with the same meanings as in the familiar ip route configuration command on a network access server. If gateway is omitted, the peer’s address is the gateway. The route is expunged when the connection terminates. | no   | yes  | yes  | yes  | yes  | yes  | yes  |</p>

Configuring AAA Server Group Selection Based on DNIS

Cisco software allows you to authenticate users to a particular AAA server group based on the Dialed Number Identification Service (DNIS) number of the session. Any phone line (a regular home phone or a commercial T1/PRI line) can be associated with several phone numbers. The DNIS number identifies the number that was called to reach you.

For example, suppose you want to share the same phone number with several customers, but you want to know which customer is calling before you pick up the phone. You can customize how you answer the phone because DNIS allows you to know which customer is calling when you answer.

Cisco devices with either ISDN or internal modems can receive the DNIS number. This functionality allows users to assign different TACACS+ server groups for different customers (that is, different TACACS+ servers for different DNIS numbers). Additionally, using server groups you can specify the same server group for AAA services or a separate server group for each AAA service.

Cisco IOS software provides the flexibility to implement authentication and accounting services in several ways:
• Globally--AAA services are defined using global configuration access list commands and applied in general to all interfaces on a specific network access server.

• Per interface--AAA services are defined using interface configuration commands and applied specifically to the interface being configured on a specific network access server.

• DNIS mapping--You can use DNIS to specify an AAA server to supply AAA services.

Because AAA configuration methods can be configured simultaneously, Cisco has established an order of precedence to determine which server or groups of servers provide AAA services. The order of precedence is as follows:

• Per DNIS--If you configure the network access server to use DNIS to identify which server group provides AAA services, then this method takes precedence over any additional AAA selection method.

• Per interface--If you configure the network access server per interface to use access lists to determine how a server provides AAA services, this method takes precedence over any global configuration AAA access lists.

• Globally--If you configure the network access server by using global AAA access lists to determine how the security server provides AAA services, this method has the lowest precedence.

Prior to configuring AAA Server Group Selection Based on DNIS, you must configure the remote security servers associated with each AAA server group. See Identifying the TACACS Server Host and Configuring AAA Server Groups for more information.

To configure the device to select a particular AAA server group based on the DNIS of the server group, configure DNIS mapping. To map a server group with a group name with DNIS number, use the following commands in global configuration mode:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Device&gt;enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Device#configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Device (config)#aaa dnis map enable</td>
<td>Enables DNIS mapping.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Router(config)# aaa dnis map dnis-number authentication ppp group server-group-name</td>
<td>Maps a DNIS number to a defined AAA server group; the servers in this server group are being used for authentication.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Router(config)# aaa dnis map dnis-number accounting network [none</td>
<td>start-stop</td>
</tr>
</tbody>
</table>
**TACACS+ Configuration Options**

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

**TACACS+ Login Authentication**

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**TACACS+ Authorization for Privileged EXEC Access and Network Services**

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

**TACACS+ Authentication**

After you have identified the TACACS+ daemon and defined an associated TACACS+ encryption key, you must define method lists for TACACS+ authentication. Because TACACS+ authentication is operated via AAA, you need to issue the `aaa authentication` command, specifying TACACS+ as the authentication method.

**TACACS+ Authorization**

AAA authorization enables you to set parameters that restrict a user’s access to the network. Authorization via TACACS+ may be applied to commands, network connections, and EXEC sessions. Because TACACS+ authorization is facilitated through AAA, you must issue the `aaa authorization` command, specifying TACACS+ as the authorization method.

**TACACS+ Accounting**

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.
Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

Note Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

Per VRF for TACACS Servers

The Per VRF for TACACS+ Servers feature allows per virtual routing and forwarding (VRF) AAA to be configured on TACACS+ servers. TACACS+ server access is required to configure this feature.

How to Configure TACACS+

Identifying the TACACS+ Server Host and Setting the Authentication Key

Follow these steps to identify the TACACS+ server host and set the authentication key:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>tacacs-server host hostname</td>
<td>Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# tacacs-server host yourserver</td>
<td>For <em>hostname</em>, specify the name or IP address of the host.</td>
</tr>
</tbody>
</table>
### Configuring TACACS+ Login Authentication

Follow these steps to configure TACACS+ login authentication:

**Before you begin**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>aaa group server tacacs+ group-name</td>
<td>(Optional) Defines the AAA server-group with a group name. This command puts the Switch in a server group subconfiguration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa group server tacacs+ your_server_group</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>server ip-address</td>
<td>(Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group. Each server in the group must be previously defined in Step 3.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# server 10.1.2.3</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

For more information about the `ip http authentication` command, see the *Cisco IOS Security Command Reference, Release 12.4.*

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa authentication login `{default</td>
<td>list-name}` method1 [method2...]</td>
</tr>
<tr>
<td>Example:</td>
<td>• To create a default list that is used when a named list is <em>not</em> specified in the <code>login authentication</code> command, use the <code>default</code> keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td><code>Switch(config)# aaa authentication login</code></td>
<td>• For <code>list-name</code>, specify a character string to name the list you are creating.</td>
</tr>
<tr>
<td><code>default tacacs+ local</code></td>
<td>• For <code>method1...</code>, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.</td>
</tr>
</tbody>
</table>

Select one of these methods:
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <em>enable</em>—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the <code>enable password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <em>group tacacs</em>—Uses TACACS+ authentication. Before you can use this authentication method, you must configure the TACACS+ server. For more information, see the Identifying the TACACS+ Server Host and Setting the Authentication Key, on page 725.</td>
<td></td>
</tr>
<tr>
<td>• <em>line</em>—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <code>password password</code> line configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <em>local</em>—Use the local username database for authentication. You must enter username information in the database. Use the <code>username password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <em>local-case</em>—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <em>none</em>—Do not use any authentication for login.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

```
line [console | tty | vty] line-number
[ending-line-number]
```

**Example:**

```
Switch(config)# line 2 4
```

Enters line configuration mode, and configures the lines to which you want to apply the authentication list.

**Step 6**

```
login authentication {default | list-name}
```

**Example:**

```
Switch(config-line)# login authentication default
```

Applies the authentication list to a line or set of lines.

- If you specify `default`, use the default list created with the `aaa authentication login` command.
- For `list-name`, specify the list created with the `aaa authentication login` command.
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

You can use the `aaa authorization` global configuration command with the `tacacs+` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
<tr>
<td>3</td>
<td>aaa authorization network tacacs+</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa authorization network tacacs+</td>
</tr>
<tr>
<td>4</td>
<td>aaa authorization exec tacacs+</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa authorization exec tacacs+</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>6</td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

### Starting TACACS+ Accounting

Follow these steps to start TACACS+ Accounting:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

• Enter your password if prompted.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa accounting network start-stop tacacs+</td>
<td>Enables TACACS+ accounting for all network-related service requests.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa accounting network start-stop tacacs+</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa accounting exec start-stop tacacs+</td>
<td>Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa accounting exec start-stop tacacs+</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### What to do next

To establish a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.
Establishing a Session with a Router if the AAA Server is Unreachable

To establishing a session with a router if the AAA server is unreachable, use the **aaa accounting system guarantee-first** command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

Establishing a Session with a Router if the AAA Server is Unreachable

The **aaa accounting system guarantee-first** command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

Configuring Per VRF on a TACACS Server

The initial steps in this procedure are used to configure AAA and a server group, create a VRF routing table, and configure an interface. Steps 10 through 13 are used to configure the per VRF on a TACACS+ server feature:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>ip vrf vrf-name</code></td>
<td>Configures a VRF table and enters VRF configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# ip vrf cisco</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>rd route-distinguisher</code></td>
<td>Creates routing and forwarding tables for a VRF instance.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-vrf)# rd 100:1</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>5</td>
<td><strong>exit</strong></td>
<td>Exits VRF configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-vrf)# exit</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><strong>interface</strong> <code>interface-name</code></td>
<td>Configures an interface and enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# interface Loopback0</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td><strong>ip vrf forwarding</strong> <code>vrf-name</code></td>
<td>Configures a VRF for the interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# ip vrf forwarding cisco</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td><strong>ip address</strong> <code>ip-address mask [secondary]</code></td>
<td>Sets a primary or secondary IP address for an interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# ip address 10.0.0.2 255.0.0.0</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td><strong>exit</strong></td>
<td>Exits interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td><strong>aaa group server tacacs</strong> <code>group-name</code></td>
<td>Groups different TACACS+ server hosts into distinct lists and distinct methods and enters server-group configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# aaa group server tacacs tacacs1</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td><strong>server-private</strong> `{ip-address</td>
<td>name} [nat] [single-connection] [port port-number] [timeout seconds] [key [0</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-sg-tacacs)# server-private 10.1.1.1 port 19 key cisco</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td><strong>ip vrf forwarding</strong> <code>vrf-name</code></td>
<td>Configures the VRF reference of a AAA TACACS+ server group.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-sg-tacacs)# ip vrf forwarding cisco</td>
<td></td>
</tr>
</tbody>
</table>
Verifying Per VRF for TACACS Servers

To verify the per VRF TACACS+ configuration, perform the following steps:

The `debug` commands may be used in any order.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>debug tacacs authentication</code></td>
<td>Displays information about AAA/TACACS+ authentication.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Device# debug tacacs authentication</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>debug tacacs authorization</code></td>
<td>Displays information about AAA/TACACS+ authorization.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Device# debug tacacs authorization</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>debug tacacs accounting</code></td>
<td>Displays information about accountable events as they occur.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Device# debug tacacs accounting</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>debug tacacs packets</code></td>
<td>Displays information about TACACS+ packets.</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Device# debug tacacs packets</td>
<td></td>
</tr>
</tbody>
</table>
## Monitoring TACACS+

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show tacacs</td>
<td>Displays TACACS+ server statistics.</td>
</tr>
</tbody>
</table>

### Configuration Examples for TACACS+

#### Example: TACACS Authorization

The following example shows how to configure TACACS+ as the security protocol for PPP authentication using the default method list; it also shows how to configure network authorization via TACACS+:

```plaintext
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
aaa authorization network default group tacacs+
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.
- The **aaa authentication** command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword **default** means that PPP authentication is applied by default to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group** **tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
- The **aaa authorization** command configures network authorization via TACACS+. Unlike authentication lists, this authorization list always applies to all incoming network connections made to the network access server.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”
- The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.
Example: TACACS Accounting

The following example shows how to configure TACACS+ as the security protocol for PPP authentication using the default method list; it also shows how to configure accounting via TACACS+:

```plaintext
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
aaa accounting network default stop-only group tacacs+
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
    ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The `aaa new-model` command enables the AAA security services.
- The `aaa authentication` command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword `default` means that PPP authentication is applied by default to all interfaces. The `if-needed` keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword `group tacacs+` means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword `local` indicates that authentication will be attempted using the local database on the network access server.
- The `aaa accounting` command configures network accounting via TACACS+. In this example, accounting records describing the session that just terminated will be sent to the TACACS+ daemon whenever a network connection terminates.
- The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The `tacacs-server key` command defines the shared encryption key to be “goaway.”
- The `interface` command selects the line, and the `ppp authentication` command applies the default method list to this line.

Example: TACACS Authentication

The following example shows how to configure TACACS+ as the security protocol for PPP authentication:

```plaintext
aaa new-model
aaa authentication ppp test group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
    ppp authentication chap pap test
```

The lines in the preceding sample configuration are defined as follows:

- The `aaa new-model` command enables the AAA security services.
- The `aaa authentication` command defines a method list, “test,” to be used on serial interfaces running PPP. The keyword `group tacacs+` means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword `local` indicates that authentication will be attempted using the local database on the network access server.
The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The `tacacs-server key` command defines the shared encryption key to be “goaway.”

The `interface` command selects the line, and the `ppp authentication` command applies the test method list to this line.

The following example shows how to configure TACACS+ as the security protocol for PPP authentication, but instead of the “test” method list, the “default” method list is used.

```plaintext
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
  tacacs-server host 10.1.2.3
  tacacs-server key goaway
interface serial 0
  ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The `aaa new-model` command enables the AAA security services.
- The `aaa authentication` command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword `default` means that PPP authentication is applied by default to all interfaces. The `if-needed` keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword `group tacacs+` means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword `local` indicates that authentication will be attempted using the local database on the network access server.
- The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The `tacacs-server key` command defines the shared encryption key to be “goaway.”
- The `interface` command selects the line, and the `ppp authentication` command applies the default method list to this line.

The following example shows how to create the same authentication algorithm for PAP, but it calls the method list “MIS-access” instead of “default”:

```plaintext
aaa new-model
aaa authentication pap MIS-access if-needed group tacacs+ local
  tacacs-server host 10.1.2.3
  tacacs-server key goaway
interface serial 0
  ppp authentication pap MIS-access
```

The lines in the preceding sample configuration are defined as follows:

- The `aaa new-model` command enables the AAA security services.
- The `aaa authentication` command defines a method list, “MIS-access,” to be used on serial interfaces running PPP. The method list, “MIS-access,” means that PPP authentication is applied to all interfaces. The `if-needed` keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword `group tacacs+` means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword `local` indicates that authentication will be attempted using the local database on the network access server.
• The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The `tacacs-server key` command defines the shared encryption key to be “gonway.”

• The `interface` command selects the line, and the `ppp authentication` command applies the default method list to this line.

The following example shows the configuration for a TACACS+ daemon with an IP address of 10.2.3.4 and an encryption key of “apple”:

```plaintext
aaa new-model
aaa authentication login default group tacacs+ local
tacacs-server host 10.2.3.4
tacacs-server key apple
```

The lines in the preceding sample configuration are defined as follows:

• The `aaa new-model` command enables the AAA security services.

• The `aaa authentication` command defines the default method list. Incoming ASCII logins on all interfaces (by default) will use TACACS+ for authentication. If no TACACS+ server responds, then the network access server will use the information contained in the local username database for authentication.

• The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.2.3.4. The `tacacs-server key` command defines the shared encryption key to be “apple.”

**Example: Configuring Per VRF for TACACS Servers**

The following output example shows that the group server `tacacs1` is configured for per VRF AAA services:

```plaintext
aaa group server tacacs+ tacacs1
    server-private 10.1.1.1 port 19 key cisco
    ip vrf forwarding cisco
    ip tacacs source-interface Loopback0
    ip vrf cisco
    rd 100:1
    interface Loopback0
    ip address 10.0.0.2 255.0.0.0
    ip vrf forwarding cisco
```

**Additional References for TACACS+**

Configuring RADIUS

The RADIUS security system is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco devices and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

- Finding Feature Information, on page 741
- Prerequisites for Configuring RADIUS, on page 741
- Restrictions for Configuring RADIUS, on page 742
- Information about RADIUS, on page 742
- How to Configure RADIUS, on page 762
- Configuration Examples for RADIUS, on page 776

- Feature Information for RADIUS, on page 780

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring RADIUS

This section lists the prerequisites for controlling Switch access with RADIUS.

General:

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- Use the `aaa new-model` global configuration command to enable AAA.
• Use the `aaa authentication` global configuration command to define method lists for RADIUS authentication.

• Use `line` and `interface` commands to enable the defined method lists to be used.

• At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.

• You should have access to and should configure a RADIUS server before configuring RADIUS features on your Switch.

• The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

• To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

For RADIUS operation:

• Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

### Restrictions for Configuring RADIUS

This topic covers restrictions for controlling Switch access with RADIUS.

**General:**

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

• Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.

• Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.

• Networks using a variety of services. RADIUS generally binds a user to one service model.

### Information about RADIUS

#### RADIUS and Switch Access

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.
RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validates users and to grant access to network resources.

- Networks already using RADIUS. You can add a Cisco Switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.

- Networks in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, “Configuring IEEE 802.1x Port-Based Authentication.”

- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

*Figure 67: Transitioning from RADIUS to TACACS+ Services*

![Diagram of RADIUS to TACACS+ Services](image)

RADIUS Operation

When a user attempts to log in and authenticate to a Switch that is access controlled by a RADIUS server, these events occur:
1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
   - ACCEPT—The user is authenticated.
   - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   - CHALLENGE—A challenge requires additional data from the user.
   - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

**Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

**RADIUS Server Host**

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS_DEAD message appears,
and then the switch tries the second host entry configured on the same device for accounting services. (The
RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses.
To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS
server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers,
on a per-server basis, or in some combination of global and per-server settings.

RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list
to various ports. The method list defines the types of authentication to be performed and the sequence in which
they are performed; it must be applied to a specific port before any of the defined authentication methods are
performed. The only exception is the default method list. The default method list is automatically applied to
all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You
can designate one or more security protocols to be used for authentication, thus ensuring a backup system for
authentication in case the initial method fails. The software uses the first method listed to authenticate users;
if that method fails to respond, the software selects the next authentication method in the method list. This
process continues until there is successful communication with a listed authentication method or until all
defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security
server or local username database responds by denying the user access—the authentication process stops, and
no other authentication methods are attempted.

AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You
select a subset of the configured server hosts and use them for a particular service. The server group is used
with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier
(the combination of the IP address and UDP port number), allowing different ports to be individually defined
as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be
sent to different UDP ports on a server at the same IP address. If you configure two different host entries on
the same RADIUS server for the same service, (for example, accounting), the second configured host entry
acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network
access server tries the second host entry configured on the same device for accounting services. (The RADIUS
host entries are tried in the order in which they are configured.)

AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch
uses information retrieved from the user’s profile, which is in the local user database or on the security server,
to configure the user’s session. The user is granted access to a requested service only if the information in the
user profile allows it.
RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

```
protocol : attribute sep value *
```

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco’s “multiple named IP address pools” feature to be activated during IP authorization (during PPP’s Internet Protocol Control Protocol (IPCP) address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an “*”, the AV pair “ip:addr-pool=first” becomes optional. Note that any AV pair can be made optional:

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)
  - Vendor-Id
  - Vendor-Type
  - Vendor-Length
  - Vendor-Data
The figure below shows the packet format for a VSA encapsulated “behind” attribute 26.

**Figure 68: VSA Encapsulated Behind Attribute 26**

<table>
<thead>
<tr>
<th>0</th>
<th>8</th>
<th>16</th>
<th>24</th>
</tr>
</thead>
<tbody>
<tr>
<td>01234567012345670123456701234567</td>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor’s definition of that attribute.

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).

**Table 90: Vendor-Specific Attributes Table Field Descriptions**

<table>

<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>callback-dialstring</td>
<td>Defines a dialing string to be used for callback.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>data-service</td>
<td>No description available.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>dial-number</td>
<td>Defines the number to dial.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>force-56</td>
<td>Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>map-class</td>
<td>Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-auth</td>
<td>Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.</td>
</tr>
</tbody>
</table>
PPP name authentication. To apply for PAP, do not configure the `ppp pap sent-name password` command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.

**Note** The send-name attribute has changed over time: Initially, it performed the functions now provided by both the send-name and remote-name attributes. Because the remote-name attribute has been added, the send-name attribute is restricted to its current behavior.
PPP password authentication. The vendor-specific attributes (VSAs) “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both “preauth:send-name” and “preauth:send-secret” will be used in the response packet.

Miscellaneous Attributes
<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| 26     | 9                           | 2               | Cisco-NAS-Port  | Specifies additional vendor specific attribute (VSA) information for NAS-Port accounting. To specify additional NAS-Port information in the form an Attribute-Value Pair (AVPair) string, use the `radius-server vsa send` global configuration command.  
**Note** This VSA is typically used in Accounting, but may also be used in Authentication (Access-Request) packets. |
| 26     | 9                           | 1               | min-links       | Sets the minimum number of links for MLP. |
| 26     | 9                           | 1               | proxyacl#<n>    | Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces. |
Carries the authentication information needed by the home agent to authenticate a mobile node during registration. The information is in the same syntax as the `ip mobile secure host <addr>` configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range.

### RADIUS Disconnect-Cause Attribute Values

Disconnect-cause attribute values specify the reason a connection was taken offline. The attribute values are sent in Accounting request packets. These values are sent at the end of a session, even if the session fails to be authenticated. If the session is not authenticated, the attribute can cause stop records to be generated without first generating start records.

The table below lists the cause codes, values, and descriptions for the Disconnect-Cause (195) attribute.

The Disconnect-Cause is incremented by 1000 when it is used in RADIUS AVPairs; for example, disc-cause 4 becomes 1004.

#### Table 92: Disconnect-Cause Attribute Values

<table>
<thead>
<tr>

<tr>
<td>65</td>
<td>TCP-Host-Unreachable</td>
<td>TCP host is unreachable.</td>
</tr>
<tr>
<td>66</td>
<td>TCP-Network-Admin Unreachable</td>
<td>TCP network is unreachable for administrative reasons.</td>
</tr>
<tr>
<td>67</td>
<td>TCP-Port-Unreachable</td>
<td>TCP port in unreachable.</td>
</tr>
<tr>
<td>100</td>
<td>Session-Timeout</td>
<td>Session timed out.</td>
</tr>
<tr>
<td>101</td>
<td>Session-Failed-Security</td>
<td>Session failed for security reasons.</td>
</tr>
<tr>
<td>102</td>
<td>Session-End-Callback</td>
<td>Session terminated due to callback.</td>
</tr>
<tr>
<td>120</td>
<td>Invalid-Protocol</td>
<td>Call refused because the detected protocol is disabled.</td>
</tr>
<tr>
<td>150</td>
<td>RADIUS-Disconnect</td>
<td>Disconnected by RADIUS request.</td>
</tr>
<tr>
<td>151</td>
<td>Local-Admin-Disconnect</td>
<td>Administrative disconnect.</td>
</tr>
<tr>
<td>152</td>
<td>SNMP-Disconnect</td>
<td>Disconnected by SNMP request.</td>
</tr>
<tr>
<td>160</td>
<td>V110-Retries</td>
<td>Allowed V.110 retries have been exceeded.</td>
</tr>
<tr>
<td>170</td>
<td>PPP-Authentication-Timeout</td>
<td>PPP authentication timed out.</td>
</tr>
<tr>
<td>Cause Code</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>180</td>
<td>Local-Hangup</td>
<td>Disconnected by local hangup.</td>
</tr>
<tr>
<td>185</td>
<td>Remote-Hangup</td>
<td>Disconnected by remote end hangup.</td>
</tr>
<tr>
<td>190</td>
<td>T1-Quiesced</td>
<td>Disconnected because T1 line was quiesced.</td>
</tr>
<tr>
<td>195</td>
<td>Call-Duration</td>
<td>Disconnected because the maximum duration of the call was exceeded.</td>
</tr>
<tr>
<td>600</td>
<td>VPN-User-Disconnect</td>
<td>Call disconnected by client (through PPP). Code is sent if the LNS receives a PPP terminate request from the client.</td>
</tr>
<tr>
<td>601</td>
<td>VPN-Carrier-Loss</td>
<td>Loss of carrier. This can be the result of a physical line going dead. Code is sent when a client is unable to dial out using a dialer.</td>
</tr>
<tr>
<td>602</td>
<td>VPN-No-Resources</td>
<td>No resources available to handle the call. Code is sent when the client is unable to allocate memory (running low on memory).</td>
</tr>
<tr>
<td>603</td>
<td>VPN-Bad-Control-Packet</td>
<td>Bad L2TP or L2F control packets. Code is sent when an invalid control packet, such as missing mandatory Attribute-Value pairs (AVP), from the peer is received. When using L2TP, the code will be sent after six retransmits; when using L2F, the number of retransmits is user configurable. Note VPN-Tunnel-Shut will be sent if there are active sessions in the tunnel.</td>
</tr>
<tr>
<td>604</td>
<td>VPN-Admin-Disconnect</td>
<td>Administrative disconnect. This can be the result of a VPN soft shutdown, which is when a client reaches maximum session limit or exceeds maximum hopcount. Code is sent when a tunnel is brought down by issuing the clear vpdn tunnel command.</td>
</tr>
<tr>
<td>605</td>
<td>VPN-Tunnel-Shut</td>
<td>Tunnel teardown or tunnel setup has failed. Code is sent when there are active sessions in a tunnel and the tunnel goes down. Note This code is not sent when tunnel authentication fails.</td>
</tr>
<tr>
<td>606</td>
<td>VPN-Local-Disconnect</td>
<td>Call is disconnected by LNS PPP module. Code is sent when the LNS sends a PPP terminate request to the client. It indicates a normal PPP disconnection initiated by the LNS.</td>
</tr>
<tr>
<td>607</td>
<td>VPN-Session-Limit</td>
<td>VPN soft shutdown is enabled. Code is sent when a call has been refused due to any of the soft shutdown restrictions previously mentioned.</td>
</tr>
<tr>
<td>608</td>
<td>VPN-Call-Redirect</td>
<td>VPN call redirect is enabled.</td>
</tr>
</tbody>
</table>
RADIUS Progress Codes

The RADIUS Progress Codes feature adds additional progress codes to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates a connection state before a call is disconnected through progress codes.

Attribute 196 is sent in network, exec, and resource accounting “start” and “stop” records. This attribute can facilitate call failure debugging because each progress code identifies accounting information relevant to the connection state of a call. The attribute is activated by default; when an accounting “start” or “stop” accounting record is requested, authentication, authorization, and accounting (AAA) adds attribute 196 into the record as part of the standard attribute list. Attribute 196 is valuable because the progress codes, which are sent in accounting “start” and “stop” records, facilitate the debugging of call failures.

Note

In accounting “start” records, attribute 196 does not have a value.

Table 33: Newly Supported Progress Codes for Attribute 196

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Modem allocation and negotiation is complete; the call is up.</td>
</tr>
<tr>
<td>30</td>
<td>The modem is up.</td>
</tr>
<tr>
<td>33</td>
<td>The modem is waiting for result codes.</td>
</tr>
<tr>
<td>41</td>
<td>The max TNT is establishing the TCP connection by setting up a TCP clear call.</td>
</tr>
<tr>
<td>60</td>
<td>Link control protocol (LCP) is the open state with PPP and IP Control Protocol (IPCP) negotiation; the LAN session is up.</td>
</tr>
<tr>
<td>65</td>
<td>PPP negotiation occurs and, initially, the LCP negotiation occurs; LCP is in the open state.</td>
</tr>
<tr>
<td>67</td>
<td>After PPP negotiation with LCP in the open state occurs, IPCP negotiation begins.</td>
</tr>
</tbody>
</table>

Note

Progress codes 33, 30, and 67 are generated and seen through debugs on the NAS; all other codes are generated and seen through debugs and the accounting record on the RADIUS server.

Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius server` global configuration commands.
Enhanced Test Command

The Enhanced Test Command feature allows a named user profile to be created with calling line ID (CLID) or dialed number identification service (DNIS) attribute values. The CLID or DNIS attribute values can be associated with the RADIUS record that is sent with the user profile so that the RADIUS server can access CLID or DNIS attribute information for all incoming calls.

How to Configure RADIUS

Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the Switch, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`.

You can configure the Switch to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the Switch and the key string to be shared by both the server and the Switch. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

**Before you begin**

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> radius server name</td>
<td>Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Identifying the RADIUS Server Host

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# radius server ISE</td>
<td>The switch also supports RADIUS for IPv6.</td>
</tr>
</tbody>
</table>

**Step 4**  
**address** `{ipv4 | ipv6} ip address {auth-port port number | acct-port port number}`  
**Example:**  
Switch(config-radius-server)# address ipv4 10.1.1.1 auth-port 1645 acct-port 1646  
(Optional) Specifies the RADIUS server parameters.  
For **auth-port port-number**, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536. For **acct-port port-number**, specify the UDP destination port for authentication requests. The default is 1646.

**Step 5**  
**key string**  
**Example:**  
Switch(config-radius-server)# key cisco123  
(Optional) For **key string**, specify the authentication and encryption key used between the Switch and the RADIUS daemon running on the RADIUS server.  
**Note** The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the `radius server` command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.

**Step 6**  
**retransmit value**  
**Example:**  
Switch(config-radius-server)# retransmit 10  
(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the `radius-server retransmit` global configuration command setting.

**Step 7**  
**timeout seconds**  
**Example:**  
Switch(config-radius-server)# timeout 60  
(Optional) Specifies the time interval that the Switch waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the `radius-server timeout` global configuration command setting.

**Step 8**  
**end**  
**Example:**  
Switch(config)# end  
Returns to privileged EXEC mode.
### Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configure terminal</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# radius-server key your_server_key</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# key your_server_key</td>
<td>Note: The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Radius-server retransmit retries</strong></td>
<td>radius-server retransmit retries</td>
<td>Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# radius-server retransmit 5</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

#### Command or Action

**Step 4**

**radius-server timeout** *seconds*

*Example:*

Switch(config)# radius-server timeout 3

Specifies the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.

**Step 5**

**radius-server deadtime** *minutes*

*Example:*

Switch(config)# radius-server deadtime 0

When a RADIUS server is not responding to authentication requests, this command specifies a time to stop the request on that server. This avoids the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.

**Step 6**

**end**

*Example:*

Switch(config)# end

Returns to privileged EXEC mode.

**Step 7**

**show running-config**

*Example:*

Switch# show running-config

Verifies your entries.

**Step 8**

**copy running-config startup-config**

*Example:*

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### Configuring RADIUS Login Authentication

Follow these steps to configure RADIUS login authentication:

#### Before you begin

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring RADIUS Login Authentication

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

**Example:**

```plaintext
Switch# configure terminal
```

Enables AAA.

**Step 3**

**aaa new-model**

**Example:**

```plaintext
Switch(config)# aaa new-model
```

**Step 4**

**aaa authentication login {default | list-name} method1 [method2...]**

**Example:**

```plaintext
Switch(config)# aaa authentication login default local
```

**Example:**

```plaintext
Switch(config)# aaa authentication login default radius
```

*To create a default list that is used when a named list is not specified in the `login authentication` command, use the `default` keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.*

- **For list-name**, specify a character string to name the list you are creating.
- **For method1...**, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.

Select one of these methods:

- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the `enable password` global configuration command.
- **group radius**—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server.
- **line**—Use the line password for authentication. Before you can use this authentication method, you must
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>define a line password. Use the <code>password</code> line configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>local</strong>—Use the local username database for authentication. You must enter username information in the database. Use the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>local-case</strong>—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>none</strong>—Do not use any authentication for login.</td>
<td></td>
</tr>
<tr>
<td>Enters line configuration mode, and configure the lines to which you want to apply the authentication list.</td>
<td></td>
</tr>
<tr>
<td>Applies the authentication list to a line or set of lines.</td>
<td></td>
</tr>
<tr>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Verifies your entries.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**
```
line [console | tty | vty] line-number [ending-line-number]
```

**Example:**
```
Switch(config)# line 1 4
```

**Step 6**
```
login authentication {default | list-name}
```

**Example:**
```
Switch(config)# login authentication default
```

**Step 7**
```
end
```

**Example:**
```
Switch(config)# end
```

**Step 8**
```
show running-config
```

**Example:**
```
Switch# show running-config
```
Defining AAA Server Groups

You use the `server` group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional `auth-port` and `acct-port` keywords.

Follow these steps to define AAA server groups:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>radius server name</code></td>
<td>Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode. The switch also supports RADIUS for IPv6.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# radius server ISE</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>`address {ipv4</td>
<td>ipv6} {ip-address</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-radius-server)# address ipv4 10.1.1.1 auth-port 1645 acct-port 1646</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring RADIUS Authorization for User Privileged Access and Network Services

#### Note

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user privileged access and network services:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> key string</td>
<td>Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-radius-server)# key cisco123</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Exits RADIUS server configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-radius-server)# end</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>

| Purpose | Enters global configuration mode. |

<table>
<thead>
<tr>
<th>Step 3</th>
<th>aaa authorization network radius</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# aaa authorization network radius</td>
</tr>
</tbody>
</table>

| Purpose | Configures the switch for user RADIUS authorization for all network-related service requests. |

<table>
<thead>
<tr>
<th>Step 4</th>
<th>aaa authorization exec radius</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# aaa authorization exec radius</td>
</tr>
</tbody>
</table>

| Purpose | Configures the switch for user RADIUS authorization if the user has privileged EXEC access. |

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

| Purpose | Returns to privileged EXEC mode. |

<table>
<thead>
<tr>
<th>Step 6</th>
<th>show running-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# show running-config</td>
</tr>
</tbody>
</table>

| Purpose | Verifies your entries. |

<table>
<thead>
<tr>
<th>Step 7</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

| Purpose | (Optional) Saves your entries in the configuration file. |

### What to do next

You can use the `aaa authorization` global configuration command with the `radius` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.
## Starting RADIUS Accounting

Follow these steps to start RADIUS accounting:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><strong>enable</strong>&lt;br&gt;Example: Switch&gt; <strong>enable</strong></td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>configure terminal</strong>&lt;br&gt;Example: Switch# <strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>aaa accounting network start-stop radius</strong>&lt;br&gt;Example: Switch(config)# <strong>aaa accounting network start-stop radius</strong></td>
<td>Enables RADIUS accounting for all network-related service requests.</td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>aaa accounting exec start-stop radius</strong>&lt;br&gt;Example: Switch(config)# <strong>aaa accounting exec start-stop radius</strong></td>
<td>Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>Step 5</td>
<td><strong>end</strong>&lt;br&gt;Example: Switch(config)# <strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><strong>show running-config</strong>&lt;br&gt;Example: Switch# <strong>show running-config</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 7</td>
<td><strong>copy running-config startup-config</strong>&lt;br&gt;Example: Switch# <strong>copy running-config startup-config</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
**What to do next**

To establish a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. This command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reboots, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reboots, use the `no aaa accounting system guarantee-first` command.

**Verifying Attribute 196**

No configuration is required to configure RADIUS Progress Codes. To verify attribute 196 in accounting “start” and “stop” records, perform the following steps.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>debug aaa accounting</code></td>
<td>Displays information on accountable events as they occur.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# debug aaa accounting</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>show radius statistics</code></td>
<td>Displays the RADIUS statistics for accounting and authentication packets.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# debug aaa authorization</code></td>
<td></td>
</tr>
</tbody>
</table>

**Configuring the Switch to Use Vendor-Specific RADIUS Attributes**

Follow these steps to configure the switch to use vendor-specific RADIUS attributes:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Enables the switch to recognize and use VSAs as defined by RADIUS IETF attribute 26.</td>
</tr>
<tr>
<td><strong>Step 3</strong> radius-server vsa send [accounting</td>
<td>Enables the switch to recognize and use VSAs as defined by RADIUS IETF attribute 26.</td>
</tr>
<tr>
<td></td>
<td>authentication]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used.</td>
</tr>
<tr>
<td><code>Switch(config)# radius-server vsa send accounting</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show running-config</code></td>
<td></td>

<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Follow these steps to configure the switch to use vendor-proprietary RADIUS server communication:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# enable</code></td>
<td></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command/Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> radius-server host {hostname</td>
<td>ip-address} non-standard</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# radius-server host 172.20.30.15 non-standard</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> radius-server key string</td>
<td>Specifies the shared secret text string used between the switch and the vendor-proprietary RADIUS server. The switch and the RADIUS server use this text string to encrypt passwords and exchange responses.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# radius-server key rad124</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td></td>
</tr>
<tr>
<td>The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config</td>
<td></td>
</tr>
</tbody>
</table>
Configuring a User Profile and Associating it with the RADIUS Record

This section describes how to create a named user profile with CLID or DNIS attribute values and associate it with the RADIUS record.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
  | Example:          | • Enter your password if prompted. |
|      | Device> enable    |         |
| 2    | configure terminal| Enters global configuration mode. |
|      | Example:          |         |
|      | Device# configure terminal | |
| 3    | aaa user profile  | Creates a user profile. |
|      | profile-name      |         |
|      | Example:          |         |
|      | Device(config)# aaa user profile profilename1 | |
| 4    | aaa attribute     | Adds DNIS or CLID attribute values to the user profile and enters AAA-user configuration mode. |
|      | {dnis | clid}        |         |
|      | Example:          |         |
|      | Device# configure terminal | |
| 5    | exit              | Exit Global Configuration mode. |
| 6    | test aaa group    | Associates a DNIS or CLID named user profile with the record sent to the RADIUS server. |
|      | {group-name | radius}  | Note: The profile-name must match the profile-name specified in the aaa user profile command. |
|      | username password new-code {profile profile-name} | |
|      | Example:          |         |
|      | Device# test aaa group radius secret new-code profile profilename1 | |

Verifying the Enhanced Test Command Configuration

To verify the Enhanced Test Command configuration, use the following commands in privileged EXEC mode:
Configuration Examples for RADIUS

Examples: Identifying the RADIUS Server Host

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```
Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
```

This example shows how to configure host1 as the RADIUS server and to use the default ports for both authentication and accounting:

```
Switch(config)# radius-server host host1
```

Example: Using Two Different RADIUS Group Servers

In this example, the switch is configured to recognize two different RADIUS group servers (group1 and group2). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

Examples: AAA Server Groups

The following example shows how to create server group radgroup1 with three different RADIUS server members, each using the default authentication port (1645) and accounting port (1646):

```
aaa group server radius radgroup1
server 172.16.1.11
```
server 172.17.1.21
server 172.18.1.31

The following example shows how to create server group radgroup2 with three RADIUS server members, each with the same IP address but with unique authentication and accounting ports:

```bash
aaa group server radius radgroup2
server 172.16.1.1 auth-port 1000 acct-port 1001
server 172.16.1.1 auth-port 2000 acct-port 2001
server 172.16.1.1 auth-port 3000 acct-port 3001
```

**Troubleshooting Tips for RADIUS Progress Codes**

The following example is a sample debug output from the `debug ppp negotiation` command. This debug output is used to verify that accounting “stop” records have been generated and that attribute 196 (Ascend-Connect-Progress) has a value of 65.

```
Tue Aug 7 06:21:03 2001
NAS-IP-Address = 10.0.58.62
NAS-Port = 20018
Vendor-Specific = ""
NAS-Port-Type = ISDN
User-Name = "peer_16a"
Called-Station-Id = "5213124"
Calling-Station-Id = "5212175"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Framed-User
Acct-Session-Id = "00000014"
Framed-Protocol = PPP
Framed-IP-Address = 172.16.0.2
Acct-Input-Octets = 3180
Acct-Output-Octets = 3186
Acct-Input-Packets = 40
Acct-Output-Packets = 40
Ascend-Connect-Pro = 65
Acct-Session-Time = 49
Acct-Delay-Time = 0
Timestamp = 997190463
Request-Authenticator = Unverified
```

**Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes**

For example, this AV pair activates Cisco’s *multiple named ip address pools* feature during IP authorization (during PPP IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

This example shows how to specify an authorized VLAN in the RADIUS server database:
Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any decnet-iv"

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"

Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of rad124 between the switch and the server:

Switch(config)# radius-server host 172.20.30.15 nonstandard
Switch(config)# radius-server key rad124

Example: User Profile Associated With the test aaa group Command

The following example shows how to configure the dnis = dnisvalue user profile “prfl1” and associate it with a test aaa group command. In this example, the debug radius command has been enabled and the output follows the configuration.

aaa user profile prfl1
  aaa attribute dnis
  aaa attribute dnis dnisvalue
  no aaa attribute clid
  ! Attribute not found.
  aaa attribute clid clidvalue
  no aaa attribute clid
  exit

! Associate the dnis user profile with the test aaa group command.
test aaa group radius user1 pass new-code profile prfl1
!
!
! debug radius output, which shows that the dnis value has been passed to the radius server.
*Dec 31 16:35:48: RADIUS: Sending packet for Unique id = 0
*Dec 31 16:35:48: RADIUS: Initial Transmit unknown id 8 172.22.71.21:1645, Access-Request, len 68
*Dec 31 16:35:48: RADIUS: code=Access-Request id=08 len=0068

CHAPTER 38

RADIUS Server Load Balancing

The RADIUS Server Load Balancing feature distributes authentication, authorization, and accounting (AAA) authentication and accounting transactions across RADIUS servers in a server group. These servers can share the AAA transaction load and thereby respond faster to incoming requests.

This module describes the RADIUS Server Load Balancing feature.

- Finding Feature Information, on page 781
- Prerequisites for RADIUS Server Load Balancing, on page 781
- Restrictions for RADIUS Server Load Balancing, on page 782
- Information About RADIUS Server Load Balancing, on page 782
- How to Configure RADIUS Server Load Balancing, on page 784
- Configuration Examples for RADIUS Server Load Balancing, on page 787
- Additional References for RADIUS Server Load Balancing, on page 794
- Feature Information for RADIUS Server Load Balancing, on page 795

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for RADIUS Server Load Balancing

- Authentication, authorization, and accounting (AAA) must be configured on the RADIUS server.
- AAA RADIUS server groups must be configured.
- RADIUS must be configured for functions such as authentication, accounting, or static route download.
Restrictions for RADIUS Server Load Balancing

- Incoming RADIUS requests, such as Packet of Disconnect (POD) requests, are not supported.
- Load balancing is not supported on proxy RADIUS servers and for private server groups.

Information About RADIUS Server Load Balancing

RADIUS Server Load Balancing Overview

Load balancing distributes batches of transactions to RADIUS servers within a server group. Load balancing assigns each batch of transactions to the server with the lowest number of outstanding transactions in its queue. The process of assigning a batch of transactions is as follows:

1. The first transaction is received for a new batch.
2. All server transaction queues are checked.
3. The server with the lowest number of outstanding transactions is identified.
4. The identified server is assigned the next batch of transactions.

The batch size is a user-configured parameter. Changes in the batch size may impact CPU load and network throughput. As batch size increases, CPU load decreases and network throughput increases. However, if a large batch size is used, all available server resources may not be fully utilized. As batch size decreases, CPU load increases and network throughput decreases.

There is no set number for large or small batch sizes. A batch with more than 50 transactions is considered large and a batch with fewer than 25 transactions is considered small.

If a server group contains ten or more servers, we recommend that you set a high batch size to reduce CPU load.

Transaction Load Balancing Across RADIUS Server Groups

You can configure load balancing either per-named RADIUS server group or for the global RADIUS server group. The load balancing server group must be referred to as “radius” in the authentication, authorization, and accounting (AAA) method lists. All public servers that are part of the RADIUS server group are then load balanced.

You can configure authentication and accounting to use the same RADIUS server or different servers. In some cases, the same server can be used for preauthentication, authentication, or accounting transactions for a session. The preferred server, which is an internal setting and is set as the default, informs AAA to use the same server for the start and stop record for a session regardless of the server cost. When using the preferred
server setting, ensure that the server that is used for the initial transaction (for example, authentication), the preferred server, is part of any other server group that is used for a subsequent transaction (for example, accounting).

The preferred server is not used if one of the following criteria is true:

- The **load-balance method least-outstanding ignore-preferred-server** command is used.
- The preferred server is dead.
- The preferred server is in quarantine.
- The want server flag has been set, overriding the preferred server setting.

The want server flag, an internal setting, is used when the same server must be used for all stages of a multistage transaction regardless of the server cost. If the want server is not available, the transaction fails.

You can use the **load-balance method least-outstanding ignore-preferred-server** command if you have either of the following configurations:

- Dedicated authentication server and a separate dedicated accounting server
- Network where you can track all call record statistics and call record details, including start and stop records and records that are stored on separate servers

If you have a configuration where authentication servers are a superset of accounting servers, the preferred server is not used.

**RADIUS Server Status and Automated Testing**

The RADIUS Server Load Balancing feature considers the server status when assigning batches. Transaction batches are sent only to live servers. We recommend that you test the status of all RADIUS load-balanced servers, including low usage servers (for example, backup servers).

Transactions are not sent to a server that is marked dead. A server is marked dead until its timer expires, at which time it moves to quarantine state. A server is in quarantine until it is verified alive by the RADIUS automated tester functionality.

To determine if a server is alive and available to process transactions, the RADIUS automated tester sends a request periodically to the server for a test userID. If the server returns an Access-Reject message, the server is alive; otherwise the server is either dead or quarantined.

A transaction sent to an unresponsive server is failed over to the next available server before the unresponsive server is marked dead. We recommend that you use the retry reorder mode for failed transactions.

When using the RADIUS automated tester, verify that the authentication, authorization, and accounting (AAA) servers are responding to the test packets that are sent by the network access server (NAS). If the servers are not configured correctly, packets may be dropped and the server erroneously marked dead.

---

**Caution**

We recommend that you use a test user that is not defined on the RADIUS server for the RADIUS server automated testing to protect against security issues that may arise if the test user is not correctly configured.
### How to Configure RADIUS Server Load Balancing

#### Enabling Load Balancing for a Named RADIUS Server Group

**Procedure**

<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>load-balance method least-outstanding [batch-size number] [ignore-preferred-server]</td>
<td>Enables the least-outstanding load balancing for a named server group.</td>
</tr>
<tr>
<td><em>Example:</em> Device(config-sg)# load-balance method least-outstanding batch-size 30</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Exits server group configuration mode and enters privileged EXEC mode.</td>
</tr>
<tr>
<td><em>Example:</em> Device(config-sg)# end</td>
<td></td>
</tr>
</tbody>
</table>

---

*Note: Use the test aaa group command to check load-balancing transactions.*
Enabling Load Balancing for a Global RADIUS Server Group

The global RADIUS server group is referred to as “radius” in the authentication, authorization, and accounting (AAA) method lists.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2**       | configure terminal |
| Example:         | Device# configure terminal |
|                  | Enters global configuration mode. |

| **Step 3**       | radius-server host {hostname | ip-address} |
| Example:         | Device(config)# radius-server host 192.0.2.1 test username test1 idle-time 1 |
|                  | Enables RADIUS automated testing. |

| **Step 4**       | radius-server load-balance method least-outstanding [batch-size number] |
| Example:         | Device(config)# radius-server load-balance method least-outstanding |
|                  | Enables the least-outstanding load balancing for the global RADIUS server group and enters server group configuration mode. |
|                  | • The default batch size is 25. The batch size range is from 1 to 2147483647. |

| **Step 5**       | load-balance method least-outstanding [batch-size number] |
| Example:         | Device(config-sg)# load-balance method least-outstanding batch-size 5 |
|                  | Enables least-outstanding load balancing for a global named server group. |

| **Step 6**       | end |
| Example:         | Device(config-sg)# end |
|                  | Exits server group configuration mode and enters privileged EXEC mode. |

Troubleshooting RADIUS Server Load Balancing

After configuring the RADIUS Server Load Balancing feature, you can monitor the idle timer, dead timer, and load balancing server selection or verify the server status by using a manual test command.
Procedure

Step 1
Use the `debug aaa test` command to determine when an idle timer or dead timer has expired, when test packets are sent, the status of the server, or to verify the server state.

The idle timer is used to check the server status and is updated with or without any incoming requests. Monitoring the idle timer helps to determine if there are nonresponsive servers and to keep the RADIUS server status updated to efficiently utilize available resources. For instance, an updated idle timer would help ensure that incoming requests are sent to servers that are alive.

The dead timer is used either to determine that a server is dead or to update a dead server’s status appropriately. Monitoring server selection helps to determine how often the server selection changes. Server selection is effective in analyzing if there are any bottlenecks, a large number of queued requests, or if only specific servers are processing incoming requests.

The following sample output from the `debug aaa test` command shows when the idle timer expired:

**Example:**
```
Device# debug aaa test
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) quarantined.
Jul 16 00:07:01: AAA/SG/TEST: Sending test request(s) to server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Sending 1 Access-Requests, 1 Accounting-Requests in current batch.
Jul 16 00:07:01: AAA/SG/TEST(Req#: 1): Sending test AAA Accounting-Request.
Jul 16 00:07:01: AAA/SG/TEST: Obtained Test response from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Obtained Test response from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Necessary responses received from server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) marked ALIVE. Idle timer set for 60 sec(s).
Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) removed from quarantine.
```

Step 2
Use the `debug aaa sg-server selection` command to determine the server that is selected for load balancing.

The following sample output from the `debug aaa sg-server selection` command shows five access requests being sent to a server group with a batch size of three:

**Example:**
```
Device# debug aaa sg-server selection
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining a new least loaded server.
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Server[0] load: 3
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Selected Server[1] with load 0
Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
```

Step 3
Use the `test aaa group` command to manually verify the RADIUS load-balanced server status.
The following sample output shows the response from a load-balanced RADIUS server that is alive when the username “test” does not match a user profile. The server is verified alive when it issues an Access-Reject response to an authentication, authorization, and accounting (AAA) packet generated using the `test aaa group` command.

**Example:**

Device# `test aaa group SG1 test lab new-code`

```
00:06:07: RADIUS/ENCODE(00000000):Orig. component type = INVALID
00:06:07: RADIUS/ENCODE(00000000): dropping service type, "radius-server attribute 6 on-for-login-auth" is off
00:06:07: RADIUS(00000000): Config NAS IP: 192.0.2.4
00:06:07: RADIUS(00000000): sending

---

**Configuration Examples for RADIUS Server Load Balancing**

**Example: Enabling Load Balancing for a Named RADIUS Server Group**

The following examples show load balancing enabled for a named RADIUS server group. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information.

The following sample output shows the relevant RADIUS configuration:

Device# `show running-config`

```
   .
   .
   .
   .  
   aaa group server radius server-group1
   server 192.0.2.238 auth-port 2095 acct-port 2096
   server 192.0.2.238 auth-port 2015 acct-port 2016
   load-balance method least-outstanding batch-size 5
   !
   aaa authentication ppp default group server-group1
   aaa accounting network default start-stop group server-group1
   .
   .
   .
```

The lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The `aaa group server radius` command shows the configuration of a server group with two member servers.
• The **load-balance** command enables load balancing for global RADIUS server groups with the batch size specified.

• The **aaa authentication ppp** command authenticates all PPP users using RADIUS.

• The **aaa accounting** command enables sending of all accounting requests to the AAA server when the client is authenticated and then disconnected using the **start-stop** keyword.

The show debug sample output below shows the selection of the preferred server and the processing of requests for the preceding configuration:

```
Device# show debug
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(0000002C):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(0000002D):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(0000002E):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(0000002F):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(00000030):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:51:16.019:AAA/SG/SERVER_SELECT(00000031):Server(192.0.2.238:2095,2096) now being used as preferred server
```
The following sample output from the `show aaa servers` command shows the AAA server status for the named RADIUS server group configuration:

The sample output shows the status of two RADIUS servers. Both servers are alive, and no requests have been processed since the counters were cleared 0 minutes ago.

Device# `show aaa servers`

```
RADIUS:id 8, priority 1, host 192.0.2.238, auth-port 2095, acct-port 2096
   State:current UP, duration 3781s, previous duration 0s
   Dead:total time 0s, count 0
   Quarantined:No
   Authen:request 0, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 0ms
      Transaction:success 0, failure 0
   Author:request 0, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 0ms
      Transaction:success 0, failure 0
   Account:request 0, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 0ms
      Transaction:success 0, failure 0
   Elapsed time since counters last cleared:0m
```

```
RADIUS:id 9, priority 2, host 192.0.2.238, auth-port 2015, acct-port 2016
   State:current UP, duration 3781s, previous duration 0s
   Dead:total time 0s, count 0
   Quarantined:No
   Authen:request 0, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 0ms
      Transaction:success 0, failure 0
   Author:request 0, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 0ms
      Transaction:success 0, failure 0
   Account:request 0, timeouts 0
      Response:unexpected 0, server error 0, incorrect 0, time 0ms
      Transaction:success 0, failure 0
   Elapsed time since counters last cleared:0m
```

**Example: Enabling Load Balancing for a Global RADIUS Server Group**

The following examples show how to enable load balancing for global RADIUS server groups. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information. You can use delimiting characters to display relevant parts of the configuration.

The following example shows the relevant RADIUS configuration:

Device# `show running-config | include radius`

```
aaa authentication ppp default group radius
aaa accounting network default start-stop group radius
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 key cisco
radius-server load-balance method least-outstanding batch-size 5
```

Lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The **aaa authentication ppp** command authenticates all PPP users using RADIUS.

---

**Example: Enabling Load Balancing for a Global RADIUS Server Group**

The following examples show how to enable load balancing for global RADIUS server groups. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information. You can use delimiting characters to display relevant parts of the configuration.

The following example shows the relevant RADIUS configuration:

Device# `show running-config | include radius`

```
aaa authentication ppp default group radius
aaa accounting network default start-stop group radius
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 key cisco
radius-server load-balance method least-outstanding batch-size 5
```

Lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The **aaa authentication ppp** command authenticates all PPP users using RADIUS.

---

**Example: Enabling Load Balancing for a Global RADIUS Server Group**

The following examples show how to enable load balancing for global RADIUS server groups. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information. You can use delimiting characters to display relevant parts of the configuration.

The following example shows the relevant RADIUS configuration:

Device# `show running-config | include radius`

```
aaa authentication ppp default group radius
aaa accounting network default start-stop group radius
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 key cisco
radius-server load-balance method least-outstanding batch-size 5
```

Lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The **aaa authentication ppp** command authenticates all PPP users using RADIUS.
The `aaa accounting` command enables the sending of all accounting requests to an AAA server when the client is authenticated and then disconnected through use of the `start-stop` keyword.

The `radius-server host` command defines the IP address of the RADIUS server host with the authorization and accounting ports specified and the authentication and encryption keys identified.

The `radius-server load-balance` command enables load balancing for global RADIUS server groups with the batch size specified.

The `show debug` sample output below shows the selection of the preferred server and the processing of requests for the configuration:

```
Device# show debug

General OS:
  AAA server group server selection debugging is on
#<sending 10 pppoe requests>
Device#
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000014):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000015):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000016):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000017):Server(192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000018):Server(192.0.2.238:2095,2096) now being used as preferred server
```
The following sample output from the `show aaa servers` command shows the AAA server status for the global RADIUS server group configuration:

The sample output shows the status of two RADIUS servers. Both servers are up and successfully processed in the last 2 minutes:

- Five out of six authentication requests
- Five out of five accounting requests

```
Device# show aaa servers
RADIUS:id 4, priority 1, host 192.0.2.238, auth-port 2095, acct-port 2096
  State:current UP, duration 3175s, previous duration 0s
  Dead:total time 0s, count 0
  Quarantined:No
  Authen:request 6, timeouts 1
    Response:unexpected 1, server error 0, incorrect 0, time 1841ms
    Transaction:success 5, failure 0
  Author:request 0, timeouts 0
    Response:unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction:success 0, failure 0
  Account:request 5, timeouts 0
    Response:unexpected 0, server error 0, incorrect 0, time 3303ms
    Transaction:success 5, failure 0
  Elapsed time since counters last cleared:2m

RADIUS:id 5, priority 2, host 192.0.2.238, auth-port 2015, acct-port 2016
  State:current UP, duration 3175s, previous duration 0s
  Dead:total time 0s, count 0
  Quarantined:No
  Authen:request 6, timeouts 1
    Response:unexpected 1, server error 0, incorrect 0, time 1955ms
    Transaction:success 5, failure 0
  Author:request 0, timeouts 0
    Response:unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction:success 0, failure 0
  Account:request 5, timeouts 0
    Response:unexpected 0, server error 0, incorrect 0, time 3247ms
    Transaction:success 5, failure 0
  Elapsed time since counters last cleared:2m
```

Example: Monitoring Idle Timer

The following example shows idle timer and related server state for load balancing enabled for a named RADIUS server group. The current configuration of the RADIUS command output and debug command output are also displayed.

The following sample output shows the relevant RADIUS configuration:

```
Device# show running-config | include radius
aaa group server radius server-group1
  radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 test username junk1 idle-time 1 key cisco
  radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 test username junk1 idle-time 1 key cisco
  radius-server load-balance method least-outstanding batch-size 5
```

The lines in the current configuration of the preceding RADIUS command output are defined as follows:
• The `aaa group server radius` command shows the configuration of a server group.

• The `radius-server host` command defines the IP address of the RADIUS server host with authorization and accounting ports specified and the authentication and encryption key identified.

• The `radius-server load-balance` command enables load balancing for the RADIUS server with the batch size specified.

The `show debug` sample output below shows test requests being sent to servers. The response to the test request sent to the server is received, the server is removed from quarantine as appropriate, the server is marked alive, and then the idle timer is reset.

```
Device# show debug
*Feb 28 13:52:20.835:AAA/SG/TEST:Sending test request(s) to server (192.0.2.238:2015,2016)
```

**Example: Configuring the Preferred Server with the Same Authentication and Authorization Server**

The following example shows an authentication server group and an authorization server group that use the same servers 209.165.200.225 and 209.165.200.226. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
aaa group server radius accounting-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
```

When a preferred server is selected for a session, all transactions for that session will continue to use the original preferred server. The servers 209.165.200.225 and 209.165.200.226 are load balanced based on sessions rather than transactions.

**Example: Configuring the Preferred Server with Different Authentication and Authorization Servers**

The following example shows an authentication server group that uses servers 209.165.200.225 and 209.165.200.226 and an authorization server group that uses servers 209.165.201.1 and 209.165.201.2. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
```
The authentication server group and the accounting server group do not share any common servers. A preferred server is never found for accounting transactions; therefore, authentication and accounting servers are load-balanced based on transactions. Start and stop records are sent to the same server for a session.

**Example: Configuring the Preferred Server with Overlapping Authentication and Authorization Servers**

The following example shows an authentication server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1 and an accounting server group that uses servers 209.165.201.1 and 209.165.201.2. Both server groups have the preferred server flag enabled.

```plaintext
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
  server 209.165.201.1 key radkey3
  server 209.165.201.2 key radkey4

aaa group server radius accounting-group
  server 209.165.201.1 key radkey3
  server 209.165.201.2 key radkey4
```

If all servers have equal transaction processing capability, one-third of all authentication transactions are directed toward the server 209.165.201.1. Therefore, one-third of all accounting transactions are also directed toward the server 209.165.201.1. The remaining two-thirds of accounting transactions are load-balanced equally between servers 209.165.201.1 and 209.165.201.2. The server 209.165.201.1 receives fewer authentication transactions because the server 209.165.201.1 has outstanding accounting transactions.

**Example: Configuring the Preferred Server with Authentication Servers As a Subset of Authorization Servers**

The following example shows an authentication server group that uses servers 209.165.200.225 and 209.165.200.226 and an authorization server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1. Both server groups have the preferred server flag enabled.

```plaintext
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2

aaa group server radius accounting-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
  server 209.165.201.1 key radkey3
```

One-half of all authentication transactions are sent to the server 209.165.200.225 and the other half to the server 209.165.200.226. Servers 209.165.200.225 and 209.165.200.226 are preferred servers for authentication and accounting transaction. Therefore, there is an equal distribution of authentication and accounting transactions across servers 209.165.200.225 and 209.165.200.226. The server 209.165.201.1 is relatively unused.
Example: Configuring the Preferred Server with Authentication Servers As a Superset of Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1 and an authorization server group that uses servers 209.165.200.225 and 209.165.200.226. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
    server 209.165.200.225 key radkey1
    server 209.165.200.226 key radkey2
    server 209.165.201.1 key radkey3
aaa group server radius accounting-group
    server 209.165.200.225 key radkey1
    server 209.165.200.226 key radkey2
```

Initially, one-third of authentication transactions are assigned to each server in the authorization server group. As accounting transactions are generated for more sessions, accounting transactions are sent to servers 209.165.200.225 and 209.165.200.226 because the preferred server flag is on. As servers 209.165.200.225 and 209.165.200.226 begin to process more transactions, authentication transactions will start to be sent to server 209.165.201.1. Transaction requests authenticated by server 209.165.201.1 do not have any preferred server setting and are split between servers 209.165.200.225 and 209.165.200.226, which negates the use of the preferred server flag. This configuration should be used cautiously.

Feature Information for RADIUS Server Load Balancing
CHAPTER 39

RADIUS Change of Authorization Support

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated.

Identity-Based Networking Services supports RADIUS change of authorization (CoA) commands for session query, reauthentication, and termination, port bounce and port shutdown, and service template activation and deactivation.

- Information About RADIUS Change-of-Authorization, on page 797
- How to Configure RADIUS Change-of-Authorization, on page 808
- Additional References for RADIUS Change-of-Authorization, on page 811
- Feature Information for RADIUS Change-of-Authorization Support, on page 812

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About RADIUS Change-of-Authorization

RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.
A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst switches support the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

The switch supports these per-session CoA requests:

• Session reauthentication
• Session termination
• Session termination with port shutdown
• Session termination with port bounce

This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst switches. However, some basic configuration is required for the following attributes:

• Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.
• Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

• CoA acknowledgement (ACK) [CoA-ACK]
• CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.

The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.

### Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

### RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.
This table shows the IETF attributes are supported for this feature.

</table>
Preconditions

To use the CoA interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IPAddress (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect- negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.
The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**Session Identification**

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- **Acct-Session-Id** (IETF attributes #44)
- **Audit-Session-Id** (Cisco VSA)
- **Calling-Station-Id** (IETF attribute #31, which contains the host MAC address)
- **IPv6 Attributes**, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
  - **Plain IP Address** (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**CoA ACK Response Code**

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

**CoA NAK Response Code**

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use `show` commands to verify a successful CoA.

**Session Reauthentication**

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: `Cisco:Avpair="subscriber:command=reauthenticate"` and one or more session identification attributes.
The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -Requestld message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

### Session Reauthentication in a Switch Stack

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.
- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack member.
- If the stack master fails before authentication completes, reauthentication is initiated after stack master switch-over based on the original command (which is subsequently removed).
- If the stack master fails before sending an ACK, the new stack master treats the re-transmitted command as a new command.

### Session Termination

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

### CoA Activate Service Command

The CoA activate service command can be used to activate a service template on a session. The AAA server sends the request in a standard CoA-Request message using the following VSAs:

Cisco:Avpair="subscriber:command=activate-service"
Cisco:Avpair="subscriber:service-name=<service-name>"
Cisco:Avpair="subscriber:precedence=<precedence-number>"
Cisco:Avpair="subscriber:activation-mode=replace-all"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the Session Identification section below. If the device cannot locate a session, it returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the device locates a session, it initiates an activate template operation for the hosting port and a CoA-ACK is returned. If activating the template fails, a CoA-NAK message is returned with the Error-Code attribute set to the appropriate message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

CoA Deactivate Service Command

The CoA deactivate service command can be used to deactivate a service template on a session. The AAA server sends the request in a standard CoA-Request message using the following VSAs:

Cisco:Avpair="subscriber:command=deactivate-service"
Cisco:Avpair="subscriber:service-name=<service-name>"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the Session Identification section below. If the device cannot locate a session, it returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the device locates a session, it initiates a deactivate template operation for the hosting port and a CoA-ACK is returned. If deactivating the template fails, a CoA-NAK message is returned with the Error-Code attribute set to the appropriate message.
If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

**Session Identification**

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

-acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  • Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  • Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**CoA Request: Disable Host Port**

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network access on the port, reenable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

Cisco:Avpair="subscriber:command=disable-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

**Note**

A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.
CoA Request: Bounce-Port

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

CoA Session Query Command

The CoA session query command requests service information about a subscriber session. The AAA server sends the request in a standard CoA-Request message containing the following VSA:

Cisco:Avpair="subscriber:command=session-query"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the Session Identification section below. If the device cannot locate a session, it returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the device locates a session, it performs a session query operation on the session and returns a CoA-ACK message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

• Acct-Session-Id (IETF attribute #44)
• Audit-Session-Id (Cisco VSA)
• Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
• IPv6 Attributes, which can be one of the following:
  • Framed-Ipv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  • Framed-Ipv6-Address
• Plain IP Address (IETF attribute #8)
If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

CoA Session Reauthenticate Command

To initiate session authentication, the AAA server sends a standard CoA-Request message containing the following VSAs:

Cisco:Avpair=“subscriber:command=reauthenticate”
Cisco:Avpair=“subscriber:reauthenticate-type=<last | rerun>”

“reauthenticate-type” defines whether the CoA reauthentication request uses the authentication method that last succeeded on the session or whether the authentication process is completely rerun.

The following rules apply:

• “subscriber:command=reauthenticate” must be present to trigger a reauthentication.

• If “subscriber:reauthenticate-type” is not specified, the default behavior is to rerun the last successful authentication method for the session. If the method reauthenticates successfully, all old authorization data is replaced with the new reauthenticated authorization data.

• “subscriber:reauthenticate-type” is valid only when included with “subscriber:command=reauthenticate.” If it is included in another CoA command, the VSA will be silently ignored.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is resent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

CoA Session Terminate Command

A CoA Disconnect-Request command terminates a session without disabling the host port. This command causes reinitialization of the authenticator state machine for the specified host, but does not restrict the host’s access to the network. If the session cannot be located, the device returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the device terminates the session. After the session has been completely removed, the device returns a Disconnect-ACK.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair=“subscriber:command=disable-host-port” VSA. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. When you want to restore network access on the port, reenable it using a non-RADIUS mechanism.

Stacking Guidelines for Session Termination

No special handling is required for CoA Disconnect-Request messages in a switch stack.
Stacking Guidelines for CoA-Request Bounce-Port

Because the **bounce-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid **bounce-port** command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby stack master.

If the stack master fails before the port-bounce completes, a port-bounce is initiated after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

Stacking Guidelines for CoA-Request Disable-Port

Because the **disable-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid **disable-port** command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby stack master.

If the stack master fails before the port-disable operation completes, the port is disabled after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

How to Configure RADIUS Change-of-Authorization

Configuring CoA on the Switch

Follow these steps to configure CoA on a switch. This procedure is required.
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>aaa server radius dynamic-author</td>
<td>Configures the switch as an authentication, authorization, and accounting (AAA) server to facilitate interaction with an external policy server.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# aaa server radius dynamic-author</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>client {ip-address</td>
<td>name} [vrf vrfname] [server-key string]</td>
</tr>
<tr>
<td>Step 6</td>
<td>server-key [0</td>
<td>7] string</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-sg-radius)# server-key your_server_key</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>port port-number</td>
<td>Specifies the port on which a device listens for RADIUS requests from configured RADIUS clients.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-sg-radius)# port 25</td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td>auth-type {any</td>
<td>all</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-sg-radius)# auth-type any</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 9** | ignore session-key  
(Optional) Configures the switch to ignore the session-key.  
For more information about the *ignore* command, see the *Cisco IOS Intelligent Services Gateway Command Reference* on Cisco.com. |
| **Step 10** | ignore server-key  
Example:  
```
Switch(config-sg-radius)# ignore server-key
```  
(Optional) Configures the switch to ignore the server-key.  
For more information about the *ignore* command, see the *Cisco IOS Intelligent Services Gateway Command Reference* on Cisco.com. |
| **Step 11** | authentication command bounce-port ignore  
Example:  
```
Switch(config-sg-radius)# authentication command bounce-port ignore
```  
(Optional) Configures the switch to ignore a CoA request to temporarily disable the port hosting a session. The purpose of temporarily disabling the port is to trigger a DHCP renegotiation from the host when a VLAN change occurs and there is no supplicant on the endpoint to detect the change. |
| **Step 12** | authentication command disable-port ignore  
Example:  
```
Switch(config-sg-radius)# authentication command disable-port ignore
```  
(Optional) Configures the switch to ignore a nonstandard command requesting that the port hosting a session be administratively shut down. Shutting down the port results in termination of the session.  
Use standard CLI or SNMP commands to re-enable the port. |
| **Step 13** | end  
Example:  
```
Switch(config-sg-radius)# end
```  
Returns to privileged EXEC mode. |
| **Step 14** | show running-config  
Example:  
```
Switch# show running-config
```  
Verifies your entries. |
| **Step 15** | copy running-config startup-config  
Example:  
```
Switch# copy running-config
```  
(Optional) Saves your entries in the configuration file. |
Monitoring and Troubleshooting CoA Functionality

The following Cisco IOS commands can be used to monitor and troubleshoot CoA functionality on the switch:

- `debug radius`
- `debug aaa coa`
- `debug aaa pod`
- `debug aaa subsys`
- `debug cmdhd [detail | error | events]`
- `show aaa attributes protocol radius`

Configuring Kerberos

Kerberos is a secret-key network authentication protocol, developed at the Massachusetts Institute of Technology (MIT), that uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication. Kerberos was designed to authenticate requests for network resources. Kerberos, like other secret-key systems, is based on the concept of a trusted third party that performs secure verification of users and services. In the Kerberos protocol, this trusted third party is called the key distribution center (KDC).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

• So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.
Information About Kerberos

Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

Note

In the Kerberos configuration examples, the trusted third party can be any switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the key distribution center (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

Note

A Kerberos server can be any switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called single logon. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

Kerberos supports these network services:
This table lists the common Kerberos-related terms and definitions.

**Table 99: Kerberos Terms**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.</td>
</tr>
<tr>
<td>Authorization</td>
<td>A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.</td>
</tr>
<tr>
<td>Credential</td>
<td>A general term that refers to authentication tickets, such as TGTs and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.</td>
</tr>
</tbody>
</table>
| Instance      | An authorization level label for Kerberos principals. Most Kerberos principals are of the form `user@REALM` (for example, smith@EXAMPLE.COM). A Kerberos principal with a Kerberos instance has the form `user/instance@REALM` (for example, smith/admin@EXAMPLE.COM). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so.  
**Note** The Kerberos principal and instance names must be in all lowercase characters. 
**Note** The Kerberos realm name must be in all uppercase characters. |
| KDC          | Key distribution center that consists of a Kerberos server and database program that is running on a network host.                              |
| Kerberized    | A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.                      |
| Kerberos realm | A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service.  
**Note** The Kerberos realm name must be in all uppercase characters. |
| Kerberos server | A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services. |
A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB.

Principal
Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server.

Note The Kerberos principal name must be in all lowercase characters.

Service credential
A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.

SRVTAB
A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.

TGT
Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC.

Kerberos Operation
A Kerberos server can be a switch that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

Authenticating to a Boundary Switch
This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
   • If the decryption is successful, the user is authenticated to the switch.
   • If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.

Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a key distribution center (KDC) and obtain a ticket granting ticket (TGT) from the KDC to access network services.

When a remote user authenticates to a boundary device, that user technically becomes part of the network; that is, the network is extended to include the remote user and the user’s machine or network. To gain access to network services, however, the remote user must obtain a TGT from the KDC. The following process describes how remote users authenticate to the KDC:

1. The remote user, at a workstation on a remote site, launches the KINIT program (part of the client software provided with the Kerberos protocol).
2. The KINIT program finds the identity of the user and requests a TGT from the KDC.
3. The KDC creates a TGT, which contains the identity of the user, the identity of the KDC, and the expiration time of the TGT.
4. Using the user’s password as a key, the KDC encrypts the TGT and sends the TGT to the workstation.
5. When the KINIT program receives the encrypted TGT, it prompts the user for a password (this is the password that is defined for the user in the KDC).
6. If the KINIT program can decrypt the TGT with the password the user enters, the user is authenticated to the KDC, and the KINIT program stores the TGT in the user’s credential cache.

At this point, the user has a TGT and can communicate securely with the KDC. In turn, the TGT allows the user to authenticate to other network services.

Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a ticket granting ticket (TGT) must now authenticate to the network services in a Kerberos realm.
The following process describes how a remote user with a TGT authenticates to network services within a given Kerberos realm. Assume the user is on a remote workstation (Host A) and wants to log in to Host B.

1. The user on Host A initiates a Kerberized application (such as Telnet) to Host B.
2. The Kerberized application builds a service credential request and sends it to the KDC. The service credential request includes (among other things) the user’s identity and the identity of the desired network service. The TGT is used to encrypt the service credential request.
3. The KDC tries to decrypt the service credential request with the TGT it issued to the user on Host A. If the KDC can decrypt the packet, it is assured that the authenticated user on Host A sent the request.
4. The KDC notes the network service identity in the service credential request.
5. The KDC builds a service credential for the appropriate network service on Host B on behalf of the user on Host A. The service credential contains the client’s identity and the desired network service’s identity.
6. The KDC then encrypts the service credential twice. It first encrypts the credential with the SRVTAB that it shares with the network service identified in the credential. It then encrypts the resulting packet with the TGT of the user (who, in this case, is on Host A).
7. The KDC sends the twice-encrypted credential to Host A.
8. Host A attempts to decrypt the service credential with the user’s TGT. If Host A can decrypt the service credential, it is assured the credential came from the real KDC.
9. Host A sends the service credential to the desired network service. Note that the credential is still encrypted with the SRVTAB shared by the KDC and the network service.
10. The network service attempts to decrypt the service credential using its SRVTAB.
11. If the network service can decrypt the credential, it is assured the credential was in fact issued from the KDC. Note that the network service trusts anything it can decrypt from the KDC, even if it receives it indirectly from a user. This is because the user first authenticated with the KDC.

At this point, the user is authenticated to the network service on Host B. This process is repeated each time a user wants to access a network service in the Kerberos realm.

**How to Configure Kerberos**

To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

**Configuring the KDC Using Kerberos Commands**

After a host is configured to function as the KDC in the Kerberos realm, entries must be made to the KDC database (and to modify existing database information) for all principals in the realm. Principals can be network services on devices and hosts or principals can be users.
All Kerberos command examples are based on Kerberos 5 Beta 5 of the original MIT implementation. Later versions use a slightly different interface.

### Adding Users to the KDC Database

Follow these steps to add users to the KDC and create privileged instances for those users:

#### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Use the <code>su</code> command to become root on the host running the KDC.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Use the <code>kdb5_edit</code> program to configure the commands in the next steps.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The Kerberos realm name in the following steps must be in uppercase characters.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Use the <code>ank</code> (add new key) command in privileged EXEC mode to add a user to the KDC. This command prompts for a password that the user must enter to authenticate the router. For example:</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device # <code>ank username@REALM</code></td>
</tr>
<tr>
<td>Step 4</td>
<td>Use the <code>ank</code> command to add a privileged instance of a user. For example:</td>
</tr>
<tr>
<td></td>
<td>Device # <code>ank username/instance@REALM</code></td>
</tr>
</tbody>
</table>

#### Example

The following example adds the user `loki` to the Kerberos realm `COMPANY.COM`:

```
ank loki@COMPANY.COM
```

Privileged instances can be created to allow network administrators to connect to the router at the enable level so that a clear text password is not used to avoid compromising security and to enter enabled modes. See the Enabling Kerberos Instance Mapping, on page 824 for more information on mapping Kerberos instances to various Cisco IOS privilege levels.

### Creating and Extracting a SRVTAB on the KDC

All devices authenticated through Kerberos must have a SRVTAB that contains the password or randomly generated key for the service principal key that was entered into the KDC database. A service principal key must be shared with the host running that service. To do this, the SRVTAB entry must be saved (extracted) to a file and copied to the device and all hosts in the Kerberos realm.
Follow these steps to make a SRVTAB entry and extract this SRVTAB to a file on the KDC in privileged EXEC mode:

**Procedure**

**Step 1** Use the `ark` (add random key) command to add a network service supported by a host or device to the KDC. For example:

**Example:**

```
Device# ark
SERVICE/HOSTNAME@REALM
```

**Step 2** Use the `kdb5_edit` command `xst` to write an SRVTAB entry to a file. For example:

**Example:**

```
Device# xst
device-name host
```

**Step 3** Use the `quit` command to exit the `kdb5_edit` program.

**Example**

The following example shows how to add a Kerberized authentication service for a device called `device1` to the Kerberos realm `COMPANY.COM`:

```
ark host/device1.company.com@COMPANY.COM
```

The following example shows how to write an entry for all network services on all Kerberized hosts that use this KDC for authentication to a file:

```
xst device1.company.com@COMPANY.COM host
```

### Configuring the Device to Use the Kerberos Protocol

#### Defining a Kerberos Realm

For a device to authenticate a user defined in the Kerberos database, it must know the host name or IP address of the host running the KDC, the name of the Kerberos realm and, optionally, be able to map the host name or Domain Name System (DNS) domain to the Kerberos realm.

To configure the device to authenticate to a specified KDC in a specified Kerberos realm, use the following commands in global configuration mode. Note that DNS domain names must begin with a leading dot (`.`):

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Device(config)# kerberos local-realm kerberos-realm</td>
<td>Defines the default realm for the device.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Device(config)# kerberos server kerberos-realm {hostname</td>
</tr>
<tr>
<td>-------</td>
<td>-----------------------------------------------------------------</td>
</tr>
<tr>
<td>Step 3</td>
<td>Device(config)# kerberos realm {dns-domain</td>
</tr>
</tbody>
</table>

**What to do next**

Because the machine running the KDC and all Kerberized hosts must interact within a 5-minute window or authentication fails, all Kerberized machines, and especially the KDC, should be running the Network Time Protocol (NTP).

The `kerberos local-realm`, `kerberos realm`, and `kerberos server` commands are equivalent to the UNIX `krb.conf` file. The table below identifies mappings from the Cisco IOS configuration commands to a Kerberos 5 configuration file (`krb5.conf`).

### Table 100: Kerberos 5 Configuration File and Commands

<table>
<thead>
<tr>
<th>krb5.conf File</th>
<th>Cisco IOS Configuration Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>[libdefaults]</td>
<td>(in configuration mode)</td>
</tr>
<tr>
<td>default_realm = DOMAIN.COM</td>
<td>kerberos local-realm</td>
</tr>
<tr>
<td></td>

<td>(172.65.44.2 is the example IP address for DOMAIN.PIL.COM)</td>
</tr>
<tr>
<td>admin_server = DOMAIN.PIL.COM</td>
<td></td>
</tr>
<tr>
<td>default_domain = DOMAIN.COM</td>
<td></td>
</tr>
</tbody>
</table>

### Copying SRVTAB Files

To make it possible for remote users to authenticate to the device using Kerberos credentials, the device must share a secret key with the KDC. To do this, you must give the device a copy of the SRVTAB you extracted on the KDC.
The most secure method to copy an SRVTAB file to the hosts in your Kerberos realm is to copy it onto physical media and go to each host in turn and manually copy the files onto the system. To copy an SRVTAB file to the device, which does not have a physical media drive, it must be transferred over the network using TFTP.

To remotely copy an SRVTAB file to the device from the KDC, use the `kerberos srvtab remote` command in global configuration mode:

```
Device(config)# kerberos srvtab remote {hostname | ip-address} {filename}
```

When you copy the SRVTAB file from the device to the KDC, the `kerberos srvtab remote` command parses the information in this file and stores it in the running configuration of the device, in the `kerberos srvtab entry` format. To ensure that the SRVTAB is available (does not need to be acquired from the KDC) when you reboot the device, use the `write memory` configuration command to write your running configuration (which contains the parsed SRVTAB file) to NVRAM.

### Specifying Kerberos Authentication

See the Configuring Authentication feature module for more information on configuring authentication on the device. The `aaa authentication` command is used to specify Kerberos as the authentication method.

### Enabling Credentials Forwarding

With Kerberos configured thus far, a user authenticated to a Kerberized device has a TGT and can use it to authenticate to a host on the network. However, if the user tries to list credentials after authenticating to a host, the output will show no Kerberos credentials present.

You can optionally configure the device to forward users’ TGTs with them as they authenticate from the device to Kerberized remote hosts on the network when using Kerberized Telnet, rcp, rsh, and rlogin (with the appropriate flags).

To force all clients to forward users’ credentials as they connect to other hosts in the Kerberos realm, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# kerberos credentials forward</code></td>
<td>Forges all clients to forward user credentials upon successful Kerberos authentication.</td>
</tr>
</tbody>
</table>

With credentials forwarding enabled, users’ TGTs are automatically forwarded to the next host they authenticate to. In this way, users can connect to multiple hosts in the Kerberos realm without running the KINIT program each time to get a new TGT.

### Opening a Telnet Session to a Device

To use Kerberos to authenticate users opening a Telnet session to the device from within the network, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Device(config)# aaa authentication login {default</td>
<td>list-name} krb5_telnet`</td>
</tr>
</tbody>
</table>
Although Telnet sessions to the device are authenticated, users must still enter a clear text password if they want to enter enable mode. The `kerberos instance map` command, discussed in a later section, allows them to authenticate to the device at a predefined privilege level.

**Establishing an Encrypted Kerberized Telnet Session**

Another way for users to open a secure Telnet session is to use Encrypted Kerberized Telnet. With Encrypted Kerberized Telnet, users are authenticated by their Kerberos credentials before a Telnet session is established. The Telnet session is encrypted using 56-bit Data Encryption Standard (DES) encryption with 64-bit Cipher Feedback (CFB). Because data sent or received is encrypted, not clear text, the integrity of the dialed device or access server can be more easily controlled.

### Note

This feature is available only if you have the 56-bit encryption image. 56-bit DES encryption is subject to U.S. Government export control regulations.

To establish an encrypted Kerberized Telnet session from a device to a remote host, use either of the following commands in EXEC command mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# <code>connect host</code> [port] <code>/encrypt kerberos</code> or Device(config)# <code>telnet host</code> [port] <code>/encrypt kerberos</code></td>
<td>Establishes an encrypted Telnet session.</td>
</tr>
</tbody>
</table>

When a user opens a Telnet session from a device to a remote host, the device and remote host negotiate to authenticate the user using Kerberos credentials. If this authentication is successful, the device and remote host then negotiate whether or not to use encryption. If this negotiation is successful, both inbound and outbound traffic is encrypted using 56-bit DES encryption with 64-bit CFB.

When a user dials in from a remote host to a device configured for Kerberos authentication, the host and device will attempt to negotiate whether or not to use encryption for the Telnet session. If this negotiation is successful, the device will encrypt all outbound data during the Telnet session.

If encryption is not successfully negotiated, the session will be terminated and the user will receive a message stating that the encrypted Telnet session was not successfully established.

**Enabling Mandatory Kerberos Authentication**

As an added layer of security, you can optionally configure the device so that, after remote users authenticate to it, these users can authenticate to other services on the network only with Kerberized Telnet, rlogin, rsh, and rcp. If you do not make Kerberos authentication mandatory and Kerberos authentication fails, the application attempts to authenticate users using the default method of authentication for that network service; for example, Telnet and rlogin prompt for a password, and rsh attempts to authenticate using the local rhost file.

To make Kerberos authentication mandatory, use the following command in global configuration mode:
Enabling Kerberos Instance Mapping

You can create administrative instances of users in the KDC database. The `kerberos instance map` command allows you to map those instances to Cisco IOS privilege levels so that users can open secure Telnet sessions to the device at a predefined privilege level, obviating the need to enter a clear text password to enter enable mode.

To map a Kerberos instance to a Cisco IOS privilege level, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# kerberos instance map instance privilege-level</td>
<td>Maps a Kerberos instance to a Cisco IOS privilege level.</td>
</tr>
</tbody>
</table>

If there is a Kerberos instance for user loki in the KDC database (for example, loki/admin), user loki can now open a Telnet session to the device as loki/admin and authenticate automatically at privilege level 15, assuming instance “admin” is mapped to privilege level 15.

Cisco IOS commands can be set to various privilege levels using the `privilege level` command.

After you map a Kerberos instance to a Cisco IOS privilege level, you must configure the device to check for Kerberos instances each time a user logs in. To run authorization to determine if a user is allowed to run an EXEC shell based on a mapped Kerberos instance, use the `aaa authorization` command with the `krb5-instance` keyword. For more information, refer to the chapter “Configuring Authorization.”

Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the following commands:

- `show running-config`
- `show kerberos creds`: Lists the credentials in a current user’s credentials cache.
- `clear kerberos creds`: Destroys all credentials in a current user’s credentials cache, including those forwarded.

Configuration Examples for Kerberos

Example: Defining a Kerberos Realm

To define CISCO.COM as the default Kerberos realm, use the following command:

```
kerberos local-realm CISCO.COM
```
To tell the device that the CISCO.COM KDC is running on host 10.2.3.4 at port number 170, use the following Kerberos command:

```
kerberos server CISCO.COM 10.2.3.4 170
```

To map the DNS domain cisco.com to the Kerberos realm CISCO.COM, use the following command:

```
kerberos realm.cisco.com CISCO.COM
```

**Example: Copying a SRVTAB File**

To copy over the SRVTAB file on a host named host123.cisco.com for a device named device1.cisco.com, the command would look like this:

```
kerberos srvtab remote host123.cisco.com device1.cisco.com-new-srvtab
```

**Example: Configuring Kerberos**

This section provides a typical non-Kerberos device configuration and shows output for this configuration from the `write term` command, then builds on this configuration by adding optional Kerberos functionality. Output for each configuration is presented for comparison against the previous configuration.

This example shows how to use the `kdb5_edit` program to perform the following configuration tasks:

- Adding user chet to the Kerberos database
- Adding a privileged Kerberos instance of user chet (chet/admin) to the Kerberos database
- Adding a restricted instance of chet (chet/restricted) to the Kerberos database
- Adding workstation chet-ss20.cisco.com
- Adding device chet-2500.cisco.com to the Kerberos database
- Adding workstation chet-ss20.cisco.com to the Kerberos database
- Extracting SRVTABs for the device and workstations
- Listing the contents of the KDC database (with the `ldb` command)

---

**Note**

In this sample configuration, host chet-ss20 is also the KDC:

```
chet-ss20# sbin/kdb5_edit
kdb5_edit: ank chet
Enter password:
Re-enter password for verification:
kdb5_edit: ank chet/admin
Enter password:
Re-enter password for verification:
kdb5_edit: ank chet/restricted
Enter password:
Re-enter password for verification:
kdb5_edit: ark host/chet-ss20.cisco.com
```
Example: Configuring Kerberos

The following example shows output from a `write term` command, which displays the configuration of device chet-2500. This is a typical configuration with no Kerberos authentication.

```
chet-2500# write term

The following example shows how to enable user authentication on the device via the Kerberos database. To enable user authentication via the Kerberos database, you would perform the following tasks:

- Entering configuration mode
- Defining the Kerberos local realm
- Identifying the machine hosting the KDC
- Enabling credentials forwarding
- Specifying Kerberos as the method of authentication for login
- Exiting configuration mode (CTL-Z)
- Writing the new configuration to the terminal

chet-2500# configure term
Enter configuration commands, one per line. End with CNTL/Z.
chet-2500(config)# kerberos local-realm CISCO.COM
chet-2500(config)# kerberos server CISCO.COM chet-ss20
Translating "chet-ss20"...domain server (192.168.0.0) [OK]

chet-ss20%

The following example shows how to authenticate to the device using Kerberos credentials. To authenticate using Kerberos credentials, you would perform the following tasks:

- Entering configuration mode
- Remotely copying over the SRVTAB file from the KDC
Example: Configuring Kerberos

- Setting authentication at login to use the Kerberos 5 Telnet authentication protocol when using Telnet to connect to the device
- Writing the configuration to the terminal

Note that the new configuration contains a kerberos srvtab entry line. This line is created by the kerberos srvtab remote command.

```
chet-2500# configure term
Enter configuration commands, one per line. End with CNTL/Z.
chet-2500(config)# kerberos srvtab remote earth chet/chet-2500.cisco.com-new-srvtab

The following examples show how to map Kerberos instances to Cisco’s privilege levels. To map Kerberos instances to privilege levels, you would perform the following tasks:

- Entering configuration mode
- Mapping the Kerberos instance admin to privilege level 15
- Mapping the Kerberos instance restricted to privilege level 3
- Specifying that the instance defined by the `kerberos instance map` command be used for AAA Authorization
- Writing the configuration to the terminal

```
chet-2500# configure term
Enter configuration commands, one per line. End with CNTL/Z.
chet-2500(config)# kerberos instance map admin 15
chet-2500(config)# kerberos instance map restricted 3
chet-2500(config)# aaa authorization exec default krb5-instance
chet-2500(config)#
chet-2500#
%SYS-5-CONFIG_I: Configured from console by console

Chapter 41

Configuring Accounting

The AAA Accounting feature allows the services that users are accessing and the amount of network resources that users are consuming to be tracked. When AAA Accounting is enabled, the network access server reports user activity to the TACACS+ or RADIUS security server (depending on which security method is implemented) in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, and auditing.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Accounting

The following tasks must be performed before configuring accounting using named method lists:

- Enable AAA on the network access server by using the `aaa new-model` command in global configuration mode.

- Define the characteristics of the RADIUS or TACACS+ security server if RADIUS or TACACS+ authorization is issued. For more information about configuring the Cisco network access server to
communicate with the RADIUS security server, see the Configuring RADIUS module. For more information about configuring the Cisco network access server to communicate with the TACACS+ security server, see the Configuring TACACS+ module.

**Restrictions for Configuring Accounting**

- Accounting information can be sent simultaneously to a maximum of only four AAA servers.

- For Service Selection Gateway (SSG) systems, the `aaa accounting network broadcast` command broadcasts only `start-stop` accounting records. If interim accounting records are configured using the `ssg accounting interval` command, the interim accounting records are sent only to the configured default RADIUS server.

**Information About Configuring Accounting**

**Named Method Lists for Accounting**

Similar to authentication and authorization method lists, method lists for accounting define the way accounting is performed and the sequence in which these methods are performed.

Named accounting method lists allow particular security protocol to be designated and used on specific lines or interfaces for accounting services. The only exception is the default method list (which is named “default”). The default method list is automatically applied to all interfaces except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list is simply a named list describing the accounting methods to be queried (such as RADIUS or TACACS+), in sequence. Method lists allow one or more security protocols to be designated and used for accounting, thus ensuring a backup system for accounting in case the initial method fails. Cisco IOS software uses the first method listed to support accounting; if that method fails to respond, the Cisco IOS software selects the next accounting method listed in the method list. This process continues until there is successful communication with a listed accounting method, or all methods defined are exhausted.

**Note**

The Cisco IOS software attempts accounting with the next listed accounting method only when there is no response from the previous method. If accounting fails at any point in this cycle—meaning that the security server responds by denying the user access—the accounting process stops and no other accounting methods are attempted.

Accounting method lists are specific to the type of accounting being requested. AAA supports seven different types of accounting:

- **Network** --Provides information for all PPP, SLIP, or ARAP sessions, including packet and byte counts.

- **EXEC** --Provides information about user EXEC terminal sessions of the network access server.

- **Commands** --Provides information about the EXEC mode commands that a user issues. Command accounting generates accounting records for all EXEC mode commands, including global configuration commands, associated with a specific privilege level.
- **Connection** --Provides information about all outbound connections made from the network access server, such as Telnet, local-area transport (LAT), TN3270, packet assembler/disassembler (PAD), and rlogin.

- **System** --Provides information about system-level events.

- **Resource** --Provides “start” and “stop” records for calls that have passed user authentication, and provides “stop” records for calls that fail to authenticate.

- **VRRS** --Provides information about Virtual Router Redundancy Service (VRRS).

---

**Note**

System accounting does not use named accounting lists; only the default list for system accounting can be defined.

Once again, when a named method list is created, a particular list of accounting methods for the indicated accounting type are defined.

Accounting method lists must be applied to specific lines or interfaces before any of the defined methods are performed. The only exception is the default method list (which is named “default”). If the **aaa accounting** command for a particular accounting type is issued without specifying a named method list, the default method list is automatically applied to all interfaces or lines except those that have a named method list explicitly defined (A defined method list overrides the default method list). If no default method list is defined, then no accounting takes place.

This section includes the following subsections:

### Method Lists and Server Groups

A server group is a way to group existing LDAP, RADIUS, or TACACS+ server hosts for use in method lists. The figure below shows a typical AAA network configuration that includes four security servers: R1 and R2 are RADIUS servers, and T1 and T2 are TACACS+ servers. R1 and R2 make up the group of RADIUS servers. T1 and T2 make up the group of TACACS+ servers.

Using server groups, a subset of the configured server hosts can be specified and use them for a particular service. For example, server groups allows R1 and R2 to be defined as separate server groups, and T1 and T2 as separate server groups. This allows either R1 and T1 to be specified in the method list or R2 and T2 in the method list, which provides more flexibility in the way that RADIUS and TACACS+ resources are assigned.

Server groups also can include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and a UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. In other words, this unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service--for example, authorization--the second host entry configured acts as fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order they are configured.)

### AAA Accounting Methods

The Cisco IOS software supports the following two methods for accounting:
• TACACS+—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

• RADIUS—The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

With CSCu3c2663, passwords and accounting logs are masked before being sent to the TACACS+ or RADIUS security servers. Use the `aaa accounting commands visible-keys` command to send unmasked information to the TACACS+ or RADIUS security servers.

### Accounting Record Types

For minimal accounting, use the `stop-only` keyword, which instructs the specified method (RADIUS or TACACS+) to send a stop record accounting notice at the end of the requested user process. For more accounting information, use the `start-stop` keyword to send a start accounting notice at the beginning of the requested event and a stop accounting notice at the end of the event. To stop all accounting activities on this line or interface, use the `none` keyword.

### AAA Accounting Methods

The Cisco IOS software supports the following two methods for accounting:

• TACACS+—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

• RADIUS—The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

With CSCu3c2663, passwords and accounting logs are masked before being sent to the TACACS+ or RADIUS security servers. Use the `aaa accounting commands visible-keys` command to send unmasked information to the TACACS+ or RADIUS security servers.

### AAA Accounting Types

#### Network Accounting

Network accounting provides information for all PPP, SLIP, or ARAP sessions, including packet and byte counts.

The following example shows the information contained in a RADIUS network accounting record for a PPP user who comes in through an EXEC session:
The following example shows the information contained in a TACACS+ network accounting record for a PPP user who first started an EXEC session:
The precise format of accounting packets records may vary depending on the security server daemon.

The following example shows the information contained in a RADIUS network accounting record for a PPP user who comes in through autoselect:

Wed Jun 27 04:30:52 2001 172.16.25.15 username1 tty4 4327528 start task_id=28
service=shell
Wed Jun 27 04:36:49 2001 172.16.25.15 username1 tty4 408/4327528 update
task_id=30 addr=10.1.1.1 service=ppp protocol=ip addr=10.1.1.1
Wed Jun 27 04:36:49 2001 172.16.25.15 username1 tty4 408/4327528 stop task_id=30
addr=10.1.1.1 service=ppp protocol=ip addr=10.1.1.1 bytes_in=2844
bytes_out=1682 paks_in=36 paks_out=24 elapsed_time=51
Wed Jun 27 04:01:31 2001 172.16.25.15 username1 tty4 562/4327528 stop task_id=28
service=shell elapsed_time=57

The following example shows the information contained in a TACACS+ network accounting record for a PPP user who comes in through autoselect:

Wed Jun 27 04:30:52 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 3
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000B"
Framed-Protocol = PPP
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:36:49 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 3
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000B"
Framed-Protocol = PPP
Framed-IP-Address = "10.1.1.1"
Acct-Input-Octets = 8630
Acct-Output-Octets = 5722
Acct-Input-Packets = 94
Acct-Output-Packets = 64
Acct-Session-Time = 357
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
**EXEC Accounting**

EXEC accounting provides information about user EXEC terminal sessions (user shells) on the network access server, including username, date, start and stop times, the access server IP address, and (for dial-in users) the telephone number the call originated from.

The following example shows the information contained in a RADIUS EXEC accounting record for a dial-in user:

```
Wed Jun 27 04:26:23 2001
NAS-IP-Address = “172.16.25.15”
NAS-Port = 1
User-Name = “username1”
Client-Port-DNIS = “4327528”
Caller-ID = “5622329483”
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = “00000006”
Acct-Delay-Time = 0
User-Id = “username1”
NAS-Identifier = “172.16.25.15”
```

The following example shows the information contained in a TACACS+ EXEC accounting record for a dial-in user:

```
NAS-IP-Address = “172.16.25.15”
NAS-Port = 1
User-Name = “username1”
Client-Port-DNIS = “4327528”
Caller-ID = “5622329483”
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = “00000006”
Acct-Session-Time = 62
Acct-Delay-Time = 0
User-Id = “username1”
NAS-Identifier = “172.16.25.15”
```

The following example shows the information contained in a RADIUS EXEC accounting record for a Telnet user:

```
NAS-IP-Address = “172.16.25.15”
NAS-Port = 26
User-Name = “username1”
Caller-ID = “10.68.202.158”
Acct-Status-Type = Start
Acct-Authentic = RADIUS
```
Service-Type = Exec-User
Acct-Session-Id = "00000010"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

NAS-IP-Address = "172.16.25.15"
NAS-Port = 26
User-Name = "username1"
Caller-ID = "10.68.202.158"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "00000010"
Acct-Session-Time = 14
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

The following example shows the information contained in a TACACS+ EXEC accounting record for a Telnet user:

start task_id=41 service=shell
stop task_id=41 service=shell elapsed_time=9

Command Accounting

Command accounting provides information about the EXEC shell commands for a specified privilege level that are being executed on a network access server. Each command accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the user who executed it.

The following example shows the information contained in a TACACS+ command accounting record for privilege level 1:

Wed Jun 27 03:46:47 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=3 service=shell priv-lvl=1 cmd=show version <cr>
Wed Jun 27 03:46:58 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=4 service=shell priv-lvl=1 cmd=show interfaces Ethernet 0 <cr>
Wed Jun 27 03:47:03 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=5 service=shell priv-lvl=1 cmd=show ip route <cr>

The following example shows the information contained in a TACACS+ command accounting record for privilege level 15:

Wed Jun 27 03:47:17 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=6 service=shell priv-lvl=15 cmd=configure terminal <cr>
Wed Jun 27 03:47:21 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=7 service=shell priv-lvl=15 cmd=interface Serial 0 <cr>
Wed Jun 27 03:47:29 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=8 service=shell priv-lvl=15 cmd=ip address 10.1.1.1 255.255.255.0 <cr>
The Cisco implementation of RADIUS does not support command accounting.

Connection Accounting

Connection accounting provides information about all outbound connections made from the network access server such as Telnet, LAT, TN3270, PAD, and rlogin.

The following example shows the information contained in a RADIUS connection accounting record for an outbound Telnet connection:

```
Wed Jun 27 04:28:00 2001
NAS-IP-Address = “172.16.25.15”
NAS-Port = 2
User-Name = “username1”
Client-Port-DNIS = “4327528”
Caller-ID = “5622329477”
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = “00000008”
Login-Service = Telnet
Login-IP-Host = “10.68.202.158”
Acct-Delay-Time = 0
User-Id = “username1”
NAS-Identifier = “172.16.25.15”

NAS-IP-Address = “172.16.25.15”
NAS-Port = 2
User-Name = “username1”
Client-Port-DNIS = “4327528”
Caller-ID = “5622329477”
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = “00000008”
Login-Service = Telnet
Login-IP-Host = “10.68.202.158”
Acct-Delay-Time = 0
User-Id = “username1”
NAS-Identifier = “172.16.25.15”
```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound Telnet connection:

```
Wed Jun 27 03:47:43 2001
172.16.25.15 username1 tty3 5622329430/4327528
start task_id=10 service=connection protocol=telnet addr=10.68.202.158 cmd=telnet
username1-sun

Wed Jun 27 03:48:38 2001
172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=10 service=connection protocol=telnet addr=10.68.202.158 cmd=telnet
username1-sun bytes_in=4467 bytes_out=96 paks_in=61 paks_out=72 elapsed_time=55
```
The following example shows the information contained in a RADIUS connection accounting record for an outbound rlogin connection:

```
NAS-IP-Address = "172.16.25.15"
NAS-Port = 2
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329477"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = "0000000A"
Login-Service = Rlogin
Login-IP-Host = "10.68.202.158"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
```

```
Wed Jun 27 04:30:09 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 2
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329477"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = "0000000A"
Login-Service = Rlogin
Login-IP-Host = "10.68.202.158"
Acct-Input-Octets = 18686
Acct-Output-Octets = 86
Acct-Input-Packets = 90
Acct-Output-Packets = 68
Acct-Session-Time = 22
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound rlogin connection:

```
Wed Jun 27 03:48:46 2001
172.16.25.15 username1 tty3 5622329430/4327528
start task_id=12 service=connection protocol=rlogin addr=10.68.202.158 cmd=rlogin
username1-sun /user username1
Wed Jun 27 03:51:37 2001
172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=12 service=connection protocol=rlogin addr=10.68.202.158 cmd=rlogin
username1-sun /user username1 bytes_in=659926 bytes_out=138 paks_in=2378 paks_out=1251 elapsed_time=171
```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound LAT connection:

```
Wed Jun 27 03:53:06 2001
172.16.25.15 username1 tty3 5622329430/4327528
start task_id=18 service=connection protocol=lat addr=VAX cmd=lat
VAX
Wed Jun 27 03:54:15 2001
172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=18 service=connection protocol=lat addr=VAX cmd=lat
VAX bytes_in=0 bytes_out=0 paks_in=0 paks_out=0 elapsed_time=6
```
System Accounting

System accounting provides information about all system-level events (for example, when the system reboots or when accounting is turned on or off).

The following accounting record shows a typical TACACS+ system accounting record server indicating that AAA Accounting has been turned off:

```
  service=system event=sys_acct reason=reconfigure
```

The precise format of accounting packets records may vary depending on the TACACS+ daemon.

The following accounting record shows a TACACS+ system accounting record indicating that AAA Accounting has been turned on:

```
Wed Jun 27 03:55:22 2001 172.16.25.15 unknown unknown unknown stop task_id=23
  service=system event=sys_acct reason=reconfigure
```

Additional tasks for measuring system resources are covered in the Cisco IOS software configuration guides. For example, IP accounting tasks are described in the Configuring IP Services chapter in the *Cisco IOS Application Services Configuration Guide*.

Resource Accounting

The Cisco implementation of AAA accounting provides “start” and “stop” record support for calls that have passed user authentication. The additional feature of generating “stop” records for calls that fail to authenticate as part of user authentication is also supported. Such records are necessary for users employing accounting records to manage and monitor their networks.

This section includes the following subsections:

AAA Resource Failure Stop Accounting

Before AAA resource failure stop accounting, there was no method of providing accounting records for calls that failed to reach the user authentication stage of a call setup sequence. Such records are necessary for users employing accounting records to manage and monitor their networks and their wholesale customers.

This functionality generates a “stop” accounting record for any calls that do not reach user authentication; “stop” records are generated from the moment of call setup. All calls that pass user authentication behave as they did before; that is, no additional accounting records are seen.

The figure below illustrates a call setup sequence with normal call flow (no disconnect) and without AAA resource failure stop accounting enabled.

*Figure 69: Modem Dial-In Call Setup Sequence With Normal Flow and Without Resource Failure Stop Accounting Enabled*
The figure below illustrates a call setup sequence with normal call flow (no disconnect) and with AAA resource failure stop accounting enabled.

*Figure 70: Modem Dial-In Call Setup Sequence With Normal Flow and With Resource Failure Stop Accounting Enabled*

The figure below illustrates a call setup sequence with call disconnect occurring before user authentication and with AAA resource failure stop accounting enabled.

*Figure 71: Modem Dial-In Call Setup Sequence With Call Disconnect Occurring Before User Authentication and With Resource Failure Stop Accounting Enabled*

The figure below illustrates a call setup sequence with call disconnect occurring before user authentication and without AAA resource failure stop accounting enabled.

*Figure 72: Modem Dial-In Call Setup Sequence With Call Disconnect Occurring Before User Authentication and Without Resource Failure Stop Accounting Enabled*

---

**AAA Resource Accounting for Start-Stop Records**

AAA resource accounting for start-stop records supports the ability to send a “start” record at each call setup, followed by a corresponding “stop” record at the call disconnect. This functionality can be used to manage and monitor wholesale customers from one source of data reporting, such as accounting records.

With this feature, a call setup and call disconnect “start-stop” accounting record tracks the progress of the resource connection to the device. A separate user authentication “start-stop” accounting record tracks the
user management progress. These two sets of accounting records are interlinked by using a unique session ID for the call.

The figure below illustrates a call setup sequence with AAA resource start-stop accounting enabled.

**Figure 73: Modem Dial-In Call Setup Sequence With Resource Start-Stop Accounting Enabled**

---

**VRRS Accounting**

Virtual Router Redundancy Service (VRRS) provides a multiclent information abstraction and management service between a First Hop Redundancy Protocol (FHRP) and a registered client. The VRRS multiclent service provides a consistent interface with FHRP protocols by abstracting over several FHRPs and providing an idealized view of their state. VRRS manages data updates, allowing interested clients to register in one place and receive updates for named FHRP groups or all registered FHRP groups.

Virtual Router Redundancy Protocol (VRRP) is an FHRP that acts as a server that pushes FHRP status information out to all registered VRRS clients. Clients obtain status on essential information provided by the FHRP, including current and previous redundancy states, active and inactive L3 and L2 addresses, and, in some cases, information about other redundant gateways in the network. Clients can use this information to provide stateless and stateful redundancy information to clients and protocols.

**VRRS Accounting Plug-in**

The VRRS Accounting plug-in provides a configurable AAA method list mechanism that provides updates to a RADIUS server when a VRRS group transitions its state. The VRRS accounting plug-in is an extension of existing AAA system accounting messages. The VRRS Accounting plug-in provides accounting-on and accounting-off messages and an additional Vendor-Specific Attribute (VSA) that sends the configured VRRS name in RADIUS accounting messages. The VRRS name is configured using the `vrrp name` command in interface configuration mode.

The VRRS Accounting plug-in provides a configurable AAA method list mechanism that provides updates to a RADIUS server when a VRRS group transitions its state.

The following RADIUS attributes are included in VRRS accounting messages by default:

- Attribute 4, NAS-IP-Address
- Attribute 26, Cisco VSA Type 1, VRRS Name
- Attribute 40, Acct-Status-Type
- Attribute 41, Acct-Delay-Time
AAA Accounting Enhancements

AAA Broadcast Accounting

AAA broadcast accounting allows accounting information to be sent to multiple AAA servers at the same time; that is, accounting information can be broadcast to one or more AAA servers simultaneously. This functionality allows service providers to send accounting information to their own private AAA servers and to the AAA servers of their end customers. It also provides redundant billing information for voice applications.

Broadcasting is allowed among groups of RADIUS or TACACS+ servers, and each server group can define its backup servers for failover independently of other groups.

Thus, service providers and their end customers can use different protocols (RADIUS or TACACS+) for the accounting server. Service providers and their end customers can also specify their backup servers independently. As for voice applications, redundant accounting information can be managed independently through a separate group with its own failover sequence.

AAA Session MIB

The AAA session MIB feature allows customers to monitor and terminate their authenticated client connections using Simple Network Management Protocol (SNMP). The data of the client is presented so that it correlates directly to the AAA Accounting information reported by either the RADIUS or the TACACS+ server. AAA session MIB provides the following information:

- Statistics for each AAA function (when used in conjunction with the `show radius statistics` command)
- Status of servers providing AAA functions
- Identities of external AAA servers
- Real-time information (such as idle times), providing additional criteria for use by SNMP networks for assessing whether or not to terminate an active call

Note

This command is supported only on Cisco AS5300 and Cisco AS5800 universal access server platforms.

The table below shows the SNMP user-end data objects that can be used to monitor and terminate authenticated client connections with the AAA session MIB feature.

**Table 101: SNMP End-User Data Objects**

<table>
<thead>
<tr>
<th>SessionId</th>
<th>The session identification used by the AAA Accounting protocol (same value as reported by RADIUS attribute 44 (Acct-Session-ID)).</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserId</td>
<td>The user login ID or zero-length string if a login is unavailable.</td>
</tr>
<tr>
<td>IpAddr</td>
<td>The IP address of the session or 0.0.0.0 if an IP address is not applicable or unavailable.</td>
</tr>
</tbody>
</table>
The elapsed time in seconds that the session has been idle. **IdleTime**

The session termination object used to disconnect the given client. **Disconnect**

The entry index corresponding to this accounting session that the Call Tracker record stored. **CallId**

The table below describes the AAA summary information provided by the AAA session MIB feature using SNMP on a per-system basis.

**Table 102: SNMP AAA Session Summary**

<table>
<thead>
<tr>
<th><strong>ActiveTableEntries</strong></th>
<th>Number of sessions currently active.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ActiveTableHighWaterMark</strong></td>
<td>Maximum number of sessions present at once since last system reinstallation.</td>
</tr>
<tr>
<td><strong>TotalSessions</strong></td>
<td>Total number of sessions since last system reinstallation.</td>
</tr>
<tr>
<td><strong>DisconnectedSessions</strong></td>
<td>Total number of sessions that have been disconnected using since last system reinstallation.</td>
</tr>
</tbody>
</table>

### Accounting Attribute-Value Pairs

The network access server monitors the accounting functions defined in either TACACS+ AV pairs or RADIUS attributes, depending on which security method is implemented.

### How to Configure Accounting

#### Configuring AAA Accounting Using Named Method Lists

To configure AAA Accounting using named method lists, perform the following steps:

<table>
<thead>
<tr>
<th><strong>Step</strong></th>
<th><strong>Command or Action</strong></th>
<th><strong>Purpose</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device&gt; enable</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device# configure terminal</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring RADIUS System Accounting

Perform this task to configure RADIUS system accounting on the global RADIUS server:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| configure terminal|       |
| Example:          |       |
| Device(config-line)# end | (Optional) Exits line configuration mode and returns to global configuration mode. |

---

### Command Reference

**Step 3**

aaa accounting {system | network | exec | connection | commands level}{default | list-name}{start-stop | stop-only | none}{method1 [method2...]}

Example:

```
Device(config)# aaa accounting system default start-stop
```

**Step 4**

Do one of the following:

- `line [aux | console | tty | vty] line-number [ending-line-number]`
- `interface interface-type interface-number`

Example:

```
Device(config)# line aux line1
```

**Step 5**

Do one of the following:

- `accounting {arap | commands level | connection | exec}{default | list-name}
- `ppp accounting {default | list-name}`

Example:

```
Device(config-line)# accounting arap default
```

**Step 6**

Device(config-line)# end

Example:

```
Device(config-line)# end
```

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device# configure terminal</strong></td>
<td>Enables AAA network security services.</td>
</tr>
</tbody>
</table>
| **Step 3** aaa new-model  
  **Example:**  
  Device(config)# aaa new-model | Enables the device to send a system accounting record for the addition and deletion of a RADIUS server. |
| **Step 4** radius-server accounting system host-config  
  **Example:**  
  Device(config)# radius-server accounting system host-config | Adds the RADIUS server and enters server-group configuration mode.  
  - The `server-name` argument specifies the RADIUS server group name. |
| **Step 5** aaa group server radius server-name  
  **Example:**  
  Device(config)# aaa group server radius radgroup1 | Enters the hostname or IP address of the RADIUS server and hidden server key.  
  - (Optional) 0 with the `server-key` argument specifies that an unencrypted (cleartext) hidden server key follows.  
  - (Optional) 7 with the `server-key` argument specifies that an encrypted hidden server key follows.  
  - The `server-key` argument specifies the hidden server key. If the `server-key` argument is configured without the 0 or 7 preceding it, it is unencrypted. |
| **Step 6** server-private `{host-name | ip-address} key [{0 server-key} | 7 server-key] server-key`  
  **Example:**  
  Device(config-sg-radius)# server-private 172.16.1.11 key cisco | Enables the generation of system accounting records for private server hosts when they are added or deleted. |
| **Step 7** accounting system host-config  
  **Example:**  
  Device(config-sg-radius)# accounting system host-config | Exits server-group configuration mode and returns to privileged EXEC mode. |
| **Step 8** end  
  **Example:**  
  Device(config-sg-radius)# end | --- |
Suppressing Generation of Accounting Records for Null Username Sessions

When AAA Accounting is activated, the Cisco IOS software issues accounting records for all users on the system, including users whose username string, because of protocol translation, is NULL. An example of this is users who come in on lines where the `aaa authentication login method-list none` command is applied. To prevent accounting records from being generated for sessions that do not have usernames associated with them, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting suppress null-username</td>
<td>Prevents accounting records from being generated for users whose username string is NULL.</td>
</tr>
</tbody>
</table>

Generating Interim Accounting Records

To enable periodic interim accounting records to be sent to the accounting server, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting update [newinfo] [periodic] number</td>
<td>Enables periodic interim accounting records to be sent to the accounting server.</td>
</tr>
</tbody>
</table>

When the `aaa accounting update` command is activated, the Cisco IOS software issues interim accounting records for all users on the system. If the keyword `newinfo` is used, interim accounting records are sent to the accounting server every time there is new accounting information to report. An example of this would be when IPCP completes IP address negotiation with the remote peer. The interim accounting record includes the negotiated IP address used by the remote peer.

When used with the keyword `periodic`, interim accounting records are sent periodically as defined by the `number` argument. The interim accounting record contains all of the accounting information recorded for that user up to the time the interim accounting record is sent.

Caution

Using the `aaa accounting update periodic` command can cause heavy congestion when many users are logged in to the network.

Generating Accounting Records for Failed Login or Session

When AAA Accounting is activated, the Cisco IOS software does not generate accounting records for system users who fail login authentication, or who succeed in login authentication but fail PPP negotiation for some reason.

To specify that accounting stop records be generated for users who fail to authenticate at login or during session negotiation, use the following command in global configuration mode:
Specifying Accounting NETWORK-Stop Records Before EXEC-Stop Records

For PPP users who start EXEC terminal sessions, you can specify the NETWORK records to be generated before EXEC-stop records. In cases such as billing customers for specific services, it can be desirable to keep network start and stop records together, essentially “nesting” them within the framework of the EXEC start and stop messages. For example, a user dialing in using PPP can create the following records: EXEC-start, NETWORK-start, EXEC-stop, NETWORK-stop. By nesting the accounting records, NETWORK-stop records follow NETWORK-start messages: EXEC-start, NETWORK-start, NETWORK-stop, EXEC-stop.

To nest accounting records for user sessions, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting nested</td>
<td>Nests network accounting records.</td>
</tr>
</tbody>
</table>

Configuring AAA Resource Failure Stop Accounting

To enable resource failure stop accounting, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting resource method-list stop-failure group server-group</td>
<td>Generates a “stop” record for any calls that do not reach user authentication.</td>
</tr>
</tbody>
</table>

**Note** Before configuring this feature, the tasks described in the Prerequisites for Configuring Accounting, on page 837 section must be performed, and SNMP must be enabled on the network access server.

Configuring AAA Resource Accounting for Start-Stop Records

To enable full resource accounting for start-stop records, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting send stop-record authentication failure</td>
<td>Generates “stop” records for users who fail to authenticate at login or during session negotiation using PPP.</td>
</tr>
<tr>
<td>Device(config)# aaa accounting send stop-record always</td>
<td>Sends authentication, authorization, and accounting (AAA) stop records regardless of whether a start record was sent earlier.</td>
</tr>
</tbody>
</table>
Configuring AAA Broadcast Accounting

To configure AAA broadcast accounting, use the `aaa accounting` command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting resource method-list start-stop group server-group</td>
<td>Supports the ability to send a “start” record at each call setup, followed with a corresponding “stop” record at the call disconnect.</td>
</tr>
</tbody>
</table>

**Note**: Before configuring this feature, the tasks described in the Prerequisites for Configuring Accounting, on page 837 section must be performed, and SNMP must be enabled on the network access server.

Configuring Per-DNIS AAA Broadcast Accounting

To configure AAA broadcast accounting per DNIS, use the `aaa dnis map accounting network` command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa dnis map dnis-number accounting network [start-stop</td>
<td>stop-only</td>
</tr>
</tbody>
</table>

Configuring AAA Session MIB

The following tasks must be performed before configuring the AAA session MIB feature:

- Configure SNMP.
- Configure AAA.
- Define the RADIUS or TACACS+ server characteristics.
Overusing SNMP can affect the overall system performance; therefore, normal network management performance must be considered when this feature is used.

To configure AAA session MIB, use the following command in global configuration mode:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Device (config)# aaa session-mib disconnect</td>
<td>Monitors and terminates authenticated client connections using SNMP. To terminate the call, the disconnect keyword must be used.</td>
</tr>
</tbody>
</table>

### Configuring VRRS Accounting

Perform the following task to configure Virtual Router Redundancy Service (VRRS) to send AAA Accounting messages to the AAA server:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 aaa accounting vrrs {default</td>
<td>Enables AAA accounting for VRRS.</td>
</tr>
<tr>
<td>start-stop method1 [method2...]}</td>
<td></td>
</tr>
<tr>
<td>Example: Device(config)# aaa accounting vrrs default start-stop</td>
<td></td>
</tr>
<tr>
<td>Step 4 aaa attribute list list-name</td>
<td>Defines a AAA attribute list locally on a device, and enters attribute list configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# aaa attribute list list1</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>-------------------</td>
</tr>
<tr>
<td>5</td>
<td><strong>attribute type</strong> name value [service service] [protocol protocol][mandatory][tag tag-value]</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-attr-list)# attribute type example 1</td>
</tr>
<tr>
<td>6</td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-attr-list)# exit</td>
</tr>
<tr>
<td>7</td>
<td>vrrs vrrs-group-name</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config)# vrrs vrrs1</td>
</tr>
<tr>
<td>8</td>
<td>accounting delay seconds</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-vrrs)# accounting delay 10</td>
</tr>
<tr>
<td>9</td>
<td>accounting method {default</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-vrrs)# accounting method default</td>
</tr>
<tr>
<td>10</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config-vrrs)# end</td>
</tr>
</tbody>
</table>

### Establishing a Session with a Device if the AAA Server is Unreachable

To establish a console or telnet session with a device if the AAA server is unreachable, use the following command in global configuration mode:
Purpose Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# no aaa accounting system guarantee-first</td>
<td>The <code>aaa accounting system guarantee-first</code> command guarantees system accounting as the first record, which is the default condition. In some situations, users may be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than three minutes. To resolve this problem, the <code>no aaa accounting system guarantee-first</code> command can be used.</td>
</tr>
</tbody>
</table>

Note

Entering the `no aaa accounting system guarantee-first` command is not the only condition by which the console or telnet session can be started. For example, if the privileged EXEC session is being authenticated by TACACS and the TACACS server is not reachable, then the session cannot start.

Monitoring Accounting

No specific `show` command exists for either RADIUS or TACACS+ accounting. To obtain accounting records displaying information about users currently logged in, use the following command in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# show accounting</td>
<td>Allows display of the active accountable events on the network and helps collect information in the event of a data loss on the accounting server.</td>
</tr>
</tbody>
</table>

Troubleshooting Accounting

To troubleshoot accounting information, use the following command in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# debug aaa accounting</td>
<td>Displays information on accountable events as they occur.</td>
</tr>
</tbody>
</table>

Configuration Examples for Accounting

Example Configuring Named Method List

The following example shows how to configure a Cisco AS5200 (enabled for AAA and communication with a RADIUS security server) in order for AAA services to be provided by the RADIUS server. If the RADIUS server fails to respond, then the local database is queried for authentication and authorization information, and accounting services are handled by a TACACS+ server.

```
aaa new-model
aaa authentication login admins local
```
aaa authentication ppp dialins group radius local
aaa authorization network blue1 group radius local
aaa accounting network red1 start-stop group radius group tacacs+
username root password ALongPassword
tacacs-server host 172.31.255.0
tacacs-server key goaway
radius-server host 172.16.2.7
radius-server key myRaDiUSpassWoRd
interface group-async 1
group-range 1 16
encapsulation ppp
ppp authentication chap dialins
ppp authorization blue1
ppp accounting red1
line 1 16
autoselect ppp
autoselect during-login
login authentication admins
modem dialin

The lines in this sample RADIUS AAA configuration are defined as follows:

• The **aaa new-model** command enables AAA network security services.

• The **aaa authentication login admins local** command defines a method list “admins”, for login authentication.

• The **aaa authentication ppp dialins group radius local** command defines the authentication method list “dialins”, which specifies that first RADIUS authentication and then (if the RADIUS server does not respond) local authentication is used on serial lines using PPP.

• The **aaa authorization network blue1 group radius local** command defines the network authorization method list named “blue1”, which specifies that RADIUS authorization is used on serial lines using PPP. If the RADIUS server fails to respond, then local network authorization is performed.

• The **aaa accounting network red1 start-stop group radius group tacacs+** command defines the network accounting method list named red1, which specifies that RADIUS accounting services (in this case, start and stop records for specific events) are used on serial lines using PPP. If the RADIUS server fails to respond, accounting services are handled by a TACACS+ server.

• The **username** command defines the username and password to be used for the PPP Password Authentication Protocol (PAP) caller identification.

• The **tacacs-server host** command defines the name of the TACACS+ server host.

• The **tacacs-server key** command defines the shared secret text string between the network access server and the TACACS+ server host.

• The **radius-server host** command defines the name of the RADIUS server host.

• The **radius-server key** command defines the shared secret text string between the network access server and the RADIUS server host.

• The **interface group-async** command selects and defines an asynchronous interface group.

• The **group-range** command defines the member asynchronous interfaces in the interface group.

• The **encapsulation ppp** command sets PPP as the encapsulation method used on the specified interfaces.
- The **ppp authentication chap dialins** command selects Challenge Handshake Authentication Protocol (CHAP) as the method of PPP authentication and applies the “dialins” method list to the specified interfaces.

- The **ppp authorization blue1** command applies the blue1 network authorization method list to the specified interfaces.

- The **ppp accounting red1** command applies the red1 network accounting method list to the specified interfaces.

- The **line** command switches the configuration mode from global configuration to line configuration and identifies the specific lines being configured.

- The **autoselect ppp** command configures the Cisco IOS software to allow a PPP session to start up automatically on these selected lines.

- The **autoselect during-login** command is used to display the username and password prompt without pressing the Return key. After the user logs in, the autoselect function (in this case, PPP) begins.

- The **login authentication admins** command applies the admins method list for login authentication.

- The **modem dialin** command configures modems attached to the selected lines to only accept incoming calls.

The **show accounting** command yields the following output for the preceding configuration:

```
Active Accounted actions on tty1, User username2 Priv 1
Task ID 5, Network Accounting record, 00:00:52 Elapsed
task_id=5 service=ppp protocol=ip address=10.0.0.98
```

The table below describes the fields contained in the preceding output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Accounted actions on</td>
<td>Terminal line or interface name user with which the user logged in.</td>
</tr>
<tr>
<td>User</td>
<td>User’s ID.</td>
</tr>
<tr>
<td>Priv</td>
<td>User’s privilege level.</td>
</tr>
<tr>
<td>Task ID</td>
<td>Unique identifier for each accounting session.</td>
</tr>
<tr>
<td>Accounting record</td>
<td>Type of accounting session.</td>
</tr>
<tr>
<td>Elapsed</td>
<td>Length of time (hh:mm:ss) for this session type.</td>
</tr>
<tr>
<td>attribute=value</td>
<td>AV pairs associated with this accounting session.</td>
</tr>
</tbody>
</table>

**Example Configuring AAA Resource Accounting**

The following example shows how to configure the resource failure stop accounting and resource accounting for start-stop records functions:
Example Configuring AAA Broadcast Accounting

The following example shows how to turn on broadcast accounting using the global **aaa accounting** command:

```plaintext
aaa group server radius isp
  server 10.0.0.1
  server 10.0.0.2
aaa group server tacacs+ isp_customer
  server 172.0.0.1
aaa accounting network default start-stop broadcast group isp group isp_customer
  radius-server host 10.0.0.1
  radius-server host 10.0.0.2
  radius-server key key1
  tacacs-server host 172.0.0.1 key key2
```

The **broadcast** keyword causes “start” and “stop” accounting records for network connections to be sent simultaneously to server 10.0.0.1 in the group isp and to server 172.0.0.1 in the group isp_customer. If server 10.0.0.1 is unavailable, failover to server 10.0.0.2 occurs. If server 172.0.0.1 is unavailable, no failover occurs because backup servers are not configured for the group isp_customer.

Example Configuring Per-DNIS AAA Broadcast Accounting

The following example shows how to turn on per DNIS broadcast accounting using the global **aaa dnis map accounting network** command:

```plaintext
aaa group server radius isp
  server 10.0.0.1
  server 10.0.0.2
aaa group server tacacs+ isp_customer
  server 172.0.0.1
aaa dnis map
aaa dnis map 7777 accounting network start-stop broadcast group isp group isp_customer
  radius-server host 10.0.0.1
  radius-server host 10.0.0.2
```
radius-server key key_1
tacacs-server host 172.0.0.1 key key_2

The **broadcast** keyword causes “start” and “stop” accounting records for network connection calls having DNIS number 7777 to be sent simultaneously to server 10.0.0.1 in the group isp and to server 172.0.0.1 in the group isp_customer. If server 10.0.0.1 is unavailable, failover to server 10.0.0.2 occurs. If server 172.0.0.1 is unavailable, no failover occurs because backup servers are not configured for the group isp_customer.

### Example AAA Session MIB

The following example shows how to set up the AAA session MIB feature to disconnect authenticated client connections for PPP users:

```
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius
aaa accounting network default start-stop group radius
aaa session-mib disconnect
```

### Example Configuring VRRS Accounting

The following example shows how to configure VRRS to send AAA Accounting messages to the AAA server:

```bash
Router# configure terminal
Router(config)# aaa accounting vrrs vrrp-mlist-1 start-stop group radius
Router(config)# aaa attribute list vrrp-1-attr
Router(config-attr-list)# attribute type account-delay 10
Router(config-attr-list)# exit
Router(config)# vrrs vrrp-group-1
Router(config-vrrs)# accounting delay 10
Router(config-vrrs)# accounting method vrrp-mlist-1
Router(config-vrrs)# exit
```

Feature Information for Configuring Accounting

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

• Feature Information for Local Authentication and Authorization, on page 870

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the ip http authentication aaa global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>aaa authentication login default local</td>
<td>Sets the login authentication to use the local username database. The <code>default</code> keyword applies the local user database authentication to all ports.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa authentication login default local</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>aaa authorization exec local</td>
<td>Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa authorization exec local</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>aaa authorization network local</td>
<td>Configures user AAA authorization for all network-related service requests.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# aaa authorization network local</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>username name [privilege level] {password encryption-type password}</td>
<td>Enters the local database, and establishes a username-based authentication system. Repeat this command for each user.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• For name, specify the user ID as one word. Spaces and quotation marks are not allowed.</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# username your_user_name privilege 1 password 7 secret567</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Command or Action | Purpose
--- | ---

• (Optional) For `level`, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access.

• For `encryption-type`, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows.

• For `password`, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the `username` command.

CHAPTER 43

MAC Authentication Bypass

The MAC Authentication Bypass feature is a MAC-address-based authentication mechanism that allows clients in a network to integrate with the Cisco Identity Based Networking Services (IBNS) and Network Admission Control (NAC) strategy using the client MAC address. The MAC Authentication Bypass feature is applicable to the following network environments:

- Network environments in which a supplicant code is not available for a given client platform.
- Network environments in which the end client configuration is not under administrative control, that is, the IEEE 802.1X requests are not supported on these networks.

Finding Feature Information, on page 871
Prerequisites for Configuring MAC Authentication Bypass, on page 871
Information About MAC Authentication Bypass, on page 872
How to Configure MAC Authentication Bypass, on page 873
Configuration Examples for MAC Authentication Bypass, on page 878

Feature Information for MAC Authentication Bypass, on page 879

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring MAC Authentication Bypass

IEEE 802.1x—Port-Based Network Access Control

You should understand the concepts of port-based network access control and have an understanding of how to configure port-based network access control on your Cisco platform.
RADIUS and ACLs

You should understand the concepts of the RADIUS protocol and have an understanding of how to create and apply access control lists (ACLs). For more information, see the documentation for your Cisco platform and the *Securing User Services Configuration Guide Library*.

The device must have a RADIUS configuration and be connected to the Cisco secure access control server (ACS). For more information, see the *User Guide for Secure ACS Appliance 3.2*.

Information About MAC Authentication Bypass

Overview of the Cisco IOS Auth Manager

The capabilities of devices connecting to a given network can be different, thus requiring that the network support different authentication methods and authorization policies. The Cisco IOS Auth Manager handles network authentication requests and enforces authorization policies regardless of authentication method. The Auth Manager maintains operational data for all port-based network connection attempts, authentications, authorizations, and disconnections and, as such, serves as a session manager.

The possible states for Auth Manager sessions are as follows:

- Idle—In the idle state, the authentication session has been initialized, but no methods have yet been run. This is an intermediate state.
- Running—A method is currently running. This is an intermediate state.
- Authc Success—The authentication method has run successfully. This is an intermediate state.
- Authc Failed—The authentication method has failed. This is an intermediate state.
- Authz Success—All features have been successfully applied for this session. This is a terminal state.
- Authz Failed—At least one feature has failed to be applied for this session. This is a terminal state.
- No methods—There were no results for this session. This is a terminal state.

Overview of the Configurable MAB Username and Password

A MAC Authentication Bypass (MAB) operation involves authentication using RADIUS Access-Request packets with both the username and password attributes. By default, the username and the password values are the same and contain the MAC address. The Configurable MAB Username and Password feature enables you to configure both the username and the password attributes in the following scenarios:

- To enable MAB for an existing large database that uses formatted username attributes, the username format in the client MAC needs to be configured. Use the `mab request format attribute 1` command to configure the username format.
- Some databases do not accept authentication if the username and password values are the same. In such instances, the password needs to be configured to ensure that the password is different from the username. Use the `mab request format attribute 2` command to configure the password.

The Configurable MAB Username and Password feature allows interoperability between the Cisco IOS Authentication Manager and the existing MAC databases and RADIUS servers. The password is a global...
password and hence is the same for all MAB authentications and interfaces. This password is also synchronized across all supervisor devices to achieve high availability.

If the password is not provided or configured, the password uses the same value as the username. The table below describes the formatting of the username and the password:

<table>

How to Configure MAC Authentication Bypass

Enabling MAC Authentication Bypass

Perform this task to enable the MAC Authentication Bypass feature on an 802.1X port.
## Enabling Reauthentication on a Port

By default, ports are not automatically reauthenticated. You can enable automatic reauthentication and specify how often reauthentication attempts are made.

### Procedure

<table>
<thead>
<tr>

Example:  
Device(config-if)# authentication periodic |
| 9     | authentication timer reauthenticate {seconds | server} | Configures the time, in seconds, between reauthentication attempts.  
Example:  
Device(config-if)# authentication timer reauthenticate 900 |
| 10    | end               | Exits interface configuration mode and returns to privileged EXEC mode.  
Example:  

Specifying the Security Violation Mode

When there is a security violation on a port, the port can be shut down or traffic can be restricted. By default, the port is shut down. You can configure the period of time for which the port is shut down.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Specifying the Security Violation Mode

#### Step 1
- **Command or Action**: `enable`
- **Example**: `Device> enable`
  - Enables privileged EXEC mode.
  - Enter your password if prompted.

#### Step 2
- **Command or Action**: `configure terminal`
- **Example**: `Device# configure terminal`
  - Enters global configuration mode.

#### Step 3
- **Command or Action**: `interface type slot / port`
- **Example**: `Device(config)# interface Gigabitethernet 1/2/1`
  - Enters interface configuration mode.

#### Step 4
- **Command or Action**: `switchport`
- **Example**: `Device(config-if)# switchport`
  - Places interface in Layer 2 switched mode.

#### Step 5
- **Command or Action**: `switchport mode access`
- **Example**: `Device(config-if)# switchport mode access`
  - Sets the interface type as a nontrunking, nontagged single VLAN Layer 2 interface.

#### Step 6
- **Command or Action**: `authentication port-control auto`
- **Example**: `Device(config-if)# authentication port-control auto`
  - Configures the authorization state of the port.

#### Step 7
- **Command or Action**: `mab [eap]`
- **Example**: `Device(config-if)# mab [eap]`
  - Enables MAB.
### Purpose

*Command or Action*

**Device(config-if)# mab**

<table>

### Enabling Configurable MAB Username and Password

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>`mab request format attribute 1 groupsize {1</td>
<td>2</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>`mab request format attribute 2 [0</td>
<td>7] password`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Configuration Examples for MAC Authentication Bypass

Example: MAC Authentication Bypass Configuration

In the following example, the `mab` command has been configured to enable the MAC Authorization Bypass (MAB) feature on the specified interface. The optional `show authentication sessions` command has been enabled to display the interface configuration and the authentication instances on the interface.

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet2/1
Device(config-if)# mab
Device(config-if)# end
Device# show authentication sessions interface GigabitEthernet2/1 details
```

Example: Enabling Configurable MAB Username and Password

The following example shows how to configure the username format and password for MAC Authentication Bypass (MAB). In this example, the username format is configured as a group of 12 hexadecimal digits with no separator and the global password as `password1`.

```
Device> enable
Device# configure terminal
Device(config)# mab request format attribute 1 groupsize 2 separator : 
Device(config)# mab request format attribute 2 password1
Device(config)# end
```

Password Strength and Management for Common Criteria

The Password Strength and Management for Common Criteria feature is used to specify password policies and security mechanisms for storing, retrieving, and providing rules to specify user passwords.

For local users, the user profile and the password information with the key parameters are stored on the Cisco device, and this profile is used for local authentication of users. The user can be an administrator (terminal access) or a network user (for example, PPP users being authenticated for network access).

For remote users, where the user profile information is stored in a remote server, a third-party authentication, authorization, and accounting (AAA) server may be used for providing AAA services, both for administrative and network access.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Restrictions for Password Strength and Management for Common Criteria

Only four concurrent users can log on to the system by using vty at any moment.

Information About Password Strength and Management for Common Criteria

Password Composition Policy

The password composition policy allows you to create passwords of any combination of upper and lowercase characters, numbers, and special characters that include “!”, “@”, “#”, “$”, “%”, “^”, “&”, “*”, “(”, and “)”.

Password Length Policy

The administrator has the flexibility to set the password's minimum and maximum length. The recommended minimum password length is 8 characters. The administrator can specify both the minimum (1) and the maximum (64) length for the password.

Password Lifetime Policy

The security administrator can provide a configurable option for a password to have a maximum lifetime. If the lifetime parameter is not configured, the configured password will never expire. The maximum lifetime can be configured by providing the configurable value in years, months, days, hours, minutes, and seconds. The lifetime configuration will survive across reloads as it is a part of the configuration, but every time the system reboots, the password creation time will be updated to the new time. For example, if a password is configured with a lifetime of one month and on the 29th day, the system reboots, then the password will be valid for one month after the system reboots.

Password Expiry Policy

If the user attempts to log on and if the user's password credentials have expired, then the following happens:

1. The user is prompted to set the new password after successfully entering the expired password.
2. When the user enters the new password, the password is validated against the password security policy.
3. If the new password matches the password security policy, then the AAA database is updated, and the user is authenticated with the new password.
4. If the new password does not match the password security policy, then the user is prompted again for the password. From AAA perspective, there is no restriction on the number of retries. The number of retries for password prompt in case of unsuccessful authentication is controlled by the respective terminal access interactive module. For example, for telnet, after three unsuccessful attempts, the session will be terminated.
If the password's lifetime is not configured for a user and the user has already logged on and if the security administrator configures the lifetime for that user, then the lifetime will be set in the database. When the same user is authenticated the next time, the system will check for password expiry. The password expiry is checked only during the authentication phase.

If the user has been already authenticated and logged on to the system and if the password expires, then no action will be taken. The user will be prompted to change the password only during the next authentication for the same user.

**Password Change Policy**

The new password must contain a minimum of 4 character changes from the previous password. A password change can be triggered by the following scenarios:

- The security administrator wants to change the password.
- The user is trying to get authenticated using a profile, and the password for that profile has expired.

When the security administrator changes the password security policy and the existing profile does not meet the password security policy rules, no action will be taken if the user has already logged on to the system. The user will be prompted to change the password only when the user tries to get authenticated using the profile that does not meet the password security restriction.

When the user changes the password, the lifetime parameters set by the security administrator for the old profile will be the lifetime parameters for the new password.

For noninteractive clients such as dot1x, when the password expires, appropriate error messages will be sent to the clients, and the clients must contact the security administrator to renew the password.

**User Reauthentication Policy**

Users are reauthenticated when they change their passwords.

When users change their passwords on expiry, they will be authenticated against the new password. In such cases, the actual authentication happens based on the previous credentials, and the new password is updated in the database.

---

**Note**

Users can change their passwords only when they are logging on and after the expiry of the old password; however, a security administrator can change the user's password at any time.

**Support for Framed (noninteractive) Session**

When a client such as dot1x uses the local database for authentication, the Password Strength and Management for Common Criteria feature will be applicable; however, upon password expiry, clients will not be able to change the password. An appropriate failure message will be sent to such clients, and the user must request the security administrator to change the password.
How to Configure Password Strength and Management for Common Criteria

Configuring the Password Security Policy

Perform this task to create a password security policy and to apply the policy to a specific user profile.

<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Verifying the Common Criteria Policy

Perform this task to verify all the common criteria security policies.

**Procedure**

**Step 1** enable

Enables privileged EXEC mode.

**Example:**

Device> enable

**Step 2** show aaa common-criteria policy name *policy-name*
Configuration Examples for Password Strength and Management for Common Criteria

Example: Password Strength and Management for Common Criteria

The following example shows how to create a common criteria security policy and apply the specific policy to a user profile:

Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa common-criteria policy policy1
Device(config-cc-policy)# char-changes 4
Device(config-cc-policy)# max-length 20
Device(config-cc-policy)# min-length 6
Device(config-cc-policy)# numeric-count 2
Device(config-cc-policy)# special-case 2
Device(config-cc-policy)# exit
Device(config)# username user1 common-criteria-policy policy1 password password1
Device(config)# end

Feature Information for Password Strength and Management for Common Criteria

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

AAA-SERVER-MIB Set Operation

The AAA-SERVER-MIB Set Operation feature allows the authentication, authorization, and accounting (AAA) server configuration to be extended or expanded by using the CISCO-AAA-SERVER-MIB to create and add new AAA servers, modify the “KEY” under the CISCO-AAA-SERVER-MIB, and delete the AAA server configuration.

- Finding Feature Information, on page 889
- Prerequisites for AAA-SERVER-MIB Set Operation, on page 889
- Restrictions for AAA-SERVER-MIB Set Operation, on page 890
- Information About AAA-SERVER-MIB Set Operation, on page 890
- How to Configure AAA-SERVER-MIB Set Operation, on page 890
- Configuration Examples for AAA-SERVER-MIB Set Operation, on page 891
- Additional References for AAA-SERVER-MIB Set Operation, on page 893
- Feature Information for AAA-SERVER-MIB Set Operation, on page 894

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AAA-SERVER-MIB Set Operation

AAA must have been enabled on the router, that is, the `aaa new-model` command must have been configured. If this configuration has not been accomplished, the set operation fails.
Restrictions for AAA-SERVER-MIB Set Operation

Currently, the CISCO SNMP set operation is supported only for the RADIUS protocol. Therefore, only RADIUS servers in global configuration mode can be added, modified, or deleted.

Information About AAA-SERVER-MIB Set Operation

CISCO-AAA-SERVER-MIB

The CISCO-AAA-SERVER-MIB provides that statistics reflect both the state of the AAA server operation with the server itself and of AAA communications with external servers. The CISCO-AAA-SERVER-MIB provides the following information:

• Statistics for each AAA operation
• Status of servers that are providing AAA functions
• Identities of external AAA servers

CISCO-AAA-SERVER-MIB Set Operation

With the SET operation, you can do the following:

• Create or add a new AAA server.
• Modify the KEY under the CISCO-AAA-SERVER-MIB. This “secret key” is used for secure connectivity to the AAA server, which is present with the network access server (NAS) and the AAA server.
• Delete the AAA server configuration.

How to Configure AAA-SERVER-MIB Set Operation

Configuring AAA-SERVER-MIB Set Operations

No special configuration is required for this feature. The Simple Network Management Protocol (SNMP) framework can be used to manage MIBs. See the Additional References section for a reference to configuring SNMP.

Verifying SNMP Values

SNMP values can be verified by performing the following steps.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  Example: Device> enable  
  • Enter your password if prompted. |
| **Step 2** show running-config include radius-server host  
  Example: Device# show running-config include radius-server host | Displays all the RADIUS servers that are configured in the global configuration mode. |
| **Step 3** show aaa servers  
  Example: Device# show aaa servers | Displays information about the number of requests sent to and received from authentication, authorization, and accounting (AAA) servers. |

### Configuration Examples for AAA-SERVER-MIB Set Operation

#### RADIUS Server Configuration and Server Statistics Example

The following sample output shows the RADIUS server configuration and server statistics before and after the set operation.

**Before the Set Operation**

Device# show running-config include radius-server host

! The following line is for server 1.  
radius-server host 172.19.192.238 auth-port 2095 acct-port 2096 key cisco2  
! The following line is for server 2.  
radius-server host 172.19.192.238 auth-port 1645 acct-port 1646

**Server Statistics**

Device# show aaa servers

RADIUS: id 2, priority 1, host 172.19.192.238, auth-port 2095, acct-port 2096  
State: current UP, duration 25s, previous duration 0s  
  Dead: total time 0s, count 7  
  Authen: request 8, timeouts 8  
  Response: unexpected 0, server error 0, incorrect 0, time 0ms  
  Transaction: success 0, failure 2  
  Author: request 0, timeouts 0  
  Response: unexpected 0, server error 0, incorrect 0, time 0ms  
  Transaction: success 0, failure 0  
  Account: request 0, timeouts 0
Response: unexpected 0, server error 0, incorrect 0, time 0ms
Transaction: success 0, failure 0
Elapsed time since counters last cleared: 5m
RADIUS: id 3, priority 2, host 172.19.192.238, auth-port 1645, acct-port 1646
State: current UP, duration 5s, previous duration 0s
Dead: total time 0s, count 2
Authen: request 8, timeouts 8
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 4
Author: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Account: request 0, timeouts 0
  Response: unexpected 0, server error 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
Elapsed time since counters last cleared: 3m

SNMP Get Operation to Check the Configuration and Statistics of the RADIUS Servers

```
aaa-server5:/users/smetri> getmany 10.0.1.42 casConfigTable
casAddress.2.2 = 172.19.192.238
casAddress.2.3 = 172.19.192.238
casAuthenPort.2.2 = 2095
casAuthenPort.2.3 = 1645
casAcctPort.2.2 = 2096
casAcctPort.2.3 = 1646
casKey.2.2 =
casKey.2.3 =
! The following line shows priority for server 1.
casPriority.2.2 = 1
! The following line shows priority for server 2.
casPriority.2.3 = 2
casConfigRowStatus.2.2 = active(1)
casConfigRowStatus.2.3 = active(1)
aaa-server5:/users/smetri>
```

SNMP Set Operation

The key of the existing RADIUS server is being changed. The index “1” is being used. That index acts as a wildcard for addition, deletion, or modification of any entries.

```
Change the key for server 1:=>
aaa-server5:/users/smetri> setany -v2c 10.0.1.42 public casAddress.2.1 -a 172.19.192.238
casAuthenPort.2.1 -i 2095 casAcctPort.2.1 -i 2096 casKey.2.1 -o king
casAddress.2.1 = 172.19.192.238
casAuthenPort.2.1 = 2095
casAcctPort.2.1 = 2096
casKey.2.1 = king
aaa-server5:/users/smetri>
```

After the Set Operation

After the above SNMP set operation, the configurations on the device change. The following output shows the output after the set operation.

```
Device# show running-config | include radius-server host
radius-server host 172.19.192.238 auth-port 1645 acct-port 1646
! The following line shows a change in the key value to “king.”
radius-server host 172.19.192.238 auth-port 2095 acct-port 2096 key king
```
Device# show aaa servers

RADIUS: id 3, priority 1, host 172.19.192.238, auth-port 1645, acct-port 1646
  State: current UP, duration 189s, previous duration 0s
  Dead: total time 0s, count 2
  Authen: request 8, timeouts 8
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 4
  Author: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Account: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Elapsed time since counters last cleared: 6m

! The following line shows a new server with new statistics.
RADIUS: id 4, priority 2, host 172.19.192.238, auth-port 2095, acct-port 2096
  State: current UP, duration 209s, previous duration 0s
  Dead: total time 0s, count 7
  Authen: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Author: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Account: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms

Feature Information for AAA-SERVER-MIB Set Operation

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

</tbody>
</table>
Configuring Secure Shell

The Secure Shell (SSH) feature is an application and a protocol that provides a secure replacement to the Berkeley r-tools. The protocol secures sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. Two versions of SSH are available: SSH Version 1 and SSH Version 2.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.

- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adleman (RSA) key pair.
• SCP relies on SSH for security.
• SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
• A user must have appropriate authorization to use SCP.
• A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the copy command. An authorized administrator can also do this from a workstation.
• The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.
• Configure a hostname and host domain for your device by using the hostname and ip domain-name commands in global configuration mode.

Restrictions for Configuring Secure Shell

The following are restrictions for configuring the Switch for secure shell.
• The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
• SSH supports only the execution-shell application.
• The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
• The Switch supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
• This software release does not support IP Security (IPSec).
• When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.
• The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.
• The -l keyword and userid : {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

Information about SSH

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH and Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).
SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

**SSH Servers, Integrated Clients, and Supported Versions**

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

---

**Note**

The SSH client functionality is available only when the SSH server is enabled.

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

**RSA Authentication Support**

Rivest, Shamir, and Adleman (RSA) authentication available in Secure Shell (SSH) clients is not supported on the SSH server for Cisco software by default.

**SSL Configuration Guidelines**

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.
Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note
When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Secure Copy Protocol

Isn't Secure Copy Protocol related closely enough to SSH that it could be used in this book? I have moved all of the item in this topic to prerequisites or restrictions.

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the switch can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

How Secure Copy Works

The behavior of Secure Copy (SCP) is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite (Berkeley university’s own set of networking applications), except that SCP relies on Secure Shell (SSH) for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so that the device can determine whether the user has the correct privilege level.

SCP allows a user only with a privilege level of 15 to copy any file that exists in the Cisco IOS File System (IFS) to and from a device by using the copy command. An authorized administrator may also perform this action from a workstation.

Note
Enable the SCP option while using the pscp.exe file with the Cisco software.
Reverse Telnet

Reverse telnet allows you to telnet to a certain port range and connect to terminal or auxiliary lines. Reverse telnet has often been used to connect a Cisco device that has many terminal lines to the consoles of other Cisco devices. Telnet makes it easy to reach the device console from anywhere simply by telnet to the terminal server on a specific line. This telnet approach can be used to configure a device even if all network connectivity to that device is disconnected. Reverse telnet also allows modems that are attached to Cisco devices to be used for dial-out (usually with a rotary device).

Reverse SSH

Reverse telnet can be accomplished using SSH. Unlike reverse telnet, SSH provides for secure connections. The Reverse SSH Enhancements feature provides you with a simplified method of configuring SSH. Using this feature, you no longer have to configure a separate line for every terminal or auxiliary line on which you want to enable SSH. The previous method of configuring reverse SSH limited the number of ports that can be accessed to 100. The Reverse SSH Enhancements feature removes the port number limitation.

How to Configure Secure Shell

Setting Up the Switch to Run SSH

Follow these steps to set up your Switch to run SSH:

Before you begin
Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

# Configuring the SSH Server

Follow these steps to configure the SSH server:

> **Note**
>
This procedure is only required if you are configuring the Switch as an SSH server.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td><strong>Purpose:</strong>&lt;br&gt;Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>   </td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td><strong>Purpose:</strong>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip ssh version [1</td>
<td>(Optional) Configures the Switch to run SSH Version 1 or SSH Version 2. &lt;br&gt;</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip ssh version 1</td>
<td>• 1—Configure the Switch to run SSH Version 1.</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip ssh version 2</td>
<td>• 2—Configure the Switch to run SSH Version 2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip ssh {timeout seconds</td>
<td>Configures the SSH control parameters: &lt;br&gt;</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip ssh timeout 90</td>
<td>• Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the Switch uses the default time-out values of the CLI-based sessions.</td>
</tr>
<tr>
<td></td>
<td>authentication-retries 2</td>
<td>By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Repeat this step when configuring both parameters.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

Use one or both of the following:
- line
  vty line_number[ending_line_number]
- transport input ssh

**Example:**

```bash
Switch(config)# line vty 1 10
```

or

```bash
Switch(config-line)# transport input ssh
```

(Optional) Configures the virtual terminal line settings.

- Enters line configuration mode to configure the virtual terminal line settings. For `line_number` and `ending_line_number`, specify a pair of lines. The range is 0 to 15.
- Specifies that the Switch prevent non-SSH Telnet connections. This limits the router to only SSH connections.

### Step 6

`end`

**Example:**

```bash
Switch(config-line)# end
```

Returns to privileged EXEC mode.

### Step 7

`show running-config`

**Example:**

```bash
Switch# show running-config
```

Verifies your entries.

### Step 8

`copy running-config startup-config`

**Example:**

```bash
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Invoking an SSH Client

Perform this task to invoke the Secure Shell (SSH) client. The SSH client runs in user EXEC mode and has no specific configuration tasks.
Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ssh -l username -vrf vrf-name ip-address</td>
<td>Invokes the SSH client to connect to an IP host or address in the specified virtual routing and forwarding (VRF) instance.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# ssh -l user1 -vrf vrf1 192.0.2.1</td>
<td></td>
</tr>
</tbody>
</table>

Troubleshooting Tips

- If your Secure Shell (SSH) configuration commands are rejected as illegal commands, you have not successfully generated an Rivest, Shamir, and Adleman (RSA) key pair for your device. Make sure that you have specified a hostname and domain. Then use the `crypto key generate rsa` command to generate an RSA key pair and enable the SSH server.

- When configuring the RSA key pair, you might encounter the following error messages:
  - No hostname specified.
    You must configure a hostname for the device using the `hostname` global configuration command.
  - No domain specified.
    You must configure a host domain for the device using the `ip domain-name` global configuration command.

- The number of allowable SSH connections is limited to the maximum number of vtys configured for the device. Each SSH connection uses a vty resource.

- SSH uses either local security or the security protocol that is configured through AAA on your device for user authentication. When configuring Authentication, Authorization, and Accounting (AAA), you must ensure that AAA is disabled on the console for user authentication. AAA authorization is disabled on the console by default. If AAA authorization is enabled on the console, disable it by configuring the `no aaa authorization console` command during the AAA configuration stage.

Configuring Reverse SSH for Console Access

To configure reverse SSH console access on the SSH server, perform the following steps.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

**Example:**

Device# configure terminal

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifies a line for configuration and enters line configuration mode.</td>
<td>line line-number ending-line-number</td>
</tr>
</tbody>
</table>

**Step 3**

**Example:**

Device# line 1 3

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disables EXEC processing on a line.</td>
<td>no exec</td>
</tr>
</tbody>
</table>

**Step 4**

**Example:**

Device(config-line)# no exec

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines a login authentication mechanism for the lines.</td>
<td>login authentication listname</td>
</tr>
</tbody>
</table>

**Step 5**

**Note** The authentication method must use a username and password.

**Example:**

Device(config-line)# login authentication default

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines which protocols to use to connect to a specific line of the device.</td>
<td>transport input ssh</td>
</tr>
</tbody>
</table>

**Step 6**

**Example:**

Device(config-line)# transport input ssh

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exits line configuration mode.</td>
<td>exit</td>
</tr>
</tbody>
</table>

**Step 7**

**Example:**

Device(config-line)# exit

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exits global configuration mode.</td>
<td>exit</td>
</tr>
</tbody>
</table>

**Step 8**

**Example:**

Device(config)# exit

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the user ID to use when logging in on the remote networking device that is running the SSH server.</td>
<td>ssh -l userid :{number} {ip-address}</td>
</tr>
</tbody>
</table>

**Step 9**

**Example:**

Device# ssh -l lab:1 router.example.com

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>userid --User ID.</td>
<td>ssh -l</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>: --Signifies that a port number and terminal IP address will follow the userid argument.</td>
<td>--</td>
</tr>
</tbody>
</table>

**Example:**

Device# ssh -l lab:1 router.example.com
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• number --Terminal or auxiliary line number.</td>
<td></td>
</tr>
<tr>
<td>• ip-address --Terminal server IP address.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**
The `userid` argument and `:rotary {number} {ip-address}` delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for modem access.

## Configuring Reverse SSH for Modem Access

To configure Reverse SSH for modem access, perform the steps shown in the “SUMMARY STEPS” section below.

In this configuration, reverse SSH is being configured on a modem used for dial-out lines. To get any of the dial-out modems, you can use any SSH client and start a SSH session as shown (in Step 10) to get to the next available modem from the rotary device.

### Procedure

<table>

</tbody>
</table>

**Troubleshooting Reverse SSH on the Client**

To troubleshoot the reverse SSH configuration on the client (remote device), perform the following steps.
Troubleshooting Reverse SSH on the Server

To troubleshoot the reverse SSH configuration on the terminal server, perform the following steps. The steps may be configured in any order or independent of one another.

## Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>debug ip ssh client</td>
<td>Displays debugging messages for the SSH client.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# debug ip ssh client</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>show ssh</td>
<td>Displays the status of the SSH server connections.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# show ssh</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>show line</td>
<td>Displays parameters of a terminal line.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# show line</td>
</tr>
</tbody>
</table>
Monitoring the SSH Configuration and Status

This table displays the SSH server configuration and status.

### Table 108: Commands for Displaying the SSH Server Configuration and Status

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip ssh</td>
<td>Shows the version and configuration information for the SSH server.</td>
</tr>
<tr>
<td>show ssh</td>
<td>Shows the status of the SSH server.</td>
</tr>
</tbody>
</table>

Configuring Secure Copy

To configure a Cisco device for Secure Copy (SCP) server-side functionality, perform the following steps.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa new-model</td>
<td>Sets AAA authentication at login.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>aaa authentication login {default</td>
<td>Enables the AAA access control system.</td>
</tr>
<tr>
<td></td>
<td>list-name} method1 [ method2... ]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# aaa authentication login default group tacacs+</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>aaa authorization {network</td>
<td>Sets parameters that restrict user access to a network.</td>
</tr>
<tr>
<td></td>
<td>exec</td>
<td>commands level</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[method2... ]]</td>
</tr>
</tbody>
</table>

### Purpose

Command or Action | Purpose
--- | ---
**Example:**
Device(config)# aaa authorization exec
default group tacacs+

**Note**
The `exec` keyword runs authorization to determine if the user is allowed to run an EXEC shell; therefore, you must use the `exec` keyword when you configure SCP.

---

### Step 6

**username** name [privilege level] **password**
encryption-type encrypted-password

**Example:**
Device(config)# username superuser
privilege 2 password 0 superpassword

**Establishes a username-based authentication system.**

**Note**
You may omit this step if a network-based authentication mechanism, such as TACACS+ or RADIUS, has been configured.

---

### Step 7

**ip scp server enable**

**Example:**
Device(config)# ip scp server enable

**Enables SCP server-side functionality.**

---

### Step 8

**exit**

**Example:**
Device(config)# exit

**Exits global configuration mode and returns to privileged EXEC mode.**

---

### Step 9

**show running-config**

**Example:**
Device# show running-config

**(Optional) Displays the SCP server-side functionality.**

---

### Step 10

**debug ip scp**

**Example:**
Device# debug ip scp

**(Optional) Troubleshoots SCP authentication problems.**

---

## Configuration Examples for Secure Shell

### Example: Secure Copy Configuration Using Local Authentication

The following example shows how to configure the server-side functionality of Secure Copy (SCP). This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly in order for SCP to work.
aaa new-model
aaa authentication login default local
aaa authorization exec default local
```

---

username user1 privilege 15 password 0 lab
! SSH must be configured and functioning properly.
ip scp server enable

Example: SCP Server-Side Configuration Using Network-Based Authentication

The following example shows how to configure the server-side functionality of SCP using a network-based authentication mechanism:

! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable

Example Reverse SSH Console Access

The following configuration example shows that reverse SSH has been configured for console access for terminal lines 1 through 3:

Terminal Server Configuration

```
line 1 3
  no exec
  login authentication default
  transport input ssh
```

Client Configuration

The following commands configured on the SSH client will form the reverse SSH session with lines 1, 2, and 3, respectively:

```
ssh -l lab:1 router.example.com
ssh -l lab:2 router.example.com
ssh -l lab:3 router.example.com
```

Example Reverse SSH Modem Access

The following configuration example shows that dial-out lines 1 through 200 have been grouped under rotary group 1 for modem access:

```
line 1 200
  no exec
  login authentication default
  rotary 1
  transport input ssh
  exit
```

The following command shows that reverse SSH will connect to the first free line in the rotary group:
Example: Monitoring the SSH Configuration and Status

To verify that the Secure Shell (SSH) server is enabled and to display the version and configuration data for your SSH connection, use the `show ip ssh` command. The following example shows that SSH is enabled:

Device# show ip ssh

SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3

The following example shows that SSH is disabled:

Device# show ip ssh
%SSH has not been enabled

To verify the status of your SSH server connections, use the `show ssh` command. The following example shows the SSH server connections on the device when SSH is enabled:

Device# show ssh

Connection Version Encryption State Username
0 1.5 3DES Session Started guest

The following example shows that SSH is disabled:

Device# show ssh
%No SSH server connections running.

Secure Shell Version 2 Support

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

- Finding Feature Information, on page 913
- Information About Secure Shell Version 2 Support, on page 913
- How to Configure Secure Shell Version 2 Support, on page 917
- Configuration Examples for Secure Shell Version 2 Support, on page 930
- Additional References for Secure Shell Version 2 Support, on page 935

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Secure Shell Version 2 Support

Secure Shell Version 2

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The `ip ssh version` command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.
SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the `ip ssh version` command and specify Version 2.

The `ip ssh rsa keypair-name` command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the `ip ssh rsa keypair-name` command, you can overcome this behavior. If you configure the `ip ssh rsa keypair-name` command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

**Secure Shell Version 2 Enhancements**

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The `ip ssh dh min size` command configures the modulus size on the SSH server. In addition to this, the `ssh` command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The `debug ip ssh` command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the `debug ip ssh` command with a keyword, messages are limited to information specified by the keyword.

**Secure Shell Version 2 Enhancements for RSA Keys**

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.
User authentication—RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.

An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user’s public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

Server authentication—While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a “Server Authentication Failed” message.

---

**Note**

Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.

**Note**

RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.

**Note**

For server authentication, configure the RSA public key of the server manually and configure the `ip ssh stricthostkeycheck` command on the Cisco SSH client.

---

### SNMP Trap Generation

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled. For information about enabling SNMP traps, see the “Configuring SNMP Support” module in the *SNMP Configuration Guide*.

**Note**

When you configure the `snmp-server host` command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server.
You must also enable SNMP debugging using the `debug snmp packet` command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session.

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client.

```
snmp-server
snmp-server host a.b.c.d public tty
```

The following is sample output from the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

```
Switch# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:
Switch# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2

*Jul 18 10:18:42.879: SNMP: Packet sent via UDP to 10.0.0.2
```

### SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)
# How to Configure Secure Shell Version 2 Support

## Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

### Procedure

<table>

<td></td>
</tr>
<tr>
<td></td>
<td>host1(config)# crypto key generate rsa</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>ip ssh pubkey-chain</td>
<td>Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>host1(config)# ip ssh pubkey-chain</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The user authentication is successful if the RSA public key stored on the server</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 7** username  
**Example:** host1(conf-ssh-pubkey)# username user1 | Configures the SSH username and enters public-key user configuration mode. |
| **Step 8** key-string  
**Example:** host1(conf-ssh-pubkey-user)# key-string | Specifies the RSA public key of the remote peer and enters public-key data configuration mode.  
**Note** You can obtain the public key value from an open SSH client; that is, from the .ssh/id_rsa.pub file. |
| **Step 9** key-hash  
**key-type**  
**key-name**  
**Example:**  
host1(conf-ssh-pubkey-data)# key-hash ssh-rsa key1 | (Optional) Specifies the SSH key type and version.  
• The key type must be ssh-rsa for the configuration of private public key pairs.  
• This step is optional only if the key-string command is configured.  
• You must configure either the key-string command or the key-hash command.  
**Note** You can use a hashing software to compute the hash of the public key string, or you can also copy the hash value from another Cisco device. Entering the public key data using the key-string command is the preferred way to enter the public key data for the first time. |
| **Step 10** end  
**Example:** host1(conf-ssh-pubkey-data)# end | Exits public-key data configuration mode and returns to privileged EXEC mode.  
• Use no hostname command to return to the default host. |
Configuring the Cisco IOS SSH Client to Perform RSA-Based Server Authentication

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
  * Enter your password if prompted.  
  Example:  
  Device> enable |
| Step 2 | configure terminal | Enters global configuration mode.  
  Example:  
  Device# configure terminal |
| Step 3 | hostname name | Specifies the hostname.  
  Example:  
  Device(config)# hostname host1 |
| Step 4 | ip domain-name name | Defines a default domain name that the Cisco software uses to complete unqualified hostnames.  
  Example:  
  host1(config)# ip domain-name name1 |
| Step 5 | crypto key generate rsa | Generates RSA key pairs.  
  Example:  
  host1(config)# crypto key generate rsa |

Starting an Encrypted Session with a Remote Device

The device with which you want to connect must support a Secure Shell (SSH) server that has an encryption algorithm that is supported in Cisco software. Also, you need not enable your device. SSH can be run in disabled mode.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> `ssh [-v {1</td>
<td>2}</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# ssh -v 2 -c aes256-ctr -m hmac-sha1-96 -l user2 10.76.82.24
```

Enabling Secure Copy Protocol on the SSH Server

The following task configures the server-side functionality for SCP. This task shows a typical configuration that allows the device to securely copy files from a remote workstation.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Command or Action</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables the AAA access control model.</td>
</tr>
<tr>
<td><code>aaa new-model</code></td>
<td>Denotes the AAA new-model command.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>aaa new-model</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Sets AAA authentication at login to use the local username database for authentication.</td>
</tr>
<tr>
<td><code>aaa authentication login default local</code></td>
<td>Signifies the authentication login command.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>aaa authentication login default local</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Sets the parameters that restrict user access to a network, runs the authorization to determine if the user ID is allowed to run an EXEC shell, and specifies that the system must use the local database for authorization.</td>
</tr>
<tr>
<td><code>aaa authorization exec default local</code></td>
<td>Indicates the authorization exec command.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>aaa authorization exec default local</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Establishes a username-based authentication system, and specifies the username, privilege level, and an unencrypted password.</td>
</tr>
<tr>
<td><code>username name privilege privilege-level password password</code></td>
<td>Defines the username and password details.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>username samplename privilege 15 password password1</code></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The minimum value for the <code>privilege-level</code> argument is 15. A privilege level of less than 15 results in the connection closing.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Sets the time interval (in seconds) that the device waits for the SSH client to respond.</td>
</tr>
<tr>
<td><code>ip ssh time-out seconds</code></td>
<td>Specifies the time-out duration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>ip ssh time-out 120</code></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Sets the number of authentication attempts after which the interface is reset.</td>
</tr>
<tr>
<td><code>ip ssh authentication-retries integer</code></td>
<td>Determines the number of authentication retries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>ip ssh authentication-retries 3</code></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Enables the device to securely copy files from a remote workstation.</td>
</tr>
<tr>
<td><code>ip scp server enable</code></td>
<td>Enables the SCP server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>ip scp server enable</code></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>exit</code></td>
<td>terminates the current configuration session.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>exit</code></td>
</tr>
</tbody>
</table>
Verifying the Status of the Secure Shell Connection

## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>

</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

```
Device# show ssh
Connection Version Encryption State Username
0 1.5 3DES Session started lab
Connection Version Mode Encryption Hmac State Username
Username  Version Mode Encryption Hmac State
1 2.0 IN aes128-cbc hmac-md5 Session started lab
1 2.0 OUT aes128-cbc hmac-md5 Session started lab
```

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

```
Device# show ssh
```
Verifying the Secure Shell Status

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>show ip ssh</code></td>
<td>Displays the version and configuration data for SSH.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# <code>show ip ssh</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Exits privileged EXEC mode and returns to user EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# <code>exit</code></td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following sample output from the `show ip ssh` command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

```
Device# `show ip ssh`

SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3
```
Monitoring and Maintaining Secure Shell Version 2

Procedure

<table>

Configuration Examples for Secure Shell Version 2 Support

Example: Configuring Secure Shell Version 2

Device# configure terminal
Device(config)# ip ssh version 2

Example: Starting an Encrypted Session with a Remote Device

Device# ssh -v 2 -c aes256-cbc -m hmac-sha1-160 -l shaship 10.76.82.24

Example: Configuring Server-Side SCP

The following example shows how to configure the server-side functionality for SCP. This example also configures AAA authentication and authorization on the device. This example uses a locally defined username and password.

Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authentication login default local
Device(config)# aaa authorization exec default local
Device(config)# username samplename privilege 15 password password1
Device(config)# ip ssh time-out 120
Device(config)# ip ssh authentication-retries 3
Device(config)# ip scp server enable
Example: Setting an SNMP Trap

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client.

```shell
snmp-server
snmp-server host a.b.c.d public tty
```

The following is sample output from the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

```
Device1# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:
Device2# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#
```

```
Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
Jul 18 10:18:42.619: SNMP: V1 Trap, ent cisco, addr 10.0.0.1, gentrap 6, spectrap 1
local.9.3.1.1.2.1 = 6
tcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 4
ltcpConnEntry.5.10.0.0.1.22.10.0.0.2.55246 = 1015
ltcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 1056
ltcpConnEntry.2.10.0.0.1.22.10.0.0.2.55246 = 1392
local.9.2.1.18.2 = lab
Jul 18 10:18:42.879: SNMP: Packet sent via UDP to 10.0.0.2
Device1#
```

Examples: SSH Keyboard Interactive Authentication

Example: Enabling Client-Side Debugs

The following example shows that the client-side debugs are turned on, and the maximum number of prompts is six (three for the SSH keyboard interactive authentication method and three for the password authentication method).

```
Password:
Password:
Password:
Password:
Password:
Password: cisc0123
Last login: Tue Dec 6 13:15:21 2005 from 10.76.248.213
user1@courier:~> exit
logout
[Connection to 10.76.248.200 closed by foreign host]
Device1# debug ip ssh client

SSH Client debugging is on
Device1# ssh -l lab 10.1.1.3
Password:
```
Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

Device1# ssh -l cisco 10.1.1.3
Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]

Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
New Password: cisco
Re-enter New password: cisco12
The New and Re-entered passwords have to be the same.
Try again.
New Password: cisco
Re-enter New password: cisco

Device2>

Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

Device# ssh -l cisco 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Device2> exit
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Device2> exit
[Connection to 10.1.1.3 closed by foreign host]
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Device2>

Example: SNMP Debugging

The following is sample output from the debug snmp packet command. The output provides SNMP trap information for an SSH session.

Device1# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:
Device2# exit
Examples: SSH Debugging Enhancements

The following is sample output from the `debug ip ssh detail` command. The output provides debugging information about the SSH protocol and channel requests.

```
Device# debug ip ssh detail
00:04:22: SSH0: starting SSH control process
00:04:22: SSH0: sent protocol version id SSH-1.99-Cisco-1.25
00:04:22: SSH0: protocol version id is - SSH-1.99-Cisco-1.25
00:04:22: SSH2 0: SSH2_MSG_KEXINIT sent
00:04:22: SSH2 0: SSH2_MSG_KEXINIT received
00:04:22: SSH2 0: expecting SSH2_MSG_KEXDH_INIT
00:04:22: SSH2 0: SSH2_MSG_KEXDH_INIT received
00:04:22: SSH2: kex_derive_keys complete
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS sent
00:04:22: SSH2 0: waiting for SSH2_MSG_NEWKEYS
00:04:22: SSH2 0: SSH2_MSG_NEWKEYS received
00:04:24: SSH2 0: authentication successful for lab
00:04:24: SSH2 0: channel open request
00:04:24: SSH2 0: pty-req request
00:04:24: SSH2 0: setting TTY - requested: height 24, width 80; set: height 24, width 80
00:04:24: SSH2 0: shell request
00:04:24: SSH2 0: shell message received
00:04:24: SSH2 0: starting shell for vty
00:04:38: SSH0: Session terminated normally
```

The following is sample output from the `debug ip ssh packet` command. The output provides debugging information about the SSH packet.

```
Device# debug ip ssh packet
00:05:43: SSH2 0: send:packet of length 280 (length also includes padlen of 4)
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: input: total packet length of 280 bytes
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 64 bytes received
00:05:43: SSH2 0: partial packet length(block size)8 bytes, needed 272 bytes, maclen 0
00:05:43: SSH2 0: ssh_receive: 24 bytes received
```

Feature Information for Secure Shell Version 2 Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Information for Secure Shell Version 2 Support
CHAPTER 48

X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature uses public key algorithm (PKI) for server and user authentication, and allows the Secure Shell (SSH) protocol to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

This module describes how to configure server and user certificate profiles for a digital certificate.

- Finding Feature Information, on page 939

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature replaces the **ip ssh server authenticate user** command with the **ip ssh server algorithm authentication** command. Configure the **default ip ssh server authenticate user** command to remove the **ip ssh server authenticate user** command from the configuration. The IOS secure shell (SSH) server will start using the **ip ssh server algorithm authentication** command.

When you configure the **ip ssh server authenticate user** command, the following message is displayed:
Warning

SSH command accepted; but this CLI will be deprecated soon. Please move to new CLI `ip ssh server algorithm authentication`. Please configure the “default ip ssh server authenticate user” to make the CLI ineffective.

Restrictions for X.509v3 Certificates for SSH Authentication

- The X.509v3 Certificates for SSH Authentication feature implementation is applicable only on the Cisco IOS Secure Shell (SSH) server side.
- The Cisco IOS SSH server supports only the x509v3-ssh-rsa algorithm-based certificate for server and user authentication.

Information About X.509v3 Certificates for SSH Authentication

X.509v3 Certificates for SSH Authentication Overview

The Secure Shell (SSH) protocol provides a secure remote access connection to network devices. The communication between the client and server is encrypted.

There are two SSH protocols that use public key cryptography for authentication. The Transport Layer Protocol, uses a digital signature algorithm (called the public key algorithm) to authenticate the server to the client. And the User Authentication Protocol uses a digital signature to authenticate (public key authentication) the client to the server.

The validity of the authentication depends upon the strength of the linkage between the public signing key and the identity of the signer. Digital certificates, such as those in X.509 Version 3 (X.509v3), are used to provide identity management. X.509v3 uses a chain of signatures by a trusted root certification authority and intermediate certificate authorities to bind a public signing key to a specific digital identity. This implementation allows the use of a public key algorithm for server and user authentication, and allows SSH to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

Server and User Authentication Using X.509v3

For server authentication, the Secure shell (SSH) server sends its own certificate to the SSH client for verification. This server certificate is associated with the trustpoint configured in the server certificate profile (ssh-server-cert-profile-server configuration mode).

For user authentication, the SSH client sends the user's certificate to the IOS SSH server for verification. The SSH server validates the incoming user certificate using public key infrastructure (PKI) trustpoints configured in the server certificate profile (ssh-server-cert-profile-user configuration mode).

By default, certificate-based authentication is enabled for server and user at the IOS SSH server end.

## OCSP Response Stapling

The Online Certificate Status Protocol (OCSP) enables applications to determine the (revocation) state of an identified certificate. This protocol specifies the data that needs to be exchanged between an application checking the status of a certificate and the server providing that status. An OCSP client issues a status request to an OCSP responder and suspends acceptance of the certificate until a response is received. An OCSP response at a minimum consists of a responseStatus field that indicates the processing status of the request.

For the public key algorithms, the key format consists of a sequence of one or more X.509v3 certificates followed by a sequence of zero or more OCSP responses.

The X.509v3 Certificate for SSH Authentication feature uses OCSP Response Stapling. By using OCSP response stapling, a device obtains the revocation information of its own certificate by contacting the OCSP server and then stapling the result along with its certificates and sending the information to the peer rather than having the peer contact the OCSP responder.

## How to Configure X.509v3 Certificates for SSH Authentication

### Configuring Digital Certificates for Server Authentication

</table>
Verifying the Server and User Authentication Using Digital Certificates

### Procedure

**Step 1**  
**enable**  
Enables privileged EXEC mode.  
• Enter your password if prompted.  

**Example:**  
Device> enable

**Step 2**  
**show ip ssh**  
Displays the currently configured authentication methods. To confirm the use of certificate-based authentication, ensure that the x509v3-ssh-rsa algorithm is the configured host key algorithm.  

**Example:**  
Device# show ip ssh  
SSH Enabled - version 1.99  
Authentication methods:publickey,keyboard-interactive,password  
Authentication Publickey Algorithms:x509v3-ssh-rsa,ssh-rsa  
Hostkey Algorithms:x509v3-ssh-rsa,ssh-rsa  
Authentication timeout: 120 secs; Authentication retries: 3  
Minimum expected Diffie Hellman key size : 1024 bits

---

### Verifying the Server and User Authentication Using Digital Certificates

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 8**  
ocsp-response required  
**Example:**  
Switch(ssh-server-cert-profile-user)# ocsp-response required | (Optional) Mandates the presence of the Online Certificate Status Protocol (OCSP) response with the incoming user certificate.  
**Note**  
By default, the user certificate is accepted without an OCSP response. |
| **Step 9**  
end  
**Example:**  
Switch(ssh-server-cert-profile-user)# end | Exits SSH server certificate profile user configuration mode and returns to privileged EXEC mode. |
Configuration Examples for X.509v3 Certificates for SSH Authentication

Example: Configuring Digital Certificates for Server Authentication

Switch> enable
Switch# configure terminal
Switch(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa
Switch(config)# ip ssh server certificate profile
Switch(ssh-server-cert-profile)# server
Switch(ssh-server-cert-profile-server)# trustpoint sign trust1
Switch(ssh-server-cert-profile-server)# exit

Example: Configuring Digital Certificate for User Authentication

Switch> enable
Switch# configure terminal
Switch(config)# ip ssh server algorithm authentication publickey
Switch(config)# ip ssh server algorithm publickey x509v3-ssh-rsa
Switch(config)# ip ssh server certificate profile
Switch(ssh-server-cert-profile)# user
Switch(ssh-server-cert-profile-user)# trustpoint verify trust2
Switch(ssh-server-cert-profile-user)# end

Feature Information for X.509v3 Certificates for SSH Authentication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 110: Feature Information for X.509v3 Certificates for SSH Authentication

<table>
<thead>
<tr>

<th>Feature Information</th>
</tr>
</thead>
</table>
| X.509v3 Certificates for SSH Authentication      | Cisco IOS 15.2(4)E1 | The X.509v3 Certificates for SSH Authentication feature uses the X5.09v3 digital certificates in server and user authentication at the SSH server side. The following commands were introduced or modified: ip ssh server algorithm hostkey, ip ssh server algorithm authentication, and ip ssh server certificate profile. This feature was implemented on the following platforms:  
  • Catalyst 2960C, 2960CX, 2960P, 2960X, and 2960XR Series Switches  
  • Catalyst 3560CX and 3560X Series Switches  
  • Catalyst 3750X Series Switches  
  • Catalyst 4500E Sup7-E, Sup7L-E, Sup8-E, and 4500X Series Switches  
  • Catalyst 4900M, 4900F-E Series Switches |
Feature Information for X.509v3 Certificates for SSH Authentication
Configuring Secure Socket Layer HTTP

This feature provides Secure Socket Layer (SSL) version 3.0 support for the HTTP 1.1 server and HTTP 1.1 client within Cisco IOS software. SSL provides server authentication, encryption, and message integrity to allow secure HTTP communications. SSL also provides HTTP client authentication. HTTP over SSL is abbreviated as HTTPS.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Secure Socket Layer HTTP

Secure HTTP Servers and Clients Overview

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with https:// instead of http://.
SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as trustpoints.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.

- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

When a new certificate is enrolled, the new configuration change is not applied to the HTTPS server until the server is restarted. You can restart the server using either the CLI or by physical reboot. On restarting the server, the switch starts using the new certificate.

If a self-signed certificate has been generated, this information is included in the output of the `show running-config` privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.
Switch# show running-config
Building configuration...

  30333030 30303030 35395A17 0D323030 31303030 305A3059 312F302D
<output truncated>

You can remove this self-signed certificate by disabling the secure HTTP server and entering the no crypto pki trustpoint TP-self-signed-30890755072 global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

The values that follow TP self-signed depend on the serial number of the device.

You can use an optional command (ip http secure-client-auth) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

CipherSuites

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL_RSA_WITH_DES_CBC_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. SSL_RSA_WITH_DES_CBC_SHA—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest
2. SSL_RSA_WITH_NULL_SHA key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
3. SSL_RSA_WITH_NULL_MD5 key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).
4. SSL_RSA_WITH_RC4_128_MD5—RSA key exchange with RC4 128-bit encryption and MD5 for message digest
5. SSL_RSA_WITH_RC4_128_SHA—RSA key exchange with RC4 128-bit encryption and SHA for message digest
6. SSL_RSA_WITH_3DES_EDE_CBC_SHA—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest
7. SSL_RSA_WITH_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
8. SSL_RSA_WITH_AES_256_CBC_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).
9. SSL_RSA_WITH_DHE_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
10. SSL_RSA_WITH_DHE_AES_256_CBC_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

Note
The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

Default SSL Configuration
The standard HTTP server is enabled.
SSL is enabled.
No CA trustpoints are configured.
No self-signed certificates are generated.

SSL Configuration Guidelines
When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.
Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.
In a switch stack, the SSL session terminates at the stack master.
How to Configure Secure Socket Layer HTTP

Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter https://URL, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

Note

AES256_SHA2 is not supported.

https://209.165.129:1026

or

https://host.domain.com:1026

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show ip http server status</td>
<td>(Optional) Displays the status of the HTTP server to determine if the secure HTTP server feature is supported in the software. You should see one of these lines in the output:</td>

</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip http secure-server</td>
<td>Enables the HTTPS server if it has been disabled. The HTTPS server is enabled by default.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip http secure-server</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip http secure-port <strong>port-number</strong></td>
<td>(Optional) Specifies the port number to be used for the HTTPS server. The default port number is 443. Valid options are 443 or any number in the range 1025 to 65535.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip http secure-port 443</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ip http secure-ciphersuite</td>
<td>(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particularly CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.</td>
</tr>
<tr>
<td>{{3des-ede-cbc-sha}} [rc4-128-md5]</td>
<td></td>
</tr>
<tr>
<td>{{rc4-128-sha}} [des-cbc-sha];</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip http secure-ciphersuite rc4-128-md5</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip http secure-client-auth</td>
<td>(Optional) Configures the HTTP server to request an X.509v3 certificate from the client for authentication during the connection process. The default is for the client to request a certificate from the server, but the server does not attempt to authenticate the client.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip http secure-client-auth</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> ip http secure-trustpoint <strong>name</strong></td>
<td>Specifies the CA trustpoint to use to get an X.509v3 security certificate and to authenticate the client certificate connection.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip http secure-trustpoint your_trustpoint</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> Use of this command assumes you have already configured a CA trustpoint according to the previous procedure.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> ip http path <strong>path-name</strong></td>
<td>(Optional) Sets a base HTTP path for HTML files. The path specifies the location of the HTTP server files on the local system (usually located in system flash memory).</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip http path /your_server:80</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> ip http access-class <strong>access-list-number</strong></td>
<td>(Optional) Specifies an access list to use to allow access to the HTTP server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

### Before you begin

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.
## Configuring a CA Trustpoint

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# configure terminal
```

(Optional) Specifies the CA trustpoint to be used if the remote HTTP server requests client authentication. Using this command assumes that you have already configured a CA trustpoint by using the previous procedure. The command is optional if client authentication is not needed or if a primary trustpoint has been configured.

**Example:**

```
Switch(config)# ip http client secure-trustpoint your_trustpoint
```

(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particular CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.

**Example:**

```
Switch(config)# ip http client secure-ciphersuite rc4-128-md5
```

Returns to privileged EXEC mode.

**Example:**

```
Switch(config)# end
```

### Purpose

Command or Action | Purpose |
--- | --- |
**Step 9** | primary name  
Example:  
Switch(ca-trustpoint)# primary your_trustpoint  
(Optional) Specifies that the trustpoint should be used as the primary (default) trustpoint for CA requests.  
- For name, specify the trustpoint that you just configured. |
**Step 10** | exit  
Example:  
Switch(ca-trustpoint)# exit  
Exits CA trustpoint configuration mode and return to global configuration mode. |
**Step 11** | crypto ca authentication name  
Example:  
Switch(config)# crypto ca authentication your_trustpoint  
Authenticates the CA by getting the public key of the CA. Use the same name used in Step 5. |
**Step 12** | crypto ca enroll name  
Example:  
Switch(config)# crypto ca enroll your_trustpoint  
Obtains the certificate from the specified CA trustpoint. This command requests a signed certificate for each RSA key pair. |
**Step 13** | end  
Example:  
Switch(config)# end  
Returns to privileged EXEC mode. |

### Monitoring Secure HTTP Server and Client Status

To monitor the SSL secure server and client status, use the privileged EXEC commands in the following table.

#### Table 111: Commands for Displaying the SSL Secure Server and Client Status

<table>
<thead>
<tr>

</tbody>
</table>
Configuration Examples for Secure Socket Layer HTTP

Example: Configuring Secure Socket Layer HTTP

The following example shows a configuration session in which the secure HTTP server is enabled, the port for the secure HTTP server is configured as 1025, and the remote CA trustpoint server “CA-trust-local” is used for certification.

Device# show ip http server status

HTTP server status: Disabled
HTTP server port: 80
HTTP server authentication method: enable
HTTP server access class: 0
HTTP server base path:
Maximum number of concurrent server connections allowed: 5
Server idle time-out: 600 seconds
Server life time-out: 600 seconds
Maximum number of requests allowed on a connection: 1
HTTP secure server capability: Present
HTTP secure server status: Disabled
HTTP secure server port: 443
HTTP secure server ciphersuite: 3des-ede-cbc-sha des-cbc-sha rc4-128-md5 rc4-12a
HTTP secure server client authentication: Disabled
HTTP secure server trustpoint:

Device# configure terminal
Device(config)# ip http secure-server
Device(config)# ip http client secure-trustpoint CA-trust-local
Device(config)# ip http secure-port 1024
Invalid secure port value.
Device(config)# ip http secure-port 1025
Device(config)# ip http secure-ciphersuite rc4-128-sha rc4-128-md5
Device(config)# end

Device# show ip http server secure status

HTTP secure server status: Enabled
HTTP secure server port: 1025
HTTP secure server ciphersuite: rc4-128-md5 rc4-128-sha
HTTP secure server client authentication: Disabled
HTTP secure server trustpoint: CA-trust-local

In the following example, the CA trustpoint CA-trust-local is specified, and the HTTPS client is configured to use this trustpoint for client authentication requests:

Device# config terminal
Device(config)# crypto ca trustpoint CA-trust-local
Device(ca-trustpoint)# enrollment url http://example.com
Device(ca-trustpoint)# crl query ldap://example.com
Device(ca-trustpoint)# primary
Device(ca-trustpoint)# exit
Device(config)# ip http client secure-trustpoint CA-trust-local
Device(config)# end
Device# copy running-config startup-config

Glossary

**RSA**—RSA is a widely used Internet encryption and authentication system that uses public and private keys for encryption and decryption. The RSA algorithm was invented in 1978 by Ron Rivest, Adi Shamir, and Leonard Adleman. The abbreviation RSA comes from the first letter of the last names of the three original developers. The RSA algorithm is included in many applications, such as the web browsers from Microsoft and Netscape. The RSA encryption system is owned by RSA Security.

**SHA**—The Secure Hash Algorithm. SHA was developed by NIST and is specified in the Secure Hash Standard (SHS, FIPS 180). Often used as an alternative to Digest 5 algorithm.

**signatures, digital** —In the context of SSL, “signing” means to encrypt with a private key. In digital signing, one-way hash functions are used as input for a signing algorithm. In RSA signing, a 36-byte structure of two hashes (one SHA and one MD5) is signed (encrypted with the private key).
SSL 3.0 — Secure Socket Layer version 3.0. SSL is a security protocol that provides communications privacy over the Internet. The protocol allows client and server applications to communicate in a way that is designed to prevent eavesdropping, tampering, or message forgery. SSL uses a program layer located between the Internet’s HTTP and TCP layers. SSL is included as part of most web server products and as part of most Internet browsers. The SSL 3.0 specification can be found at https://tools.ietf.org/html/rfc6101.
Certification Authority Interoperability

This chapter describes how to configure certification authority (CA) interoperability, which is provided in support of the IPSec protocol. CA interoperability permits Cisco IOS devices and CAs to communicate so that your Cisco IOS device can obtain and use digital certificates from the CA. Although IPSec can be implemented in your network without the use of a CA, using a CA provides manageability and scalability for IPSec.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites For Certification Authority

You need to have a certification authority (CA) available to your network before you configure this interoperability feature. The CA must support the Public Key Infrastructure (PKI) protocol, and the Simple Certificate Enrollment Protocol (SCEP).

Restrictions for Certification Authority

When configuring your CA, the following restrictions apply:
This feature should be configured only when you also configure both IPsec and Internet Key Exchange (IKE) in your network.

The Cisco IOS software does not support CA server public keys greater than 2048 bits.

Information About Certification Authority

CA Supported Standards

Without certification authority (CA) interoperability, Cisco IOS devices could not use CAs when deploying IPsec. CAs provide a manageable, scalable solution for IPsec networks.

Cisco supports the following standards with this feature:

- IPSec—IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer; it uses Internet Key Exchange to handle negotiation of protocols and algorithms based on local policy, and to generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

- Internet Key Exchange (IKE)—A hybrid protocol that implements Oakley and Skeme key exchanges inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with the IPsec protocol. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

- Public-Key Cryptography Standard #7 (PKCS #7)—A standard from RSA Data Security, Inc., used to encrypt and sign certificate enrollment messages.

- Public-Key Cryptography Standard #10 (PKCS #10)—A standard syntax from RSA Data Security, Inc. for certificate requests.

- RSA Keys—RSA is the public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. RSA keys come in pairs: one public key and one private key.

- X.509v3 certificates—Certificate support that allows the IPsec-protected network to scale by providing the equivalent of a digital ID card to each device. When two devices wish to communicate, they exchange digital certificates to prove their identity (thus removing the need to manually exchange public keys with each peer or to manually specify a shared key at each peer). These certificates are obtained from a CA. X.509 is part of the X.500 standard of the ITU.

Purpose of CAs

Certificate authorities (CAs) are responsible for managing certificate requests and issuing certificates to participating IPsec network devices. These services provide centralized key management for the participating devices.

CAs simplify the administration of IPsec network devices. You can use a CA with a network containing multiple IPsec-compliant devices such as routers.

Digital signatures, enabled by public key cryptography, provide a means of digitally authenticating devices and individual users. In public key cryptography, such as the RSA encryption system, each user has a key pair containing both a public and a private key. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other. In simple terms, a signature is formed when data is encrypted with a user's private key. The receiver verifies the signature by decrypting the message with the sender's public
The fact that the message could be decrypted using the sender's public key indicates that the holder of the private key, the sender, must have created the message. This process relies on the receiver's having a copy of the sender's public key and knowing with a high degree of certainty that it really does belong to the sender and not to someone pretending to be the sender.

Digital certificates provide the link. A digital certificate contains information to identify a user or device, such as the name, serial number, company, department, or IP address. It also contains a copy of the entity's public key. The certificate is itself signed by a certification authority (CA), a third party that is explicitly trusted by the receiver to validate identities and to create digital certificates.

In order to validate the signature of the CA, the receiver must first know the CA's public key. Normally this process is handled out-of-band or through an operation done at installation. For instance, most web browsers are configured with the public keys of several CAs by default. The Internet Key Exchange (IKE), an essential component of IPSec, can use digital signatures to scalably authenticate peer devices before setting up security associations.

Without digital signatures, one must manually exchange either public keys or secrets between each pair of devices that use IPSec to protect communications between them. Without certificates, every new device added to the network requires a configuration change on every other device with which it communicates securely. With digital certificates, each device is enrolled with a certification authority. When two devices wish to communicate, they exchange certificates and digitally sign data to authenticate each other. When a new device is added to the network, one simply enrolls that device with a CA, and none of the other devices needs modification. When the new device attempts an IPSec connection, certificates are automatically exchanged and the device can be authenticated.

**Implementing IPsec Without CAs**

Without a CA, if you want to enable IPSec services (such as encryption) between two Cisco devices, you must first ensure that each device has the key of the other device (such as an RSA public key or a shared key). This requirement means that you must manually perform one of the following operations:

- At each device, enter the RSA public key of the other device.
- At each device, specify a shared key to be used by both device.

In the above illustration, each device uses the key of the other device to authenticate the identity of the other device; this authentication always occurs when IPSec traffic is exchanged between the two devices.

If you have multiple Cisco devices in a mesh topology and wish to exchange IPSec traffic passing among all of those devices, you must first configure shared keys or RSA public keys among all of those devices. Every time a new device is added to the IPsec network, you must configure keys between the new device and each of the existing devices. (In Figure 34, four additional two-part key configurations would be required to add a single encrypting device to the network.) Consequently, the more devices there are that require IPSec services, the more involved the key administration becomes. This approach does not scale well for larger, more complex encrypting networks.

**Implementing IPsec With CAs**

With a CA, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA, requesting a certificate for the device. When this has been accomplished, each participating device can dynamically authenticate all the other participating devices. This process is illustrated in the illustration.
To add a new IPsec device to the network, you need only configure that new device to request a certificate from the CA, instead of making multiple key configurations with all the other existing IPsec devices.

**Implementing IPsec with Multiple Root CAs**

With multiple root CAs, you no longer have to enroll a device with the CA that issued a certificate to a peer. Instead, you configure a device with multiple CAs that it trusts. Thus, a device can use a configured CA (a trusted root) to verify certificates offered by a peer that were not issued by the same CA defined in the identity of the device.

Configuring multiple CAs allows two or more devices enrolled under different domains (different CAs) to verify the identity of each other when using IKE to set up IPsec tunnels.

Through Simple Certificate Enrollment Protocol (SCEP), each device is configured with a CA (the enrollment CA). The CA issues a certificate to the device that is signed with the private key of the CA. To verify the certificates of peers in the same domain, the device is also configured with the root certificate of the enrollment CA.

To verify the certificate of a peer from a different domain, the root certificate of the enrollment CA in the domain of the peer must be configured securely in the device.

During Internet Key Exchange (IKE) phase one signature verification, the initiator will send the responder a list of its CA certificates. The responder should send the certificate issued by one of the CAs in the list. If the certificate is verified, the device saves the public key contained in the certificate on its public key ring.

With multiple root CAs, VPN users can establish trust in one domain and easily and securely distribute it to other domains. Thus, the required private communication channel between entities authenticated under different domains can occur.

**How CA Certificates Are Used by IPsec Devices**

When two IPsec devices want to exchange IPsec-protected traffic passing between them, they must first authenticate each other—otherwise, IPsec protection cannot occur. The authentication is done with IKE.

Without a CA, a device authenticates itself to the remote device using either RSA-encrypted nonces or preshared keys. Both methods require that keys must have been previously configured between the two devices.

With a CA, a device authenticates itself to the remote device by sending a certificate to the remote device and performing some public key cryptography. Each device must send its own unique certificate that was issued and validated by the CA. This process works because the certificate of each device encapsulates the public key of the device, each certificate is authenticated by the CA, and all participating devices recognize the CA as an authenticating authority. This scheme is called IKE with an RSA signature.

Your device can continue sending its own certificate for multiple IPsec sessions, and to multiple IPsec peers until the certificate expires. When its certificate expires, the device administrator must obtain a new one from the CA.

CAs can also revoke certificates for devices that will no longer participate in IPsec. Revoked certificates are not recognized as valid by other IPsec devices. Revoked certificates are listed in a certificate revocation list (CRL), which each peer may check before accepting a certificate from another peer.
Registration Authorities

Some CAs have a registration authority (RA) as part of their implementation. An RA is essentially a server that acts as a proxy for the CA so that CA functions can continue when the CA is offline.

Some of the configuration tasks described in this document differ slightly, depending on whether your CA supports an RA.

How to Configure Certification Authority

Managing NVRAM Memory Usage

Certificates and certificate revocation lists (CRLs) are used by your device when a CA is used. Normally certain certificates and all CRLs are stored locally in the NVRAM of the device, and each certificate and CRL uses a moderate amount of memory.

The following certificates are normally stored at your device:

- Certificate of your device
- Certificate of the CA
- Root certificates obtained from CA servers (all root certificates are saved in RAM after the device has been initialized)
- Two registration authority (RA) certificates (only if the CA supports an RA)

CRLs are normally stored at your device according to the following conditions:

- If your CA does not support an RA, only one CRL gets stored in the device.
- If your CA supports an RA, multiple CRLs can be stored in the device.

In some cases, storing these certificates and CRLs locally will not present any difficulty. In other cases, memory might become a problem—particularly if the CA supports an RA and a large number of CRLs have to be stored on the device. If the NVRAM is too small to store root certificates, only the fingerprint of the root certificate is saved.

To save NVRAM space, specify that certificates and CRLs should not be stored locally, but should be retrieved from the CA when needed. This alternative will save NVRAM space but could result in a slight performance impact. To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode.

If you do not enable query mode now, you can do it later even if certificates and CRLs have are already stored on the device. In this case, when you enable query mode, the stored certificates and CRLs are deleted from the device after you save the configuration. (If you copy the configuration to a TFTP site prior to enabling query mode, you can save any stored certificates and CRLs at the TFTP site.)

Before disabling query mode, perform the copy system:running-config nvrarn:startup-config command to save all current certificates and CRLs to NVRAM. Otherwise they could be lost during a reboot.

To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode by using the following command in global configuration mode:

```plaintext
copy system:running-config nvrarn:startup-config
```

Note

Query mode may affect availability if the CA is down.
### Configuring the Device Host Name and IP Domain Name

You must configure the host name and IP domain name of a device if this has not already been done. This is required because the device assigns a fully qualified domain name (FQDN) to the keys and certificates used by IPsec, and the FQDN is based on the host name and IP domain name assigned to the device. For example, a certificate named "device20.example.com" is based on a device host name of "device20" and a device IP domain name of "example.com".

### Generating an RSA Key Pair

Rivest, Shamir, and Adelman (RSA) key pairs are used to sign and encrypt IKE key management messages and are required before obtaining a certificate for your device.
# Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

## Declaring a Certification Authority

You should declare one certification authority (CA) to be used by the device.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto ca trustpoint name</td>
<td>Declares the certification authority (CA) that</td>
</tr>
<tr>
<td>Example:</td>
<td>your device should use and enters the CA</td>
</tr>
<tr>
<td>Device(config)# crypto ca trustpoint ka</td>
<td>profile enroll configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> enrollment url url</td>
<td>Specifies the URL of the CA server to which</td>
</tr>
<tr>
<td>Example:</td>
<td>enrollment requests are sent.</td>
</tr>
<tr>
<td>Device(ca-profile-enroll)# enrollment url <a href="http://entrust:81">http://entrust:81</a></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 5    | enrollment command | Specifies the HTTP command that is sent to the CA for enrollment.  
**Example:**  
Device(ca-profile-enroll)# enrollment command |
| 6    | exit | Exit CA profile enroll configuration mode and returns to global configuration mode.  
**Example:**  
Device(ca-profile-enroll)# exit |
| 7    | crypto pki trustpoint name | Declares the trustpoint that your device should use and enters Ca-trustpoint configuration mode.  
**Example:**  
Device(config)# crypto pki trustpoint ka |
| 8    | crl query ldap://url:[port] | Queries the certificate revocation list (CRL) to ensure that the certificate of the peer is not revoked.  
**Example:**  
Device(ca-trustpoint)# crl query ldap://bar.cisco.com:3899 |
| 9    | enrollment [mode ra | retry count number | retry period minutes | url url] | Specifies the enrollment wait period between certificate request retries.  
**Example:**  
Device(ca-trustpoint)# enrollment retry period 2 |
| 10   | enrollment [mode ra | retry count number | retry period minutes | url url] | Specifies the number of times a device will resend a certificate request when it does not receive a response from the previous request.  
**Example:**  
Device(ca-trustpoint)# enrollment retry count 8 |
**Example:**  
Device(ca-trustpoint)# revocation-check crl ocsp |
| 12   | end | Exit CA trustpoint configuration mode and returns to privileged EXEC mode.  
**Example:**  
Device(ca-trustpoint)# end |
Configuring a Root CA (Trusted Root)

Procedure

<td>enrollment http-proxy hostname port-number</td>
<td>Accesses the certification authority (CA) by HTTP through the proxy server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(ca-trustpoint)# enrollment http-proxy host2 8080</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
<td>Exits CA trustpoint configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(ca-trustpoint)# end</td>
<td></td>
</tr>
</tbody>
</table>

Authenticating the CA

The device must authenticate the certification authority (CA). It does this by obtaining the self-signed certificate of the CA, which contains the public key of the CA. Because the certificate of the CA is self-signed (the CA signs its own certificate) the public key of the CA should be manually authenticated by contacting the CA administrator to compare the fingerprint of the CA certificate when you perform this step.

Perform the following task to get the public key of the CA:
### Requesting Signed Certificates

You must obtain a signed certificate from the certification authority (CA) for each of the RSA key pairs on your device. If you generated general-purpose RSA keys, your device has only one RSA key pair and needs only one certificate. If you previously generated special-usage RSA keys, your device has two RSA key pairs and needs two certificates.

Perform the following task to request signed certificates from the CA:

**Note**

If your device reboots after you have issued the `crypto pki enroll` command, but before you have received the certificates, you must reissue the command and notify the CA administrator.

</table>
Monitoring and Maintaining Certification Authority

Requesting a Certificate Revocation List

You can request a certificate revocation list (CRL) only if the certification authority (CA) does not support a registration authority (RA). The following task applies only when the CA does not support an RA.

When a device receives a certificate from a peer, your device will download a CRL from the CA. The device then checks the CRL to make sure the certificate that the peer sent has not been revoked. (If the certificate appears on the CRL, the device will not accept the certificate and will not authenticate the peer.)

A CRL can be reused with subsequent certificates until the CRL expires if query mode is off. If the device receives a peer's certificate after the applicable CRL has expired, the device will download the new CRL.

If the device has a CRL that has not yet expired, but you suspect that the contents of the CRL are out of date, you can request that the latest CRL be downloaded immediately to replace the old CRL.

**Procedure**

<table>
<thead>
<tr>

</tbody>
</table>
Querying a Certification Revocation List

You can query a certificate revocation list (CRL) only when you configure your device with a trusted root. When your device receives a certificate from a peer from another domain (with a different CA), the CRL downloaded from the CA of the device will not include certificate information about the peer. Therefore, you should check the CRL published by the configured root with the LDAP URL to ensure that the certificate of the peer has not been revoked.

If you would like CRL of the root certificate to be queried when the device reboots, you must enter the `crl query` command.

Perform the following task to query the CRL published by the configured root with the LDAP URL:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>

<tr>
<td>Device(ca-trustpoint)# end</td>
<td></td>
</tr>
</tbody>
</table>
Deleting RSA Keys from a Device

Under certain circumstances you may want to delete RSA keys from your device. For example, if you believe the RSA keys were compromised in some way and should no longer be used, you should delete the keys.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
   Enables privileged EXEC mode.
   **Example:**
   Device> enable |
| **Step 2**
   Enters global configuration mode.
   **Example:**
   Device# configure terminal |
| **Step 3**
   Deletes all Rivest, Shamir, and Adelman (RSA) keys from your device.
   **Example:**
   Device(config)# crypto key zeroize rsa [key-pair-label] |
| **Step 4**
   Exits global configuration mode and returns to privileged EXEC mode.
   **Example:**
   Device(config)# end |

What to do next

After you delete RSA keys from the device, you should also complete the following two additional tasks:

- Ask the CA administrator to revoke the device certificates at the CA; you must supply the challenge password that you created when you originally obtained the device certificates with the `crypto pki enroll` command.
- Manually remove the device certificates from the device configuration.

Deleting Public Keys for a Peer

Under certain circumstances you may want to delete RSA public keys of peer devices from your device configuration. For example, if you no longer trust the integrity of the public key of a peer, you should delete the key.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
   Enables privileged EXEC mode.
   **Example:**
   Device> enable |
## Deleting Certificates from the Configuration

If the need arises, you can delete certificates that are saved in your device. Your devices saves its own certificates, the certificate of the CA, and any RA certificates.

To delete the CA's certificate, you must remove the entire CA identity, which also removes all certificates associated with the CA—your router's certificate, the CA certificate, and any RA certificates.

### Procedure

<table>
<thead>
<tr>

Access Control List Overview

Access lists filter network traffic by controlling the forwarding or blocking of packets at the interface of a device. A device examines each packet to determine whether to forward or drop that packet, based on the criteria specified in access lists.

The criteria that can be specified in an access list include the source address of the traffic, the destination address of the traffic, and the upper-layer protocol.

Note
Some users might successfully evade basic access lists because these lists require no authentication.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Access Control Lists

Definition of an Access List

An access list is a sequential list consisting of at least one permit statement and possibly one or more deny statements. In the case of IP access lists, the statements can apply to IP addresses, upper-layer IP protocols, or other fields in IP packets. The access list is identified and referenced by a name or a number. Access list acts as a packet filter, filtering packets based on the criteria defined in the access list.
An access list may be configured, but it does not take effect until the access list is either applied to an interface, a virtual terminal line (vty), or referenced by some command that accepts an access list. Multiple commands can reference the same access list.

The following configuration example shows how to create an IP access list named branchoffices. The ACL is applied to serial interface 0 on incoming packets. No sources other than those on the networks specified by each source address and mask pair can access this interface. The destinations for packets coming from sources on network 172.20.7.0 are unrestricted. The destination for packets coming from sources on network 172.29.2.0 must be 172.25.5.4.

```
ip access-list extended branchoffices
  10 permit 172.20.7.0 0.0.0.3 any
  20 permit 172.29.2.0 0.0.0.255 host 172.25.5.4
!interface serial 0
  ip access-group branchoffices in
```

**Functions of an Access Control List**

There are many reasons to configure access lists; for example, to restrict contents of routing updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide security for your network, which is the focus of this module.

Use access lists to provide a basic level of security for accessing your network. If you do not configure access lists on your device, all packets passing through the device are allowed access to all parts of your network.

Access lists can allow a host to access a part of your network and prevent another host from accessing the same area. In the figure below, Host A is allowed to access the Human Resources network, but Host B is prevented from accessing the Human Resources network.

You can also use access lists to define the type of traffic that is forwarded or blocked at device interfaces. For example, you can permit e-mail traffic to be routed but at the same time block all Telnet traffic.

**Purpose of IP Access Lists**

Access lists perform packet filtering to control which packets move through the network and where. Such control can help limit network traffic and restrict the access of users and devices to the network. Access lists have many uses, and therefore many commands accept a reference to an access list in their command syntax. Access lists can be used to do the following:

- Filter incoming packets on an interface.
- Filter outgoing packets on an interface.
- Restrict the contents of routing updates.
- Limit debug output based on an address or protocol.
- Control virtual terminal line access.
- Identify or classify traffic for advanced features, such as congestion avoidance, congestion management, and priority and custom queuing.
- Trigger dial-on-demand routing (DDR) calls.
Reasons to Configure ACLs

There are many reasons to configure access lists; for example, you can use access lists to restrict contents of switching updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide a basic level of security for your network by controlling access to it. If you do not configure access lists on your device, all packets passing through the device could be allowed onto all parts of your network.

An access list can allow one host to access a part of your network and prevent another host from accessing the same area. For example, by applying an appropriate access list to interfaces of a device, Host A is allowed to access the human resources network and Host B is prevented from accessing the human resources network.

You can use access lists on a device that is positioned between two parts of your network, to control traffic entering or exiting a specific part of your internal network.

To provide some security benefits of access lists, you should at least configure access lists on border devices—devices located at the edges of your networks. Such an access list provides a basic buffer from the outside network or from a less controlled area of your own network into a more sensitive area of your network. On these border devices, you should configure access lists for each network protocol configured on the device interfaces. You can configure access lists so that inbound traffic or outbound traffic or both are filtered on an interface.

Access lists are defined on a per-protocol basis. In other words, you should define access lists for every protocol enabled on an interface if you want to control traffic flow for that protocol.

Software Processing of an Access List

The following general steps describe how the an access list is processed when it is applied to an interface, a vty, or referenced by any command. These steps apply to an access list that has 13 or fewer access list entries.

- The software receives an IP packet and tests parts of each packet being filtered against the conditions in the access list, one condition (permit or deny statement) at a time. For example, the software tests the source and destination addresses of the packet against the source and destination addresses in a permit or deny statement.

- If a packet does not match an access list statement, the packet is then tested against the next statement in the list.

- If a packet and an access list statement match, the rest of the statements in the list are skipped and the packet is permitted or denied as specified in the matched statement. The first entry that the packet matches determines whether the software permits or denies the packet. That is, after the first match, no subsequent entries are considered.

- If the access list denies a packet, the software discards the packet and returns an Internet Control Message Protocol (ICMP) Host Unreachable message.

- If no conditions match, the software drops the packet. This is because each access list ends with an unwritten, implicit deny statement. That is, if the packet has not been permitted by the time it was tested against each statement, it is denied.

An access list with more than 13 entries is processed using a trie-based lookup algorithm. This process will happen automatically; it does not need to be configured.
Access List Rules

The following rules apply to access control lists (ACLs):

- Only one access list per interface, per protocol, and per direction is allowed.
- An access list must contain at least one `permit` statement or all packets are denied entry into the network.
- The order in which access list conditions or match criteria are configured is important. While deciding whether to forward or block a packet, Cisco software tests the packet against each criteria statement in the order in which these statements are created. After a match is found, no more criteria statements are checked. The same `permit` or `deny` statements specified in a different order can result in a packet being passed under one circumstance and denied in another circumstance.
- If an access list is referenced by a name, but the access list does not exist, all packets pass. An interface or command with an empty access list applied to it permits all traffic into the network.
- Standard access lists and extended access lists cannot have the same name.
- Inbound access lists process packets before packets are sent to an outbound interface. Inbound access lists that have filtering criteria that deny packet access to a network saves the overhead of a route lookup. Packets that are permitted access to a network based on the configured filtering criteria are processed for routing. For inbound access lists, when you configure a `permit` statement, packets are processed after they are received, and when you configure a `deny` statement, packets are discarded.
- Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed by the outbound access list. For outbound access lists, when you configure a `permit` statement, packets are sent to the output buffer, and when you configure a `deny` statement, packets are discarded.
- An access list can control traffic arriving at a device or leaving a device, but not traffic originating at a device.

Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient access lists.

- Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit `deny` statement that follows could cause you immediate access problems.
- Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.
- All access lists need at least one `permit` statement; otherwise, all packets are denied and no traffic passes.
- Because the software stops testing conditions after it encounters the first match (to either a `permit` or `deny` statement), you will reduce processing time and resources if you put the statements that packets are most likely to match at the beginning of the access list. Place more frequently occurring conditions before less frequent conditions.
- Organize your access list so that more specific references in a network or subnet appear before more general ones.
• Use the statement `permit any any` if you want to allow all other packets not already denied. Using the statement `permit any any` in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry `permit any any` because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify `permit any any`, all traffic not already denied will get through.

• Although all access lists end with an implicit `deny` statement, we recommend use of an explicit `deny` statement (for example, `deny ip any any`). On most platforms, you can display the count of packets denied by issuing the `show access-list` command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit `deny` statements are counted, which is why the explicit `deny` statement will yield more complete data for you.

• While you are creating an access list or after it is created, you might want to delete an entry.
  • You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
  • You can delete an entry from a named access list. Use the `no permit` or `no deny` command to delete the appropriate entry.

• In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the `remark` command.

• If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the `log` keyword with the corresponding `deny` statement so that the packets denied from that source are logged for you.

• This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

### IP Packet Fields You Can Filter to Control Access

You can use an extended access list to filter on any of the following fields in an IP packet. Source address and destination address are the two most frequently specified fields on which to base an access list:

• Source address--Specifies a source address to control packets coming from certain networking devices or hosts.

• Destination address--Specifies a destination address to control packets being sent to certain networking devices or hosts.

• Protocol--Specifies an IP protocol indicated by the keyword `eigrp`, `gre`, `icmp`, `igmp`, `ip`, `ipinip`, `nos`, `ospf`, `tcp`, or `udp`, or indicated by an integer in the range from 0 to 255 (representing an Internet protocol). If you specify a transport layer protocol (`icmp`, `igmp`, `tcp`, or `udp`), the command has a specific syntax.
  • Ports and non-contiguous ports--Specifies TCP or UDP ports by a port name or port number. The port numbers can be noncontiguous port numbers. Port numbers can be useful to filter Telnet traffic or HTTP traffic, for example.
  • TCP flags--Specifies that packets match any flag or all flags set in TCP packets. Filtering on specific TCP flags can help prevent false synchronization packets.

• IP options--Specifies IP options; one reason to filter on IP options is to prevent routers from being saturated with spurious packets containing them.
Source and Destination Addresses

Source and destination address fields in an IP packet are two typical fields on which to base an access list. Specify source addresses to control the packets being sent from certain networking devices or hosts. Specify destination addresses to control the packets being sent to certain networking devices or hosts.

Wildcard Mask for Addresses in an Access List

Address filtering uses wildcard masking to indicate to the software whether to check or ignore corresponding IP address bits when comparing the address bits in an access list entry to a packet being submitted to the access list. By carefully setting wildcard masks, you can specify one or more IP addresses for permit or deny tests.

Wildcard masking for IP address bits uses the number 1 and the number 0 to specify how the software treats the corresponding IP address bits. A wildcard mask is sometimes referred to as an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet (network) mask.

- A wildcard mask bit 0 means check the corresponding bit value; they must match.
- A wildcard mask bit 1 means ignore that corresponding bit value; they need not match.

If you do not supply a wildcard mask with a source or destination address in an access list statement, the software assumes an implicit wildcard mask of 0.0.0.0, meaning all values must match.

Unlike subnet masks, which require contiguous bits indicating network and subnet to be ones, wildcard masks allow noncontiguous bits in the mask.

The table below shows examples of IP addresses and masks from an access list, along with the corresponding addresses that are considered a match.

Table 112: Sample IP Addresses, Wildcard Masks, and Match Results

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Access List Sequence Numbers

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within
an access list. If you wanted to insert an entry in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When you add a new entry, you specify the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

**ACL Supported Types**

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

**Supported ACLs**

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply only one IP access list and one MAC access list to a Layer 2 interface.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- VLAN ACLs or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

**ACL Precedence**

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
• When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

• When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface only in inbound direction. The following access lists are supported:

• Standard IP access lists using source addresses
• Extended IP access lists using source and destination addresses and optional protocol type information
• MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

Figure 75: Using ACLs to Control Traffic in a Network

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.
You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

**Note**

Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

**Access Control Entries**

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies *permit* or *deny* and a set of conditions the packet must satisfy in order to match the ACE. The meaning of *permit* or *deny* depends on the context in which the ACL is used.

**ACEs and Fragmented and Unfragmented Traffic**

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.
- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.
ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:

```
Switch(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Switch(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Switch(config)# access-list 102 permit tcp any host 10.1.1.2
Switch(config)# access-list 102 deny tcp any any
```

**Note**

In the first and second ACEs in the examples, the `eq` keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2, port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

  Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.
CHAPTER 52

Configuring IPv4 Access Control Lists

Access control lists (ACLs) perform packet filtering to control which packets move through the network and where. Such control provides security by helping to limit network traffic, restrict the access of users and devices to the network, and prevent traffic from leaving a network. IP access lists can reduce the chance of spoofing and denial-of-service attacks and allow dynamic, temporary user access through a firewall.

IP access lists can also be used for purposes other than security, such as bandwidth control, restricting the content of routing updates, redistributing routes, triggering dial-on-demand (DDR) calls, limiting debug output, and identifying or classifying traffic for quality of service (QoS) features. This module provides an overview of IP access lists.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring IPv4 Access Control Lists

This section lists the prerequisites for configuring network security with access control lists (ACLs).
Restrictions for Configuring IPv4 Access Control Lists

General Network Security

The following are restrictions for configuring network security with ACLs:

- Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name.
- A standard ACL and an extended ACL cannot have the same name.
- Though visible in the command-line help strings, `appletalk` is not supported as a matching condition for the `deny` and `permit` MAC access-list configuration mode commands.
- ACL wildcard is not supported in downstream client policy.

IPv4 ACL Network Interfaces

The following restrictions apply to IPv4 ACLs to network interfaces:

- When controlling access to an interface, you can use a named or numbered ACL.
- If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.
- You do not have to enable routing to apply ACLs to Layer 2 interfaces.

MAC ACLs on a Layer 2 Interface

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

Note

The `mac access-group` interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

IP Access List Entry Sequence Numbering

- This feature does not support dynamic, reflexive, or firewall access lists.
Information About Configuring IPv4 Access Control Lists

ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.
- ACL logging for port ACLs and VLAN maps
Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating. This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

**Table 113: Access List Numbers**

<table>
<thead>
<tr>
<th>Access List Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>
<td>IP standard access list</td>
<td>Yes</td>
</tr>
<tr>
<td>100–199</td>
<td>IP extended access list</td>
<td>Yes</td>
</tr>
<tr>
<td>200–299</td>
<td>Protocol type-code access list</td>
<td>No</td>
</tr>
<tr>
<td>300–399</td>
<td>DECnet access list</td>
<td>No</td>
</tr>
<tr>
<td>400–499</td>
<td>XNS standard access list</td>
<td>No</td>
</tr>
<tr>
<td>500–599</td>
<td>XNS extended access list</td>
<td>No</td>
</tr>
<tr>
<td>600–699</td>
<td>AppleTalk access list</td>
<td>No</td>
</tr>
<tr>
<td>700–799</td>
<td>48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>800–899</td>
<td>IPX standard access list</td>
<td>No</td>
</tr>
<tr>
<td>900–999</td>
<td>IPX extended access list</td>
<td>No</td>
</tr>
<tr>
<td>1000–1099</td>
<td>IPX SAP access list</td>
<td>No</td>
</tr>
<tr>
<td>1100–1199</td>
<td>Extended 48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>1200–1299</td>
<td>IPX summary address access list</td>
<td>No</td>
</tr>
<tr>
<td>1300–1999</td>
<td>IP standard access list (expanded range)</td>
<td>Yes</td>
</tr>
<tr>
<td>2000–2699</td>
<td>IP extended access list (expanded range)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

**Numbered Standard IPv4 ACLs**

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.
The switch always rewrites the order of standard access lists so that entries with host matches and entries with matches having a don’t care mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero don’t care masks. Therefore, in show command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to VLANs, to terminal lines, or to interfaces.

**Numbered Extended IPv4 ACLs**

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

**Note**

ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

These IP protocols are supported:

- Authentication Header Protocol \( (ahp) \)
- Encapsulation Security Payload \( (esp) \)
- Enhanced Interior Gateway Routing Protocol \( (eigrp) \)
- generic routing encapsulation \( (gre) \)
- Internet Control Message Protocol \( (icmp) \)
- Internet Group Management Protocol \( (igmp) \)
- any Interior Protocol \( (ip) \)
- IP in IP tunneling \( (ipinip) \)
- KA9Q NOS-compatible IP over IP tunneling \( (nos) \)
- Open Shortest Path First routing \( (ospf) \)
- Payload Compression Protocol \( (pcp) \)
- Protocol-Independent Multicast \( (pim) \)
- Transmission Control Protocol \( (tcp) \)
- User Datagram Protocol \( (udp) \)
Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

Note

The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines before configuring named ACLs:

• Numbered ACLs are also available.
• A standard ACL and an extended ACL cannot have the same name.
• You can use standard or extended ACLs (named or numbered) in VLAN maps.

Benefits of Using the Named ACL Support for Noncontiguous Ports on an Access Control Entry Feature

The Named ACL Support for Noncontiguous Ports on an Access Control Entry feature allows you to specify noncontiguous ports in a single access control entry, which greatly reduces the number of entries required in an access control list when several entries have the same source address, destination address, and protocol, but differ only in the ports.

This feature greatly reduces the number of access control entries (ACEs) required in an access control list to handle multiple entries for the same source address, destination address, and protocol. If you maintain large numbers of ACEs, use this feature to consolidate existing groups of access list entries wherever it is possible and when you create new access list entries. When you configure access list entries with noncontiguous ports, you will have fewer access list entries to maintain.

Benefits of IP Access List Entry Sequence Numbering

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If a user wanted to insert an entry (statement) in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When a user adds a new entry, the user chooses the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

Sequence Numbering Behavior

• For backward compatibility with previous releases, if entries with no sequence numbers are applied, the first entry is assigned a sequence number of 10, and successive entries are incremented by 10. The maximum sequence number is 2147483647. If the generated sequence number exceeds this maximum number, the following message is displayed:

Exceeded maximum sequence number.
• If the user enters an entry without a sequence number, it is assigned a sequence number that is 10 greater than the last sequence number in that access list and is placed at the end of the list.

• If the user enters an entry that matches an already existing entry (except for the sequence number), then no changes are made.

• If the user enters a sequence number that is already present, the following error message is generated:

Duplicate sequence number.

• If a new access list is entered from global configuration mode, then sequence numbers for that access list are generated automatically.

• Distributed support is provided so that the sequence numbers of entries in the Route Processor (RP) and line card are in synchronization at all times.

• Sequence numbers are not nvgened. That is, the sequence numbers themselves are not saved. In the event that the system is reloaded, the configured sequence numbers revert to the default sequence starting number and increment. The function is provided for backward compatibility with software releases that do not support sequence numbering.

• This feature works with named and numbered, standard and extended IP access lists.

Including comments in ACLs

You can use the remark keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the access-list access-list number remark global configuration command. To remove the remark, use the no form of this command.

The following is an example of a remark that describes function of the subsequent deny statement:

```
ip access-list extended telnetting
    remark Do not allow host1 subnet to telnet out
    deny tcp host 172.16.2.88 any eq telnet
```

Hardware and Software Treatment of IP ACLs

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

Note

If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.
For router ACLs, other factors can cause packets to be sent to the CPU:

- Using the `log` keyword
- Generating ICMP unreachable messages

When traffic flows are both logged and forwarded, forwarding is done by hardware, but logging must be done by software. Because of the difference in packet handling capacity between hardware and software, if the sum of all flows being logged (both permitted flows and denied flows) is of great enough bandwidth, not all of the packets that are forwarded can be logged.

When you enter the `show ip access-lists` privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the `show platform acl counters hardware` privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Router ACLs function as follows:

- The hardware controls permit and deny actions of standard and extended ACLs (input and output) for security access control.
- If `log` has not been specified, the flows that match a `deny` statement in a security ACL are dropped by the hardware if `ip unreachable` is disabled. The flows matching a `permit` statement are switched in hardware.
- Adding the `log` keyword to an ACE in a router ACL causes a copy of the packet to be sent to the CPU for logging only. If the ACE is a `permit` statement, the packet is still switched and routed in hardware.

### Time Ranges for ACLs

You can selectively apply extended ACLs based on the time of day and the week by using the `time-range` global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The `time-range` keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).
- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

---

**Note**

The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.
IPv4 ACL Interface Considerations

When you apply the `ip access-group` interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the `ip icmp rate-limit unreachable` global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

Apply an Access Control List to an Interface

With some protocols, you can apply up to two access lists to an interface: one inbound access list and one outbound access list. With other protocols, you apply only one access list that checks both inbound and outbound packets.

If the access list is inbound, when a device receives a packet, Cisco software checks the access list’s criteria statements for a match. If the packet is permitted, the software continues to process the packet. If the packet is denied, the software discards the packet.

If the access list is outbound, after receiving and routing a packet to the outbound interface, Cisco software checks the access list’s criteria statements for a match. If the packet is permitted, the software transmits the packet. If the packet is denied, the software discards the packet.

---

**Note**

Access lists that are applied to interfaces on a device do not filter traffic that originates from that device.
The figure above shows that Device 2 is a bypass device that is connected to Device 1 and Device 3. An outbound access list is applied to Gigabit Ethernet interface 0/0/0 on Device 1. When you ping Device 3 from Device 1, the access list does not check for packets going outbound because the traffic is locally generated.

The access list check is bypassed for locally generated packets, which are always outbound.

By default, an access list that is applied to an outbound interface for matching locally generated traffic will bypass the outbound access list check; but transit traffic is subjected to the outbound access list check.

---

**Note**
The behavior described above applies to all single-CPU platforms that run Cisco software.

---

## ACL Logging

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the `logging console` commands controlling the syslog messages.

---

**Note**
ACL logging is only supported for RACL.

---

**Note**
Because routing is done in hardware and logging is done in software, if a large number of packets match a `permit` or `deny` ACE containing a `log` keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.
The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

How to Configure ACLs

Configuring IPv4 ACLs

These are the steps to use IP ACLs on the switch:

**Procedure**

**Step 1**
Create an ACL by specifying an access list number or name and the access conditions.

**Step 2**
Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

Creating a Numbered Standard ACL

Follow these steps to create a numbered standard ACL:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  * enable  
  Example:
  ```bash
  Switch> enable
  ``` |

Enables privileged EXEC mode. Enter your password if prompted.

| **Step 2**
  * configure terminal  
  Example:
  ```bash
  Switch# configure terminal
  ``` |

Enters global configuration mode.

| **Step 3**
  * access-list access-list-number {deny | permit} source source-wildcard [log]  
  Example:
  ```bash
  Switch(config)# access-list 2 deny
  ``` |

Defines a standard IPv4 access list by using a source address and wildcard. The access-list-number is a decimal number from 1 to 99 or 1300 to 1999.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `your_host`       | Enter `deny` or `permit` to specify whether to deny or permit access if conditions are matched. The `source` is the source address of the network or host from which the packet is being sent specified as:  
  - The 32-bit quantity in dotted-decimal format.  
  - The keyword `any` as an abbreviation for `source and source-wildcard of 0.0.0.0 255.255.255.255`. You do not need to enter a source-wildcard.  
  - The keyword `host` as an abbreviation for `source and source-wildcard of source 0.0.0.0`. (Optional) The `source-wildcard` applies wildcard bits to the source.  
  (Optional) Enter `log` to cause an informational logging message about the packet that matches the entry to be sent to the console.  |

**Step 4**  
**Example:**  
Switch(config)# end  
Returns to privileged EXEC mode.

**Step 5**  
**Example:**  
Switch# show running-config  
Verifies your entries.

**Step 6**  
**Example:**  
Switch# copy running-config startup-config  
(Optional) Saves your entries in the configuration file.

---

**Creating a Numbered Extended ACL**

Follow these steps to create a numbered extended ACL:
**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> access-list access-list-number {deny</td>
<td>permit} protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>precedence</strong>—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: <strong>routine</strong> (0), <strong>priority</strong> (1), <strong>immediate</strong> (2), <strong>flash</strong> (3), <strong>flash override</strong> (4), <strong>critical</strong> (5), <strong>internet</strong> (6), <strong>network</strong> (7).</td>
<td></td>
</tr>
<tr>
<td><strong>fragments</strong>—Enter to check non-initial fragments.</td>
<td></td>
</tr>
<tr>
<td><strong>tos</strong>—Enter to match by type of service level, specified by a number from 0 to 15 or a name: <strong>normal</strong> (0), <strong>max-reliability</strong> (2), <strong>max-throughput</strong> (4), <strong>min-delay</strong> (8).</td>
<td></td>
</tr>
<tr>
<td><strong>log</strong>—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or <strong>log-input</strong> to include the input interface in the log entry.</td>
<td></td>
</tr>
<tr>
<td><strong>time-range</strong>—Specify the time-range name.</td>
<td></td>
</tr>
<tr>
<td><strong>dscp</strong>—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values.</td>
<td></td>
</tr>
</tbody>
</table>

**Note** If you enter a **dscp** value, you cannot enter **tos** or **precedence**. You can enter both a **tos** and a **precedence** value with no **dscp**.

**Step 3**

access-list access-list-number {deny | permit} tcp source source-wildcard [operator port] destination destination-wildcard [operator port] [established] [precedence precedence] [tos tos] [fragments] [log [precedence] [log-input] [time-range time-range-name] [dscp dscp] [flag]

**Example:**

Switch(config)# access-list 101 permit tcp any any eq 500

Defines an extended TCP access list and the access conditions.

The parameters are the same as those described for an extended IPv4 ACL, with these exceptions:

(Optional) Enter an **operator** and **port** to compare source (if positioned after **source source-wildcard**) or destination (if positioned after **destination destination-wildcard**) port. Possible operators include **eq** (equal), **gt** (greater than), **lt** (less than), **neq** (not equal), and **range** (inclusive range). Operators require a port number (range requires two port numbers separated by a space).

Enter the **port** number as a decimal number (from 0 to 65535) or the name of a TCP port.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Use only TCP port numbers or names when filtering TCP. The other optional keywords have these meanings:  
  - **established** — Enter to match an established connection. This has the same function as matching on the `ack` or `rst` flag.  
  - **flag** — Enter one of these flags to match by the specified TCP header bits: `ack` (acknowledge), `fin` (finish), `psh` (push), `rst` (reset), `syn` (synchronize), or `urg` (urgent). |

**Step 4**  
```  
access-list access-list-number {deny | permit}  
udp source source-wildcard [operator port]  
destination destination-wildcard [operator port]  
[precedence precedence] [tos tos] [fragments]  
[log [log-input] [time-range time-range-name]  
[dscp dscp]  
```

*Example:*  
```  
Switch(config)# access-list 101 permit  
udp any any eq 100  
```

**Step 5**  
```  
access-list access-list-number {deny | permit}  
icmp source source-wildcard destination  
destination-wildcard [operator port]  
[precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp]  
```

*Example:*  
```  
Switch(config)# access-list 101 permit  
icmp any any 200  
```

**Step 6**  
```  
access-list access-list-number {deny | permit}  
igmp source source-wildcard destination  
destination-wildcard [igmp-type] [precedence]  
```

*Optional* Defines an extended IGMP access list and the access conditions.

The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the addition of the IGMP message type and code parameters. These optional keywords have these meanings:  
  - **igmp-type** — Enter to filter by IGMP message type, a number from 0 to 255.  
  - **igmp-code** — Enter to filter IGMP packets that are filtered by the IGMP message code type, a number from 0 to 255.  
  - **igmp-message** — Enter to filter IGMP packets by the IGMP message type name or the IGMP message type and code name.
The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.

**igmp-type**—To match IGMP message type, enter a number from 0 to 15, or enter the message name: dvmrp, host-query, host-report, pim, or trace.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>precedence [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]]</td>
<td>The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter. <strong>igmp-type</strong>—To match IGMP message type, enter a number from 0 to 15, or enter the message name: dvmrp, host-query, host-report, pim, or trace.</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config)# access-list 101 permit igmp any any 14

**Step 7**

**end**

**Example:**

Switch(config)# end

**Creating Named Standard ACLs**

Follow these steps to create a standard ACL using names:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | |
| Switch# configure terminal | |

| **Step 3** ip access-list standard name | Defines a standard IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 1 to 99. |
| **Example:** | |
| Switch(config)# ip access-list standard 20 | |

| **Step 4** Use one of the following: | In access-list configuration mode, specify one or more conditions denied or permitted to decide if the packet is forwarded or dropped. |
| **• deny** source [source-wildcard] | host source [any] [log] |
| **• permit** source [source-wildcard] | host source [any] [log] |
| **• host source**—A source and source wildcard of source 0.0.0.0. | |
### Command or Action

**Example:**

```plaintext
Switch(config-standard-nacl)# deny 192.168.0.0 0.0.255.255 255.255.0.0 0.0.255.255

or

Switch(config-standard-nacl)# permit 10.108.0.0 0.0.0.0 255.255.255.0 0.0.0.0
```

- **any**—A source and source wildcard of 0.0.0.0 255.255.255.255.

### Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

### Creating Extended Named ACLs

Follow the procedure given below to create an extended ACL using names:

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

**Creating Extended Named ACLs**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> ip access-list extended name</td>
<td>Defines an extended IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 100 to 199.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# ip access-list extended 150</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 4** \{deny \| permit\} protocol \{source [source-wildcard] \| host source \| any\} \{destination [destination-wildcard] \| host destination \| any\} \{precedence precedence\} \{tos tos\} \{established\} \{log\} \{time-range time-range-name\} | In access-list configuration mode, specify the conditions allowed or denied. Use the log keyword to get access list logging messages, including violations.  
- *host source*—A source and source wildcard of `source 0.0.0.0`.  
- *host destination*—A destination and destination wildcard of `destination 0.0.0.0`.  
- *any*—A source and source wildcard or destination and destination wildcard of `0.0.0.0 255.255.255.255`. |
| **Example:** Switch(config-ext-nacl)# permit 0 any any |
| **Step 5** end | Returns to privileged EXEC mode. |
| **Example:** Switch(config-ext-nacl)# end |
| **Step 6** show running-config | Verifies your entries. |
| **Example:** Switch# show running-config |
| **Step 7** copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| **Example:** Switch# copy running-config startup-config |

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, `0.0.0.0` is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use `no permit` and `no deny` access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.
**What to do next**
After creating a named ACL, you can apply it to interfaces or to VLANs.

**Configuring an Access Control Entry with Noncontiguous Ports**

Perform this task to create access list entries that use noncontiguous TCP or UDP port numbers. Although this task uses TCP ports, you could use the UDP syntax of the `permit` and `deny` commands to filter noncontiguous UDP ports.

Although this task uses a `permit` command first, use the `permit` and `deny` commands in the order that achieves your filtering goals.

---

**Note**
The ACL—Named ACL Support for Noncontiguous Ports on an Access Control Entry feature can be used only with named, extended ACLs.

---

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the IP access list by name and enters named access list configuration mode.</td>
</tr>
<tr>
<td><code>ip access-list extended access-list-name</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip access-list extended acl-extd-1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies a <code>permit</code> statement in named IP access list configuration mode.</td>
</tr>
<tr>
<td>`[sequence-number] permit tcp source [source-wildcard] destination [destination-wildcard] [operator [port] [port]] [established] [match-any</td>
<td>match-all] [flags] [precedence] [tos] [log] [time-range] [fragments]`</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ext-nacl)# permit tcp any eq telnet ftp any eq 450 679</td>
<td>- If the operator is positioned after the source and source-wildcard arguments, it must match the source port. If the operator is positioned after the destination and destination-wildcard arguments, it must match the destination port.</td>
</tr>
<tr>
<td></td>
<td>- The <code>range</code> operator requires two port numbers. You can configure up to 10 ports after the <code>eq</code> and <code>neq</code> operators. All other operators require one port number.</td>
</tr>
</tbody>
</table>
### Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry

Perform this task to consolidate a group of access list entries with noncontiguous ports into one access list entry.

Although this task uses TCP ports, you could use the UDP syntax of the `permit` and `deny` commands to filter noncontiguous UDP ports.

Although this task uses a `permit` command first, use the `permit` and `deny` commands in the order that achieves your filtering goals.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td>To filter UDP ports, use the UDP syntax of this command.</td>
</tr>
<tr>
<td>[sequence-number] deny tcp source source-wildcard [operator port [port]] destination destination-wildcard [operator [port]] [established</td>
<td>(Optional) Specifies a <code>deny</code> statement in named access list configuration mode.</td>
</tr>
<tr>
<td></td>
<td>[match-any</td>
</tr>
<tr>
<td></td>
<td>{+</td>
</tr>
<tr>
<td></td>
<td>[tos tos] [log]</td>
</tr>
<tr>
<td></td>
<td>[fragments]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ext-nacl)# deny tcp any neq 45 565 632</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 6** | Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the `no sequence-number` command to delete an entry. |
| **Step 7** | (Optional) Exits named access list configuration mode and returns to privileged EXEC mode. |
| `end` | |
| **Example:** | |
| Device(config-ext-nacl)# end |

<p>| <strong>Step 8</strong> | (Optional) Displays the contents of the access list. |
| <code>show ip access-lists access-list-name</code> | |
| <strong>Example:</strong> | |
| Device# show ip access-lists kmd1 |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
Example: Device> enable  
• Enter your password if prompted. |
| Step 2 | show ip access-lists access-list-name | (Optional) Displays the contents of the IP access list.  
Example: Device# show ip access-lists mylist1  
• Review the output to see if you can consolidate any access list entries. |
| Step 3 | configure terminal | Enters global configuration mode.  
Example: Device# configure terminal |
| Step 4 | ip access-list extended access-list-name | Specifies the IP access list by name and enters named access list configuration mode.  
Example: Device(config)# ip access-list extended mylist1 |
| Step 5 | no [sequence-number] permit protocol source source-wildcard destination destination-wildcard option option-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments] | Removes the redundant access list entry that can be consolidated.  
Example: Device(config-ext-nacl)# no 10  
• Repeat this step to remove entries to be consolidated because only the port numbers differ.  
• After this step is repeated to remove the access list entries 20, 30, and 40, for example, those entries are removed because they will be consolidated into one permit statement.  
• If a sequence-number is specified, the rest of the command syntax is optional. |
| Step 6 | [sequence-number] permit protocol source source-wildcard[operator port][port] destination destination-wildcard[operator port][port] option option-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments] | Specifies a permit statement in named access list configuration mode.  
Example: Device(config-ext-nacl)# permit tcp any neq 45 565 632 any eq 23 45 34 43  
• In this instance, a group of access list entries with noncontiguous ports was consolidated into one permit statement.  
• You can configure up to 10 ports after the eq and neq operators. |
| Step 7 | Repeat Steps 5 and 6 as necessary, adding permit or deny statements to consolidate access | Allows you to revise the access list. |
### Sequencing Access-List Entries and Revising the Access List

This task shows how to assign sequence numbers to entries in a named IP access list and how to add or delete an entry to or from an access list. When completing this task, keep the following points in mind:

- Resequencing the access list entries is optional. The resequencing step in this task is shown as required because that is one purpose of this feature and this task demonstrates that functionality.
- In the following procedure, the `permit` command is shown in Step 5 and the `deny` command is shown in Step 6. However, that order can be reversed. Use the order that suits the need of your configuration.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>`ip access-list resequence access-list-name</td>
<td>Resequences the specified IP access list using the starting sequence number and the increment of sequence numbers.</td>
</tr>
<tr>
<td><code>starting-sequence-number increment</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip access-list resequence km1 100 15</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>`ip access-list {standard</td>
<td>extended} access-list-name`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>• If you specify <code>standard</code>, make sure you subsequently specify <code>permit</code> and/or <code>deny</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device(config)# ip access-list standard kmd1</td>
<td>Specifies a permit statement in named IP access list mode.</td>
</tr>
<tr>
<td>• sequence-number permit source source-wildcard</td>
<td>• This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need.</td>
</tr>
<tr>
<td>• sequence-number permit protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>• As the prompt indicates, this access list was a standard access list. If you had specified extended in Step 4, the prompt for this step would be Device(config-ext-nacl) and you would use the extended permit command syntax.</td>
</tr>
<tr>
<td>Example: Device(config-std-nacl)# 105 permit 10.5.5.5 0.0.0 255</td>
<td>(Optional) Specifies a deny statement in named IP access list mode.</td>
</tr>
<tr>
<td>• sequence-number deny source source-wildcard</td>
<td>• This access list uses a permit statement first, but a deny statement could appear first, depending on the order of statements you need.</td>
</tr>
<tr>
<td>• sequence-number deny protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>• As the prompt indicates, this access list was a standard access list. If you had specified extended in Step 4, the prompt for this step would be Device(config-ext-nacl) and you would use the extended deny command syntax.</td>
</tr>
<tr>
<td>Example: Device(config-std-nacl)# 105 deny 10.6.6.7 0.0.0 255</td>
<td>Specifies a permit statement in named IP access list mode.</td>
</tr>
<tr>
<td>• sequence-number permit source source-wildcard</td>
<td>• This access list happens to use a permit statement first, but a deny statement could appear first, depending on the order of statements you need.</td>
</tr>
<tr>
<td>• sequence-number permit protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>• See the permit (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP).</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
**Command or Action**

Device(config-ext-nacl)# 150 permit tcp any any log

**Purpose**

- Use the `no sequence-number` command to delete an entry.

**Step 8**

Do one of the following:

- `sequence-number deny source source-wildcard`
- `sequence-number deny protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]

**Example:**

Device(config-ext-nacl)# 150 deny tcp any any log

- (Optional) Specifies a deny statement in named IP access list mode.
  - This access list happens to use a `permit` statement first, but a `deny` statement could appear first, depending on the order of statements you need.
  - See the deny (IP) command for additional command syntax to permit upper layer protocols (ICMP, IGMP, TCP, and UDP).
  - Use the `no sequence-number` command to delete an entry.

**Step 9**

Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.

**Step 10**

`end`

**Example:**

Device(config-std-nacl)# end

**Step 11**

`show ip access-lists access-list-name`

**Example:**

Device# show ip access-lists kmd1

- (Optional) Displays the contents of the IP access list.

**Examples**

Review the output of the `show ip access-lists` command to see that the access list includes the new entries:

Device# show ip access-lists kmd1

```
Standard IP access list kmd1
100 permit 10.4.4.0, wildcard bits 0.0.0.255
105 permit 10.5.5.0, wildcard bits 0.0.0.255
115 permit 10.0.0.0, wildcard bits 0.0.0.255
130 permit 10.5.5.0, wildcard bits 0.0.0.255
145 permit 10.0.0.0, wildcard bits 0.0.0.255
```

**Configuring Commented IP ACL Entries**

Either use a named or numbered access list configuration. You must apply the access list to an interface or terminal line after the access list is created for the configuration to work.
Configuring Time Ranges for ACLs

Follow these steps to configure a time-range parameter for an ACL:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2  configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3  ip access-list {standard</td>
<td>Identifies the access list by a name or number and enters extended</td>
</tr>
<tr>
<td>extended} {name</td>
<td>named access list</td>
</tr>
<tr>
<td>number}</td>
<td>configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip access-</td>
<td></td>
</tr>
<tr>
<td>list extended</td>
<td></td>
</tr>
<tr>
<td>telnetting</td>
<td></td>
</tr>
<tr>
<td>Step 4  remark remark</td>
<td>Adds a remark for an entry in a named IP access list.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-ext-nacl)#</td>
<td></td>
</tr>
<tr>
<td>remark</td>
<td></td>
</tr>
<tr>
<td>Do not allow host1 subnet</td>
<td></td>
</tr>
<tr>
<td>to telnet out</td>
<td></td>
</tr>
<tr>
<td>Step 5  deny protocol host host-</td>
<td>Sets conditions in a named IP access list that denies packets.</td>
</tr>
<tr>
<td>address any eq port</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-ext-nacl)#</td>
<td></td>
</tr>
<tr>
<td>deny tcp host 172.16.2.88</td>
<td></td>
</tr>
<tr>
<td>any eq telnet</td>
<td></td>
</tr>
<tr>
<td>Step 6  end</td>
<td>Exits extended named access list configuration mode and enters</td>
</tr>
<tr>
<td>Example:</td>
<td>privileged EXEC mode.</td>
</tr>
<tr>
<td>Device(config-ext-nacl)#</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
</tbody>
</table>

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Switch 3**

```
Step 3  time-range time-range-name
Example:
Switch(config)# time-range workhours
```

Assigns a meaningful name (for example, `workhours`) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.

**Step 4**

Use one of the following:

- **absolute** `start time date` [`end time date`]
- **periodic** `day-of-the-week hh:mm to [day-of-the-week] hh:mm`
- **periodic** `{weekdays | weekend | daily} hh:mm to hh:mm`

**Example:**

```bash
Switch(config-time-range)# absolute start 00:00 1 Jan 2006 end 23:59 1 Jan 2006
```

or

```bash
Switch(config-time-range)# periodic weekdays 8:00 to 12:00
```

Specifies when the function it will be applied to is operational.

- You can use only one `absolute` statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.
- You can enter multiple `periodic` statements. For example, you could configure different hours for weekdays and weekends.

See the example configurations.

**Step 5**

```
Step 5  end
Example:
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 6**

```
Step 6  show running-config
Example:
Switch# show running-config
```

Verifies your entries.

**Step 7**

```
Step 7  copy running-config startup-config
Example:
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### What to do next

Repeat the steps if you have multiple items that you want in effect at different times.
Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Identifies a specific line to configure, and enter in-line configuration mode.</td>
</tr>
<tr>
<td>**line [console</td>
<td>vty] line-number**</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# line console 0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Restricts incoming and outgoing connections between a particular virtual terminal line (into a device) and the addresses in an access list.</td>
</tr>
<tr>
<td>**access-class access-list-number {in</td>
<td>out}**</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-line)# access-class 10 in</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-line)# end</td>
<td></td>
</tr>
</tbody>
</table>
Applying an IPv4 ACL to an Interface

This section describes how to apply IPv4 ACLs to network interfaces. Beginning in privileged EXEC mode, follow these steps to control access to an interface:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>interface interface-id</td>
<td>Identifies a specific interface for configuration, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>The interface can be a Layer 2 interface (port ACL), or a Layer 3 interface (router ACL).</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet1/0/1</td>
<td></td>
</tr>
</tbody>

Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the `ip access-group` interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

### Table 114: Commands for Displaying Access Lists and Access Groups

Configuration Examples for ACLs

ACLs in a Small Networked Office

Figure 77: Using Router ACLs to Control Traffic

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing confidential payroll data. All users can access Server A, but Server B has restricted access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

Example: Numbered ACLs

In this example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 10.0.0.0 subnets. The ACL is applied to packets entering a port.

```plaintext
Switch(config)# access-list 2 permit 10.48.0.3  
Switch(config)# access-list 2 deny 10.48.0.0 0.0.255.255  
Switch(config)# access-list 2 permit 10.0.0.0 0.255.255.255  
Switch(config)# interface gigabitethernet2/0/1
```
Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# access-list 102 permit icmp any any
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip access-group 102 in

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 102 in

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The established keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.

Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 102 in

Examples: Named ACLs

Creating named standard and extended ACLs

This example creates a standard ACL named internet_filter and an extended ACL named marketing_group. The internet_filter ACL allows all traffic from the source address 1.2.3.4.

Switch(config)# ip access-list standard internet_filter
Example: Configuring an Access Control Entry with Noncontiguous Ports

The marketing_group ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

The Internet_filter ACL is applied to outgoing traffic and the marketing_group ACL is applied to incoming traffic on a Layer 3 port.

Deleting individual ACEs from named ACLs

This example shows how you can delete individual ACEs from the named access list border-list:

**Example: Configuring an Access Control Entry with Noncontiguous Ports**

The following access list entry can be created because up to ten ports can be entered after the eq and neq operators:

```
ip access-list extended aaa
  permit tcp any eq telnet ftp any eq 23 45 34
end
```

Enter the `show access-lists` command to display the newly created access list entry.

```
Device# show access-lists aaa

Extended IP access list aaa
  10 permit tcp any eq telnet ftp any eq 23 45 34
```

**Example: Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry**

The `show access-lists` command is used to display a group of access list entries for the access list named abc:

```
Device# show access-lists abc
```
Extended IP access list abc
10 permit tcp any eq telnet any eq 450
20 permit tcp any eq telnet any eq 679
30 permit tcp any eq ftp any eq 450
40 permit tcp any eq ftp any eq 679

Because the entries are all for the same permit statement and simply show different ports, they can be consolidated into one new access list entry. The following example shows the removal of the redundant access list entries and the creation of a new access list entry that consolidates the previously displayed group of access list entries:

ip access-list extended abc
no 10
no 20
no 30
no 40
permit tcp any eq telnet ftp any eq 450 679
end

When the show access-lists command is reentered, the consolidated access list entry is displayed:

Device# show access-lists abc
Extended IP access list abc
10 permit tcp any eq telnet ftp any eq 450 679

Example Resequencing Entries in an Access List

The following example shows an access list before and after resequencing. The starting value is 1, and increment value is 2. The subsequent entries are ordered based on the increment values that users provide, and the range is from 1 to 2147483647.

When an entry with no sequence number is entered, by default it has a sequence number of 10 more than the last entry in the access list.

Router# show access-list carls
Extended IP access list carls
10 permit ip host 10.3.3.3 host 172.16.5.34
20 permit icmp any any
30 permit tcp any host 10.3.3.3
40 permit ip host 10.4.4.4 any
50 Dynamic test permit ip any any
60 permit ip host 172.16.2.2 host 10.3.3.12
70 permit ip host 10.3.3.3 any log
80 permit tcp host 10.3.3.3 host 10.1.2.2
90 permit ip host 10.3.3.3 any
100 permit ip any any

Router(config)# ip access-list extended carls
Router(config)# ip access-list resequence carls 1 2
Router(config)# end
Router# show access-list carls
Extended IP access list carls
1 permit ip host 10.3.3.3 host 172.16.5.34
3 permit icmp any any
5 permit tcp any host 10.3.3.3
7 permit ip host 10.4.4.4 any
9 Dynamic test permit ip any any
11 permit ip host 172.16.2.2 host 10.3.3.12
13 permit ip host 10.3.3.3 any log
15 permit tcp host 10.3.3.3 host 10.1.2.2
Example Adding an Entry with a Sequence Number

In the following example, an new entry (sequence number 15) is added to an access list:

```
Router# show ip access-list
Standard IP access list tryon
  2 permit 10.4.4.2, wildcard bits 0.0.255.255
  5 permit 10.0.0.44, wildcard bits 0.0.0.255
  10 permit 10.0.0.1, wildcard bits 0.0.0.255
  20 permit 10.0.0.2, wildcard bits 0.0.0.255
Router(config)# ip access-list standard tryon
Router(config-std-nacl)# 15 permit 10.5.5.0 0.0.0.255
Router# show ip access-list
Standard IP access list tryon
  2 permit 10.4.0.0, wildcard bits 0.0.255.255
  5 permit 10.0.0.0, wildcard bits 0.0.0.255
  10 permit 10.0.0.0, wildcard bits 0.0.0.255
  15 permit 10.5.5.0, wildcard bits 0.0.0.255
  20 permit 10.0.0.0, wildcard bits 0.0.0.255
```

Example Adding an Entry with No Sequence Number

The following example shows how an entry with no specified sequence number is added to the end of an access list. When an entry is added without a sequence number, it is automatically given a sequence number that puts it at the end of the access list. Because the default increment is 10, the entry will have a sequence number 10 higher than the last entry in the existing access list.

```
Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.1.1.1 0.0.0.255
Router(config-std-nacl)# permit 10.2.2.2 0.0.0.255
Router(config-std-nacl)# permit 10.3.3.3 0.0.0.255
Router# show access-list
Standard IP access list resources
  10 permit 10.1.1.1, wildcard bits 0.0.0.255
  20 permit 10.2.2.2, wildcard bits 0.0.0.255
  30 permit 10.3.3.3, wildcard bits 0.0.0.255
Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.4.4.4 0.0.0.255
Router(config-std-nacl)# end
Router# show access-list
Standard IP access list resources
  10 permit 10.1.1.1, wildcard bits 0.0.0.255
  20 permit 10.2.2.2, wildcard bits 0.0.0.255
  30 permit 10.3.3.3, wildcard bits 0.0.0.255
  40 permit 10.4.4.4, wildcard bits 0.0.0.255
```

Examples: Configuring Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```
Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
```
Switch(config)# access-list 1 remark Do not allow Smith workstation through
Switch(config)# access-list 1 deny 171.69.3.13

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

Switch(config)# access-list 100 remark Do not allow Winter to browse the web
Switch(config)# access-list 100 deny host 171.69.3.85 any eq www
Switch(config)# access-list 100 remark Do not allow Smith to browse the web
Switch(config)# access-list 100 deny host 171.69.3.13 any eq www

In this example of a named ACL, the Jones subnet is not allowed access:

Switch(config)# ip access-list standard prevention
Switch(config-std-nacl)# remark Do not allow Jones subnet through
Switch(config-std-nacl)# deny 171.69.0.0 0.0.255.255

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet

Examples: Using Time Ranges with ACLs

This example shows how to verify after you configure time ranges for *workhours* and to configure January 1, 2006, as a company holiday.

Switch# show time-range
time-range entry: new_year_day_2003 (inactive)
    absolute start 00:00 01 January 2006 end 23:59 01 January 2006
    time-range entry: workhours (inactive)
        periodic weekdays 8:00 to 12:00
        periodic weekdays 13:00 to 17:00

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

Switch(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Switch(config)# access-list 188 permit tcp any any time-range workhours
Switch(config)# end
Switch# show access-lists
Extended IP access list 188
  10 deny tcp any any time-range new_year_day_2006 (inactive)
  20 permit tcp any any time-range workhours (inactive)

This example uses named ACLs to permit and deny the same traffic.

Switch(config)# ip access-list extended deny_access
Switch(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Switch(config-ext-nacl)# exit
Switch(config)# ip access-list extended may_access
Examples: Time Range Applied to an IP ACL

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m. (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

Switch(config)# time-range no-http
Switch(config)# periodic weekdays 8:00 to 18:00

Switch(config)# time-range udp-yes
Switch(config)# periodic weekend 12:00 to 20:00

Switch(config)# ip access-list extended strict
Switch(config-ext-nacl)# deny tcp any eq www time-range no-http
Switch(config-ext-nacl)# permit udp any any time-range udp-yes

Switch(config-ext-nacl)# exit
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip access-group strict in

Examples: ACL Logging

Two variations of logging are supported on ACLs. The log keyword sends an informational logging message to the console about the packet that matches the entry; the log-input keyword includes the input interface in the log entry.

In this example, standard named access list stanl denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the log keyword.

Switch(config)# ip access-list standard stanl
Switch(config-standard-nacl)# deny 10.1.1.0 0.0.0.255 log
Switch(config-standard-nacl)# permit any log
Switch(config-standard-nacl)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group stanl in
Switch(config-if)# end
Switch# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Console logging: level debugging, 37 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 37 messages logged
  File logging: disabled
  Trap logging: level debugging, 39 message lines logged

Log Buffer (4096 bytes):

00:00:48: NTP: authentication delay calculation problems
This example is a named extended access list `ext1` that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.

```
Switch(config)# ip access-list extended ext1
Switch(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Switch(config-ext-nacl)# deny udp any any log
Switch(config-std-nacl)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip access-group ext1 in
```

This is an example of a log for an extended ACL:

```
01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1 packet
01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7 packets
01:26:12:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 1 packet
01:31:33:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 8 packets
```

Note that all logging entries for IP ACLs start with `%SEC-6-IPACCESSLOG` with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the `log-input` keyword is entered:

```
00:04:21:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 (Vlan1 0001.42ef.a400) -> 10.1.1.61 (0/0), 1 packet
```

A log message for the same sort of packet using the `log` keyword does not include the input interface information:

```
00:05:47:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 -> 10.1.1.61 (0/0), 1 packet
```

**Examples: Troubleshooting ACLs**

If this ACL manager message appears and `[chars]` is the access-list name,

```
ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The switch has insufficient resources to create a hardware representation of the ACL. The resources include hardware memory and label space but not CPU memory. A lack of available logical operation units or specialized hardware resources causes this problem. Logical operation units are needed for a TCP flag match or a test other than `eq` (ne, gt, lt, or range) on TCP, UDP, or SCTP port numbers.
Use one of these workarounds:

- Modify the ACL configuration to use fewer resources.
- Rename the ACL with a name or number that alphanumerically precedes the ACL names or numbers.

To determine the specialized hardware resources, enter the `show platform layer4 acl` map privileged EXEC command. If the switch does not have available resources, the output shows that index 0 to index 15 are not available.

For more information about configuring ACLs with insufficient resources, see CSCsq63926 in the Bug Toolkit.

For example, if you apply this ACL to an interface:

```plaintext
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
permit tcp source source-wildcard destination destination-wildcard
```

And if this message appears:

```
ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The flag-related operators are not available. To avoid this issue,

- Move the fourth ACE before the first ACE by using `ip access-list resequence` global configuration command:

```plaintext
permit tcp source source-wildcard destination destination-wildcard
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```

or

- Rename the ACL with a name or number that alphanumerically precedes the other ACLs (for example, rename ACL 79 to ACL 1).

You can now apply the first ACE in the ACL to the interface. The switch allocates the ACE to available mapping bits in the Opselect index and then allocates flag-related operators to use the same bits in the hardware memory.

IPv6 Access Control Lists

Access lists determine what traffic is blocked and what traffic is forwarded at device interfaces and allow filtering of traffic based on source and destination addresses, and inbound and outbound traffic to a specific interface. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control.

This module describes how to configure IPv6 traffic filtering and to control access to virtual terminal lines.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IPv6 ACLs

The following are the prerequisites for IPv6 ACLs:

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the `sdm prefer {default | dual-ipv4-and-ip6}` global configuration command.
Restrictions for IPv6 ACLs

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

• The switch does not support matching on these keywords: routing header, and undetermined-transport.
• The switch does not support reflexive ACLs (the reflect keyword).
• This release supports port ACLs, router ACLs and VLAN ACLs (VLAN maps) for IPv6.
• Output router ACLs and input port ACLs for IPv6 are supported only on switch stacks. Switches support only control plane (incoming) IPv6 ACLs.
• The switch does not apply MAC-based ACLs on IPv6 frames.
• When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
• If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:

• Fragmented frames (the fragments keyword as in IPv4) are supported
• The same statistics supported in IPv4 are supported for IPv6 ACLs.
• If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
• Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.
• Logging is supported for router ACLs, but not for port ACLs.
• The switch supports IPv6 address-matching for a full range of prefix-lengths.

Information About Configuring IPv6 ACLs

You can filter IP version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic.

Note
To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the sdm prefer [default | dual-ipv4-and-ipv6] global configuration command.
**ACL Overview**

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

**IPv6 ACLs Overview**

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similar to how you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running IP base and LAN base feature sets.

A switch supports three types of IPv6 ACLs:

- **IPv6 router ACLs** are supported on inbound or outbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.

- **IPv6 port ACLs** are supported on outbound and inbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

- **VLAN ACLs** or VLAN maps access-control all packets in a VLAN. You can use VLAN maps to filter traffic between devices in the same VLAN. ACL VLAN maps are applied on L2 VLANs. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv6. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets entering the VLAN are checked against the VLAN map.

The switch supports VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

**Understanding IPv6 ACLs**

A switch image supports two types of IPv6 ACLs:

- **IPv6 router ACLs** - Supported on inbound or outbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. Applied to only IPv6 packets that are routed.
• IPv6 port ACLs - Supported on inbound traffic on Layer 2 interfaces only. Applied to all IPv6 packets entering the interface.

**Note**

If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take affect.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface.

As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

• When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

• When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

**Note**

If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

**Interactions with Other Features and Switches**

• If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

• If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.

• You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

  You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

• You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.

• If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.

**Default Configuration for IPv6 ACLs**

The default IPv6 ACL configuration is as follows:

```
Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
```
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any nd-na sequence 40
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100

**Supported ACL Features**

IPv6 ACLs on the switch have these characteristics:

- Fragmented frames (the fragments keyword as in IPv4) are supported.
- The same statistics supported in IPv4 are supported for IPv6 ACLs.
- If the switch runs out of TCAM space, packets associated with the ACL label are forwarded to the CPU, and the ACLs are applied in software.
- Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.
- Logging is supported for router ACLs, but not for port ACLs.

**IPv6 Port-Based Access Control List Support**

The IPv6 PACL feature provides the ability to provide access control (permit or deny) on Layer 2 switch ports for IPv6 traffic. IPv6 PACLs are similar to IPv4 PACLs, which provide access control on Layer 2 switch ports for IPv4 traffic. They are supported only in the ingress direction and in hardware.

A PACL can filter ingress traffic on Layer 2 interfaces based on Layer 3 and Layer 4 header information or non-IP Layer 2 information.

**ACLs and Traffic Forwarding**

The IPv6 ACL Extensions for Hop by Hop Filtering feature allows you to control IPv6 traffic that might contain hop-by-hop extension headers. You can configure an access control list (ACL) to deny all hop-by-hop traffic or to selectively permit traffic based on protocol.

IPv6 access control lists (ACLs) determine what traffic is blocked and what traffic is forwarded at device interfaces. ACLs allow filtering based on source and destination addresses, inbound and outbound to a specific interface. Use the `ipv6 access-list` command to define an IPv6 ACL, and the `deny` and `permit` commands to configure its conditions.

The IPv6 ACL Extensions for Hop by Hop Filtering feature implements RFC 2460 to support traffic filtering in any upper-layer protocol type.
## How to Configure IPv6 ACLs

### Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

<table>
<thead>
<tr>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
</tr>
<tr>
<td>Example:</td>
</tr>
<tr>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>Example:</td>
</tr>
<tr>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
</tr>
<tr>
<td>Example:</td>
</tr>
<tr>
<td>Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
</tr>
</tbody>
</table>

Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions:

- For protocol, enter the name or number of an Internet protocol: `ahp`, `esp`, `icmp`, `ipv6`, `ospf`, `tcp`, `udp`, or an integer in the range 0 to 255 representing an IPv6 protocol number.

- The `source-ipv6-prefix/prefix-length` or `destination-ipv6-prefix/prefix-length` is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

- Enter any as an abbreviation for the IPv6 prefix `::/0`.

- For `host source-ipv6-address` or `destination-ipv6-address`, enter the source IPv6 address.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range.</td>
<td></td>
</tr>
<tr>
<td>If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/prefix-length argument, it must match the destination port.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) The <strong>port-number</strong> is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter <strong>dscp</strong> value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter <strong>fragments</strong> to check noninitial fragments. This keyword is visible only if the protocol is ipv6.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter <strong>log</strong> to cause a logging message to be sent to the console about the packet that matches the entry. Enter <strong>log-input</strong> to include the input interface in the log entry. Logging is supported only for router ACLs.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter <strong>routing</strong> to specify that IPv6 packets be routed.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter <strong>sequence</strong> value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4,294,967,295.</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong> **{deny</td>
<td>permit} tcp** {source-ipv6-prefix/prefix-length</td>
</tr>
<tr>
<td><strong>Step 6</strong> **{deny</td>
<td>permit} udp** {source-ipv6-prefix/prefix-length</td>
</tr>
</tbody>
</table>
| **Step 7** **{deny | permit} icmp** {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type [icmp-code] | (Optional) Define an ICMP access list and the access conditions. Enter **icmp** for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 1, with the addition of the ICMP message type
Purpose

Command or Action | Purpose
--- | ---
icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name] | and code parameters. These optional keywords have these meanings:
- **icmp-type**—Enter to filter by ICMP message type, a number from 0 to 255.
- **icmp-code**—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.
- **icmp-message**—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.

Step 8 | end | Return to privileged EXEC mode.
Step 9 | show ipv6 access-list | Verify the access list configuration.
Step 10 | show running-config | Verifies your entries.

**Example:**

Switch# show running-config

Step 11 | copy running-config startup-config | (Optional) Saves your entries in the configuration file.

**Example:**

Switch# copy running-config startup-config

### What to do next

Attach the IPv6 ACL to an Interface

#### Attaching an IPv6 ACL to an Interface

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.

Follow these steps to control access to an interface:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
</tr>
</tbody>
</table>
### Attaching an IPv6 ACL to an Interface

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Example:**
Switch> enable     | • Enter your password if prompted. |
| **Step 2**
**configure terminal**
**Example:**
Switch# configure terminal | Enters global configuration mode. |
| **Step 3**
interface interface-id | Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode. |
| **Step 4**
no switchport | If applying a router ACL, this changes the interface from Layer 2 mode (the default) to Layer 3 mode. |
| **Step 5**
ipv6 address ipv6-address | Configure an IPv6 address on a Layer 3 interface (for router ACLs). |
| **Step 6**
ipv6 traffic-filter access-list-name {in | out} | Apply the access list to incoming or outgoing traffic on the interface. 
**Note** The out keyword is not supported for Layer 2 interfaces (port ACLs). |
| **Step 7**
end
**Example:**
Switch(config)# end | Returns to privileged EXEC mode. |
| **Step 8**
show running-config
**Example:**
Switch# show running-config | Verifies your entries. |
| **Step 9**
copy running-config startup-config
**Example:**
Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
Monitoring IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show access-lists</td>
<td>Displays all access lists configured on the switch.</td>
</tr>
<tr>
<td>show ipv6 access-list [access-list-name]</td>
<td>Displays all configured IPv6 access lists or the access list specified by name.</td>
</tr>
<tr>
<td>show vlan access-map [map-name]</td>
<td>Displays VLAN access map configuration.</td>
</tr>
<tr>
<td>show vlan filter [access-map access-map vlan vlan-id]</td>
<td>Displays the mapping between VACLs and VLANs.</td>
</tr>
</tbody>
</table>

This is an example of the output from the show access-lists privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

Switch # show access-lists
Extended IP access list hello
  10 permit ip any any
IPv6 access list ipv6
  permit ipv6 any any sequence 10

This is an example of the output from the show ipv6 access-list privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

Switch# show ipv6 access-list
IPv6 access list inbound
  permit tcp any any eq bgp (8 matches) sequence 10
  permit tcp any any eq telnet (15 matches) sequence 20
  permit udp any any sequence 30
IPv6 access list outbound
  deny udp any any sequence 10
  deny tcp any any eq telnet sequence 20

This is an example of the output from the show vlan access-map privileged EXEC command. The output shows VLAN access map information.

Switch# show vlan access-map
Vlan access-map "m1" 10
  Match clauses:
    ipv6 address: ip2
  Action: drop

Configuring PACL Mode and Applying IPv6 PACL on an Interface

Before you begin

Before you configure the IPv6 PACL feature, you must configure an IPv6 access list. Once you have configured the IPv6 access list, you must configure the port-based access control list (PACL) mode on the specified IPv6 Layer 2 interface.
## Configuring IPv6 ACL Extensions for Hop by Hop Filtering

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv6 access-list <strong>access-list-name</strong></td>
<td>Defines an IPv6 ACL and enters IPv6 access list configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# ipv6 access-list list1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits IPv6 access list configuration mode and enters global configuration mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> permit protocol {source-ipv6-prefix/prefix-length</td>
<td>any</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ipv6-acl)# permit icmp any any dest-option-type</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> deny protocol {source-ipv6-prefix/prefix-length</td>
<td>any</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ipv6-acl)# deny icmp any any dest-option-type</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device (config-ipv6-acl)# end</td>
<td></td>
</tr>
</tbody>
</table>
Configuration Examples for IPv6 ACLs

Example: Configuring IPv6 ACLs

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch(config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any

Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out

Example: Configuring PACL Mode and Applying IPv6 PACL on an Interface

Device# configure terminal
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)# exit
Device(config-if)# ipv6 traffic-filter list1 in

Example: IPv6 ACL Extensions for Hop by Hop Filtering

Device(config)# ipv6 access-list hhb_acl
Device(config-ipv6-acl)# permit tcp any any hhb
Device(config-ipv6-acl)# permit tcp any any
Device(config-ipv6-acl)# permit udp any any
Device(config-ipv6-acl)# permit udp any any hhb
Device(config-ipv6-acl)# permit hhb any any
Device(config-ipv6-acl)# permit any any
Device(config-ipv6-acl)# hardware statistics
Device(config-ipv6-acl)# exit

! Assign an IP address and add the ACL on the interface.

Device(config)# interface FastEthernet3/1
Device(config-if)# ipv6 address 1001::1/64
Device(config-if)# ipv6 traffic-filter hbh_acl in
Device(config-if)# exit
Device(config)# exit
Device# clear counters
Clear "show interface" counters on all interfaces [confirm]
Device#

! Verify the configurations.
Device# show running-config interface FastEthernet3/1
Building configuration...

Current configuration : 114 bytes

interface FastEthernet3/1
no switchport
ipv6 address 1001::1/64
ipv6 traffic-filter hbh_acl
end

CHAPTER 54

ACL Support for Filtering IP Options

The ACL Support for Filtering IP Options feature describes how to use an IP access list to filter IP packets that contain IP options to prevent devices from becoming saturated with spurious packets.

This module also describes the ACL TCP Flags Filtering feature and how to use an IP access list to filter IP packets that contain TCP flags. The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for ACL Support for Filtering IP Options

Before you configure the ACL Support for Filtering IP Options feature, you must understand the concepts of the IP access lists.
Information About ACL Support for Filtering IP Options

IP Options

IP uses four key mechanisms in providing its service: Type of Service, Time to Live, Options, and Header Checksum.

The Options, commonly referred to as IP Options, provide for control functions that are required in some situations but unnecessary for the most common communications. IP Options include provisions for time stamps, security, and special routing.

IP Options may or may not appear in datagrams. They must be implemented by all IP modules (host and gateways). What is optional is their transmission in any particular datagram, not their implementation. In some environments the security option may be required in all datagrams.

The option field is variable in length. There may be zero or more options. IP Options can have one of two formats:

• Format 1: A single octet of option-type.

• Format 2: An option-type octet, an option-length octet, and the actual option-data octets.

The option-length octet counts the option-type octet, the option-length octet, and the option-data octets.

The option-type octet is viewed as having three fields: a 1-bit copied flag, a 2-bit option class, and a 5-bit option number. These fields form an 8-bit value for the option type field. IP Options are commonly referred to by their 8-bit value.

For a complete list and description of IP Options, refer to RFC 791, Internet Protocol at the following URL: http://www.faqs.org/rfcs/rfc791.html

Benefits of Filtering IP Options

• Filtering of packets that contain IP Options from the network relieves downstream devices and hosts of the load from options packets.

• This feature also minimizes load to the Route Processor (RP) for packets with IP Options that require RP processing on distributed systems. Previously, the packets were always routed to or processed by the RP CPU. Filtering the packets prevents them from impacting the RP.

Benefits of Filtering on TCP Flags

The ACL TCP Flags Filtering feature provides a flexible mechanism for filtering on TCP flags. Previously, an incoming packet was matched as long as any TCP flag in the packet matched a flag specified in the access control entry (ACE). This behavior allows for a security loophole, because packets with all flags set could get past the access control list (ACL). The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

Because TCP packets can be sent as false synchronization packets that can be accepted by a listening port, it is recommended that administrators of firewall devices set up some filtering rules to drop false TCP packets.
The ACEs that make up an access list can be configured to detect and drop unauthorized TCP packets by allowing only the packets that have a very specific group of TCP flags set or not set. The ACL TCP Flags Filtering feature provides a greater degree of packet-filtering control in the following ways:

- You can select any desired combination of TCP flags on which to filter TCP packets.
- You can configure ACEs to allow matching on a flag that is set, as well as on a flag that is not set.

**TCP Flags**

The table below lists the TCP flags, which are further described in RFC 793, *Transmission Control Protocol*.

<table>
<thead>
<tr>
<th>TCP Flag</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK</td>
<td>Acknowledge flag—Indicates that the acknowledgment field of a segment specifies the next sequence number the sender of this segment is expecting to receive.</td>
</tr>
<tr>
<td>FIN</td>
<td>Finish flag—Used to clear connections.</td>
</tr>
<tr>
<td>PSH</td>
<td>Push flag—Indicates the data in the call should be immediately pushed through to the receiving user.</td>
</tr>
<tr>
<td>RST</td>
<td>Reset flag—Indicates that the receiver should delete the connection without further interaction.</td>
</tr>
<tr>
<td>SYN</td>
<td>Synchronize flag—Used to establish connections.</td>
</tr>
<tr>
<td>URG</td>
<td>Urgent flag—Indicates that the urgent field is meaningful and must be added to the segment sequence number.</td>
</tr>
</tbody>
</table>

**How to Configure ACL Support for Filtering IP Options**

**Filtering Packets That Contain IP Options**

Complete these steps to configure an access list to filter packets that contain IP options and to verify that the access list has been configured correctly.

- The ACL Support for Filtering IP Options feature can be used only with named, extended ACLs.
- Resource Reservation Protocol (RSVP) Multiprotocol Label Switching Traffic Engineering (MPLS TE), Internet Group Management Protocol Version 2 (IGMPV2), and other protocols that use IP options packets may not function in drop or ignore mode if this feature is configured.
- On most Cisco devices, a packet with IP options is not switched in hardware, but requires control plane software processing (primarily because there is a need to process the options and rewrite the IP header), so all IP packets with IP options will be filtered and switched in software.
### Filtering Packets That Contain IP Options

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip access-list extended access-list-name</td>
<td>Specifies the IP access list by name and enters named access list configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# ip access-list extended mylist1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>[sequence-number] deny protocol source source-wildcard destination destination-wildcard [option option-value] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>(Optional) Specifies a deny statement in named IP access list mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ext-nacl)# deny ip any any option traceroute</td>
<td>• This access list happens to use a deny statement first, but a permit statement could appear first, depending on the order of statements you need.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Use the option keyword and option-value argument to filter packets that contain a particular IP Option.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In this example, any packet that contains the traceroute IP option will be filtered out.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Use the no sequence-number form of this command to delete an entry.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>[sequence-number] permit protocol source source-wildcard destination destination-wildcard [option option-value] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>Specifies a permit statement in named IP access list mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ext-nacl)# permit ip any any option security</td>
<td>• In this example, any packet (not already filtered) that contains the security IP option will be permitted.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Use the no sequence-number form of this command to delete an entry.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Repeat Step 4 or Step 5 as necessary.</td>
<td>Allows you to revise the access list.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
<td>(Optional) Exits named access list configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-ext-nacl)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Filtering Packets That Contain TCP Flags

This task configures an access list to filter packets that contain TCP flags and verifies that the access list has been configured correctly.

#### Note
- TCP flag filtering can be used only with named, extended ACLs.
- The ACL TCP Flags Filtering feature is supported only for Cisco ACLs.
- Previously, the following command-line interface (CLI) format could be used to configure a TCP flag-checking mechanism:

\[\text{permit tcp any any rst} \]

The following format that represents the same access control entry (ACE) can now be used: \[\text{permit tcp any any match-any +rst} \]

Both the CLI formats are accepted; however, if the new keywords \text{match-all} or \text{match-any} are chosen, they must be followed by the new flags that are prefixed with “+” or “-”. It is advisable to use only the old format or the new format in a single ACL. You cannot mix and match the old and new CLI formats.

#### Caution
If a device having ACEs with the new syntax format is reloaded with a previous version of the Cisco software that does not support the ACL TCP Flags Filtering feature, the ACEs will not be applied, leading to possible security loopholes.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip access-list extended access-list-name</td>
<td>Specifies the IP access list by name and enters named access list configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# ip access-list extended kmd1</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies a <strong>permit</strong> statement in named IP access list mode.</td>
</tr>
</tbody>
</table>
| [sequence-number] permit tcp source source-wildcard [operator [port]] destination destination-wildcard [operator [port]] [established] [match-any | match-all] {+ | -} flag-name] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments] | - This access list happens to use a **permit** statement first, but a **deny** statement could appear first, depending on the order of statements you need.  
- Use the TCP command syntax of the **permit** command.  
- Any packet with the RST TCP header flag set will be matched and allowed to pass the named access list `kmd1` in Step 3. |
| **Example:** Device(config-ext-nacl)# permit tcp any any match-any +rst | |
| **Step 5** | (Optional) Specifies a **deny** statement in named IP access list mode. |
| [sequence-number] deny tcp source source-wildcard [operator [port]] destination destination-wildcard [operator [port]] [established] [match-any | match-all] {+ | -} flag-name] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments] | - This access list happens to use a **permit** statement first, but a **deny** statement could appear first, depending on the order of statements you need.  
- Use the TCP command syntax of the **deny** command.  
- Any packet that does not have the ACK flag set, and also does not have the FIN flag set, will not be allowed to pass the named access list `kmd1` in Step 3.  
- See the **deny** (IP) command for additional command syntax to permit upper-layer protocols (ICMP, IGMP, TCP, and UDP). |
| **Example:** Device(config-ext-nacl)# deny tcp any any match-all -ack -fin | |
| **Step 6** | Allows you to revise the access list. |
| Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the **no sequence-number** command to delete an entry. | |
| **Step 7** | (Optional) Exits the configuration mode and returns to privileged EXEC mode. |
| end | **Example:** Device(config-ext-nacl)# end | |
| **Step 8** | (Optional) Displays the contents of the IP access list. |
| show ip access-lists access-list-name | **Example:** Device# show ip access-lists kmd1 |  
- Review the output to confirm that the access list includes the new entry. |
Configuration Examples for ACL Support for Filtering IP Options

Example: Filtering Packets That Contain IP Options

The following example shows an extended access list named mylist2 that contains access list entries (ACEs) that are configured to permit TCP packets only if they contain the IP Options that are specified in the ACEs:

```
ip access-list extended mylist2
10 permit ip any any option eool
20 permit ip any any option record-route
30 permit ip any any option zsu
40 permit ip any any option mtup
```

The `show access-list` command has been entered to show how many packets were matched and therefore permitted:

```
Device# show ip access-list mylist2
Extended IP access list test
10 permit ip any any option eool (1 match)
20 permit ip any any option record-route (1 match)
30 permit ip any any option zsu (1 match)
40 permit ip any any option mtup (1 match)
```

Example: Filtering Packets That Contain TCP Flags

The following access list allows TCP packets only if the TCP flags ACK and SYN are set and the FIN flag is not set:

```
ip access-list extended aaa
permit tcp any any match-all +ack +syn -fin
end
```

The `show access-list` command has been entered to display the ACL:

```
Device# show access-list aaa
Extended IP access list aaa
10 permit tcp any any match-all +ack +syn -fin
```

CHAPTER 55

VLAN Access Control Lists

VLAN access control lists (ACLs) or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet access control entries (ACEs). After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

This module provides more information about VLAN ACLs and how to configure them.

- Finding Feature Information, on page 1057
- Information About VLAN Access Control Lists, on page 1057
- How to Configure VLAN Access Control Lists, on page 1060

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About VLAN Access Control Lists

VLAN Maps

VLAN ACLs or VLAN maps are used to control network traffic within a VLAN. You can apply VLAN maps to all packets that are bridged within a VLAN in the switch or switch stack. VACLs are strictly for security packet filtering and for redirecting traffic to specific physical interfaces. VACLs are not defined by direction (ingress or egress).
All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

*Figure 78: Using VLAN Maps to Control Traffic*

This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

### VLAN Map Configuration Guidelines

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.

- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.

- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.

- Logging is not supported for VLAN maps.

- When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.

- If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

### VLAN Maps with Router ACLs

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.
If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

---

**Note**

When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.

If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

---

**VLAN Maps and Router ACL Configuration Guidelines**

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:
  
  ```
  permit... permit... permit... deny ip any any
  ```
  or
  
  ```
  deny... deny... deny... permit ip any any
  ```

- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.

- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use *don’t care* bits in the IP address, whenever possible.

  If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

---

**VACL Logging**

When you configure VACL logging, syslog messages are generated for denied IP packets under these circumstances:

- When the first matching packet is received.

- For any matching packets received within the last 5 minutes.

- If the threshold is reached before the 5-minute interval.
Log messages are generated on a per-flow basis. A flow is defined as packets with the same IP addresses and Layer 4 (UDP or TCP) port numbers. If a flow does not receive any packets in the 5-minute interval, that flow is removed from the cache. When a syslog message is generated, the timer and packet counter are reset.

VACL logging restrictions:

- Only denied IP packets are logged.
- Packets that require logging on the outbound port ACLs are not logged if they are denied by a VACL.

## How to Configure VLAN Access Control Lists

### Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Follow these steps to create a named MAC extended ACL:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>mac access-list extended name</td>
<td>Defines an extended MAC access list using a name.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# mac access-list extended mac1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>{deny</td>
<td>permit} {any</td>
</tr>
</tbody>
</table>

### Applying a MAC ACL to a Layer 2 Interface

Follow these steps to apply a MAC access list to control access to a Layer 2 interface:

**Step 5**

**Example:**

```bash
Switch(config-ext-macl)# end
```

Returns to privileged EXEC mode.

**Step 6**

**show running-config**

**Example:**

```bash
Switch# show running-config
```

Verifies your entries.

**Step 7**

**copy running-config startup-config**

**Example:**

```bash
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`          | Enables privileged EXEC mode.  
**Example:**  
```
Switch> enable
```
|      |                   | - Enter your password if prompted. |
| 2    | `configure terminal` | Enters global configuration mode.  
**Example:**  
```
Switch# configure terminal
```
| 3    | `interface interface-id` | Identifies a specific interface, and enter interface configuration mode. The interface must be a physical Layer 2 interface (port ACL).  
**Example:**  
```
Switch(config)# interface gigabitethernet1/0/2
```
| 4    | `mac access-group {name} {in | out }` | Controls access to the specified interface by using the MAC access list.  
**Example:**  
```
Switch(config-if)# mac access-group mac1 in
```
| 5    | `end` | Returns to privileged EXEC mode.  
**Example:**  
```
Switch(config-if)# end
```
| 6    | `show mac access-group [interface interface-id]` | Displays the MAC access list applied to the interface or all Layer 2 interfaces.  
**Example:**  
```
Switch# show mac access-group interface gigabitethernet1/0/2
```
| 7    | `show running-config` | Verifies your entries.  
**Example:**  
```
Switch# show running-config
```
| 8    | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file.  
**Example:**  
```
```
After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.

Configuring VLAN Maps

To create a VLAN map and apply it to one or more VLANs, perform these steps:

**Before you begin**

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>vlan access-map name [number]</code></td>
<td>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# vlan access-map map_1 20</code></td>
<td>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match. Entering this command changes to access-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>`match {ip</td>
<td>mac} address {name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-access-map)# match ip address ip2</code></td>
<td></td>
</tr>
</tbody>
</table>
### Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

#### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch# configure terminal
```
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td><code>vlan access-map name [number]</code></td>
<td>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match. Entering this command changes to access-map configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>`match [ip</td>
<td>mac] address {name</td>
</tr>
<tr>
<td>Step 4</td>
<td>`action {drop</td>
<td>forward}`</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show running-config</code></td>
<td>Displays the access list configuration.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Applying a VLAN Map to a VLAN

Beginning in privileged EXEC mode, follow these steps to apply a VLAN map to one or more VLANs:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><em>enable</em></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><em>configure terminal</em></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><em>vlan filter</em></td>
<td>Applies the VLAN map to one or more VLAN IDs.</td>
</tr>
<tr>
<td><em>mapname</em></td>
<td></td>
</tr>
<tr>
<td><em>vlan-list</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# vlan filter mapname vlan-list 20-22</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><em>end</em></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><em>show running-config</em></td>
<td>Displays the access list configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><em>copy running-config</em></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><em>startup-config</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>

# Configuring VACL Logging

Beginning in privileged EXEC mode:

## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>vlan access-map name [number]</code></td>
<td>Creates a VLAN map. Give it a name and optionally a number. The number is the sequence number of the entry within the map. The sequence number range is from 0 to 65535. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. Specifying the map name and optionally a number enters the access-map configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# vlan access-map gandymede 10</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>action drop log</code></td>
<td>Sets the VLAN access map to drop and log IP packets.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-access-map)# action drop log</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>exit</code></td>
<td>Exits the VLAN access map configuration mode and return to the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config-access-map)# exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>`vlan access-log {maxflow max_number</td>
<td>threshold pkt_count}`</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# vlan access-log threshold 4000</code></td>
<td></td>
</tr>
</tbody>
</table>

- **maxflow max_number**—Sets the log table size. The content of the log table can be deleted by setting the `maxflow` to 0. When the log table is full, the software drops logged packets from new flows. The range is from 0 to 2048. The default is 500.
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• threshold \textit{pkt_count}—Sets the logging threshold. A logging message is generated if the threshold for a flow is reached before the 5-minute interval. The threshold range is from 0 to 2147483647. The default threshold is 0, which means that a syslog message is generated every 5 minutes.</td>
</tr>
</tbody>
</table>

### Step 6

**Example:**

Switch(config)# \texttt{end}

Returns to privileged EXEC mode.

---

### Configuration Examples for ACLs and VLAN Maps

#### Example: Creating an ACL and a VLAN Map to Deny a Packet

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the \textit{ip1} ACL (TCP packets) would be dropped. You first create the \textit{ip1} ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

Switch(config)# ip access-list extended ip1
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 10
Switch(config-access-map)# match ip address ip1
Switch(config-access-map)# action drop

#### Example: Creating an ACL and a VLAN Map to Permit a Packet

This example shows how to create a VLAN map to permit a packet. ACL \textit{ip2} permits UDP packets and any packets that match the \textit{ip2} ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

Switch(config)# ip access-list extended ip2
Switch(config-ext-nacl)# permit udp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 20
Switch(config-access-map)# match ip address ip2
Switch(config-access-map)# action forward
Example: Default Action of Dropping IP Packets and Forwarding MAC Packets

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists igmp-match and tcp-match, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

Switch(config)# access-list 101 permit udp any any
Switch(config)# ip access-list extended igmp-match
Switch(config-ext-nacl)# permit igmp any

Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map drop-ip-default 10
Switch(config-access-map)# match ip address 101
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 20
Switch(config-access-map)# match ip address igmp-match
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 30
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward

Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists good-hosts and good-protocols, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

Switch(config)# mac access-list extended good-hosts
Switch(config-ext-macl)# permit host 000.0c00.0111 any
Switch(config-ext-macl)# permit host 000.0c00.0211 any
Switch(config-ext-nacl)# exit
Switch(config)# action forward
Switch(config-ext-macl)# mac access-list extended good-protocols
Switch(config-ext-macl)# permit any any vines-ip
Switch(config-ext-nacl)# exit
Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists tcp-match and good-hosts from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets

Configuration Examples for Using VLAN Maps in Your Network

Example: Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classificationACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be
If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list *http* that permits (matches) any TCP traffic on the HTTP port.

```bash
Switch(config)# ip access-list extended http
Switch(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Switch(config-ext-nacl)# exit
```

Next, create VLAN access map *map2* so that traffic that matches the *http* access list is dropped and all other IP traffic is forwarded.

```bash
Switch(config)# vlan access-map map2 10
Switch(config-access-map)# match ip address http
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# ip access-list extended match_all
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map2 20
Switch(config-access-map)# match ip address match_all
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
```

Then, apply VLAN access map *map2* to VLAN 1.

```bash
Switch(config)# vlan filter map2 vlan 1
```
Example: Restricting Access to a Server on Another VLAN

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map SERVER1 that denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map SERVER1 to VLAN 10.

Define the IP ACL that will match the correct packets.

```
Switch(config)# ip access-list extended SERVER1_ACL
Switch(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Switch(config-ext-nacl)# exit
```

Define a VLAN map using this ACL that will drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

```
Switch(config)# vlan access-map SERVER1_MAP
Switch(config-access-map)# match ip address SERVER1_ACL
Switch(config-access-map)# action drop
Switch(config)# vlan access-map SERVER1_MAP 20
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
```

Apply the VLAN map to VLAN 10.
Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet’s path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

Example: ACLs and Switched Packets

*Figure 81: Applying ACLs on Switched Packets*

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.

Example: ACLs and Bridged Packets

*Figure 82: Applying ACLs on Bridged Packets*

This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.
Example: ACLs and Routed Packets

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:
1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN
Example: ACLs and Multicast Packets

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.
Example: ACLs and Multicast Packets
CHAPTER 56

Configuring DHCP

• Information About DHCP, on page 1077

Information About DHCP

DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator. The switch can act as a DHCP server.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.

DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

Note

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.
An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCPRELEASE or DHCPDECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.

When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allow-untrusted` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

Normally, it is not desirable to broadcast packets to wireless clients. So, DHCP snooping replaces destination broadcast MAC address (ffff.ffff.ffff) with unicast MAC address for DHCP packets that are going from server to wireless clients. The unicast MAC address is retrieved from CHADDR field in the DHCP payload. This processing is applied for server to client packets such as DHCP OFFER, DHCP ACK, and DHCP NACK messages. The `ip dhcp snooping wireless bootp-broadcast enable` can be used to revert this behavior. When the wireless BOOTP broadcast is enabled, the broadcast DHCP packets from server are forwarded to wireless clients without changing the destination MAC address.
Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

**Figure 85: DHCP Relay Agent in a Metropolitan Ethernet Network**

When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. You can configure the remote ID and circuit ID.
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.
- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.
In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, *Suboption Packet Formats*):

- Circuit-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit-ID type
  - Length of the circuit-ID type

- Remote-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote-ID type
  - Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet1/0/25, and so forth.

The illustration, *Suboption Packet Formats*, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option global configuration command`.

*Figure 86: Suboption Packet Formats*

The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command
and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- Circuit-ID suboption fields
  - The circuit-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

- Remote-ID suboption fields
  - The remote-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

Figure 87: User-Configured Suboption Packet Formats

Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.
**DHCP Snooping Binding Database**

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP~SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP~SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1bdb223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 584a38f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:
• The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.

• An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).

• The interface in the entry no longer exists on the system.

• The interface is a routed interface or a DHCP snooping-trusted interface.

**DHCP Snooping and Switch Stacks**

DHCP snooping is managed on the stack master. When a new switch joins the stack, the switch receives the DHCP snooping configuration from the stack master. When a member leaves the stack, all DHCP snooping address bindings associated with the switch age out.

All snooping statistics are generated on the stack master. If a new stack master is elected, the statistics counters reset.

When a stack merge occurs, all DHCP snooping bindings in the stack master are lost if it is no longer the stack master. With a stack partition, the existing stack master is unchanged, and the bindings belonging to the partitioned switches age out. The new master of the partitioned stack begins processing the new incoming DHCP packets.

**DHCP Server and Switch Stacks**

The DHCP binding database is managed on the stack master. When a new stack master is assigned, the new master downloads the saved binding database from the TFTP server. If the stack master fails, all unsaved bindings are lost. The IP addresses associated with the lost bindings are released. You should configure an automatic backup by using the `ip dhcp database url [timeout seconds] | write-delay seconds` global configuration command.

When a stack merge occurs, the stack master that becomes a stack member loses all of the DHCP lease bindings. With a stack partition, the new master in the partition acts as a new DHCP server without any of the existing DHCP lease bindings.

**Information About Configuring DHCP Server Port-Based Address Allocation**

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.

When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier option in the DHCP packet. Clients that do not include the client identifier option are identified by the client
hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

How to Configure DHCP Features

Default DHCP Snooping Configuration

<table>

</tbody>
</table>

12 The switch responds to DHCP requests only if it is configured as a DHCP server.
The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.
Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

**DHCP Snooping Configuration Guidelines**

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust interface` configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.
- You can display DHCP snooping statistics by entering the `show ip dhcp snooping statistics` user EXEC command, and you can clear the snooping statistics counters by entering the `clear ip dhcp snooping statistics` privileged EXEC command.

**Configuring the DHCP Server**

The switch can act as a DHCP server.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the *Cisco IOS IP Configuration Guide, Release 12.4*.

**Configuring the DHCP Relay Agent**

Follow these steps to enable the DHCP relay agent on the switch:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>service dhcp</code></td>
<td>Enables the DHCP server and relay agent on your switch. By default, this feature is enabled.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>service dhcp</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# service dhcp</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>
Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the `ip helper-address address` interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the `ip helper-address` command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>3</td>
<td>interface vlan vlan-id</td>
<td>Creates a switch virtual interface by entering a VLAN ID, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface vlan 1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>ip address ip-address subnet-mask</td>
<td>Configures the interface with an IP address and an IP subnet.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# ip address 192.108.1.27 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>ip helper-address address</td>
<td>Specifies the DHCP packet forwarding address.</td>

<tr>
<td>9</td>
<td>switchport access vlan vlan-id</td>
<td>Assigns the ports to the same VLAN as configured in Step 2.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# switchport access vlan 1</td>
<td></td>
</tr>
</tbody>
</table>
Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

- You must globally enable DHCP snooping on the switch.
- Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
- If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.
- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.
- For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.
- You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.
- To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.
- The following prerequisites apply to DHCP snooping binding database configuration:
  - You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.
  - Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
  - For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation.
for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.

- To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).

- If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

- Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.

- If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the ip dhcp snooping trust interface configuration command.

- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the no ip dhcp snooping trust interface configuration command.

### Enabling DHCP Snooping and Option 82

Follow these steps to enable DHCP snooping on the switch:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip dhcp snooping</td>
<td>Enables DHCP snooping globally.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# ip dhcp snooping</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip dhcp snooping vlan vlan-range</td>
<td>Enables DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| by entering the starting and ending VLAN IDs separated by a space.  
  - You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space. |

**Step 5**  
**ip dhcp snooping information option**  
**Example:**  
Switch(config)# ip dhcp snooping information option

Enables the switch to insert and remove DHCP relay information (option-82 field) in forwarded DHCP request messages to the DHCP server. This is the default setting.

**Step 6**  
**ip dhcp snooping information option format remote-id [string ASCI-string | hostname]**  
**Example:**  
Switch(config)# ip dhcp snooping information option format remote-id string acsiistring2

(Optional) Configures the remote-ID suboption.  
You can configure the remote ID as:  
- String of up to 63 ASCII characters (no spaces)  
- Configured hostname for the switch  

**Note** If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration.  
The default remote ID is the switch MAC address.

**Step 7**  
**ip dhcp snooping information option allow-untrusted**  
**Example:**  
Switch(config)# ip dhcp snooping information option allow-untrusted

(Optional) If the switch is an aggregation switch connected to an edge switch, this command enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch.  
The default setting is disabled.  
**Note** Enter this command only on aggregation switches that are connected to trusted devices.

**Step 8**  
**interface interface-id**  
**Example:**  
Switch(config)# interface gigabitethernet2/0/1

Specifies the interface to be configured, and enter interface configuration mode.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td><code>ip dhcp snooping vlan vlan-id information option format-type circuit-id [override] string ASCII-string</code></td>
<td>(Optional) Configures the circuit-ID suboption for the specified interface. Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format <code>vlan-mod-port</code>. You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces). (Optional) Use the <code>override</code> keyword when you do not want the circuit-ID suboption inserted in TLV format to define subscriber information.</td>
</tr>
<tr>
<td>10</td>
<td><code>ip dhcp snooping trust</code></td>
<td>(Optional) Configures the interface as trusted or untrusted. Use the <code>no</code> keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted.</td>
</tr>
<tr>
<td>11</td>
<td><code>ip dhcp snooping limit rate rate</code></td>
<td>(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured. <strong>Note</strong> We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN with DHCP snooping.</td>
</tr>
<tr>
<td>12</td>
<td><code>exit</code></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>13</td>
<td><code>ip dhcp snooping verify mac-address</code></td>
<td>(Optional) Configures the switch to verify that the source MAC address in a DHCP packet received on untrusted ports matches the client hardware address in the packet. The default is to verify that the source MAC address matches the client hardware address in the packet.</td>
</tr>
<tr>
<td>14</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4

Monitoring DHCP Snooping Information

Table 119: Commands for Displaying DHCP Information

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip dhcp snooping</td>
<td>Displays the DHCP snooping configuration for a switch</td>
</tr>
<tr>
<td>show ip dhcp snooping binding</td>
<td>Displays only the dynamically configured bindings in the DHCP snooping binding database, also referred to as a binding table.</td>
</tr>
<tr>
<td>show ip dhcp snooping database</td>
<td>Displays the DHCP snooping binding database status and statistics.</td>
</tr>
<tr>
<td>show ip dhcp snooping statistics</td>
<td>Displays the DHCP snooping statistics in summary or detail form.</td>
</tr>
<tr>
<td>show ip source binding</td>
<td>Display the dynamically and statically configured bindings.</td>
</tr>
</tbody>
</table>

Note

If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.
Configuring DHCP Server Port-Based Address Allocation

Default Port-Based Address Allocation Configuration

By default, DHCP server port-based address allocation is disabled.

Port-Based Address Allocation Configuration Guidelines

- By default, DHCP server port-based address allocation is disabled.
- To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the reserved-only DHCP pool configuration command.

Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
| Step 3    | ip dhcp snooping database 
flash[number]:/filename | Specifies the URL for the database agent or the binding file by using one of these forms: |
|           | ftp://user:password@host/filename | • flash[number]:/filename |
|           | http://[[username:password[@]]{hostname | (Optional) Use the number parameter to specify the stack member number of the stack master. The range for number is 1 to 9. |
|           | host-ip}{directory}/image-name.tar | • ftp://user:password@host/filename |
|           | rcp://user@host/filename | • http://[[username:password[@]]{hostname | |
|           | tftp://host/filename | host-ip}{directory}/image-name.tar | |
| Example:  | Switch(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2 | • rcp://user@host/filename |
|           |                  | • tftp://host/filename |
### Enabling the DHCP Snooping Binding Database Agent

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 4    | `ip dhcp snooping database timeout seconds` **Example:**  
      | `Switch(config)# ip dhcp snooping database timeout 300` | Specifies (in seconds) how long to wait for the database transfer process to finish before stopping the process.  
      | | The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely. |
| 5    | `ip dhcp snooping database write-delay seconds` **Example:**  
      | `Switch(config)# ip dhcp snooping database write-delay 15` | Specifies the duration for which the transfer should be delayed after the binding database changes. The range is from 15 to 86400 seconds. The default is 300 seconds (5 minutes). |
| 6    | `end` **Example:**  
      | `Switch(config)# end` | Returns to privileged EXEC mode. |
| 7    | `ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds` **Example:**  
      | `Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gi1/1 expiry 1000` | (Optional) Adds binding entries to the DHCP snooping binding database. The `vlan-id` range is from 1 to 4904. The `seconds` range is from 1 to 4294967295.  
      | | Enter this command for each entry that you add.  
      | | Use this command when you are testing or debugging the switch. |
| 8    | `show ip dhcp snooping database [detail]` **Example:**  
      | `Switch# show ip dhcp snooping database detail` | Displays the status and statistics of the DHCP snooping binding database agent. |
| 9    | `show running-config` **Example:**  
      | `Switch# show running-config` | Verifies your entries. |
| 10   | `copy running-config startup-config` **Example:**  
      | `Switch# copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
Enabling DHCP Server Port-Based Address Allocation

Follow these steps to globally enable port-based address allocation and to automatically generate a subscriber identifier on an interface.

### Procedure

<table>
<thead>
<tr>

CHAPTER 57

Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- Finding Feature Information, on page 1099
- Information About IP Source Guard, on page 1099
- How to Configure IP Source Guard, on page 1101
- Monitoring IP Source Guard, on page 1104
- Additional References, on page 1105

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IP Source Guard

IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address in the binding table is allowed, all other traffic is denied.
The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

IP Source Guard for Static Hosts

Note

Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the `show ip device tracking all` EXEC command, the IP device tracking table displays the entries as ACTIVE.

Note

Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.
IP Source Guard Configuration Guidelines

- You can configure static IP bindings only on nonrouted ports. If you enter the `ip source binding mac-address vlan vlan-id ip-address interface interface-id` global configuration command on a routed interface, this error message appears:

  Static IP source binding can only be configured on switch port.

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.

- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

  Note
  If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

- You can enable this feature when 802.1x port-based authentication is enabled.

- When you configure IP source guard smart logging, packets with a source address other than the specified address or an address learned by DHCP are denied, and the packet contents are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled.

- In a switch stack, if IP source guard is configured on a stack member interface and you remove the the configuration of that switch by entering the `no switch stack-member-number provision` global configuration command, the interface static bindings are removed from the binding table, but they are not removed from the running configuration. If you again provision the switch by entering the `switch stack-member-number provision` command, the binding is restored.

  To remove the binding from the running configuration, you must disable IP source guard before entering the `no switch provision` command. The configuration is also removed if the switch reloads while the interface is removed from the binding table.

How to Configure IP Source Guard

Enabling IP Source Guard

</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>configure terminal&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>interface interface-id&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# interface gigabitethernet 1/0/1</td>
<td>Specifies the interface to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>4</td>
<td>ip verify source [mac-check ]&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config-if)# ip verify source</td>
<td>Enables IP source guard with source IP address filtering. (Optional) <strong>mac-check</strong>—Enables IP Source Guard with source IP address and MAC address filtering.</td>
</tr>
<tr>
<td>5</td>
<td>exit&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config-if)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>6</td>
<td>ip source binding mac-address vlan vlan-id ip-address interface interface-id&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1</td>
<td>Adds a static IP source binding. Enter this command for each static binding.</td>
</tr>
<tr>
<td>7</td>
<td>end&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>8</td>
<td>show running-config&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>9</td>
<td>copy running-config startup-config&lt;br&gt;<strong>Example:</strong>&lt;br&gt;</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
You must configure the `ip device tracking maximum limit-number` interface configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.
- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.
• Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

• Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

> **Note**

Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

• A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

• The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

• The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.

If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

• Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none` interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.

• When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.

• In the presence of vlan-bridging & IP device tracking, the cross-stack ARP packet forwarding will not work.
Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

Figure 88: ARP Cache Poisoning

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic man-in-the-middle attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets
Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan vlan-range` global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the `arp access-list acl-name` global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate {[src-mac] [dst-mac] [ip]}` global configuration command.

## Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `ip arp inspection trust interface` configuration command.

⚠️ **Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.
Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

---

**Note**

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

---

**Rate Limiting of ARP Packets**

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.
The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command.

Default Dynamic ARP Inspection Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic ARP inspection</td>
<td>Disabled on all VLANs.</td>
</tr>
<tr>
<td>Interface trust state</td>
<td>All interfaces are untrusted.</td>
</tr>
<tr>
<td>Rate limit of incoming ARP packets</td>
<td>The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second. The rate is unlimited on all trusted interfaces. The burst interval is 1 second.</td>
</tr>
<tr>
<td>ARP ACLs for non-DHCP environments</td>
<td>No ARP ACLs are defined.</td>
</tr>
<tr>
<td>Validation checks</td>
<td>No checks are performed.</td>
</tr>
</tbody>
</table>
When dynamic ARP inspection is enabled, all denied or dropped ARP packets are logged. The number of entries in the log is 32. The number of system messages is limited to 5 per second. The logging-rate interval is 1 second.

Per-VLAN logging

All denied or dropped ARP packets are logged.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan global configuration` command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

### Command or Action

**Switch# configure terminal**

**Purpose**

- Defines an ARP ACL, and enters ARP access-list configuration mode. By default, no ARP access lists are defined.

**Note**

At the end of the ARP access list, there is an implicit **deny ip any mac any** command.

**Step 3**

- **arp access-list acl-name**

**Step 4**

- **permit ip host sender-ip mac host sender-mac**

Permits ARP packets from the specified host (Host 2).

- For **sender-ip**, enter the IP address of Host 2.
- For **sender-mac**, enter the MAC address of Host 2.

**Step 5**

- **exit**

Returns to global configuration mode.

**Step 6**

- **ip arp inspection filter arp-acl-name vlan vlan-range [static]**

Applies ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.

- For **arp-acl-name**, specify the name of the ACL created in Step 2.
- For **vlan-range**, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.

  - (Optional) Specify **static** to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.

  If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.

ARP packets containing only IP-to-MAC address bindings are compared against the

**Configuring Dynamic ARP Inspection in DHCP Environments**

**Before you begin**

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic...
ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

### Procedure

<table>
<thead>

| <strong>Step 4</strong> | ip arp inspection vlan <em>vlan-range</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# ip arp inspection vlan 1 | Enable dynamic ARP inspection on a per-VLAN basis. By default, dynamic ARP inspection is disabled on all VLANs. For <em>vlan-range</em>, specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. Specify the same VLAN ID for both switches. |
| <strong>Step 5</strong> | Interface<em>interface-id</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# interface gigabitethernet1/0/1 | Specifies the interface connected to the other switch, and enter interface configuration mode. |
| <strong>Step 6</strong> | ip arp inspection trust&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config-if)#ip arp inspection trust | Configures the connection between the switches as trusted. By default, all interfaces are untrusted. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>The switch does not check ARP packets that it receives from the other switch on the trusted interface. It simply forwards the packets. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 7**  
**Example:**  
Switch(config-if)#end  
Returns to privileged EXEC mode.

**Step 8**  
**Example:**  
show ip arp inspection interfaces  
Verifies the dynamic ARP inspection configuration on interfaces.

**Step 9**  
**Example:**  
show ip arp inspection vlan vlan-range  
Verifies the dynamic ARP inspection configuration on VLAN.

**Step 10**  
**Example:**  
show ip dhcp snooping binding  
Verifies the DHCP bindings.

**Step 11**  
**Example:**  
show ip arp inspection statistics vlan vlan-range  
Checks the dynamic ARP inspection statistics on VLAN.

**Step 12**  
**Example:**  
configure terminal  
Enter global configuration mode.

**Step 13**  
**Example:**  
configure terminal  
Enter global configuration mode.
Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

Note

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the `no ip arp inspection limit` interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Specifies the interface to be rate-limited, and enter interface config mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip arp inspection limit {rate pps [burst interval seconds]</td>
<td>Limits the rate of incoming ARP requests and responses on the interface. The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second.</td>
</tr>
</tbody>
</table>

The keywords have these meanings:

- For `rate pps`, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps.
- (Optional) For `burst interval seconds`, specify the consecutive interval in
Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

<td></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>src-mac</strong>, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>dst-mac</strong>, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>ip</strong>, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</td>
</tr>
</tbody>
</table>

| Step 4 | **exit** | Returns to privileged EXEC mode. |
Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
</tbody>
</table>
### Command

**show ip arp inspection interfaces [interface-id]**
- Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.

**show ip arp inspection vlan vlan-range**
- Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).

CHAPTER 59

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term switch refers to a standalone switch or a switch stack.

- Finding Feature Information, on page 1123
- Information About 802.1x Port-Based Authentication, on page 1123
- How to Configure 802.1x Port-Based Authentication, on page 1156
- Monitoring 802.1x Statistics and Status, on page 1208
- Additional References, on page 1209
- Feature Information for 802.1x Port-Based Authentication, on page 1210

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About 802.1x Port-Based Authentication

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Note

TACACS is not supported with 802.1x authentication.
Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

**Note**
For complete syntax and usage information for the commands used in this chapter, see the “RADIUS Commands” section in the Cisco IOS Security Command Reference, Release 3SE

### Port-Based Authentication Process

To configure IEEE 802.1X port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.
- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.
- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.
- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

**Note**
Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.
This figure shows the authentication process.

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during re-authentication. The actions are Initialize and ReAuthenticate. When the Initialize action is set (the attribute value is DEFAULT), the 802.1x session ends, and connectivity is lost during re-authentication. When the ReAuthenticate action is set (the attribute value is RADIUS-Request), the session is not affected during re-authentication.
On an interface having authentication configuration and sessions, we recommend you not to DEFAULT the interface with session in place. The console will hang if you DEFAULT a range of interfaces in a stack.

- You manually re-authenticate the client by entering the `dot1x re-authenticate interface interface-id` privileged EXEC command.

## Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the `authentication port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.
Figure 91: Message Exchange

This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

Figure 92: Message Exchange During MAC Authentication Bypass

This figure shows the message exchange during MAC authentication bypass.

15 Supported in Cisco IOS Release 12.2(50)SE and later.
16 For clients that do not support 802.1x authentication.

Per-User ACLs and Filter-Ids

Note: You can only set any as the source in the ACL.
For any ACL configured for multiple-host mode, the source portion of statement must be any. (For example, permit icmp any host 10.10.1.1.)

You must specify any in the source ports of any defined ACL. Otherwise, the ACL cannot be applied and authorization fails. Single host is the only exception to support backward compatibility.

More than one host can be authenticated on MDA-enabled and multiauth ports. The ACL policy applied for one host does not effect the traffic of another host. If only one host is authenticated on a multi-host port, and the other hosts gain network access without authentication, the ACL policy for the first host can be applied to the other connected hosts by specifying any in the source address.

Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the authentication host-mode, authentication violation, and authentication timer interface configuration commands.

802.1x-specific commands begin with the dot1x keyword. For example, the authentication port-control auto interface configuration command enables authentication on an interface. However, the dot1x system-authentication control global configuration command only globally enables or disables 802.1x authentication.

If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

The authentication manager commands provide the same functionality as earlier 802.1x commands.

When filtering out verbose system messages generated by the authentication manager, the filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The no authentication logging verbose global configuration command filters verbose messages from the authentication manager.
- The no dot1x logging verbose global configuration command filters 802.1x authentication verbose messages.
- The no mab logging verbose global configuration command filters MAC authentication bypass (MAB) verbose messages.

| `authentication event` | `dot1x auth-fail vlan`  
`dot1x critical (interface configuration)`  
`dot1x guest-vlan6` | Enable the restricted VLAN on a port.
Enable the inaccessible-authentication-bypass feature.
Specify an active VLAN as an 802.1x guest VLAN. |
| `authentication fallback`  
`fallback-profile` | `dot1x fallback fallback-profile` | Configure a port to use web authentication as a fallback method for clients that do not support 802.1x authentication. |
| `authentication host-mode`  
`[multi-auth | multi-domain | multi-host | single-host]` | `dot1x host-mode {single-host | multi-host | multi-domain}` | Allow a single host (client) or multiple hosts on an 802.1x-authorized port. |
| `authentication order` | `mab` | Provides the flexibility to define the order of authentication methods to be used. |
| `authentication periodic` | `dot1x reauthentication` | Enable periodic re-authentication of the client. |
| `authentication port-control {auto | force-authorized | force-unauthorized}` | `dot1x port-control {auto | force-authorized | force-unauthorized}` | Enable manual control of the authorization state of the port. |
| `authentication timer` | `dot1x timeout` | Set the 802.1x timers. |
| `authentication violation {protect | restrict | shutdown}` | `dot1x violation-mode {shutdown | restrict | protect}` | Configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port. |
Ports in Authorized and Unauthorized States

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the unauthorized state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the authorized state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

Note

CDP bypass is not supported and may cause a port to go into err-disabled state.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the `authentication port-control` interface configuration command and these keywords:

- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.

- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.

- **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.
Port-Based Authentication and Switch Stacks

If a switch is added to or removed from a switch stack, 802.1x authentication is not affected as long as the IP connectivity between the RADIUS server and the stack remains intact. This statement also applies if the stack master is removed from the switch stack. Note that if the stack master fails, a stack member becomes the new stack master by using the election process, and the 802.1x authentication process continues as usual.

If IP connectivity to the RADIUS server is interrupted because the switch that was connected to the server is removed or fails, these events occur:

- Ports that are already authenticated and that do not have periodic re-authentication enabled remain in the authenticated state. Communication with the RADIUS server is not required.
- Ports that are already authenticated and that have periodic re-authentication enabled (with the `dot1x re-authentication` global configuration command) fail the authentication process when the re-authentication occurs. Ports return to the unauthenticated state during the re-authentication process. Communication with the RADIUS server is required.

For an ongoing authentication, the authentication fails immediately because there is no server connectivity.

If the switch that failed comes up and rejoins the switch stack, the authentications might or might not fail depending on the boot-up time and whether the connectivity to the RADIUS server is re-established by the time the authentication is attempted.

To avoid loss of connectivity to the RADIUS server, you should ensure that there is a redundant connection to it. For example, you can have a redundant connection to the stack master and another to a stack member, and if the stack master fails, the switch stack still has connectivity to the RADIUS server.

802.1x Host Mode

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

![Multiple Host Mode Example](image)

For all host modes, the line protocol stays up before authorization when port-based authentication is configured.
The switch supports multidomain authentication (MDA), which allows both a data device and a voice device, such as an IP Phone (Cisco or non-Cisco), to connect to the same switch port.

### 802.1x Multiple Authentication Mode

Multiple-authentication (multi-auth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multi-auth port.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

---

**Note**

When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information.
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
- The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.
- After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.
- You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.
- The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

---

### Multi-auth Per User VLAN assignment

**Note**

This feature is supported only on Catalyst 2960X switches running the LAN base image.

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.

The number of hosts per multi-auth port is 8, however there can be more hosts.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

**Scenario one**
When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behaviour is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 sends untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

Scenario two

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

Scenario three

When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).

The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

Limitation in Multi-auth Per User VLAN assignment

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs**: Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.

- **IPv6 control packets**: In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assign incorrect IPv6 address to itself. Such a host is unable to get access to the network.

The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports. The packet is replicated for each client in multi-auth
port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

- **IP multicast**: Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANs join the multicast group. When two hosts in different VLANs join a multicast group (on the same multi-auth port), two copies of each multicast packet are sent out from that port.

## MAC Move

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port. MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on the that port.) When a MAC address moves from one port to another, the switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port. The MAC move feature applies to both voice and data hosts.

**Note**

In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.

## MAC Replace

The MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

**Note**

This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the `authentication violation` interface configuration command with the `replace` keyword, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
- The authentication manager replaces the MAC address of the current data host on the port with the new MAC address.
- The authentication manager initiates the authentication process for the new MAC address.
- If the authentication manager determines that the new host is a voice host, the original voice host is removed.
If a port is in open authentication mode, any new MAC address is immediately added to the MAC address table.

**802.1x Accounting**

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor this activity on 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

**802.1x Accounting Attribute-Value Pairs**

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- **START**—sent when a new user session starts
- **INTERIM**—sent during an existing session for updates
- **STOP**—sent when a session terminates

You can view the AV pairs that are being sent by the switch by entering the `debug radius accounting` privileged EXEC command. For more information about this command, see the *Cisco IOS Debug Command Reference, Release 12.4*.

This table lists the AV pairs and when they are sent are sent by the switch.

**Table 125: Accounting AV Pairs**

802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.

Configuring 802.1x Readiness Check, on page 1160

Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.
802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode in Cisco IOS Release 12.2(37)SE. In Cisco IOS Release 12.2(40)SE and later, when a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.

- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

  Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).

- If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.

- If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.

- Enabling port security does not impact the RADIUS server-assigned VLAN behavior.

- If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.

- If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

  - If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, then authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.

  - If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.
When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

- If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.

- If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

The 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN Membership Policy Server (VMPS).

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  - `[64] Tunnel-Type = VLAN`
  - `[65] Tunnel-Medium-Type = 802`
  - `[81] Tunnel-Private-Group-ID = VLAN name or VLAN ID`
  - `[83] Tunnel-Preference`

  Attribute [64] must contain the value `VLAN` (type 13). Attribute [65] must contain the value `802` (type 6). Attribute [81] specifies the `VLAN name or VLAN ID` assigned to the IEEE 802.1x-authenticated user.

### 802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes
precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port
to which a port ACL is applied are filtered by the port ACL. Incoming routed packets received on other ports
are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration
conflicts, you should carefully plan the user profiles stored on the RADIUS server.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes
(VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs
used for per-user ACLs are `inac#<n>` for the ingress direction and `outac#<n>` for the egress direction. MAC
ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It
does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server.
When the definitions are passed from the RADIUS server, they are created by using the extended naming
convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the
switch. The attribute contains the ACL number followed by `.in` for ingress filtering or `.out` for egress filtering.
If the RADIUS server does not allow the `.in` or `.out` syntax, the access list is applied to the outbound ACL by
default. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported
only for IP ACLs numbered 1 to 199 and 1300 to 2699 (IP standard and IP extended ACLs).

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of
RADIUS-server per-user ACLs.

To configure per-user ACLs:

- Enable AAA authentication.
- Enable AAA authorization by using the `network` keyword to allow interface configuration from the
  RADIUS server.
- Enable 802.1x authentication.
- Configure the user profile and VSAs on the RADIUS server.
- Configure the 802.1x port for single-host mode.

---

**Note** Per-user ACLs are supported only in single-host mode.

---

### 802.1x Authentication with Downloadable ACLs and Redirect URLs

You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication
or MAC authentication bypass of the host. You can also download ACLs during web authentication.

---

**Note** A downloadable ACL is also referred to as a dACL.

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode,
the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.
If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.

**Note**
The limit for dACL with stacking is 64 ACEs per dACL per port. The limit without stacking is the number of available TCAM entries which varies based on the other ACL features that are active.

Beginning with Cisco IOS Release 12.2(55)SE, if there is no static ACL on a port, a dynamic auth-default ACL is created, and policies are enforced before dACLs are downloaded and applied.

**Note**
The auth-default-ACL does not appear in the running configuration.

The auth-default ACL is created when at least one host with an authorization policy is detected on the port. The auth-default ACL is removed from the port when the last authenticated session ends. You can configure the auth-default ACL by using the `ip access-list extended auth-default-acl` global configuration command.

**Note**
The auth-default-ACL does not support Cisco Discovery Protocol (CDP) bypass in the single host mode. You must configure a static ACL on the interface to support CDP bypass.

The 802.1x and MAB authentication methods support two authentication modes, open and closed. If there is no static ACL on a port in closed authentication mode:

- An auth-default-ACL is created.
- The auth-default-ACL allows only DHCP traffic until policies are enforced.
- When the first host authenticates, the authorization policy is applied without IP address insertion.
- When a second host is detected, the policies for the first host are refreshed, and policies for the first and subsequent sessions are enforced with IP address insertion.

If there is no static ACL on a port in open authentication mode:

- An auth-default-ACL-OPEN is created and allows all traffic.
- Policies are enforced with IP address insertion to prevent security breaches.
- Web authentication is subject to the auth-default-ACL-OPEN.

To control access for hosts with no authorization policy, you can configure a directive. The supported values for the directive are open and default. When you configure the open directive, all traffic is allowed. The default directive subjects traffic to the access provided by the port. You can configure the directive either in the user profile on the AAA server or on the switch. To configure the directive on the AAA server, use the `authz-directive =<open/default>` global command. To configure the directive on the switch, use the `epm access-control open` global configuration command.
The default value of the directive is `default`.

If a host falls back to web authentication on a port without a configured ACL:

- If the port is in open authentication mode, the auth-default-ACL-OPEN is created.
- If the port is in closed authentication mode, the auth-default-ACL is created.

The access control entries (ACEs) in the fallback ACL are converted to per-user entries. If the configured fallback profile does not include a fallback ACL, the host is subject to the auth-default-ACL associated with the port.

If you use a custom logo with web authentication and it is stored on an external server, the port ACL must allow access to the external server before authentication. You must either configure a static port ACL or change the auth-default-ACL to provide appropriate access to the external server.

### Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL

The switch uses these `cisco-av-pair` VSAs:

- `url-redirect` is the HTTP or HTTPS URL.
- `url-redirect-acl` is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the end point. The switch then forwards the client web browser to the specified redirect address. The `url-redirect` AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The `url-redirect-acl` attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.

- Traffic that matches a permit ACE in the ACL is redirected.
- Define the URL redirect ACL and the default port ACL on the switch.

If a redirect URL is configured for a client on the authentication server, we recommend that you configure a default port ACL on the connected client switch port.

When redirect ACLs are used, we recommend that you configure a dynamic ACL that has an explicit permit statement for the IP address to which the traffic should be redirected. This change is applicable to Cisco IOS Release 15.2(2)E6, 15.2(4)E2, and 15.2(5)E, and later releases.

### Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS `cisco-av-pair` vendor-specific attributes (VSAs). This pair specifies the names of the downloadable ACLs on the Cisco Secure ACS with the `#ACL-IP-name-number` attribute.

- The `name` is the ACL name.
• The **number** is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

**VLAN ID-based MAC Authentication**

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

---

**Note**

This feature is not supported on Cisco ACS Server. (The ACS server ignores the sent VLAN-IDs for new hosts and only authenticates based on the MAC address.)

**802.1x Authentication with Guest VLAN**

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:

• Enter the **authentication event no-response action authorize vlan** `vlan-id` interface configuration command to allow access to the guest VLAN.
• Enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command to restart the port.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.

---

**Note**

If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

Any number of 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes. You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports MAC authentication bypass. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

### 802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN (also referred to as an **authentication failed VLAN**) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN. These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

---

**Note**

You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count increments when the RADIUS server replies with either an EAP failure or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.
Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a link down or EAP logoff event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the link down or EAP logoff event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports.

You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as critical authentication or the AAA fail policy, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated. You can configure the switch to connect those hosts to critical ports.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the critical VLAN. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the critical-authentication state, which is a special case of the authentication state.

**Note**

If critical authentication is configured on interface, then vlan used for critical authorization (critical vlan) should be active on the switch. If the critical vlan is inactive (or) down, critical authentication session will keep trying to enable inactive vlan and fail repeatedly. This can lead to large amount of memory holding.

Inaccessible Authentication Bypass Support on Multiple-Authentication Ports

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on multiple-authentication (multiauth) ports, use the authentication event server dead action reinitialize vlan vlan-id command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.
Inaccessible Authentication Bypass Authentication Results

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.

- If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.

- If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

Inaccessible Authentication Bypass Feature Interactions

Inaccessible authentication bypass interacts with these features:

- Guest VLAN—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 8021.x port, the features interact as follows:
  - If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
  - If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
  - If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.
  - If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.

- Restricted VLAN—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.

- 802.1x accounting—Accounting is not affected if the RADIUS servers are unavailable.

- Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.

- Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.

- Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.

In a switch stack:
- The stack master checks the status of the RADIUS servers by sending keepalive packets. When the status of a RADIUS server changes, the stack master sends the information to the stack members. The stack members can then check the status of RADIUS servers when re-authenticating critical ports.

- If the new stack master is elected, the link between the switch stack and RADIUS server might change, and the new stack immediately sends keepalive packets to update the status of the RADIUS servers. If the server status changes from dead to alive, the switch re-authenticates all switch ports in the critical-authentication state.

When a member is added to the stack, the stack master sends the member the server status.

**802.1x Critical Voice VLAN**

When an IP phone connected to a port is authenticated by the access control server (ACS), the phone is put into the voice domain. If the ACS is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS server is available (up) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

You can enter the `authentication event server dead action authorize voice` interface configuration command to configure the critical voice VLAN feature. When the ACS does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through CDP (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the `switchport voice vlan vlan-id` interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

**802.1x User Distribution**

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.

- Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.

- Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured by using the switch CLI. If the VLAN group name is found,
the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.

Note
The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups.

**802.1x User Distribution Configuration Guidelines**

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

**IEEE 802.1x Authentication with Voice VLAN Ports**

A voice VLAN port is a special access port associated with two VLAN identifiers:

- VVID to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- PVID to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone.
If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the switch for up to 30 seconds.

**IEEE 802.1x Authentication with Port Security**

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

**IEEE 802.1x Authentication with Wake-on-LAN**

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the magic packet. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

If PortFast is not enabled on the port, the port is forced to the bidirectional state.

When you configure a port as unidirectional by using the `authentication control-direction in` interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.

When you configure a port as bidirectional by using the `authentication control-direction both` interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

**IEEE 802.1x Authentication with MAC Authentication Bypass**

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.

If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and
password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured. This process works for most client devices; however, it does not work for clients that use an alternate MAC address format. You can configure how MAB authentication is performed for clients with MAC addresses that deviate from the standard format or where the RADIUS configuration requires the user name and password to differ.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant and uses 802.1x authentication (not MAC authentication bypass) to authorize the interface. EAPOL history is cleared if the interface link status goes down.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is DEFAULT.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]) and if the Termination-Action RADIUS attribute (Attribute [29]) action is Initialize (the attribute value is DEFAULT), the MAC authentication bypass session ends, and connectivity is lost during re-authentication. If MAC authentication bypass is enabled and the IEEE 802.1x authentication times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—You can enable MAC authentication bypass only if 802.1x authentication is enabled on the port.
- Guest VLAN—If a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.
- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.
- Port security
- Voice VLAN
- Private VLAN—You can assign a client to a private VLAN.
- Network Edge Access Topology (NEAT)—MAB and NEAT are mutually exclusive. You cannot enable MAB when NEAT is enabled on an interface, and you should not enable NEAT when MAB is enabled on an interface.

Cisco IOS Release 12.2(55)SE and later supports filtering of verbose MAB system messages.
Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or posture of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.
- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the DEFAULT or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.
- Set the list of VLAN number or name or VLAN group name as the value of the Tunnel Group Private ID (Attribute[81]) and the preference for the VLAN number or name or VLAN group name as the value of the Tunnel Preference (Attribute[83]). If you do not configure the Tunnel Preference, the first Tunnel Group Private ID (Attribute[81]) attribute is picked up from the list.
- View the NAC posture token, which shows the posture of the client, by using the `show authentication` privileged EXEC command.
- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. The IEEE 802.1X Flexible Authentication feature supports three authentication methods:

- `dot1X`—IEEE 802.1X authentication is a Layer 2 authentication method.
- `mab`—MAC-Authentication Bypass is a Layer 2 authentication method.
- `webauth`—Web authentication is a Layer 3 authentication method.

Using this feature, you can control which ports use which authentication methods, and you can control the failover sequencing of methods on those ports. For example, MAC authentication bypass and 802.1x can be the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

The IEEE 802.1X Flexible Authentication feature supports the following host modes:

- `multi-auth`—Multiauthentication allows one authentication on a voice VLAN and multiple authentications on the data VLAN.
- `multi-domain`—Multidomain authentication allows two authentications: one on the voice VLAN and one on the data VLAN.

Related Topics

Configuring Flexible Authentication Ordering, on page 1203
Open1x Authentication

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

- Single-host mode with open authentication—Only one user is allowed network access before and after authentication.
- MDA mode with open authentication—Only one user in the voice domain and one user in the data domain are allowed.
- Multiple-hosts mode with open authentication—Any host can access the network.
- Multiple-authentication mode with open authentication—Similar to MDA, except multiple hosts can be authenticated.

If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the `authentication open` interface configuration command, the port will grant access to the host irrespective of the `authentication port-control` interface configuration command.

Note

If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the `authentication open` interface configuration command, the port will grant access to the host irrespective of the `authentication port-control` interface configuration command.

Multidomain Authentication

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Follow these guidelines for configuring MDA:

- You must configure a switch port for MDA.
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.
- Voice VLAN assignment on an MDA-enabled port is supported Cisco IOS Release 12.2(40)SE and later.
- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of `device-traffic-class=voice`. Without this value, the switch treats the voice device as a data device.
• The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.

• If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.

• Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.

• A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.

• MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.

• When a data or a voice device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.

• If more than five devices are detected on the data VLAN or more than one voice device is detected on the voice VLAN while a port is unauthorized, the port is error disabled.

• When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.

• Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.

• Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.

• If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.

• We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

**Limiting Login for Users**

The Limiting Login feature helps Network administrators to limit the login attempt of users to a network. When a user fails to successfully login to a network within a configurable number of attempts within a configurable time limit, the user can be blocked. This feature is enabled only for local users and not for remote users. You need to configure the `aaa authentication rejected` command in global configuration mode to enable this feature.

**802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)**

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms). This allows any type of device to authenticate on the port.
• 802.1x switch supplicant: You can configure a switch to act as a supplicant to another switch by using the 802.1x supplicant feature. This configuration is helpful in a scenario, where, for example, a switch is outside a wiring closet and is connected to an upstream switch through a trunk port. A switch configured with the 802.1x switch supplicant feature authenticates with the upstream switch for secure connectivity. Once the supplicant switch authenticates successfully the port mode changes from access to trunk in an authenticator switch. In a supplicant switch you must manually configure trunk when enabling CISP.

Note
NEAT configuration is the only supported and qualified method to authenticate switches using 802.1x. Any other method to authenticate a network switch can result in an undefined behavior.

• If the access VLAN is configured on the authenticator switch, it becomes the native VLAN for the trunk port after successful authentication.

In the default state, when you connect a supplicant switch to an authenticator switch that has BPDU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the `dot1x supplicant controlled transient` global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the `no dot1x supplicant controlled transient` global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the `dot1x supplicant controlled transient` command on a supplicant switch when BPDU guard is enabled on the authenticator switch port with the `spanning-tree bpduguard enable` interface configuration command.

Note
If you globally enable BPDU guard on the authenticator switch by using the `spanning-tree portfast bpduguard default` global configuration command, entering the `dot1x supplicant controlled transient` command does not prevent the BPDU violation.

You can enable MDA or multi auth mode on the authenticator switch interface that connects to one more supplicant switches. Multihost mode is not supported on the authenticator switch interface.

When you reboot an authenticator switch with single-host mode enabled on the interface, the interface may move to err-disabled state before authentication. To recover from err-disabled state, flap the authenticator port to activate the interface again and initiate authentication.

Use the `dot1x supplicant force-multicast` global configuration command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

• Host Authorization: Ensures that only traffic from authorized hosts (connecting to the switch with supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting to the supplicant switch to the authenticator switch.

• Auto enablement: Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs coming from supplicant switches. Configure the `cisco-av-pair` as `device-traffic-class=switch` at the ACS. (You can configure this under the `group` or the `user` settings.)
Figure 94: Authenticator and Supplicant Switch using CISP

1. Workstations (clients)
2. Supplicant switch (outside wiring closet)
3. Authenticator switch
4. Access control server (ACS)
5. Trunk port

The `switchport nonegotiate` command is not supported on supplicant and authenticator switches with NEAT. This command should not be configured at the supplicant side of the topology. If configured on the authenticator side, the internal macros will automatically remove this command from the port.

**Voice Aware 802.1x Security**

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Common Session ID

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.

The session ID includes:

- The IP address of the Network Access Device (NAD)
- A monotonically increasing unique 32 bit integer
- The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 160000050000000B288508E5:

```
Switch# show authentication sessions
Interface       MAC Address  Method  Domain  Status       Session ID
Fa4/0/4         0000.0000.0203  mab     DATA  Authz Success  160000050000000B288508E5
```

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 160000050000000B288508E5:

```
1w0d: %AUTHMGR-5-START: Starting 'mab' for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %MAB-5-SUCCESS: Authentication successful for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %AUTHMGR-7-RESULT: Authentication result 'success' from 'mab' for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
```

The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

802.1x Authentication Configuration Guidelines

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

• When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.

• If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

• The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:

  • Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.

  • EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.

  • Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

• Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

• Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

</tr>
</tbody>
</table>
VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

• When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

• The 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VMPS.

• You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

• After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (authentication timer inactivity and authentication timer reauthentication interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.

• When configuring the inaccessible authentication bypass feature, follow these guidelines:
  • The feature is supported on 802.1x port in single-host mode and multihosts mode.
  • If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
  • If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.
  • You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.
  • If the CTS links are in Critical Authentication mode and the master reloads, the policy where SGT was configured on a device will not be available on the new master. This is because the internal bindings will not be synced to the standby switch in a 3750-X switch stack.
  • You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
  • When wireless guest clients obtains IP from foreign client VLAN instead of anchor client VLAN, you should use the ip dhcp required command under the WLAN configuration to force clients to issue a new DHCP request. This prevents the clients from getting an incorrect IP at anchor.

MAC Authentication Bypass

These are the MAC authentication bypass configuration guidelines:

• Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.
• If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.

• If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.

• If the port is in the authorized state, the port remains in this state until re-authorization occurs.

• You can configure a timeout period for hosts that are connected by MAC authentication bypass but are inactive. The range is 1 to 65535 seconds.

Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an 802.1x-enabled port:

• In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.

• In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.

• In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

Configuring 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as dot1x force-unauthorized.

Follow these steps to enable the 802.1x readiness check on the switch:

Before you begin

Follow these guidelines to enable the readiness check on the switch:

• The readiness check is typically used before 802.1x is enabled on the switch.

• If you use the dot1x test capol-capable privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.

• When you configure the dot1x test capol-capable command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.

• When you configure the dot1x test capol-capable command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds...
within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
• The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

</table>
Configuring Voice Aware 802.1x Security

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature on the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

- You enable voice aware 802.1x security by entering the `errdisable detect cause security-violation shutdown vlan` global configuration command. You disable voice aware 802.1x security by entering the `no` version of this command. This command applies to all 802.1x-configured ports in the switch.

  **Note**  
  If you do not include the `shutdown vlan` keywords, the entire port is shut down when it enters the error-disabled state.

- If you use the `errdisable recovery cause security-violation` global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the `shutdown` and `no shutdown` interface configuration commands.

- You can re-enable individual VLANs by using the `clear errdisable interface interface-id vlan [vlan-list]` privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** errdisable detect cause security-violation shutdown vlan | Shut down any VLAN on which a security violation error occurs.  
  **Note** If the `shutdown vlan` keywords are not included, the entire port enters the error-disabled state and shuts down. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>errdisable recovery cause security-violation</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>clear errdisable interfaceinterface-id vlan [vlan-list]</td>
<td>(Optional) Reenable individual VLANs that have been error disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For interface-id specify the port on which to reenable individual VLANs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For vlan-list specify a list of VLANs to be re-enabled. If vlan-list is not specified, all VLANs are re-enabled.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Enter the following:</td>
<td>(Optional) Re-enable an error-disabled VLAN, and clear all error-disable indications.</td>
</tr>
<tr>
<td></td>
<td>• shutdown</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• no shutdown</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>show errdisable detect</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to configure the switch to shut down any VLAN on which a security violation error occurs:

```
Switch(config)# errdisable detect cause security-violation shutdown vlan
```

This example shows how to re-enable all VLANs that were error disabled on port Gigabit Ethernet 40/2.

```
Switch# clear errdisable interface gigabitethernet40/2 vlan
```

You can verify your settings by entering the `show errdisable detect` privileged EXEC command.

### Configuring the Switch-to-RADIUS-Server Communication

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius-server host` global configuration command. If you want to configure these options on a

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>124.2.2.12</td>
<td></td>
</tr>
</tbody>
</table>

**Step 7**

```plaintext
radius-server key *string*
```

*Example:*

```
Switch(config)# radius-server key abc1234
```

(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.

**Step 8**

```plaintext
interface *interface-id*
```

*Example:*

```
Switch(config)# interface gigabitethernet1/0/2
```

Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.

**Step 9**

```plaintext
switchport mode access
```

*Example:*

```
Switch(config-if)# switchport mode access
```

(Optional) Sets the port to access mode only if you configured the RADIUS server in Step 6 and Step 7.

**Step 10**

```plaintext
authentication port-control auto
```

*Example:*

```
Switch(config-if)# authentication port-control auto
```

Enables 802.1x authentication on the port.

**Step 11**

```plaintext
dot1x pae authenticator
```

*Example:*

```
Switch(config-if)# dot1x pae authenticator
```

Sets the interface Port Access Entity to act only as an authenticator and ignore messages meant for a supplicant.

**Step 12**

```plaintext
end
```

*Example:*

```
Switch(config-if)# end
```

Returns to privileged EXEC mode.
per-server basis, use the `radius-server timeout`, the `radius-server retransmit`, and the `radius-server key` global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

**Before you begin**

You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `radius-server host {hostname</td>
<td>ip-address}<code> </code>auth-port<code> </code>port-number<code> </code>key<code> </code>string`</td>
</tr>
<tr>
<td>Example: Switch(config)# <code>radius-server host 125.5.5.43 auth-port 1645 key rad123</code></td>
<td>For `hostname</td>
</tr>
</tbody>
</table>
Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the authentication port-control interface configuration command set to auto. Use the multi-domain keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

<td>interface interface-id</td>
<td>Specifies the port to which multiple hosts are indirectly attached, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
</tbody>
</table>

Related Topics

Switch-to-RADIUS-Server Communication, on page 1137
### Purpose

**Command or Action**

**Step 3**

`authentication host-mode [multi-auth | multi-domain | multi-host | single-host]`

**Example:**

```
Switch(config-if)# authentication host-mode multi-host
```

**Purpose**

Allows multiple hosts (clients) on an 802.1x-authorized port.

The keywords have these meanings:

- **multi-auth**—Allow multiple authenticated clients on both the voice VLAN and data VLAN.

  **Note**  
  The *multi-auth* keyword is only available with the `authentication host-mode` command.

- **multi-host**—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated.

- **multi-domain**—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port.

  **Note**  
  You must configure the voice VLAN for the IP phone when the host mode is set to `multi-domain`.

Make sure that the `authentication port-control` interface configuration command is set to `auto` for the specified interface.

**Step 4**

`end`

**Example:**

```
Switch(config-if)# end
```

Returns to privileged EXEC mode.

### Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.
**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> authentication periodic</td>
<td>Enables periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# authentication periodic</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> authentication timer {[[inactivity</td>
<td>reauthenticate</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-if)# authentication timer reauthenticate 180</td>
<td></td>
</tr>
</tbody>
</table>

Note: The default value is 3600 seconds. To change the value of the reauthentication timer or to have the switch use a RADIUS-provided session timeout, enter the `authentication timer reauthenticate` command.

This command affects the behavior of the switch only if periodic re-authentication is enabled.
Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The `authentication timer restart` interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

**Procedure**

**Step 6**

**copy running-config startup-config**  
**Example:**  
`Switch# copy running-config startup-config`

(Optional) Saves your entries in the configuration file.

---

### Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

---

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
`configure terminal`  
**Example:**  
`Switch# configure terminal` | Enters global configuration mode. |
| **Step 2**
`interface interface-id`  
**Example:**  
`Switch(config)# interface gigabitethernet2/0/1` | Specifies the port to be configured, and enter interface configuration mode. |
| **Step 3**
`authentication timer reauthenticate seconds`  
**Example:**  
`Switch(config-if)# authentication timer reauthenticate 60` | Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.

The range is 1 to 65535 seconds; the default is 5. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>show authentication sessions interface interface-id</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# show authentication sessions interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

## Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

### Note

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

#### Note

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switchport mode access</td>
<td>Sets the port to access mode only if you previously configured the RADIUS server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

---

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)# end
```

Sets the number of times that the switch sends an EAP-request/identity frame to the client before restarting the authentication process. The range is 1 to 10; the default is 2.

Returns to privileged EXEC mode.
### Enabling MAC Move

MAC move allows an authenticated host to move from one port on the switch to another.

Beginning in privileged EXEC mode, follow these steps to globally enable MAC move on the switch. This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>authentication mac-move permit</td>
<td>Enables MAC move on the switch. Default is deny.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# authentication mac-move</td>
<td></td>
</tr>
<tr>
<td></td>
<td>permit</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>In Session Aware Networking mode, the default CLI is <strong>access-session mac-move deny</strong>. To enable Mac Move in Session Aware Networking, use the <strong>no access-session mac-move</strong> global configuration command.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Enabling MAC Replace

MAC replace allows a host to replace an authenticated host on a port.

Beginning in privileged EXEC mode, follow these steps to enable MAC replace on an interface. This procedure is optional.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# interface gigabitethernet2/0/2</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>authentication violation {protect</td>
<td>replace</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-if)# authentication violation replace</td>
<td></td>
</tr>
</tbody>
</table>

The other keywords have these effects:

- **protect**: the port drops packets with unexpected MAC addresses without generating a system message.
- **restrict**: violating packets are dropped by the CPU and a system message is generated.
- **shutdown**: the port is error disabled when it receives an unexpected MAC address.
### Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```

When the stop message is not sent successfully, this message appears:

```
00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.
```

**Note**

You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

</tbody>
</table>
**Configuring a Guest VLAN**

When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code></td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config)# interface gigabitethernet 2/0/2</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Use one of the following:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>switchport mode access</code></td>
<td>• Sets the port to access mode.</td>
</tr>
<tr>
<td></td>
<td>• <code>switchport mode private-vlan host</code></td>
<td>• Configures the Layer 2 port as a private-VLAN host port.</td>

<td><code>authentication event no-response action authorize vlan vlan-id</code></td>
<td>Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config-if)# authentication event no-response action authorize vlan 2</code></td>
<td>You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
## Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>authentication port-control auto</td>
<td>Enables 802.1x authentication on the port.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# authentication port-control auto</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>authentication event fail action authorize vlan vlan-id</td>
<td>Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# authentication event fail action authorize vlan 2</td>
<td></td>
</tr>
</tbody>
</table>
You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the `authentication event retry retry count` interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

### Procedure

<table>

</tbody>
</table>

### Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN

Beginning in privileged EXEC mode, follow these steps to configure critical voice VLAN on a port and enable the inaccessible authentication bypass feature.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Switch(config)# aaa new-model</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Sets the conditions that determine when a RADIUS server is considered un-available or down (dead).</td>
</tr>
<tr>
<td>radius-server dead-criteria {time seconds } [tries number]</td>
<td>Example:</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| Switch(config)# radius-server dead-criteria time 20 tries 10 | - **time**—1 to 120 seconds. The switch dynamically determines a default *seconds* value between 10 and 60.  
- **number**—1 to 100 tries. The switch dynamically determines a default *tries number* between 10 and 100.  

**Step 4**

radius-server deadtime minutes

Example:

Switch(config)# radius-server deadtime 60

(Optional) Sets the number of minutes during which a RADIUS server is not sent requests. The range is from 0 to 1440 minutes (24 hours). The default is 0 minutes.

**Step 5**

radius-server host ip-address address[acct-port udp-port][auth-port udp-port] [testusername name][idle-time time] [ignore-acct-port][ignore-auth-port] [key string]

Example:

Switch(config)# radius-server host 1.1.1.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234

(Optional) Configure the RADIUS server parameters by using these keywords:

- **acct-portudp-port**—Specify the UDP port for the RADIUS accounting server. The range for the UDP port number is from 0 to 65536. The default is 1646.

- **auth-portudp-port**—Specify the UDP port for the RADIUS authentication server. The range for the UDP port number is from 0 to 65536. The default is 1645.

**Note** You should configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.

- **test username name**—Enable automated testing of the RADIUS server status, and specify the username to be used.

- **idle-time time**—Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes. The default is 60 minutes (1 hour).

- **ignore-acct-port**—Disable testing on the RADIUS-server accounting port.

- **ignore-auth-port**—Disable testing on the RADIUS-server authentication port.
• For keystring, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.

**Note** Always configure the key as the last item in the `radius-server host` command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.

You can also configure the authentication and encryption key by using the `radius-server key {0string | 7string | string}` global configuration command.

### Step 6

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x critical {eapol</td>
<td>recovery delay milliseconds}</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# dot1x critical eapol
Switch(config)# dot1x critical recovery delay 2000
```

- **eapol**—Specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port.

- **recovery delay milliseconds**—Set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The range is from 1 to 10000 milliseconds. The default is 1000 milliseconds (a port can be re-initialized every second).

### Step 7

**Command or Action**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# interface gigabitethernet 1/0/1
```
Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 8** | `authentication event server dead action {authorize | reinitialize} vlan vlan-id` | Use these keywords to move hosts on the port if the RADIUS server is unreachable:  
  - **authorize**—Move any new hosts trying to authenticate to the user-specified critical VLAN.  
  - **reinitialize**—Move all authorized hosts on the port to the user-specified critical VLAN. |
| Example: | Switch(config-if)# `authentication event server dead action authorize vlan 20` |
| **Step 9** | `switchport voice vlan vlan-id` | Specifies the voice VLAN for the port. The voice VLAN cannot be the same as the critical data VLAN configured in Step 6. |
| Example: | Switch(config-if)# `switchport voice vlan 20` |
| **Step 10** | `authentication event server dead action authorize voice` | Configures critical voice VLAN to move data traffic on the port to the voice VLAN if the RADIUS server is unreachable. |
| Example: | Switch(config-if)# `authentication event server dead action authorize voice` |
| **Step 11** | `show authentication interface interface-id` | (Optional) Verify your entries. |
| Example: | Switch(config-if)# `do show authentication interface gigabit 1/0/1` |
| **Step 12** | `copy running-config startup-config` | (Optional) Verify your entries. |
| Example: | Switch(config-if)# `do copy running-config startup-config` |

**Example**

To return to the RADIUS server default settings, use the `no radius-server dead-criteria`, the `no radius-server deadtime`, and the `no radius-server host` global configuration commands. To disable inaccessible authentication bypass, use the `no authentication event server dead action` interface configuration command. To disable critical voice VLAN, use the `no authentication event server dead action authorize voice` interface configuration command.
Example of Configuring Inaccessible Authentication Bypass

This example shows how to configure the inaccessible authentication bypass feature:

```
Switch(config)# radius-server dead-criteria time 30 tries 20
Switch(config)# radius-server deadtime 60
Switch(config)# radius-server host 1.1.1.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234
Switch(config)# dot1x critical eapol
Switch(config)# dot1x critical recovery delay 2000
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# dot1x critical
Switch(config-if)# dot1x critical vlan 20
Switch(config-if)# end
```

Configuring 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>

</table>
### Formatting a MAC Authentication Bypass Username and Password

Use the optional `mab request format` command to format the MAB username and password in a style accepted by the authentication server. The username and password are usually the MAC address of the client. Some authentication server configurations require the password to be different from the username.

Beginning in privileged EXEC mode, follow these steps to format MAC authentication bypass username and passwords.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the format of the MAC address in the User-Name attribute of MAB-generated Access-Request packets.</td>
</tr>
<tr>
<td>`mab request format attribute 1 groupsize {1</td>
<td>2</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>1—Sets the username format of the 12 hex digits of the MAC address.</td>
</tr>
<tr>
<td><code>Switch(config)# mab request format attribute 1 groupsize 12</code></td>
<td>group size—The number of hex nibbles to concatenate before insertion of a separator. A valid groupsize must be either 1, 2, 4, or 12. separator—The character that separates the hex nibbles according to group size. A valid separator must be either a hyphen, colon, or period. No separator is used for a group size of 12. {lowercase</td>
</tr>
</tbody>
</table>
### Configuring 802.1x User Distribution

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal  
Example:  
Switch# configure terminal | Enters global configuration mode. |
| **Step 2**
vlan group *vlan-group-name* vlan-list *vlan-list*  
Example:  
Switch(config)# vlan group eng-dept vlan-list 10 | Configures a VLAN group, and maps a single VLAN or a range of VLANs to it. |
| **Step 3**
end  
Example:  
Switch(config)# end | Returns to privileged EXEC mode. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# end</code></td>
<td>Clears the VLAN group configuration or elements of the VLAN group configuration.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>no vlan group vlan-group-name vlan-list</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# no vlan group eng-dept vlan-list 10</code></td>
</tr>
</tbody>
</table>

### Example of Configuring VLAN Groups

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```
Switch(config)# vlan group eng-dept vlan-list 10
Switch(config)# show vlan group group-name eng-dept
Group Name   Vlans Mapped
-------------
eng-dept     10

Switch(config)# show dot1x vlan-group all
Group Name   Vlans Mapped
-------------
eng-dept     10
hr-dept      20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:

```
Switch(config)# vlan group eng-dept vlan-list 30
Switch(config)# show vlan group eng-dept
Group Name   Vlans Mapped
-------------
eng-dept     10,30
```

This example shows how to remove a VLAN from a VLAN group:

```
Switch# no vlan group eng-dept vlan-list 10
```

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:

```
Switch(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.
```

This example shows how to clear all the VLAN groups:

```
Switch(config)# no vlan group end-dept vlan-list all
```
Switch(config)# show vlan-group all

For more information about these commands, see the Cisco IOS Security Command Reference.

Configuring NAC Layer 2 802.1x Validation

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface</td>
<td></td>
</tr>
<tr>
<td></td>
<td>gigabitethernet2/0/3</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport mode access</td>
<td>Sets the port to access mode only if you configured the RADIUS server.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# switchport mode</td>
<td></td>
</tr>
<tr>
<td></td>
<td>access</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>authentication event no-response action authorize vlan vlan-id</td>
<td>Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN, or a voice VLAN as an 802.1x guest VLAN.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# authentication</td>
<td></td>
</tr>
<tr>
<td></td>
<td>event no-response action authorize</td>
<td></td>
</tr>
<tr>
<td></td>
<td>vlan 8</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>authentication periodic</td>
<td>Enables periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# authentication</td>
<td></td>
</tr>
<tr>
<td></td>
<td>periodic</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring Limiting Login for Users

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> () enable () Example: Device&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> () configure terminal () Example: Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> () aaa new-model () Example: Device(config)# aaa new-model</td>
<td>Enables the authentication, authorization, and accounting (AAA) access control model.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>-------------------</td>
</tr>
<tr>
<td>4</td>
<td>aaa authentication login default local</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config)# aaa authentication login default local</td>
</tr>
<tr>
<td>5</td>
<td>aaa authentication rejected $n$ in $m$ ban $x$</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config)# aaa authentication rejected 3 in 20 ban 300</td>
</tr>
<tr>
<td>6</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device(config)# end</td>
</tr>
<tr>
<td>7</td>
<td>show aaa local user blocked</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device# show aaa local user blocked</td>
</tr>
<tr>
<td>8</td>
<td>clear aaa local user blocked username $username$</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td></td>
<td>Device# clear aaa local user blocked username user1</td>
</tr>
</tbody>
</table>

**Example**

The following is sample output from the **show aaa local user blocked** command:

```
Device# show aaa local user blocked

Local-user     State
user1           Watched (till 11:34:42 IST Feb 5 2015)
```
Configuring an Authenticator Switch with NEAT

Configuring this feature requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

- The authenticator switch interface configuration must be restored to access mode by explicitly flapping it if a line card is removed and inserted in the chassis when CISP or NEAT session is active.
- The cisco-av-pairs must be configured as device-traffic-class=switch on the ISE, which sets the interface as a trunk after the supplicant is successfully authenticated.

Beginning in privileged EXEC mode, follow these steps to configure a switch as an authenticator:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>cisp enable</td>
<td>Enables CISP.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# cisp enable</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>switchport mode access</td>
<td>Sets the port mode to access.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>authentication port-control auto</td>
<td>Sets the port-authentication mode to auto.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# authentication port-control auto</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Supplicant Switch with NEAT

Beginning in privileged EXEC mode, follow these steps to configure a switch as a supplicant:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>(Optional) Saves your entries in the</td>
</tr>
<tr>
<td>Example:</td>
<td>configuration file.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Saving changes to the configuration</td>
</tr>
<tr>
<td></td>
<td>file will mean that the authenticator</td>
</tr>
<tr>
<td></td>
<td>interface will continue to be in trunk mode</td>
</tr>
<tr>
<td></td>
<td>after reload. If you want the authenticator</td>
</tr>
<tr>
<td></td>
<td>interface to remain as an access port, do not</td>
</tr>
<tr>
<td></td>
<td>save your changes to the configuration file.</td>
</tr>
</tbody>
</table>

#### Configuring a Supplicant Switch with NEAT

<table>
<thead>
<tr>
<th>Step 6</th>
<th>dot1x pae authenticator</th>
<th>Configures the interface as a port access entity (PAE) authenticator.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# dot1x pae authenticator</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>spanning-tree portfast</th>
<th>Enables Port Fast on an access port connected to a single workstation or server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# spanning-tree portfast trunk</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>end</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>show running-config interface interface-id</th>
<th>Verifies your configuration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# show running-config interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 10</th>
<th>copy running-config startup-config</th>
<th>(Optional) Saves your entries in the configuration file.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

Saving changes to the configuration file will mean that the authenticator interface will continue to be in trunk mode after reload. If you want the authenticator interface to remain as an access port, do not save your changes to the configuration file.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enables CISP.</td>
</tr>
</tbody>
</table>
| **Step 2** cisp enable  
  Example:  
  Switch(config)# cisp enable | |
| **Step 3** dot1x credentials profile  
  Example:  
  Switch(config)# dot1x credentials test | Creates 802.1x credentials profile. This must be attached to the port that is configured as supplicant. |
| **Step 4** username suppswitch  
  Example:  
  Switch(config)# username suppswitch | Creates a username. |
| **Step 5** password password  
  Example:  
  Switch(config)# password myswitch | Creates a password for the new username. |
| **Step 6** dot1x supplicant force-multicast  
  Example:  
  Switch(config)# dot1x supplicant force-multicast | Forces the switch to send only multicast EAPOL packets when it receives either unicast or multicast packets. This also allows NEAT to work on the supplicant switch in all host modes. |
| **Step 7** interface interface-id  
  Example:  
  Switch(config)# interface gigabitethernet1/0/1 | Specifies the port to be configured, and enter interface configuration mode. |
| **Step 8** switchport trunk encapsulation dot1q  
  Example:  
  Switch(config-if)# switchport trunk encapsulation dot1q | Sets the port to trunk mode. |
### Purpose

**Command or Action**

**Step 9**  
*switchport mode trunk*  
*Example:*  
Switch(config-if)# switchport mode trunk

**Step 10**  
*dot1x pae supplicant*  
*Example:*  
Switch(config-if)# dot1x pae supplicant

**Step 11**  
*dot1x credentials* *profile-name*  
*Example:*  
Switch(config-if)# dot1x credentials test

**Step 12**  
*end*  
*Example:*  
Switch(config-if)# end

**Step 13**  
*show running-config interface* *interface-id*  
*Example:*  
Switch# show running-config interface gigabitethernet1/0/1

**Step 14**  
*copy running-config startup-config*  
*Example:*  
Switch# copy running-config startup-config

**Step 15**  
Configuring NEAT with Auto Smartports Macros  
(Optional) Saves your entries in the configuration file.

You can also use an Auto Smartports user-defined macro instead of the switch VSA to configure the authenticator switch. For more information, see the *Auto Smartports Configuration Guide* for this release.
Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

In addition to configuring 802.1x authentication on the switch, you need to configure the ACS. For more information, see the Configuration Guide for Cisco Secure ACS 4.2: http://www.cisco.com/en/US/docs/net_mgmt/cisco_secure_access_control_server_for_windows/4.2/configuration/guide/acs_config.pdf

You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the `show ip access-list` privileged EXEC command to display the downloaded ACLs on the port.

Configuring Downloadable ACLs

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configure terminal</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip device tracking</code></td>
<td>Sets the ip device tracking table.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# ip device tracking</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>aaa new-model</code></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>aaa authorization network default local group radius</code></td>
<td>Sets the authorization method to local. To remove the authorization method, use the <code>no aaa authorization network default local group radius</code> command.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# aaa authorization network default local group radius</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>radius-server vsa send authentication</code></td>
<td>Configures the radius vsa send authentication.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>access-list access-list-number { deny</td>
<td>permit }</td>
</tr>
</tbody>
</table>

The access-list-number is a decimal number from 1 to 99 or 1300 to 1999.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# access-list 1 deny any log</td>
<td>Enter <code>deny</code> or <code>permit</code> to specify whether to deny or permit access if conditions are matched. The source is the source address of the network or host that sends a packet, such as this:</td>
</tr>
<tr>
<td></td>
<td>• <code>hostname</code>: The 32-bit quantity in dotted-decimal format.</td>
</tr>
<tr>
<td></td>
<td>• <code>any</code>: The keyword <code>any</code> as an abbreviation for source and source-wildcard value of 0.0.0.0.255.255.255.255. You do not need to enter a source-wildcard value.</td>
</tr>
<tr>
<td></td>
<td>• <code>host</code>: The keyword <code>host</code> as an abbreviation for source and source-wildcard of source 0.0.0.0.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Applies the source-wildcard wildcard bits to the source.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</td>
</tr>
</tbody>
</table>

**Step 3**  
**interface** `interface-id`  
**Example:**  
Switch(config)# interface gigabitethernet2/0/2  

Enters interface configuration mode.  

**Step 4**  
**ip access-group** `acl-id` in  
**Example:**  
Switch(config-if)# ip access-group default_acl in  

Configures the default ACL on the port in the input direction.  

**Note**: The acl-id is an access list name or number.  

**Step 5**  
**exit**  
**Example:**  
Switch(config-if)# exit  

Returns to global configuration mode.  

**Step 6**  
**aaa new-model**  
**Example:**  
Switch(config)# aaa new-model  

Enables AAA.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td><code>aaa authorization network default group radius</code></td>
<td>Sets the authorization method to local. To remove the authorization method, use the <code>no aaa authorization network default group radius</code> command.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# aaa authorization network default group radius</code></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td><code>ip device tracking</code></td>
<td>Enables the IP device tracking table. To disable the IP device tracking table, use the <code>no ip device tracking</code> global configuration commands.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# ip device tracking</code></td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>`ip device tracking probe [count</td>
<td>interval</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# ip device tracking probe count</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>• count count</code>—Sets the number of times that the switch sends the ARP probe. The range is from 1 to 5. The default is 3.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>• interval interval</code>—Sets the number of seconds that the switch waits for a response before resending the ARP probe. The range is from 30 to 300 seconds. The default is 30 seconds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>• use-svi</code>—Uses the switch virtual interface (SVI) IP address as source of ARP probes.</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td><code>radius-server vsa send authentication</code></td>
<td>Configures the network access server to recognize and use vendor-specific attributes.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# radius-server vsa send authentication</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The downloadable ACL must be operational.</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

## Configuring VLAN ID-based MAC Authentication

Beginning in privileged EXEC mode, follow these steps:
### Configuring Flexible Authentication Ordering

The examples used in the instructions below change the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.

**Note**

Beginning in privileged EXEC mode, follow these steps:

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>mab request format attribute 32 vlan access-vlan</td>
<td>Enables VLAN ID-based MAC authentication.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# mab request format attribute 32 vlan access-vlan</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Open1x

Beginning in privileged EXEC mode, follow these steps to enable manual control of the port authorization state:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Sets the port to access mode only if you previously configured the RADIUS server.</td>
</tr>
<tr>
<td><code>switchport mode access</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# switchport mode access</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Sets the order of authentication methods used on a port.</td>
</tr>
<tr>
<td>`authentication order [ dot1x</td>
<td>mab ]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# authentication order mab dot1x</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Adds an authentication method to the port-priority list.</td>
</tr>
<tr>
<td>`authentication priority [ dot1x</td>
<td>mab ]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# authentication priority mab dot1x</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

</tbody>
</table>
### Disabling 802.1x Authentication on the Port

You can disable 802.1x authentication on the port by using the `no dot1x pae` interface configuration command. Beginning in privileged EXEC mode, follow these steps to disable 802.1x authentication on the port. This procedure is optional.

#### Procedure

<table>

Configuring Web-Based Authentication

The Web-Based Authentication feature, also known as web authentication proxy, authenticates end users on host systems that do not run the IEEE 802.1x supplicant.

- Finding Feature Information, on page 1211
- Information About Web-Based Authentication, on page 1211
- How to Configure Web-Based Authentication, on page 1228
- Configuration Examples for Web-Based Authentication, on page 1242
- Additional References for Web-Based Authentication, on page 1244
- Feature Information for Web-Based Authentication, on page 1244

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Web-Based Authentication

Web-Based Authentication Overview

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

Note

You can configure web-based authentication on Layer 2 and Layer 3 interfaces.
When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.

**Note**
HTTPS traffic interception for central web authentication redirect is not supported.

**Note**
You should use global parameter-map (for method-type, custom, and redirect) only for using the same web authentication methods like consent, web consent, and webauth, for all the clients and SSIDs. This ensures that all the clients have the same web-authentication method.

If the requirement is to use Consent for one SSID and Web-authentication for another SSID, then you should use two named parameter-maps. You should configure Consent in first parameter-map and configure webauth in second parameter-map.

**Note**
The traceback that you receive when webauth client tries to do authentication does not have any performance or behavioral impact. It happens rarely when the context for which FFM replied back to EPM for ACL application is already dequeued (possibly due to timer expiry) and the session becomes ‘unauthorized’.

Based on where the web pages are hosted, the local web authention can be categorized as follows:

- **Internal**—The internal default HTML pages (Login, Success, Fail, and Expire) in the controller are used during the local web authentication.

- **Customized**—The customized web pages (Login, Success, Fail, and Expire) are downloaded onto the controller and used during the local web authentication.

- **External**—The customized web pages are hosted on the external web server instead of using the in-built or custom web pages.

Based on the various web authentication pages, the types of web authentication are as follows:

- **Webauth**—This is a basic web authentication. Herein, the controller presents a policy page with the user name and password. You need to enter the correct credentials to access the network.

- **Consent or web-passthrough**—Herein, the controller presents a policy page with the Accept or Deny buttons. You need to click the Accept button to access the network.

- **Webconsent**—This is a combination of webauth and consent web authentication types. Herein, the controller presents a policy page with Accept or Deny buttons along with user name or password. You need to enter the correct credentials and click the Accept button to access the network.
Device Roles

With web-based authentication, the devices in the network have these specific roles:

- **Client**—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with JavaScript enabled.

- **Authentication server**—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.

- **Switch**—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

*Figure 95: Web-Based Authentication Device Roles*

This figure shows the roles of these devices in a network.

Host Detection

The switch maintains an IP device tracking table to store information about detected hosts.

*Note* By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- **ARP based trigger**—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.

- **Dynamic ARP inspection**

- **DHCP snooping**—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.
Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- Reviews the exception list.
  
  If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.

- Reviews for authorization bypass
  
  If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.
  
  If the server response is access accepted, authorization is bypassed for this host. The session is established.

- Sets up the HTTP intercept ACL
  
  If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.

Authentication Process

When you enable web-based authentication, these events occur:

- The user initiates an HTTP session.

- The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.

- If the authentication succeeds, the switch downloads and activates the user’s access policy from the authentication server. The login success page is sent to the user.

- If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.

- If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.

- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.

- The feature applies the downloaded timeout or the locally configured session timeout.

Note

Beginning with Cisco IOS XE Denali 16.1.1 and later, the default session timeout value for web-based authentication on WLC is 1800 seconds. The default session timeout value was infinite seconds, prior to Cisco IOS XE Denali 16.1.1.

- If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.

- If the terminate action is default, the session is dismantled, and the applied policy is removed.
Using Authentication Proxy

The authentication proxy feature requires some user interaction on the client host. The table below describes the interaction of the authentication proxy with the client host.

<table>
<thead>
<tr>
<th>Authentication Proxy Action with Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Triggering on HTTP connections</td>
<td>If a user is not currently authenticated at the firewall router, any HTTP connection initiated by the user triggers the authentication proxy. If the user is already authenticated, the authentication proxy is transparent to the user.</td>
</tr>
<tr>
<td>Logging in using the login page</td>
<td>Triggering the authentication proxy generates an HTML-based login page. The user must enter a username and password to be authenticated with the AAA server. The Authentication Proxy Login Page figure, in the How the Authentication Proxy Works module, illustrates the authentication proxy login page.</td>
</tr>
<tr>
<td>Authenticating the user at the client</td>
<td>Following the login attempt, the authentication proxy action can vary depending on whether JavaScript is enabled in the browser. If JavaScript is enabled, and authentication is successful, the authentication proxy displays a message indicating the status of the authentication as shown in the Authentication Proxy Login Status Message figure, in the How the Authentication Proxy Works module. After the authentication status is displayed, the proxy automatically completes the HTTP connection. If JavaScript is disabled, and authentication is successful, the authentication proxy generates a popup window with additional instructions for completing the connection. See the Authentication Proxy Login Status Message with JavaScript Disabled figure, in the Secure Authentication module. If authentication is unsuccessful in any case, the user must log in again from the login page.</td>
</tr>
</tbody>
</table>

When to Use the Authentication Proxy

The following are some situations in which you can use the authentication proxy:

- You want to manage access privileges on an individual (per-user) basis using the services provided by the authentication servers instead of configuring access control based on host IP address or global access policies. Authenticating and authorizing users from any host IP address also allows network administrators to configure host IP addresses using DHCP.

- You want to authenticate and authorize local users before permitting access to intranet or Internet services.

- You want to authenticate and authorize remote users before permitting access to local services.

- You want to control access for specific extranet users. For example, you might want to authenticate and authorize the financial officer of a corporate partner with one set of access privileges while authorizing the technology officer for that same partner to use another set of access privileges.

- You want to use the authentication proxy in conjunction with VPN client software to validate users and to assign specific access privileges.
• You want to use the authentication proxy in conjunction with AAA accounting to generate “start” and “stop” accounting records that can be used for billing, security, or resource allocation purposes, thereby allowing users to track traffic from the authenticated hosts.

**Applying Authentication Proxy**

Apply the authentication proxy in the inbound direction at any interface on the router where you want per-user authentication and authorization. Applying the authentication proxy inbound at an interface causes it to intercept the initial connection request from an user, before that request is subjected to any other processing. If the user fails to gain authentication with the AAA server, the connection request is dropped.

How you apply the authentication proxy depends on your security policy. For example, you can block all traffic through an interface and enable the authentication proxy feature to require authentication and authorization for all user-initiated HTTP connections. Users are authorized for services only after successful authentication with the AAA server.

The authentication proxy feature also allows you to use standard access lists to specify a host or group of hosts whose initial HTTP traffic triggers the proxy.

The figure below shows the authentication proxy applied at the LAN interface with all network users required to be authenticated upon the initial connection (all traffic is blocked at each interface).

*Figure 96: Applying the Authentication Proxy at the Local Interface*

The figure below shows the authentication proxy applied at the dial-in interface with all network traffic blocked at each interface.

*Figure 97: Applying the Authentication Proxy at an Outside Interface*
Local Web Authentication Banner

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.

The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

- **Authentication Successful**
- **Authentication Failed**
- **Authentication Expired**

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:

- **Legacy mode**—Use the `ip admission auth-proxy-banner http` global configuration command.
- **New-style mode**—Use the `parameter-map type webauth global banner` global configuration command.

The default banner *Cisco Systems* and *Switch host-name Authentication* appear on the Login Page. *Cisco Systems* appears on the authentication result pop-up page.

*Figure 98: Authentication Successful Banner*

![Authentication Successful Banner](image)

The banner can be customized as follows:

- Add a message, such as switch, router, or company name to the banner:
  - **Legacy mode**—Use the `ip admission auth-proxy-banner http banner-text` global configuration command.
  - **New-style mode**—Use the `parameter-map type webauth global banner` global configuration command.

- Add a logo or text file to the banner:
- Legacy mode—Use the `ip admission auth-proxy-banner http file-path` global configuration command.

- New-style mode—Use the `parameter-map type webauth global banner` global configuration command.

Figure 99: Customized Web Banner

If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.
Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

- **Login**—Your credentials are requested.
- **Success**—The login was successful.
- **Fail**—The login failed.
- **Expire**—The login session has expired because of excessive login failures.

**Guidelines**

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the *login, success, failure*, and *expire* web pages.
- On the banner page, you can specify text in the login page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, http://www.cisco.com). An incomplete URL might cause *page not found* or similar errors on a web browser.
• If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).

• The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.

• If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.

•Configured web pages can be copied to the switch boot flash or flash.

• On stackable switches, configured pages can be accessed from the flash on the stack master or members.

• The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).

• You must configure all four pages.

• The banner page has no effect if it is configured with the web page.

• All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use web_auth_<filename> as the file name.

• The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.

Figure 101: Customizable Authentication Page
Authentication Proxy Web Page Guidelines

When configuring customized authentication proxy web pages, follow these guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.

- The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.

- Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.

- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.

- To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.

- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.

- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.

- To remove the specification of a custom file, use the no form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as **uname** and **pwd**.

- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.

- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.

- To remove the specification of a redirection URL, use the no form of the command.

- If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, http://) followed by the URL information. If only the URL is given without http://, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

Web Authentication Redirection to Original URL Overview

The Web Authentication Redirection to Original URL feature enables networks to redirect guest users to the URL that they had originally requested. This feature is enabled by default and requires no configuration.

Guest networks are network connections provided by an enterprise to allow their guests to gain access to the Internet and to their own enterprise networks without compromising the security of the host enterprise. Guest
users of an enterprise network can connect to the guest access network through either a wired Ethernet connection or a wireless connection.

Guest access uses a captive portal to gather all web requests made by guests and redirect these requests to one of the guest on-boarding web pages. When guests successfully complete the guest workflow, they are redirected to the page that they had originally requested.

The originally requested URL is passed as metadata along with the Cisco Identity Services Engine (ISE) guest access redirect URL. The Cisco ISE is a security policy management and control platform. It automates and simplifies access control and security compliance for wired, wireless, and VPN connectivity. The requested URL is added at the end of the Cisco ISE guest URL so that the device can send the redirect URL to the guest client. The Cisco ISE parses the URL and redirects the guest to the original URL after completing the on-boarding.

The following is an example of a redirect URL along with the original requested URL:

In this example, the URL, https://10.64.67.92:8443/guestportal/gateway?sessionId=0920269E0000000B0002426B&action=cwa is the URL for the guest portal, “&” tells the browser that what follows is a list of name value pairs, and redirect_url=http://www.cisco.com identifies the URL that the user originally requested and to which the user is redirected after completing the guest workflow.

This illustration displays the packet flow that redirects a user to the originally requested URL:
1. A user accesses a network for the first time and sends an HTTP request to access www.google.com. When the user first accesses the network, a MAC authentication bypass (MAB) is triggered and the MAC address is sent to the Cisco ISE.

2. The Cisco ISE returns a RADIUS access-accept message (even if the MAC address is not received) along with the redirect access control list (ACL), the ACL-WEBAUTH-REDIRECT message, and the guest web portal URL to the device.

   The RADIUS message instructs the device to open a port that is restricted based on the configured port and the redirect ACLs, for regular network traffic.

3. When the user launches a web browser, the device intercepts the HTTP traffic and redirects the browser to the Cisco ISE central web authentication (CWA) guest web portal URL; the user-requested URL is extracted and appended to the Cisco ISE guest URL.

4. When the user is authenticated, the Cisco ISE sends the Device Registration page to the user. The user enters the required information, and the page is returned to the Cisco ISE. The Cisco ISE downloads user profiles and redirects the user to the originally requested URL: www.google.com.
Web-based Authentication Interactions with Other Features

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.

- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

- Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

AAA Accounting with Authentication Proxy

Using the authentication proxy, you can generate “start” and “stop” accounting records with enough information to be used for billing and security auditing purposes. Thus, you can monitor the actions of authenticated hosts that use the authentication proxy service.

When an authentication proxy cache and associated dynamic access control lists (ACLs) are created, the authentication proxy will start to track the traffic from the authenticated host. Accounting saves data about this event in a data structure stored with the data of other users. If the accounting start option is enabled, you can generate an accounting record (a “start” record) at this time. Subsequent traffic from the authenticated host will be recorded when the dynamic ACL created by the authentication proxy receives the packets.

When an authentication proxy cache expires and is deleted, additional data, such as elapsed time, is added to the accounting information and a “stop” record is sent to the server. At this point, the information is deleted from the data structure.
The accounting records for the authentication proxy user session are related to the cache and the dynamic ACL usage.

**ACLs**

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

**Context-Based Access Control**

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

**EtherChannel**

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

**Gateway IP**

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

**LAN Port IP**

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated by using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated, and posture is validated again.

**Port Security**

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.
Default Web-Based Authentication Configuration

The following table shows the default web-based authentication configuration.

Table 130: Default Web-based Authentication Configuration

<table>
<thead>
<tr>
<th>Feature</th>

<td>• None specified</td>
</tr>
<tr>
<td>Default value of inactivity timeout</td>
<td>3600 seconds</td>
</tr>
<tr>
<td>Inactivity timeout</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Web-Based Authentication Configuration Guidelines and Restrictions

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- External web authentication, where the switch redirects a client to a particular host or web server for displaying login message, is not supported.
- You must configure the default ACL on the interface before configuring web-based authentication. Configure a port ACL for a Layer 2 interface or a Cisco IOS ACL for a Layer 3 interface.
- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable-host policy.
- Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.
- Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.
• Web-based authentication NRH (Non-Responsive Host) is not supported for voice devices.

• Only the Password Authentication Protocol (PAP) is supported for web-based RADIUS authentication on controllers. The Challenge Handshake Authentication Protocol (CHAP) is not supported for web-based RADIUS authentication on controllers.

• Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:
  
  • Host name
  • Host IP address
  • Host name and specific UDP port numbers
  • IP address and specific UDP port numbers

  The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

• When you configure the RADIUS server parameters:

  • Specify the key string on a separate command line.

  • For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.

  • When you specify the key string, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.

  • You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the radius-server host global configuration command. If you want to configure these options on a per-server basis, use the radius-server timeout, radius-server transmit, and the radius-server key global configuration commands. For more information, see the Cisco IOS Security Configuration Guide, Release 12.4 and the Cisco IOS Security Command Reference, Release 12.4.

  ————

  Note

  You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.

  ————

• When you upgrade from IOS XE release 3.6.x and 3.7.x, ensure that you use radius-server attribute wireless accounting call-station-id macaddress command to configure mac-address. This is because the accounting default call-station-id is changed from mac-address to IP address from Cisco IOS XE Denali 16.3.x onwards.
How to Configure Web-Based Authentication

Configuring the Authentication Rule and Interfaces

Follow these steps to configure the authentication rule and interfaces:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt;</code> <code>enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>ip admission name name proxy http</code></td>
<td>Configures an authentication rule for web-based authorization.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# ip admission name webauth1 proxy http</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>interface type slot/port</code></td>
<td>Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# interface gigabitethernet 1/0/1</code></td>
<td><code>type</code> can be fastethernet, gigabit ethernet, or tengigabitethernet.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>ip access-group name</code></td>
<td>Applies the default ACL.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-if)# ip access-group webauthag</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>ip admission name</code></td>
<td>Configures an authentication rule for web-based authorization for the interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# ip admission name</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring AAA Authentication

Follow these steps to configure AAA authentication:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>* enable</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

Use default list for AAA authorization, if you are planning to use features such as dACL.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>configure terminal&lt;br&gt;Example: Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>aaa new-model&lt;br&gt;Example: Switch(config)# aaa new-model</td>
<td>Enables AAA functionality.</td>
</tr>
<tr>
<td>4</td>
<td>aaa authentication login default group {tacacs+</td>
<td>radius}&lt;br&gt;Example: Switch(config)# aaa authentication login default group tacacs+</td>
</tr>
<tr>
<td>5</td>
<td>aaa authorization auth-proxy default group {tacacs+</td>
<td>radius}&lt;br&gt;Example: Switch(config)# aaa authorization auth-proxy default group tacacs+</td>
</tr>
<tr>
<td>6</td>
<td>tacacs-server host {hostname</td>
<td>ip_address}&lt;br&gt;Example: Switch(config)# tacacs-server host 10.1.1.1</td>
</tr>
<tr>
<td>7</td>
<td>tacacs-server key {key-data}&lt;br&gt;Example: Switch(config)# tacacs-server key</td>
<td>Configures the authorization and encryption key used between the switch and the TACACS server.</td>
</tr>
<tr>
<td>8</td>
<td>end&lt;br&gt;Example: Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>9</td>
<td>show running-config&lt;br&gt;Example:</td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>
### Configuring Switch-to-RADIUS-Server Communication

Follow these steps to configure the RADIUS server parameters:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| Example: Switch> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: Switch# configure terminal |
| **Step 3** ip radius source-interface vlan vlan interface number | Specifies that the RADIUS packets have the IP address of the indicated interface. |
| Example: Switch(config)# ip radius source-interface vlan 80 |
| **Step 4** radius-server host {hostname | ip-address} test username username | Specifies the host name or IP address of the remote RADIUS server.  
  The **test username username** option enables automated testing of the RADIUS server connection. The specified **username** does not need to be a valid user name.  
  The **key** option specifies an authentication and encryption key to use between the switch and the RADIUS server. |
| Example: Switch(config)# radius-server host 172.120.39.46 test username user1 |
To use multiple RADIUS servers, reenter this command for each server.

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.</td>
<td>radius-server key string</td>
</tr>
</tbody>
</table>

Example:
```
Switch(config)# radius-server key rad123
```

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive. The range of num-tries is 1 to 100.</td>
<td>radius-server dead-criteria tries num-tries</td>
</tr>
</tbody>
</table>

Example:
```
Switch(config)# radius-server dead-criteria tries 30
```

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns to privileged EXEC mode.</td>
<td>end</td>
</tr>
</tbody>
</table>

Example:
```
Switch(config)# end
```

### Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the Switch. You can enable the server for either HTTP or HTTPS.

#### Note

The Apple psuedo-browser will not open if you configure only the `ip http secure-server` command. You should also configure the `ip http server` command.

Follow these steps to enable the server for either HTTP or HTTPS:

#### Procedure

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables privileged EXEC mode.</td>
<td>enable</td>
</tr>
</tbody>
</table>

Example:
```
Switch> enable
```

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enters global configuration mode.</td>
<td>configure terminal</td>
</tr>
</tbody>
</table>

Example:
```
```
## Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the Switch default HTML pages during web-based authentication.

For the equivalent Session Aware Networking configuration example for this feature, see the section "Configuring a Parameter Map for Web-Based Authentication" in the chapter, "Configuring Identity Control Policies." of the book, "Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)."

Follow these steps to specify the use of your custom authentication proxy web pages:

### Before you begin

Store your custom HTML files on the Switch flash memory.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

### Step 3

**Purpose** Enables the HTTP server. The web-based authentication feature uses the HTTP server to communicate with the hosts for user authentication.

**Example:**

```
Switch(config)# ip http server
```

### Step 4

**Purpose** Enables HTTPS.

**Example:**

```
Switch(config)# ip http secure-server
```

**Note** To ensure secure authentication when you enter the `ip http secure-server` command, the login page is always in HTTPS (secure HTTP) even if the user sends an HTTP request.

### Step 5

**Purpose** Returns to privileged EXEC mode.

**Example:**

```
Switch(config)# end
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission proxy http login page file device:login-filename</td>
<td>Specifies the location in the Switch memory file system of the custom HTML file to use in place of the default login page. The <code>device:</code> is flash memory.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip admission proxy http login page file disk1:login.htm</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip admission proxy http success page file device:success-filename</td>
<td>Specifies the location of the custom HTML file to use in place of the default login success page.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip admission proxy http success page file disk1:success.htm</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ip admission proxy http failure page file device:fail-filename</td>
<td>Specifies the location of the custom HTML file to use in place of the default login failure page.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip admission proxy http fail page file disk1:fail.htm</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip admission proxy http login expired page file device:expired-filename</td>
<td>Specifies the location of the custom HTML file to use in place of the default login expired page.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip admission proxy http login expired page file disk1:expired.htm</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
## Specifying a Redirection URL for Successful Login

Follow these steps to specify a URL to which the user is redirected after authentication, effectively replacing the internal Success HTML page:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission proxy http success redirect <em>url-string</em></td>
<td>Specifies a URL for redirection of the user in place of the default login success page.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Configuring the Web-Based Authentication Parameters

Follow these steps to configure the maximum number of failed login attempts before the client is placed in a watch list for a waiting period:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission proxy http success redirect <em>url-string</em></td>
<td>Specifies a URL for redirection of the user in place of the default login success page.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring a Web Authentication Local Banner

For the equivalent Session Aware Networking configuration example for this feature, see the section "Configuring a Parameter Map for Web-Based Authentication" in the chapter, "Configuring Identity Control Policies" of the book, "Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)."

Beginning in privileged EXEC mode, follow these steps to configure a local banner on a switch that has web authentication configured.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission max-login-attempts number</td>
<td>Sets the maximum number of failed login attempts. The range is 1 to 2147483647 attempts. The default is 5.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip admission max-login-attempts 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Web-Based Authentication without SVI

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client without creating an IP address in the routing table. These steps are optional.

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client. This is done without creating an IP address in the SVI interface which then would be applied to the WebAuth enabled interface. These steps are optional.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  * Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Step 3** parameter-map type webauth global | Creates a parameter map and enters parameter-map webauth configuration mode.  
The specific configuration commands supported |
### Command or Action

| Step 4 | l2-webauth-enabled |

**Example:**

Switch (config-params-parameter-map)# l2-webauth-enabled

Enables the web-based authentication without SVI feature.

| Step 5 | end |

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

| Step 6 | show running-config |

**Example:**

Switch# show running-config

Verifies your entries.

| Step 7 | copy running-config startup-config |

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

## Configuring Web-Based Authentication with VRF Aware

You configure the web-based authentication with VRF aware to redirect the HTML login page to the client. These steps are optional.

### Procedure

| Step 1 | enable |

**Example:**

Switch> enable

Enables privileged EXEC mode.

- Enter your password if prompted.

| Step 2 | configure terminal |

**Example:**

Switch# configure terminal

Enters global configuration mode.
Removing Web-Based Authentication Cache Entries

Follow these steps to remove web-based authentication cache entries:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> clear ip auth-proxy cache { *</td>
<td>host ip address }</td>
</tr>
<tr>
<td>Example: Switch# clear ip auth-proxy cache</td>
<td></td>
</tr>
</tbody>
</table>
Monitoring Web-Based Authentication Status

Use the commands in this topic to display the web-based authentication settings for all interfaces or for specific ports.

Table 131: Privileged EXEC show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show authentication sessions method webauth</code></td>
<td>Displays the web-based authentication settings for all interfaces for fastethernet, gigabitethernet, or tengigabitethernet</td>
</tr>
<tr>
<td><code>show authentication sessions interface type slot/port [details]</code></td>
<td>Displays the web-based authentication settings for the specified interface for fastethernet, gigabitethernet, or tengigabitethernet. In Session Aware Networking mode, use the <code>show access-session interface</code> command.</td>
</tr>
</tbody>
</table>

Displaying Web-Based Authentication Status

Perform this task to display the web-based authentication settings for all interfaces or for specific ports:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show authentication sessions {interface type/slot}</code></td>
<td>Displays the web-based authentication settings. <code>type = fastethernet, gigabitethernet, or tengigabitethernet</code> (Optional) Use the interface keyword to display the web-based authentication settings for a specific interface</td>
</tr>
</tbody>
</table>

Example:

This example shows how to view the network-based authentication status:

```
Switch# show authentication sessions
```

Example:

This example shows how to view the network-based authentication settings for gigabit interface 3/27:
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show authentication sessions interface gigabitethernet 3/27</td>
<td></td>
</tr>
</tbody>
</table>

### Monitoring HTTP Authentication Proxy

Perform the following task to troubleshoot your HTTP authentication proxy configuration:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(enable)</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>debug ip auth-proxy detailed</td>
<td>Displays the authentication proxy configuration information on the device.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# debug ip auth-proxy detailed</td>
<td></td>
</tr>
</tbody>
</table>

### Verifying HTTPS Authentication Proxy

To verify your HTTPS authentication proxy configuration, perform the following optional steps:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(enable)</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>show ip auth-proxy configuration</td>
<td>Displays the current authentication proxy configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# show ip auth-proxy configuration</td>
<td></td>
</tr>
<tr>
<td></td>
<td>show ip auth-proxy cache</td>
<td>Displays the list of user authentication entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>The authentication proxy cache lists the host IP address, the source port number, the timeout</td>
</tr>
<tr>
<td></td>
<td></td>
<td>value for the authentication proxy, and the state of the connection. If the authentication proxy</td>
</tr>
<tr>
<td></td>
<td>Device# show ip auth-proxy cache</td>
<td></td>
</tr>
</tbody>
</table>
### Configuration Examples for Web-Based Authentication

#### Example: Configuring the Authentication Rule and Interfaces

This example shows how to enable web-based authentication on Fast Ethernet port 5/1:

```
Switch(config)# ip admission name webauth1 proxy http
Switch(config)# interface fastethernet 5/1
Switch(config-if)# ip admission webauth1
Switch(config-if)# exit
Switch(config)# ip device tracking
```

This example shows how to verify the configuration:

```
Switch# show ip admission status
IP admission status:
  Enabled interfaces 0
  Total sessions 0
  Init sessions 0  Max init sessions allowed 100
     Limit reached 0  Hi watermark 0
  TCP half-open connections 0  Hi watermark 0
  TCP new connections 0  Hi watermark 0
  TCP half-open + new 0  Hi watermark 0
HTTPD1 Contexts 0  Hi watermark 0

Parameter Map: Global
   Custom Pages
          Custom pages not configured
       Banner
             Banner not configured
```

#### Example: AAA Configuration

```
aaa new-model
aaa authentication login default group tacacs group radius
  ! Set up the aaa new model to use the authentication proxy.
aaa authorization auth-proxy default group tacacs group radius
  ! Define the AAA servers used by the router.
aaa accounting auth-proxy default start-stop group tacacs+
  ! Set up authentication proxy with accounting.
tacacs-server host 172.31.54.143
tacacs-server key cisco
```
radius-server host 172.31.54.143
radius-server key cisco

Example: HTTP Server Configuration

! Enable the HTTP server on the router.
ip http server
! Set the HTTP server authentication method to AAA.
ip http authentication aaa
! Define standard access list 61 to deny any host.
access-list 61 deny any
! Use ACL 61 to deny connections from any host to the HTTP server.
ip http access-class 61

Example: Customizing the Authentication Proxy Web Pages

This example shows how to configure custom authentication proxy web pages:

Switch(config)# ip admission proxy http login page file flash:login.htm
Switch(config)# ip admission proxy http success page file flash:success.htm
Switch(config)# ip admission proxy http fail page file flash:fail.htm
Switch(config)# ip admission proxy http login expired page flash flash:expired.htm

This example shows how to verify the configuration of a custom authentication proxy web pages:

Switch# show ip admission configuration
Authentication proxy webpage
Login page : flash:login.htm
Success page : flash:success.htm
Fail Page : flash:fail.htm
Login expired Page : flash:expired.htm

Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Session ratelimit is 100
Authentication Proxy Watch-list is disabled
Authentication Proxy Auditing is disabled
Max Login attempts per user is 5

Example: Specifying a Redirection URL for Successful Login

Configuring redirection URL for successful login

Switch(config)# ip admission proxy http success redirect www.cisco.com

Verifying redirection URL for Successful Login

This example shows how to configure a redirection URL for successful login:

Switch# show ip admission status
Enabled interfaces 0

### Feature Information for Web-Based Authentication

<table>
<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS Release 15.0(2)EX</td>
<td>This feature is introduced.</td>
</tr>
</tbody>
</table>
Auto Identity

The Auto Identity feature provides a set of built-in policies at global configuration and interface configuration modes. This feature is available only in Class-Based Policy Language (CPL) control policy-equivalent new-style mode. To convert all the relevant authentication commands to their CPL control policy-equivalents, use the `authentication convert-to new-style` command.

This module describes the feature and explains how to configure it.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Auto Identity

Auto Identity Overview

The Cisco Identity-Based Networking Services (IBNS) solution provides a policy and identity-based framework in which edge devices can deliver flexible and scalable services to subscribers. IBNS allows the concurrent operation of IEEE 802.1x (dot1x), MAC authentication bypass (MAB), and web authentication methods, making it possible to invoke multiple authentication methods in parallel, on a single subscriber session. These authentication methods, dot1x, authentication, authorization, and accounting (AAA), and RADIUS are available in global configuration and interface configuration modes.

The Auto Identity feature uses the Cisco Common Classification Policy Language-based configuration that significantly reduces the number of commands used to configure both authentication methods and interface-level
commands. The Auto Identity feature provides a set of built-in policies that are based on policy maps, class maps, parameter maps, and interface templates.

In global configuration mode, the **source template AI_GLOBAL_CONFIG_TEMPLATE** command enables the Auto Identity feature. In interface configuration mode, configure the **AI_MONITOR_MODE**, **AI_LOW_IMPACT_MODE**, or **AI_CLOSED_MODE** interface templates to enable the feature on interfaces.

You can configure multiple templates; however, you must bind multiple templates together using the **merge** command. If you do not bind the templates, the last configured template is used. While binding templates, if the same command is repeated in two templates with different arguments, the last configured command is used.

---

**Note**

You can also enable user-defined templates that are configured using the **template name** command in global configuration mode.

Use the **show template interface** or **show template global** commands to display information about built-in templates. Built-in templates can be edited. Built-in template information is displayed in the output of the **show running-config** command, if the template is edited. If you delete an edited built-in template, the built-in template reverts to the default and is not deleted from the configuration. However, if you delete a user-defined template, it is deleted from the configuration.

---

**Note**

Before you delete a template, ensure that it is not attached to a device.

### Auto Identity Global Template

To enable the global template, configure the **source template template-name** command.

---

**Note**

You must configure the RADIUS server commands, because these are not automatically configured when the global template is enabled.

The following example shows how to enable the global template:

```
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 172.20.254.4 auth-port 1645 acct-port 1646
Switch(config-radius-server)# key cisco
Switch(config-radius-server)# end
```

The **AI_GLOBAL_CONFIG_TEMPLATE** automatically configures the following commands:

- `dot1x system-auth-control`
- `aaa new-model`
- `aaa authentication dot1x default group radius`
- `aaa authorization network default group radius`
- `aaa authorization auth-proxy default group radius`
- `aaa accounting identity default start-stop group radius`
- `aaa accounting system default start-stop group radius`
- `radius-server attribute 6 on-for-login-auth`
- `radius-server attribute 6 support-multiple`
- `radius-server attribute 6 voice 1`
Auto Identity Interface Templates

The following interface templates are available in the Auto Identity feature:

- **AI_MONITOR_MODE**—Passively monitors sessions that have authentication in open mode.
- **AI_LOW_IMPACT_MODE**—Similar to monitor mode, but with a configured static policy such as a port access control list (PACL).
- **AI_CLOSED_MODE**—Secure mode in which data traffic is not allowed into the network, until authentication is complete. This mode is the default.

The following commands are inbuilt in the **AI_MONITOR_MODE**:

```
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_LOW_IMPACT_MODE**:

```
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
ip access-group AI_PORT_ACL in
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_CLOSED_MODE**:

```
switchport mode access
access-session closed
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

Auto Identity Built-in Policies

The following five built-in policies are available in the Auto Identity feature:

- **AI_DOT1X_MAB_AUTH**—Enables flexible authentication with dot1x, and then MAC Address Bypass (MAB).
- **AI_DOT1X_MAB_POLICIES**—Enables flexible authentication with dot1x, and then MAB. Applies critical VLAN in case the Authentication, Authorization, and Accounting (AAA) server is not reachable.
- **AI_DOT1X_MAB_WEBAUTH**—Enables flexible authentication with dot1x, MAB, and then web authentication.
- **AI_NEXTGEN_AUTHBYBASS**—Skips authentication if an IP phone device is detected. Enables the `device classifier` command in global configuration mode and the `voice-vlan` command in interface configuration mode to detect the device. This is a reference policy map, and users can copy the contents of this policy map to other policy maps.
• **AI_STANDALONE_WEBAUTH**—Defines standalone web authentication.

**Auto Identity Class Maps Templates**

The following built-in class maps are supported by the Auto Identity feature:

- **AI_NRH**—Specifies that the nonresponsive host (NRH) authentication method is enabled.
- **AI_WEBAUTH_METHOD**—Specifies that the web authentication method is enabled.
- **AI_WEBAUTH_FAILED**—Specifies that the web authentication method failed to authenticate.
- **AI_WEBAUTH_NO_RESP**—Specifies that the web authentication client failed to respond.
- **AI_DOT1X_METHOD**—Specifies that the dot1x method is enabled.
- **AI_DOT1X_FAILED**—Specifies that the dot1x method failed to authenticate.
- **AI_DOT1X_NO_RESP**—Specifies that the dot1x client failed to respond.
- **AI_DOT1X_TIMEOUT**—Specifies that the dot1x client stopped responding after the initial acknowledge (ACK) request.
- **AI_MAB_METHOD**—Specifies that the MAC Authentication Bypass (MAB) method is enabled.
- **AI_MAB_FAILED**—Specifies that the MAB method failed to authenticate.
- **AI_AAA_SVR_DOWN_AUTHD_HOST**—Specifies that the Authentication, Authorization, and Accounting (AAA) server is down, and the client is in authorized state.
- **AI_AAA_SVR_DOWN_UNAUTHD_HOST**—Specifies that the AAA server is down, and the client is in unauthorized state.
- **AI_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is applied.
- **AI_NOT_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is not applied.
- **AI_METHOD_DOT1XDEVICE_PHONE**—Specifies that the method is dot1x and the device type is IP phone.
- **AI_DEVICE_PHONE**—Specifies that the device type is IP phone.

**Auto Identity Parameter Maps**

The following built-in parameter map templates are supported by the Auto Identity feature:

- **AI_NRH_PMAP**—Starts nonresponsive host (NRH) authentication.
- **AI_WEBAUTH_PMAP**—Starts web authentication.

**Auto Identity Service Templates**

Service templates are available inside built-in policy maps. The following built-in service templates are supported by the Auto Identity feature:

- **AI_INACTIVE_TIMER**—Template to start the inactivity timer.
- **AI_CRITICAL_ACL**—Dummy template; users can configure this template as per their requirements.
# How to Configure Auto Identity

## Configuring Auto Identity Globally

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
| **Example:** | `Switch> enable` | - Enter your password if prompted. |
| **Step 2** | `configure terminal` | Enters global configuration mode. |
| **Example:** | `Switch# configure terminal` | |
| **Step 3** | `sourcetemplate`  
| &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;`{AI_GLOBAL_CONFIG_TEMPLATE | template-name}` | Configures an auto identity template.  
| **Example:** | `Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE` | - `AI_GLOBAL_CONFIG_TEMPLATE` is a built-in template.  
| &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;`template-name` | is a user-defined template. |
| **Step 4** | `aaa new-model` | Enables the authentication, authorization, and accounting (AAA) access control mode. |
| **Example:** | `Switch(config)# aaa new-model` | |
| **Step 5** | `radius server name` | Specifies the name for the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode. |
| **Example:** | `Switch(config)# radius server ISE` | |
| **Step 6** | `address ipv4`  
| &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;`{hostname | ipv4-address}` | Configures the IPv4 address for the RADIUS server accounting and authentication parameters.  
| **Example:** | `Switch(config-radius-server)# address ipv4 10.1.1.1` | - **Note** This command is not a part of the global template, and you must configure it. |
| **Step 7** | `key ipv4`  
| &nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;`{0 string | 7 string} string` | Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.  
| **Example:** | `Switch(config-radius-server)# key ipv4 cisco` | - **Note** This command is not a part of the global template, and you must configure it. |
| **Step 8** | `end` | Exits RADIUS server configuration mode and returns to privileged EXEC mode. |
| **Example:** | | |
Configuring Auto Identity at an Interface Level

When you configure two interface templates, you must configure the `merge` keyword. If you do not, the last configured template is used.

**Procedure**

### Configuration Examples for Auto Identity

#### Example: Configuring Auto Identity Globally

```plaintext
Switch> enable
Switch# configure terminal
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# aaa new-model
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 10.1.1.1
Switch(config-radius-server)# key ipv4 cisco
Switch(config-radius-server)# end
```

#### Example: Configuring Auto Identity at an Interface Level

```plaintext
Switch> enable
Switch# configure terminal
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# source template AI_CLOSED_MODE
Switch(config-if)# source template AI_MONITOR_MODE merge
Switch(config-if)# switchport access vlan 100
Switch(config-if)# switchport voice vlan 101
Switch(config-if)# end
```

### Verifying Auto Identity

#### Procedure

**Step 1** enable<br><br>**Example:**<br>`Switch> enable`<br>Enables Privileged EXEC mode.<br>• Enter your password if prompted.
**Step 2**

**show template interface source built-in all**

Displays all the configured built-in interface templates.

**Example:**

```
Switch# show template interface source built-in all

Template Name : AI_CLOSED_MODE
Modified : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session closed
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES

Template Name : AI_LOW_IMPACT_MODE
Modified : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
ip access-group AI_PORT_ACL in

Template Name : AI_MONITOR_MODE
Modified : No
Template Definition :
dot1x pae authenticator
switchport mode access
mab
access-session port-control auto
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

**Step 3**

**show template global source built-in all**

Displays all the configured global built-in templates.

**Example:**

```
Switch# show template global source built-in all

Global Template Name : AI_GLOBAL_CONFIG_TEMPLATE
Modified : No
Global Template Definition : global
dot1x system-auth-control
aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
```
**Step 4**

`show derived-config | include aaa | radius-server`  

Displays the composite results of all the configuration commands that apply to an interface, including commands that come from sources such as static templates, dynamic templates, dialer interfaces, and authentication, authorization, and accounting (AAA) per-user attributes.

**Example:**

```
Switch# show derived-config | inc aaa | radius-server

aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
aaa session-id common
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
radius-server host 10.25.18.42 key cisco
```

**Step 5**

`show derived-config | interface type-number`  

Displays the composite results of all configuration for an interface.

**Example:**

```
Switch# show derived-config | interface gigabitethernet2/0/6

Building configuration...

Derived configuration : 267 bytes

! interface GigabitEthernet2/0/6
  switchport mode access
  switchport voice vlan 100
  access-session closed
  access-session port-control auto
  mab
  dot1x pae authenticator
  spanning-tree portfast edge
  service-policy type control subscriber AI_DOT1X_MAB_POLICIES
end
```

**Step 6**

`show access-session | interface interface-type-number details`  

Displays the policies applied to an interface.

**Example:**

```
Switch# show access-session interface gigabitethernet2/0/6 details

Interface: GigabitEthernet2/0/6
  MAC Address: c025.5c43.be00
  IPv6 Address: Unknown
  IPv4 Address: Unknown
  User-Name: CP-9971-SEPC0255C43BE00
  Device-type: Cisco-IP-Phone-9971
```
Step 7  
**show running-config interface type-number**

Displays the contents of the current running configuration file or the configuration for an interface.

**Example:**

```
Switch# show running-config interface gigabitethernet2/0/6
```

Building configuration...

Current configuration : 214 bytes

```
! interface GigabitEthernet2/0/6
   switchport mode access
   switchport voice vlan 100
   access-session port-control auto
   spanning-tree portfast edge
   service-policy type control subscriber AI_NEXTGEN_AUTHBYPASS
end
```

Step 8  
**show lldp neighbor**

Displays information about one or all neighboring devices discovered using the Link Layer Discovery Protocol (LLDP).

**Example:**

```
Switch# show lldp neighbor
```

Capability codes:
(R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device

Feature Information for Auto Identity

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

• Storm Control
• Protected Ports
• Port Blocking
• Port Security
• Protocol Storm Protection

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

• Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
• Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
• Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
• Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

**Note**

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

---

### Traffic Patterns

*Figure 103: Broadcast Storm Control Example*

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.
Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the `storm-control` interface configuration commands to set the threshold value for each traffic type.

**How to Configure Storm Control**

**Configuring Storm Control and Threshold Levels**

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

---

**Note**

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

**Before you begin**

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

**Procedure**

<table>
<thead>

<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

---
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specifies the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>storm-control action {shutdown</td>
<td>trap}</td>
</tr>
<tr>
<td>Example:</td>

<td></td>
</tr>
<tr>
<td>storm-control {broadcast</td>
<td>multicast</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# storm-control unicast level 87 65</td>
<td></td>
</tr>
</tbody>
</table>

The keywords have these meanings:

- For **level**, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.

- (Optional) For **level-low**, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00.

If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.

- For **bps bps**, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 1000000000.0. 
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) For <strong>bps-low</strong>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</td>
<td></td>
</tr>
<tr>
<td>• For <strong>pps</strong> <strong>pps</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <strong>pps-low</strong>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is <strong>0.0 to 10000000000.0</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.

**Step 6**

**end**

*Example:*

Switch(config-if)# end

Returns to privileged EXEC mode.

**Step 7**

**show storm-control [interface-id] [broadcast | multicast | unicast]**

*Example:*

Switch# show storm-control gigabitethernet 1/0/1 unicast

Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, details for all traffic types (broadcast, multicast and unicast) are displayed.

**Step 8**

**copy running-config startup-config**

*Example:*

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

**Configuring Small-Frame Arrival Rate**

Incoming VLAN-tagged packets smaller than 67 bytes are considered small frames. They are forwarded by the switch, but they do not cause the switch storm-control counters to increment.
You globally enable the small-frame arrival feature on the switch and then configure the small-frame threshold for packets on each interface. Packets smaller than the minimum size and arriving at a specified rate (the threshold) are dropped since the port is error disabled.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
Information About Protected Ports

Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

• A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

• Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

Default Protected Port Configuration

The default is to have no protected ports defined.

Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

How to Configure Protected Ports

Configuring a Protected Port

Before you begin

Protected ports are not pre-defined. This is the task to configure one.

**Information About Port Blocking**

**Port Blocking**

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

**Note**

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.
How to Configure Port Blocking

Blocking Flooded Traffic on an Interface

Before you begin

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>

Prerequisites for Port Security

Note
If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

Restrictions for Port Security

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

Information About Port Security

Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

Related Topics

- Enabling and Configuring Port Security, on page 1277
- Configuration Examples for Port Security, on page 1297

Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:
• Static secure MAC addresses—These are manually configured by using the `switchport port-security mac-address mac-address` interface configuration command, stored in the address table, and added to the switch running configuration.

• Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.

• Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

### Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

### Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.

- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

- Running diagnostic tests with port security enabled.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- protect—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

**Note**

We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.
• restrict—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

• shutdown—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command, or you can manually re-enable it by entering the shutdown and no shutdown interface configuration commands. This is the default mode.

• shutdown vlan—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.

This table shows the violation mode and the actions taken when you configure an interface for port security.

Table 135: Security Violation Mode Actions

<table>
<thead>
<tr>
<th>Violation Mode</th>
<th>Traffic is forwarded</th>
<th>Sends SNMP trap</th>
<th>Sends syslog message</th>
<th>Displays error message</th>
<th>Violation counter increments</th>
<th>Shuts down port</th>
</tr>
</thead>
<tbody>
<tr>
<td>protect</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>shutdown vlan</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

18 Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.
19 The switch returns an error message if you manually configure an address that would cause a security violation.
20 Shuts down only the VLAN on which the violation occurred.

Port Security Aging

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

• Absolute—The secure addresses on the port are deleted after the specified aging time.

• Inactivity—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

Related Topics

Enabling and Configuring Port Security Aging, on page 1283
Port Security and Switch Stacks

When a switch joins a stack, the new switch will get the configured secure addresses. All dynamic secure addresses are downloaded by the new stack member from the other stack members.

When a switch (either the active switch or a stack member) leaves the stack, the remaining stack members are notified, and the secure MAC addresses configured or learned by that switch are deleted from the secure MAC address table.

</tr>
</tbody>
</table>

Port Security Configuration Guidelines

• Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.

• A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

• When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.

• When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the `switchport voice` and `switchport priority extend` interface configuration commands has no effect.
When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

- The switch does not support port security aging of sticky secure MAC addresses.

This table summarizes port security compatibility with other port-based features.

22 A port configured with the switchport mode dynamic interface configuration command.
23 A VLAN Query Protocol (VQP) port configured with the switchport access vlan dynamic interface configuration command.
24 You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.
## Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

## How to Configure Port Security

### Enabling and Configuring Port Security

**Before you begin**

This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch&gt; enable</td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> port-security mac-address forbidden mac address</td>
<td>Specifies a MAC address that should be forbidden by port-security on all the interfaces.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# port-security mac-address forbidden 2.2.2</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 4**
interface interface-id  
Example:  
Switch(config)# interface gigabitethernet1/0/1  
| Specifies the interface to be configured, and enter interface configuration mode. |
| **Step 5**
switchport mode {access | trunk}  
Example:  
Switch(config-if)# switchport mode access  
| Sets the interface switchport mode as access or trunk; an interface in the default mode (dynamic auto) cannot be configured as a secure port. |
| **Step 6**
switchport voice vlan vlan-id  
Example:  
Switch(config-if)# switchport voice vlan 22  
| Enables voice VLAN on a port.  
vlan-id—Specifies the VLAN to be used for voice traffic. |
| **Step 7**
switchport port-security  
Example:  
Switch(config-if)# switchport port-security  
| Enable port security on the interface.  
**Note** Under certain conditions, when port security is enabled on the member ports in a switch stack, the DHCP and ARP packets would be dropped. To resolve this, configure a shut and no shut on the interface. |
| **Step 8**
switchport port-security [maximum value [vlan {vlan-list | {access | voice} |]]]  
Example:  
Switch(config-if)# switchport port-security maximum 20  
| (Optional) Sets the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is set by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.  
(Optional) vlan—sets a per-VLAN maximum value  
Enter one of these options after you enter the vlan keyword:  
• vlan-list—On a trunk port, you can set a per-VLAN maximum value on a range of
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.</td>
<td></td>
</tr>
</tbody>
</table>

- **access**—On an access port, specifies the VLAN as an access VLAN.
- **voice**—On an access port, specifies the VLAN as a voice VLAN.

**Note** The `voice` keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.

**Step 9**

```
switchport port-security violation {protect | restrict | shutdown | shutdown vlan} (Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:
```

- **protect**—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

  **Note** We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- **restrict**—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>trap is sent, a syslog message is logged, and the violation counter increments.</td>
<td><strong>shutdown</strong>—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.</td>
</tr>
<tr>
<td><strong>shutdown vlan</strong>—Use to set the security violation mode per VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.</td>
<td><strong>Note</strong> When a secure port is in the error-disabled state, you can bring it out of this state by entering the <code>errdisable recovery cause psecure-violation</code> global configuration command. You can manually re-enable it by entering the <code>shutdown</code> and <code>no shutdown</code> interface configuration commands or by using the <code>clear errdisable interface vlan</code> privileged EXEC command.</td>
</tr>
</tbody>
</table>

### Step 10

**switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}]}]**

**Example:**

```
Switch(config-if)# switchport port-security mac-address 00:A0:C7:12:C9:25 vlan 3 voice
```

(Optional) Enters a secure MAC address for the interface. You can use this command to enter the maximum number of secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.

**Note** If you enable sticky learning after you enter this command, the secure addresses that were dynamically learned are converted to sticky secure MAC addresses and are added to the running configuration.

(Optional) **vlan**—sets a per-VLAN maximum value.

Enter one of these options after you enter the **vlan** keyword:

- **vlan-id**—On a trunk port, you can specify the VLAN ID and the MAC address. If
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>you do not specify a VLAN ID, the native VLAN is used.</td>
<td></td>
</tr>
<tr>
<td><strong>• access</strong>—On an access port, specifies the VLAN as an access VLAN.</td>
<td></td>
</tr>
<tr>
<td><strong>• voice</strong>—On an access port, specifies the VLAN as a voice VLAN.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> The voice keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 11**

```
switchport port-security mac-address sticky
```

**Example:**

```
Switch(config-if)# switchport port-security mac-address sticky
```

(Optional) Enables sticky learning on the interface.

**Step 12**

```
switchport port-security mac-address sticky
[mac-address | vlan {vlan-id | {access | voice}}]
```

**Example:**

```
Switch(config-if)# switchport port-security mac-address sticky
00:A0:C7:12:C9:25 vlan voice
```

(Optional) Enters a sticky secure MAC address, repeating the command as many times as necessary. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned, are converted to sticky secure MAC addresses, and are added to the running configuration.

**Note** If you do not enable sticky learning before this command is entered, an error message appears, and you cannot enter a sticky secure MAC address.

(Optional) `vlan`—sets a per-VLAN maximum value.

Enter one of these options after you enter the `vlan` keyword:

- **• vlan-id**—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used.
- **• access**—On an access port, specifies the VLAN as an access VLAN.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• voice</td>
<td>On an access port, specifies the VLAN as a voice VLAN.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The <code>voice</code> keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN.</td>
</tr>
</tbody>
</table>

### Step 13
```
switchport port-security mac-address forbidden mac address
```
Specifies a MAC address that should be forbidden by port-security on the particular interface.

#### Example:
```
Switch(config-if)# switchport port-security mac-address forbidden 2.2.2
```

### Step 14
```
end
```
Returns to privileged EXEC mode.

#### Example:
```
Switch(config)# end
```

### Step 15
```
show port-security
```
Verifies your entries.

#### Example:
```
Switch# show port-security
```

### Step 16
```
show running-config
```
Verifies your entries.

#### Example:
```
Switch# show running-config
```

### Step 17
```
copy running-config startup-config
```
(Optional) Saves your entries in the configuration file.

#### Example:
```
Switch# copy running-config startup-config
```

Enabling and Configuring Port Security Aging

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | **enable**        | Enables privileged EXEC mode.  
Example:  
Switch> enable  
- Enter your password if prompted. |
| 2    | configure terminal | Enters global configuration mode.  
Example:  
Switch# configure terminal |
| 3    | interface interface-id | Specifies the interface to be configured, and enter interface configuration mode.  
Example:  
Switch(config)# interface gigabitethernet 1/0/1 |
| 4    | switchport port-security aging {static | time time | type {absolute | inactivity}} | Enables or disable static aging for the secure port, or set the aging time or type.  
**Note**  
The switch does not support port security aging of sticky secure addresses.  
Enter **static** to enable aging for statically configured secure addresses on this port.  
For **time**, specifies the aging time for this port. The valid range is from 0 to 1440 minutes.  
For **type**, select one of these keywords:  
- **absolute**—Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified lapses and are removed from the secure address list.  
- **inactivity**—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data |

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
Information About Storm Control

Storm Control
Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured
Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

Note

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

Traffic Patterns

Figure 104: Broadcast Storm Control Example

This example shows broadcast traffic patterns on an interface over a given period of time.
Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

Note

You use the storm-control interface configuration commands to set the threshold value for each traffic type.

How to Configure Storm Control

Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

Note

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:
Before you begin

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

### Procedure

<table>

</tr>
<tr>
<td></td>
<td></td>
<td>• For level, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For level-low, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• For <strong>bps</strong> <em>bps</em>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <strong>bps-low</strong>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• For <strong>pps</strong> <em>pps</em>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <strong>pps-low</strong>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is <strong>0.0 to 10000000000.0</strong>.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.

**Step 6**

**Example:**

Returns to privileged EXEC mode.
### Configuring Small-Frame Arrival Rate

Incoming VLAN-tagged packets smaller than 67 bytes are considered small frames. They are forwarded by the switch, but they do not cause the switch storm-control counters to increment.

You globally enable the small-frame arrival feature on the switch and then configure the small-frame threshold for packets on each interface. Packets smaller than the minimum size and arriving at a specified rate (the threshold) are dropped since the port is error disabled.

#### Procedure

<table>
<thead>

</tr>
</tbody>
</table>
### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Information About Protected Ports

#### Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

#### Default Protected Port Configuration

The default is to have no protected ports defined.

#### Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.
# How to Configure Protected Ports

## Configuring a Protected Port

### Before you begin

Protected ports are not pre-defined. This is the task to configure one.

### Procedure

Information About Port Blocking

Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

Note

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.
# How to Configure Port Blocking

## Blocking Flooded Traffic on an Interface

### Before you begin

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
Example:  
Switch> `enable` |
|   | `configure terminal` | Enters global configuration mode.  
Example:  
Switch# `configure terminal` |
| Step 3 | `interface interface-id` | Specifies the interface to be configured, and enter interface configuration mode.  
Example:  
Switch(config)# `interface gigabitethernet 1/0/1` |
| Step 4 | `switchport block multicast` | Blocks unknown multicast forwarding out of the port.  
Note: Pure Layer 2 multicast traffic as well as multicast packets that contain IPv6 information in the header are blocked.  
Example:  
Switch(config-if)# `switchport block multicast` |
| Step 5 | `switchport block unicast` | Blocks unknown unicast forwarding out of the port.  
Example:  
Switch(config-if)# `switchport block unicast` |
| Step 6 | `end` | Returns to privileged EXEC mode.  
Example: |
<table>

Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

```
Switch(config)# interface gigabitethernet 1/0/1
```
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 50
Switch(config-if)# switchport port-security mac-address sticky

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

Switch(config)# interface gigabitethernet 1/0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

Switch(config)# interface tengigabitethernet 1/0/1
Switch(config-if)# switchport access vlan 21
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 22
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 20
Switch(config-if)# switchport port-security violation restrict
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security mac-address 0000.0000.0002
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0003
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0001 vlan voice
Switch(config-if)# switchport port-security maxima 10 vlan access
Switch(config-if)# switchport port-security maximum 10 vlan voice

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Protocol Storm Protection

Protocol Storm Protection

When a switch is flooded with Address Resolution Protocol (ARP) or control packets, high CPU utilization can cause the CPU to overload. These issues can occur:

- Routing protocol can flap because the protocol control packets are not received, and neighboring adjacencies are dropped.
- Spanning Tree Protocol (STP) reconverges because the STP bridge protocol data unit (BPDU) cannot be sent or received.
- CLI is slow or unresponsive.
Using protocol storm protection, you can control the rate at which control packets are sent to the switch by specifying the upper threshold for the packet flow rate. The supported protocols are ARP, ARP snooping, Dynamic Host Configuration Protocol (DHCP) v4, DHCP snooping, Internet Group Management Protocol (IGMP), and IGMP snooping.

When the packet rate exceeds the defined threshold, the switch drops all traffic arriving on the specified virtual port for 30 seconds. The packet rate is measured again, and protocol storm protection is again applied if necessary.

For further protection, you can manually error disable the virtual port, blocking all incoming traffic on the virtual port. You can manually enable the virtual port or set a time interval for automatic re-enabling of the virtual port.

Excess packets are dropped on no more than two virtual ports.

Virtual port error disabling is not supported for EtherChannel and Flexlink interfaces

**Default Protocol Storm Protection Configuration**

Protocol storm protection is disabled by default. When it is enabled, auto-recovery of the virtual port is disabled by default.

CHAPTER 63

Configuring FIPS

- Information About FIPS and Common Criteria, on page 1303

Information About FIPS and Common Criteria

The Federal Information Processing Standard (FIPS) certification documents for Cisco Catalyst series switches are posted on the following website:

Click the link in the Certification column to view the Consolidated Validation Certificate and the Security Policy document. The Security Policy document describes the FIPS implementation, hardware installation, firmware initialization, and software configuration procedures for FIPS operation.

Common Criteria is an international standard (ISO/IEC 15408) for computer security certification. This standard is a set of requirements, tests, and evaluation methods that ensures that the Target of Evaluation complies with a specific Protection Profile or custom Security Target. For more information, see the security target document for specific Cisco Catalyst switch models and Cisco IOS Releases at:

http://www.niap-ccevs.org/CCEVS_Products/pcl.cfm?tech_name=Network+Switch
Configuring Control Plane Policing

- Finding Feature Information, on page 1305
- Restrictions for Control Plane Policing, on page 1305
- Control Plane Policing, on page 1305
- Configuring Control Plane Policing, on page 1306
- Examples: Configuring CoPP, on page 1307

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Control Plane Policing

The following restrictions apply while Configuring Control Plane Policing:

- Only six among the following protocols can be configured simultaneously: rip, ospf-v6, eigrp-v6, rip-v6, dhcp-snoop-client-to-server, dhcp-snoop-server-to-client, ndp-router-solicitation, ndp-router-advertisement, ndp-redirect, dhcpv6-client-to-server, dhcpv6-server-to-client, igrp.

- For ospf, eigrp and ripv2 protocols, control packets which are destined to multicast Mac of the router are policed along with the "reserve-multicast-group" option.

Control Plane Policing

Configure the Control Plane Policing (CoPP) feature on a predefined set of protocols to control the flow of traffic coming to the CPU. The CoPP allows you to set a rate limit on specific protocol packets. These packets are policed, and the packets that conform to the defined rate limit are permitted into the CPU. COPP protects the packets from being routed to the CPU at an undesired rate that might impact the performance of a switch and the network. In addition, the CoPP protects the CPU from denial of service (DoS) attacks and ensures
routing stability, reachability, and packet delivery. You can use Multi-Layer Switching QoS CLI to set the rate limit and policing parameters on a specific protocol.

---

**Note**

CoPP is supported only on LAN BASE, IP Lite, and IP Service licenses.

---

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on SLAs

This section lists the restrictions on SLAs.

The following are restrictions on IP SLAs network performance measurement:

- The switch does not support VoIP service levels using the gatekeeper registration delay operations measurements.

- Only a Cisco IOS device can be a source for a destination IP SLAs responder.

- You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

- Switches running the IP base or LAN base feature set support only IP SLAs responder functionality and must be configured with another device that supports full IP SLAs functionality.
Information About SLAs

Cisco IOS IP Service Level Agreements (SLAs)

Cisco IOS IP SLAs send data across the network to measure performance between multiple network locations or across multiple network paths. They simulate network data and IP services and collect network performance information in real time. Cisco IOS IP SLAs generate and analyze traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLA operations can be used for troubleshooting, for problem analysis, and for designing network topologies.

Depending on the specific Cisco IOS IP SLA operations, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLA packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs are Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collect and analyze the following performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivity (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like Cisco Prime Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products.

Using IP SLAs can provide the following benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
  - Measurement of jitter, latency, or packet loss in the network.
  - Continuous, reliable, and predictable measurements.
• IP service network health assessment to verify that the existing QoS is sufficient for new IP services.

• Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).

• Network operation troubleshooting by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.

• Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the switch supports MPLS).

Network Performance Measurement with Cisco IOS IP SLAs

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices.

Figure 105: Cisco IOS IP SLAs Operation

The following figure shows how IP SLAs begin when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

Related Topics
- Monitoring IP SLA Operations, on page 1317

IP SLA Responder and IP SLA Control Protocol

The IP SLA responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLA request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLA Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond.
The IP SLA responder can be a Cisco IOS Layer 2, responder-configurable switch. The responder does not need to support full IP SLA functionality.

The following figure shows where the Cisco IOS IP SLA responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLA operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLA packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

Figure 106: Cisco IOS IP SLAs Operation

You do not need to enable the responder on the destination device for all IP SLA operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP).

Related Topics
- Configuring the IP SLA Responder, on page 1316
- Restrictions on SLAs, on page 1311

Response Time Computation for IP SLAs

Switches, controllers, and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimize these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLA test packets use time stamping to minimize the processing delays.

When the IP SLA responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

Figure 107: Cisco IOS IP SLA Responder Time Stamping

The following figure demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is
subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt level to allow for greater accuracy.

\[
\text{RTT (Round-trip time)} = T4 \text{ (Time stamp 4)} - T1 \text{ (Time stamp 1)} - \Delta
\]

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

### How to Configure IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the *Cisco IOS IP SLAs Configuration Guide*. It does include several operations as examples, including configuring the responder, configuring a UDP jitter operation, which requires a responder, and configuring an ICMP echo operation, which does not require a responder. For details about configuring other operations, see the *Cisco IOS IP SLAs Configuration Guide*.

#### Default Configuration

No IP SLAs operations are configured.

**Related Topics**

- Configuration Guidelines, on page 1315

#### Configuration Guidelines

For information on the IP SLA commands, see the *Cisco IOS IP SLAs Command Reference, Release 12.4T* command reference.

For detailed descriptions and configuration procedures, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4TL*.

**Related Topics**

- Default Configuration, on page 1315
Configuring the IP SLA Responder

The IP SLA responder is available only on Cisco IOS software-based devices, including some Layer 2 switches that do not support full IP SLA functionality.

Follow these steps to configure the IP SLA responder on the target device (the operational target):

Managing Switch Stacks

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Switch Stacks

All stack members must run the same Cisco IOS software image to ensure compatibility among stack members.

For switch stack hardware considerations, see the Catalyst 2960-X Switch Hardware Installation Guide.

Restrictions for Switch Stacks

The following are restrictions for your switch stack configuration:

• Stacking is not supported on switches running the LAN Lite image. All switches in the stack must be running the LAN Base image.
Information About Switch Stacks

Switch Stack Overview

A switch stack is a set of up to eight stacking-capable switches connected through their stack ports. You can connect only one switch type in a stack, or you can connect a mix of Catalyst 2960-X and Catalyst 2960-S switches in the stack. The stack can have one of these configurations:

- Homogeneous stack—A Catalyst 2960-X stack with only Catalyst 2960-X switches as stack members. A homogenous stack can have up to 8 stack members.

- Mixed stack—A stack with a mix of Catalyst 2960-X and Catalyst 2960-S switches. A mixed stack can have up to 4 stack members, with either a Catalyst 2960-X or Catalyst 2960-S switch as the stack master.

The stack master controls the operation of the switch stack, and is the single point of stack-wide management. From the stack master, you configure:

- System-level (global) features that apply to all stack members

- Interface-level features for each stack member

The stack master contains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level settings for each stack member. Each stack member has a current copy of these files for back-up purposes.

Supported Features in a Switch Stack

The system-level features supported on the stack master are supported on the entire switch stack.

Encryption Features

If the stack master is running the cryptographic universal software image (supports encryption), the encryption features are available on the switch stack.

FlexStack-Plus

The stack members use the Cisco FlexStack-Plus technology to work together as a unified system. Layer 2 protocols support the entire switch stack as a single entity in the network.
Switch stacks running the LAN Base image do not support Layer 3 features.

The FlexStack-Plus bandwidth for a single stack port is 20 Gbps. With FlexStack-Plus technology, up to eight members can be joined into a single stack. In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, FlexStack-Plus reverts to FlexStack capabilities of 10 Gbps stack port bandwidth and a maximum of four members per stack.

Fast Stack Convergence

When a single link in a full ring stack becomes inoperable, there is a disruption in the forwarding of packets, and the stack moves to a half ring. In a homogenous stack of Catalyst 2960-X switches this disruption of traffic (or stack convergence time) takes milliseconds. In a mixed stack configuration, the stack takes 1 to 2 seconds to reconverge.

When a single link in a full ring stack becomes inoperable, there is a disruption in the forwarding of packets, and the stack moves to a half ring. With switches this disruption of traffic (or stack convergence time) takes milliseconds.

Switch Stack Membership

A switch stack has up to eight stack members connected through their stack ports. A switch stack always has one stack master.

A standalone switch is a switch stack with one stack member that also operates as the stack master. You can connect one standalone switch to another to create a switch stack containing two stack members, with one of them as the stack master. You can connect standalone switches to an existing switch stack to increase the stack membership.

Figure 108: Creating a Switch Stack from Two Standalone Switches
Changes to Switch Stack Membership

If you replace a stack member with an identical model, the new switch functions with exactly the same configuration as the replaced switch, assuming that the new switch (referred to as the provisioned switch) is using the same member number as the replaced switch.

The operation of the switch stack continues uninterrupted during membership changes unless you remove the stack master or you add powered-on standalone switches or switch stacks.

- Adding powered-on switches (merging) causes the stack masters of the merging switch stacks to elect a stack master from among themselves. The reelected stack master retains its role and configuration as do its stack members. All remaining switches, including the former stack masters, reload and join the switch stack as stack members. They change their stack member numbers to the lowest available numbers and use the stack configuration of the reelected stack master.

- Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. This can cause:
  - An IP address conflict in your network. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks.
  - A MAC address conflict between two members in the stack. You can use the `stack-mac update force` command to resolve the conflict.
Make sure that you power off the switches that you add to or remove from the switch stack.

After adding or removing stack members, make sure that the switch stack is operating at full bandwidth. Press the Mode button on a stack member until the Stack mode LED is on. The last two right port LEDs on all switches in the stack should be green. Depending on the switch model, the last two right ports are 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports (10/100/1000 ports). If one or both of these LEDs are not green on any of the switches, the stack is not operating at full bandwidth.

It may take up to 4 seconds for stack convergence when a new stack member is added to the existing switch stack.

If you remove powered-on members but do not want to partition the stack:
  * Power off the switches in the newly created switch stacks.
  * Reconnect them to the original switch stack through their stack ports.
  * Power on the switches.

For cabling and power considerations that affect switch stacks, see the *Catalyst 2960-X Switch Hardware Installation Guide*.

**Stack Member Numbers**

The stack member number (1 to 8) identifies each member in the switch stack. The member number also determines the interface-level configuration that a stack member uses. You can display the stack member number by using the `show switch` EXEC command.

A new, out-of-the-box Switch (one that has not joined a Switch stack or has not been manually assigned a stack member number) ships with a default stack member number of 1. When it joins a Switch stack, its default stack member number changes to the lowest available member number in the stack.

Stack members in the same Switch stack cannot have the same stack member number. Every stack member, including a standalone Switch, retains its member number until you manually change the number or unless the number is already being used by another member in the stack.

  * If you manually change the stack member number by using the `switch current-stack-member-number renumber new-stack-member-number` global configuration command, the new number goes into effect after that stack member resets (or after you use the `reload slot stack-member-number` privileged EXEC command) and only if that number is not already assigned to any other members in the stack. Another way to change the stack member number is by changing the Switch_NUMBER environment variable. If the number is being used by another member in the stack, the Switch selects the lowest available number in the stack.

  * If you manually change the number of a stack member and no interface-level configuration is associated with that new member number, that stack member resets to its default configuration.

You cannot use the `switch current-stack-member-number renumber new-stack-member-number` global configuration command on a provisioned Switch. If you do, the command is rejected.

  * If you move a stack member to a different Switch stack, the stack member retains its number only if the number is not being used by another member in the stack. If it is being used, the Switch selects the lowest available number in the stack.
If you merge Switch stacks, the Switch that join the Switch stack of a new stack master select the lowest available numbers in the stack.

As described in the hardware installation guide, you can use the Switch port LEDs in Stack mode to visually determine the stack member number of each stack member.

In the **default** mode Stack LED will blink in green color only on the stack master. However, when we scroll the Mode button to **Stack** option - Stack LED will glow green on all the stack members.

When mode button is scrolled to **Stack** option, the switch number of each stack member will be displayed as LEDs on the first five ports of that switch. The switch number is displayed in binary format for all stack members. On the switch, the amber LED indicates value 0 and green LED indicates value 1.

Example for switch number 5 (Binary - 00101):

First five LEDs will glow in below color combination on stack member with switch number 5.

- Port-1: Amber
- Port-2: Amber
- Port-3: Green
- Port-4: Amber
- Port-5: Green

Similarly first five LEDs will glow in amber or green, depending on the switch number on all stack members.

---

**Note**

- Stack port will not go down but only transmission/reception will be disabled. The log message shown below will be displayed on the console. Once the peer end network port is converted to stack port, transmission/reception on this stack port will be enabled.

%STACKMGR-4-HSTACK_LINK_CONFIG: Verify peer stack port setting for hstack
StackPort-1 switch 5 (hostname-switchnumber)

---

**Stack Member Priority Values**

A higher priority value for a stack member increases the probability of it being elected stack master and retaining its stack member number. The priority value can be 1 to 15. The default priority value is 1. You can display the stack member priority value by using the **show switch** EXEC command.

---

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the stack master. This ensures that the switch is reelected as the stack master if a reelection occurs.

To change the priority value for a stack member, use the **switch stack-member-number priority new priority-value** global configuration command. For more information, see the “Setting the Stack Member Priority Value” section.
The new priority value takes effect immediately but does not affect the current stack master. The new priority value helps determine which stack member is elected as the new stack master when the current stack master or the switch stack resets.

**Switch Stack Bridge ID and MAC Address**

The MAC address of the stack master determines the stack MAC address.

When the stack initializes, the MAC address of the stack master determines the bridge ID that identifies the stack in the network.

If the stack master changes, the MAC address of the new stack master determines the new bridge ID and stack MAC address.

If the entire switch stack reloads, the switch stack uses the MAC address of the stack master.

**Persistent MAC Address on the Switch Stack**

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes. During this time period, if the previous active switch rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not an active switch. If the previous active switch does not rejoin the stack during this period, the switch stack takes the MAC address of the new active switch as the stack MAC address. By default, the stack MAC address will be the MAC address of the first active switch, even if a new active switch takes over.

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes to the MAC address of the new stack master. When this feature is enabled, the stack MAC address changes in approximately 4 minutes. During this time, if the previous stack master rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not a stack master. If the previous stack master does not rejoin the stack during this period, the switch stack takes the MAC address of the new stack master as the stack MAC address.

You can also configure stack MAC persistency so that the stack MAC address never changes to the new stack master MAC address.

**Stack Master Election and Reelection**

All stack members are eligible to be the active switch or the standby switch. If the active switch becomes unavailable, the standby switch becomes the active switch.

An active switch retains its role unless one of these events occurs:

- The switch stack is reset.
- The active switch is removed from the switch stack.
- The active switch is reset or powered off.
- The active switch fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.

All stack members are eligible stack masters. If the stack master becomes unavailable, the remaining members elect a new stack master from among themselves.

The stack master is elected or reelected based on one of these factors and in the order listed:
1. The switch that is currently the stack master.

2. The switch with the highest stack member priority value.

---

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the stack master. This ensures that the switch is reelected as stack master if a reelection occurs.

---

3. The switch with the shortest start-up time.

4. The switch that has the configuration file.

5. The switch with the lowest MAC address.

---

**Note**

The factors for electing or reelecting a new standby switch are same as those for the active switch election or reelection, and are applied to all participating switches except the active switch.

---

After election, the new active switch becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new active switch election and reset.

When the previous active switch becomes available, it does not resume its role as the active switch.

If you power on or reset an entire switch stack, some stack members might not participate in the active switch election. Stack members that are powered on within the same 2-minute timeframe participate in the active switch election and have a chance to become the active switch. Stack members that are powered on after the 120-second timeframe do not participate in this initial election and become stack members. For powering considerations that affect active-switch elections, see the switch hardware installation guide.

As described in the hardware installation guide, you can use the ACTV LED on the switch to see if the switch is the active switch.

A stack master retains its role unless one of these events occurs:

- The switch stack is reset.*
- The stack master is removed from the switch stack.
- The stack master is reset or powered off.
- The stack master fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.*

In the events marked by an asterisk (*), the current stack master might be reelected based on the listed factors.

When you power on or reset an entire switch stack, some stack members might not participate in the stack master election. Stack members that are powered on within the same 20-second time frame participate in the stack master election and have a chance to become the stack master. Stack members that are powered on after the 20-second time frame do not participate in this initial election and become stack members. All stack members participate in reelections. For all powering considerations that affect stack-master elections, see the “Switch Installation” chapter in the hardware installation guide.
The new stack master becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new stack master election and reset.

After a new stack master is elected and the previous stack master becomes available, the previous stack master does not resume its role as stack master.

For all powering considerations that affect stack-master elections, see the Catalyst 2960-X Switch Hardware Installation Guide.

### Switch Stack Configuration Files

The active switch has the saved and running configuration file for the switch stack. The standby switch automatically receives the synchronized running configuration file. Stack members receive synchronized copies when the running configuration file is saved into the startup configuration file. If the active switch becomes unavailable, the standby switch takes over with the current running configuration.

The stack master has the saved and running configuration files for the switch stack. All stack members periodically receive synchronized copies of the configuration files from the stack master. If the stack master becomes unavailable, any stack member assuming the role of stack master has the latest configuration files.

The configuration files record these settings:

- System-level (global) configuration settings such as IP, STP, VLAN, and SNMP settings that apply to all stack members
- Stack member interface-specific configuration settings that are specific for each stack member

---

**Note**

The interface-specific settings of the stack master are saved if the stack master is replaced without saving the running configuration to the startup configuration.

A new, out-of-box switch joining a switch stack uses the system-level settings of that switch stack. If a switch is moved to a different switch stack before it is powered on, that switch loses its saved configuration file and uses the system-level configuration of the new switch stack. If the switch is powered on as a standalone switch before it joins the new switch stack, the stack will reload. When the stack reloads, the new switch may become the stack master, retain its configuration and overwrite the configuration files of the other stack members.

The interface-specific configuration of each stack member is associated with the stack member number. Stack members retain their numbers unless they are manually changed or they are already used by another member in the same switch stack. If the stack member number changes, the new number goes into effect after that stack member resets.

- If an interface-specific configuration does not exist for that member number, the stack member uses its default interface-specific configuration.
- If an interface-specific configuration exists for that member number, the stack member uses the interface-specific configuration associated with that member number.

If you replace a failed member with an identical model, the replacement member automatically uses the same interface-specific configuration as the failed switch. You do not need to reconfigure the interface settings. The replacement switch (referred to as the provisioned switch) must have the same stack member number as the failed switch.
You back up and restore the stack configuration in the same way as you would for a standalone switch configuration.

**Offline Configuration to Provision a Stack Member**

You can use the offline configuration feature to provision (to supply a configuration to) a new switch before it joins the switch stack. You can configure the stack member number, the switch type, and the interfaces associated with a switch that is not currently part of the stack. The configuration that you create on the switch stack is called the *provisioned configuration*. The switch that is added to the switch stack and that receives this configuration is called the *provisioned switch*.

You manually create the provisioned configuration through the `switch stack-member-number provision type` global configuration command. You must change the `stack-member-number` on the provisioned switch before you add it to the stack, and it must match the stack member number that you created for the new switch on the switch stack. The switch type in the provisioned configuration must match the switch type of the newly added switch. The provisioned configuration is automatically created when a switch is added to a switch stack and when no provisioned configuration exists.

When you configure the interfaces associated with a provisioned switch, the switch stack accepts the configuration, and the information appears in the running configuration. However, as the switch is not active, any configuration on the interface is not operational and the interface associated with the provisioned switch does not appear in the display of the specific feature. For example, VLAN configuration information associated with a provisioned switch does not appear in the `show vlan` user EXEC command output on the switch stack.

The switch stack retains the provisioned configuration in the running configuration whether or not the provisioned switch is part of the stack. You can save the provisioned configuration to the startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. The startup configuration file ensures that the switch stack can reload and can use the saved information whether or not the provisioned switch is part of the switch stack.

**Effects of Adding a Provisioned Switch to a Switch Stack**

When you add a provisioned Switch to the switch stack, the stack applies either the provisioned configuration or the default configuration. This table lists the events that occur when the switch stack compares the provisioned configuration with the provisioned switch.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stack member numbers and the Switch types match.</td>
<td>1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, and 2. If the Switch type of the provisioned switch matches the Switch type in the provisioned configuration on the stack.</td>
</tr>
</tbody>
</table>
Scenario | Result
--- | ---
The stack member numbers match but the Switch types do not match. | 1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, but 2. The Switch type of the provisioned switch does not match the Switch type in the provisioned configuration on the stack.
The switch stack applies the default configuration to the provisioned switch and adds it to the stack. The provisioned configuration is changed to reflect the new information.
The stack member number is not found in the provisioned configuration. | The switch stack applies the default configuration to the provisioned switch and adds it to the stack. The provisioned configuration is changed to reflect the new information.
The stack member number of the provisioned switch is not found in the provisioned configuration. | The switch stack applies the default configuration to the provisioned switch and adds it to the stack.

If you add a provisioned switch that is a different type than specified in the provisioned configuration to a powered-down switch stack and then apply power, the switch stack rejects the (now incorrect) `switch stack-member-number provision type` global configuration command in the startup configuration file. However, during stack initialization, the nondefault interface configuration information in the startup configuration file for the provisioned interfaces (potentially of the wrong type) is executed. Depending on the differences between the actual Switch type and the previously provisioned switch type, some commands are rejected, and some commands are accepted.

If the switch stack does not contain a provisioned configuration for a new Switch, the Switch joins the stack with the default interface configuration. The switch stack then adds to its running configuration with a `switch stack-member-number provision type` global configuration command that matches the new Switch. For configuration information, see the Provisioning a New Member for a Switch Stack section.

**Effects of Replacing a Provisioned Switch in a Switch Stack**

When a provisioned switch in a switch stack fails, it is removed from the stack, and is replaced with another Switch, the stack applies either the provisioned configuration or the default configuration to it. The events that occur when the switch stack compares the provisioned configuration with the provisioned switch are the same as those when you add a provisioned switch to a stack.
Effects of Removing a Provisioned Switch from a Switch Stack

If you remove a provisioned switch from the switch stack, the configuration associated with the removed stack member remains in the running configuration as provisioned information. To completely remove the configuration, use the `no switch stack-member-number provision` global configuration command.

Stack Protocol Version

Each software image includes a stack protocol version. The stack protocol version has a major version number and a minor version number (for example 1.4, where 1 is the major version number and 4 is the minor version number). Both version numbers determine the level of compatibility among the stack members. You can display the stack protocol version by using the `show platform stack manager all` privileged EXEC command.

The switches with the same Cisco IOS software version have the same stack protocol version. Such switches are fully compatible, and all features function properly across the switch stack. A switch with the same Cisco IOS software version as the stack master can immediately join the switch stack.

If an incompatibility exists, the fully functional stack members generate a system message that describes the cause of the incompatibility on the specific stack members. The stack master sends the message to all stack members.

For more information, see the Major Version Number Incompatibility Among Switches procedure and the Minor Version Number Incompatibility Among Switches procedure.

Major Stack Protocol Version Number Incompatibility Among Stack-Capable Switches

Switch with different major Cisco IOS software versions usually have different stack protocol versions. Switch with different major version numbers are incompatible and cannot exist in the same switch stack.

Minor Stack Protocol Version Number Incompatibility Among Stack-Capable Switches

Switches with the same major version number but with a different minor version number are considered partially compatible. When connected to a switch stack, a partially compatible switch enters version-mismatch (VM) mode and cannot join the stack as a fully functioning member. The software detects the mismatched software and tries to upgrade (or downgrade) the switch in VM mode with the switch stack image or with a tar file image from the switch stack flash memory. The software uses the automatic upgrade (auto-upgrade) and the automatic advise (auto-advise) features.

The port LEDs on switches in version-mismatch mode will also remain off. Pressing the Mode button does not change the LED mode.

Auto-Upgrade

The purpose of the auto-upgrade feature is to allow a switch to be upgraded to a compatible software image, so that the switch can join the switch stack.

When a new switch attempts to join a switch stack, each stack member performs compatibility checks with itself and the new switch. Each stack member sends the results of the compatibility checks to the stack master, which uses the results to determine whether the switch can join the switch stack. If the software on the new switch is incompatible with the switch stack, the new switch enters version-mismatch (VM) mode.

If the auto-upgrade feature is enabled on the existing switch stack, the stack master automatically upgrades the new switch with the same software image running on a compatible stack member. Auto-upgrade starts a few minutes after the mismatched software is detected before starting.
By default, auto-upgrade is enabled (the `boot auto-copy-sw` global configuration command is enabled). You can disable auto-upgrade by using the `no boot auto-copy-sw` global configuration command on the stack master. You can check the status of auto-upgrade by using the `show boot` privileged EXEC command and by checking the `Auto upgrade` line in the display.

Auto-upgrade includes an auto-copy process and an auto-extract process.

- Auto-copy automatically copies the software image running on any stack member to the new switch to automatically upgrade it. Auto-copy occurs if auto-upgrade is enabled, if there is enough flash memory in the new switch, and if the software image running on the switch stack is suitable for the new switch.

  **Note**  A switch in VM mode might not run all released software. For example, new switch hardware is not recognized in earlier versions of software.

- Automatic extraction (auto-extract) occurs when the auto-upgrade process cannot find the appropriate software in the stack to copy to the new switch. In that case, the auto-extract process searches all switches in the stack for the tar file needed to upgrade the switch stack or the new switch. The tar file can be in any flash file system in the switch stack or in the new switch. If a tar file suitable for the new switch is found on a stack member, the process extracts the file and automatically upgrades the new switch.

The auto-upgrade (auto-copy and auto-extract) processes start a few minutes after the mismatched software is detected.

When the auto-upgrade process is complete, the new switch reloads and joins the stack as a fully functioning member. If you have both stack cables connected during the reload, network downtime does not occur because the switch stack operates on two rings.

**Auto-Advise**

The auto-advise feature is triggered when:

- The auto-upgrade feature is disabled.

- The new switch is in bundle mode and the stack is in installed mode. Auto-advise displays syslog messages about using the `software auto-upgrade` privileged EXEC command to change the new switch to installed mode.

- The stack is in bundle mode. Auto-advise displays syslog messages about booting the new switch in bundle mode so that it can join the stack.

- An auto-upgrade attempt fails because the new switch is running incompatible software. After the switch stack performs compatibility checks with the new switch, auto-advise displays syslog messages about whether the new switch can be auto-upgraded.

Auto-advise cannot be disabled. It does not give suggestions when the switch stack software and the software of the switch in version-mismatch (VM) mode do not contain the same license level.

Automatic advise (auto-advise) occurs when the auto-upgrade process cannot find appropriate stack member software to copy to the new switch. This process tells you the command (`archive copy-sw` or `archive download-sw` privileged EXEC command) and the image name (tar filename) needed to manually upgrade the switch stack or the new switch. The recommended image can be the running switch stack image or a tar file in any flash file system in the switch stack (including the new switch). If an appropriate image is not found.
in the stack flash file systems, the auto-advice process tells you to install new software on the switch stack. Auto-advice cannot be disabled, and there is no command to check its status.

**Examples of Auto-Advise Messages**

When you add a switch that has a different minor version number to the switch stack, the software displays messages in sequence (assuming that there are no other system messages generated by the switch).

This example shows that the switch stack detected a new switch that is running a different minor version number than the switch stack. Auto-copy starts, finds suitable software to copy from a stack member to the switch in VM mode, upgrades the switch in VM mode, and then reloads it:

* Mar 11 20:31:19.247: %STACKMGR-6-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state UP
* Mar 11 20:31:23.232: %STACKMGR-6-SWITCH_ADDED_VM: Switch 1 has been ADDED to the stack (VERSION_MISMATCH)
* Mar 11 20:31:23.291: %STACKMGR-6-SWITCH_ADDED_VM: Switch 1 has been ADDED to the stack (VERSION_MISMATCH) (Stack 1-3)
* Mar 11 20:33:23.248: %IMAGEMGR-6-AUTO_COPY_SW_INITIATED: Auto-copy-software process initiated for switch number(s) 1
* Mar 11 20:36:15.038: %IMAGEMGR-6-AUTO_COPY_SW: Searching for stack member to act as software donor...
* Mar 11 20:36:15.038: %IMAGEMGR-6-AUTO_COPY_SW: Found donor (system #2) for member(s) 1
* Mar 11 20:36:15.038: %IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
* Mar 11 20:36:15.038: %IMAGEMGR-6-AUTO_COPY_SW: Installing (renaming): `flash1:c2960x-universalk9-mz.150-2.EX' ->
Auto-advise and auto-copy identify which images are running by examining the info file and by searching the directory structure on the switch stack. If you download your image by using the `copy tftp` boot loader command instead of the `archive download-sw` privileged EXEC command, the proper directory structure is not created. For more information about the info file, see the "Catalyst 2960-X Switch Managing Cisco IOS Image Files Configuration Guide."
**SDM Template Mismatch in Switch Stacks**

The LAN Base default template is used with switches in a homogeneous stack, and the LAN Base routing template is used with switches in a mixed stack.

All stack members use the Switch Database Management (SDM) template configured on the stack master. When a new switch is added to a stack, the SDM configuration that is stored on the stack master overrides the template configured on an individual switch.

When you add a Catalyst 2960-S switch to a stack of Catalyst 2960-X switches running the LAN Base default template, the Catalyst 2960-S switch will go into SDM-mismatch mode. You must change the template of the switch stack to the LAN Base routing template.

You can use the `show switch` privileged EXEC command to see if any stack members are in SDM-mismatch mode.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM-mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition.

For more information about SDM templates, see the *Catalyst 2960-X Switch System Management Configuration Guide*.

**Switch Stack Management Connectivity**

You manage the switch stack and the stack member interfaces through the stack master. You can use the CLI, SNMP, and supported network management applications such as CiscoWorks. You cannot manage stack members on an individual Switch basis.

**Connectivity to Specific Stack Members**

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug a specific stack member, you can access it from the stack master by using the `session stack-member-number` privileged EXEC command. The stack member number is appended to the system prompt. For example, `Switch-2#` is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the stack master is `Switch`. Only the `show` and `debug` commands are available in a CLI session to a specific stack member.

To debug the standby switch, you can access it from the active switch using the `session standby ios` privileged EXEC command. To debug a specific stack member, use the `session switch stack-member-number` privileged EXEC command from the active switch to access the diagnostic shell of the stack member. Only the `show` and `debug` commands are available in a CLI session to a specific stack member.

**Connectivity to the Switch Stack Through an IP Address**

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the stack master or to any other stack member. You can still manage the stack through the same IP address even if you remove the stack master or any other stack member from the stack, provided there is IP connectivity.
Stack members retain their IP addresses when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP addresses of any Switch that you remove from the switch stack.

For related information about switch stack configurations, see the *Switch Stack Configuration Files* section.

**Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports**

You can connect to the stack master by using one of these methods:

- You can connect a terminal or a PC to the stack master through the console port of one or more stack members.

- You can connect a PC to the stack master through the Ethernet management ports of one or more stack members. For more information about connecting to the switch stack through Ethernet management ports, see the *Using the Ethernet Management Port* section.

You can connect to the stack master by connecting a terminal or a PC to the stack master through the console port of one or more stack members.

Be careful when using multiple CLI sessions to the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

We recommend using only one CLI session when managing the switch stack.

**How to Configure a Switch Stack**

**Enabling the Persistent MAC Address Feature**

- **Note**: When you enter the command to configure this feature, a warning message appears with the consequences of your configuration. You should use this feature cautiously. Using the old stack master MAC address elsewhere in the same domain could result in lost traffic.

Follow these steps to enable persistent MAC address:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Enabling the Persistent MAC Address Feature

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2**
  - `configure terminal`  
  **Example:**
  
  Switch# configure terminal | Enters global configuration mode. |
| **Step 3**
  - `stack-mac persistent timer [0 | time-value]`  
  **Example:**
  
  Switch(config)# stack-mac persistent timer 7 | Enables a time delay after a stack-master change before the stack MAC address changes to that of the new stack master. If the previous stack master rejoins the stack during this period, the stack uses that MAC address as the stack MAC address. You can configure the time period as 0 to 60 minutes. |
  - • Enter the command with no value to set the default delay of approximately 4 minutes. We recommend that you always enter a value. If the command is entered without a value, the time delay appears in the running-config file with an explicit timer value of 4 minutes. |
  - • Enter 0 to continue using the MAC address of the current stack master indefinitely. The stack MAC address of the previous stack master is used until you enter the `no stack-mac persistent timer` command, which immediately changes the stack MAC address to that of the current stack master. |
  - • Enter a `time-value` from 1 to 60 minutes to configure the time period before the stack MAC address changes to the new stack master. The stack MAC address of the previous stack master is used until the configured time period expires or until you enter the `no stack-mac persistent timer` command. |
  - **Note**  
  If you enter the `no stack-mac persistent timer` command after a new stack master takes over, before the time expires, the switch stack moves to the current stack master MAC address. |
Assigning a Stack Member Number

This optional task is available only from the stack master.

Follow these steps to assign a member number to a stack member:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switch current-stack-member-number renumber new-stack-member-number</td>
<td>Specifies the current stack member number and the new stack member number for the stack member. The range is 1 to 8. You can display the current stack member number by using the show switch user EXEC command.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# switch 3 renumber 4</td>
<td></td>
</tr>
</tbody>
</table>
Setting the Stack Member Priority Value

This optional task is available only from the stack master.

Follow these steps to assign a priority value to a stack member:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
 enable  
 Example:  
`Switch enable` | Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2**  
`switch stack-member-number priority new-priority-number`  
Example:  
`Switch# switch 3 priority 2` | Specifies the stack member number and the new priority for the stack member. The stack member number range is 1 to 8. The priority value range is 1 to 15. You can display the current priority value by using the `show switch` user EXEC command. The new priority value takes effect immediately but does not affect the current stack master. The new priority value helps determine which stack... |
### Setting the Stack Port Speed to 10 Gbps

In a mixed stack of Catalyst 2960-X and 2960-S switches, you must set the stack port speed to 10 Gbps. This task is required in a mixed stack configuration and must be run on a Catalyst 2960-X switch in the switch stack before you add a 2960-S switch to the stack. Otherwise, the switches will not stack.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>switch stack port-speed 10</td>
<td>Sets the stack port speed to 10 Gbps.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# switch stack port-speed 10</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
## Provisioning a New Member for a Switch Stack

This optional task is available only from the stack master.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>show switch</code></td>
<td>Displays summary information about the switch stack.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>show switch</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>switch stack-member-number provision type</code></td>
<td>Specifies the stack member number for the preconfigured switch. By default, no switches are provisioned.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>switch 3 provision WS-xxxx</code></td>
<td>For <code>stack-member-number</code>, the range is 1 to 8. Specify a stack member number that is not already used in the switch stack. See Step 1. For <code>type</code>, enter the model number of a supported switch that is listed in the command-line help strings.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
Removing Provisioned Switch Information

Before you begin, you must remove the provisioned switch from the stack. This optional task is available only from the stack master.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>no switch stack-member-number provision</td>
<td>Removes the provisioning information for the specified member.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# no switch 3 provision</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

If you are removing a provisioned switch in a stack with this configuration:

- The stack has four members
- Stack member 1 is the stack master
- Stack member 3 is a provisioned switch

and want to remove the provisioned information and to avoid receiving an error message, you can remove power from stack member 3, disconnect the StackWise-480 stack cables between the stack member 3 and switches to which it is connected, reconnect the cables between the remaining stack members, and enter the **no switch stack-member-number provision** global configuration command.
Troubleshooting the Switch Stack

Accessing the CLI of a Specific Member

This optional task is for debugging purposes, and is available only from the stack master.

You can access all or specific members by using the remote command `{all | stack-member-number}` privileged EXEC command. The stack member number range is 1 to 8.

You can access specific members by using the session `stack-member-number` privileged EXEC command. The member number is appended to the system prompt. For example, the prompt for member 2 is `Switch-2#`, and system prompt for the stack master is `Switch#`. Enter `exit` to return to the CLI session on the stack master. Only the `show` and `debug` commands are available on a specific member.

Temporarily Disabling a Stack Port

If a stack port is flapping and causing instability in the stack ring, to disable the port, enter the `switch stack-member-number stack port port-number disable` privileged EXEC command. To reenable the port, enter the `switch stack-member-number stack port port-number enable` command.

Be careful when using the `switch stack-member-number stack port port-number disable` command. When you disable the stack port, the stack operates at half bandwidth.

A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state.

The stack is in the partial-ring state when the following occurs:

- All members are connected through their stack ports but some are not in the ready state.
- Some members are not connected through the stack ports.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack-member-number stack port port-number disable</code></td>
<td>Disables the specified stack port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# switch 2 stack port 1 disable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack-member-number stack port port-number enable</code></td>
<td>Reenables the stack port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# switch 2 stack port 1 enable</code></td>
<td></td>
</tr>
</tbody>
</table>
When you disable a stack port and the stack is in the full-ring state, you can disable only one stack port. This message appears:

Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]

When you disable a stack port and the stack is in the partial-ring state, you cannot disable the port. This message appears:

Disabling stack port not allowed with current stack configuration.

Reenabling a Stack Port While Another Member Starts

Stack Port 1 on Switch 1 is connected to Port 2 on Switch 4. If Port 1 is flapping, you can disable Port 1 with the `switch 1 stack port 1 disable` privileged EXEC command. While Port 1 on Switch 1 is disabled and Switch 1 is still powered on, follow these steps to reenable a stack port:

**Procedure**

- **Step 1**: Disconnect the stack cable between Port 1 on Switch 1 and Port 2 on Switch 4.
- **Step 2**: Remove Switch 4 from the stack.
- **Step 3**: Add a switch to replace Switch 4 and assign it switch-number 4.
- **Step 4**: Reconnect the cable between Port 1 on Switch 1 and Port 2 on Switch 4 (the replacement switch).
- **Step 5**: Reenable the link between the switches. Enter the `switch 1 stack port 1 enable` privileged EXEC command to enable Port 1 on Switch 1.
- **Step 6**: Power on Switch 4.

**Caution**

Powering on Switch 4 before enabling the Port 1 on Switch 1 might cause one of the switches to reload. If Switch 4 is powered on first, you might need to enter the `switch 1 stack port 1 enable` and the `switch 4 stack port 2 enable` privileged EXEC commands to bring up the link.

Monitoring the Switch Stack

**Table 142: Commands for Displaying Stack Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show controller ethernet-controller stack port {1</td>
<td>2}`</td>
</tr>
<tr>
<td><code>show controller ethernet-controller fastethernet0</code></td>
<td>Displays information about the Ethernet management port, including the port status and the per-interface send and receive statistics read from the hardware.</td>
</tr>
<tr>
<td><code>show platform stack compatibility</code></td>
<td>Displays information about HULC feature compatibility.</td>
</tr>
</tbody>
</table>
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show platform stack manager all</code></td>
<td>Displays all stack manager information, such as the stack protocol version.</td>
</tr>
<tr>
<td><code>show platform stack passive-links</code></td>
<td>Displays information about stack passive links.</td>
</tr>
<tr>
<td><code>show switch</code></td>
<td>Displays summary information about the stack, including the status of provisioned switches and switches in version-mismatch mode.</td>
</tr>
<tr>
<td><code>show switch stack-member-number</code></td>
<td>Displays information about a specific member.</td>
</tr>
<tr>
<td><code>show switch detail</code></td>
<td>Displays detailed information about the stack.</td>
</tr>
<tr>
<td><code>show switch neighbors</code></td>
<td>Displays the stack neighbors.</td>
</tr>
<tr>
<td><code>show switch stack-ports</code></td>
<td>Displays port information for the stack.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Switch Stacks

#### Switch Stack Configuration Scenarios

Most of these switch stack configuration scenarios assume that at least two switch are connected through their stack ports.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only one of the two stack masters becomes the new stack master.</td>
<td>Connect two powered-on switch stacks through the StackWise-480 stack ports.</td>
</tr>
<tr>
<td>The stack member with the higher priority value is elected stack master.</td>
<td>1. Connect two switches through their stack ports. 2. Use the <code>switch stack-member-number priority new-priority-number</code> global configuration command to set one stack member with a higher member priority value. 3. Restart both stack members at the same time.</td>
</tr>
<tr>
<td>Scenario</td>
<td>Result</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
</tr>
<tr>
<td>Stack master election specifically determined by the configuration file</td>
<td>The stack member with the saved configuration file is elected stack master.</td>
</tr>
<tr>
<td>Stack master election specifically determined by the MAC address</td>
<td>The stack member with the lower MAC address is elected stack master.</td>
</tr>
<tr>
<td>Stack member number conflict</td>
<td>The stack member with the higher priority value retains its stack member number. The other stack member has a new stack member number.</td>
</tr>
<tr>
<td>Add a stack member</td>
<td>The stack master is retained. The new switch is added to the switch stack.</td>
</tr>
<tr>
<td>Stack master failure</td>
<td>The standby switch becomes the new active switch. All other stack members in the stack remain as stack members and do not reboot.</td>
</tr>
<tr>
<td>Add more than eight stack members</td>
<td>Two switch become stack masters. One stack master has eight stack members. The other stack master remains as a standalone switch. Use the Mode button and port LEDs on the switch to identify which switch are stack masters and which switch belong to each stack master.</td>
</tr>
</tbody>
</table>
Enabling the Persistent MAC Address Feature: Example

This example shows how to configure the persistent MAC address feature for a 7-minute time delay and to verify the configuration:

Switch(config)# stack-mac persistent timer 7
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.
Switch(config)# end
Switch# show switch
Switch/Stack Mac Address : 0016.4727.a900
Mac persistency wait time: 7 mins

<table>
<thead>
<tr>
<th>Switch#</th>
<th>Role</th>
<th>Mac Address</th>
<th>Priority</th>
<th>Version</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>*1</td>
<td>Master</td>
<td>0016.4727.a900</td>
<td>1</td>
<td>P2B</td>
<td>Ready</td>
</tr>
</tbody>
</table>

Provisioning a New Member for a Switch Stack: Example

This example shows how to provision a switch with a stack member number of 2 for the switch stack. The show running-config command output shows the interfaces associated with the provisioned switch:

Switch(config)# switch 2 provision switch_PID
Switch(config)# end
Switch# show running-config | include switch 2
switch 2 provision switch_PID

Information About Administering the Switch

System Time and Date Management

You can manage the system time and date on your switch using automatic configuration methods (RTC and NTP), or manual configuration methods.

Note
For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference on Cisco.com.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

• RTC
• NTP
• Manual configuration

The system clock can provide time to these services:

• User show commands
• Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

Real Time Clock

A real-time clock (RTC) keeps track of the current time on the switch. The switch is shipped to you with RTC set to GMT time until you reconfigure clocking parameters.

The benefits of an RTC are:

• RTC is battery-powered.

• System time is retained during power outage and at system reboot.

The RTC and NTP clocks are integrated on the switch. When NTP is enabled, the RTC time is periodically synchronized to the NTP clock to maintain accuracy.

Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The Figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream Switch, Switch B and Switch F, respectively.

*Figure 110: Typical NTP Network Configuration*

If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Stratum**

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.
NTP Associations

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

*Figure 111: Typical NTP Network Configuration*

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F.
If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Version 4**

NTP version 4 is implemented on the switch. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

For details about configuring NTPv4, see the Implementing NTPv4 in IPv6 chapter of the Cisco IOS IPv6 Configuration Guide, Release 12.4T.

**System Name and Prompt**

You configure the system name on the Switch to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4 and the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4.

**Stack System Name and Prompt**

If you are accessing a stack member through the stack master, you must use the `session stack-member-number` privileged EXEC command. The stack member number range is from 1 through 8. When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

**Default System Name and Prompt Configuration**

The default switch system name and prompt is Switch.
DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a com domain name, so its domain name is cisco.com. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as ftp.cisco.com.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

Default DNS Settings

Table 144: Default DNS Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4.

Default Banner Configuration

The MOTD and login banners are not configured.

MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**Note**
For complete syntax and usage information for the commands used in this section, see the command reference for this release.

---

### MAC Address Table Creation

With multiple MAC addresses supported on all ports, you can connect any port on the switch to other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

### MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

### Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>
ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.4 documentation on *Cisco.com*.

How to Administer the Switch

Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

---

**Note**

You must reconfigure this setting if you have manually configured the system clock before the stack master fails and a different stack member assumes the role of stack master.

---

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Follow these steps to set the system clock:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
</tbody>
</table>
Purpose: Command or Action

Step 2: Use one of the following:
- `clock set hh:mm:ss day month year`
- `clock set hh:mm:ss month day year`

Example:
```
Switch# clock set 13:32:00 23 March 2013
```

- `clock set hh:mm:ss—` Specifies the time in hours (24-hour format), minutes, and seconds.
- `day—` Specifies the day by date in the month.
- `month—` Specifies the month by name.
- `year—` Specifies the year (no abbreviation).

---

**Configuring the Time Zone**

Follow these steps to manually configure the time zone:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>clock timezone zone hours-offset [minutes-offset]</code></td>
<td>Sets the time zone. Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# clock timezone AST -3 30</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Step 2</strong> configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> clock summer-time zone date month year hh:mm date month year hh:mm [offset]</td>
</tr>
<tr>
<td></td>
<td>Configures summer time to start and end on specified days every year.</td>
</tr>
</tbody>
</table>

### Table

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Step 5</strong> show running-config</td>
</tr>
<tr>
<td></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td><strong>Step 6</strong> copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

- **Step 1**: `enable`<br>Enter your password if prompted.<br><br>- **Step 2**: `configure terminal`<br>- **Step 3**: `clock summer-time zone date month year hh:mm date month year hh:mm [offset]`
Configuring Summer Time (Daylight Saving Time)

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 4    | clock summer-time zone recurring [week day month hh:mm weekday month hh:mm [offset]] | Configures summer time to start and end on the specified days every year. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. Summer time is disabled by default. If you specify `clock summer-time zone recurring` without parameters, the summer time rules default to the United States rules. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.  
  - `zone`—Specifies the name of the time zone (for example, PDT) to be displayed when summer time is in effect.  
  - (Optional) `week`— Specifies the week of the month (1 to 4, first, or last).  
  - (Optional) `day`—Specifies the day of the week (Sunday, Monday...).  
  - (Optional) `month`—Specifies the month (January, February...).  
  - (Optional) `hh:mm`—Specifies the time (24-hour format) in hours and minutes.  
  - (Optional) `offset`—Specifies the number of minutes to add during summer time. The default is 60. |
<p>| 5    | end | Returns to privileged EXEC mode. |
| 6    | show running-config | Verifies your entries. |
| 7    | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

Follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>clock summer-time zone date [month date year hh:mm month date year hh:mm [offset]]</code> or <code>clock summer-time zone date [date month year hh:mm date month year hh:mm [offset]]</code></td>
<td>Configures summer time to start on the first date and end on the second date.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Summer time is disabled by default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <code>zone</code>, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For <code>week</code>, specify the week of the month (1 to 5 or last).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For <code>day</code>, specify the day of the week (Sunday, Monday...).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For <code>month</code>, specify the month (January, February...).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For <code>hh:mm</code>, specify the time (24-hour format) in hours and minutes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For <code>offset</code>, specify the number of minutes to add during summer time. The default is 60.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a System Name

Follow these steps to manually configure a system name:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Procedure</strong></td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>hostname name</td>
<td>Configures a system name. When you set the system name, it is also used as the system prompt.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# hostname remote-users</td>
<td>The default setting is Switch.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.</td>
</tr>
</tbody>
</table>
Setting Up DNS

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ip domain-name name</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Example:</td>
<td>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name. At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td><strong>Switch</strong>(config)# ip domain-name Cisco.com</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>ip name-server server-address1 [server-address2 ... server-address6]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Specifies the address of one or more name servers to use for name and address resolution. You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</td>
</tr>
<tr>
<td>Switch**(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300</td>
<td></td>
</tr>
</tbody>
</table>

| Step 5 | ip domain-lookup [nsap | source-interface interface] |
|---|---|
| Example: | (Optional) Enables DNS-based hostname-to-address translation on your switch. This feature is enabled by default. If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS). |
| Switch**(config)# ip domain-lookup | |

<table>
<thead>
<tr>
<th>Step 6</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch**(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>show running-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
## Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

Follow these steps to configure a MOTD login banner:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>banner motd c message c</code></td>
<td>Specifies the message of the day.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# <code>banner motd #</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>This is a secure site. Only</td>
<td></td>
</tr>
<tr>
<td></td>
<td>authorized users are allowed.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>For access, contact technical</td>
<td></td>
</tr>
<tr>
<td></td>
<td>support.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>#</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>message</strong>—Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# <code>end</code></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

---

**Example:**

```
Switch# copy running-config startup-config
```
### Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Follow these steps to configure a login banner:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>enable</em></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>enters global configuration mode.</td>
</tr>
<tr>
<td><em>configure terminal</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>specifies the login message.</td>
</tr>
<tr>
<td><em>banner login c message c</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.</td>
</tr>
<tr>
<td>Switch(config)# banner login $</td>
<td></td>
</tr>
<tr>
<td>Access for authorized users only. Please enter your username and password.</td>
<td></td>
</tr>
<tr>
<td>$</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><em>end</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

Changing the Address Aging Time

Follow these steps to configure the dynamic address table aging time:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
</tbody>
</table>
| mac address-table aging-time [0 | Sets the length of time that a dynamic entry
| 10-1000000] [routed-mac | remains in the MAC address table after the entry
| vlan vlan-id] | is used or updated. |
| Example:          | The range is 10 to 1000000 seconds. The default |
| Switch(config)# mac address-table | is 300. You can also enter 0, which disables |
| aging-time 500 vlan 2 | aging. Static address entries are never aged or |
|                     | removed from the table. |
|                     | vlan-id—Valid IDs are 1 to 4094. |
### Configuring MAC Address Change Notification Traps

Follow these steps to configure the switch to send MAC address change notification traps to an NMS host:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server host host-addr community-string</td>
<td>Specifies the recipient of the trap message.</td>
</tr>
<tr>
<td>notification-type { informs</td>
<td>traps } { version</td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Switch(config)# snmp-server host 172.20.10.10 traps</td>
<td>• host-addr—Specifies the name or address of the NMS.</td>
</tr>
<tr>
<td>private mac-notification</td>
<td>• traps (the default)—Sends SNMP traps to the host.</td>
</tr>
<tr>
<td></td>
<td>• informs—Sends SNMP informs to the host.</td>
</tr>
</tbody>
</table>
### Configuring MAC Address Change Notification Traps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>• version</strong>—Specifies the SNMP version to support. Version 1, the default, is not available with informs.</td>
<td></td>
</tr>
<tr>
<td><strong>• community-string</strong>—Specifies the string to send with the notification operation. Though you can set this string by using the <code>snmp-server host</code> command, we recommend that you define this string by using the <code>snmp-server community</code> command before using the <code>snmp-server host</code> command.</td>
<td></td>
</tr>
<tr>
<td><strong>• notification-type</strong>—Uses the <code>mac-notification</code> keyword.</td>
<td></td>
</tr>
<tr>
<td><strong>• vrf vrf instance name</strong>—Specifies the VPN routing/forwarding instance for this host.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

Enable the switch to send MAC address change notification traps to the NMS.

```
Switch(config)# snmp-server enable traps mac-notification change
```

**Example:**

```
Switch(config)# snmp-server enable traps mac-notification change
```

**Step 5**

Enable the MAC address change notification feature.

```
Switch(config)# mac address-table notification change
```

**Example:**

```
Switch(config)# mac address-table notification change
```

**Step 6**

Enter the trap interval time and the history table size.

```
Switch(config)# mac address-table notification change [interval value] [history-size value]
```

**Example:**

```
Switch(config)# mac address-table notification change interval 123
Switch(config)# mac address-table notification change history-size 100
```

**Step 7**

Enter interface configuration mode, and specifies the Layer 2 interface on which to

```
interface interface-id
```

**Example:**

```
interface interface-id
```
### Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Follow these steps to configure the switch to send MAC address-move notification traps to an NMS host:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

---

**Purpose**

</table>
### Purpose

Command or Action | Purpose
--- | ---
Switch# configure terminal | Specifies the recipient of the trap message.

#### Step 3

**snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type**

**Example:**

Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification

- **host-addr**—Specifies the name or address of the NMS.
- **traps** (the default)—Sends SNMP traps to the host.
- **informs**—Sends SNMP informs to the host.
- **version**—Specifies the SNMP version to support. Version 1, the default, is not available with informs.
- **community-string**—Specifies the string to send with the notification operation. Though you can set this string by using the `snmp-server host` command, we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.
- **notification-type**—Uses the `mac-notification` keyword.

#### Step 4

**snmp-server enable traps mac-notification move**

**Example:**

Switch(config)# snmp-server enable traps mac-notification move

Enables the switch to send MAC address move notification traps to the NMS.

#### Step 5

**mac address-table notification mac-move**

**Example:**

Switch(config)# mac address-table notification mac-move

Enables the MAC address move notification feature.

#### Step 6

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.
Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

Follow these steps to configure the switch to send MAC address table threshold notification traps to an NMS host:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`snmp-server host host-addr {traps</td>
<td>informs} {version {1</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• <code>host-addr</code>—Specifies the name or address of the NMS.</td>
</tr>
</tbody>
</table>

What to do next

To disable MAC address-move notification traps, use the `no snmp-server enable traps mac-notification move` global configuration command. To disable the MAC address-move notification feature, use the `no mac address-table notification mac-move` global configuration command.

You can verify your settings by entering the `show mac address-table notification mac-move` privileged EXEC commands.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification` | • **traps** (the default)—Sends SNMP traps to the host.  
• **informs**—Sends SNMP informs to the host.  
• **version**—Specifies the SNMP version to support. Version 1, the default, is not available with informs.  
• **community-string**—Specifies the string to send with the notification operation. You can set this string by using the `snmp-server host` command, but we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.  
• **notification-type**—Uses the `mac-notification` keyword. |

**Step 4**  
**snmp-server enable traps mac-notification threshold**  
**Example:**  
`Switch(config)# snmp-server enable traps mac-notification threshold`

Enables MAC threshold notification traps to the NMS.

**Step 5**  
**mac address-table notification threshold**  
**Example:**  
`Switch(config)# mac address-table notification threshold`

Enables the MAC address threshold notification feature.

**Step 6**  
**mac address-table notification threshold [limit percentage] [interval time]**  
**Example:**  
`Switch(config)# mac address-table notification threshold interval 123`  
`Switch(config)# mac address-table notification threshold limit 78`

Enters the threshold value for the MAC address threshold usage monitoring.  
• (Optional) **limit percentage**—Specifies the percentage of the MAC address table use; valid values are from 1 to 100 percent. The default is 50 percent.  
• (Optional) **interval time**—Specifies the time between notifications; valid values are greater than or equal to 120 seconds. The default is 120 seconds.
Adding and Removing Static Address Entries

Follow these steps to add a static address:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>

## Monitoring and Maintaining Administration of the Switch

### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear mac address-table dynamic</code></td>
<td>Removes all dynamic entries.</td>
</tr>
<tr>
<td><code>clear mac address-table dynamic address mac-address</code></td>
<td>Removes a specific MAC address.</td>
</tr>
<tr>
<td><code>clear mac address-table dynamic interface interface-id</code></td>
<td>Removes all addresses on the specified physical port or port channel.</td>
</tr>
<tr>
<td><code>clear mac address-table dynamic vlan vlan-id</code></td>
<td>Removes all addresses on a specified VLAN.</td>
</tr>
<tr>
<td><code>show clock [detail]</code></td>
<td>Displays the time and date configuration.</td>
</tr>
</tbody>
</table>
### Configuration Examples for Switch Administration

#### Example: Setting the System Clock

This example shows how to manually set the system clock:

```
Switch# clock set 13:32:00 23 July 2013
```

#### Examples: Configuring Summer Time

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
Switch(config)# clock summer-time PDT recurring PST date
```
10 March 2013 2:00 3 November 2013 2:00

This example shows how to set summer time start and end dates:

Switch(config)#clock summer-time PST date
20 March 2013 2:00 20 November 2013 2:00

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

Switch(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Switch(config)#

This example shows the banner that appears from the previous configuration:

Unix> telnet 192.0.2.15
Trying 192.0.2.15...
Connected to 192.0.2.15.
Escape character is '^]'.
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
User Access Verification
Password:

Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

Switch(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
Switch(config)#
Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 123
Switch(config)# mac address-table notification change history-size 100
Switch(config)# interface gigabitethernet 1/2/1
Switch(config-if)# snmp trap mac-notification change added
```

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

```
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/1/1
```

**Note**

You cannot associate the same static MAC address to multiple interfaces. If the command is executed again with a different interface, the static MAC address is overwritten on the new interface.

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/1/1
```

Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

Information About Performing Switch Setup Configuration

Review the sections in this module before performing your initial switch configuration tasks that include IP address assignments and DHCP autoconfiguration.

Boot Process

To start your switch, you need to follow the procedures in the getting started guide or the hardware installation guide for installing and powering on the switch and setting up the initial switch configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The boot loader software performs the normal boot process and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
- Loads a default operating system software image into memory and boots up the switch.

The boot loader provides access to the flash file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door operation provides enough access to the system so that if it is
necessary, you can format the flash file system, reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.

Before you can assign switch information, make sure that you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match that of the switch console port settings:

- Baud rate default is 9600.
- Data bits default is 8.

**Note**

If the data bits option is set to 8, set the parity option to none.

- Stop bits default is 2 (minor).
- Parity settings default is none.

## Switches Information Assignment

You can assign IP information through the switch setup program, through a DHCP server, or manually.

Use the switch setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

**Note**

If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use the setup program described in the Boot Process section.

### Default Switch Information

**Table 146: Default Switch Information**

DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

DHCP Client Request Process

When you boot up your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

*Figure 112: DHCP Client and Server Message Exchange*

```
Switch A       DHCP server
        +-----------------+    +-----------------+
      DHCPDISCOVER (broadcast)  DHCPREQUEST (broadcast)
        |                  |    |                  |
        v                  v    v                  v
DHCOFFER (unicast)       DHCPACK (unicast)  DHCPACK (unicast)
```

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCP_OFFER unicast message.
In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCDDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

The DHCP hostname option allows a group of switches to obtain hostnames and a standard configuration from the central management DHCP server. A client (switch) includes in its DCHPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the hostname name global configuration command is not configured or the no hostname global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the ip address dhcp interface configuration command. In this case, if the client receives the DCHP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

DHCP-based Autoconfiguration and Image Update

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more switches in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new switch added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

Restrictions for DHCP-based Autoconfiguration

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
• The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.

• The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the `write memory` or `copy running-configuration startup-configuration` privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

**DHCP Autoconfiguration**

DHCP autoconfiguration downloads a configuration file to one or more switches in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the switch. It does not overwrite the bootup configuration saved in the flash, until you reload the switch.

**DHCP Auto-Image Update**

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more switches in your network. The switch (or switches) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

To enable a DHCP auto-image update on the switch, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the switch in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the switch, and the new image is downloaded and installed on the switch. When you reboot the switch, the configuration is stored in the saved configuration on the switch.

**DHCP Server Configuration Guidelines**

Follow these guidelines if you are configuring a device as a DHCP server:

• You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.

• If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:
  • IP address of the client (required)
  • Subnet mask of the client (required)
  • DNS server IP address (optional)
  • Router IP address (default gateway address to be used by the switch) (required)

• If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
• TFTP server name (required)
• Boot filename (the name of the configuration file that the client needs) (recommended)
• Hostname (optional)

Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the switch is not configured. If the router IP address or the TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

The switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured. (These features are not operational.)

**Purpose of the TFTP Server**

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, ciscoconf.res, hostname.config, or hostname.cfg, where hostname is the switch’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

• The configuration file named in the DHCP reply (the actual switch configuration file).
• The network-config or the ciscoconf.res file (known as the default configuration files).
• The router-config or the ciscoconf.cfg file (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the switch, or if it is to be accessed by the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.
Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database. The DNS server can be on the same LAN or on a different LAN from the switch. If it is on a different LAN, the switch must be able to access it through a router.

How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).
  
  The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).
  
  The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).
  
  The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the network-config or ciscoconf.default configuration file. (If the network-config file cannot be read, the switch reads the ciscoconf.default file.)

  The default configuration file contains the hostnames-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the switch uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the switch uses the default Switch as its hostname.

  After obtaining its hostname from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its hostname (hostname-config or hostname.cfg, depending on whether network-config or ciscoconf.default was read earlier) from the TFTP server. If the ciscoconf.default file is read, the filename of the host is truncated to eight characters.

  If the switch cannot read the network-config, ciscoconf.default, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscortr.cfg file.
The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

**How to Control Environment Variables**

With a normally operating switch, you enter the boot loader mode only through the console connection. Unplug the switch power cord, then reconnect the power cord. Hold down the **MODE** button until you see the boot loader switch prompt.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader or any other software running on the system, functions. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

Environment variables store two kinds of data:

- Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.

- Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.
Common Environment Variables

This table describes the function of the most common environment variables.

Table 147: Common Environment Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Boot Loader Command</th>
<th>Cisco IOS Global Configuration Command</th>
</tr>
</thead>

<tr>
<td></td>
<td>This command can be issued when the flash filesystem is initialized when ENABLE_BREAK is set to yes.</td>
<td></td>
</tr>
</tbody>
</table>

**Environment Variables for TFTP**

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

**Table 148: Environment Variables for TFTP**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_ADDR</td>
<td>Specifies the MAC address of the switch.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> We recommend that you do not modify this variable.</td>
</tr>
<tr>
<td></td>
<td>However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP.</td>
</tr>
</tbody>
</table>
### Variable Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP_ADDR</td>
<td>Specifies the IP address and the subnet mask for the associated IP subnet of the switch.</td>
</tr>
<tr>
<td>DEFAULT_ROUTER</td>
<td>Specifies the IP address and subnet mask of the default gateway.</td>
</tr>
</tbody>
</table>

### Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).

**Note**

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The reload command halts the system. If the system is not set to manually boot up, it reboots itself.

If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.

### How to Perform Switch Setup Configuration

Using DHCP to download a new image and a new configuration to a switch requires that you configure at least two switches. One switch acts as a DHCP and TFTP server and the second switch (client) is configured to download either a new configuration file or a new configuration file and a new image file.

### Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing switch in the network so that it can support the autoconfiguration of a new switch.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch# <code>configure terminal</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip dhcp pool poolname</code></td>
<td>Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>ip dhcp pool pool</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>boot filename</code></td>
<td>Specifies the name of the configuration file that is used as a boot image.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(dhcp-config)# <code>boot config-boot.text</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>network network-number mask prefix-length</code></td>
<td>Specifies the subnet network number and mask of the DHCP address pool.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(dhcp-config)# <code>network 10.10.10.0 255.255.255.0</code></td>
<td></td>
<td>Note: The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>default-router address</code></td>
<td>Specifies the IP address of the default router for a DHCP client.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(dhcp-config)# <code>default-router 10.10.10.1</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>option 150 address</code></td>
<td>Specifies the IP address of the TFTP server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(dhcp-config)# <code>option 150 10.10.10.1</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td><code>exit</code></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Switch(dhcp-config)# exit</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> tftp-server flash:filename.text</td>
<td>Specifies the configuration file on the TFTP server.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# tftp-server flash:config-boot.text</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> interface interface-id</td>
<td>Specifies the address of the client that will receive the configuration file.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet 1/0/4</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> no switchport</td>
<td>Puts the interface into Layer 3 mode.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config-if)# no switchport</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> ip address address mask</td>
<td>Specifies the IP address and mask for the interface.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config-if)# ip address 10.10.10.1 255.255.255.0</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config-if)# end</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Configuring DHCP Auto-Image Update (Configuration File and Image)**

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing switch to support the installation of a new switch.

**Before you begin**
You must first create a text file (for example, autoinstall_dhcp) that will be uploaded to the switch. In the text file, put the name of the image that you want to download (for example,
c3750e-ipservices-mz.122-44.3.SE.tar.c3750x-ipservices-mz.122-53.3.SE2.tar). This image must be a tar and not a bin file.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | configure terminal
   
   **Example:**
   
   `Switch# configure terminal` | Enters global configuration mode. |
| 2    | ip dhcp pool *poolname*
   
   **Example:**
   
   `Switch(config)# ip dhcp pool pool1` | Creates a name for the DHCP server address pool and enter DHCP pool configuration mode. |
| 3    | boot *filename*
   
   **Example:**
   
   `Switch(dhcp-config)# boot config-boot.text` | Specifies the name of the file that is used as a boot image. |
| 4    | network *network-number mask prefix-length*
   
   **Example:**
   
   `Switch(dhcp-config)# network 10.10.10.0 255.255.255.0` | Specifies the subnet network number and mask of the DHCP address pool.  
   
   **Note**
   
   The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/). |
| 5    | default-router *address*
   
   **Example:**
   
   `Switch(dhcp-config)# default-router 10.10.10.1` | Specifies the IP address of the default router for a DHCP client. |
| 6    | option 150 *address*
   
   **Example:**
   
   `Switch(dhcp-config)# option 150 10.10.10.1` | Specifies the IP address of the TFTP server. |
<table>
<thead>
<tr>

**Configuring the Client to Download Files from DHCP Server**

**Note**

You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> boot host dhcp</td>
<td>Enables autoconfiguration with a saved configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(conf)# boot host dhcp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> boot host retry timeout timeout-value</td>
<td>(Optional) Sets the amount of time the system tries to download a configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(conf)# boot host retry timeout 300</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> banner config-save ^C warning-message ^C</td>
<td>(Optional) Creates warning messages to be displayed when you try to save the configuration file to NVRAM.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(conf)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot^C</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show boot</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show boot</td>
<td></td>
</tr>
</tbody>
</table>

### Related Topics

### Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):
**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

- **Example:**
  - Switch# configure terminal

| Step 2 | Enters interface configuration mode, and enter the VLAN to which the IP information is assigned. The range is 1 to 4094. |

- **Example:**
  - Switch(config)# interface vlan 99

| Step 3 | Enters the IP address and subnet mask. |

- **Example:**
  - Switch(config-vlan)# ip address 10.10.10.2 255.255.255.0

| Step 4 | Returns to global configuration mode. |

- **Example:**
  - Switch(config-vlan)# exit

| Step 5 | Enters the IP address of the next-hop router interface that is directly connected to the switch where a default gateway is being configured. The default gateway receives IP packets with unresolved destination IP addresses from the switch. Once the default gateway is configured, the switch has connectivity to the remote networks with which a host needs to communicate. |

- **Note:** When your switch is configured to route with IP, it does not need to have a default gateway set.

- **Example:**
  - Switch(config)# ip default-gateway 10.10.10.1

| Step 6 | Returns to privileged EXEC mode. |

- **Example:**
  - Switch(config)# end

| Step 7 | Verifies the configured IP address. |

- **Example:**
  - Switch(config)# show interfaces vlan vlan-id
### Configuring the NVRAM Buffer Size

The default NVRAM buffer size is 512 KB. In some cases, the configuration file might be too large to save to NVRAM. Typically, this occurs when you have many switches in a switch stack. You can configure the size of the NVRAM buffer to support larger configuration files. The new NVRAM buffer size is synced to all current and new member switches.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>boot buffersize size</code></td>
<td>Configures the NVRAM buffersize in KB. The valid range for <code>size</code> is from 4096 to 1048576.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# boot buffersize 524288</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>show boot</code></td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

After you configure the NVRAM buffer size, reload the switch or switch stack.

When you add a switch to a stack and the NVRAM size differs, the new switch syncs with the stack and reloads automatically.
Modifying the Switch Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

**Before you begin**

Use a standalone switch for this task.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>boot flash:/file-url</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# boot flash:config.text</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# end</td>

<tr>
<td><strong>Step 2</strong> boot manual</td>
<td>Enables the switch to manually boot up during the next boot cycle.</td>
</tr>
<tr>
<td>Example: Switch(config)# boot manual</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> show boot</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Switch# show boot</td>
<td></td>
</tr>
<tr>
<td>(Optional) Saves your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

The `boot manual` global command changes the setting of the MANUAL_BOOT environment variable.

The next time you reboot the system, the switch is in boot loader mode, shown by the `switch:` prompt. To boot up the system, use the `boot filesystem:/file-url` boot loader command.

- `filesystem:`—Uses flash: for the system board flash device.

  switch: boot flash:
### Configuring a Scheduled Software Image Reload

This task describes how to configure your switch to reload the software image at a later time.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Saves your switch configuration information to the startup configuration before you use the <code>reload</code> command.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.</td>
</tr>
<tr>
<td>reload in [hh:]mm [text]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# reload in 12</td>
<td></td>
</tr>
<tr>
<td>System configuration has been modified. Save? [yes/no]: y</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies the time in hours and minutes for the reload to occur.</td>
</tr>
<tr>
<td>reload at hh: mm [month day] [day month] [text]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

Switch(config)# reload at 14:00

### Purpose

**Note**  Use the `at` keyword only if the switch system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the switch. To schedule reloads across several switches to occur simultaneously, the time on each switch must be synchronized with NTP.

### Step 5

**reload cancel**

**Example:**

Switch(config)# reload cancel

Cancels a previously scheduled reload.

### Step 6

**show reload**

**Example:**

show reload

Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the switch.

---

## Monitoring Switch Setup Configuration

### Example: Verifying the Switch Running Configuration

Switch# show running-config
Building configuration...

Current configuration: 1363 bytes

enable secret 5 $1$ej9.$DMUvAUzOAmvmgqBEzIxE0
!
<output truncated>
.
interface gigabitethernet6/0/2
mvr type source
<output truncated>
.
...!
interface VLAN1
ip address 172.20.137.50 255.255.255.0

---
Examples: Displaying Software Install

This example displays software bootup in install mode:

```
switch# boot flash:/c2960x-universalk9-mz-150-2.EX/c2960x-universalk9-mz-150-2.EX.bin
```

Configuration Examples for Performing Switch Setup

Example: Configuring a Switch as a DHCP Server

```
Switch# configure terminal
Switch(config)# ip dhcp pool pool1
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# boot config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.10.1
Switch(dhcp-config)# exit
Switch(config)# tftp-server flash:config-boot.text
Switch(config)# interface gigabitethernet 1/0/4
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end
```

- Configuring DHCP Autoconfiguration (Only Configuration File), on page 1395

Example: Configuring DHCP Auto-Image Update

```
Switch# configure terminal
Switch(config)# ip dhcp pool pool1
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# boot config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.10.1
Switch(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370
Switch(dhcp-config)# exit
```
Example: Configuring a Switch to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

Switch# configure terminal
Switch(config)# boot host dhcp
Switch(config)# boot host retry timeout 300
Switch(config)# banner config-save "Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot"
Switch(config)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
Config file: flash:/config.text
Private Config file: flash:/private-config.text
Enable Break: no
Manual Boot: no
HELPER path-list:
NVRAM/Config file
buffer size: 32768
Timeout for Config Download: 300 seconds
Config Download via DHCP: enabled (next boot: enabled)
Switch#

Example: Configuring NVRAM Buffer Size

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# boot buffersize 600000
Switch(config)# end
Switch# show boot
BOOT path-list:
Config file: flash:/config.text
Private Config file: flash:/private-config.text
Enable Break: no

Configuring AVC with DNS-AS

• Finding Feature Information, on page 1413
• Prerequisites for AVC with DNS-AS, on page 1413
• Restrictions and Guidelines for AVC with DNS-AS, on page 1414
• Information About AVC with DNS-AS, on page 1414
• How to Configure AVC with DNS-AS, on page 1418
• Monitoring AVC with DNS-AS, on page 1432
• Troubleshooting AVC with DNS-AS, on page 1435
• Feature History and Information for AVC with DNS-AS, on page 1436

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AVC with DNS-AS

• You have the Cisco ONE for Access license to use AVC with DNS-AS.
• You have enabled Multilayer Switch (MLS) Quality of Service (QoS).
• You have maintained metadata in the authoritative DNS server and reachability exists - before you enable AVC with DNS-AS
• The DNS-AS client can snoop forward look-up requests originating from hosts.
• To ensure DNS packet logging or snooping, you have attached the policy map to the interface, by using the service-policy input command.
Restrictions and Guidelines for AVC with DNS-AS

- Only a forward look-up is supported.
- Two DNS servers are supported (in case of a failover). One is considered the primary DNS server and other, the secondary DNS server.
- IPv6 is not supported—AAAA requests, and IPv6 DNS servers are not supported.
- AVC with DNS-AS is supported only on physical interfaces, in the ingress direction.
- Virtual Routing and Forwarding (VRF) is not supported.
- We recommend a maximum of 300 AVC with DNS-AS applications (domain names) in the binding table, because of its effect on the ternary content addressable memory (TCAM). To know how the addition of applications affects the TCAM see the Troubleshooting AVC with DNS-AS section of this chapter.

Information About AVC with DNS-AS

The Application Visibility Control (AVC) with Domain Name System as an Authoritative Source (DNS-AS) feature (AVC with DNS-AS) provides a centralized means of controlling the identification and classification of trusted network traffic in an organization. It accomplishes this by using network metadata stored in a DNS server that is authoritative to the domain in question, to identify applications, Quality of Service (QoS) to classify the corresponding traffic and apply suitable policies, and Flexible NetFlow (FNF), to monitor and export application information to an external collector.

The feature provides:

- **Application Visibility**—Ensuring unambiguous visibility of applications.
  The DNS-AS mechanism snoops requests and does not require a CPU-intensive, deep packet inspection (DPI). Since traffic classification is by means of a DNS request and not DPI, this feature is compatible in scenarios where network traffic is encrypted.

- **Metadata Driven**—Using information about applications.
  You can program the network holistically so it behaves like a self-driving car. You now have information about all the required applications in your network, irrespective of whether traffic is encrypted or not.

- **Centralized Control**—Using a cross-domain application intent policy controller.
  The feature leverages an existing, universally available query-response mechanism to enable local DNS servers within an organization to act as authoritative servers and propagate application classification information to DNS-AS clients (switches) in an enterprise network.

- **Control without Administrative Access**—Proving alternatives to controller-based approaches.
  The feature supports scenarios where your network may be in the cloud and you may not own it. You can still control network devices across the Internet, even though you may not have administrative control of these devices.
Overview of AVC with DNS-AS

The process starts with an organization’s requirements relating to management and control of network traffic. You begin by assessing the software applications that run on the various hosts (phones, PCs etc.) in your network, the domains (websites) and applications accessed by these devices, and the business-relevance of these domains and applications in your organization.

The assessment helps you arrive at a list of domains and applications that are “trusted” by your organization, designating all remaining domains and applications as untrusted.

With DNS-AS enabled on your network and the list of trusted domains at hand, the networking devices or DNS-AS clients in your network identify which applications the network traffic belongs to or which domains are being requested. As long as the traffic is part of the trusted list, the switch requests the DNS server for metadata and IP address information. This request is sent in the form of a DNS-query. The response, once received, is cached locally until the Time-to-Live (TTL) for that resource record expires. The response is bound to the traffic and allows the DNS-AS client to now identify, classify, and forward traffic accordingly.

Key Concepts for AVC with DNS-AS

<table>
<thead>
<tr>
<th>Concept</th>
<th>Meaning or Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata (RFC6759)</td>
<td>In the context of the AVC with DNS-AS feature, this includes traffic classification information, application identification information, and business relevance information. Metadata is maintained in the form of TXT records. The following is a sample metadata record in the prescribed format: CISCO-CLS=app-name:example</td>
</tr>
<tr>
<td>Forward look-up</td>
<td>A request for an IP address or a request for an “A” record, originating from a host. Being able to snoop these forward lookups in the network traffic is fundamental to the AVC with DNS-AS feature.</td>
</tr>
<tr>
<td>Host</td>
<td>A PC or mobile where users run software applications, access websites and so on. Forward look-up requests originate from hosts.</td>
</tr>
<tr>
<td>Client or DNS-AS client</td>
<td>Networking devices throughout your network. Host traffic is always routed through such a client. <strong>Note</strong> This chapter deals with the configuration of the AVC with DNS-AS on Cisco Catalyst Switches that are deployed as access switches only. Throughout this document, the term client, DNS-AS client, refers to the switch where AVC with DNS-AS is enabled. DNS-AS clients receive metadata from an authoritative DNS server and maintain a database of this information in the form of records. How long the record remains in the client’s database, is determined by the record’s TTL.</td>
</tr>
</tbody>
</table>
## AVC with DNS-AS Process Flow

The working of AVC with DNS-AS involves the DNS snooping process and the DNS-AS client process—both of which are loosely coupled, but independent processes.

### DNS Snooping Process

#### Procedure

| Step 1 | The host initiates an “A” record request. |

---

<table>
<thead>
<tr>
<th>Concept</th>
<th>Meaning or Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Binding table</td>
<td>A table that resides in the DNS-AS client and serves as a database of parsed DNS server responses [TXT records and “A” records]. Every DNS-AS client has a binding table of its own. This table not to be confused with the trusted domain list which is only a list of the trusted domains.</td>
</tr>
<tr>
<td>&quot;A&quot; record</td>
<td>A record containing the domain name and IP address information [Only IPv4 address]. This is one of the DNS-Server responses (the other being the TXT record) and has a predefined lifespan. A forward lookup request from a host is a request for an “A” record.</td>
</tr>
<tr>
<td>TXT DNS-AS resource record or TXT record</td>
<td>A record containing metadata. This is one of the DNS-Server responses (the other being the “A” record) and has a predefined lifespan. A TXT record is limited to 255 characters. For AVC with DNS-AS, the TXT attribute is always CISCO-CLS. Any TXT record that starts with CISCO-CLS= can be recognized as an AVC with DNS-AS message. The message format is as follows: CISCO-CLS=&lt;option&gt;:&lt;val&gt;{}&lt;option&gt;:&lt;val&gt;*</td>
</tr>
<tr>
<td>Time-to-Live (TTL)</td>
<td>The lifespan of an “A” record and TXT record in the binding table. TTL values are configured on the DNS server. While a TTL accompanies both TXT and “A” record responses, the DNS client only goes by the “A” record response from the DNS server.</td>
</tr>
<tr>
<td>Authoritative DNS server</td>
<td>The go-to DNS server for all client metadata and “A” record requests. Every DNS domain has only one authoritative DNS server. Such a server maintains records of application metadata in the form of a TXT record, and only returns responses to queries about domain names that have been maintained in the required format. The following is a sample metadata record in the prescribed format: CISCO-CLS=app-name:example</td>
</tr>
</tbody>
</table>
A user from your organization is in a meeting room in an office building. The associated DNS-AS client here is a switch (Network traffic from this meeting room is routed through this switch). The user looks up a website www.example.com, which initiates the request for an “A” record.

**Step 2**  
The authoritative DNS-server responds with an “A” record response.

---

**DNS-AS Client Process**

**Procedure**

**Step 1**  
The DNS-AS client sends a DNS query (TXT request) to the authoritative DNS server.

The DNS-AS client, which is constantly snooping for requests (that correspond with entries in the trusted domain list), finds the host’s forward look-up request. Based on the snooped result, the DNS-AS client sends a TXT request to the authoritative DNS server.

**Note**  
The DNS-AS client receives a copy of the host’s “A” record request, and does not alter the host’s original request in any manner.

**Step 2**  
The authoritative DNS-server responds with a TXT record response.

**Step 3**  
A successful TXT response is followed by an “A” record request.

**Step 4**  
The authoritative DNS-server responds with an “A” record response.

**Step 5**  
The DNS-AS client parses and saves the response in its binding table.

The DNS-AS client saves the TXT record and “A” record in its binding table. The response will remain saved in the binding table for the duration specified by the TTL of the “A” record. The system automatically checks and prevents duplicate entries for a fully qualified domain name in the binding table.

The DNS-AS client uses the metadata it receives (from the DNS Server), to determine if a QoS policy should be applied.

The DNS-AS client forwards information about identified applications, to FNF, enabling you to export this information.

---

An "A" record request from the host to the DNS server

<table>
<thead>
<tr>
<th>Part II: DNS-As Client Process</th>
</tr>
</thead>
</table>

| A copy of the host’s “A” record request that the DNS-AS client saves | - | - |
| TXT record and “A” record request from the DNS-AS client to the DNS server | TXT record and “A” record response from the DNS server to the DNS-AS client |

Stacking and AVC with DNS-AS

AVC with DNS-AS supports stacking. To ensure successful stack management, the binding table database of the active stack master (also a DNS-AS client) is synchronized with the stack member (also a DNS-AS client). As long as AVC with DNS-AS is enabled, no additional user configuration is required. The binding table entries are synchronized at these times:

- The stack member comes up (bulk synchronization).
- New entries are added to the binding table database.
- One or more entries are cleared from the database.

Default Configuration for AVC with DNS-AS

DNS-AS is disabled.

How to Configure AVC with DNS-AS

Generating Metadata Streams

Application metadata is configured and saved on the local, authoritative DNS server. You configure application classification information, for each trusted domain, in a prescribed format (a metadata stream). This is the information that the server propagates to switches when queried for application metadata. When the switch sends a TXT query regarding an application, the DNS server sends the relevant metadata in the TXT response.

To generate metadata streams, perform the following task:
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** Go to the: AVIC Resource Record Generator. **Example:**<br>CISCO-CLS=app-name:example|app-class:TD|business:MY|app-id:1728/202 | Helps you generate a metadata stream for an application or domain, in a TXT record format. You can specify the following metadata fields:  
  - (Optional) Domain Name  
  - (Mandatory) Application Name—A value is mandatory. This can be an existing application name or custom application name.  
    - Existing Application Name *(app-name):*—Select from the list of standard applications.  
    - (Optional) Custom Application Name *(app-name):*—If you enter a custom application name, you must also maintain the Traffic Class and Business Relevance information in the metadata stream.  
  - (Optional) Selector ID *(app-id):*—Consists of a classification engine ID (first eight bits) and a selector ID (the next twenty-four bits).  
    - Engine ID or Classification Engine ID—Defines the context for the selector ID. Only these engine IDs are allowed:  
      - L3—IANA layer 3 protocol number  
      - L4—IANA layer 4 well-known port number  
      - L7—Cisco global application ID  
      - CU—Custom protocol. Use this engine ID for custom application names.  
    - Selector ID—An application identifier, for a given classification engine ID. Enter a numeric value between 1 and 65535 |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note</strong></td>
<td>When you enter the engine ID and selector ID for existing application names, be sure to align with the Network Based Application Recognition (NBAR) standard. Only then will the FNF exporters report with a common ID and in a consistent manner.</td>
</tr>
<tr>
<td>• (Optional) Port Range <em>(server-port:)</em></td>
<td></td>
</tr>
<tr>
<td>• (Optional) Traffic Class <em>(app-class:)</em></td>
<td></td>
</tr>
<tr>
<td>• (Optional) Business Relevance <em>(business:)</em>—If you do not select yes or no, the business relevance value is set based on the app-class or app-name, in that order of priority.</td>
<td></td>
</tr>
<tr>
<td>For information about how traffic class and business relevance fields here map to QoS traffic classification, see <a href="#">App-Class and QoS Traffic Mapping</a>.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Click one of the options to generate the metadata stream.</td>
</tr>
<tr>
<td>• Generate predefined</td>
<td><strong>Generate predefined</strong>—Generate a predefined metadata stream for well known applications, using best practice defaults.</td>
</tr>
<tr>
<td>• Generate custom</td>
<td><strong>Generate custom</strong>—Generate a custom metadata stream for your own applications using custom values.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><em>Generate predefined</em></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Copy metadata into the corresponding TXT Resource Record of the DNS server in charge of the DNS domain that you have marked as a trusted domain.</td>
</tr>
<tr>
<td></td>
<td>Copy and paste the metadata stream from the website, to the authoritative DNS server you are using.</td>
</tr>
</tbody>
</table>

## Configuring a DNS Server as the Authoritative Server

All DNS-AS clients in the network should be configured to send all DNS queries to one authoritative DNS server. On a Cisco Catalyst switch, perform the following task:
### Enabling AVC with DNS-AS

DNS-AS is disabled by default. To enable the feature on a Cisco Catalyst switch, perform the following task:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>ip name-server server-address</td>
<td>Specifies the address of the authoritative DNS server. The port number is always 53. You can configure up to two DNS Servers, in case of a failover.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip name-server server-address 192.0.2.1 192.0.2.2</td>
<td></td>
</tr>
</tbody>
</table>

#### Note
The command allows you configure up to six name servers (IPv4 and IPv6). Ensure that at least the first two IP addresses in the sequence are IPv4 addresses, because the AVC with DNS-AS feature will use only these. See the example below, here the first two addresses are IPv4 (192.0.2.1 and 192.0.2.2), the third one (2001:DB8::1) is an IPv6 address. AVC with DNS-AS will use the first two.

Switch(config)# ip name-server 192.0.2.1 192.0.2.2 2001:DB8::1
Maintaining the List of Trusted Domains

Trusted domains are saved in every DNS-AS client where AVC with DNS-AS is enabled. When the feature is first enabled on the DNS-AS client, the list is empty. You must enter the domains that the switch should trust. The switch snoops only for network traffic that is maintained in this list. To make entries in the trusted domain list, perform the following task:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> [no] avc dns-as client trusted-domains</td>
<td>Enters the trusted domain configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# avc dns-as client trusted-domains</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> [no] domain domain-name</td>
<td>Enter the domain name you would like to add to the trusted domain list. This forms part of the list of trusted domains for the DNS-AS client. All remaining domains are ignored and will follow default forwarding behavior. You can enter up to 50 domains. You can use regular expressions to match the domain name. For example, to represent all the domains for an organization, if you enter: Switch(config-trusted-domains)# domain <em>.example.</em>, the DNS-AS client matches <a href="http://www.example.com">www.example.com</a>, ftp.example.org and any other domain that pertains to the organization “example”. But use such an entry at your discretion, because it could increase the size of the binding table considerably.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-trusted-domains)# domain</td>
<td></td>
</tr>
<tr>
<td><a href="http://www.example.com">www.example.com</a></td>
<td></td>
</tr>
<tr>
<td>OR Switch(config-trusted-domains)# domain</td>
<td></td>
</tr>
<tr>
<td>*example.com</td>
<td></td>
</tr>
</tbody>
</table>

Note: To ensure DNS packet logging or snooping, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface by using the **service-policy input** command. For more information, see Configuring QoS for AVC with DNS-AS, on page 1423.
Configuring QoS for AVC with DNS-AS

In order to isolate and classify trusted traffic as defined in the metadata stream, you must create class maps (one for each traffic class) > define traffic-class match criteria and business-relevance match criteria > create a policy map > add the class map > set action > attach the policy map to the interface. For more information, see the Classification Overview section of the Configuring QoS chapter in this guide.

Class Map Configuration in the Easy QoS Model

In order to determine the number of traffic classes that should be provisioned, you can use the 12-class Easy QoS Model. This model provides a uniform, standards-based recommendations to help ensure that QoS designs and deployments are unified and consistent across an organization. The following sample output displays class map configuration for traffic class and business relevance, according to the 12-class Easy QoS Model:

Only in the context of the DNS-AS feature, you can specify up to two match attributes for each class.

```
class-map match-all VOICE
match protocol attribute traffic-class voip-telephony
match protocol attribute business-relevance business-relevant
class-map match-all BROADCAST-VIDEO
match protocol attribute traffic-class broadcast-video
match protocol attribute business-relevance business-relevant
class-map match-all REAL-TIME-INTERACTIVE
match protocol attribute traffic-class real-time-interactive

Policy Map Definitions in the Easy QoS Model

The following sample output displays the policy map definitions, with traffic attribute marking for all the traffic classes in the 12-class Easy QoS Model:

```
policy-map MARKING
  class VOICE
    set dscp ef
  class BROADCAST-VIDEO
    set dscp cs5
  class REAL-TIME-INTERACTIVE
    set dscp cs4
  class MULTIMEDIA-CONFERENCING
    set dscp af41
  class MULTIMEDIA-STREAMING
    set dscp af31
  class SIGNALING
    set dscp cs3
  class NETWORK-CONTROL
    set dscp cs6
  class NETWORK-MANAGEMENT
    set dscp cs2
  class TRANSACTIONAL-DATA
    set dscp af21
  class BULK-DATA
    set dscp af11
  class SCAVENGER
    set dscp cs1
  class class-default
    set dscp default
```

App-Class and QoS Traffic Mapping

The following table shows how the `app-class` field in the metadata stream maps to the 12-class Easy QoS Model of traffic classification.

### App-Class and QoS Traffic Mapping

<table>
<thead>
<tr>
<th>Application Class Long Text</th>
<th>Application Class Short Text</th>
<th>Corresponding QoS Traffic Class Name and Business Relevance</th>
</tr>
</thead>
</table>
| VOIP-TELEPHONY                               | VO                           | Traffic-class = voip-telephoney  
Business-relevance = YES                        |
| BROADCAST-VIDEO                              | BV                           | Traffic-class = broadcast-video  
Business-relevance = YES                        |
| REALTIME-INTERACTIVE                         | RTI                          | Traffic-class = real-time-interactive  
Business-relevance = YES                        |
| MULTIMEDIA-CONFERENCING                      | MMC                          | Traffic-class = multimedia-conferencing  
Business-relevance = YES                        |
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Classifying Network Control Traffic**

The following example shows how to classify network control traffic. The corresponding metadata that should be maintained is: CISCO-CLS=app-name:example|app-class:NC|business:YES

1. Create class maps and match attributes:

   ```
   Switch# configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   Switch(config)# class-map NETWORK-CONTROL
   Switch(config-cmap)# match protocol attribute traffic-class network-control
   Switch(config-cmap)# match protocol attribute business-relevance business-relevant
   Switch(config-cmap)# end
   ```

2. Create the policy map, attach the class map to it and specify priority:

   ```
   Switch# configure terminal
   Switch configuration commands, one per line. End with CNTL/Z.
   Switch(config)# policy-map MARKING
   Switch(config-pmap)# class NETWORK-CONTROL
   Switch(config-pmap-c)# set dscp ef
   Switch(config-pmap-c)# end
   ```

3. Attach the policy map to an interface:
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface tengigabitethernet 1/0/1
Switch(config-if)# service-policy input MARKING
Switch(config-if)# end

Configuring FNF for AVC with DNS-AS

With FNF you can gain visibility into the applications running on your network, and use FNF option templates to export application ID, description, and attribute information. You must configure these FNF settings on the DNS-AS client:

• Configure a flow record to collect nonkey field application-name, and the key fields ipv4 source address and ipv4 destination address

• Configure a flow exporter and the two option templates. Option templates fetch application information.

Option template application-table, exports only applications resolved by the DNS-AS client, that is, the application ID and name from the binding table. The corresponding application descriptions are from Network Based Application Recognition (NBAR) definition for standard applications. A constructed help string is used for custom applications.

Option template application-attributes fetches attribute information by mapping it to the application name. Where standard application names are used, the option template uses standard Network Based Application Recognition (NBAR) attribute definitions; where custom application names are used, user-defined application names and only certain attribute fields are guaranteed to carry values.

• Configure a flow monitor and apply it to an interface to enable network traffic monitoring.

FNF Interaction with DNS-AS—With every flow that is created in the flow table, the DNS-AS client resolves the application name for the flow (if the entry exists in the binding table), by using the destination IP address (and if not available), the source IP address.

At periodic, configured intervals (600 seconds, by default), FNF exports option template data, that is mapped to the corresponding application name, to an external collector.

Option Templates

The application-table and application-attributes option templates are supported. Option templates determine the information that is exported to an external collector.

option application-table

This template exports the application name, application tag, and description to the external collector.

On a device where AVC with DNS-AS is enabled, only applications resolved by the DNS-AS client are exported. But as a permanent feature, the application-table template exports applications unclassified and unknown, irrespective of whether the feature is enabled or not.

• Application Name—For custom and standard applications, this information is derived from the TXT response (app-name:) that is saved in the binding table.

• Application Tag—The same as the application ID in the context of the AVC with DNS-AS feature. It consists of the engine ID and selector ID.
• Engine ID or Classification Engine ID—Defines the context for the selector ID. Only these values are supported:
  • L3—IANA layer 3 protocol number (IANA_L3_STANDARD, ID: 1)
  • L4—IANA layer 4 well-known port number (IANA_L4_STANDARD, ID: 3)
  • L7—Cisco global application ID (CISCO_L7_GLOBAL, ID: 13)
  • CU—Custom protocol, (NBAR_CUSTOM, ID: 6)

• Selector ID—Uniquely identifies the application or classification.

For standard applications, the application tag information is derived from these sources, in the given order of precedence:

1. TXT response (app-id)
2. The NBAR definition for standard applications (if the TXT response does not carry a value).

For custom applications, the following applies to application tag information:

• It is derived only from the TXT response (app-id)

• For the engine ID, the DNS-AS client automatically uses CU—Custom protocol, (NBAR_CUSTOM, ID: 6).

• For the selector ID, the DNS-AS client allots a custom selector ID. A maximum of 120 custom applications are supported - out of which 110 are available to the DNS-AS client. Starting with selector ID value 243, IDs are assigned in descending order. When there are no remaining IDs to assign, the entry is not saved in the binding table.

• Description—This information is derived from the NBAR definition for standard applications. For custom applications, the DNS-AS client uses: User Defined Protocol <app-name>.

**option application-attributes**

This template enables the collector to map the application names (from the option application-table), to attributes. Attributes are statically assigned to each protocol or application, and are not dependent on traffic. The template supports the following attributes:

For standard applications—

• Application Tag—See the Application Tag info in the option application-table section above. The same applies here.

• Category—Groups applications based on the first level of categorization for each protocol as the match criteria. Similar applications are grouped together under one category. For example, the email category contains all email applications such as, Internet Mail Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP), Lotus Notes, and so on.

• Sub-category—Groups applications based on the second level of categorization for each protocol as the match criteria. For example, clearcase, dbase, rda, mysql and other database applications are grouped under the database group.
• Application Group—Groups the same networking applications together. For instance, Example-Messenger, Example-VoIP-messenger, and Example-VoIP-over-SIP are grouped together under the example-messenger-group

• Peer-to-peer (p2p)—Groups protocols based on whether or not they use p2p technology.

• Tunnel—Groups protocols based on whether or not a protocol tunnels the traffic of other protocols. Protocols for which the NBAR does not provide any value are categorized under the unassigned tunnel group. For example, Layer 2 Tunneling Protocols (L2TP).

• Encryption—Groups applications based on the encrypted and nonencrypted status of the applications. Protocols for which the NBAR does not provide any value are categorized under the unassigned encrypted group.

• Traffic class—Groups applications and protocols based on the traffic class they belong to. For example, all applications that have traffic class TD. Traffic class information is derived from these sources, in the given order of precedence:

  1. TXT response (**app-class:**)

  2. The NBAR definition for standard applications (if the TXT response does not carry a value)

• Business relevance—Groups applications based on whether or not they have been marked as business-relevant. For example, all applications that have business relevance as YES. Business relevance information is derived from these sources, in the given order of precedence:

  1. TXT response (**business:**)

  2. The NBAR definition for standard applications (if the TXT response does not carry a value)

For custom applications—

Only these attributes of the application-attributes options template are guaranteed to carry a value:

• Application Tag—See the Application Tag info in the option application-table section above. The same applies here.

• Traffic class—This information is derived from the TXT response (**app-class:**)

• Business relevance—This information is derived from the TXT response (**business:**)

**Sample FNF Configuration for AVC with DNS-AS**

The following example shows how you can configure FNF for AVC with DNS-AS:

**Part 1:** Create a flow record. As in the example, you must configure:

• The source and destination IP addresses as key fields, in order to resolve application names.

• The use of the application name as a nonkey field in flow record.

Additionally (not mandatory), you can also configure the number of bytes or packets in a flow as a nonkey field, to display the number of applications sent to the collector

```
Switch# configure terminal
Switch(config)# flow record example-record1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
```
Switch(config-flow-record)# collect application name
Switch(config-flow-record)# collect counter packets
Switch(config-flow-record)# exit

Switch# show flow record example-record1
flow record example-record1
    match ipv4 source address
    match ipv4 destination address
    collect application name
    collect counter packets

Part 2: Create a flow exporter.

Also configure the application-table and application-attributes option templates in the exporter. Without option templates, the collector cannot retrieve meaningful application information. At a minimum we recommend that you configure the application-table option. For attribute information, also configure the application-attribute option.

You can also change the frequency of template export in seconds (the allowed range is 1 to 86400 seconds; the default is 600 seconds).

Switch(config)# flow exporter example-exporter1
Switch(config-flow-exporter)# option application-table
Switch(config-flow-exporter)# option application-attributes
Switch(config-flow-exporter)# template data timeout 500
Switch(config-flow-exporter)# exit

Switch# show flow exporter example-exporter1
Flow Exporter example-exporter1:
    Description: User defined
    Export protocol: NetFlow Version 9
    Transport Configuration:
        Destination IP address: 192.0.1.254
        Source IP address: 192.51.100.2
        Transport Protocol: UDP
        Destination Port: 9995
        Source Port: 54964
        DSCP: 0x0
        TTL: 255
        Output Features: Not Used
    Options Configuration:
        application-table (timeout 500 seconds)
        application-attributes (timeout 500 seconds)

Switch# show flow exporter example-exporter1 statistics
Flow Exporter example-exporter1:
    Packet send statistics (last cleared 00:00:48 ago):
        Successfully sent: 2 (924 bytes)

Client send statistics:
    Client: Option options application-name
        Records added: 4
        - sent: 4
        Bytes added: 332
        - sent: 332
    Client: Option options application-attributes
        Records added: 2
        - sent: 2
        Bytes added: 388
        - sent: 388
Part 3: Create a flow monitor

Apply the flow monitor to an interface, to perform network traffic monitoring.

You can also apply a QoS policy to the same interface. This example applies the QoS policy created as part of the sample QoS configuration (Classifying Network Control Traffic, on page 1425)

Switch# configure terminal
Switch(config)# flow monitor example-monitor1
Switch(config-flow-monitor)# record example-record1
Switch(config-flow-monitor)# exporter example-exporter1
Switch(config-flow-monitor)# exit
Switch(config)# interface tengigabitethernet 1/0/1
Switch(config-if)# switchport access vlan 100
Switch(config-if)# switchport mode access
Switch(config-if)# ip flow monitor example-monitor1 input
Switch(config-if)# service-policy input MARKING
Switch(config-if)# end

Switch# show flow monitor
flow monitor example-monitor1
record example-record1
exporter example-exporter1
!
Switch# show interface tengigabitethernet1/0/1
interface tengigabitethernet1/0/1
switchport access vlan 100
switchport mode access
ip flow monitor example-monitor1 input

Switch# show flow monitor example-monitor1 cache
Cache type: Normal
Cache size: 16640
Current entries: 3
High Watermark: 3

Flows added: 6
Flows aged: 3
- Active timeout (1800 secs) 0
- Inactive timeout (30 secs) 3
- Event aged 0
- Watermark aged 0
- Emergency aged 0

Monitoring AVC with DNS-AS

To display the various AVC with DNS-AS settings you have configured, use these commands in the privileged EXEC mode:

Table 149: AVC with DNS-AS Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
<th>Sample Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show avc dns-as client status</code></td>
<td>Displays current status of the DNS-AS client. Use this command to know whether AVC with DNS-AS is enabled or not.</td>
<td>Example: <code>show avc dns-as client status</code></td>
</tr>
<tr>
<td><code>show avc dns-as client trusted-domains</code></td>
<td>Displays list of trusted domains maintained in the binding table.</td>
<td>Example: <code>show avc dns-as client trusted-domains</code></td>
</tr>
<tr>
<td><code>show avc dns-as client binding-table</code></td>
<td>Displays AVC with DNS-AS metadata for the list of trusted domains and resolved entries. You can filter the output by application name, domain name, and so on. Both commands display the same information, in different formats.</td>
<td>Example: <code>show avc dns-as client binding-table</code></td>
</tr>
<tr>
<td><code>show avc dns-as client statistics</code></td>
<td>Displays packet logging information—the number of DNS queries sent and the number of responses received.</td>
<td>Example: <code>show avc dns-as client statistics</code></td>
</tr>
<tr>
<td><code>show avc dns-as client name-server brief</code></td>
<td>Displays information about the DNS server to which the metadata request was sent.</td>
<td>Example: <code>show avc dns-as client name-server brief</code></td>
</tr>
<tr>
<td><code>show ip name-server</code></td>
<td>Displays all the name server IP addresses that have been maintained.</td>
<td>Example: <code>show ip name-server</code></td>
</tr>
<tr>
<td><code>show platform team utilization</code></td>
<td>Displays information about TCAM availability</td>
<td>Example: <code>show platform team utilization</code></td>
</tr>

<output truncated>

Back to Table 149: AVC with DNS-AS Monitoring Commands

Example: show avc dns-as client statistics

Note

Two DNS servers are configured in this example.

Switch# show avc dns-as client statistics
Server details: vrf-id - 0 vrf-name - <default> ip = 192.0.2.1
AAAA Query Error packets 0
AAAA Query TX packets 0
AAAA Response RX packets 0
TXT Query Error packets 0
TXT Query TX packets 8
TXT Response RX packets 0
A Query Error packets 0
A Query TX packets 6
A Response RX packets 0
Server details: vrf-id - 0 vrf-name - <default> ip = 192.0.2.2
AAAA Query Error packets 0
AAAA Query TX packets 0
AAAA Response RX packets 0
TXT Query Error packets 0
TXT Query TX packets 2
TXT Response RX packets 2
A Query Error packets 0
A Query TX packets 4
A Response RX packets 2
Total Drop packets 0

avc_dns_as_pkts_logged = 2
avc_dns_as_q_pkts_processed = 2

Back to Table 149: AVC with DNS-AS Monitoring Commands

Example: show avc dns-as client name-server brief

Switch# show avc dns-as client name-server brief

Server-IP | Vrf-name
--- | ---
192.0.2.1 | <default>
192.0.2.2 | <default>

Back to Table 149: AVC with DNS-AS Monitoring Commands

Example: show ip name-server

Switch# show ip name-server
192.0.2.1
192.0.2.2
2001:DB8::1

Back to Table 149: AVC with DNS-AS Monitoring Commands

Example: show platform tcam utilization

Switch# show platform tcam utilization

The relevant TCAM entry is IPv4 qos aces:

Note: Allocation of TCAM entries per feature uses a complex algorithm. The above information is meant to provide an abstract view of the current TCAM utilization.
# Troubleshooting AVC with DNS-AS

## Problem | Possible Causes and Solutions
--- | ---
There are no entries in the binding table. | The binding table may be empty because of either one or both of these reasons:  
- Metadata is not maintained in DNS server—complete task Generating Metadata Streams, on page 1418  
- The entry is not maintained in the trusted domain list—complete task Maintaining the List of Trusted Domains, on page 1422

Unsuccessful DNS snooping or packet logging. | To ensure DNS snooping and packet logging, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface—See the example in the Configuring QoS for AVC with DNS-AS, on page 1423

The DNS server does not return correct values. | Verify that the correct DNS-AS metadata is maintained in the DNS system.  
- Using Linux `dig`:  
  ```  
  ```  
- Using Windows `nslookup`:  
  ```  
  C:\Windows\system32>NSLookup.exe -q=TXT www.example.org [dns-server-ip]  www.example.org text = "CISCO-CLS=app-name:example|app-class:TD|business:YES|app-id:CU/28202"  
  ```

The QoS policy you applied is removed from the port. | When the DNS-AS client recognises an application, along with saving the "A" record response in the binding table, the system utilises the TCAM to save the IP address of the application. A single application can in effect have multiple IP addresses, each utilising additional space in the TCAM. When the TCAM is exhausted, QoS policies cease to be applied.

To avoid the problem, monitor TCAM utilisation on a regular basis. Enter the `show platform tcam utilisation` command in privilege EXEC mode, to display information about TCAM availability.

The DNS-AS client ignores the QoS mapping you’ve defined and applies default forwarding behavior. | The DNS-AS client ignores QoS mapping and applies default forwarding behavior in these cases:  
- If the match attributes that you specify for the traffic class and business relevance do not match what you have defined in the metadata stream—Check and correct as required.  
- If the binding table entry is no longer active. This refers to the age of the entry—Use the `show avc dns-as client binding-table` command to display the age of an entry.
Feature History and Information for AVC with DNS-AS

The following table provides release information about the feature or features described in this chapter. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

CHAPTER 70

Configuring SDM Templates

- Finding Feature Information, on page 1437
- Information About Configuring SDM Templates, on page 1437
- How to Configure SDM Templates, on page 1440
- Configuration Examples for SDM Templates, on page 1441
- Additional References for SDM Templates, on page 1443
- Feature History and Information for Configuring SDM Templates, on page 1444

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring SDM Templates

Restrictions for SDM Templates

The following are restrictions when using SDM templates:

- The default template is the only template supported on switches running the LAN Lite image.
- The LAN Base default template is used with switches in a homogeneous stack.
- The LAN Base routing template is supported only on switches running the LAN Base image.
- The LAN Base routing template is used with switches in a mixed stack.
- The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.
• The default template is the only template supported on switches running the LAN Base image.

SDM Templates

You can use Switch Database Management (SDM) templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

To allocate ternary content addressable memory (TCAM) resources for different usages, the switch SDM templates prioritize system resources to optimize support for certain features. The templates supported on your device:

• Default—The default template gives balance to all functions.
• LAN Base default—The LAN Base default template is to be used with switches in a homogeneous stack.
• LAN Base routing—The LAN Base routing template supports IPv4 unicast routes for static routing SVI configuration.

The LAN Base routing template prevents other features from using the memory allocated to unicast routing. Routing must be enabled on your switch before you can use the routing template.

For more information about homogeneous and mixed stacks, see the Catalyst 2960-X Switch Stacking Configuration Guide.

After you change the template and the system reboots, you can use the show sdmprefer privileged EXEC command to verify the new template configuration. If you enter the show sdmprefer command before you enter the reload privileged EXEC command, the show sdmprefer command shows the template currently in use and the template that becomes active after a reload.

Note

• The SDM templates contain only those commands that are defined as part of the templates. If a template enables another related command that is not defined in the template, then this other command will be visible when the show running config command is entered. For example, if the SDM template enables the switchport voice vlan command, then the spanning-tree portfast edge command may also be enabled (although it is not defined on the SDM template).

If the SDM template is removed, then other such related commands are also removed and have to be reconfigured explicitly.

• SDM templates do not create VLANs. You must create the VLANs before adding commands to the SDM templates.

Default and LAN Base Templates

• Default and LAN Base routing templates—Optimizes the resources in the switch to support feature level for no routed interfaces and 255 VLANs.
• LAN Base default—Optimizes the resources in the switch to support feature level for no routed interfaces and 1024 VLANs.
### Table 150: Approximate Number of Feature Resources Allowed by Templates

<table>
<thead>
<tr>
<th>Resource</th>
<th>Default</th>
<th>LAN Base Default</th>

### SDM Templates and Switch Stacks

All stack members use the same SDM template that is stored on the stack master. When a new switch is added to a stack, as with the switch configuration and VLAN database files, the SDM configuration that is stored on the stack master overrides the template configured on an individual switch.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition. You can use the `show switch` privileged EXEC command to see if any stack members are in SDM-mismatch mode.

### How to Configure SDM Templates

#### Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`sdm prefer { default</td>
<td>lanbase-default</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• default—The default template provides balance for all Layer 2, IPv4 and IPv6 functionality.</td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# sdm prefer lanbase-routing</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuration Examples for SDM Templates

#### Examples: Displaying SDM Templates

This is an example output showing the default template information.

Switch#  **show sdm prefer default**

"default" template:
The selected template optimizes the resources in the switch to support this level of features for 0 routed interfaces and 255 VLANs.

- number of unicast mac addresses: 8K
- number of IPv4 IGMP groups + multicast routes: 0.375k
- number of IPv4 unicast routes: 0
- number of IPv6 multicast groups: 0.25K
- number of directly-connected IPv6 addresses: 0.25K
- number of indirect IPv6 unicast routes: 32

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>lanbase-default</strong></td>
<td>The LAN Base default template provides both IPv4 and IPv6 static routing functionality.</td>
</tr>
<tr>
<td><strong>lanbase-routing</strong></td>
<td>The LAN Base routing templates provides both IPv4 and IPv6 static routing functionality.</td>
</tr>
</tbody>
</table>

**Note**
In Catalyst 2960-X switches with Lan Base license, up to 200 OSPF routes are supported, for each IPv4 and IPv6 routes.

Use the **no sdm prefer** command to set the switch to the default template. The default template balances the use of system resources.

**Step 4**

**Example:**

Switch(config)#  **end**

Returns to privileged EXEC mode.

**Step 5**

**Example:**

Switch#  **reload**

Reloads the operating system.
This is an example output showing the LAN Base default template information.

```
Switch# show sdm prefer lanbase-default

"lanbase-default" template:
The selected template optimizes the resources in
the switch to support this level of features for
0 routed interfaces and 1024 VLANs.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>number of unicast mac addresses</td>
<td>16K</td>

</tbody>
</table>
```

Switch#
Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

Switch(config)# sdm prefer lanbase-routing
Switch(config)# exit
Switch# reload
    Proceed with reload? [confirm]

Switch(config)# sdm prefer dual-ipv4-and-ipv6 default
Switch(config)# exit
Switch# reload
    Proceed with reload? [confirm]

Restrictions for Configuring System Message Logs

When the `logging discriminator` command is configured, the device may experience memory leak or crash. This usually happens during heavy syslog or debug output. The rate of the memory leak is dependent on the number of logs being produced. In extreme cases, the device may also crash. As a workaround, use the `no logging discriminator` command to disable the logging discriminator.

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and `debug` privileged EXEC commands to a logging process. Stack members can trigger system messages. A stack member that generates a system message appends its hostname in the form of hostname-n, where n is a switch range from 1 to 8, and redirects the output to the logging process on the stack master. Though the stack master is a stack member, it does not append its hostname to system messages. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time...
debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch, and in the case of a switch stack, on the stack master. If a standalone switch or the stack master fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port. In a switch stack, all stack member consoles provide the same console output.

Note

The syslog format is compatible with 4.3 BSD UNIX.

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- `seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)`
- `seq no:timestamp: %facility-severity-MNEMONIC:description`

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- `service sequence-numbers`
- `service timestamps log datetime`
- `service timestamps log datetime [localtime] [msec] [show-timezone]`
- `service timestamps log uptime`

Table 151: System Log Message Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq no:</td>
<td>Stamps log messages with a sequence number only if the <code>service sequence-numbers</code> global configuration command is configured.</td>
</tr>
<tr>
<td>timestamp formats:</td>
<td>Date and time of the message or event. This information appears only if the `service timestamps log [datetime</td>
</tr>
</tbody>
</table>

- `mm/dd` or `hh:mm:ss` (short uptime)
- `d h` (long uptime)
### Default System Message Logging Settings

</tr>
</tbody>
</table>

### Enabling Syslog Trap Messages

You can enable Syslog traps using the `snmp-server enable traps syslog` command.

After enabling Syslog traps, you have to specify the trap message severity. Use the `logging snmp-trap` command to specify the trap level. By default, the command enables severity 0 to 4. To enable all the severity level, configure the `logging snmp-trap 0 7` command.

To enable individual trap levels, configure the following commands:

- `logging snmp-trap emergencies`: Enables only severity 0 traps.
• **logging snmp-trap alert** Enables only severity 1 traps.

Note that, along with the Syslog traps, the Syslog history should also be applied. Without this configuration, Syslog traps are not sent.

Use the **logging history informational** command to enable the Syslog history.

### How to Configure System Message Logs

#### Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console. This task is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure</td>
<td></td>
</tr>
<tr>
<td>terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**          |                                              |
| logging buffered    | Logs messages to an internal buffer on the   |
| [size]              | switch or on a standalone switch or, in the   |
|                     | case of a switch stack, on the stack master. |
| Example:            | The range is 4096 to 2147483647 bytes. The   |
|                     | default buffer size is 4096 bytes.           |
|                     | If a standalone switch or the stack master    |
|                     | fails, the log file is lost unless you       |
|                     | previously saved it to flash memory. See     |
|                     | Step 4.                                       |

**Note**: Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the `show memory` privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.

<p>| <strong>Step 3</strong>          |                                              |
| logging host        | Logs messages to a UNIX syslog server host.  |
| Example:            | <code>host</code> specifies the name or IP address of   |
|                     | the host to be used as the syslog server.    |
| Switch(config)#      |                                              |
| logging 125.1.1.100 |                                              |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
<td>Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the stack master.</td>
</tr>
<tr>
<td><em>Step 4</em></td>
<td><strong>logging file flash</strong>: filename [max-file-size [min-file-size]] [severity-level-number</td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Switch(config)# logging file flash:log_msg.txt 40960 4096 3</td>
<td>• <em>filename</em>—Enters the log message filename.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) <strong>max-file-size</strong>—Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) <strong>min-file-size</strong>—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) **severity-level-number</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>terminal monitor</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Switch# terminal monitor</td>
<td>Logs messages to a nonconsole terminal during the current session.</td>
</tr>
<tr>
<td></td>
<td>Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.</td>
</tr>
</tbody>
</table>

### Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore,
unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> line [console</td>
<td>vty] line-number [ending-line-number]</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# line console</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> logging synchronous [level [severity-level</td>
<td>all]</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# logging synchronous level 3 limit 1000</td>
<td></td>
</tr>
</tbody>
</table>

You can change the setting of all 16 vty lines at once by entering:

```plaintext
line vty 0 15
```

You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:

```plaintext
line vty 2
```

When you enter this command, the mode changes to line configuration.
Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The logging synchronous global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return.

To reenable message logging after it has been disabled, use the logging on global configuration command. This task is optional.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  configure terminal  
  Example:
  Switch# configure terminal | Enters global configuration mode. |
| **Step 2**
  no logging console  
  Example:
  Switch(config)# no logging console | Disables message logging. |
Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.
This task is optional.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>Use one of these commands:</td>
<td>Enables log time stamps.</td>
</tr>
<tr>
<td>• service timestamps log uptime</td>
<td></td>
</tr>
<tr>
<td>• service timestamps log datetime[msec</td>
<td>localtime</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# service timestamps log uptime</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# service timestamps log datetime</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.
This task is optional.
## Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message.

This task is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>configure terminal</code></td>

Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP. This task is optional.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 logging history level</td>
<td>Changes the default level of syslog messages stored in the history file and sent to the SNMP server. By default, warnings, errors, critical, alerts, and emergencies messages are sent.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging history 3</td>
<td></td>
</tr>
<tr>
<td>Step 3 logging history size number</td>
<td>Specifies the number of syslog messages that can be stored in the history table. The default is to store one message. The range is 0 to 500 messages.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# logging history size 200</td>
<td></td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Logging Messages to a UNIX Syslog Daemon

This task is optional.

---

Note

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX `man syslogd` command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

---

Before you begin

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | Add a line to the file `/etc/syslog.conf`. **Example:** `local7.debug /usr/adm/logs/cisco.log` | • `local7`—Specifies the logging facility.  
• `debug`—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it. |
| Step 2 | Enter these commands at the UNIX shell prompt. **Example:**  

```
$ touch /var/log/cisco.log
$ chmod 666 /var/log/cisco.log
```

| Step 3 | Make sure the syslog daemon reads the new changes. **Example:**  

```
$ kill -HUP `cat /etc/syslog.pid`
```

| | For more information, see the `man syslog.conf` and `man syslogd` commands on your UNIX system. |
Monitoring and Maintaining System Message Logs

Monitoring Configuration Archive Logs

Configuration Examples for System Message Logs

Example: Switch System Message

This example shows a partial switch system message on a switch:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down 2
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) 18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

Examples: Displaying Service Timestamps Log

This example shows part of a logging display with the service timestamps log datetime global configuration command enabled:

```
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
```

This example shows part of a logging display with the service timestamps log uptime global configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)
```
This example shows part of a logging display with the sequence numbers enabled.

000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)

Configuring Online Diagnostics

• Information About Configuring Online Diagnostics, on page 1459
• How to Configure Online Diagnostics, on page 1460
• Monitoring and Maintaining Online Diagnostics, on page 1464
• Configuration Examples for Online Diagnostic Tests, on page 1465
• Additional References for Online Diagnostics, on page 1469
• Feature History and Information for Configuring Online Diagnostics, on page 1470

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Switch while the Switch is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

• Hardware components
• Interfaces (Ethernet ports and so forth)
• Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Switch is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Switch or switch stack and the diagnostic tests that have already run.
How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`diagnostic start switch number test {name</td>
<td>test-id</td>
</tr>
</tbody>
</table>

The `switch number` keyword is supported only on stacking switches. The range is from 1 to 8.

You can specify the tests by using one of these options:

- `name`—Enters the name of the test.
- `test-id`—Enters the ID number of the test.
- `test-id-range`—Enters the range of test IDs by using integers separated by a comma and a hyphen.
- `all`—Starts all of the tests.
- `basic`— Starts the basic test suite.
- `non-disruptive`—Starts the non-disruptive test suite.

Example:

```
Switch# diagnostic start switch 2 test basic
```

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the `no` form of this command to remove the scheduling.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`diagnostic schedule switch number test [name</td>
<td>test-id</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# diagnostic schedule switch 1 test 1-5 on July 3 2013 23:10</code></td>
<td>The <code>switch number</code> keyword is supported only on stacking switches. The range is from 1 to 8. When specifying the tests to be scheduled, use these options:</td>
</tr>
<tr>
<td></td>
<td>• <code>name</code>—Name of the test that appears in the <code>show diagnostic content</code> command output.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>test-id</code>—ID number of the test that appears in the <code>show diagnostic content</code> command output.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>test-id-range</code>—ID numbers of the tests that appear in the <code>show diagnostic content</code> command output.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>all</code>—All test IDs.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>basic</code>—Starts the basic on-demand diagnostic tests.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>non-disruptive</code>—Starts the non-disruptive test suite.</td>
<td></td>
</tr>
</tbody>
</table>

You can schedule the tests as follows:

- Daily—Use the `daily hh:mm` parameter.
- Specific day and time—Use the `on mm dd yyyy hh:mm` parameter.
- Weekly—Use the `weekly day-of-week hh:mm` parameter.

---

### Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a Switch while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Switch to generate a syslog message because of a test failure, and enable a specific test.
Use the no form of this command to disable testing.

By default, health monitoring is disabled, but the Switch generates a syslog message when a test fails.

Follow these steps to configure and enable the health-monitoring diagnostic tests:

## Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>

</table>
Monitoring and Maintaining Online Diagnostics

Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Switch or Switch stack and check the test results by using the privileged EXEC `show` commands in this table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show diagnostic content switch [number</td>
<td>all]`</td>
</tr>
<tr>
<td><code>show diagnostic status</code></td>
<td>Displays the currently running diagnostic tests.</td>
</tr>
<tr>
<td>`show diagnostic result switch [number</td>
<td>all] [detail]</td>
</tr>
<tr>
<td>`show diagnostic switch [number</td>
<td>all] [detail]`</td>
</tr>
</tbody>
</table>
Configuration Examples for Online Diagnostic Tests

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>**diagnostic start switch number test [name</td>
<td>test-id</td>
<td>test-id-range</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td>The switch <code>number</code> keyword is supported only on stacking switches. The range is from 1 to 8.</td>
</tr>
<tr>
<td></td>
<td><code>Switch# diagnostic start switch 2 test basic</code></td>
<td>You can specify the tests by using one of these options:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>name</code>—Enters the name of the test.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>test-id</code>—Enters the ID number of the test.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>test-id-range</code>—Enters the range of test IDs by using integers separated by a comma and a hyphen.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>all</code>—Starts all of the tests.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>basic</code>—Starts the basic test suite.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>non-disruptive</code>—Starts the non-disruptive test suite.</td>
</tr>
</tbody>
</table>

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
```
Switch(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback

Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

Switch(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30

Displaying Online Diagnostics: Examples

This example shows how to display the online diagnostic detailed information on a specific switch:

Switch# show diagnostic switch 1 detail
Switch 1: SerialNo : 
Overall Diagnostic Result for Switch 1 : UNTESTED
Test results: ( . = Pass, F = Fail, U = Untested)

1) TestPortAsicStackPortLoopback ----> U
Error code ------------------> 3 (DIAG_SKIPPED)
Total run count -------------> 0
Last test testing type -------> n/a
Last test execution time -----> n/a
First test failure time ------> n/a
Last test failure time -------> n/a
Last test pass time ------> n/a
Total failure count ---------> 0
Consecutive failure count ---> 0

2) TestPortAsicLoopback ---------> U
Error code ------------------> 3 (DIAG_SKIPPED)
Total run count -------------> 0
Last test testing type -------> n/a
Last test execution time -----> n/a
First test failure time ------> n/a
Last test failure time -------> n/a
Last test pass time ------> n/a
Total failure count ---------> 0
Consecutive failure count ---> 0

3) TestPortAsicCam ------------> U
Error code ------------------> 3 (DIAG_SKIPPED)
Total run count -------------> 0
Last test testing type -------> n/a
This example shows how to display the online diagnostics that are configured on a specific switch:

Switch# `show diagnostic content switch 3`

Switch 1:
Diagnostics test suite attributes:
- B/* - Basic ondemand test / NA
- P/V/* - Per port test / Per device test / NA
- D/N/* - Disruptive test / Non-disruptive test / NA
- S/* - Only applicable to standby unit / NA
- X/* - Not a health monitoring test / NA
- F/* - Fixed monitoring interval test / NA
- E/* - Always enabled monitoring test / NA
- A/I - Monitoring is active / Monitoring is inactive
- R/* - Switch will reload after test list completion / NA
- P/* - will partition stack / NA

<table>
<thead>
<tr>
<th>ID</th>

<td>n/a</td>
</tr>
<tr>
<td>6</td>
<td>TestPortAsicMem</td>
<td>B<em>D<strong>X</strong>IR</em></td>
<td>not configured</td>
<td>n/a</td>
</tr>
</tbody>
</table>
This example shows how to display the online diagnostic results for a switch:

```
Switch# show diagnostic result

Switch 1: SerialNo :
Overall diagnostic result: PASS
Test results: (. = Pass, F = Fail, U = Untested)
1) TestPortAsicStackPortLoopback --> .
2) TestPortAsicLoopback ------------> .
3) TestPortAsicCam -----------------> .
4) TestPortAsicRingLoopback --------> .
5) TestMicRingLoopback -------------> .
6) TestPortAsicMem -----------------. 
```

This example shows how to display the online diagnostic test status:

```
Switch# show diagnostic status

<BU> - Bootup Diagnostics, <HM> - Health Monitoring Diagnostics,
<OD> - OnDemand Diagnostics, <SCH> - Scheduled Diagnostics

<table>
<thead>
<tr>

CHAPTER 73

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

- Information About Troubleshooting the Software Configuration, on page 1471
- How to Troubleshoot the Software Configuration, on page 1478
- Verifying Troubleshooting of the Software Configuration, on page 1493
- Scenarios for Troubleshooting the Software Configuration, on page 1496
- Configuration Examples for Troubleshooting Software, on page 1498
- Additional References for Troubleshooting Software Configuration, on page 1500
- Feature History and Information for Troubleshooting Software Configuration, on page 1501

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Related Topics
Recovering from a Software Failure

Lost or Forgotten Password on a Switch

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.
On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

Note
You cannot recover encryption password key, when Cisco WLC configuration is copied from one Cisco WLC to another (in case of an RMA).

Related Topics
- Recovering from a Lost or Forgotten Password

### Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the Catalyst 2960-X Switch Interface and Hardware Component Configuration Guide.

### Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Switch port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the **shutdown** interface configuration command, and then enter the **no shutdown** interface command. You can also configure automatic recovery on the Switch to recover from the error-disabled state.

On a Switch, the **errdisable recovery cause loopback** and the **errdisable recovery interval seconds** global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.
Monitoring PoE Port Status

- **show controllers power inline** privileged EXEC command
- **show power inline** EXEC command
- **debug ipower** privileged EXEC command

Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the **power inline never** interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the **shutdown** and the **no shutdown** interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the **power inline never** command.

Ping

The Switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (hostname is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a no-answer message is returned.
- Unknown host—If the host does not exist, an unknown host message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a destination-unreachable message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a network or host unreachable message is returned.

- Example: Pinging an IP Host, on page 1498

Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Switch in the path. When the Switch detects a device in the path that does not support Layer 2 traceroute, the Switch continues to send Layer 2 trace queries and lets them time out.

The Switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.
Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.

  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

- A Switch is reachable from another Switch when you can test connectivity by using the ping privileged EXEC command. All Switch in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the traceroute mac or the traceroute mac ip privileged EXEC command on a Switch that is not in the physical path from the source device to the destination device. All Switch in the path must be reachable from this switch.

- The traceroute mac command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

- The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Switch uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

  - If an ARP entry exists for the specified IP address, the Switch uses the associated MAC address and identifies the physical path.

  - If an ARP entry does not exist, the Switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

- This feature is not supported in Token Ring VLANs.

IP Traceroute

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Switch can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the Switch is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate Switch do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN.
However, if the intermediate Switch is a multilayer Switch that is routing a particular packet, this Switch shows up as a hop in the traceroute output.

The **traceroute** privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP *port-unreachable* error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

---

### Time Domain Reflector Guidelines

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported only on 10/100/1000 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Switch
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Switch reports accurate information in these situations:
• The cable for the gigabit link is a solid-core cable.
• The open-ended cable is not terminated.

When you run TDR, the Switch does not report accurate information in these situations:
• The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
• The link is a 10-megabit or a 100-megabit link.
• The cable is a stranded cable.
• The link partner is a Cisco IP Phone.
• The link partner is not IEEE 802.3 compliant.

Debug Commands

⚠️ Caution
Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.

All `debug` commands are entered in privileged EXEC mode, and most `debug` commands take no arguments.

Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Switch. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Switch problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Switch and small form-factor pluggable (SFP) modules. The Switch stores this information in the flash memory:
• CLI commands—Record of the OBFL CLI commands that are entered on a standalone Switch or a switch stack member.
• Environment data—Unique device identifier (UDI) information for a standalone Switch or a switch stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
• Message—Record of the hardware-related system messages generated by a standalone Switch or a switch stack member.
• Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone Switch or a switch stack member.
• Temperature—Temperature of a standalone Switch or a switch stack member.

• Uptime data—Time when a standalone Switch or a switch stack member starts, the reason the Switch restarts, and the length of time the Switch has been running since it last restarted.

• Voltage—System voltages of a standalone Switch or a switch stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Switch is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the Switch fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Switch is restarted, there is a 10-minute delay before logging of new data begins.

### Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

**Note**

You may see increased system memory usage when Cisco Catalyst 4500E Supervisor Engine 8-E is used in wireless mode.

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

Layer 3 switches:

- Dropped packets or increased latency for packets routed in software
- BGP or OSPF routing topology changes
- HSRP flapping
How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Switch software can be corrupted during an upgrade by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses the Xmodem Protocol to recover from a corrupt or wrong image file. There are many software packages that support the Xmodem Protocol, and this procedure is largely dependent on the emulation software that you are using.

This recovery procedure requires that you have physical access to the switch.

Procedure

Step 1
From your PC, download the software image tar file (image_filename.tar) from Cisco.com. The Cisco IOS image is stored as a bin file in a directory in the tar file. For information about locating the software image files on Cisco.com, see the release notes.

Step 2
Extract the bin file from the tar file. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using UNIX, follow these steps:

a) Display the contents of the tar file by using the tar -tvf <image_filename.tar> UNIX command.

Example:
unix-1% tar -tvf image_filename.tar

b) Locate the bin file, and extract it by using the tar -xvf <image_filename.tar> <image_filename.bin> UNIX command.

Example:
unix-1% tar -xvf image_filename.tar image_filename.bin
x c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin, 2928176 bytes,
5720 tape blocks

c) Verify that the bin file was extracted by using the ls -l <image_filename.bin> UNIX command.

Example:
unix-1% ls -l image_filename.bin
-rw-r--r-- 1 boba 2928176 Apr 21 12:01 c2960x-universalk9-mz.150-2.0.66.UCP/c2960x-universalk9-mz.150-2.0.66.UCP.bin

Step 3
Connect your PC with terminal-emulation software supporting the Xmodem Protocol to the switch console port.

Step 4
Set the line speed on the emulation software to 9600 baud.

Step 5
Unplug the switch power cord.
Step 6 Press the **Mode** button, and at the same time reconnect the power cord to the switch. You can release the Mode button a second or two after the LED above port 1 goes off. Several lines of information about the software appear along with instructions.

**Example:**

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software:

```
flash_init
load_helper
boot
```

Step 7 Initialize the flash file system.

**Example:**

```
switch: flash_init
```

Step 8 If you had set the console port speed to any speed other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

Step 9 Load any helper files.

**Example:**

```
switch: load_helper
```

Step 10 Start the file transfer by using the Xmodem Protocol.

**Example:**

```
switch: copy xmodem: flash:image_filename.bin
```

Step 11 After the Xmodem request appears, use the appropriate command on the terminal-emulation software to start the transfer and to copy the software image into flash memory.

Step 12 Boot the newly downloaded Cisco IOS image.

**Example:**

```
switch: boot flash:image_filename.bin
```

Step 13 Use the **archive download-sw** privileged EXEC command to download the software image to the switch or to the switch stack.

Step 14 Use the **reload** privileged EXEC command to restart the switch and to verify that the new software image is operating properly.

Step 15 Delete the **flash:image_filename.bin** file from the switch.
Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

---

**Note**

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

You enable or disable password recovery by using the `service password-recovery` global configuration command.

The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

---

**Procedure**

**Step 1**

Connect a terminal or PC to the switch.

- Connect a terminal or a PC with terminal-emulation software to the switch console port.
- Or
- Connect a PC to the Ethernet management port.

**Step 2**

Set the line speed on the emulation software to 9600 baud.

**Step 3**

On a switch, power off the switch.

**Step 4**

Reconnect the power cord to the switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid, then release the **Mode** button.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.

- If you see a message that begins with this statement:
  
  The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system

  proceed to the "Procedure with Password Recovery Enabled" section, and follow the steps.

- If you see a message that begins with this statement:

  The password-recovery mechanism has been triggered, but is currently disabled.

  proceed to the "Procedure with Password Recovery Disabled" section, and follow the steps.

**Step 5**

After recovering the password, reload the switch.
On a switch:

Switch> **reload**
Proceed with reload? [confirm] **y**

---

**Procedure with Password Recovery Enabled**

If the password-recovery operation is enabled, this message appears:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software:

```
flash_init
load_helper
boot
```

**Procedure**

**Step 1**

Initialize the flash file system.

Switch: `flash_init`

**Step 2**

If you had set the console port speed to any number other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

**Step 3**

Load any helper files.

Switch: `load_helper`

**Step 4**

Display the contents of flash memory.

Switch: `dir: flash`:

Directory of flash:

```
11 -rwx 5825 Mar 01 2013 22:31:59 config.text
```

16128000 bytes total (10003456 bytes free)

**Step 5**

Rename the configuration file to `config.text.old`

This file contains the password definition.

Switch: `rename flash: config.text flash: config.text.old`

**Step 6**

Boot up the system.

Switch: `boot`

You are prompted to start the setup program. Enter N at the prompt.
Continue with the configuration dialog?? [yes/no]: No

**Step 7** At the switch prompt, enter privileged EXEC mode.

Switch> enable
Switch#

**Step 8** Rename the configuration file to its original name.

Switch# rename flash: config.text.old flash: config.text

Note Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. Failure to follow this step can result in a lost configuration depending on how your switch is set up.

**Step 9** Copy the configuration file into memory

Switch# copy flash: config.text system: running-config
Source filename [config.text]?
Destination filename [running-config]?

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

**Step 10** Enter global configuration mode.

Switch# configure terminal

**Step 11** Change the password.

Switch(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 12** Return to privileged EXEC mode.

Switch(config)# exit
Switch#

**Step 13** Write the running configuration to the startup configuration file.

Switch# copy running-config startup-config

The new password is now in the startup configuration.

Note This procedure is likely to leave your switch virtual interface in a shutdown state. You can see which interface is in this state by entering the show running-config privileged EXEC command. To reenable the interface, enter the interface vlan vlan-id global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the no shutdown command.

**Step 14** Boot the switch with the packages.conf file from flash.
Switch: boot flash:packages.conf

Step 15
Reload the switch stack.

Switch# reload

---

Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

Caution

Returning the Switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Switch and VLAN configuration files.

- If you enter n (no), the normal boot process continues as if the Mode button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue.......

- If you enter y (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

---

Procedure

Step 1
Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? Y

Step 2
Display the contents of flash memory:

Switch: dir flash:

The Switch file system appears.
Directory of flash:
  13 drwx 192 Mar 01 2013 22:30:48 c2960x-universalk9-mz.150-2.0.63.UCP.bin
  16128000 bytes total (10003456 bytes free)

Step 3  Boot up the system:
Switch: boot

You are prompted to start the setup program. To continue with password recovery, enter N at the prompt:

Continue with the configuration dialog? [yes/no]: N

Step 4  At the Switch prompt, enter privileged EXEC mode:
Switch> enable

Step 5  Enter global configuration mode:
Switch# configure terminal

Step 6  Change the password:
Switch(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 7  Return to privileged EXEC mode:
Switch(config)# exit
Switch#

Note Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. The stacking feature is supported on Switch running the LAN Base image.

Step 8  Write the running configuration to the startup configuration file:
Switch# copy running-config startup-config

The new password is now in the startup configuration.

Step 9  You must now reconfigure the Switch. If the system administrator has the backup Switch and VLAN configuration files available, you should use those.

Recovering from a Command Switch Failure

This section describes how to recover from a failed command switch. You can configure a redundant command switch group by using the Hot Standby Router Protocol (HSRP).
This feature is introduced from Cisco IOS Release 15.2(5)E2.

If you have not configured a standby command switch, and your command switch loses power or fails in some other way, management contact with the member switches is lost, and you must install a new command switch. However, connectivity between switches that are still connected is not affected, and the member switches forward packets as usual. You can manage the members as standalone switches through the console port, or, if they have IP addresses, through the other management interfaces.

You can prepare for a command switch failure by assigning an IP address to a member switch or another switch that is command-capable, making a note of the command-switch password, and cabling your cluster to provide redundant connectivity between the member switches and the replacement command switch. These sections describe two solutions for replacing a failed command switch:

- Replacing a Failed Command Switch with a Cluster Member
- Replacing a Failed Command Switch with Another Switch

These recovery procedures require that you have physical access to the switch. For information on command-capable switches, see the release notes.

### Replacing a Failed Command Switch with a Cluster Member

To replace a failed command switch with a command-capable member in the same cluster, follow these steps.

**Procedure**

**Step 1**  
Disconnect the command switch from the member switches, and physically remove it from the cluster.

**Step 2**  
Insert the member switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 3**  
Start a CLI session on the new command switch.

You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see "Catalyst 2960-X Switch Hardware Installation Guide."  

**Step 4**  
At the switch prompt, enter privileged EXEC mode.

**Example:**

```
Switch> enable
Switch#
```

**Step 5**  
Enter the password of the failed command switch.

**Step 6**  
Enter global configuration mode.

**Example:**

```
Switch# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

**Step 7**  
Remove the member switch from the cluster.

**Example:**

```
```
Step 8
Return to privileged EXEC mode.

Example:
Switch(config)# end
Switch#

Step 9
Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter setup, and press Return.

Example:
Switch# setup

--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.
Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.
Would you like to enter basic management setup? [yes/no]:

Step 10
Enter Y at the first prompt.

Example:

The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y

or

Configuring global parameters:

If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

Step 11
Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

Step 12
When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

Step 13
When prompted, make sure to enable the switch as the cluster command switch, and press Return.

Step 14
When prompted, assign a name to the cluster, and press Return.
The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

Step 15
After the initial configuration displays, verify that the addresses are correct.

Step 16
If the displayed information is correct, enter Y, and press Return.
If this information is not correct, enter \textbf{N}, press \textbf{Return}, and begin again at Step 9.

\textbf{Step 17} \hspace{1em} Start your browser, and enter the IP address of the new command switch.

\textbf{Step 18} \hspace{1em} From the Cluster menu, select \textbf{Add to Cluster} to display a list of candidate switches to add to the cluster.

\section*{Replacing a Failed Command Switch with Another Switch}

To replace a failed command switch with a switch that is command-capable but not part of the cluster, follow these steps:

\textbf{Procedure}

\begin{itemize}
  \item \textbf{Step 1} \hspace{1em} Insert the new switch in place of the failed command switch, and duplicate its connections to the cluster members.
  \item \textbf{Step 2} \hspace{1em} You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.
  \item \textbf{Step 3} \hspace{1em} At the switch prompt, enter privileged EXEC mode.
    \textbf{Example:}
    \begin{verbatim}
    Switch> enable
    Switch#
    \end{verbatim}
  \item \textbf{Step 4} \hspace{1em} Enter the password of the \textit{failed command switch}.
  \item \textbf{Step 5} \hspace{1em} Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter \texttt{setup}, and press \textbf{Return}.
    \textbf{Example:}
    \begin{verbatim}
    Switch# setup
    --- System Configuration Dialog ---
    Continue with configuration dialog? [yes/no]: y
    At any point you may enter a question mark '?' for help.
    Use ctrl-c to abort configuration dialog at any prompt.
    Default settings are in square brackets '[]'.
    Basic management setup configures only enough connectivity
    for management of the system, extended setup will ask you
    to configure each interface on the system
    Would you like to enter basic management setup? [yes/no]:
    \end{verbatim}
  \item \textbf{Step 6} \hspace{1em} Enter \texttt{Y} at the first prompt.
    \textbf{Example:}
    \begin{verbatim}
    The prompts in the setup program vary depending on the member switch that you selected to
    be the command switch:
    Continue with configuration dialog? [yes/no]: y
    or
    Configuring global parameters:
    \end{verbatim}
\end{itemize}
If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

**Step 7**
Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

**Step 8**
When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

**Step 9**
When prompted, make sure to enable the switch as the cluster command switch, and press Return.

**Step 10**
When prompted, assign a name to the cluster, and press Return.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 11**
After the initial configuration displays, verify that the addresses are correct.

**Step 12**
If the displayed information is correct, enter Y, and press Return.

If this information is not correct, enter N, press Return, and begin again at Step 9.

**Step 13**
Start your browser, and enter the IP address of the new command switch.

**Step 14**
From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.

---

**Preventing Switch Stack Problems**

To prevent switch stack problems, you should do the following:

- Make sure that the Switch that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.
- Press the Mode button on a stack member until the Stack mode LED is on. The last two port LEDs on the Switch should be green. Depending on the Switch model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.
- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.
- Manually assigning stack member numbers according to the placement of the Switch in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the Switch have manually assigned numbers if you add, remove, or rearrange Switch later. Use the switch current-stack-member-number renumber new-stack-member-number global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new Switch functions with the exact same configuration as the replaced Switch. This is also assuming the new Switch is using the same member number as the replaced Switch.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP
address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.
3. Power on the Switch.

For the commands that you can use to monitor the switch stack and its members, see the Displaying Switch Stack Information section.

Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Switch settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

Note

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Switch, the Switch software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

Note

The security error message references the GBIC_SECURITY facility. The Switch supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the Switch, and replace it with a Cisco module. After inserting a Cisco SFP module, use the `errdisable recovery cause gbic-invalid` global
configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Switch brings the interface out of the error-disabled state and retries the operation. For more information about the errdisablerecovery command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

### Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the `show interfaces transceiver` command in the command reference for this release.

### Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Switch.

**Note**

Though other protocol keywords are available with the `ping` command, they are not supported in this release.

Use this command to ping another device on the network from the Switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ping ip host</td>
<td>address`</td>
</tr>
</tbody>
</table>

```
Switch# ping 172.20.52.3
```

**Related Topics**

- [Ping](#)
- [Example: Pinging an IP Host](#)

### Monitoring Temperature

The Switch monitors the temperature conditions and uses the temperature information to control the fans. Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Switch (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.
Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

| Table 154: Monitoring the Physical Path |
|-------------------------------|-------------------------------------------------|
| **Command**                   | **Purpose**                                     |
| **tracert outlet mac**        | Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address. |
| 
| **tracert outlet mac ip**    | Displays the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname. |

Executing IP Traceroute

**Note**

Though other protocol keywords are available with the `tracert` privileged EXEC command, they are not supported in this release.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tracert ip host</code></td>
<td>Traces the path that packets take through the network.</td>
</tr>
</tbody>
</table>

Switch# tracert ip 192.51.100.1

Related Topics

IP Traceroute, on page 1474
Example: Performing a Traceroute to an IP Host, on page 1499

Running TDR and Displaying the Results

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command.

To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command.

Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.
Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see Configuring System Message Logging.

Related Topics
Debug Commands, on page 1476

Using the show platform forward Command

The output from the show platform forward privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the Switch application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Configuring OBFL

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the hw-switch switch [switch-number] logging onboard [message level level] global configuration command. On switches, the range for switch-number is from 1 to 9. Use the message level level parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.

- To copy the OBFL data to the local network or a specific file system, use the copy onboard switch switch-number url url-destination privileged EXEC command.

- To disable OBFL, use the no hw-switch switch [switch-number] logging onboard [message level level] global configuration command.

- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the clear onboard switch switch-number privileged EXEC command.

- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the hw-switch switch [switch-number] logging onboard [message level level] global configuration command.

- You can enable or disable OBFL on a member switch from the stack master.

For more information about the commands in this section, see the command reference for this release.

**Example: Verifying the Problem and Cause for High CPU Utilization**

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```
Switch# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
```
This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

### Table 156: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.”</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts.</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”</td>
</tr>

</table>
**Scenarios for Troubleshooting the Software Configuration**

**Scenarios to Troubleshoot Power over Ethernet (PoE)**

*Table 157: Power over Ethernet Troubleshooting Scenarios*

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</td>
<td>Verify that the powered device works on another PoE port. Use the <code>show run</code>, or <code>show interface status</code> user EXEC commands to verify that the port is not shut down or error-disabled. <strong>Note</strong> Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional. Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host. Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters. Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on. If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <code>show inline power</code> command to verify the amount of available power.</td>
</tr>
<tr>
<td>Symptom or Problem</td>
<td>Possible Cause and Solution</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>No PoE on all ports or a group of ports. Trouble is on all switch ports. Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</td>
<td>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch. If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch. Use the <code>show log</code> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes. If there are no alarms, use the <code>show interface status</code> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <code>shut</code> and <code>no shut</code> interface configuration commands to reenable the ports. Use the <code>show env power</code> and <code>show power inline</code> privileged EXEC commands to review the PoE status and power budget (available PoE). Review the running configuration to verify that <code>power inline never</code> is not configured on the ports. Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <code>shut</code> and <code>no shut</code> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected. Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port. Use the <code>show power inline</code> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on. If a powered device can power on when only one powered device is connected to the switch, enter the <code>shut</code> and <code>no shut</code> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <code>show interface status</code> and <code>show power inline</code> privileged EXEC commands to monitor inline power statistics and port status. If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Troubleshooting Software

#### Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Switch# ping 172.20.52.3
```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
Switch#

Table 158: Ping Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>C</td>
<td>A congestion experienced packet was received.</td>
</tr>
<tr>
<td>I</td>
<td>User interrupted test.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

To end a ping session, enter the escape sequence (**Ctrl-^X** by default). Simultaneously press and release the **Ctrl, Shift, and 6** keys and then press the **X** key.

**Related Topics**

- **Ping**, on page 1473

### Example: Performing a Traceroute to an IP Host

This example shows how to perform a **traceroute** to an IP host:

```
Switch# traceroute ip 192.0.2.10
```

Type escape sequence to abort.
Tracing the route to 192.0.2.10

```
1 192.0.2.1 0 msec 0 msec 4 msec
2 192.0.2.203 12 msec 8 msec 0 msec
3 192.0.2.100 4 msec 0 msec 0 msec
4 192.0.2.10 0 msec 4 msec 0 msec
```

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

Table 159: Traceroute Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>The probe timed out.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>Character</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>

Example: Enabling All System Diagnostics

⚠️ Caution

Because debugging output takes priority over other network traffic, and because the debug all privileged EXEC command generates more output than any other debug command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific debug commands.

This command disables all-system diagnostics:

```
Switch# debug all
```

The no debug all privileged EXEC command disables all diagnostic output. Using the no debug all command is a convenient way to ensure that you have not accidentally left any debug commands enabled.

Feature History and Information for Troubleshooting Software Configuration
PART XIV

Working with the Cisco IOS File System, Configuration Files, and Software Images

• Working with the Cisco IOS File System, Configuration Files, and Software Images, on page 1505
Working with the Flash File System

Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the switch is named flash:

As viewed from the active switch, or any stack member, flash: refers to the local flash device, which is the device attached to the same switch on which the file system is being viewed.

Only one user at a time can manage the software bundles and configuration files.

Displaying Available File Systems

To display the available file systems on your switch, use the show file systems privileged EXEC command as shown in this example for a standalone switch:

```
Switch# show file systems
File Systems:
  Name   Size(b) Free(b) Type Flags Prefixes
  * flash: 15998976 5136972 flash rw flash:
  -   -   -   opaque rw bs:
  -   -   -   opaque rw vb:
```
This example shows a switch stack. In this example, the active switch is stack member 1; the file system on stack member 2 is displayed as flash-2; the file system on stack member 3 is displayed as flash-3; and so on up to stack member 8, displayed as flash-8: for an 8-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active switch:

```
Switch# show file systems
File Systems:
Size(b) Free(b) Type Flags Prefixes
145898496 5479424 disk rw crashinfo:crashinfo-1:
145898496 5479424 disk rw crashinfo-2:stby-crashinfo:

<td>ro—read-only.</td>
</tr>
<tr>
<td></td>
<td>rw—read/write.</td>
</tr>
<tr>
<td></td>
<td>wo—write-only.</td>
</tr>
</tbody>
</table>
Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefixes</td>
<td>Alias for file system.</td>
</tr>
<tr>
<td></td>
<td><code>crashinfo:</code>—Crashinfo file.</td>
</tr>
<tr>
<td></td>
<td><code>flash:</code>—Flash file system.</td>
</tr>
<tr>
<td></td>
<td><code>ftp:</code>—FTP server.</td>
</tr>
<tr>
<td></td>
<td><code>http:</code>—HTTP server.</td>
</tr>
<tr>
<td></td>
<td><code>https:</code>—Secure HTTP server.</td>
</tr>
<tr>
<td></td>
<td><code>nvram:</code>—NVRAM.</td>
</tr>
<tr>
<td></td>
<td><code>null:</code>—Null destination for copies. You can copy a remote file to null to find its size.</td>
</tr>
<tr>
<td></td>
<td><code>scp:</code>—Session Control Protocol (SCP) server.</td>
</tr>
<tr>
<td></td>
<td><code>system:</code>—Contains the system memory, including the running configuration.</td>
</tr>
<tr>
<td></td>
<td><code>tftp:</code>—TFTP network server.</td>
</tr>
<tr>
<td></td>
<td><code>usbflash0:</code>—USB flash memory.</td>
</tr>
<tr>
<td></td>
<td><code>xmodem:</code>—Obtain the file from a network machine by using the Xmodem protocol.</td>
</tr>
<tr>
<td></td>
<td><code>ymodem:</code>—Obtain the file from a network machine by using the Ymodem protocol.</td>
</tr>
</tbody>
</table>
Table 161: Commands for Displaying Information About Files

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir [/all] [filesystem:filename]</td>
<td>Displays a list of files on a file system.</td>
</tr>
<tr>
<td>show file systems</td>
<td>Displays more information about each of the files on a file system.</td>
</tr>
<tr>
<td>show file information file-url</td>
<td>Displays information about a specific file.</td>
</tr>
<tr>
<td>show file descriptors</td>
<td>Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

Changing Directories and Displaying the Working Directory

Follow these steps to change directories and to display the working directory:

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>dir filesystem:</td>
<td>Displays the directories on the specified file system.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>For filesystem:, use flash: for the system board flash device.</td>
</tr>
<tr>
<td></td>
<td>Switch# dir flash:</td>
<td>To access flash partitions of switch members in a stack, use flash-n where n is the stack member number. For example, flash-4.</td>
</tr>
<tr>
<td>3</td>
<td>cd directory_name</td>
<td>Navigates to the specified directory.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>The command example shows how to navigate to the directory named new_configs.</td>
</tr>
<tr>
<td></td>
<td>Switch# cd new_configs</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>pwd</td>
<td>Displays the working directory.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Switch# pwd</td>
</tr>
<tr>
<td>5</td>
<td>cd</td>
<td>Navigates to the default directory.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Creating Directories

Beginning in privileged EXEC mode, follow these steps to create a directory:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# cd</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 1

**dir filesystem:**

**Example:**

Switch# dir flash:

- **Purpose:** Displays the directories on the specified file system.
- **For filesystem:**; use flash: for the system board flash device.

#### Step 2

**mkdir directory_name**

**Example:**

Switch# mkdir new_configs

- **Purpose:** Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons.

#### Step 3

**dir filesystem:**

**Example:**

Switch# dir flash:

- **Purpose:** Verifies your entry.

Removing Directories

To remove a directory with all its files and subdirectories, use the `delete /force /recursive filesystem:/file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

⚠️ **Caution**

When directories are deleted, their contents cannot be recovered.

Copying Files

To copy a file from a source to a destination, use the `copy source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use `running-config` and `startup-config` keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running
configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (xmodem:, ymodem:) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, and tftp: and have these syntaxes:

- FTP—ftp://[username [password]@location]/directory/filename
- RCP—rcp://[username@location]/directory/filename
- TFTP—tftp://[location]/directory/filename

Local writable file systems include flash:.

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the copy flash: flash: command is invalid)

**Copying Files from One Switch in a Stack to Another Switch in the Same Stack**

To copy a file from one switch in a stack to another switch in the same stack, use the flash-X: notation, where X is the switch number.

To view all switches in a stack, use the show switch command in privileged EXEC mode, as in the following example of a 9-member switch stack:

```
Switch# show switch
Switch/Stack Mac Address : 0006.f6b9.b580 - Local Mac Address Mac persistency wait time: Indefinite

Switch# Role   Mac Address   Priority  Version  State
-----------------------------------------------
*1 Active 0006.f6b9.b580 15  P3B  Ready
  2 Standby 0006.f6ba.0c80 14  P3B  Ready
  3 Member 0006.f6ba.3300  7  P3B  Ready
  4 Member 0006.f6b9.df80  6  P3B  Ready
  5 Member 0006.f6ba.3880 13  P1A  Ready
  6 Member 1ce6.c7b6.e00  4  PP  Ready
  7 Member 2037.06ce.2580  3  P2A  Ready
  8 Member 2037.0653.7e00  2  P5A  Ready
  9 Member 2037.0653.9280  1  P5B  Ready
```

To view all file systems available to copy on a specific switch, use the copy command as in the following example of a 5-member stack:

```
Switch# copy flash: ?
crashinfo-1: Copy to crashinfo-1: file system
crashinfo-2: Copy to crashinfo-2: file system
crashinfo-3: Copy to crashinfo-3: file system
crashinfo-4: Copy to crashinfo-4: file system
crashinfo-5: Copy to crashinfo-5: file system
flash-1: Copy to flash-1: file system
```
This example shows how to copy a config file stored in the flash partition of switch 2 to the flash partition of switch 4. It assumes that switch 2 and switch 4 are in the same stack.

Switch# copy flash-2:config.txt flash-4:config.txt

Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the `delete [/force] [/recursive] [filesystem:]file-url` privileged EXEC command.

Use the `/recursive` keyword for deleting a directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `/force` and `/recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

If you omit the `filesystem:` option, the switch uses the default device specified by the `cd` command. For `file-url`, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

Caution

When files are deleted, their contents cannot be recovered.
This example shows how to delete the file `myconfig` from the default flash memory device:

```
Switch# delete myconfig
```

## Creating, Displaying and Extracting Files

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>archive tar /create destination-url flash: /file-url</strong></td>
<td>Creates a file and adds files to it.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</td>
</tr>
<tr>
<td>switch# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</td>
<td>- Local flash file system syntax:</td>
</tr>
<tr>
<td></td>
<td>- FTP syntax:</td>
</tr>
<tr>
<td></td>
<td>ftp://[username][password]@location]/directory]/-filename.</td>
</tr>
<tr>
<td></td>
<td>- TFTP syntax:</td>
</tr>
<tr>
<td></td>
<td><strong>ftp:</strong> [location]/directory]/-filename.</td>
</tr>
<tr>
<td></td>
<td>For <strong>flash:</strong>/file-url, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</td>
</tr>
<tr>
<td></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td><strong>archive tar /table source-url</strong></td>
<td>Displays the contents of a file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>For source-url, specify the source URL alias for the local or network file system. The -filename is the file to display. These options are supported:</td>
</tr>
<tr>
<td>switch# archive tar /table flash: /new_configs</td>
<td>- Local flash file system syntax:</td>
</tr>
<tr>
<td></td>
<td>- FTP syntax:</td>
</tr>
<tr>
<td></td>
<td>ftp://[username][password]@location]/directory]/-filename.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>rcp</code>://[username@location]/directory/-filename.</td>
<td>TFTP syntax: <code>tftp://location/directory/-filename</code>. You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear.</td>
</tr>
</tbody>
</table>

**Step 3**

**archive tar **/xtract source-url flash://file-url [dir/file...]

**Example:**

```
switch# archive tar /xtract
tftp://172.20.10.30/saved.
flash://new-configs
```

Extracts a file into a directory on the flash file system.

For source-url, specify the source URL alias for the local file system. The -filename is the file from which to extract files. These options are supported:

- Local flash file system syntax:
  - `flash:`
- FTP syntax:
  - `ftp://username:password@location/directory/-filename`
- RCP syntax:
  - `rcp://[username@location]/directory/-filename`
- TFTP syntax:
  - `tftp://[location]/directory/-filename`

For flash://file-url [dir/file...], specify the location on the local flash file system from which the file is extracted. Use the dir/file... option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.

**Step 4**

**more [ /ascii | /binary | /ebcdic ] /file-url**

**Example:**

```
switch# more
flash://new-configs
```

Displays the contents of any readable file, including a file on a remote file system.

---

**Working with Configuration Files**

**Information on Configuration Files**

Configuration files contain commands entered to customize the function of the Cisco IOS software. A way to create a basic configuration file is to use the setup program or to enter the setup privileged EXEC command.
You can copy (download) configuration files from a TFTP, FTP, or RCP server to the running configuration or startup configuration of the switch. You might want to perform this for one of these reasons:

- To restore a backed-up configuration file.

- To use the configuration file for another switch. For example, you might add another switch to your network and want it to have a configuration similar to the original switch. By copying the file to the new switch, you can change the relevant parts rather than recreating the whole file.

- To load the same configuration commands on all the switches in your network so that all the switches have similar configurations.

You can copy (upload) configuration files from the switch to a file server by using TFTP, FTP, or RCP. You might perform this task to back up a current configuration file to a server before changing its contents so that you can later restore the original configuration file from the server.

The protocol you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.

**Guidelines for Creating and Using Configuration Files**

Creating configuration files can aid in your switch configuration. Configuration files can contain some or all of the commands needed to configure one or more switches. For example, you might want to download the same configuration file to several switches that have the same hardware configuration.

Use these guidelines when creating a configuration file:

- We recommend that you connect through the console port or Ethernet management port for the initial configuration of the switch. If you are accessing the switch through a network connection instead of through a direct connection to the console port or Ethernet management port, keep in mind that some configuration changes (such as changing the switch IP address or disabling ports) can cause a loss of connectivity to the switch.

- If no password has been set on the switch, we recommend that you set one by using the `enable secret secret-password` global configuration command.

Note

The `copy {ftp: | rcp: | tftp:} system:running-config privileged EXEC command loads the configuration files on the switch as if you were entering the commands at the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration might not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, copy the configuration file directly to the startup configuration (by using the `copy {ftp: | rcp: | tftp:} nvram:startup-config privileged EXEC command), and reload the switch.
Configuration File Types and Location

Startup configuration files are used during system startup to configure the software. Running configuration files contain the current configuration of the software. The two configuration files can be different. For example, you might want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration but not save the configuration by using the copy running-config startup-config privileged EXEC command.

The running configuration is saved in DRAM; the startup configuration is stored in the NVRAM section of flash memory.

Creating a Configuration File By Using a Text Editor

When creating a configuration file, you must list commands logically so that the system can respond appropriately. This is one method of creating a configuration file:

Procedure

Step 1 Copy an existing configuration from a switch to a server.
Step 2 Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.
Step 3 Extract the portion of the configuration file with the desired commands, and save it in a new file.
Step 4 Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).
Step 5 Make sure the permissions on the file are set to world-read.

Copying Configuration Files By Using TFTP

You can configure the switch by using configuration files you create, download from another switch, or download from a TFTP server. You can copy (upload) configuration files to a TFTP server for storage.

Preparing to Download or Upload a Configuration File By Using TFTP

Before you begin downloading or uploading a configuration file by using TFTP, do these tasks:

• Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:

        tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot

Make sure that the /etc/services file contains this line:

        tftp 69/udp
You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a fastboot command (on the SunOS 4.x) or a reboot command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the ping command.

- Ensure that the configuration file to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).

- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.

- Before uploading the configuration file, you might need to create an empty file on the TFTP server. To create an empty file, enter the touch filename command, where filename is the name of the file you will use when uploading it to the server.

- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

### Downloading the Configuration File By Using TFTP

To configure the switch by using a configuration file downloaded from a TFTP server, follow these steps:

#### Procedure

**Step 1** Copy the configuration file to the appropriate TFTP directory on the workstation.

**Step 2** Verify that the TFTP server is properly configured.

**Step 3** Log into the switch through the console port, the Ethernet management port, or a Telnet session.

**Step 4** Download the configuration file from the TFTP server to configure the switch.

Specify the IP address or hostname of the TFTP server and the name of the file to download.

Use one of these privileged EXEC commands:

- `copy tftp://location/directory/filename` system:running-config
- `copy tftp://location/directory/filename` nvram:startup-config
- `copy tftp://location/directory/filename` flash[n]:/directory/startup-config

The configuration file downloads, and the commands are executed as the file is parsed line-by-line.
Uploading the Configuration File By Using TFTP

To upload a configuration file from a switch to a TFTP server for storage, follow these steps:

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Verify that the TFTP server is properly configured.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Log into the switch through the console port, the Ethernet management port, or a Telnet session.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Upload the switch configuration to the TFTP server. Specify the IP address or hostname of the TFTP server and the destination filename. Use one of these privileged EXEC commands:</td>
</tr>
<tr>
<td></td>
<td>• copy system:running-config tftp:[][location][directory]/filename</td>
</tr>
<tr>
<td></td>
<td>• copy nvram:startup-config tftp:[][location][directory]/filename</td>
</tr>
<tr>
<td></td>
<td>• copy flash[n]:/directory/startup-config tftp:[][location][directory]/filename</td>
</tr>
<tr>
<td></td>
<td>The file is uploaded to the TFTP server.</td>
</tr>
</tbody>
</table>

Example

This example shows how to upload a configuration file from a switch to a TFTP server:

Switch# copy system:running-config tftp://172.16.2.155/tokyo-config
Write file tokyo-config on host 172.16.2.155? [confirm] y
#
Writing tokyo-config!!! [OK]

Copying a Configuration File from the Switch to an FTP Server

You can copy a configuration file from the switch to an FTP server.

Understanding the FTP Username and Password

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the switch to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:
Preparing to Download or Upload a Configuration File By Using FTP

Before you begin downloading or uploading a configuration file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the ping command.

- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the show users privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the ip ftp username username global configuration command during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the copy command if you want to specify a username for only that copy operation.

- When you upload a configuration file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

**Downloading a Configuration File By Using FTP**

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using FTP:

1. The username specified in the copy EXEC command, if a username is specified.
2. The username set by the ip ftp username global configuration command, if the command is configured.
3. Anonymous.

The switch sends the first valid password it encounters in the following sequence:

1. The password specified in the copy command, if a password is specified.
2. The password set by the ip ftp password command, if the command is configured.
3. The switch forms a password username@switchname.domain. The variable username is the username associated with the current session, switchname is the configured host name, and domain is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the switch. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more information.

Use the ip ftp username and ip ftp password global configuration commands to specify a username and password for all copies. Include the username in the copy EXEC command if you want to specify a username for that copy operation only.

Preparing to Download or Upload a Configuration File By Using FTP
Downloading a Configuration File By Using FTP

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td>• copy nvram:startup-config ftp: [username[:password]@[location]/directory]/filename</td>
<td></td>
</tr>
</tbody>
</table>

Example

This example shows how to copy a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 and to load and run those commands on the switch:

Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-config

Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]

Switch#

%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101

This example shows how to specify a remote username of netadmin1. The software copies the configuration file host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the switch startup configuration.

Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp: nvram:startup-config

Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config

Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:![OK]

Switch#

%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure terminal</td>
<td>Enter global configuration mode on the switch. This step is required only if you override the default remote username or password (see Steps 2, 3, and 4).</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Do one of the following:</td>
<td>Using FTP, store the switch running or startup configuration file to the specified location.</td>
</tr>
<tr>
<td></td>
<td>• copy system:running-config ftp: [[[[[username [password ]@]location]directory ]filename ] or</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• copy nvram:startup-config ftp: [[[[[username [password ]@]location]directory ]filename ]</td>
</tr>
</tbody>
</table>

**Example**

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
Switch# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/switch2-config
```

Write file switch2-config on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#

This example shows how to store a startup configuration file on a server by using FTP to copy the file:

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin2
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy nvram:startup-config ftp:
Remote host[]? 172.16.101.101
Name of configuration file to write [switch2-config]?
Write file switch2-config on host 172.16.101.101?[confirm] ![OK]```
Copying Configuration Files By Using RCP

The RCP provides another method of downloading, uploading, and copying configuration files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

The RCP requires a client to send a remote username with each RCP request to a server. When you copy a configuration file from the switch to a server, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `copy` command if a username is specified.
- The username set by the `ip rcmd remote-username username` global configuration command if the command is configured.
- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.
- The switch hostname.

For a successful RCP copy request, you must define an account on the network server for the remote username. If the server has a directory structure, the configuration file is written to or copied from the directory associated with the remote username on the server. For example, if the configuration file is in the home directory of a user on the server, specify that user's name as the remote username.

Preparing to Download or Upload a Configuration File By Using RCP

Before you begin downloading or uploading a configuration file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the show users privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the RCP username. Include the username in the copy command if you want to specify a username for only that copy operation.
- When you upload a file to the RCP server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose that the switch contains these configuration lines:
hostname Switch1
ip rcmd remote-username User0

If the switch IP address translates to Switch1.company.com, the .rhosts file for User0 on the RCP server should contain this line:

Switch1.company.com Switch1

For more information, see the documentation for your RCP server.

### Downloading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using RCP:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode on the switch. This step is required only if you override the default remote username (see Steps 2 and 3).</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip rcmd remote-username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Do one of the following:</td>
<td>Using RCP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
<tr>
<td></td>
<td>• copy rcp://username@location/directory/filename system:running-config</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• copy rcp://username@location/directory/filename nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

This example shows how to copy a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 and load and run those commands on the switch:

```
Switch# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config!: [OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

This example shows how to specify a remote username of netadmin1. Then it copies the configuration file host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin1
Switch(config)# end
Switch# copy rcp: nvram:startup-config
Address of remote host (255.255.255.255)? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
```
Uploading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using RCP

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode on the switch.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This step is required only if you override the default remote username (see Steps 2 and 3).</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip rcmd remote-username username</td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Do one of the following:</td>
<td>Using RCP, copy the configuration file from a switch running configuration or startup configuration file to a network server.</td>
</tr>
<tr>
<td></td>
<td>• copy system:running-config</td>
<td></td>
</tr>
<tr>
<td></td>
<td>rcp://username@location/directory/filename</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• copy nvram:startup-config</td>
<td></td>
</tr>
<tr>
<td></td>
<td>rcp://username@location/directory/filename</td>
<td></td>
</tr>
</tbody>
</table>

Example

This example shows how to copy the running configuration file named switch2-confg to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

Switch# copy system:running-config
rcp://netadmin1@172.16.101.101/switch2-confg
Write file switch2-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#

This example shows how to store a startup configuration file on a server:

Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin2
Switch(config)# end
Switch# copy nvram:startup-config rcp:
Remote host[?] 172.16.101.101
Name of configuration file to write [switch2-confg]? Write file switch2-confg on host 172.16.101.101?[confirm]
[OK]

Configure using host2-confg from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:![OK]
[OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101
Clearing Configuration Information

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the setup program so that you can reconfigure the switch with all new settings.

Clearing the Startup Configuration File

To clear the contents of your startup configuration, use the `erase nvram:` or the `erase startup-config` privileged EXEC command.

Note

You cannot restore the startup configuration file after it has been deleted.

Deleting a Stored Configuration File

To delete a saved configuration from flash memory, use the `delete flash:filename` privileged EXEC command. Depending on the setting of the file prompt global configuration command, you might be prompted for confirmation before you delete a file. By default, the switch prompts for confirmation on destructive file operations. For more information about the file prompt command, see the Cisco IOS Command Reference for Release 12.4.

Note

You cannot restore a file after it has been deleted.

Replacing and Rolling Back Configurations

The configuration replacement and rollback feature replaces the running configuration with any saved Cisco IOS configuration file. You can use the rollback function to roll back to a previous configuration.

Information on Configuration Replacement and Rollback

Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the `configure replace` command. Before this feature was introduced, you could save copies of the running configuration using the `copy running-config destination-url` command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the `configure replace` command to revert to previous configuration states.

The `archive config` command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent
Identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The `show archive` command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the `configure replace` command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.

**Configuration Replace**

The `configure replace` privileged EXEC command replaces the running configuration with any saved configuration file. When you enter the `configure replace` command, the running configuration is compared with the specified replacement configuration, and a set of configuration differences is generated. The resulting differences are used to replace the configuration. The configuration replacement operation is usually completed in no more than three passes. To prevent looping behavior no more than five passes are performed.

You can use the `copy source-url running-config` privileged EXEC command to copy a stored configuration file to the running configuration. When using this command as an alternative to the `configure replace target-url` privileged EXEC command, note these major differences:

- The `copy source-url running-config` command is a merge operation and preserves all the commands from both the source file and the running configuration. This command does not remove commands from the running configuration that are not present in the source file. In contrast, the `configure replace target-url` command removes commands from the running configuration that are not present in the replacement file and adds commands to the running configuration that are not present.

- You can use a partial configuration file as the source file for the `copy source-url running-config` command. You must use a complete configuration file as the replacement file for the `configure replace target-url` command.

**Configuration Rollback**

You can also use the `configure replace` command to roll back changes that were made since the previous configuration was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the configuration rollback capability reverts to a specific configuration based on a saved configuration file.

If you want the configuration rollback capability, you must first save the running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes by using the `configure replace target-url` command.

You can specify any saved configuration file as the rollback configuration. You are not limited to a fixed number of rollbacks, as is the case in some rollback models.

**Configuration Guidelines**

Follow these guidelines when configuring and performing configuration replacement and rollback:

- Make sure that the switch has free memory larger than the combined size of the two configuration files (the running configuration and the saved replacement configuration). Otherwise, the configuration replacement operation fails.

- Make sure that the switch also has sufficient free memory to execute the configuration replacement or rollback configuration commands.

- Certain configuration commands, such as those pertaining to physical components of a networking device (for example, physical interfaces), cannot be added or removed from the running configuration.
A configuration replacement operation cannot remove the `interface interface-id` command line from the running configuration if that interface is physically present on the device.

- The `interface interface-id` command line cannot be added to the running configuration if no such interface is physically present on the device.

- When using the `configure replace` command, you must specify a saved configuration as the replacement configuration file for the running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the `copy running-config destination-url` command).

**Note**

If you generate the replacement configuration file externally, it must comply with the format of files generated by Cisco IOS devices.

---

## Configuring the Configuration Archive

Using the `configure replace` command with the configuration archive and with the `archive config` command is optional but offers significant benefit for configuration rollback scenarios. Before using the `archive config` command, you must first configure the configuration archive. Starting in privileged EXEC mode, follow these steps to configure the configuration archive:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>archive</code></td>
<td>Enter archive configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>path url</code></td>
<td>Specify the location and filename prefix for the files in the configuration archive.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>maximum number</code></td>
<td>(Optional) Set the maximum number of archive files of the running configuration to be saved in the configuration archive. <code>number</code>-Maximum files of the running configuration file in the configuration archive. Valid values are from 1 to 14. The default is 10.</td>
</tr>
<tr>
<td>Note</td>
<td>Before using this command, you must first enter the <code>path</code> <code>archive</code> configuration command to specify the location and filename prefix for the files in the configuration archive.</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>time-period minutes</code></td>
<td>(Optional) Set the time increment for automatically saving an archive file of the running configuration in the configuration archive.</td>
</tr>
</tbody>
</table>
Performing a Configuration Replacement or Rollback Operation

Starting in privileged EXEC mode, follow these steps to replace the running configuration file with a saved configuration file:

Procedure

**Step 1**
archive config
(Optional) Save the running configuration file to the configuration archive.

*Note*  
Enter the path archive configuration command before using this command.

**Step 2**
configure terminal
Enter global configuration mode.

**Step 3**
Make necessary changes to the running configuration.

**Step 4**
exit
Return to privileged EXEC mode.

**Step 5**
configure replace target-url [list] [force] [time seconds] [nolock]
Replace the running configuration file with a saved configuration file.

*target-url*—URL (accessible by the file system) of the saved configuration file that is to replace the running configuration, such as the configuration file created in Step 2 by using the *archive config* privileged EXEC command.

*list*—Display a list of the command entries applied by the software parser during each pass of the configuration replacement operation. The total number of passes also appears.

*force*—Replace the running configuration file with the specified saved configuration file without prompting you for confirmation.

*time seconds*—Specify the time (in seconds) within which you must enter the *configure confirm* command to confirm replacement of the running configuration file. If you do not enter the *configure confirm* command within the specified time limit, the configuration replacement operation is automatically stopped. (In other words, the running configuration file is restored to the configuration that existed before you entered the *configure replace* command.)
You must first enable the configuration archive before you can use the `time` seconds command line option.

- **nolock** — Disable the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replacement operation.

**Step 6**

**configure confirm**

(Optional) Confirm replacement of the running configuration with a saved configuration file.

- **Note**
  Use this command only if the `time` seconds keyword and argument of the `configure replace` command are specified.

**Step 7**

**copy running-config startup-config**

(Optional) Save your entries in the configuration file.

---

**Working with Software Images**

**Information on Working with Software Images**

This section describes how to archive (download and upload) software image files, which contain the system software, the Cisco IOS code, and the embedded device manager software.

- **Note**
  Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch in the stack that has an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

You can download a switch image file from a TFTP, FTP, or RCP server to upgrade the switch software. If you do not have access to a TFTP server, you can download a software image file directly to your PC or workstation by using a web browser (HTTP) and then by using the device manager or Cisco Network Assistant to upgrade your switch. For information about upgrading your switch by using a TFTP server or a web browser (HTTP), see the release notes.

You can replace the current image with the new one or keep the current image in flash memory after a download.

You upload a switch image file to a TFTP, FTP, or RCP server for backup purposes. You can use this uploaded image for future downloads to the same switch or to another of the same type.

The protocol that you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.
For a list of software images and the supported upgrade paths, see the release notes.

**Image Location on the Switch**

The Cisco IOS image is stored as a .bin file in a directory that shows the version number. A subdirectory contains the files needed for web management. The image is stored on the system board flash memory (flash:).

You can use the `show version` privileged EXEC command to see the software version that is currently running on your switch. In the display, check the line that begins with System image file is... It shows the directory name in flash memory where the image is stored.

You can also use the `dir filesystem` privileged EXEC command to see the directory names of other software images that might be stored in flash memory.

**File Format of Images on a Server or Cisco.com**

Software images located on a server or downloaded from Cisco.com are provided in a tar file format, which contains these files:

- An info file, which serves as a table of contents for the tar file
- One or more subdirectories containing other images and files, such as Cisco IOS images and web management files

This example shows some of the information contained in the info file. The table provides additional details about this information:

```
system_type:0x00000000:image-name
   image_family:xxxx
   stacking_number:x
   info_end:

version_suffix:xxxx
   version_directory:image-name
   image_system_type_id:0x00000000
   image_name:image-nameB.bin
   ios_image_file_size:6398464
   total_image_file_size:8133632
   image_feature:IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
   image_family:xxxx
   stacking_number:x
   board_ids:0x401100c4 0x00000000 0x00000001 0x00000003 0x00000002 0x00008000 0x00008002 0x40110000
   info_end
```

<table>

</tbody>
</table>
Copying Image Files Using TFTP

You can download a switch image from a TFTP server or upload the image from the switch to a TFTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes; this uploaded image can be used for future downloads to the same or another switch of the same type.

Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch with an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

Preparing to Download or Upload an Image File By Using TFTP

Before you begin downloading or uploading an image file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the `/etc/inetd.conf` file contains this line:

```bash
tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot
```
Make sure that the /etc/services file contains this line:

```
tftp 69/udp
```

**Note**
You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inet process and restart it, or enter a fastboot command (on the SunOS 4.x) or a reboot command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnet if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the ping command.
- Ensure that the image to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).
- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.
- Before uploading the image file, you might need to create an empty file on the TFTP server. To create an empty file, enter the touch filename command, where filename is the name of the file you will use when uploading the image to the server.
- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

## Downloading an Image File By Using TFTP

You can download a new image file and replace the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 3 to download a new image from a TFTP server and overwrite the existing image. To keep the current image, go to Step 3.

**Procedure**

**Step 1**
Copy the image to the appropriate TFTP directory on the workstation. Make sure that the TFTP server is properly configured.

**Step 2**
Log into the switch through the console port or a Telnet session.

**Step 3**
```
archive download-sw/overwrite/reload tftp: [ //location] /directory /image-name.tar
```
Download the image file from the TFTP server to the switch, and overwrite the current image.
- The /overwrite option overwrites the software image in flash memory with the downloaded image.
• The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.
• For // location, specify the IP address of the TFTP server.
• For /directory/image-name.tar specify the directory (optional) and the image to download. Directory and image names are case sensitive.

Step 4

archive download-sw/leave-old-sw/reload tftp: [ [ // location ]/directory]/image-name.tar

Download the image file from the TFTP server to the switch, and keep the current image.
• The /leave-old-sw option keeps the old software version after a download.
• The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.
• For //location, specify the IP address of the TFTP server.
• For /directory/image-name.tar specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the /overwrite option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

Note If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the /overwrite option.

If you specify the /leave-old-sw, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image on the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you keep the old image during the download process (you specified the /leave-old-sw keyword), you can remove it by entering the delete(force/recursive filesystem:/: file-url privileged EXEC command. For filesystem, use flash: for the system board flash device. For file-url, enter the directory name of the old image. All the files in the directory and the directory are removed.

Note For the download and upload algorithms to operate properly, do not rename image names.

Uploading an Image File Using TFTP

You can upload an image from the switch to a TFTP server. You can later download this image to the switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to a TFTP server:

Procedure

Step 1  Make sure the TFTP server is properly configured

Step 2  Log into the switch through the console port or a Telnet session.

Step 3  `archive upload-sw tftp://location/directory/image-name.tar`

Upload the currently running switch image to the TFTP server.

- For `//location`, specify the IP address of the TFTP server.

- For `/directory/image-name.tar` specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The `image-name.tar` is the name of the software image to be stored on the server.

The `archive upload-sw` privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

**Note**  For the download and upload algorithms to operate properly, do not rename image names.

---

## Copying Image Files Using FTP

You can download a switch image from an FTP server or upload the image from the switch to an FTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the switch or another switch of the same type.

**Note**  Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch with an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.
Preparing to Download or Upload an Image File By Using FTP

You can copy images files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy an image file from the switch to a server by using FTP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip ftp username` username global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:

- The password specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a password is specified.
- The password set by the `ip ftp password` password global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured hostname, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from you.

Use the `ip ftp username` and `ip ftp password` commands to specify a username and password for all copies. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.

If the server has a directory structure, the image file is written to or copied from the directory associated with the username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the `ip ftp username` username global configuration command. This new name will be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username for that operation only.
- When you upload an image file to the FTP server, it must be properly configured to accept the write request from the user on the switch.
For more information, see the documentation for your FTP server.

**Downloading an Image File By Using FTP**

You can download a new image file and overwrite the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 7 to download a new image from an FTP server and overwrite the existing image. To keep the current image, go to Step 7.

**Procedure**

---

**Step 1**
Verify that the FTP server is properly configured.

---

**Step 2**
Log into the switch through the console port or a Telnet session.

---

**Step 3**
```
configure terminal
```
Enter global configuration mode.

This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).

**Step 4**
```
ip ftp username username
```
(Optional) Change the default remote username.

**Step 5**
```
ip ftp password password
```
(Optional) Change the default password.

**Step 6**
```
end
```
Return to privileged EXEC mode.

**Step 7**
```
archive download-sw /overwrite/reload
ftp: [ // username [:password] @ location ] / directory / image-name.tar
```
Download the image file from the FTP server to the switch, and overwrite the current image.

- The `/overwrite` option overwrites the software image in flash memory with the downloaded image.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `/username [:password]` specify the username and password; these must be associated with an account on the FTP server.
- For `@ location`, specify the IP address of the FTP server.
- For `directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

**Step 8**
```
archive download-sw /leave-old-sw/reload
ftp: [ // username [:password] @ location ] / directory / image-name.tar
```
Download the image file from the FTP server to the switch, and keep the current image.

- The `/leave-old-sw` option keeps the old software version after a download.
• The **reload** option reloads the system after downloading the image unless the configuration has been changed and not been saved.
• For **//username [password]** specify the username and password; these must be associated with an account on the FTP server.
• For **@ location**, specify the IP address of the FTP server.
• For **directory/image-name.tar**, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the **/overwrite** option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note** If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the **/overwrite** option.

If you specify the **/leave-old-sw**, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (**flash:**). The image is placed into a new directory named with the software version string, and the **BOOT** environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the **/leave-old-sw** keyword), you can remove it by entering the **delete force recursive filesystem :/file-url** privileged EXEC command. For **filesystem**, use **flash:** for the system board flash device. For **file-url**, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

---

**Uploading an Image File By Using FTP**

You can upload an image from the switch to an FTP server. You can later download this image to the same switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an FTP server:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode. This step is required only if you override the default remote username or password (see Steps 2, 3, and 4.)</td>
</tr>
<tr>
<td><strong>Step 2</strong> ip ftp username username</td>
<td>Optional) Change the default remote username.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 archive upload-sw</td>
<td>Upload the currently running switch image to the FTP server.</td>
</tr>
<tr>
<td></td>
<td>• For //username:password, specify the username and password. These must be associated with an account on the FTP server.</td>
</tr>
<tr>
<td></td>
<td>• For @location, specify the IP address of the FTP server.</td>
</tr>
<tr>
<td></td>
<td>• For /directory/image-name.tar, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The image-name.tar is the name of the software image to be stored on the server.</td>
</tr>
</tbody>
</table>

The archive upload-sw command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

---

**Copying Image Files Using RCP**

You can download a switch image from an RCP server or upload the image from the switch to an RCP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download. You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the same switch or another of the same type.

**Note** Instead of using the copy privileged EXEC command or the archive tar privileged EXEC command, we recommend using the archive download-sw and archive upload-sw privileged EXEC commands to download and upload software image files. For switch stacks, the archive download-sw and archive upload-sw privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members. To upgrade a switch with an incompatible software image, use the archive copy-sw privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.
Preparing to Download or Upload an Image File Using RCP

RCP provides another method of downloading and uploading image files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

RCP requires a client to send a remote username on each RCP request to a server. When you copy an image from the switch to a server by using RCP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip rcmd remote-username username` global configuration command if the command is entered.
- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.
- The switch hostname.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the image file is written to or copied from the directory associated with the remote username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and there is no need to set the RCP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.
- When you upload an image to the RCP to the server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server.

For example, suppose the switch contains these configuration lines:

```
hostname Switch1
ip rcmd remote-username User0
```
If the switch IP address translates to Switch1.company.com, the .rhosts file for User0 on the RCP server should contain this line:

Switch1.company.com Switch1

For more information, see the documentation for your RCP server.

Downloading an Image File using RCP

You can download a new image file and replace or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 6 to download a new image from an RCP server and overwrite the existing image. To keep the current image, go to Step 6.

**Procedure**

**Step 1** Verify that the RCP server is properly configured.

**Step 2** Log into the switch through the console port or a Telnet session.

**Step 3** `configure terminal`

Enter global configuration mode.

This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).

**Step 4** `ip rcmd remote-username username`

(Optional) Specify the remote username.

**Step 5** `end`

Return to privileged EXEC mode.

**Step 6** `archive download-sw /overwrite reload rcp: [[ //username@] /location] /directory] /image-name.tar`

Download the image file from the RCP server to the switch, and overwrite the current image.

- The `/overwrite` option overwrites the software image in flash memory with the downloaded image.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `/username` specify the username. For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username.
- For `@ location`, specify the IP address of the RCP server.
- For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

**Step 7** `archive download-sw /leave-old-sw reload rcp: [[ //username@] location] /directory] /image-name.tar`

Download the image file from the FTP server to the switch, and keep the current image.

- The `/leave-old-sw` option keeps the old software version after a download.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
• For `username` specify the username. For the RCP copy request to execute, an account must be defined on the network server for the remote username.
• For `@ location`, specify the IP address of the RCP server.
• For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note** If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.

If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (`flash:`). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete force recursive filesystem :/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

---

**Uploading an Image File using RCP**

You can upload an image from the switch to an RCP server. You can later download this image to the same switch or to another switch of the same type.

The upload feature should be used only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an RCP server:

**Procedure**

## Copying an Image File from One Stack Member to Another

For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can be used only through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch that has an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the one that has incompatible software. That switch automatically reloads and joins the stack as a fully functioning member.

### Note

To successfully use the **archive copy-sw** privileged EXEC command, you must have downloaded from a TFTP server the images for both the stack member switch being added and the stack master. You use the **archive download-sw** privileged EXEC command to perform the download.

Beginning in privileged EXEC mode from the stack member that you want to upgrade, follow these steps to copy the running image file from the flash memory of a different stack member:
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `archive copy-sw/destination-system destination-stack-member-number / force-reload source-stack-member-number` | Copy the running image file from a stack member, and then unconditionally reload the updated stack member.  
**Note** At least one stack member must be running the image that is to be copied to the switch that is running the incompatible software.  
For `/destination-system/destination-stack-member-number`, specify the number of the stack member (the destination) to which to copy the source running image file. If you do not specify this stack member number, the default is to copy the running image file to all stack members.  
Specify `/force-reload` to unconditionally force a system reload after successfully downloading the software image.  
For `source-stack-member-number`, specify the number of the stack member (the source) from which to copy the running image file. The stack member number range is 1 to 9. |
| Step 2 | `reload slot stack-member-number`                                                 | Reset the updated stack member, and put this configuration change into effect.                |

Embedded Event Manager Overview

Embedded Event Manager (EEM) is a distributed and customized approach to event detection and recovery offered directly in a Cisco IOS device. EEM offers the ability to monitor events and take informational, corrective, or any desired EEM action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

This module contains a technical overview of EEM. EEM can be used alone, or with other network management technologies to help monitor and maintain your network. Before you begin to implement EEM, it is important that you understand the information presented in this module.

• Finding Feature Information, on page 1547
• Information About Embedded Event Manager, on page 1547
• Where to Go Next, on page 1566
• Feature Information for Embedded Event Manager 4.0 Overview, on page 1566
• Additional References, on page 1566

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Embedded Event Manager

Embedded Event Manager

Event tracking and management has traditionally been performed by devices external to the networking device. Embedded Event Manager (EEM) has been designed to offer event management capability directly in Cisco IOS devices. The on-device, proactive event management capabilities of EEM are useful because not all event management can be done off device because some problems compromise communication between the device and the external network management device. Capturing the state of the device during such situations can be invaluable in taking immediate recovery actions and gathering information to perform root-cause analysis.
Network availability is also improved if automatic recovery actions are performed without the need to fully reboot the routing device.

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs. The EEM policies that are configured using the Cisco command-line interface (CLI) then implement recovery on the basis of the current state of the system and the actions specified in the policy for the given event.

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

**Note**

If your network has a higher version of EEM, that version would include the previous releases of EEM version as well.
Embedded Event Manager 1.0

EEM 1.0 introduced the following event detectors:

- SNMP—The Simple Network Management Protocol (SNMP) event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

- Syslog—The syslog event detector allows for screening syslog messages for a regular expression pattern match.

EEM 1.0 introduced the following actions:

- Generating prioritized syslog messages.
- Generating a Cisco Networking Services (CNS) event for upstream processing by CNS devices.
- Reloading the Cisco software.
- Switching to a secondary processor in a fully redundant hardware configuration.

Embedded Event Manager 2.0

EEM 2.0 introduced some new features. EEM 2.0 introduced the following event detectors:

- Application-Specific—The application-specific event detector allows any Embedded Event Manager policy to publish an event.

- Counter—The counter event detector publishes an event when a named counter crosses a specified threshold.

- Interface Counter—The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold.

- Timer—The timer event detector publishes events for the following four different types of timers: absolute-time-of-day, countdown, watchdog, and CRON.

- Watchdog System Monitor (IOSWDSysMon)—The Cisco IOS watchdog system monitor event detector publishes an event when CPU or memory utilization for a Cisco IOS process crosses a threshold.

EEM 2.0 introduced the following actions:

- Setting or modifying a named counter.
- Publishing an application-specific event
- Generating an SNMP trap.

The ability to run a Cisco defined sample policy written using Tool Command Language (Tcl) was introduced. A sample policy was provided that could be stored in the system policy directory.

Embedded Event Manager 2.1

EEM 2.1 introduced the following new event detectors:
• CLI—The CLI event detector screens command-line interface (CLI) commands for a regular expression match.
• None—The none event detector publishes an event when the Cisco IOS event manager run command executes an EEM policy.
• OIR—The online insertion and removal (OIR) event detector publishes an event when a particular hardware insertion or removal event occurs.

EEM 2.1 introduced the following actions:
• Executing a Cisco CLI command.
• Requesting system information when an event occurs.
• Sending a short e-mail.
• Manually running an EEM policy.

EEM 2.1 also permits multiple concurrent policies to be run using the new event manager scheduler script command. Support for SNMP event detector rate-based events is provided as is the ability to create policies using Tool Command Language (Tcl).

**Embedded Event Manager 2.1 (Software Modularity)**

EEM 2.1 (Software Modularity) is supported on Cisco Software Modularity images. EEM 2.1 (Software Modularity) introduced the following event detectors:

• GOLD—The Generic Online Diagnostic (GOLD) event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.
• System Manager—The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.
• Watchdog System Monitor (WDSysMon)—The Cisco Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.

EEM 2.1 for Software Modularity introduced the ability to display EEM reliability metric data for processes.

---

**Note**

EEM 2.1 for Software Modularity images also supports the resource and RF event detectors introduced in EEM 2.2, but it does not support the enhanced object tracking event detector or the actions to read and set tracked objects.

---

**Embedded Event Manager 2.2**

EEM 2.2 introduced some new features. EEM 2.2 introduced the following event detectors:

• Enhanced Object Tracking—The enhanced object tracking event detector publishes an event when the tracked object changes. Enhanced object tracking provides complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes.
• Resource—The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy.

• RF—The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

EEM 2.2 introduced the following actions:

• Reading the state of a tracked object.

• Setting the state of a tracked object.

Embedded Event Manager 2.3

EEM 2.3 is supported on the Cisco Catalyst 6500 Series switches and introduces enhancements to the Generic Online Diagnostics (GOLD) Event Detector on that product.

• The event gold command was enhanced with the addition of the action-notify, testing-type, test-name, test-id, consecutive-failure, platform-action, and maxrun keywords for improved reaction to GOLD test failures and conditions.

• The following platform-wide GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables:
  • Boot-up diagnostic level
  • Card index, name, serial number
  • Port counts
  • Test counts

• The following test-specific GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables (available to EEM applets only):
  • Test name, attribute, total run count
  • Test result per test, port, or device
  • Total failure count, last fail time
  • Error code
  • Occurrence of consecutive failures

These enhancements result in reduced mean time to recovery (MTTR) and higher availability through improved automation and fault detection.

Embedded Event Manager 2.4

EEM 2.4 introduced the following event detectors:

• SNMP Notification—The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into the device. An SNMP notification event is generated when an incoming SNMP trap or inform message matches specified values or crosses specified thresholds.

• RPC—The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses
Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

EEM 2.4 added enhancements to the following event detectors:

- Interface counter rate-based trigger—This feature adds the ability for an interface event to be triggered based on a rate of change over a period of time. A rate can be specified both for the entry value and the exit value. This feature copies the rate-based functionality that currently exists for the SNMP event detector.

- SNMP delta value—The difference between the monitored Object Identifier (OID) value at the beginning of the monitored period and the actual OID value when the event is published will be provided in the event reqinfo data for both the SNMP event detector and the Interface Counter event detector.

EEM 2.4 introduced the following actions:

- Multiple event support—The ability to run multiple events was introduced. and show event manager commands were enhanced to show multiple events.

- Support for parameters—The parameter argument has been added to the event manager run command. A maximum of 15 parameters can be used.

- Display of Job IDs and completion status—Some of the show event manager commands were enhanced to display Job IDs and completion status.

- Bytecode support—Tcl 8 defines a specialized bytecode language (BCL) and includes a just-in-time compiler that translates Tcl scripts to BCL. Byte sequence is executed by a “virtual machine,” Tcl_ExecuteByteCode(), or TEBEC for short, as often as needed. Currently EEM accepts file extensions, such as *.tcl for user policies and *.tm for system policies. Tcl standard extension for bytecode scripts are *.tbc. Now EEM will accept *.tbc as valid EEM policies.

- Registration substitution enhancement—Supports replacing multiple parameters in the event registration statement lines with a single environment variable.

- Tcl package support

**Embedded Event Manager 3.0**

EEM 3.0 introduced the following new event detectors:

- Custom CLI--The custom CLI event detector publishes an event to add and enhance existing CLI command syntax.

- Routing--The Routing event detector publishes an event when route entries change in the Routing Information Base (RIB).

- NetFlow-- The NetFlow event detector publishes an event when a NetFlow event is triggered.

- IP SLA--The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

EEM 3.0 introduced the following features:

- Class-based scheduling--The EEM policies will be assigned a class using the class keyword when they are registered. EEM policies registered without a class will be assigned to the default class.
• High performance Tcl policies--Three new Tcl commands are introduced `event_completion`, `event_wait`, and `event_completion_with_wait`.

• Interactive cli support--The synchronous applets are enhanced to support interaction with the local console (TTY). Two new IOS commands, `action gets` and `action puts`, are introduced to allow users to enter and display input directly on the console.

• Variable logic for applets--The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions.

• Digital signature support--A new API performs digital signature verification for a Tcl script to check it the script is signed by Cisco before execution.

• Support authenticating e-mail servers--The `action mail` command is modified to include an optional username and password.

• SMTP IPv6 support--The keyword `sourceaddr` is added in Tcl e-mail templates to specify either an IPv6 or IPv4 address.

• SNMP library extensions--The EEM applet `action info` and Tcl `sys_reqinfo_snmp` commands are enhanced to include functionality for SNMP getid, inform, trap, and set-type operations.

• SNMP Notification IPv6 support--IPv6 address is supported for the source and destination IP addresses.

• CLI Library XML-PI support--Provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support.

### Embedded Event Manager 3.1

EEM 3.1 introduced one new event detector:

• SNMP Object--The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

EEM 3.1 added an enhancement to the following event detector:

• SNMP Notification--The SNMP notification event detector now can wait and intercept the outgoing SNMP traps and informs.

EEM 3.1 added enhancement to the following action:

• Specify facility--The `action syslog` command has been enhanced to specify syslog facility.

EEM 3.1 introduces the following features:

• Provides the ability to create a short description for the registered policy--A new `description` command has been introduced to register policies with a brief description in Cisco IOS CLI and Tcl policies. The `show event manager policy available` command and the `show event manager policy registered` command have been enhanced to add the `description` keyword to display the description of the registered applet.
• Enables EEM policies to bypass AAA authorization--The event manager application command has been enhanced to provide authorization and bypass keywords to disable AAA.

• Introduces CLI Library enhancements--Provides two new commands in the CLI library: cli_run and cli_run_interactive.

Embedded Event Manager 3.2

EEM 3.2 introduced the following new event detectors:

• Neighbor Discovery--Neighbor Discovery event detector provides the ability to publish a policy to respond to automatic neighbor detection when:
  • a Cisco Discovery Protocol (CDP) cache entry is added, deleted or updated.
  • a Link Layer Discovery Protocol (LLDP) cache entry is added, deleted, or updated.
  • an interface link status changes.
  • an interface line status changes.

• Identity--Identity event detector generates an event when AAA authorization and authentication is successful, when failure occurs, or after normal user traffic on the port is allowed to flow.

• Mac-Address-Table--Mac-Address-Table event detector generates an event when a MAC address is learned in the MAC address table.

Note

The Mac-Address-Table event detector is supported only on switch platforms and can be used only on Layer 2 interfaces where MAC addresses are learned. Layer 3 interfaces do not learn addresses and devices do not usually support the mac-address-table infrastructure needed to notify EEM of a learned MAC address.

EEM 3.2 also introduces new CLI commands to support the applets to work with the new event detectors.

Embedded Event Manager 4.0

EEM 4.0 introduces the following new features:

• EEM Email Action Enhancements
  • TLS support for SMTP mail actions—The new optional secure keyword is added to the action mail CLI with tls and none keyword options. There are no updates to the corresponding Tcl Policy.
  • Custom port for SMTP mail actions—The new optional port keyword is added to the action mail CLI. In the Tcl policy, the port number can be specified by adding a line to the e-mail template.

• EEM Security Enhancements
  • Checksum-based script integrity—Where digital signature is not supported or unavailable, users can still enforce some basic integrity check on the TCL policy by using the Unix command openssl sha1. The new optional checksum, md5, and sha-1 keywords have been added to the event manager policy command.
  • Third-party digital signature support—Requires Tcl secure mode and a trustpoint to associate with the TCL scripts in order to verify the signature.
• Script owner identification—If a policy is successfully registered with a digital signature, the owner (or signer) of the policy can be identified by using the `show event manager policy registered` command and checking the `Dsig` keyword in the show output.

• Registration of remote Tcl policies—The new optional `remote` keyword has been added to the `event manager policy` command.

• EEM Resource Management
  
  • Resource consumption throttling—The new optional `resource-limit` keyword has been added to the `event manager scheduler` command.
  
  • Rate limiting of triggered policies per event—The new optional `rate-limit` keyword has been added to the `event syslog` command.

• EEM Usability Enhancements
  
  • File operations in EEM applet actions—The new CLI `action file` has been added to allow file selection.
  
  • New fields are added in EEM to track statistics of queue size, dropped events, and run-time using the `show event manager statistics` EXEC command. A set of new clear commands—`clear event manager detector counters` and `clear event manager server counters`—are introduced to clear the event manager queue counters.

• EEM Event Detector Enhancements
  
  • CLI event detector enhancement—Provides the ability to detect the session where the user enters the `event cli` command. Four new keywords and built-in environmental variables—`username`, `host`, `privilege`, and `tty`—are added to the `event cli` applet and `event_reginfo` array names to the `event_register_cli` event detector. The `show event manager detector` EXEC command has also been modified to reflect the enhancement.
  
  • Syslog event detector performance enhancement—Provides the option to perform string matching on specific log message fields. The four new keywords—`facility`, `mnemonic`, `sequence`, and `timestamp` keywords—are added to the `action syslog` command, `event syslog` command, and to the `event_register_syslog` event detector. The `show event manager detector` EXEC command has also been modified to reflect the enhancement.

**EEM Event Detectors Available by Cisco IOS Release**

EEM uses software programs known as event detectors to determine when an EEM event occurs. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. Use the table below to determine which event detectors are available in your specific Cisco IOS release. A blank entry (--) indicates that the event detector is not available: the text “Yes” indicates that the event detector is available. The event detectors shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each event detector, see the Event Detectors concept in the “Embedded Event Manager Overview” module.

## Event Detectors

Embedded Event Manager (EEM) uses software programs known as *event detectors* to determine when an EEM event occurs. Event detectors are separate systems that provide an interface between the agent being monitored, for example Simple Network Management Protocol (SNMP), and the EEM policies where an action can be implemented. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. For details of which event detector is supported in each Cisco IOS release, see the EEM Event Detectors Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM contains the following event detectors.

### Application-Specific Event Detector

The application-specific event detector allows any Embedded Event Manager policy to publish an event. When an EEM policy publishes an event it must use an EEM subsystem number of 798 with any event type. If an existing policy is registered for subsystem 798 and a specified event type, a second policy of the same event type will trigger the first policy to run when the specified event is published.

### CLI Event Detector

The CLI event detector screens command-line interface (CLI) commands for a regular expression match. When a match is found, an event is published. The match logic is performed on the fully expanded CLI command after the command is successfully parsed and before it is executed. The CLI event detector supports three publish modes:

- Synchronous publishing of CLI events--The CLI command is not executed until the EEM policy exits, and the EEM policy can control whether the command is executed. The read/write variable, `exit_status`, allows you to set the exit status at policy exit for policies triggered from synchronous events. If `exit_status` is 0, the command is skipped, if `exit_status` is 1, the command is run.

**Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(5)E (Catalyst 2960-X Switches) | 1557**
• Asynchronous publishing of CLI events--The CLI event is published, and then the CLI command is executed.

• Asynchronous publishing of CLI events with command skipping--The CLI event is published, but the CLI command is not executed.

**Counter Event Detector**

The counter event detector publishes an event when a named counter crosses a specified threshold. There are two or more participants that affect counter processing. The counter event detector can modify the counter, and one or more subscribers define the criteria that cause the event to be published. After a counter event has been published, the counter monitoring logic can be reset to start monitoring the counter immediately or it can be reset when a second threshold--called an exit value--is crossed.

**Custom CLI Event Detector**

The custom CLI event detector publishes an event to add and enhance existing CLI command syntax. When the special parser characters Tab, ? (question mark), and Enter are entered, the parser sends the input to the custom CLI event detector for processing. The custom CLI event detector then compares this input against registered strings to determine if this is a new or enhanced CLI command. Upon a match the custom CLI event detector takes appropriate actions, such as displaying help for the command if ? is entered, displaying the entire command if Tab is entered, or executing the command if Enter was entered. If a match does not occur, the parser regains control and processes the information as usual.

**Enhanced Object Tracking Event Detector**

The enhanced object tracking (EOT) event detector publishes an event when the status of a tracked object changes. Object tracking was first introduced into the Hot Standby Router Protocol (HSRP) as a simple tracking mechanism that allowed you to track the interface line-protocol state only. If the line-protocol state of the interface went down, the HSRP priority of the device was reduced, allowing another HSRP device with a higher priority to become active.

Object tracking was enhanced to provide complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes. Thus, several clients such as HSRP, VRRP, or GLBP can register their interest with the tracking process, track the same object, and each take different action when the object changes. Each tracked object is identified by a unique number that is specified on the tracking command-line interface (CLI). Client processes use this number to track a specific object. The tracking process periodically polls the tracked objects and notes any change of value. The changes in the tracked object are communicated to interested client processes, either immediately or after a specified delay. The object values are reported as either up or down.

Enhanced object tracking is now integrated with EEM to allow EEM to report on a status change of a tracked object and to allow enhanced object tracking to track EEM objects. A new type of tracking object--a stub object--is created. The stub object can be manipulated using the existing CLI commands that already allow tracked objects to be manipulated.

**GOLD Event Detector**

The GOLD event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.
**Interface Counter Event Detector**

The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold. A threshold can be specified as an absolute value or an incremental value. If the incremental value is set to 50, for example, an event would be published when the interface counter increases by 50.

After an interface counter event has been published, the interface counter monitoring logic is reset using two methods. The interface counter is reset either when a second threshold—called an exit value—is crossed or when an elapsed period of time occurs.

**IP SLA Event Detector**

The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

**NetFlow Event Detector**

The NetFlow event detector publishes an event when a NetFlow event is triggered.

**None Event Detector**

The none event detector publishes an event when the Cisco IOS `event manager run` CLI command executes an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. An EEM policy must be identified and registered to be permitted to run manually before the `event manager run` command will execute.

**OIR Event Detector**

The online insertion and removal (OIR) event detector publishes an event when one of the following hardware insertion or removal event occurs:

- A card is removed.
- A card is inserted.

Route Processors (RPs), line cards, or feature cards can be monitored for OIR events.

**Resource Event Detector**

The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy. The ERM infrastructure tracks resource depletion and resource dependencies across processes and within a system to handle various error conditions. The error conditions are handled by providing an equitable sharing of resources between various applications. The ERM framework provides a communication mechanism for resource entities and allows communication between these resource entities from numerous locations. The ERM framework also helps in debugging CPU and memory-related issues. The ERM monitors system resource usage to better understand scalability needs by allowing you to configure threshold values for resources such as the CPU, buffers, and memory. The ERM event detector is the preferred method for monitoring resources in Cisco software but the ERM event detector is not supported in Software Modularity images. For more details about ERM, go to “Embedded Resource Manager” module.

**RF Event Detector**

The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).
**RPC Event Detector**

The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

**Routing Event Detector**

The routing event detector publishes an event when a route entry changes in the Routing Information Base (RIB).

**SNMP Event Detector**

The SNMP event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

**SNMP Notification Event Detector**

The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into or going out of the device. An SNMP notification event is generated when an incoming or outgoing SNMP trap or inform message matches specified values or crosses specified thresholds. The SNMP event detector can wait and intercept the outgoing SNMP traps and informs.

**SNMP Object Event Detector**

The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

**Syslog Event Detector**

The syslog event detector allows for screening syslog messages for a regular expression pattern match. The selected messages can be further qualified, requiring that a specific number of occurrences be logged within a specified time. A match on a specified event criteria triggers a configured policy action.

**System Manager Event Detector**

The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.

**Timer Event Detector**

The timer event detector publishes events for the following four different types of timers:

- An absolute-time-of-day timer publishes an event when a specified absolute date and time occurs.
- A countdown timer publishes an event when a timer counts down to zero.
- A watchdog timer publishes an event when a timer counts down to zero and then the timer automatically resets itself to its initial value and starts to count down again.
- A CRON timer publishes an event using a UNIX standard CRON specification to indicate when the event is to be published. A CRON timer never publishes events more than once per minute.
Watchdog System Monitor (IOSWD SysMon) Event Detector for Cisco IOS

The Cisco IOS watchdog system monitor event detector publishes an event when one of the following occurs:

• CPU utilization for a Cisco IOS task crosses a threshold.
• Memory utilization for a Cisco IOS task crosses a threshold.

Note
Cisco IOS processes are now referred to as tasks to distinguish them from Cisco IOS Software Modularity processes.

Two events may be monitored at the same time, and the event publishing criteria can be specified to require one event or both events to cross their specified thresholds.

Watchdog System Monitor (WDSysMon) Event Detector for Cisco IOS Software Modularity

The Cisco IOS Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.

EEM Actions Available by Cisco IOS Release

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some actions are available in every Cisco IOS release, but most actions have been introduced in a specific release. Use the table below to determine which actions are available in your specific Cisco IOS release. A blank entry (--) indicates that the action is not available; the text “Yes” indicates that the action is available. The actions shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each action, see the Embedded Event Manager Actions concept in the “Embedded Event Manager Overview” module.

### Embedded Event Manager Actions

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some EEM actions are available on every Cisco IOS release, but most EEM actions have been introduced in a specific release. For details of which EEM action is supported in each Cisco IOS release, see the EEM Actions Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM supports the following actions:

- Executing a Cisco IOS command-line interface (CLI) command.
- Generating a CNS event for upstream processing by Cisco CNS devices.
- Setting or modifying a named counter.
- Switching to a secondary processor in a fully redundant hardware configuration.
- Requesting system information when an event occurs.
- Sending a short e-mail.
- Manually running an EEM policy.
- Publishing an application-specific event.
- Reloading the Cisco software.

• Reading the state of a tracked object.
• Setting the state of a tracked object.

EEM action CLI commands contain an EEM action label that is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumerical (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumerical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

### Embedded Event Manager Environment Variables

EEM allows environment variables to be used in EEM policies. Tool Command Language (Tcl) allows global variables to be defined that are known to all procedures within a Tcl script. EEM allows environment variables to be defined using a CLI command, the `event manager environment` command, for use within an EEM policy. All EEM environment variables are automatically assigned to Tcl global variables before a Tcl script is run. There are three different types of environment variables associated with Embedded Event Manager:

- **User-defined**—Defined by you if you create an environment variable in a policy that you have written.
- **Cisco-defined**—Defined by Cisco for a specific sample policy.
- **Cisco built-in (available in EEM applets)**—Defined by Cisco and can be read only or read/write. The read only variables are set by the system before an applet starts to execute. The single read/write variable, `_exit_status`, allows you to set the exit status at policy exit for policies triggered from synchronous events.

Cisco-defined environment variables (see the table below) and Cisco system-defined environment variables may apply to one specific event detector or to all event detectors. Environment variables that are user-defined or defined by Cisco in a sample policy are set using the `event manager environment` command. Variables that are used in the EEM policy must be defined before you register the policy. A Tcl policy contains a section called “Environment Must Define” that can be defined to check that any required environment variables are defined before the policy runs.

Cisco built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write, and these variables may apply to one specific event detector or to all event detectors. For more details and a table listing the Cisco system-defined variables, see the ““Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

---

**Note**

Cisco-defined environment variables begin with an underscore character (_). We strongly recommend that customers avoid the same naming convention to prevent naming conflicts.

The table below describes the Cisco-defined variables used in the sample EEM policies. Some of the environment variables do not have to be specified for the corresponding sample policy to run and these are marked as optional.

</tr>
</tbody>
</table>
### Embedded Event Manager Policy Creation

EEM is a policy driven process in which the EEM policy engine receives notifications when faults and other events occur in the Cisco software system. Embedded Event Manager policies implement recovery based on the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

Although there are some EEM CLI configuration and `show` commands, EEM is implemented through the creation of policies. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tcl.

The creation of an EEM policy involves:

- Selecting the event for which the policy is run.
- Defining the event detector options associated with logging and responding to the event.
- Defining the environment variables, if required.
- Choosing the actions to be performed when the event occurs.

There are two ways to create an EEM policy. The first method is to write applets using CLI commands, and the second method is to write Tcl scripts. Cisco provides enhancements to Tcl in the form of Tcl command extensions that facilitate the development of EEM policies. Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. When a policy is registered with the Embedded Event Manager, the software examines the policy and registers it to be run when the specified event occurs. Policies can be unregistered or suspended. Both types of policies can be used to implement EEM in your network.

For details on writing EEM policies using the Cisco IOS CLI, go to “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

For details on writing EEM policies using Tcl, go to “Writing Embedded Event Manager Policies Using Tcl” module.

Where to Go Next

- If you want to write EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

- If you want to write EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

Feature Information for Embedded Event Manager 4.0 Overview

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 76

Information About Writing EEM Policies Using the Cisco IOS CLI

- Finding Feature Information, on page 1569
- Prerequisites for Writing EEM Policies Using the Cisco IOS CLI, on page 1569
- Information About Writing EEM Policies Using the Cisco IOS CLI, on page 1570
- How to Write EEM Policies Using the Cisco IOS CLI, on page 1581
- Configuration Examples for Writing Embedded Event Manager Policies Using Tcl, on page 1621
- Additional References, on page 1637
- Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI, on page 1639

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Writing EEM Policies Using the Cisco IOS CLI

- Before writing EEM policies, you should be familiar with the concepts explained in the “Embedded Event Manager Overview” module.
- If the action cns-event command is used, access to a Cisco Networking Services (CNS) Event gateway must be configured.
- If the action force-switchover command is used, a secondary processor must be configured on the device.
- If the action snmp-trap command is used, the snmp-server enable traps event-manager command must be enabled to permit SNMP traps to be sent from the Cisco IOS device to the SNMP server. Other relevant snmp-server commands must also be configured; for details see the action snmp-trap command page.
Information About Writing EEM Policies Using the Cisco IOS CLI

Embedded Event Manager Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

EEM Applet

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In applet configuration mode, three types of configuration statements are supported. The event commands are used to specify the event criteria to trigger the applet to run, the action commands are used to specify an action to perform when the EEM applet is triggered, and the set command is used to set the value of an EEM applet variable. Currently only the _exit_status variable is supported for the set command.

Only one event configuration command is allowed within an applet configuration. When applet configuration mode is exited and no event command is present, a warning is displayed stating that no event is associated with this applet. If no event is specified, this applet is not considered registered. When no action is associated with this applet, events are still triggered but no actions are performed. Multiple action configuration commands are allowed within an applet configuration. Use the show event manager policy registered command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

The action configuration commands are uniquely identified using the label argument, which can be any string value. Actions are sorted in ascending alphanumeric key sequence using the label argument as the sort key, and they are run using this sequence.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

EEM Script

Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM policy involves:

- Selecting the event for which the policy is run.
- Defining the event detector options associated with logging and responding to the event.
- Choosing the actions to be followed when the event occurs.
Cisco provides enhancements to Tcl in the form of keyword extensions that facilitate the development of EEM policies. The main categories of keywords identify the detected event, the subsequent action, utility information, counter values, and system information. For more details about writing EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

## Embedded Event Manager Built-In Environment Variables Used in EEM Applets

EEM built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write and these variables may apply to one specific event detector or to all event detectors. The table below lists the Cisco built-in environment variables that are read-only alphabetically by event detector and subevent.

### Table 167: EEM Built-In Environment Variables (Read Only)

## How to Write EEM Policies Using the Cisco IOS CLI

### Registering and Defining an Embedded Event Manager Applet

Perform this task to register an applet with Embedded Event Manager and to define the EEM applet using the Cisco IOS CLI **event** and **action** commands. Only one **event** command is allowed in an EEM applet. Multiple **action** commands are permitted. If no **event** and no **action** commands are specified, the applet is removed when you exit configuration mode.

The SNMP event detector and the syslog **action** commands used in this task are just representing any event detector and **action** commands. For examples using other event detectors and **action** commands, see the Embedded Event Manager Applet Configuration Examples, on page 1621.

### EEM Environment Variables

EEM environment variables for EEM policies are defined using the EEM **event manager environment** configuration command. By convention, all Cisco EEM environment variables begin with “_”. In order to avoid future conflict, customers are urged not to define new variables that start with “_”.

You can display the EEM environment variables set on your system by using the `show event manager environment` privileged EXEC command.

For example, you can create EEM policies that can send e-mails when an event occurs. The table below describes the e-mail-specific environment variables that can be used in EEM policies.

**Table 168: EEM E-mail-Specific Environmental Variables**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| _email_server        | A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail. | The e-mail server name--Mailservername-- can be in any one of the following template formats:  
  • username:password@host  
  • username@host  
  • host |
| _email_to            | The address to which e-mail is sent. | engineering@example.com |
| _email_from          | The address from which e-mail is sent. | devtest@example.com |
| _email_cc            | The address to which the e-mail is copied. | manager@example.com |

**Alphabetical Order of EEM Action Labels**

An EEM action label is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumerical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>show event manager environment [all]</td>
<td>(Optional) Displays the name and value of EEM environment variables.</td>
</tr>
<tr>
<td>variable-name</td>
<td>Example:</td>
<td>• The optional all keyword displays all the EEM environment variables.</td>
</tr>
<tr>
<td></td>
<td>Device# show event manager environment</td>
<td>• The optional variable-name argument displays information about the</td>
</tr>
<tr>
<td>all</td>
<td>all</td>
<td>specified environment variable.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>3</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>event manager environment</code> <code>variable-name</code> <code>string</code></td>
<td>Configures the value of the specified EEM environment variable.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config)# event manager environment _email_to <a href="mailto:engineering@example.com">engineering@example.com</a></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Repeat <strong>Alphabetical Order of EEM Action Labels</strong> for all the required environment variables.</td>
<td>Repeat <strong>Alphabetical Order of EEM Action Labels</strong> to configure all the environment variables required by the policy to be registered in <strong>Alphabetical Order of EEM Action Labels</strong>.</td>
</tr>
<tr>
<td>6</td>
<td><code>event manager applet</code> <code>applet-name</code></td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device(config)# event manager applet memory-fail</td>
<td></td>
</tr>
</tbody>
</table>
| 7    | Do one of the following:  
|      | • `event snmp oid` `oid-value` `get-type`  
|      |    `{exact | next}` `entry-op` `operator`  
|      |    `entry-val` `entry-value` `{exit-comb | and}` `{exit-op` `operator` `{exit-val exit-value}` `{exit-time exit-time-value}` `poll-interval` `poll-int-value`  
|      | **Example:** Device(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000 poll-interval 90 |
| 8    | `action` `label` `cli` `command` `cli-string`  
|      | `[pattern` `pattern-string`]  
|      | **Example:** Device(config-applet)# action 1.0 cli command "enable"  
|      | **Example:** Device(config-applet)# action 2.0 cli command "clear counters Ethernet0/1" pattern "confirm" |

The **pattern** keyword is optional and is used only when the command string solicits input. The **action cli command** ends when the solicited prompt as specified in the optional **pattern** keyword is received. You are required to specify a regular expression pattern that will match the next solicited prompt. Specification of an incorrect pattern will cause the **action**
### Purpose

**cli** command to wait forever until the applet execution times out due to the maxrun timer expiration.

- The action taken is to specify an EEM applet to run when the **pattern** keyword specifies the **confirm** argument for the **clear counters Ethernet0/1** command. In this case the command string solicits input, such as “confirm,” which has to be completed with a “yes” or a “no” input.

### Example

```
Device(config-applet)# action 3.0 cli command "y"
```

- The action taken is to specify an EEM applet to run when the pattern keyword specifies the confirm argument for the clear counters Ethernet0/1 command. In this case the command string solicits input, such as “confirm,” which has to be completed with a “yes” or a “no” input.

### Step 9

#### action label syslog [priority priority-level] msg msg-text facility string

- Specifies the action to be taken when an EEM applet is triggered.
- In this example, the action taken is to write a message to syslog.

#### Example

```
Device(config-applet)# action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $_snmp_oid_val bytes"
```

- The optional **priority** keyword specifies the priority level of the syslog messages. If selected, the **priority-level** argument must be defined.

- The **msg-text** argument can be character text, an environment variable, or a combination of the two.

- The **facility** keyword specifies the location of generated message

- The **string** argument can be character text, an environment variable, or a combination of the two.

### Step 10

#### action label mail server server-address to to-address from from-address [cc cc-address] subject subject body body-text

- Specifies the action of sending a short e-mail when an EEM applet is triggered.

#### Example

```
Device(config-applet)# action 2.0 mail server 192.168.1.10 to engineering@example.com from devtest@example.com subject "Memory failure" body "Memory exhausted; current available memory is $_snmp_oid_val bytes"
```

- The **server-address** argument specifies the fully qualified domain name of the e-mail server to be used to forward the e-mail.

- The **to-address** argument specifies the e-mail address where the e-mail is to be sent.

- The **from-address** argument specifies the e-mail address from which the e-mail is sent.

- The **subject** argument specifies the subject line content of the e-mail as an alphanumeric string.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The body-text argument specifies the text content of the e-mail as an alphanumeric string.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 11

Add more action commands as required.

### Step 12

**end**

**Example:**

Device(config-applet)# end

---

**Troubleshooting Tips**

Use the **debug event manager** command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution as the volume of generated output can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

---

**Registering and Defining an EEM Tcl Script**

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

**Before you begin**

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided--see the details in the Sample EEM Policies, on page 1658 to see which policies are available for the Cisco IOS release image that you are using--and these sample policies are stored in the system policy directory.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>show event manager environment [all] variable-name]</strong></td>
<td>(Optional) Displays the name and value of EEM environment variables.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show event manager environment all</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> event manager environment variable-name string</td>
<td>Configures the value of the specified EEM environment variable.</td>

<tr>
<td><strong>Example:</strong> Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Repeat <strong>Registering and Defining an EEM Tcl Script</strong> to configure all the environment variables required by the policy to be registered in <strong>Registering and Defining an EEM Tcl Script</strong>.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> event manager policy policy-filename [type {system</td>
<td>user}] [trap]</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# event manager policy tm_cli_cmd.tcl type system</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the `show event manager environment` privileged EXEC command is used to display the name and value of all EEM environment variables.

```
Device# show event manager environment all
No. Name Value
1 _cron_entry 0-59/2 0-23/1 * * 0-6
2 _show_cmd show ver
3 _syslog_pattern .*UPDOWN.*Ethernet1/0.*
4 _config_cmd1 interface Ethernet1/0
5 _config_cmd2 no shut
```
# Unregistering Embedded Event Manager Policies

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>show event manager policy registered</code></td>
<td>(Optional) Displays the EEM policies that are currently registered.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# show event manager policy registered</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The optional <code>system</code> and <code>user</code> keywords display the registered system and user policies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If no keywords are specified, EEM registered policies for all event types are displayed in time order.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>no event manager policy policy-filename</code></td>
<td>Removes the EEM policy from the configuration, causing the policy to be unregistered.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# no event manager policy IPSLAping1</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>exit</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# exit</code></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>Repeat Step 2 to ensure that the policy has been removed.</td>
<td>--</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# show event manager policy registered</code></td>
<td></td>
</tr>
</tbody>
</table>
Examples

In the following example, the `show event manager policy registered` privileged EXEC command is used to display the two EEM applets that are currently registered:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system snmp Off Fri Aug 12 17:42:52 2005 IPSLAping1
   oid (1.3.6.1.4.1.9.9.42.1.2.9.1.6.4) get-type exact entry-op eq entry-val {1}
   exit-op eq exit-val (2) poll-interval 90.000
   action 1.0 syslog priority critical msg "Server IP echo failed: OID=$_snmp_oid_val"
   action 1.1 snmp-trap strdata "EEM detected server reachability failure to 10.1.88.9"
   action 1.2 publish-event sub-system 88000101 type 1 arg1 "10.1.88.9" arg2 "IPSLAEcho"
   action 1.3 counter name _IPSLA1F op inc value 1
2 applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val (5120000)
   poll-interval 90
   action 1.0 syslog priority critical msg Memory exhausted; current available memory is
   $snmp_oid_val bytes
   action 2.0 force-switchover
```

In the following example, the `show event manager policy registered` privileged EXEC command is used to show that applet IPSLAping1 has been removed after entering the `no event manager policy` command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val (5120000)
   poll-interval 90
   action 1.0 syslog priority critical msg Memory exhausted; current available memory is
   $snmp_oid_val bytes
   action 2.0 force-switchover
```

Suspending All Embedded Event Manager Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them might be necessary for reasons of temporary performance or security.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>show event manager policy registered [description [policy-name]</td>
</tr>
<tr>
<td></td>
<td>(Optional) Displays the EEM policies that are currently registered.</td>
</tr>
<tr>
<td></td>
<td>• The optional system and user keywords display the registered system and user policies.</td>
</tr>
</tbody>
</table>
### Displaying Embedded Event Manager History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

**Procedure**

**Step 1**  
**enable**  
Enables privileged EXEC mode. Enter your password if prompted.  
**Example:**  
Device> enable

**Step 2**  
**configure terminal**  
Enters global configuration mode.  
**Example:**  
Device# configure terminal

**Step 3**  
**event manager history size** \{events | traps\} \[size\]  
Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:  
**Example:**  
Device(config)# event manager history size events 30
Step 4  exit

Exits global configuration mode and returns to privileged EXEC mode.

Example:

Device(config)# exit

Step 5  show event manager history events [detailed] [maximum number]

Use this command to display detailed information about each EEM event, for example:

Example:

Device# show event manager history events

<table>
<thead>
<tr>
<th>No.</th>
<th>Time of Event</th>
<th>Event Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fri Aug13 21:42:57 2004</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>2</td>
<td>Fri Aug13 22:20:29 2004</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>4</td>
<td>Wed Aug18 22:06:38 2004</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>5</td>
<td>Wed Aug18 22:30:58 2004</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>6</td>
<td>Wed Aug18 22:34:58 2004</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>7</td>
<td>Wed Aug18 22:51:18 2004</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>8</td>
<td>Wed Aug18 22:51:18 2004</td>
<td>application</td>
<td>applet: CustApp1</td>
</tr>
</tbody>
</table>

Step 6  show event manager history traps {server | policy}

Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy. In the following example, the EEM SNMP traps that were triggered from within an EEM policy are displayed.

Example:

Device# show event manager history traps policy

<table>
<thead>
<tr>
<th>No.</th>
<th>Time of Event</th>
<th>Trap Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Wed Aug18 22:30:58 2004</td>
<td>policy</td>
<td>EEM Policy Director</td>
</tr>
<tr>
<td>2</td>
<td>Wed Aug18 22:34:58 2004</td>
<td>policy</td>
<td>EEM Policy Director</td>
</tr>
<tr>
<td>3</td>
<td>Wed Aug18 22:51:18 2004</td>
<td>policy</td>
<td>EEM Policy Director</td>
</tr>
</tbody>
</table>

Displaying Embedded Event Manager Registered Policies

Perform this optional task to display registered EEM policies.

Procedure

Step 1  enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2  show event manager policy registered [event-type event-name] [time-ordered | name-ordered]
Use this command with the **time-ordered** keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Time</th>
<th>Registered Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>applet</td>
<td>snmp</td>
<td>Thu May30 05:57:16 2004 memory-fail</td>
<td>oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val (5120000) poll-interval 90</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 1.0 syslog priority critical msg &quot;Memory exhausted; current available memory is $_snmp_oid_val bytes&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 2.0 force-switchover</td>
</tr>
<tr>
<td>2</td>
<td>applet</td>
<td>syslog</td>
<td>Wed Jul16 00:05:17 2004 intf-down</td>
<td>pattern {.*UPDOWN.<em>Ethernet1/0.</em>)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 1.0 cns-event msg &quot;Interface state change: $_syslog_msg&quot;</td>
</tr>
</tbody>
</table>

Use this command with the **name-ordered** keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
Device# show event manager policy registered name-ordered
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Time</th>
<th>Registered Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>applet</td>
<td>syslog</td>
<td>Wed Jul16 00:05:17 2004 intf-down</td>
<td>pattern {.*UPDOWN.<em>Ethernet1/0.</em>)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 1.0 cns-event msg &quot;Interface state change: $_syslog_msg&quot;</td>
</tr>
<tr>
<td>2</td>
<td>applet</td>
<td>snmp</td>
<td>Thu May30 05:57:16 2004 memory-fail</td>
<td>oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val (5120000) poll-interval 90</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 1.0 syslog priority critical msg &quot;Memory exhausted; current available memory is $_snmp_oid_val bytes&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 2.0 force-switchover</td>
</tr>
</tbody>
</table>

Use this command with the **event-type** keyword to display information about currently registered policies for the event type specified in the **event-name** argument, for example:

**Example:**

```
Device# show event manager policy registered event-type syslog
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Time</th>
<th>Registered Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>applet</td>
<td>syslog</td>
<td>Wed Jul16 00:05:17 2004 intf-down</td>
<td>pattern {.*UPDOWN.<em>Ethernet1/0.</em>)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>action 1.0 cns-event msg &quot;Interface state change: $_syslog_msg&quot;</td>
</tr>
</tbody>
</table>

---

**Configuring Event SNMP Notification**

Perform this task to configure SNMP notifications.

**Before you begin**

- SNMP event manager must be configured using the `snmp-server manager` command.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Example: | Device> enable | |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal | |
| Step 3 | event manager applet applet-name | Registers the applet with the event manager server and enters applet configuration mode. |
| Example: | Device(config)# event manager applet snmp | |
| Step 4 | event [tag event-tag] snmp-notification oid oid-string oid-val comparison-value op operator [maxrun maxruntime-number] [src-ip-address ip-address] [dest-ip-address ip-address] [default seconds] [direction {incoming | outgoing}] [msg-op {drop | send}] | Specifies the event criteria for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP) notification. |
| Example: | Device(config-applet)# event snmp-notification dest-ip-address 192.168.1.1 oid 1 op eq oid-val 10 | |
| Step 5 | end | Exits applet configuration mode and returns to privileged EXEC mode. |
| Example: | Device(config-applet)# end | |

### Configuring Multiple Event Support

The multiple event support feature adds the ability to register multiple events in the EEM server. The multiple event support involves one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The event parameters are specified in the CLI commands. The data structure to handle multiple events contains multiple event identifiers and correlation logic. This data is used to register multiple events in the EEM Server.

### Setting the Event Configuration Parameters

The `trigger` command enters the trigger applet configuration mode and specifies the multiple event configuration statements for EEM applets. The trigger statement is used to relate multiple event statement using the `tag` argument specified in each event statement. The events are raised based on the specified parameters.
<table>

### Step 8

**action label cli command cli-string**

**Example:**

Device(config-applet)# action 1.0 cli command "show pattern"

---

### Examples

In the following example, applet is run if the **show bgp all** CLI command and any syslog message that contains the string "COUNT" occurred within a period 60 seconds.

```
event manager applet delay_50
event tag 1.0 cli pattern "show bgp all" sync yes occurs 32 period 60 maxrun 60
event tag 2.0 syslog pattern "COUNT"
  trigger occurs 1 delay 50
  correlate event 1.0 or event 2.0
  attribute tag 1.0 occurs 1
  attribute tag 2.0 occurs 1
  action 1.0 cli command "show pattern"
  action 2.0 cli command "enable"
  action 3.0 cli command "config terminal"
  action 4.0 cli command "ip route 192.0.2.0 255.255.255.224 192.0.2.12"
  action 91.0 cli command "exit"
  action 99.0 cli command "show ip route | incl 192.0.2.5"
```

### Configuring EEM Class-Based Scheduling

To schedule Embedded Event Manager (EEM) policies and set policy scheduling options, perform this task. In this task, two EEM execution threads are created to run applets assigned to the default class.

The EEM policies will be assigned a class using the **class** keyword when they are registered. EEM policies registered without a class will be assigned to the default class. Threads that have default class, will service the default class when the thread is available for work. Threads that are assigned specific class letters will service any policy with a matching class letter when the thread is available for work.

If there is no EEM execution thread available to run the policy in the specified class and a scheduler rule for the class is configured, the policy will wait until a thread of that class is available for execution. Synchronous policies that are triggered from the same input event should be scheduled in the same execution thread.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>

**Step 1**

**enable**

**Example:**

Device> enable

---

- Enables privileged EXEC mode.
- Enter your password if prompted.
### Purpose

**Command or Action**: configure terminal
**Example**: Device# configure terminal

Enters global configuration mode.

### Example

**Step 2**

```
Device# configure terminal
```

Schedules EEM policies and sets policy scheduling options.

**Step 3**

```
event manager scheduler {applet | axp | call-home} thread class class-options number thread-number
```

**Example**: Device(config)# event manager scheduler applet thread class default number 2

- In this example, two EEM execution threads are created to run applets assigned to the default class.

### Example

**Step 4**

```
ex
```

Exits global configuration mode and returns to privileged EXEC mode.

### Procedure

To hold a scheduled EEM policy event or event queue in the EEM scheduler, perform this task. In this task, all pending EEM policies are displayed. A policy identified using a job ID of 2 is held in the EEM scheduler, and the final step shows that the policy with a job ID of 2 has changed status from pending to held.

**Purpose**

**Command or Action**

**Step 1**

```
enable
```

Enables privileged EXEC mode.

**Example**

```
Device> enable
```

- Enter your password if prompted.

**Step 2**

```
show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options | detailed]
```

**Example**

```
Device# show event manager policy pending
```

Displays the pending EEM policies.

**Step 3**

```
event manager scheduler hold {all | policy job-id} [queue-type {applet | call-home | axp | script} class class-options] [processor {rp_primary | rp_standby}]
```

**Example**

```
Device# event manager scheduler hold policy 2
```

Holds a scheduled EEM policy event or event queue in the EEM scheduler.

- In this example, a policy with a job ID of 2 is put on hold.
### Resuming Execution of EEM Policy Events or Event Queues

To resume the execution of specified EEM policies, perform this task. In this task, the policy that was put on hold in the Holding a Scheduled EEM Policy Event or Event Queue task is now allowed to resume execution.

#### Procedure

<table>
<thead>

</tr>
<tr>
<td>Device# event manager scheduler release policy</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to view all pending EEM policies and to hold the EEM policy with a job ID of 2.

Device# show event manager policy pending
no. job id status time of event event type name
1  1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2  2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3  3 pend Thu Sep 7 02:54:04 2006 syslog applet: three

Device# event manager scheduler hold policy 2
Device# show event manager policy pending
no. job id status time of event event type name
1  1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2  2 held Thu Sep 7 02:54:04 2006 syslog applet: two
3  3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
### Clearing Pending EEM Policy Events or Event Queues

Perform this task to clear EEM policies that are executing or pending execution. In this task, the EEM policy with a job ID of 2 is cleared from the pending queue. The `show event manager policy pending` command is used to display the policies that are pending before and after the policy is cleared.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  Example:
  Device> enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> show event manager policy pending</td>
<td>Displays the pending EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager scheduler clear {all</td>
<td>policy job-id</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# event manager scheduler clear policy 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> show event manager policy pending</td>
<td>Displays all the pending EEM policies except the policy cleared in Step 3.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to clear the EEM policy with a job ID of 2 that was pending execution. The `show` commands are used to display the policies that are pending before and after the policy is cleared.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep  7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep  7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep  7 02:54:04 2006 syslog applet: three

Device# event manager scheduler clear policy 2
Device# show event manager policy pending
```

### Modifying the Scheduling Parameters of EEM Policy Events or Event Queues

To modify the scheduling parameters of the EEM policies, perform this task. The `show event manager policy pending` command displays policies that are assigned to the B or default class. All the currently pending
policies are then changed to class A. After the configuration modification, the `show event manager policy pending` command shows all policies assigned as class A.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Displays the pending EEM policies. |
| `show event manager policy pending` | Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |
| **Example:**      |         |
| `Device# show event manager policy pending` |         |

| **Step 3**        | Modifies the scheduling parameters of the EEM policies. |
| `event manager scheduler modify {all | policy job-id | queue-type {applet | call-home | axp | script} | class class-options} | queue-priority {high | last | low | normal} | processor {rp_primary | rp_standby}]` | • In this example, all currently pending EEM policies are assigned to class A. |
| **Example:**      |         |
| `Device# event manager scheduler modify all class A` |         |

| **Step 4**        | Displays the EEM policies modified in Step 3 along with other pending policies. |
| `show event manager policy pending` | Note Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference. |
| **Example:**      |         |
| `Device# show event manager policy pending` |         |

### Examples

The following example shows how to modify the scheduling parameters of the EEM policies. In this example, the `show event manager policy pending` command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the `show event manager policy pending` command verifies that all policies are now assigned as class A.

```
Device# show event manager policy pending
no. class status time of event event type name
1  default pend Thu Sep 7  02:54:04 2006 syslog applet: one
2  default pend Thu Sep 7  02:54:04 2006 syslog applet: two
```
Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the `show event manager policy active` command.

**Procedure**

```
show event manager policy active [queue-type {applet | call-home | axp | script} class class-options | detailed]
```

This command displays only the running EEM policies. This command includes `class`, `detailed` and `queue-type` optional keywords. The following is sample output from this command:

**Example:**

```
Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct 29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct 29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct 29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct 29 20:49:59 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
6 125852 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
7 125853 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
8 125854 N A running Mon Oct 29 21:11:10 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
9 125855 N A running Mon Oct 29 21:11:10 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
10 125856 N A running Mon Oct 29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
11 125857 N A running Mon Oct 29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
12 125858 N A running Mon Oct 29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
```

Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the `show event manager policy active` command.

**Procedure**

```
show event manager policy active [queue-type {applet | call-home | axp | script} class class-options | detailed]
```

This command displays only the running EEM policies. This command includes `class`, `detailed` and `queue-type` optional keywords. The following is sample output from this command:

**Example:**

```
Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct 29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct 29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct 29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct 29 20:49:59 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
6 125852 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
7 125853 N A running Mon Oct 29 21:11:09 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
8 125854 N A running Mon Oct 29 21:11:10 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
9 125855 N A running Mon Oct 29 21:11:10 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
10 125856 N A running Mon Oct 29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
11 125857 N A running Mon Oct 29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
12 125858 N A running Mon Oct 29 21:11:11 2007 counter WDOG_SYSLG_CNTR_TRACK_INTF_APPL
```
Verifying Pending EEM Policies

To verify the EEM policies that are pending for execution, use the `show event manager policy pending` command. Use the optional keywords to specify EEM class-based scheduling options.

Procedure

```
show event manager policy pending [queue-type {applet|call-home | axp | script} class class-options | detailed]
```

This command displays only the pending policies. This command includes class, detailed and queue-type optional keywords. The following is sample output from this command:

Example:

```
Device# show event manager policy pending
no. job id p s status time of event event type name
1 12851 N A pend Mon Oct29 20:51:18 2007 timer watchdog loop.tcl
2 12868 N A pend Mon Oct29 20:51:24 2007 timer watchdog loop.tcl
3 12873 N A pend Mon Oct29 20:51:27 2007 timer watchdog loop.tcl
4 12907 N A pend Mon Oct29 20:51:41 2007 timer watchdog loop.tcl
5 13100 N A pend Mon Oct29 20:52:55 2007 timer watchdog loop.tcl
```

Configuring EEM Applet (Interactive CLI) Support

The synchronous applets are enhanced to support interaction with the local console (tty) using two commands, `action gets` and `action puts`, and these commands allow users to enter and display input directly on the console. The output for synchronous applets will bypass the system logger. The local console will be opened by the applets and serviced by the corresponding synchronous Event Detector pty. Synchronous output will be directed to the opened console.

Reading and Writing Input from the Active Console for Synchronous EEM Applets

Use the following tasks to implement EEM applet interactive CLI support:
Reading Input from the Active Console

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event_reqinfo call, and store the given console information for use by the `action gets` command.

The `action gets` command reads a line of the input from the active console and stores the input in the variable. The trailing new line will not be returned.

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; <code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>event manager applet applet-name</code></td>
<td>Registers the applet with the EEM and enters applet configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# <code>event manager applet action</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>event none</code></td>
<td>Specifies that an EEM policy is to be registered with the EEM and can be run manually.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-applet)# <code>event none</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>action label gets variable</code></td>
<td>Gets input from the local console in a synchronous applet and stores the value in the given variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-applet)# <code>action label2 gets input</code></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>action label syslog [priority priority-level] msg msg-text</code></td>
<td>Specifies the action to be taken when an EEM applet is triggered.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>• In this example, the action to be taken is to write the value of the variable specified in Step 5, to syslog.</td>
</tr>
<tr>
<td></td>
<td>Device(config-applet)# <code>action label3 syslog msg &quot;Input entered was &quot;$input&quot;&quot;</code></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td><code>exit</code></td>
<td>Exits applet configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-applet)# <code>exit</code></td>
<td></td>
</tr>
</tbody>
</table>
Example
The following example shows how to get the input from the local tty in a synchronous applet and store the value

Device(config)# event manager applet action
Device(config-applet)# event none
Device(config-applet)# action label2 gets input
Device(config-applet)# action label3 syslog msg "Input entered was \\
"$input\\"

Writing Input to the Active Console
When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event_reqinfo call, and store the given console information for use by the action puts command.

The action puts command will write the string to the active console. A new line will be displayed unless the newline keyword is specified. The output from the action puts command for a synchronous applet is displayed directly to the console, bypassing the system logger. The output of the action puts command for an asynchronous applet is directed to the system logger.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>event manager applet  applet-name</td>
<td>Registers the applet with the EEM and enters applet configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# event manager applet action</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>event none</td>
<td>Specifies that an EEM policy is to be registered with the EEM and can be run manually.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-applet)# event none</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>action label regexp string-pattern string-input [string-match [string-submatch1] [string-submatch2] [string-submatch3]]</td>
<td>Specifies the action to match the regular expression pattern on an input string when an EEM applet is triggered.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-applet)# action 1 regexp &quot;(.<em>) (.</em>) (.*)&quot; &quot;one two three&quot; _match _sub1</td>
<td>Specifies the action of printing data directly to the local console when an EEM applet is triggered.</td>
</tr>
<tr>
<td></td>
<td>• The <strong>nonewline</strong> keyword is optional and is used to suppress the display of the new line character.</td>
</tr>
</tbody>
</table>

#### Step 6

**action label puts [nonewline] string**

**Example:**

Device(config-applet)# action 2 puts "match is $_match"

#### Step 7

**exit**

**Example:**

Device(config-applet)# exit

#### Step 8

**event manager run applet-name**

**Example:**

Device# event manager run action

### Example

The following example shows how the **action puts** command prints data directly to the local console:

Device(config-applet)# event manager applet puts
Device(config-applet)# event none
Device(config-applet)# action 1 regexp "(.*) (.*) (.*)" "one two three" _match _sub1
Device(config-applet)# action 2 puts "match is $_match"
Device(config-applet)# action 3 puts "submatch 1 is $_sub1"
Device# event manager run puts
match is one two three
submatch 1 is one

### Configuring SNMP Library Extensions

Depending on your release, the SNMP Library Extensions feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.
SNMP Get and Set Operations

The SNMP Library Extensions feature extends the EEM applet action info and Tcl sys_reqinfo_snmp commands to include functionality for SNMP get-one, get-next, getid and set-any operations.

SNMP Get Operation

The SNMP event manager performs the SNMP get operation to retrieve one or more variables for the managed objects. Using the action info type snmp oid get-type and action info type snmp getid commands, you can configure the SNMP event manager to send an SNMP get request by specifying the variables to retrieve, and the IP address of the agent.

For example, if you want to retrieve the variable with the OID value of 1.3.6.1.2.1.1.1, you should specify the variable value, that is 1.3.6.1.2.1.1.1. If the specified values do not match, a trap will be generated and an error message will be written to the syslog history.

The action info type snmp oid get-type command specifies the type of the get operation to be performed. To retrieve the exact variable, the get operation type should be specified as exact. To retrieve a lexicographical successor of the specified OID value, the get operation type should be set to next.

The table below shows the built-in variables, in which the values retrieved from SNMP get operation are stored.

Table 169: Built-in Variables for action info type snmp oid Command

<table>
<thead>
<tr>
<th>Built-in Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_oid</td>
<td>The SNMP object ID.</td>
</tr>
<tr>
<td>_info_snmp_value</td>
<td>The value string of the associated SNMP data element.</td>
</tr>
</tbody>
</table>

GetID Operation

The action info type snmp getid command retrieves the following variables from the SNMP entity:

- sysDescr.0
- sysObjectID.0
- sysUpTime.0
- sysContact.0
- sysName.0
- sysLocation.0

The table below shows the built-in variables, in which the values retrieved from the SNMP getID operation are stored.

Table 170: Built-in Variables for action info type snmp getid Command

<table>
<thead>
<tr>
<th>Built-in Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_syslocation_oid</td>
<td>The OID value of the sysLocation variable.</td>
</tr>
<tr>
<td>_info_snmp_syslocation_value</td>
<td>The value string for the sysLocation variable.</td>
</tr>
</tbody>
</table>
### SNMP Set Operation

All SNMP variables are assigned a default value in the MIB view. The SNMP event manager can modify the value of these MIB variables through set operation. The set operation can be performed only on the system that allows read-write access.

To perform a set operation, you must specify the type of the variable and the value associated with it.

The table below shows the valid OID types and values for each OID type.

**Table 171: OID Type and Value for Set Operation**

<table>
<thead>
<tr>
<th>OID Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counter32</td>
<td>A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>gauge</td>
<td>A 32-bit number with a minimum value of 0. For example, the interface speed on a device is measured using a gauge object type. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>integer</td>
<td>A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a device interface, 1 represents up and 2 represents down. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>ipv4</td>
<td>IP version 4 address. IPv4 address in dotted decimal notation is valid.</td>
</tr>
<tr>
<td>octet string</td>
<td>An octet string in hexadecimal notation used to represent physical addresses. Text strings are valid.</td>
</tr>
<tr>
<td>OID Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>string</td>
<td>An octet string in text notation used to represent text strings. Text strings are valid.</td>
</tr>
<tr>
<td>unsigned32</td>
<td>A 32-bit number used to represent decimal value. Unsigned integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
</tbody>
</table>

The set operation can be carried out on both local and remote hosts.

**SNMP Traps and Inform Requests**

Traps are SNMP notifications that alert the SNMP manager or the NMS to a network condition.

SNMP inform requests refer to the SNMP notifications that alert the SNMP manager to a network condition and request for confirmation of receipt from the SNMP manager.

An SNMP event occurs when SNMP MIB object ID values are sampled, or when the SNMP counter crosses a defined threshold. If the notifications are enabled and configured for such events, the SNMP traps or inform messages generated. An SNMP notification event is triggered when an SNMP trap or inform message is received by the event manager server.

To send an SNMP trap or inform message when an Embedded Event Manager (EEM) applet is triggered, the `action info type snmp trap` and `action info type snmp inform` commands are used. The `CISCO-EMBEDDED-EVENT-MGR-MIB.my` is used to define the trap and inform messages.

**Configuring EEM Applet for SNMP Get and Set Operations**

While registering a policy with the event manager server, the actions associated with an SNMP event can be configured.

Perform this task to configure EEM applet for SNMP set and get operations.

**Before you begin**

- SNMP event manager must be configured using the `snmp-server manager` command.
- The SNMP community string should be set by using the `snmp-server community` command to enable access to the SNMP entity.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Register the applet with the event manager server and enters applet configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager applet snmp</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

Do one of the following:

- `event snmp oid oid-value get-type {exact | next} entry-op operator entry-val entry-value [exit-comb | and] [exit-op operator] [exit-val exit-value] [exit-time exit-time-value] poll-interval poll-int-value`

**Example:**

Device(config-applet)# event snmp oid

**Example:**

1.3.6.1.4.1.9.9.48.1.1.6.1 get-type exact

**Example:**

entry-op lt entry-val 5120000
poll-interval 90

| **Step 5** |  |
| action label info type snmp oid oid-value get-type {exact | next} [community community-string] [ipaddr ip-address] | Specifies the type of get operation to perform. |

**Example:**

Device(config-applet)# action 1.3 info type

**Example:**

snmp oid 1.3.6.1.4.1.9.9.48.1.1.6.1 get-type

**Example:**

exact community public ipaddr 172.17.16.69

| **Step 6** |  |
| action label info type snmp oid oid-value set-type oid-type oid-type-value community community-string [ipaddr ip-address] | (Optional) Specifies the variable to be set. |

**Example:**

Device(config-applet)# action 1.4 info type

**Note**

For set operation, you must specify the SNMP community string.
### Configuring EEM Applet for SNMP OID Notifications

Perform this task to configure SNMP notifications.

**Before you begin**

- SNMP event manager must be configured using the `snmp-server manager` command and SNMP agents must be configured to send and receive SNMP traps generated for an EEM policy.
- SNMP traps and informs must be enabled by using the `snmp-server enable traps event-manager` and `snmp-server enable traps` commands, to allow traps and inform requests to be sent from the device to the event manager server.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

**Purpose of Command or Action**

- **Command or Action:** Example:
  - `snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 set-type`  
  - `integer 42220 sysName.0 community rw ipaddr`  
  - `172.17.16.69`
  - `action label info type snmp getid oid-value`  
  - `community community-string`  
  - `ipaddr ip-address`
  - `Device(config-applet)# action 1.3 info type`  
  - `snmp getid community public ipaddr 172.17.16.69`
  - `exit`  
  - `Device(config)# exit`

---

(Optional) Specifies if the individual variables should be retrieved by the getid operation.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Registers the applet with the event manager server and enters applet configuration mode.</td>
</tr>

<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| `generic-trapnum  generic-trap-number` | • In this example, the `authenticationFailure` trap is generated.  
**Note** The specific trap number refers to the enterprise-specific trap, which is generated when an enterprise event occurs. If the generic trap number is not set to 6, the specific trap number you specify will be used to generate traps. |
| `specific-trapnum  specific-trap-number` |
| `trap-oid  trap-oid-value  trap-var` |

**Example:**

Device(config-applet)# action 1.4 info type

**Example:**

snmp trap enterprise-oid 1.3.6.1.4.1.1

**Example:**

generic-trapnum 4 specific-trapnum 7

**Example:**

1.3.6.1.4.1.1.226.0.2.1 trap-var sysUpTime.0

| Step 7 | action label info type snmp inform `trap-oid  trap-oid-value  trap-var` `trap-variable` community `community-string` ipaddr `ip-address`
|--------|-------------------------------------------------------------|

**Example:**

Device(config-applet)# action 1.4 info type

**Example:**

snmp inform trap-oid 1.3.6.1.4.1.1.226.0.2.1

**Example:**

trap-var sysUpTime.0 community public ipaddr

**Example:**

172.69.16.2

| Step 8 | exit
|--------|-------------------------------------------------------------|

**Example:**

Device(config)# exit

Generates an SNMP inform request when the EEM applet is triggered.  
• In this example, the inform request is generated for the `sysUpTime.0` variable.

Exits global configuration mode and returns to privileged mode.
Configuring Variable Logic for EEM Applets

The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Before variable logic is introduced, applets have a linear structure where each action is executed in the order in which they are configured when the event is triggered. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions. Each control structure can contain a list of applet actions including looping and if/else actions which determine if the structure is executed or not.

The information in applet configuration mode is presented as background to set the context for the action commands.

To provide a consistent user interface between the Tool Command Language (Tcl) and the applet (CLI) based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl based implementation.
- Event specification data is written using the CLI applet submode configuration statements in the applet-based implementation.

Applet configuration mode is entered using the event manager applet command. In applet configuration mode the config prompt changes to (config-applet)#. In applet configuration mode two types of config statements are supported:

- event - used to specify the event criteria to cause this applet to run.
- action - used to specify a built-in action to perform.

Multiple action applet config commands are allowed within an applet configuration. If no action applet config command is present, a warning is displayed, upon exit, stating no statements are associated with this applet. When no statements are associated with this applet, events get triggered but no action is taken. If no commands are specified in applet configuration mode, the applet will be removed upon exit. The exit applet config command is used to exit from applet configuration mode.

Depending on your release, the Variable Logic for EEM Applets feature allows you to perform the following configurations.

Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

Configuring Variable Logic for EEM Applets

EEM 3.0 adds new applet action commands to permit simple variable logic within applets.

To configure the variable logic using action commands perform the following tasks.

Specifying a Loop of Conditional Blocks

To specify a loop of a conditional block when an EEM applet is triggered, perform this task. In this task, a conditional loop is set to check if the value of the variable is less than 10. If the value of the variable is less than 10, then the message ‘i is $_i’ is written to the syslog.
Depending on your release, the `set` (EEM) command is replaced by the `action set` command. See the `action label set` command for more information. If the `set` (EEM) command is entered in certain releases, the IOS parser translates the `set` command to the `action label set` command.

## Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager applet <strong>applet-name</strong></td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# event manager applet condition</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> action <strong>label</strong> set</td>
<td>Sets an action for the event.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-applet)#action 1.0 set i 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> action <strong>label</strong> while <strong>string_op1</strong> operator <strong>string_op2</strong></td>
<td>Specifies a loop of a conditional block.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-applet)# action 2 while $i lt 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> Add any action as required.</td>
<td>Performs the action as indicated by the action command.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-applet)# action 3 syslog msg &quot;$i is $_i$&quot;</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> action <strong>label</strong> end</td>
<td>Exits from the running action.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-applet)# action 3 end</td>
<td></td>
</tr>
</tbody>
</table>
Specifying if else Conditional Blocks

To specify the beginning of an if conditional statement followed by an else conditional statement, perform this task. The if or else conditional statements can be used in conjunction with each other or separately. In this task, the value of a variable is set to 5. An if conditional block is then specified to check if the value of the variable is less than 10. Provided the if conditional block is satisfied, an action command to output the message ‘x is less than 10’ is specified.

Following the if conditional block, an else conditional block is specified. Provided the if conditional block is not satisfied, an action command to output the message ‘x is greater than 10’ is specified.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>event manager applet <em>applet-name</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# event manager applet ifcondition</td>
</tr>
<tr>
<td></td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>action <em>label</em> <em>set</em> <em>variable-name</em> <em>variable-value</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-applet)# action 1.0 set x 5</td>
</tr>
<tr>
<td></td>
<td>Sets an action for the event.</td>
</tr>
<tr>
<td></td>
<td>• In this example, the value of the variable x is set to 5.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>action <em>label</em> if [stringop1] {eq</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-applet)# action 2.0 if $x lt 10</td>
</tr>
<tr>
<td></td>
<td>Specifies an if conditional statement.</td>
</tr>
<tr>
<td></td>
<td>• In this example, an if conditional statement to check if the value of the variable is less than 10.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Add any action as required.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-applet)# action 3.0 puts &quot;$x is less than 10&quot;</td>
</tr>
<tr>
<td></td>
<td>Performs the action as indicated by the action command.</td>
</tr>
<tr>
<td></td>
<td>• In this example, the message ‘5 is less than 10’ is displayed on the screen.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 7</th>
<th>action label else</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-applet)# action 4.0 else</td>
</tr>
</tbody>
</table>

Specifies an else conditional statement.

### Purpose

- Performs the action as indicated by the action command.
  - In this example, the message ‘5 is greater than 10’ is displayed on the screen.

<table>
<thead>
<tr>
<th>Step 8</th>
<th>Add any action as required.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-applet)# action 5.0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-applet)# end</td>
</tr>
</tbody>
</table>

Exits from the running action.

---

### Specifying foreach Iterating Statements

To specify a conditional statement that iterates over an input string using the delimiter as a tokenizing pattern, perform this task. The foreach iteration statement is used to iterate through a collection to get the desired information. The delimiter is a regular expression pattern string. The token found in each iteration is assigned to the given iterator variable. All arithmetic calculations are performed as long integers with out any checks for overflow. In this task, the value of the variable x is set to 5. An iteration statement is set to run through the input string red, blue, green, orange. For every element in the input string, a corresponding message is displayed on the screen.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

Enables privileged EXEC mode.
  - Enter your password if prompted.

<table>
<thead>
<tr>
<th>Step 2</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
</tbody>
</table>

Enters global configuration mode.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>event manager applet applet-name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# event manager applet iteration</td>
</tr>
</tbody>
</table>

Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>action label foreach [string-iterator] [string-input] [string-delimiter]</th>
</tr>
</thead>
</table>

Iterates over an input string using the delimiter as a tokenizing pattern.
Using Regular Expressions

To match a regular expression pattern with an input string, perform this task. Using regular expressions, you can specify the rules for a set of possible strings to be matched.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td>event manager applet applet-name</td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager applet regexp</td>
<td></td>
</tr>
</tbody>
</table>
### Incrementing the Values of Variables

To increment the value of variables, perform this task. In this task, the value of a variable is set to 20 and then the value is incremented by 12.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable           | Enables privileged EXEC mode.  
  
  - Enter your password if prompted. |
|      |                  |         |
| 2    | configure   terminal | Enters global configuration mode. |
|      |                  |         |
| 3    | event manager applet  applet-name | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode. |
|      |                  |         |
| 4    | action label set | Sets an action for the event.  
  
  - In this example, the value of the variable is set to 20. |
|      |                  |         |
| 5    | action label increment variable-name long-integer | Increments the value of variable by the specified long integer.  
  
  - In this example, the value of the variable is incremented by 12. |

#### Example:

- **Step 1:**
  
  ```
  Device> enable
  ```

- **Step 2:**
  
  ```
  Device# configure terminal
  ```

- **Step 3:**
  
  ```
  Device(config)# event manager applet increment
  ```

- **Step 4:**
  
  ```
  Device(config-applet)# action 1.0 set varname 20
  ```

- **Step 5:**
  
  ```
  Device(config-applet)# action 2.0 increment varname 12
  ```
Configuring Event SNMP Object

Perform this task to register the Simple Network Management Protocol (SNMP) object event for an Embedded Event Manager (EEM) applet that is run by sampling SNMP object.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager applet <code>applet-name</code></td>
<td>Registers the applet with the Embedded Event Manager and enters applet configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager applet manual-policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `event snmp-object oid oid-value type value sync [yes</td>
<td>no] skip [yes</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-applet)# event snmp-object oid 1.9.9.9.9 type gauge sync yes</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>action 1 syslog msg &quot;oid - $snmp_oid&quot;</td>
<td></td>
</tr>
<tr>
<td>action 2 syslog msg &quot;request - $snmp_request&quot;</td>
<td></td>
</tr>
<tr>
<td>action 3 syslog msg &quot;request_type - $snmp_request_type&quot;</td>
<td></td>
</tr>
</tbody>
</table>

- The `oid` keyword specifies the SNMP object identifier (object ID).
- The `oid-value` argument can be the Object ID value of the data element, in SNMP dotted notation. An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value.
- The `istable` keyword specifies whether the OID is an SNMP table.
- The `sync` keyword specifies that the applet is to run in synchronous mode. The return code from the applet indicates whether to reply to the SNMP request. The description for code 0 is “do not reply to the request”
and the description for code 1 is “reply to the request”. When the return code from the applet replies to the request, a value is specified in the applet for the object using `action snmp-object-value` command.

- The `type` keyword specifies the type of object.
- The `value` argument is the value of the object.
- The `skip` keyword specifies whether to skip CLI command execution.
- The `default` keyword specifies the time to process the SET or GET request normally by the applet. If the `default` keyword is not specified, the default time period is set to 30 seconds.
- The `milliseconds` argument is the time period during which the SNMP Object event detector waits for the policy to exit.
- The `maxrun` keyword specifies the maximum runtime of the applet. If the `maxrun` keyword is specified, the `maxruntime-number` value must be specified. If the `maxrun` keyword is not specified, the default applet run time is 20 seconds.
- The `milliseconds` argument is the maximum runtime of the apple in milliseconds. If the argument is not specified, the default 20-second run-time limit is used.

### Step 5

**Example:**

```
Device(config)# exit
```

Exits global configuration mode and returns to privileged EXEC mode.

---

**Disabling AAA Authorization**

Perform this task to allow EEM policies to bypass AAA authorization when triggered.
## Configuring Description of an Embedded Event Manager Applet

Perform this task to describe an EEM applet. The description of an applet can be added in any order, before or after any other applet configuration. Configuring a new description for an applet that already has a description overwrites the current description. An applet description is optional.

Perform this task to configure a new description for an applet.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager applet <strong>applet-name</strong> [authorization bypass] [class <strong>class-options</strong>] [trap]</td>
<td>Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# event manager applet one class A authorization bypass</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits device configuration applet mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-aaplet)# exit</td>
<td></td>
</tr>
</tbody>
</table>
## Embedded Event Manager Applet Configuration Examples

The following examples show how to create an EEM applet for some of the EEM event detectors. These examples follow steps outlined in the Registering and Defining an Embedded Event Manager Applet, on page 1581.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|        | event manager applet  
**Example:**
Device(config)# event manager applet increment | Registers the applet with the EEM and enters applet configuration mode. |

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|        | description line  
**Example:**
Device(config-applet)# description "This applet looks for the word count in syslog messages" | Adds or modifies the description of an EEM applet that is run by sampling Simple Network Management Protocol (SNMP). |

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|        | event syslog pattern regular-expression  
**Example:**
Device(config-applet)# event syslog pattern "count" | Specifies the event criteria for an Embedded Event Manager (EEM) applet that is run by matching syslog messages. |

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|        | action label syslog msg msg-text  
**Example:**
Device(config-applet)# action 1 syslog msg hi | Specifies the action to be taken when an EEM applet is triggered.  
- In this example, the action taken is to write a message to syslog.  
- The msg-text argument can be character text, an environment variable, or a combination of the two. |

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|        | end  
**Example:**
Device(config-applet)# end | Exits applet configuration mode and returns to privileged EXEC mode. |
Application-Specific Event Detector

The following example shows how a policy named EventPublish_A runs every 20 seconds and publishes an event type numbered 1 to an EEM subsystem numbered 798. The subsystem value of 798 specifies that a publish event has occurred from an EEM policy. A second policy named EventPublish_B is registered to run when the EEM event type 1 occurs with subsystem 798. When the EventPublish_B policy runs, it sends a message to syslog containing data passed as an argument from the EventPublish_A policy.

```
event manager applet EventPublish_A
  event timer watchdog time 20.0
  action 1.0 syslog msg "Applet EventPublish_A"
  action 2.0 publish-event sub-system 798 type 1 arg1 twenty
  exit

event manager applet EventPublish_B
  event application sub-system 798 type 1
  action 1.0 syslog msg "Applet EventPublish_B arg1 $_application_data1"
```

CLI Event Detector

The following example shows how to specify an EEM applet to run when the Cisco IOS write memory CLI command is run. The applet provides a notification that this event has occurred via a syslog message. In the example, the sync keyword is configured with the yes argument, and this means that the event detector is notified when this policy completes running. The exit status of the policy determines whether the CLI command will be executed. In this example, the policy exit status is set to one and the CLI command runs.

```
event manager applet cli-match
  event cli pattern "write mem.*" sync yes
  action 1.0 syslog msg "$cli_msg Command Executed"
  set 2.0 _exit_status 1
```

The following example shows an applet which matches the cli pattern with the test argument. When show access-list test is entered, the CLI event detector matches the test argument, and the applet is triggered. The debug event manager detector cli output is added to show num_matches is set to one.

```
! event manager applet EEM-PIPE-TEST
  event cli pattern "test" sync yes
  action 1.0 syslog msg "Pattern matched!"
```

```
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: command_string=show access-lists test
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: num_matches = 1, response_code = 4
```

| Note |
The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe (|) character when redirection is used. |

The following example shows that when show version | include test is entered, the applet fails to trigger because the CLI event detector does not match on characters entered after the pipe (|) character and the debug event manager detector cli output shows num_matches is set to zero.

```
```
Counter Event Detector and Timer Event Detector

The following example shows that the EventCounter_A policy is configured to run once a minute and to increment a well-known counter called critical_errors. A second policy--EventCounter_B--is registered to be triggered when the well-known counter called critical_errors exceeds a threshold of 3. When the EventCounter_B policy runs, it resets the counter to 0.

```plaintext
event manager applet EventCounter_A
  event timer watchdog time 60.0
  action 1.0 syslog msg "EventCounter_A"
  action 2.0 counter name critical_errors op inc value 1
  exit

event manager applet EventCounter_B
  event counter name critical_errors entry-op gt entry-val 3 exit-op lt exit-val 3
  action 1.0 syslog msg "EventCounter_B"
  action 2.0 counter name critical_errors op set value 0
```

Interface Counter Event Detector

The following example shows how a policy named EventInterface is triggered every time the receive_throttle counter for Fast Ethernet interface 0/0 is incremented by 5. The polling interval to check the counter is specified to run once every 90 seconds.

```plaintext
event manager applet EventInterface
  event interface name FastEthernet0/0 parameter receive_throttle entry-op ge entry-val 5
    entry-val-is-increment true poll-interval 90
  action 1.0 syslog msg "Applet EventInterface"
```

Resource Event Detector

The following example shows how to specify event criteria based on an ERM event report for a policy defined to report high CPU usage:

```plaintext
event manager applet policy-one
  event resource policy cpu-high
  action 1.0 syslog msg "CPU high at @_resource_current_value percent"
```

RF Event Detector

The RF event detector is only available on networking devices that contain dual Route Processors (RPs). The following example shows how to specify event criteria based on an RF state change notification:

```plaintext
event manager applet start-rf
  event rf event rf_prog_initialization
  action 1.0 syslog msg "rf state rf_prog_initialization reached"
```

RPC Event Detector

The RPC event detector allows an outside entity to make a Simple Object Access Protocol (SOAP) request to the device and invokes a defined EEM policy or script. The following example shows how an EEM applet called Event_RPC is being registered to run an EEM script:

```plaintext
event manager applet Event_RPC
  event rpc
  action print puts "hello there"
```
The following example shows the format of the SOAP request and reply message:

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP:Body>
    <run_eemscript>
      <script_name>Event_RPC</script_name>
    </run_eemscript>
  </SOAP:Body>
</SOAP:Envelope>
```

```xml
```

**SNMP Event Detector**

The following example shows how to specify an EEM applet to run when the CPU usage is greater than 75 percent. When the EEM applet runs, the CLI commands `enable` and `show cpu processes` are run, and an e-mail containing the result of the `show cpu processes` command is sent to an engineer.

```plaintext
event manager applet snmpcpuge75
  event snmp oid 1.3.6.1.4.1.9.9.109.1.1.1.1.3.1 get-type exact entry-op ge entry-val 75
  poll-interval 10
  action 1.0 cli command "enable"
  action 2.0 cli command "show process cpu"
  action 3.0 mail server "192.168.1.146" to "engineer@cisco.com" from "devtest@cisco.com"
  subject "B25 PBX Alert" body "$_cli_result"
```

The next example is more complex and shows how to configure an EEM applet that causes a switch to the secondary (redundant) Route Processor (RP) when the primary RP runs low on memory.

This example illustrates a method for taking preventative action against a software fault that causes a memory leak. The action taken here is designed to reduce downtime by switching over to a redundant RP when a possible memory leak is detected.

The figure below shows a dual RP device that is running an EEM image. An EEM applet has been registered through the CLI using the `event manager applet` command. The applet will run when the available memory on the primary RP falls below the specified threshold of 5,120,000 bytes. The applet actions are to write a message to syslog that indicates the number of bytes of memory available and to switch to the secondary RP.

**Figure 114: Dual RP Topology**

The commands used to register the policy are shown below.

```plaintext
event manager applet memory-demo
  event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000
  poll-interval 90
  action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
The registered applet is displayed using the `show event manager policy registered` command:

```
Device# show event manager policy registered
No. Type Event Type Time Registered Name
1   applet  snmp  Thu Jan 30  05:57:16 2003 memory-demo
   event oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val {5120000}
   poll-interval 90
   action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
   $snmp_oid_val bytes"
   action 2.0 force-switchover
```

For the purpose of this example, a memory depletion is forced on the device, and a series of `show memory` commands are executed to watch the memory deplete:

```
Device# show memory
  Head  Total (b)  Used (b)  Free (b)  Lowest (b)  Largest (b)
Processor  53585260  212348444  119523060  92825384  92825384  92365916
Fast  53565260  131080  70360  60720  60720  60668
Device# show memory
  Head  Total (b)  Used (b)  Free (b)  Lowest (b)  Largest (b)
Processor  53585260  212364664  164509492  47855172  47855172  47169340
Fast  53565260  131080  70360  60720  60720  60668
Device# show memory
  Head  Total (b)  Used (b)  Free (b)  Lowest (b)  Largest (b)
Processor  53585260  212369492  179488300  32881192  32881192  32127556
Fast  53565260  131080  70360  60720  60720  60668
```

When the threshold is reached, an EEM event is triggered. The applet named memory-demo runs, causing a syslog message to be written to the console and a switch to be made to the secondary RP. The following messages are logged:

```
00:08:31: %HA_EM-2-LOG: memory-demo: Memory exhausted; current available memory is
4484196 bytes
00:08:31: %HA_EM-6-FMS_SWITCH_HARDWARE: fh_io_msg: Policy has requested a hardware
switchover
```

The following is partial output from the `show running-config` command on both the primary RP and the secondary (redundant) RP:

```
redundancy
  mode sso
  .
  .
  !
event manager applet memory-demo
  event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val
      5120000 poll-interval 90
  action 1.0 syslog priority critical msg "Memory exhausted; current available memory
      is $snmp_oid_val bytes"
  action 2.0 force-switchover
```

**SNMP Notification Event Detector**

The following example shows how to configure the `snmp-server community` public RW and `snmp-server manager` commands before `event snmp-notification` is configured.
The following example shows how an EEM applet called SNMP_Notification is being registered to run an EEM script when the device receives an SNMP notification on destination IP address 192.168.1.1 for object ID 1 whose value equals 10.

```plaintext
event manager applet SNMP_Notification
  event snmp-notification dest_ip_address 192.168.1.1 oid 1 op eq oid-value 10
  action 1 policy eem_script
```

**Syslog Event Detector**

The following example shows how to specify an EEM applet to run when syslog identifies that Ethernet interface 1/0 is down. The applet sends a message about the interface to syslog.

```plaintext
event manager applet interface-down
  event syslog pattern ".*UPDOWN.*Ethernet1/0.*" occurs 4
  action 1.0 syslog msg "Ethernet interface 1/0 changed state 4 times"
```

---

**Configuration Examples for Embedded Event Manager Applet**

**Example Identity Event Detector**

The following example shows how a policy named “EventIdentity” is triggered every time the authentication on the Fast Ethernet interface 0 is success.

```plaintext
event manager applet EventIdentity
  event identity interface FastEthernet0 authc success
  action 1.0 syslog msg "Applet EventIdentity"
```

**Example MAT Event Detector**

The following example shows how a policy named “EventMat” is triggered every time a mac-address is learned in the mac-address-table.

```plaintext
event manager applet EventMat
  event mat interface FastEthernet0
  action 1.0 syslog msg "Applet EventMat"
```

**Example Neighbor-Discovery Event Detector**

The following example shows how a policy named “EventNeighbor” is triggered when a Cisco Discovery Protocol (CDP) cache entry changes.

```plaintext
event manager applet EventNeighbor
  event neighbor-discovery interface FastEthernet0 cdp all
  action 1.0 syslog msg "Applet EventNeighbor"
```
Embedded Event Manager Manual Policy Execution Examples

The following examples show how to use the none event detector to configure an EEM policy (applet or script) to be run manually.

Using the event manager run Command

This example shows how to run a policy manually using the `event manager run` command. The policy is registered using the `event none` command under applet configuration mode and then run from global configuration mode using the `event manager run` command.

```
event manager applet manual-policy
  event none
  action 1.0 syslog msg "Manual-policy triggered"
  end
!
! event manager run manual-policy
```

Using the action policy Command

This example shows how to run a policy manually using the `action policy` command. The policy is registered using the `event none` command under applet configuration mode, and then the policy is executed using the `action policy` command in applet configuration mode.

```
event manager applet manual-policy
  event none
  action 1.0 syslog msg "Manual-policy triggered"
  exit
!
! event manager applet manual-policy-two
  event none
  action 1.0 policy manual-policy
  end
!
! event manager run manual-policy-two
```

Embedded Event Manager Watchdog System Monitor (Cisco IOS) Event Detector Configuration Example

The following example shows how to configure three EEM applets to demonstrate how the Cisco IOS watchdog system monitor (IOSWDSysMon) event detector works.

Watchdog System Monitor Sample1 Policy

The first policy triggers an applet when the average CPU usage for the process named IP Input is greater than or equal to 1 percent for 10 seconds:

```
event manager applet IOSWD_Sample1
  event ioswdsysmon sub1 cpu-proc taskname "IP Input" op ge val 1 period 10
  action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
```
Watchdog System Monitor Sample2 Policy

The second policy triggers an applet when the total amount of memory used by the process named Net Input is greater than 100 kb:

\[
\text{event manager applet IOSWD\_Sample2} \\
\text{event ioswdsysmon sub1 mem-proc taskname "Net Input" op gt val 100 is-percent false} \\
\text{action 1.0 syslog msg "IOSWD\_Sample2 Policy Triggered"}
\]

Watchdog System Monitor Sample3 Policy

The third policy triggers an applet when the total amount of memory used by the process named IP RIB Update has increased by more than 50 percent over the sample period of 60 seconds:

\[
\text{event manager applet IOSWD\_Sample3} \\
\text{event ioswdsysmon sub1 mem-proc taskname "IP RIB Update" op gt val 50 is-percent true period 60} \\
\text{action 1.0 syslog msg "IOSWD\_Sample3 Policy Triggered"}
\]

The three policies are configured, and then repetitive large pings are made to the networking device from several workstations, causing the networking device to register some usage. This will trigger policies 1 and 2, and the console will display the following messages:

00:42:23: %HA\_EM-6-LOG: IOSWD\_Sample1: IOSWD\_Sample1 Policy Triggered
00:42:47: %HA\_EM-6-LOG: IOSWD\_Sample2: IOSWD\_Sample2 Policy Triggered

To view the policies that are registered, use the `show event manager policy registered` command:

\[
\text{Device\# show event manager policy registered} \\
\text{No. Class Type Event Type Trap Time Registered Name} \\
1 \text{ applet system ioswdsysmon Off Fri Jul 23 02:27:28 2004 IOSWD\_Sample1} \\
\text{sub1 cpu_util {taskname {IP Input} op ge val 1 period 10.000 }} \\
\text{action 1.0 syslog msg "IOSWD\_Sample1 Policy Triggered"} \\
2 \text{ applet system ioswdsysmon Off Fri Jul 23 02:23:52 2004 IOSWD\_Sample2} \\
\text{sub1 mem_used {taskname {Net Input} op gt val 100 is_percent FALSE}} \\
\text{action 1.0 syslog msg "IOSWD\_Sample2 Policy Triggered"} \\
3 \text{ applet system ioswdsysmon Off Fri Jul 23 03:07:38 2004 IOSWD\_Sample3} \\
\text{sub1 mem_used {taskname {IP RIB Update} op gt val 50 is_percent TRUE period 60.000 }} \\
\text{action 1.0 syslog msg "IOSWD\_Sample3 Policy Triggered"}
\]

Configuration SNMP Library Extensions Examples

SNMP Get Operations Examples

The following example shows how to send a get request to the local host.

\[
\text{Device(config)# event manager applet snmp} \\
\text{Device(config-applet)# event snmp oid} \\
1.3.6.1.2.1.1.1.0 \text{ get-type exact entry-op} \\
1.3.6.1.2.1.1.1.0 \text{ entry-val} \\
5120000 \text{ poll-interval} \\
90 \\
\text{Device(config-applet)# action 1.3 info type snmp oid} \\
1.3.6.1.2.1.1.1.0 \text{ get-type exact} \\
\text{community public} \\
\text{Device(config-applet)# action 1.3 info type snmp oid}
\]

The following log message will be written to the SNMP event manager log:

```
1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0
```

The following example shows how to send a get request to a remote host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp oid
  1.3.6.1.2.1.1.4.0 get-type next community
  public ipadd
  172.17.16.69
Device(config-applet)# action 1.3 info type snmp getid
  1.3.6.1.2.1.1.1.0 community
  public ipadd
  172.17.16.69
```

The following log message is written to the SNMP event manager log:

```
1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0
```

### SNMP GetID Operations Examples

The following example shows how to send a getid request to the local host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp getid
  community
  public
```

The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_value=
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysdescr_oid=1.3.6.1.2.1.1.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=1.3.6.1.2.1.1.3.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_value=10131676
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_value=YYY
```

The following example shows how to send a getid request to a remote host.

```

```
Set Operations Examples

The following examples show how to perform a set operation on the local host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp getid
1.3.6.1.2.1.1.1.0 community
public ipaddr
172.17.16.69
```

The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lset: XXX
```

The following example shows how to perform a set operation on a remote host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp oid
1.3.6.1.2.1.1.1.0 set-type
integer
5 sysName.0 community
public ipaddr
172.17.16.69
```

The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lset: XXX
```
The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX

Generating SNMP Notifications Examples

The following example shows how to configure SNMP traps for the sysUpTime.0 variable:

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.4.1.9.9.48.1.1.6.1 get-type exact entry-op
lt entry-val
$120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp var
sysUpTime.0 oid
1.3.6.1.4.1.9.9.43.1.1.6.1.3.41 integer
2
Device(config-applet)# action 1.4 info type snmp trap
enterprise-oid
CiscoSyslogMIB.2 generic-trapnum
6 specific-trapnum
1 trap-oid
1.3.6.1.4.1.9.9.41.2.0.1 trap-var
sysUpTime.0
```

The following output is generated if the debug snmp packets command is enabled:

```
Device# debug snmp packets
1d04h: SNMP: Queuing packet to 172.69.16.2
1d04h: SNMP: V1 Trap, ent CiscoSyslogMIB.2, addr 172.19.rap 1

The following example shows how to configure SNMP inform requests for the sysUpTime.0 variable:
Configuring Variable Logic for EEM Applets Examples

The following sections provide examples on some selected action commands. For information on all the action commands supporting variable logic within applets, see the table below.

In this example, conditional loops \texttt{while}, \texttt{if} and \texttt{foreach} are used to print data. Other action commands such as \texttt{action divide}, \texttt{action increment} and \texttt{action puts} are used to define the actions to be performed when the conditions are met.

\begin{verbatim}
event manager applet printdata
\end{verbatim}
event none
action 100 set colors "red green blue"
action 101 set shapes "square triangle rectangle"
action 102 set i "1"
action 103 while $i lt 6
    action 104 divide $i 2
    action 105 if $._remainder eq 1
        action 106 foreach _iterator "$colors"
            action 107 puts nonewline "$_iterator "
        end
        action 108 puts 
    action 109 else
        foreach _iterator "$shapes"
            action 112 puts nonewline "$_iterator "
        end
        action 113 puts 
    end
    action 115 incement i
end

When the event manager applet ex is run, the following output is obtained:

event manager run printdata
red green blue
square triangle rectangle
red green blue
square triangle rectangle
red green blue

In this example, two environment variables poll_interface and max_rx_rate are set to F0/0 and 3 respectively. Every 30 seconds there is a poll on an interface for rx rate. If the rx rate is greater than the threshold, a syslog message is displayed.

This applet makes use of the foreach conditional statement to poll the interface, the if conditional block to compare the value under RXPS with max_rx_rate that was set in the EEM environment variable.

event manager environment poll_interfaces F0/0
event manager environment max_rx_rate 3
ev man app check_rx_rate
ev timer watchdog name rx_timer time 30
action 100 foreach int $poll_interfaces
    action 101 cli command "en"
    action 102 cli command "show int $int summ | beg ------"
    action 103 foreach line $_cli_result 
        action 105 regexp ".*[0-9]+[0-9]+[0-9]+[0-9]+[0-9]+.+/s.*" $line
            junk rxps
        action 106 if $._regexp_result eq 1
            action 107 if $rxps gt $max_rx_rate
                syslog msg "Warning rx rate for $int is > than threshold. Current value is $rxps"
                (threshold is $max_rx_rate)"
            end
        end
    action 110 end
    action 111 end
    action 112 end

Example syslog message:

Oct 16 09:29:26.153: %HA_EM-6-LOG: c: Warning rx rate for F0/0 is > than threshold. Current value is 4 (threshold is 3)
The output of show int F0/0 summ is of the format:
#show int f0/0 summ

*: interface is up
IHQ: pkts in input hold queue  IQD: pkts dropped from input queue
OHQ: pkts in output hold queue  OQD: pkts dropped from output queue
RXBS: rx rate (bits/sec)  RXPS: rx rate (pkts/sec)
TXBS: tx rate (bits/sec)  TXPS: tx rate (pkts/sec)
TRTL: throttle count

To use other action commands supporting variable logic within applets, use the commands listed in the table below.

**Table 172: Available action commands**

<table>
<thead>
<tr>
<th>Action Commands</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>action add</td>
<td>Adds the value of two variables when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action append</td>
<td>Appends the given value to the current value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action break</td>
<td>Causes an immediate exit from a loop of actions when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action comment</td>
<td>Adds comments to an applet when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action context retrieve</td>
<td>Retrieves variables identified by a given set of context name keys when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action context save</td>
<td>Saves information across multiple policy triggers when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action continue</td>
<td>Continues with a loop of actions when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action decrement</td>
<td>Decrements the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action divide</td>
<td>Divides the dividend value by the given divisor value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action else</td>
<td>Specifies the beginning of else conditional action block in if / else conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action elseif</td>
<td>Identifies the beginning of the else conditional action block in the else / if conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>Action Commands</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>action end</td>
<td>Specifies the identification of the end of an conditional action block in the if/else and while conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action exit</td>
<td>Specifies an immediate exit from the running applet configuration when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action foreach</td>
<td>Specifies the iteration of an input string using the delimiter as a tokenizing pattern, when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action gets</td>
<td>Gets an input from the local TTY in a synchronous applet and store the value in the given variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action if</td>
<td>Specifies the identification of the beginning of an if conditional block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action if goto</td>
<td>Instructs the applet to jump to a given label if the specified condition is true when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action increment</td>
<td>Increments the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type interface-names</td>
<td>Specifies the action of obtaining interface names when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp getid</td>
<td>Retrieves the individual variables from a Simple Network Management Protocol (SNMP) entity during the SNMP get operation.</td>
</tr>
<tr>
<td>action info type snmp inform</td>
<td>Sends an SNMP inform requests when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp oid</td>
<td>Specifies the type of SNMP get operation and the object to retrieve during the SNMP set operation, when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp trap</td>
<td>Sends SNMP trap requests when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp var</td>
<td>Creates a variable for an SNMP object identifier (OID) and its value from an EEM applet.</td>
</tr>
<tr>
<td>action multiply</td>
<td>Specifies the action of multiplying the variable value with a specified given integer value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action puts</td>
<td>Enables the action of printing data directly to the local tty when an EEM applet is triggered.</td>

<table>
<thead>
<tr>
<th>Purpose</th>
<th>action string trimright</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the action to trim the characters one string from the right end of another string when an EEM applet is triggered.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Purpose</th>
<th>action subtract</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subtracts the value of a variable from another value when an EEM applet is triggered.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Purpose</th>
<th>action while</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the action of identifying the beginning of a loop of conditional block when an EEM applet is triggered.</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring Event SNMP-Object Examples

The following example shows the SET operation and the value to set is in \$_snmp\_value and it is managed by the script. The example below saves the oid and its value as contexts to be retrieved later.

```plaintext
event manager applet snmp-object1
description "APPLET SNMP-OBJ-1"
event snmp-object oid 1.3.6.1.2.1.31.1.1.18 type string sync no skip no istable yes
default 0
action 1 syslog msg "SNMP-OBJ1:TRIGGERED" facility "SNMP_OBJ"
action 2 context save key myoid variable "_snmp_oid"
action 3 context save key myvalue variable "_snmp_value"
```

### Configuring Description of an EEM Applet Examples

The following example shows how to add or modify the description for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP):

```plaintext
event manager applet test
description "This applet looks for the word count in syslog messages"
event syslog pattern "count"
action 1 syslog msg hi
```

Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use the Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

| Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI |

| **Feature Name** | **Releases** | **Feature Information** |
| Embedded Event Manager 4.0 | 15.2(5)E1 | This feature was introduced and is supported only on c2960cx platform. |
Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI
Writing Embedded Event Manager Policies Using Tcl

This module describes how software developers can write and customize Embedded Event Manager (EEM) policies using Tool command language (Tcl) scripts to handle Cisco software faults and events. EEM is a policy-driven process by means of which faults in the Cisco software system are reported through a defined application programing interface (API). The EEM policy engine receives notifications when faults and other events occur. EEM policies implement recovery on the basis of the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

• Prerequisites for Writing Embedded Event Manager Policies Using Tcl, on page 1641
• Information About Writing Embedded Event Manager Policies Using Tcl, on page 1641
• How to Write Embedded Event Manager Policies Using Tcl, on page 1648
• Configuration Examples for Writing Embedded Event Manager Policies Using Tcl, on page 1675
• Additional References, on page 1697

Prerequisites for Writing Embedded Event Manager Policies Using Tcl

• Before writing EEM policies, you should be familiar with the “Embedded Event Manager Overview” module.

• If you want to write EEM policies using the command-line interface (CLI) commands, you should be familiar with the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

Information About Writing Embedded Event Manager Policies Using Tcl

EEM Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or reach a threshold. An EEM policy is an entity that defines an event and the actions to be taken
when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the command-line interface (CLI) configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

**EEM Applet**

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In EEM applet configuration mode, three types of configuration statements are supported. The event commands are used to specify the event criteria to trigger the applet to run, the action commands are used to specify an action to perform when the EEM applet is triggered, and the set command is used to set the value of an EEM applet variable. Currently only the _exit_status variable is supported for the set command.

Only one event configuration command is allowed within an applet configuration. When applet configuration submode is exited and no event command is present, a warning is displayed stating that no event is associated with the applet. If no event is specified, the applet is not considered registered. When no action is associated with the applet, events are still triggered but no actions are performed. Multiple action configuration commands are allowed within an applet configuration. Use the show event manager policy registered command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it, because changes are written to a temporary file. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

Action configuration commands within an applet are uniquely identified using the label argument, which can be any string value. Actions are sorted within an applet in ascending alphanumeric key sequence using the label argument as the sort key, and they are run using this sequence. The same label argument can be used in different applets; the labels must be unique only within one applet.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

For more details about writing EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

**EEM Script**

All Embedded Event Manager scripts are written in Tcl. Tcl is a string-based command language that is interpreted at run time. The version of Tcl supported is Tcl version 8.3.4 plus added script support. Scripts are defined using an ASCII editor on another device, not on the networking device. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM. As an enforced rule, Embedded Event Manager policies are short-lived run time routines that must be interpreted and executed in less than 20 seconds of elapsed time. If more than 20 seconds of elapsed time are required, the maxrun parameter may be specified in the event_register statement to specify any desired value.

EEM policies use the full range of the Tcl language’s capabilities. However, Cisco provides enhancements to the Tcl language in the form of Tcl command extensions that facilitate the writing of EEM policies. The main categories of Tcl command extensions identify the detected event, the subsequent action, utility information, counter values, and system information.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM script involves:
EEM Policy Tcl Command Extension Categories

There are different categories of EEM policy Tcl command extensions.

Note

The Tcl command extensions available in each of these categories for use in all EEM policies are described in later sections in this document.

<table>
<thead>
<tr>
<th>Category</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>EEM event Tcl command extensions</td>
<td>This category is represented by the <code>event_register_</code> <code>xxx</code> family of event-specific commands. There is a separate event information Tcl command extension in this category as well: <code>event_reqinfo</code>. This is the command used in policies to query the EEM for information about an event. There is also an EEM event publish Tcl command extension <code>event_publish</code> that publishes an application-specific event.</td>
</tr>
<tr>
<td>EEM action Tcl command extensions</td>
<td>These Tcl command extensions (for example, <code>action_syslog</code>) are used by policies to respond to or recover from an event or fault. In addition to these extensions, developers can use the Tcl language to implement any action desired.</td>
</tr>
<tr>
<td>EEM utility Tcl command extensions</td>
<td>These Tcl command extensions are used to retrieve, save, set, or modify application information, counters, or timers.</td>
</tr>
<tr>
<td>EEM system information Tcl command extensions</td>
<td>This category is represented by the <code>sys_reqinfo_</code> <code>xxx</code> family of system-specific information commands. These commands are used by a policy to gather system information.</td>
</tr>
<tr>
<td>EEM context Tcl command extensions</td>
<td>These Tcl command extensions are used to store and retrieve a Tcl context (the visible variables and their values).</td>
</tr>
</tbody>
</table>

General Flow of EEM Event Detection and Recovery

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, the core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs.
When an event or fault is detected, Embedded Event Manager determines from the event publishers—an example would be the OIR events publisher in the figure below—if a registration for the encountered fault or event has occurred. EEM matches the event registration information with the event data itself. A policy registers for the detected event with the Tcl command extension `event_register_`. The event information Tcl command extension `event_reqinfo` is used in the policy to query the Embedded Event Manager for information about the detected event.

Figure 115: Embedded Event Manager Core Event Detectors

Safe-Tcl

Safe-Tcl is a safety mechanism that allows untrusted Tcl scripts to run in an interpreter that was created in the safe mode. The safe interpreter has a restricted set of commands that prevent accessing some system resources and harming the host and other applications. For example, it does not allow commands to access critical Cisco IOS file system directories.

Cisco-defined scripts run in full Tcl mode, but user-defined scripts run in Safe-Tcl mode. Safe-Tcl allows Cisco to disable or customize individual Tcl commands. For more details about Tcl commands, go to [http://www.tcl.tk/man/](http://www.tcl.tk/man/).

The following list of Tcl commands are restricted with a few exceptions. Restrictions are noted against each command or command keyword:

- **cd** --Change directory is not allowed to one of the restricted Cisco directory names.
• **encoding** — The commands **encoding names**, **encoding convertfrom**, and **encoding convertto** are permitted. The **encoding system** command with no arguments is permitted, but the **encoding system** command with the **?encoding?** keyword is not permitted.

• **exec** — Not permitted.

• **fconfigure** — Permitted.

• **file** — The following are permitted:
  - **file dirname**
  - **file exists**
  - **file extension**
  - **file isdirectory**
  - **file join**
  - **file pathype**
  - **file rootname**
  - **file split**
  - **file stat**
  - **file tail**

• **file** — The following are not permitted:
  - **file atime**
  - **file attributes**
  - **file channels**
  - **file copy**
  - **file delete**
  - **file executable**
  - **file isfile**
  - **file link**
  - **file lstat**
  - **file mkdir**
  - **file mtime**
  - **file nativename**
  - **file normalize**
  - **file owned**
  - **file readable**
  - **file readlink**
  - **file rename**
  - **file rootname**
  - **file separator**
  - **file size**
  - **file system**
  - **file type**
  - **file volumes**
  - **file writable**

• **glob** — The **glob** command is not permitted when searching in one of the restricted Cisco directories. Otherwise, it is permitted.
• **load** -- Only files that are in the user policy directory or the user library directory are permitted to be loaded. Static packages (for example, libraries that consist of C code) are not permitted to be loaded with the `load` command.

• **open** -- The `open` command is not allowed for a file that is located in one of the restricted Cisco directories.

• **pwd** -- The `pwd` command is not permitted.

• **socket** -- The `socket` command is permitted.

• **source** -- The `source` command is permitted for files that are in the user policy directory or the user library directory.

### Bytecode Support for EEM 2.4

EEM 2.4 introduces bytecode language (BCL) support by accepting files with the standard bytecode script extension `.tbc`. Tcl version 8.3.4 defines a BCL and includes a compiler that translates Tcl scripts into BCL. Valid EEM policy file extensions in EEM 2.4 for user and system policies are `.tcl` (Tcl Text files) and `.tbc` (Tcl bytecode files).

Storing Tcl scripts in bytecode improves the execution speed of the policy because the code is precompiled, creates a smaller policy size, and obscures the policy code. Obfuscation makes it a little more difficult to modify scripts and hides logic to preserve intellectual property rights.

Support for bytecode is being added to provide another option for release of supported and trusted code. We recommend that you only run well understood, or trusted and supported software on network devices. To generate Tcl bytecode for IOS EEM support, use TclPro versions 1.4 or 1.5.

To translate a Tcl script to bytecode you can use procomp, part of Free TclPro Compiler, or Active State Tcl Development Kit. When a Tcl script is compiled using procomp, the code is scrambled and a `.tbc` file is generated. The bytecode files are platform-independent and can be generated on any operating system on which TclPro is available, including Windows, Linux, and UNIX. Procomp is part of TclPro and available from [http://www.tcl.tk/software/tclpro](http://www.tcl.tk/software/tclpro).

### Registration Substitution

In addition to regular Tcl substitution, EEM 2.3 permits the substitution of an individual parameter in an EEM event registration statement line with an environment variable.

EEM 2.4 introduces the ability to replace multiple parameters in event registration statement lines with a single environment variable.

---

**Note**

Only the first environment variable supports multiple parameter substitution. Individual parameters can still be specified with additional environment variables after the initial variable.

To illustrate the substitution, a single environment variable, `$_eem_syslog_statement` is configured as:

```tcl
::cisco::eem::event_register_syslog pattern COUNT
```

Using the registration substitution, the `$_eem_syslog_statement` environment variable is used in the following EEM user policy:
$eem\_syslog\_statement\ occurs\ $eem\_occurs\_val
action\ syslog\ "$this\ is\ test\ 3"

Environment\ variables\ must\ be\ defined\ before\ a\ policy\ using\ them\ is\ registered.\ To\ define\ the
$eem\_syslog\_statement\ environment\ variable:

Device(config)# event\ manager\ environment\ eem\_syslog\_statement
::cisco::eem::event\_register\_syslog\ pattern\ COUNT
Device(config)# event\ manager\ environment\ eem\_occurs\_val\ 2

Cisco\ File\ Naming\ Convention\ for\ EEM

All\ Embedded\ Event\ Manager\ policy\ names,\ policy\ support\ files\ (for\ example,\ e-mail\ template\ files),\ and
library\ filenames\ are\ consistent\ with\ the\ Cisco\ file\ naming\ convention.\ In\ this\ regard,\ Embedded\ Event
Manager\ policy\ filenames\ adhere\ to\ the\ following\ specification:

- An\ optional\ prefix--Mandatory--indicating,\ if\ present,\ that\ this\ is\ a\ system\ policy\ that\ should\ be\ registered
automatically\ at\ boot\ time\ if\ it\ is\ not\ already\ registered.\ For\ example:\ Mandatory.sl_text.tcl.
- A\ filename\ body\ part\ containing\ a\ two-character\ abbreviation\ (see\ the\ table\ below)\ for\ the\ first\ event
specified;\ an\ underscore\ part;\ and\ a\ descriptive\ field\ part\ that\ further\ identifies\ the\ policy.
- A\ filename\ suffix\ part\ defined\ as\ .tcl.

Embedded\ Event\ Manager\ e-mail\ template\ files\ consist\ of\ a\ filename\ prefix\ of\ email_template,\ followed\ by
an\ abbreviation\ that\ identifies\ the\ usage\ of\ the\ e-mail\ template.

Embedded\ Event\ Manager\ library\ filenames\ consist\ of\ a\ filename\ body\ part\ containing\ the\ descriptive\ field
that\ identifies\ the\ usage\ of\ the\ library,\ followed\ by\ _lib,\ and\ a\ filename\ suffix\ part\ defined\ as\ .tcl.

How to Write Embedded Event Manager Policies Using Tcl

Registering and Defining an EEM Tcl Script

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

Before you begin

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided--see the details in the Sample EEM Policies, on page 1658 to see which policies are available for the Cisco IOS release image that you are using--and these sample policies are stored in the system policy directory.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show event manager environment [all] variable-name]</td>
<td>(Optional) Displays the name and value of EEM environment variables.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• The optional all keyword displays all the EEM environment variables.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# show event manager environment all</td>
<td>• The optional variable-name argument displays information about the specified environment variable.</td>
</tr>
</tbody>
</table>

**Step 3**

```bash
configure terminal
```

**Example:**

```bash
Device# configure terminal
```

**Purpose:** Enters global configuration mode.

**Step 4**

```bash
event manager environment variable-name string
```

**Example:**

```bash
Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6
```

**Purpose:** Configures the value of the specified EEM environment variable.

• In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day.

**Step 5**

Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script.

**Step 6**

```bash
event manager policy policy-filename [type {system | user}] [trap]
```

**Example:**

```bash
Device(config)# event manager policy tm_cli_cmd.tcl type system
```

**Purpose:** Registers the EEM policy to be run when the specified event defined within the policy occurs.

• Use the system keyword to register a Cisco-defined system policy.

• Use the user keyword to register a user-defined system policy.

• Use the trap keyword to generate an SNMP trap when the policy is triggered.

• In this example, the sample EEM policy named tm_cli_cmd.tcl is registered as a system policy.

**Step 7**

```bash
exit
```

**Example:**

```bash
Device(config)# exit
```

**Purpose:** Exits global configuration mode and returns to privileged EXEC mode.

---

**Examples**

In the following example, the `show event manager environment` privileged EXEC command is used to display the name and value of all EEM environment variables.

```bash
Device# show event manager environment all
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Displaying EEM Registered Policies

Perform this optional task to display EEM registered policies.

**Procedure**

**Step 1**

**enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2**

**show event manager policy registered** [event-type event-name] [time-ordered] [name-ordered] [detailed policy-filename]

Use this command with the **time-ordered** keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
No. Type Event Type Trap Time Registered Name
1  system timer cron Off Wed May11 01:43:18 2005 tm_cli_cmd.tcl
    name (crontimer2) cron entry {0-59/1 0-23/1 * * 0-7}
    nice 0 priority normal maxrun 240
2  system syslog Off Wed May11 01:43:28 2005 sl_intf_down.tcl
    occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
    nice 0 priority normal maxrun 90
3  system proc abort Off Wed May11 01:43:38 2005 pr_cdp_abort.tcl
    instance 1 path {cdp2.iosproc}
    nice 0 priority normal maxrun 20
```

Use this command with the **name-ordered** keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
Device# show event manager policy registered name-ordered
No. Type Event Type Trap Time Registered Name
1  system proc abort Off Wed May11 01:43:38 2005 pr_cdp_abort.tcl
    instance 1 path {cdp2.iosproc}
    nice 0 priority normal maxrun 20
2  system syslog Off Wed May11 01:43:28 2005 sl_intf_down.tcl
    occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
    nice 0 priority normal maxrun 90
3  system timer cron Off Wed May11 01:43:18 2005 tm_cli_cmd.tcl
    name (crontimer2) cron entry {0-59/1 0-23/1 * * 0-7}
    nice 0 priority normal maxrun 240
```
Use this command with the `event-type` keyword to display information about currently registered policies for the event type specified in the `event-name` argument, for example:

**Example:**

```
Device# show event manager policy registered event-type syslog
```

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Time</th>
<th>Registered</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>system</td>
<td>syslog</td>

</table>

`occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*} nice 0 priority normal maxrun 90`

---

**Unregistering EEM Policies**

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| `show event manager policy registered [event-type event-name][system user] [time-ordered] name-ordered] [detailed policy-filename]` | (Optional) Displays the EEM policies that are currently registered. |
| **Example:**      | • The optional `system` or `user` keyword displays the registered system or user policies. |
| `Device# show event manager policy registered` | • If no keywords are specified, EEM registered policies for all event types are displayed in time order. |

| **Step 3**        |         |
| `configure terminal` | Enters global configuration mode. |
| **Example:**      |         |
| `Device# configure terminal` |         |

| **Step 4**        |         |
| `no event manager policy policy-filename` | Removes the EEM policy from the configuration, causing the policy to be unregistered. |
| **Example:**      | • In this example, the `no` form of the command is used to unregister a specified policy. |
| `Device(config)# no event manager policy pr_cdp_abort.tcl` |         |
Unregistering EEM Policies

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# exit</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Repeat <strong>Unregistering EEM Policies</strong> to ensure that the policy has been removed.</td>
<td>--</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# show event manager policy registered</td>
<td></td>
</tr>
</tbody>
</table>

Examples

In the following example, the **show event manager policy registered** privileged EXEC command is used to display the three EEM policies that are currently registered:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:43:18 2005 tm_cli_cmd.tcl
   name (crontimer2) cron entry {0-59/1 0-23/1 * * 0-7}
   nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:43:28 2005 sl_intf_down.tcl
   occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
   nice 0 priority normal maxrun 90.000
3 system proc abort Off Tue Oct11 01:43:38 2005 pr_cdp_abort.tcl
   instance 1 path {cdp2.iosproc}
   nice 0 priority normal maxrun 20.000
```

After the current policies are displayed, it is decided to delete the pr_cdp_abort.tcl policy using the **no** form of the **event manager policy** command:

```
Device# configure terminal
Device(config)# no event manager policy pr_cdp_abort.tcl
Device(config)# exit
```

The **show event manager policy registered** privileged EXEC command is entered again to display the EEM policies that are currently registered. The policy pr_cdp_abort.tcl is no longer registered.

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:45:17 2005 tm_cli_cmd.tcl
   name (crontimer2) cron entry {0-59/1 0-23/1 * * 0-7}
   nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:45:27 2005 sl_intf_down.tcl
   occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
   nice 0 priority normal maxrun 90.000
```
**Suspending EEM Policy Execution**

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them, might be necessary for reasons of temporary performance or security.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>show event manager policy registered [event-type event-name][system user] [time-ordered name-ordered] [detailed policy-filename]</td>
<td>(Optional) Displays the EEM policies that are currently registered.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# show event manager policy registered</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>event manager scheduler suspend</td>
<td>Immediately suspends the execution of all EEM policies.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# event manager scheduler suspend</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

In the following example, the `show event manager policy registered` privileged EXEC command is used to display all the EEM registered policies:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Sat Oct11 01:43:18 2003 tm_cli_cmd.tcl
   name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
   nice 0 priority normal maxrun 240.000
```
Managing EEM Policies

Perform this task to specify a directory to use for storing user library files or user-defined EEM policies.

Note

This task applies only to EEM policies that are written using Tcl scripts.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| show event manager directory user [library policy] | (Optional) Displays the directory to use for storing EEM user library or policy files. |
| Example:           | • The optional library keyword displays the directory to use for user library files. |
| Device# show event manager directory user library | • The optional policy keyword displays the directory to use for user-defined EEM policies. |

| **Step 3**        |         |
| configure terminal | Enters global configuration mode. |
| Example:           |         |
| Device# configure terminal | |

| **Step 4**        |         |
| event manager directory user {library path policy path} | Specifies a directory to use for storing user library files or user-defined EEM policies. |
| Example:           | • Use the path argument to specify the absolute pathname to the user directory. |
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# event manager directory user library disk0:/user_library</td>
</tr>
<tr>
<td>Device(config)# event manager directory user library bootflash:/user_library</td>
</tr>
</tbody>
</table>

### Step 5

**Example:**

```
Device(config)# exit
```

Exits global configuration mode and returns to privileged EXEC mode.

---

**Examples**

In the following example, the *show event manager directory user* privileged EXEC command is used to display the directory, if it exists, to use for storing EEM user library files:

```
Device# show event manager directory user library
disk0:/user_library

Device# show event manager directory user library
bootflash:/user_library
```

---

**Modifying History Table Size and Displaying EEM History Data**

Perform this optional task to change the size of the history tables and to display EEM history data.

**Procedure**

#### Step 1

**enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

#### Step 2

**configure terminal**

Enters global configuration mode.

**Example:**

```
Device# configure terminal
```

#### Step 3

**event manager history size {events | traps} [size]**

Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:
Example:

Device(config)# event manager history size events 30

Step 4

exit

Exits global configuration mode and returns to privileged EXEC mode.

Example:

Device(config)# exit

Step 5

show event manager history events [detailed] [maximum number]

Use this command to display information about each EEM event that has been triggered.

Example:

Device# show event manager history events

<table>
<thead>
<tr>
<th>No.</th>
<th>Time of Event</th>
<th>Event Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fri Sep 9 13:48:40 2005</td>
<td>syslog</td>
<td>applet: one</td>
</tr>
<tr>
<td>2</td>
<td>Fri Sep 9 13:48:40 2005</td>
<td>syslog</td>
<td>applet: two</td>
</tr>
<tr>
<td>3</td>
<td>Fri Sep 9 13:48:40 2005</td>
<td>syslog</td>
<td>applet: three</td>
</tr>
<tr>
<td>4</td>
<td>Fri Sep 9 13:50:00 2005</td>
<td>timer cron</td>
<td>script: tm_cli_cmd.tcl</td>
</tr>
<tr>
<td>5</td>
<td>Fri Sep 9 13:51:00 2005</td>
<td>timer cron</td>
<td>script: tm_cli_cmd.tcl</td>
</tr>
</tbody>
</table>

Step 6

show event manager history traps [server | policy]

Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy.

Example:

Device# show event manager history traps

<table>
<thead>
<tr>
<th>No.</th>
<th>Time of Event</th>
<th>Trap Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fri Sep 9 13:48:40 2005</td>
<td>server</td>
<td>applet: four</td>
</tr>
<tr>
<td>2</td>
<td>Fri Sep 9 13:57:03 2005</td>
<td>policy</td>
<td>script: no_snmp_test.tcl</td>
</tr>
</tbody>
</table>

Displaying Software Modularity Process Reliability Metrics Using EEM

Perform this optional task to display reliability metrics for Cisco IOS Software Modularity processes. The show event manager metric processes command is supported only in Software Modularity images.

Procedure

Step 1

enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2

show event manager metric process {all|process-name}
Use this command to display the reliability metric data for processes. The system keeps a record of when processes start and end, and this data is used as the basis for reliability analysis. In this partial example, the first and last entries showing the metric data for the processes on all the cards inserted in the system are displayed.

**Example:**

```
Device# show event manager metric process all
===================================================================================================
process name: devc-pty, instance: 1
sub_system id: 0, version: 00.00.0000
===================================================================================================
last event type: process start
recent start time: Fri Oct 10 20:34:40 2005
recent normal end time: n/a
recent abnormal end time: n/a
number of times started: 1
number of times ended normally: 0
number of times ended abnormally: 0
most recent 10 process start times:
-----------------------------------------------
Fri Oct 10 20:34:40 2005
-----------------------------------------------
most recent 10 process end times and types:
cumulative process available time: 6 hours 30 minutes 7 seconds 378 milliseconds
process availability: 0.100000000
number of abnormal ends within the past 60 minutes (since reload): 0
number of abnormal ends within the past 24 hours (since reload): 0
number of abnormal ends within the past 30 days (since reload): 0

===================================================================================================
process name: cdp2.iosproc, instance: 1
sub_system id: 0, version: 00.00.0000
===================================================================================================
last event type: process start
recent start time: Fri Oct 10 20:35:02 2005
recent normal end time: n/a
recent abnormal end time: n/a
number of times started: 1
number of times ended normally: 0
number of times ended abnormally: 0
most recent 10 process start times:
-----------------------------------------------
Fri Oct 10 20:35:02 2005
-----------------------------------------------
most recent 10 process end times and types:
cumulative process available time: 6 hours 29 minutes 45 seconds 506 milliseconds
process availability: 0.100000000
number of abnormal ends within the past 60 minutes (since reload): 0
number of abnormal ends within the past 24 hours (since reload): 0
number of abnormal ends within the past 30 days (since reload): 0
```
Troubleshooting Tips

Use the `debug event manager` command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution because the volume of output generated can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

Modifying the Sample EEM Policies

Perform this task to modify one of the sample policies. Cisco software contains some sample policies in the images that contain the Embedded Event Manager. Developers of EEM policies may modify these policies by customizing the event for which the policy is to be run and the options associated with logging and responding to the event. In addition, developers may select the actions to be implemented when the policy runs.

Sample EEM Policies

Cisco includes a set of sample policies shown in the table below. You can copy the sample policies to a user directory and then modify the policies, or you can write your own policies. Tcl is currently the only Cisco-supported scripting language for policy creation. Tcl policies can be modified using a text editor such as Emacs. Policies must execute within a defined number of seconds of elapsed time, and the time variable can be configured within a policy. The default is currently 20 seconds.

The table below describes the sample EEM policies.

<table>
<thead>
<tr>
<th>Name of Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pr_cdp_abort.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for cdp2.iosproc process abort events. It will log a message to SYSLOG and send an e-mail with the details of the abort.</td>
</tr>
<tr>
<td>pr_crash_reporter.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for all process abort events. When an event occurs, the policy will send crash information, including the crashdump file, to the specified URL where a CGI script processes the data.</td>
</tr>
<tr>
<td>pr_iprouting_abort.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for iprouting.iosproc process abort events. It will log a message to SYSLOG and send an e-mail with the details of the abort.</td>
</tr>
<tr>
<td>sl_intf_down.tcl</td>
<td>This policy runs when a configurable syslog message is logged. It will execute a configurable CLI command and e-mail the results.</td>
</tr>
<tr>
<td>tm_cli_cmd.tcl</td>
<td>This policy runs using a configurable CRON entry. It will execute a configurable CLI command and e-mail the results.</td>
</tr>
<tr>
<td>tm_crash_history.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy runs at midnight every day and e-mails a process crash history report to a specified e-mail address.</td>
</tr>
</tbody>
</table>
### Sample EEM Policies

<table>
<thead>
<tr>
<th>Name of Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tm_crash_reporter.tcl</td>
<td>This policy runs 5 seconds after it is registered. If the policy is saved in the configuration, it will also run each time that the device is reloaded. The policy will prompt for the reload reason. If the reload was due to a crash, the policy will search for the latest crashinfo file and send this information to a specified URL location.</td>
</tr>
<tr>
<td>tm_fsys_usage.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message will be displayed if disk space usage crosses configurable thresholds.</td>
</tr>
<tr>
<td>wd_mem_reporter.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy reports on low system memory conditions when the amount of memory available falls below 20 percent of the initial available system memory. A syslog message will be displayed and, optionally, an e-mail will be sent.</td>
</tr>
</tbody>
</table>

For more details about the sample policies available and how to run them, see the [EEM Event Detector Demo Examples](#), on page 1675.

### Procedure

**Step 1**  
**enable**  
Enables privileged EXEC mode. Enter your password if prompted.  
**Example:**  
Device> `enable`

**Step 2**  
**show event manager policy available detailed policy-filename**  
Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The `detailed` keyword was introduced for the `show event manager policy available` and the `show event manager policy registered` commands. Depending on your release, you may need to copy one of the two Tcl scripts from the configuration examples section in this document (see the [Programming Policies with Tcl Sample Scripts Example](#), on page 1683). In the following example, details about the sample policy `tm_cli_cmd.tcl` are displayed on the screen.  
**Example:**  
Device# `show event manager policy available detailed tm_cli_cmd.tcl`

**Step 3**  
Cut and paste the contents of the sample policy displayed on the screen to a text editor.  
Use the edit and copy functions to move the contents from the device to a text editor on another device.

**Step 4**  
Edit the policy and save it with a new filename.  
Use the text editor to modify the policy as a Tcl script. For file naming conventions, see the [Cisco File Naming Convention for EEM](#), on page 1647.

**Step 5**  
Copy the new file back to the device flash memory.  
Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the [Configuration Fundamentals Configuration Guide](#).
Copy the file to the flash file system on the device--typically bootflash:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Configuration Fundamentals Configuration Guide.

Step 6  
**configure terminal**

Enters global configuration mode.

**Example:**

```
Device# configure terminal
```

Step 7  
**event manager directory user {library path| policy path}**

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on disk0 is specified as the directory for storing user library files.

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on bootflash is specified as the directory for storing user library files.

**Example:**

```
Device(config)# event manager directory user library disk0:/user_library
```

```
Device(config)# event manager directory user library bootflash:/user_library
```

Step 8  
**event manager policy policy-filename [type {system| user}] [trap]**

Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named test.tcl is registered as a user-defined policy.

**Example:**

```
Device(config)# event manager policy test.tcl type user
```

---

### Programming EEM Policies with Tcl

Perform this task to help you program a policy using Tcl command extensions. We recommend that you copy an existing policy and modify it. There are two required parts that must exist in an EEM Tcl policy: the event_register Tcl command extension and the body. All other sections shown in the Tcl Policy Structure and Requirements, on page 1660 concept are optional.

### Tcl Policy Structure and Requirements

All EEM policies share the same structure, shown in the figure below. There are two parts of an EEM policy that are required: the event_register Tcl command extension and the body. The remaining parts of the policy are optional: environment must defines, namespace import, entry status, and exit status.
The start of every policy must describe and register the event to detect using an `event_register` Tcl command extension. This part of the policy schedules the running of the policy. The following example Tcl code shows how to register the `event_register_timer` Tcl command extension:

```tcl
::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240
```

The environment must defines section is optional and includes the definition of environment variables. The following example Tcl code shows how to check for, and define, some environment variables.

```tcl
# Check if all the env variables that we need exist. # If any of them does not exist, print out an error msg and quit.
if {![info exists _email_server]} {
    set result \
    "Policy cannot be run: variable _email_server has not been set"
    error $result $errorInfo
} if {![info exists _email_from]} {
    set result \
    "Policy cannot be run: variable _email_from has not been set"
    error $result $errorInfo
} if {![info exists _email_to]} {
    set result \
    "Policy cannot be run: variable _email_to has not been set"
    error $result $errorInfo
}
```

The namespace import section is optional and defines code libraries. The following example Tcl code shows how to configure a namespace import section.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

The body of the policy is a required structure and might contain the following:

- The `event_reqinfo` event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as `action_syslog`, that are used to specify EEM specific actions.
The system information Tcl command extensions, such as `sys_reqinfo_routername`, that are used to obtain general system information.

- Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.
- The `context_save` and `context_retrieve` Tcl command extensions that are used to save Tcl variables for use by other policies.

The following example Tcl code shows the code to query an event and log a message as part of the body section.

```tcl
# Query the event info and log a message.
array set arr_einfo [event_reqinfo]
if {$_errno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                 $_err_sub_num $_err_sub_err $_err_posix_err $_err_str]
    error $result
}

global timer_type timer_time_sec
set timer_type $arr_einfo(timer_type)
set timer_time_sec $arr_einfo(timer_time_sec)

# Log a message.
set msg [format "timer event: timer type %s, time expired %s" 
          $timer_type [clock format $timer_time_sec]]
action_syslog priority info msg $msg
if {$_errno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                 $_err_sub_num $_err_sub_err $_err_posix_err $_err_str]
    error $result
}
```

### EEM Entry Status

The entry status part of an EEM policy is used to determine if a prior policy has been run for the same event, and to determine the exit status of the prior policy. If the `_entry_status` variable is defined, a prior policy has already run for this event. The value of the `_entry_status` variable determines the return code of the prior policy.

Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

### EEM Exit Status

When a policy finishes running its code, an exit value is set. The exit value is used by the Embedded Event Manager to determine whether or not to apply the default action for this event, if any. A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.
EEM Policies and Cisco Error Number

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable _cerrno. Whenever _cerrno is set, four other Tcl global variables are derived from _cerrno and are set along with it (_cerr_sub_num, _cerr_sub_err, _cerr_posix_err, and _cerr_str).

For example, the `action_syslog` command in the example below sets these global variables as a side effect of the command execution:

```tcl
action_syslog priority warning msg "A sample message generated by action_syslog"
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
```

_cerrno: 32-Bit Error Return Values

The _cerrno set by a command can be represented as a 32-bit integer of the following form:

```
XYSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSS
```

For example, the following error return value might be returned from an EEM Tcl command extension:

```
862439AE
```

This number is interpreted as the following 32-bit value:

```
10000110001001000011100110101110
```

This 32-bit integer is divided up into the five variables shown in the table below.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XY</td>
<td>The error class (indicates the severity of the error). This variable corresponds to the first two bits in the 32-bit error return value; 10 in the case above, which indicates <code>CERR_CLASS_WARNING</code>. See the table below for the four possible error class encodings specific to this variable.</td>
</tr>
<tr>
<td>SSSSSSSSSSSSS</td>
<td>The subsystem number that generated the most recent error (13 bits = 8192 values). This is the next 13 bits of the 32-bit sequence, and its integer value is contained in $_cerr_sub_num.</td>
</tr>
<tr>
<td>EEEEEE</td>
<td>The subsystem specific error number (8 bits = 256 values). This segment is the next 8 bits of the 32-bit sequence, and the string corresponding to this error number is contained in $_cerr_sub_err.</td>
</tr>
<tr>
<td>PPPPPP</td>
<td>The pass-through POSIX error code (9 bits = 512 values). This represents the last of the 32-bit sequence, and the string corresponding to this error code is contained in $_cerr_posix_err.</td>
</tr>
</tbody>
</table>

Error Class Encodings for XY
The first variable, XY, references the possible error class encodings shown in the table below.

**Table 178: Error Class Encodings**

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Error Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>CERR_CLASS_SUCCESS</td>
</tr>
<tr>
<td>01</td>
<td>CERR_CLASS_INFO</td>
</tr>
<tr>
<td>10</td>
<td>CERR_CLASS_WARNING</td>
</tr>
<tr>
<td>11</td>
<td>CERR_CLASS_FATAL</td>
</tr>
</tbody>
</table>

An error return value of zero means SUCCESS.

**Procedure**

**Step 1**

*enable*

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device> enable

**Step 2**

*show event manager policy available detailed*  *policy-filename*

Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The **detailed** keyword was introduced for the *show event manager policy available* and the *show event manager policy registered* commands. Depending on your release, you must copy one of the two Tcl scripts from the configuration examples section in this document (see the Programming Policies with Tcl Sample Scripts Example, on page 1683). In the following example, details about the sample policy tm_cli_cmd.tcl are displayed on the screen.

**Example:**

Device# show event manager policy available detailed tm_cli_cmd.tcl

**Step 3**

Cut and paste the contents of the sample policy displayed on the screen to a text editor.

Use the edit and copy functions to move the contents from the device to a text editor on another device. Use the text editor to edit the policy as a Tcl script.

**Step 4**

Define the required *event_register* Tcl command extension.

Choose the appropriate *event_register* Tcl command extension from the table below for the event that you want to detect, and add it to the policy.

**Table 179: EEM Event Registration Tcl Command Extensions**

<table>
<thead>
<tr>
<th>Event Registration Tcl Command Extensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_register_appl</td>
</tr>
<tr>
<td>event_register_cli</td>
</tr>
<tr>
<td>event_register_counter</td>
</tr>
</tbody>
</table>
### Event Registration Tcl Command Extensions

<table>
<thead>
<tr>
<th>Command Extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_register_gold</td>
</tr>
<tr>
<td>event_register_interface</td>
</tr>
<tr>
<td>event_register_ioswdsysmon</td>
</tr>
<tr>
<td>event_register_ipsla</td>
</tr>
<tr>
<td>event_register_nf</td>
</tr>
<tr>
<td>event_register_none</td>
</tr>
<tr>
<td>event_register_oid</td>
</tr>
<tr>
<td>event_register_process</td>
</tr>
<tr>
<td>event_register_resource</td>
</tr>
<tr>
<td>event_register_rf</td>
</tr>
<tr>
<td>event_register_routing</td>
</tr>
<tr>
<td>event_register_rpc</td>
</tr>
<tr>
<td>event_register_snmp</td>
</tr>
<tr>
<td>event_register_snmp_notification</td>
</tr>
<tr>
<td>event_register_snmp_object</td>
</tr>
<tr>
<td>event_register_syslog</td>
</tr>
<tr>
<td>event_register_timer</td>
</tr>
<tr>
<td>event_register_timer_subscriber</td>
</tr>
<tr>
<td>event_register_track</td>
</tr>
<tr>
<td>event_register_wdsysmon</td>
</tr>
</tbody>
</table>

**Step 5**

Add the appropriate namespace under the ::cisco hierarchy.

Policy developers can use the new namespace ::cisco in Tcl policies in order to group all the extensions used by Cisco IOS EEM. There are two namespaces under the ::cisco hierarchy, and the table below shows which category of EEM Tcl command extension belongs under each namespace.
Table 180: Cisco IOS EEM Namespace Groupings

<table>
<thead>
<tr>
<th>Namespace</th>
<th>Category of Tcl Command Extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>::cisco::eem</td>
<td>EEM event registration</td>
</tr>
<tr>
<td></td>
<td>EEM event information</td>
</tr>
<tr>
<td></td>
<td>EEM event publish</td>
</tr>
<tr>
<td></td>
<td>EEM action</td>
</tr>
<tr>
<td></td>
<td>EEM utility</td>
</tr>
<tr>
<td></td>
<td>EEM context library</td>
</tr>
<tr>
<td></td>
<td>EEM system information</td>
</tr>
<tr>
<td>::cisco::lib</td>
<td>SMTP library</td>
</tr>
</tbody>
</table>

Note: Make sure that you import the appropriate namespaces or use the qualified command names when using the above commands.

Step 6

Program the must defines section to check for each environment variable that is used in this policy.

This is an optional step. Must defines are a section of the policy that tests whether any EEM environment variables that are required by the policy are defined before the recovery actions are taken. The must defines section is not required if the policy does not use any EEM environment variables. EEM environment variables for EEM scripts are Tcl global variables that are defined external to the policy before the policy is run. To define an EEM environment variable, use the Embedded Event Manager configuration command `event manager environment` CLI command. By convention all Cisco EEM environment variables begin with “_” (an underscore). In order to avoid future conflict, customers are urged not to define new variables that start with “_”.

Note: You can display the Embedded Event Manager environment variables set on your system by using the `show event manager environment` privileged EXEC command.

For example, Embedded Event Manager environment variables defined by the sample policies include e-mail variables. The sample policies that send e-mail must have the variables shown in the table below set in order to function properly.

The table below describes the e-mail-specific environment variables used in the sample EEM policies.
Table 181: E-mail-Specific Environmental Variables Used by the Sample Policies

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_email_server</td>
<td>A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.</td>
<td>The e-mail server name can be in any one of the following template formats: • username:password@host • username@host • host</td>
</tr>
<tr>
<td>_email_to</td>
<td>The address to which e-mail is sent.</td>
<td><a href="mailto:engineering@example.com">engineering@example.com</a></td>
</tr>
<tr>
<td>_email_from</td>
<td>The address from which e-mail is sent.</td>
<td><a href="mailto:devtest@example.com">devtest@example.com</a></td>
</tr>
<tr>
<td>_email_cc</td>
<td>The address to which the e-mail must be copied.</td>
<td><a href="mailto:manager@example.com">manager@example.com</a></td>
</tr>
</tbody>
</table>

The following example of a must define section shows how to program a check for e-mail-specific environment variables.

Example of Must Defines

Example:

```tcl
if {![info exists _email_server]} {
    set result "Policy cannot be run: variable _email_server has not been set"
    error $result $errorInfo
}
if {![info exists _email_from]} {
    set result "Policy cannot be run: variable _email_from has not been set"
    error $result $errorInfo
}
if {![info exists _email_to]} {
    set result "Policy cannot be run: variable _email_to has not been set"
    error $result $errorInfo
}
if {![info exists _email_cc]} {
    set result "Policy cannot be run: variable _email_cc has not been set"
    error $result $errorInfo
}
```

Step 7

Program the body of the script.

In this section of the script, you can define any of the following:

- The `event_reqinfo` event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as `action_syslog`, that are used to specify EEM specific actions.
- The system information Tcl command extensions, such as `sys_reqinfo_routename`, that are used to obtain general system information.
• The **context_save** and **context_retrieve** Tcl command extensions that are used to save Tcl variables for use by other policies.

• Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.

**Step 8**
Check the entry status to determine if a policy has previously run for this event.

If the prior policy is successful, the current policy may or may not require execution. Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

**Step 9**
Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.

A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.

**Step 10**
Set Cisco Error Number (_cerrno) Tcl global variables.

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable _cerrno. Whenever _cerrno is set, four other Tcl global variables are derived from _cerrno and are set along with it (_cerr_sub_num, _cerr_sub_err, _cerr_posix_err, and _cerr_str).

For example, the **action_syslog** command in the example below sets these global variables as a side effect of the command execution:

**Example:**

```tcl
action_syslog priority warning msg "A sample message generated by action_syslog
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
```

**Step 11**
Save the Tcl script with a new filename, and copy the Tcl script to the device.

Embedded Event Manager policy filenames adhere to the following specification:

• An optional prefix--Mandatory.--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl_text.tcl.

• A filename body part containing a two-character abbreviation (see EEM Policies and Cisco Error Number, on page 1663) for the first event specified; an underscore character part; and a descriptive field part further identifying the policy.

• A filename suffix part defined as .tcl.

For more details, see the Cisco File Naming Convention for EEM, on page 1647.

Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Cisco IOS Configuration Fundamentals Configuration Guide.

Copy the file to the flash file system on the device--typically bootflash:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Cisco IOS Configuration Fundamentals Configuration Guide.
Step 12 configure terminal
Enters global configuration mode.
Example:
Device# configure terminal

Step 13 event manager directory user \{library path\} policy path
Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on disk0 is specified as the directory for storing user library files.
Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on bootflash is specified as the directory for storing user library files.
Example:
Device(config)# event manager directory user library disk0:/user_library
Device(config)# event manager directory user library bootflash:/user_library

Step 14 event manager policy policy-filename \{type \{system user\}\} [trap]
Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named cl_mytest.tcl is registered as a user-defined policy.
Example:
Device(config)# event manager policy cl_mytest.tcl type user

Step 15 Cause the policy to execute, and observe the policy.
To test that the policy runs, generate the conditions that will cause the policy to execute and observe that the policy runs as expected.

Step 16 Use debugging techniques if the policy does not execute correctly.
Use the Cisco IOS debug event manager CLI command with its various keywords to debug issues. Refer to the Troubleshooting Tips, on page 1669 for details about using Tcl-specific keywords.

---

Troubleshooting Tips

- Use the debug event manager tcl commands CLI command to debug issues with Tcl extension commands. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands they are passing to the CLI are valid.

- The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. Use the debug event manager tcl cli-library CLI command to debug issues with the CLI library.

- The SMTP library allows users to send e-mail messages to an SMTP e-mail server. Use the debug event manager tcl smtp_library CLI command to debug issues with the SMTP library. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands they are passing to the SMTP library are valid.
• Tcl is a flexible language that allows you to override commands. For example, you can modify the `set` command and create a version of the `set` command that displays a message when a scalar variable is set. When the `set` command is entered in a policy, a message is displayed anytime a scalar variable is set, and this provides a way to debug scalar variables. To view an example of this debugging technique, see the Tracing Tcl set Command Operations Example, on page 1695.

To view examples of the some of these debugging techniques, see the Debugging Embedded Event Manager Policies Examples, on page 1693.

Creating an EEM User Tcl Library Index

Perform this task to create an index file that contains a directory of all the procedures contained in a library of Tcl files. This task allows you to test library support in EEM Tcl. In this task, a library directory is created to contain the Tcl library files, the files are copied into the directory, and an index (tclIndex) is created that contains a directory of all the procedures in the library files. If the index is not created, the Tcl procedures will not be found when an EEM policy is run that references a Tcl procedure.

Procedure

Step 1
On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.

The following example files can be used to create a tclIndex on a workstation running the Tcl shell:

**lib1.tcl**

Example:

```tcl
proc test1 {} {
  puts "In procedure test1"
}
proc test2 {} {
  puts "In procedure test2"
}
```

**lib2.tcl**

Example:

```tcl
proc test3 {} {
  puts "In procedure test3"
}
```

Step 2
**tclsh**

Use this command to enter the Tcl shell.

Example:

```bash
workstation% tclsh
```

Step 3
**auto_mkindex  directory_name  *.tcl**

Use the `auto_mkindex` command to create the tclIndex file. The tclIndex file that contains a directory of all the procedures contained in the Tcl library files. We recommend that you run auto_mkindex inside a directory.
because there can only be a single tclIndex file in any directory and you may have other Tcl files to be grouped together. Running auto_mkindex in a directory determines which tcl source file or files are indexed using a specific tclIndex.

**Example:**

```
workstation% auto_mkindex eem_library *.tcl
```

The following example TclIndex is created when the lib1.tcl and lib2.tcl files are in a library file directory and the `auto_mkindex` command is run.

```
tclIndex
# Tcl autoload index file, version 2.0
# This file is generated by the "auto_mkindex" command
# and sourced to set up indexing information for one or
# more commands. Typically each line is a command that
# sets an element in the auto_index array, where the
# element name is the name of a command and the value is
# a script that loads the command.

set auto_index(test1) [list source [file join $dir lib1.tcl]]
set auto_index(test2) [list source [file join $dir lib1.tcl]]
set auto_index(test3) [list source [file join $dir lib2.tcl]]
```

---

**Step 4**

Copy the Tcl library files and the tclIndex file to the directory used for storing user library files on the target device.

**Step 5**

Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl library support in EEM.

```
libtest.tcl
Example:
```

```
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

global auto_index auto_path
puts [array names auto_index]
if { [catch {test1} result]} {
    puts "calling test1 failed result = $result $auto_path"
}
if { [catch {test2} result]} {
    puts "calling test2 failed result = $result $auto_path"
}
if { [catch {test3} result]} {
    puts "calling test3 failed result = $result $auto_path"
}
```

**Step 6**

`enable`
Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 7  
configure terminal

Enables global configuration mode.

Example:

Device# configure terminal

Step 8  
event manager directory user library  path

Use this command to specify the EEM user library directory; this is the directory to which the files were copied.

Example:

Device(config)# event manager directory user library disk2:/eem_library

Step 9  
event manager directory user policy  path

Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

Example:

Device(config)# event manager directory user policy disk2:/eem_policies

Step 10  
event manager policy  policy-name [type {system | user} [trap ]

Use this command to register a user-defined EEM policy. In this example, the policy named libtest.tcl is registered.

Example:

Device(config)# event manager policy libtest.tcl

Step 11  
event manager run  policy-name

Use this command to manually run an EEM policy. In this example, the policy named libtest.tcl is run to test the Tcl support in EEM. The example output shows that the test for Tcl support in EEM was successful.

Example:

Device(config)# event manager run libtest.tcl

The following output is displayed:
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test1
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test2
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test3
Creating an EEM User Tcl Package Index

Perform this task to create a Tcl package index file that contains a directory of all the Tcl packages and version information contained in a library of Tcl package files. Tcl packages are supported, depending on your release, using the Tcl package keyword.

Tcl packages are located in either the EEM system library directory or the EEM user library directory. When a package require Tcl command is executed, the user library directory is searched first for a pkgIndex.tcl file. If the pkgIndex.tcl file is not found in the user directory, the system library directory is searched. In this task, a Tcl package directory--the pkgIndex.tcl file--is created in the appropriate library directory using the pkg_mkIndex command to contain information about all of the Tcl packages contained in the directory along with version information. If the index is not created, the Tcl packages will not be found when an EEM policy is run that contains a package require Tcl command.

Using the Tcl package support in EEM, users can gain access to packages such as XML_RPC for Tcl. When the Tcl package index is created, a Tcl script can easily make an XML-RPC call to an external entity.

---

Note

Packages implemented in C programming code are not supported in EEM.

---

Procedure

Step 1
On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.

Step 2
tclsh
Use this command to enter the Tcl shell.

Example:
workstation% tclsh

Step 3
pkg_mkindex directory_name *.tcl
Use the pkg_mkindex command to create the pkgIndex file. The pkgIndex file contains a directory of all the packages contained in the Tcl library files. We recommend that you run pkg_mkindex inside a directory because there can only be a single pkgIndex file in any directory and you may have other Tcl files to be grouped together. Running pkg_mkindex in a directory determines which Tcl package file or files are indexed using a specific pkgIndex.

Example:
workstation% pkg_mkindex eem_library *.tcl

The following example pkgIndex is created when some Tcl package files are in a library file directory and the pkg_mkindex command is run.

pkgIndex

Example:

# Tcl package index file, version 1.1
# This file is generated by the "pkg_mkIndex" command
Step 4  Copy the Tcl library files and the pkgIndex file to the directory used for storing user library files on the target device.

Step 5  Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl package support in EEM.

packagetest.tcl

Example:

```tcl
::cisco::eem::event_register_none maxrun 1000000.000
#
# test if xmlrpc available
#
# Namespace imports
# namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
#
package require xmlrpc
puts "Did you get an error?"
```

Step 6  enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 7  configure terminal

Enables global configuration mode.

Example:

Device# configure terminal

Step 8  event manager directory user library  path

Use this command to specify the EEM user library directory; this is the directory to which the files in were copied.

Example:

Device(config)# event manager directory user library disk2:/eem_library

Step 9  event manager directory user policy  path
Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

Example:

Device(config)# event manager directory user policy disk2:/eem_policies

Step 10  

event manager policy  policy-name [type {system | user} [trap]]

Use this command to register a user-defined EEM policy. In this example, the policy named packagetest.tcl is registered.

Example:

Device(config)# event manager policy packagetest.tcl

Step 11  

event manager run  policy-name

Use this command to manually run an EEM policy. In this example, the policy named packagetest.tcl is run to test the Tcl package support in EEM.

Example:

Device(config)# event manager run packagetest.tcl

Configuration Examples for Writing Embedded Event Manager Policies Using Tcl

Assigning a Username for a Tcl Session Examples

The following example shows how to set a username to be associated with a Tcl session. If you are using authentication, authorization, and accounting (AAA) security and implement authorization on a command basis, you should use the event manager session cli username command to set a username to be associated with a Tcl session. The username is used when a Tcl policy executes a CLI command. TACACS+ verifies each CLI command using the username associated with the Tcl session that is running the policy. Commands from Tcl policies are not usually verified because the device must be in privileged EXEC mode to register the policy. In the example, the username is yourname, and this is the username that is used whenever a CLI command session is initiated from within an EEM policy.

configure terminal
  event manager session cli username yourname
end

EEM Event Detector Demo Examples

EEM Sample Policy Descriptions

This configuration example features some of the sample EEM policies:

• ap_perf_test_base_cpu.tcl—Is run to measure the the CPU performance of EEM policies.
• **no_perf_test_init.tcl**—Is run to measure the CPU performance of EEM policies.

• **sl_intf_down.tcl**—Is run when a configurable syslog message is logged. It executes up to two configurable CLI commands and e-mails the results.

• **tm_cli_cmd.tcl**—Is run using a configurable CRON entry. It executes a configurable CLI command and e-mails the results.

• **tm_crash_reporter.tcl**—Is run 5 seconds after it is registered and 5 seconds after the device boots up. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable `_crash_reporter_url`.

• **tm_fsys_usage.tcl**—This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message is displayed if disk space usage crosses configurable thresholds.

### Event Manager Environment Variables for the Sample Policies

Event manager environment variables are Tcl global variables that are defined external to the EEM policy before the policy is registered and run. The sample policies require three of the e-mail environment variables to be set; only `_email_cc` is optional. Other required and optional variable settings are outlined in the following tables.

The table below describes the EEM environment variables that must be set before the **ap_perf_test_base_cpu.tcl** sample policy is run.

**Table 182: Environment Variables Used in the ap_perf_test_base_cpu.tcl Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_perf_iterations</td>
<td>The number of iterations over which to run the measurement.</td>
<td>100</td>
</tr>
<tr>
<td>_perf_cmd1</td>
<td>The first non interactive CLI command that is executed as part of the measurement test. This variable is optional and need not be specified.</td>
<td>enable</td>
</tr>
<tr>
<td>_perf_cmd2</td>
<td>The second non interactive CLI command that is as part of the measurement test. To use _perf_cmd2, _perf_cmd1 must be defined. This variable is optional and need not be specified.</td>
<td>show version</td>
</tr>
<tr>
<td>_perf_cmd3</td>
<td>The third non interactive CLI command that is as part of the measurement test. To use _perf_cmd3, _perf_cmd1 must be defined. This variable is optional and need not be specified.</td>
<td>show interface counters protocol status</td>
</tr>
</tbody>
</table>

The table below describes the EEM environment variables that must be set before the **no_perf_test_init.tcl** sample policy is run.

**Table 183: Environment Variables Used in the no_perf_test_init.tcl Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_perf_iterations</td>
<td>The number of iterations over which to run the measurement.</td>
<td>100</td>
</tr>
</tbody>
</table>
The table below describes the EEM environment variables that must be set before the sl_intf_down.tcl sample policy is run.

**Table 184: Environment Variables Used in the sl_intf_down.tcl Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_config_cmd1</td>
<td>The first configuration command that is executed.</td>
<td>interface Ethernet1/0</td>
</tr>
<tr>
<td>_config_cmd2</td>
<td>The second configuration command that is executed. This variable is optional and need not be specified.</td>
<td>no shutdown</td>
</tr>
<tr>
<td>_syslog_pattern</td>
<td>A regular expression pattern match string that is used to compare syslog messages to determine when the policy runs.</td>
<td>.*UPDOWN.<em>FastEthernet0/0.</em></td>
</tr>
</tbody>
</table>

The table below describes the EEM environment variables that must be set before the tm_cli_cmd.tcl sample policy is run.

**Table 185: Environment Variables Used in the tm_cli_cmd.tcl Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_cron_entry</td>
<td>A CRON specification that determines when the policy will run.</td>
<td>0-59/1 0-23/1 * * 0-7</td>
</tr>
<tr>
<td>_show_cmd</td>
<td>The CLI command to be executed when the policy is run.</td>
<td>show version</td>
</tr>
</tbody>
</table>

The table below describes the EEM environment variables that must be set before the tm_crash_reporter.tcl sample policy is run.
Table 186: Environment Variables Used in the tm_crash_reporter.tcl Policy

<table>
<thead>
<tr>

<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_crash_reporter_debug</td>
<td>A value that identifies whether debug information for tm_crash_reporter.tcl will be enabled. This variable is optional and need not be specified.</td>
<td>1</td>
</tr>
<tr>
<td>_crash_reporter_url</td>
<td>The URL location to which the crash report is sent.</td>
<td><a href="http://www.example.com/fm/interface_tm.cgi">http://www.example.com/fm/interface_tm.cgi</a></td>
</tr>
</tbody>
</table>

The table below describes the EEM environment variables that must be set before the tm_fsys_usage.tcl sample policy is run.

Table 187: Environment Variables Used in the tm_fsys_usage.tcl Policy

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_tm_fsys_usage_cron</td>
<td>A CRON specification that is used in the event_register Tcl command extension. If unspecified, the tm_fsys_usage.tcl policy is triggered once per minute. This variable is optional and need not be specified.</td>
<td>0-59/1 0-23/1 * * 0-7</td>
</tr>
<tr>
<td>_tm_fsys_usage_debug</td>
<td>When this variable is set to a value of 1, disk usage information is displayed for all entries in the system. This variable is optional and need not be specified.</td>
<td>1</td>
</tr>
<tr>
<td>_tm_fsys_usage_freebytes</td>
<td>Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed. This variable is optional and need not be specified.</td>
<td>disk2:98000000</td>
</tr>
<tr>
<td>_tm_fsys_usage_percent</td>
<td>Disk usage percentage thresholds for systems or specific prefixes. If the disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems. This variable is optional and need not be specified.</td>
<td>nvram:25 disk2:5</td>
</tr>
</tbody>
</table>

Registration of Some EEM Policies

Some EEM policies must be unregistered and then reregistered if an EEM environment variable is modified after the policy is registered. The event_register_xxx statement that appears at the start of the policy contains some of the EEM environment variables, and this statement is used to establish the conditions under which the policy is run. If the environment variables are modified after the policy has been registered, the conditions may become invalid. To avoid any errors, the policy must be unregistered and then reregistered. The following variables are affected:

- _cron_entry in the tm_cli_cmd.tcl policy
- _syslog_pattern in the sl_intf_down.tcl policy
**Basic Configuration Details for All Sample Policies**

To allow e-mail to be sent from the Embedded Event Manager, the **hostname** and **ip domain-name** commands must be configured. The EEM environment variables must also be set. After a Cisco IOS image has been booted, use the following initial configuration, substituting appropriate values for your network. The environment variables for the tm_fsys_usage sample policy (see the table above) are all optional and are not listed here:

```console
hostname cpu
ip domain-name example.com
event manager environment _email_server ms.example.net
event manager environment _email_to username@example.net
event manager environment _email_from engineer@example.net
event manager environment _email_cc projectgroup@example.net
event manager environment _cron_entry 0-59/2 0-23/1 * * 0-7
event manager environment _show_cmd show event manager policy registered
event manager environment _syslog_pattern .*UPDOWN.*FastEthernet0/0
event manager environment _config_cmd1 interface Ethernet1/0
event manager environment _config_cmd2 no shutdown
event manager environment _crash_reporter_debug 1
event manager environment _crash_reporter_url
http://www.example.com/fm/interface_tm.cgi
end
```

**Using the Sample Policies**

This section contains the following configuration scenarios to demonstrate how to use the some sample Tcl policies:

**Running the Mandatory.go_*-tcl Sample Policy**

There are GOLD TCL scripts for each test which runs as a part of GOLD EEM Policy. You can modify the TCL script for the test, specify the consecutive failure count, and also change the default corrective action. For example, one could chose to power down a linecard card, instead of reset or other CLI based actions.

For each registered test, a default TCL script is available, which can be registered with the system, and matches with the default action. This can be then overridden by modifying these scripts.

The following table shows a list of the mandatory polices that GOLD installed into EEM. Each of the policies performs some sort of action such as resetting the card or disabling the port.

<table>
<thead>
<tr>
<th><strong>GOLD Tcl Scripts</strong></th>
<th><strong>Test</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory.go_asicsync.tcl</td>
<td>TestAsicSync</td>
</tr>
<tr>
<td>Mandatory.go_bootup.tcl</td>
<td>Common for all bootstrap tests.</td>
</tr>
<tr>
<td>Mandatory.go_fabric.tcl</td>
<td>TestFabricHealth</td>
</tr>
<tr>
<td>Mandatory.go_fabrich0.tcl</td>
<td>TestFabricCh0Health</td>
</tr>
<tr>
<td>Mandatory.go_fabrich1.tcl</td>
<td>TestFabricCh1Health</td>
</tr>
<tr>
<td>Mandatory.go_ipsec.tcl</td>
<td>TestIPSecEncrypDecrypPkt</td>
</tr>
<tr>
<td>Mandatory.go_mac.tcl</td>
<td>TestMacNotification</td>
</tr>
<tr>
<td>Mandatory.go_nondislp.tcl</td>
<td>TestNonDisruptiveLoopback</td>
</tr>
</tbody>
</table>
The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the mandatory.go_*.*tcl policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

```plaintext
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy Mandatory.go_spuriousisr.tcl
end
show event manager policy registered
show event manager environment
```

**Running the ap_perf_test_base_cpu.tcl and no_perf_test_init.tcl Sample Policies**

These sample policies measures the CPU performance of EEM policies. The policies help find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables _perf_cmd1 and, optionally, _perf_cmd2 and _perf_cmd3.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, enter the `service timestamps debug datatime msec` command and then you can register the ap_perf_test_base_cpu.tcl and no_perf_test_init.tcl policies with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

The policies ap_perf_test_base_cpu.tcl and no_perf_test_init.tcl need to be registered together, as they run as a test suite. You can run the no_perf_test_init.tcl policy to start the tests. Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable _perf_iterations. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```plaintext
enable
show event manager policy registered
show event manager policy available
show event manager environment
configure terminal
  service timestamps debug datatime msec
  event manager environment _perf_iterations 100
  event manager policy ap_perf_test_base_cpu.tcl
  event manager policy no_perf_test_init.tcl
end
```
show event manager policy registered
show event manager policy available
show event manager environment
event manager run no_perf_test_init.tcl

Running the no_perf_test_init.tcl Sample Policy

This sample policy measures the the cpu performance of EEM policies. The policy helps to find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables _perf_cmd1 and, optionally, _perf_cmd2 and _perf_cmd3.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the enable command at the device prompt. The device enters privileged EXEC mode, where you can enter the show event manager policy registered command to verify that no policies are currently registered. The next command is the show event manager policy available command to display which policies are available to be installed. After you enter the configure terminal command to reach global configuration mode, you can register the no_perf_test_init.tcl policy with EEM using the event manager policy command. Exit from global configuration mode and enter the show event manager policy registered command again to verify that the policy has been registered.

Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable _perf_iterations. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy no_perf_test_init.tcl
end
show event manager policy registered
show event manager environment

Running the sl_intf_down.tcl Sample Policy

This sample policy demonstrates the ability to modify the configuration when a syslog message with a specific pattern is logged. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variables _config_cmd1 and, optionally, _config_cmd2. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the enable command at the device prompt. The device enters privileged EXEC mode, where you can enter the show event manager policy registered command to verify that no policies are currently registered. The next command is the show event manager policy available command to display which policies are available to be installed. After you enter the configure terminal command to reach global configuration mode, you can register the sl_intf_down.tcl policy with EEM using the event manager policy command. Exit from global configuration mode and enter the show event manager policy registered command again to verify that the policy has been registered.

The policy runs when an interface goes down. Enter the show event manager environment command to display the current environment variable values. Unplug the cable (or configure a shutdown) for the interface specified in the syslog_pattern EEM environment variable. The interface goes down, prompting the syslog daemon to log a syslog message about the interface being down, and the syslog event detector is called.
The syslog event detector reviews the outstanding event specifications and finds a match for interface status change. The EEM server is notified, and the server runs the policy that is registered to handle this event--sl_intf_down.tcl.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy sl_intf_down.tcl
end
show event manager policy registered
show event manager environment
```

**Running the tm_cli_cmd.tcl Sample Policy**

This sample policy demonstrates the ability to periodically execute a CLI command and to e-mail the results. The CRON specification “0-59/2 0-23/1 ** 0-7” causes this policy to be run on the second minute of each hour. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variable _show_cmd. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the tm_cli_cmd.tcl policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command to verify that the policy has been registered.

The timer event detector triggers an event for this case periodically according to the CRON string set in the EEM environment variable _cron_entry. The EEM server is notified, and the server runs the policy that is registered to handle this event--tm_cli_cmd.tcl.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_cli_cmd.tcl
end
show event manager policy registered
```

**Running the tm_crash_reporter.tcl Sample Policy**

This sample policy demonstrates the ability to send an HTTP-formatted crash report to a URL location. If the policy registration is saved in the startup configuration file, the policy is triggered 5 seconds after bootup. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable _crash_reporter_url. A CGI script, interface_tm.cgi, has been created to receive the URL from the tm_crash_reporter.tcl policy and save the crash information in a local database on the target URL machine.

A Perl CGI script, interface_tm.cgi, has been created and is designed to run on a machine that contains an HTTP server and is accessible by the device that runs the tm_crash_reporter.tcl policy. The interface_tm.cgi script parses the data passed into it from tm_crash_reporter.tcl and appends the crash information to a text file, creating a history of all crashes in the system. Additionally, detailed information on each crash is stored.
in three files in a crash database directory that is specified by the user. Another Perl CGI script, crash_report_display.cgi, has been created to display the information stored in the database created by the interface_tm.cgi script. The crash_report_display.cgi script should be placed on the same machine that contains interface_tm.cgi. The machine should be running a web browser such as Internet Explorer or Netscape. When the crash_report_display.cgi script is run, it displays the crash information in a readable format.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the tm_crash_reporter.tcl policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command to verify that the policy has been registered.

```plaintext
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_crash_reporter.tcl
end
show event manager policy registered
```

**Running the tm_fsys_usage.tcl Sample Policy**

This sample policy demonstrates the ability to periodically monitor disk space usage and report through syslog when configurable thresholds have been crossed.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the **enable** command at the device prompt. The device enters privileged EXEC mode, where you can enter the **show event manager policy registered** command to verify that no policies are currently registered. The next command is the **show event manager policy available** command to display which policies are available to be installed. After you enter the **configure terminal** command to reach global configuration mode, you can register the tm_fsys_usage.tcl policy with EEM using the **event manager policy** command. Exit from global configuration mode and enter the **show event manager policy registered** command again to verify that the policy has been registered. If you had configured any of the optional environment variables that are used in the tm_fsys_usage.tcl policy, the **show event manager environment** command displays the configured variables.

```plaintext
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_fsys_usage.tcl
end
show event manager policy registered
show event manager environment
```

**Programming Policies with Tcl Sample Scripts Example**

This section contains some of the sample policies that are included as EEM system policies. For more details about these policies, see the EEM Event Detector Demo Examples, on page 1675.
Mandatory.go_ipsec.tcl Sample Policy

The following sample policy for the TestIPSecEncrypDecrypPkt Test.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
# 1. query the information of latest triggered eem event
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
puts "GOLD EEM TCL policy for TestIPSecEncrypDecrypPkt"
#set msg [format "array=\%s", array names arr_einfo]
#puts "$msg $msg"
#set msg $arr_einfo(msg)
set card $arr_einfo(card)
set sub_card $arr_einfo(sub_card)
set overall_result $arr_einfo(overall_result)
#puts "GOLD event msg recleved: \$card/\$sub_card overall_result= \$overall_result"
```
# 2. execute the user-defined config commands
if [catch {cli_open} result] {
    error $result $errorInfo
} else {
    array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
    error $result $errorInfo
}
# Use "diagn action mod mod# test testname default" command
# for default platform action
if [catch {cli_exec $cli1(fd) "diagnostic action mod $card test TestIPSecEncrypD
ecrypPkt default"} result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
    error $result $errorInfo
}

ap_perf_test_base_cpu.tcl Sample Policy

The following sample policy measures the CPU performance of EEM policies.

::cisco::eem::event_register_appl sub_system 798 type 9999
#----------------------------------
# EEM policy used for measuring the cpu performance of EEM policies.
# July 2005, Cisco EEM team
# Copyright (c) 2005, 2006 by cisco Systems, Inc.
# All rights reserved.
#------------------
### Input arguments:
### arg1 $iter - current iteration count
### The following EEM environment variables are used:
### _perf_iterations (mandatory) - number of iterations over which we
### will run our measurement.
### Example:
### event manager environment _perf_iterations 100
### _perf_cmd1 (optional) - optional non interactive cli command
### to be executed as part of the measurement test.
### Example:
### event manager environment _perf_cmd1 enable
### _perf_cmd2 (optional) - optional non interactive cli command
### to be executed as part of the measurement test.
### To use _perf_cmd2, _perf_cmd1 MUST be defined.
### Example:
### event manager environment _perf_cmd2 show ver
### _perf_cmd3 (optional) - optional non interactive cli command
### to be executed as part of the measurement test.
To use _perf_cmd3, _perf_cmd1 MUST be defined.

Example:

```
event manager environment _perf_cmd3 show int counters protocol status
```

Description:
- Iterate through _perf_iterations of this policy.
- It is up to the user to calculate the average execution time based on the system timestamps.
- Optional commands _perf_cmd1, _perf_cmd2 and _perf_cmd3 are executed if defined.
- A value of 100 is a good starting point.

Outputs:
- Console output.

Usage example:

```
>conf t
>service timestamps debug datetime msec
>event manager environment _perf_iterations 100
>event manager policy ap_perf_base_cpu.tcl
>event manager policy no_perf_test_init.tcl
>end
>event manager run no_perf_test_init.tcl
```

```
Oct 16 14:57:17.284: %SYS-5-CONFIG_I: Configured from console by console
>event manager run no_perf_test_init.tcl
```

```
Oct 16 19:32:02.772: %HA_EM-6-LOG: eem_policy/no_perf_test_init.tcl: EEM performance test start
Oct 16 19:32:03.115: %HA_EM-6-LOG: eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 1
...
```

The user must calculate execution time and average time of execution.
- In this example, total time = 19:32:36.936 - 19:32:02.772 = 34.164 milliseconds
- Average script execution time = 341.64 milliseconds

```
# check if all the env variables we need exist
# If any of them doesn't exist, print out an error msg and quit
if {![info exists _perf_iterations]} {
    set result "Policy cannot be run: variable _perf_iterations has not been set"
    error $result $errorInfo
}
```

```
# ensure our target iteration count > 0
if {$_perf_iterations <= 0} {
    set result "Policy cannot be run: variable _perf_iterations <= 0"
    error $result $errorInfo
}
```

```
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

```
# query the event info
array set arr_einfo [event_reqinfo]

        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \ 
$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    }
    exit 0
}
# cause the next iteration to run
event_publish sub_system 798 type 9999 arg1 $iter
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n subsystem_num $$_cerr_sub_num $$_cerr_sub_err $$_cerr_posix_err $$_cerr_str"
    error $result
}

**tm_cli_cmd.tcl Sample Policy**

The following sample policy runs a configurable CRON entry. The policy executes a configurable Cisco IOS CLI command and e-mails the results. An optional log file can be defined to which the output is appended with a timestamp.

```tcl
::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240
#---------------------------------------------------------------------------------
# EEM policy that will periodically execute a cli command and email the
# results to a user.
# July 2005, Cisco EEM team
# Copyright (c) 2005 by cisco Systems, Inc.
# All rights reserved.
#---------------------------------------------------------------------------------
### The following EEM environment variables are used:
###
### _cron_entry (mandatory) - A CRON specification that determines
### when the policy will run. See the
### IOS Embedded Event Manager
### documentation for more information
### on how to specify a cron entry.
### Example: _cron_entry
### 0-59/1 0-23/1 * * 0-7
###
### _log_file (mandatory without _email_....)
### - A filename to append the output to.
### If this variable is defined, the
### output is appended to the specified
### file with a timestamp added.
### Example: _log_file
### bootflash:/my_file.log
###
### _email_server (mandatory without _log_file)
### - A Simple Mail Transfer Protocol (SMTP)
### mail server used to send e-mail.
### Example: _email_server
### mailserver.example.com
###
### _email_from (mandatory without _log_file)
### - The address from which e-mail is sent.
### Example: _email_from
### devtest@example.com
###
### _email_to (mandatory without _log_file)
### - The address to which e-mail is sent.
### Example: _email_to
### engineering@example.com
###
### _email_cc (optional)
### - The address to which the e-mail must
### be copied.
### Example: _email_cc
### manager@example.com
###
### _show_cmd (mandatory)
### - The CLI command to be executed when
### the policy is run.
### Example: _show_cmd
### show version
###
# check if all required environment variables exist

    error $result $errorInfo
} else {
    array set cli1 $result
} if [catch {cli_exec $cli1(fd) "en"} result] { 
    error $result $errorInfo
} # save exact execution time for command
set time_now [clock seconds]
# execute command
if [catch {cli_exec $cli1(fd) $_show_cmd} result] { 
    error $result $errorInfo
} else {
    set cmd_output $result
}
sl_intf_down.tcl Sample Policy

The following sample policy runs when a configurable syslog message is logged. The policy executes a configurable CLI command and e-mails the results.

::cisco::eem::event_register_syslog occurs 1 pattern $_syslog_pattern maxrun 90

# EEM policy to monitor for a specified syslog message.
# Designed to be used for syslog interface-down messages.
# When event is triggered, the given config commands will be run.
#
# July 2005, Cisco EEM team
#
# Copyright (c) 2005 by cisco Systems, Inc.
# All rights reserved.

### The following EEM environment variables are used:
### _syslog_pattern (mandatory) - A regular expression pattern match string
that is used to compare syslog messages
to determine when policy runs
### Example: _syslog_pattern
   .*UPDOWN.*FastEthernet0/0.*
### _email_server (mandatory) - A Simple Mail Transfer Protocol (SMTP)
mail server used to send e-mail.
### Example: _email_server
   mailserver.example.com
### _email_from (mandatory) - The address from which e-mail is sent.
### Example: _email_from
   devtest@example.com
### _email_to (mandatory) - The address to which e-mail is sent.
### Example: _email_to
   engineering@example.com
### _email_cc (optional) - The address to which the e-mail must be copied.
### Example: _email_cc
   manager@example.com
### _config_cmd1 (optional) - The first configuration command that is executed.
### Example: _config_cmd1
   interface Ethernet1/0
### _config_cmd2 (optional) - The second configuration command that is executed.
### Example: _config_cmd2
   no shutdown

# check if all the env variables we need exist
# If any of them doesn't exist, print out an error msg and quit
if {![info exists _email_server]} {

Debugging Embedded Event Manager Policies Examples

The following examples show how to debug the CLI library and the SMTP library.

Debugging the CLI Library

The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. An Embedded Event Manager debug command has been provided for users of this library. The command to enable CLI library debugging is `debug event manager tcl cli_library`. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands that they are passing to the CLI are valid.

Example of the debug event manager tcl cli_library Command

This example uses the sample policy `sl_intf_down.tcl`. When triggered, `sl_intf_down.tcl` passes a configuration command to the CLI through the CLI library. The command passed in below is `show event manager environment`. This command is not a valid command in configuration mode. Without the `debug` command enabled, the output is shown below:

```
00:00:57:sl_intf_down.tcl[0]:config_cmds are show eve man env
00:00:57:%SYS-5-CONFIG_I:Configured from console by vty0
```

Notice that with the output above the user would not know whether or not the command succeeded in the CLI. With the `debug event manager tcl cli_library` command enabled, the user sees the following:

```
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : CTL : cli_open called.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson>
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson>enable
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson#configure terminal
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : Enter configuration commands, one
per line. End with CNTL/Z.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson(config)#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson(config)#show event manager
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : ^
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : % Invalid input detected at '^'
marker.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson(config)#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson(config)#end
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : CTL : cli_close called.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson#exit
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#
01:17:07: %SYS-5-CONFIG_I: Configured from console by vty0
```

The output above shows that `show event manager environment` is an invalid command in configuration mode. The IN keyword signifies all data passed in to the TTY through the CLI library. The OUT keyword signifies all data read back from the TTY through the CLI library. The CTL keyword signifies helper functions used in the CLI library. These helper functions are used to set up and remove connections to the CLI.

Debugging the SMTP Library

The SMTP library allows users to send e-mail messages to an SMTP e-mail server. An Embedded Event Manager debug command has been provided for users of this library. The command to enable SMTP library debugging is `debug event manager tcl smtp_library`. When enabled, this command displays all data that is
passed in and read back from the SMTP library routines. This data helps ensure users that the commands that they are passing to the SMTP library are valid.

**Example of the debug event manager tcl smtp_library Command**

This example uses the sample policy tm_cli_cmd.tcl. When triggered, tm_cli_cmd.tcl runs the command `show event manager policy available system` through the CLI library. The result is then mailed to a user through the SMTP library. The output will help debug any issues related to using the SMTP library.

With the `debug event manager tcl smtp_library` command enabled, the users see the following on the console:

```
00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 220 XXXX.example.com ESMTP XXXX 1.1.0; Tue, 25 Jun 2002 14:20:39 -0700 (PDT)

```

Tracing Tcl set Command Operations Example

Tcl is a flexible language. One of the flexible aspects of Tcl is that you can override commands. In this example, the Tcl set command is renamed as _set and a new version of the set command is created that displays a message containing the text “setting” and appends the scalar variable that is being set. This example can be used to trace all instances of scalar variables being set.

rename set _set
proc set {var args} {
    puts [list setting $var $args]
    uplevel _set $var $args
}

When this is placed in a policy, a message is displayed anytime a scalar variable is set, for example:

02:17:58: sl_intf_down.tcl[0]: setting test_var 1

RPC Event Detector Example

TCL script (rpccli.tcl):
::cisco::eem::event_register_rpc
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
proc run_cli { clist } {
    set rbuf ""
    if {([llength $clist] < 1)} {
        return -code ok $rbuf
    }
    if {([catch {cli_open} result]} {
        return -code error $result
    } else {
        array set cliarr $result
    }
    if {([catch {cli_exec $cliarr(fd) "enable"} result]} {
        return -code error $result
    }
    if {([catch {cli_exec $cliarr(fd) "term length 0"} result]} {
        return -code error $result
    }
    foreach cmd $clist {
        if {([catch {cli_exec $cliarr(fd) $cmd} result]} {
            return -code error $result
        }
        append rbuf $result
    }
    if {([catch {cli_close $cliarr(fd) $cliarr(tty_id)} result]} {
        puts "WARNING: $result"
    }
    return -code ok $rbuf
}
proc run_cli_interactive { clist } {
    set rbuf ""
    if {([llength $clist] < 1)} {
        return -code ok $rbuf
    }
    if {([catch {cli_open} result]} {
        return -code error $result
    } else {
        array set cliarr $result
    }
}
if {catch {cli_exec $cliarr(fd) "enable"} result} {
  return -code error $result
}

if {catch {cli_exec $cliarr(fd) "term length 0"} result} {
  return -code error $result
}

foreach cmd $clist {
  array set sendexp $cmd
  if {catch {cli_write $cliarr(fd) $sendexp(send)} result} {
    return -code error $result
  }
  foreach response $sendexp(responses) {
    array set resp $response
    if {catch {cli_read_pattern $cliarr(fd) $resp(expect)} result} {
      return -code error $result
    }
    if {catch {cli_write $cliarr(fd) $resp(reply)} result} {
      return -code error $result
    }
  }
  if {catch {cli_read $cliarr(fd)} result} {
    return -code error $result
  }
  append rbuf $result
}

if {catch {cli_close $cliarr(fd) $cliarr(tty_id)} result} {
  puts "WARNING: $result"
}

return -code ok $rbuf

array set arr_einfo [event_reqinfo]
set args $arr_einfo(argc)
set cmds [list]
for { set i 0 } { $i < $args } { incr i } {
  set arg "arg${i}"
  # Split each argument on the '^' character. The first element is
  # the command, and each subsequent element is a prompt followed by
  # a response to that prompt.
  set cmdlist (split $arr_einfo($arg) "^")
  set cmdarr(send) [lindex $cmdlist 0]
  set cmdarr(responses) [list]
  if { [expr ($[llength $cmdlist] - 1) % 2] != 0 } {
    return -code 88
  }
  set cmdarr(responses) [list]
  for { set j 1 } { $j < [llength $cmdlist] } { incr j 2 } {
    set resps(expect) [lindex $cmdlist $j]
    set resps(reply) [lindex $cmdlist [expr $j + 1]]
    lappend cmdarr(responses) [array get resps]
  }
  lappend cmds [array get cmdarr]
}

set rc [catch {run_cli_interactive $cmds} output]
if { $rc != 0 } {
  error $output $errorInfo
  return -code 88
}

puts $output

Signed Tcl Scripts

The Signed Tcl Scripts feature allows you to create a certificate to generate a digital signature and sign a Tool Command Language (Tcl) script with that digital signature. This feature also allows you to work with existing scripts and certificates. The digital signature is verified for authentication and then run with trusted access to the Tcl interpreter. If the script does not contain the digital signature, the script may run in a limited mode for untrusted scripts, or may not run at all.

- Prerequisites for Signed Tcl Scripts, on page 1699
- Restrictions for Signed Tcl Scripts, on page 1699
- Information About Signed Tcl Scripts, on page 1700
- How to Configure Signed Tcl Scripts, on page 1701

- Additional References, on page 1717
- Feature Information for Signed Tcl Scripts, on page 1718
- Glossary, on page 1718
- Notices, on page 1719

Prerequisites for Signed Tcl Scripts

For this feature to work, the Cisco public key infrastructure (PKI) configuration trustpoint commands must be enabled.

Restrictions for Signed Tcl Scripts

For this feature to work, you must be running the following:

- Cisco IOS Crypto image
- OpenSSL Version 0.9.7a or above
- Expect
Information About Signed Tcl Scripts

The Signed Tcl Scripts feature introduces security for the Tcl scripts. This feature allows you to create a certificate to generate a digital signature and sign a Tcl script with that digital signature. This certificate examines the Tcl scripts prior to running them. The script is checked for a digital signature from Cisco. In addition, third parties may also sign a script with a digital signature. You may wish to sign your own internally developed Tcl scripts or you could use a script developed by a third party. If the script contains the correct digital signature, it is believed to be authentic and runs with full access to the Tcl interpreter. If the script does not contain the digital signature, the script may be run in a limited mode, known as Safe Tcl mode, or may not run at all.

To create and use signed Tcl scripts, you should understand the following concepts:

Cisco PKI

Cisco PKI provides certificate management to support security protocols such as IP security (IPsec), secure shell (SSH), and secure socket layer (SSL). A PKI is composed of the following entities:

• Peers communicating on a secure network
• At least one certification authority (CA) that grants and maintains certificates
• Digital certificates, which contain information such as the certificate validity period, peer identity information, encryption keys that are used for secure communication, and the signature of the issuing CA
• An optional registration authority (RA) to offload the CA by processing enrollment requests
• A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides you with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every routing device participating in the secured communication is enrolled in the PKI in a process where the routing device generates a Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has its identity validated by a trusted routing device (also known as a CA or trustpoint).

After each routing device enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

RSA Key Pair

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data that is sent to the device. The private key is kept on the device and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.
RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

**Certificate and Trustpoint**

A certification authority (CA), also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an internal CA, which is the Cisco Certificate Server.

**How to Configure Signed Tcl Scripts**

**Generating a Key Pair**

The key pair consists of a private key and a public key. The private key is intended to be kept private, accessible only to the creator. The public key is generated from the private key and is intended to be known to the public.

To generate a key pair, use the `openssl genrsa` command and then the `openssl rsa` command.

**Procedure**

**Step 1**  `openssl genrsa -out private-key-file bit-length`

This command generates a private key that is `bit-length` bits long and writes the key to the `private-key-file` file.

**Example:**

```
Host% openssl genrsa -out privkey.pem 2048
```

Generating RSA private key, 2048 bit long modulus
........++++
..........................................................+++ e is 65537 (0x10001)

**Step 2**  `ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```
The privkey.pem file contains the private key generated using the `openssl genrsa` command.

**Step 3**

`openssl rsa -in private-key-file -pubout -out public-key-file`

This command generates a public key based on the specified private key in the `private-key-file` file and writes the public key to the `public-key-file` file.

**Example:**

```
Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
```

**Step 4**

`ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

The pubkey.pem file contains the public key generated from the private key using the `openssl rsa` command.

---

**Generating a Certificate**

Perform this task to generate a certificate. To generate an X.509 certificate, use the `openssl req` command.

**Procedure**

**Step 1**

`openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`

This command creates an X.509 certificate, with full access to a private key that is stored in the `private-key-file` file, and stores the certificate in the `certificate-file` file. The certificate is configured to expire in `expiration-days` days.

To complete the command, enter the following Distinguished Name (DN) information when prompted:

- Country name
- State or province name
- Organization name
- Organizational unit name
- Common name
- Email address
At each prompt, text enclosed in square brackets indicates the default value that will be used if you do not enter a value before you press Enter.

This example shows how to create an X.509 certificate that has full access to the private key in the privkey.pem file. The certificate is written to the cert.pem file and will expire 1095 days after the creation date.

**Example:**

```
Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
```

You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value, If you enter '.', the field will be left blank.

```
Country Name (2 letter code) [GB]: US
State or Province Name (full name) [Berkshire]: California
Locality Name (eg, city) [Newbury]: San Jose
Organization Name (eg, company) [My Company Ltd]: Cisco Systems, Inc.
Organizational Unit Name (eg, section) []: DEPT_ACCT
Common Name (eg, your name or your server's hostname) []: Jane
Email Address []: janedoe@company.com
```

**Step 2**

```
is -l
```

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The cert.pem file contains the X.509 certificate created using the `openssl req` command.

---

**Signing the Tcl Scripts**

Perform this task to sign the Tcl scripts. You will need to sign the Tcl file and output in OpenSSL document in pkcs7 (PKCS#7) format.

To sign the Tcl file, use the `openssl smime` command with the `-sign` keyword.
Verifying the Signature

Perform this task to verify that the signature matches the data, use the `openssl smime` command with the `-verify` keyword. The original Tcl content must be provided in the input file, because the file does not have the original content.

**Procedure**

**Step 1**

```sh
touch $signature
```

This command verifies the signed Tcl file stored in DER PKCS#7 format in `signed-tcl-file` using the trusted Certificate Authority (CA) certificates in `certificate-file` and then writes the detached content to the file `tcl-file`.

**Example:**

```sh
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
```

puts hello
puts "argc = $argc"

---

**Verifying the Signature**

Perform this task to verify that the signature matches the data, use the `openssl smime` command with the `-verify` keyword. The original Tcl content must be provided in the input file, because the file does not have the original content.

**Procedure**

**Step 1**

```sh
touch $signature
```

This command verifies the signed Tcl file stored in DER PKCS#7 format in `signed-tcl-file` using the trusted Certificate Authority (CA) certificates in `certificate-file` and then writes the detached content to the file `tcl-file`.

**Example:**

```sh
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
```

puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful

Note  The SSL command page describes -in filename as the input message to be encrypted or signed or the MIME message to be decrypted or verified. For more information, go to http://www.openssl.org/.

Step 2  ls -l

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

Example:

Host% ls -l

total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

The hello file contains the content detached from the signed Tcl file hello.pk7 by running the openssl smime command with the -verify keyword. If the verification was successful, the signer’s certificates are written to the X.509 certificate in the cert.pem file.

---

**Converting the Signature into Nonbinary Data**

Perform this task to convert the signature from binary to nonbinary data.

**Procedure**

**Step 1**  xxd -ps signed-tcl-file > nonbinary-signature-file

This command converts the signature in signed-tcl-file from binary to nonbinary data and stores it as a hexadecimal dump in the file nonbinary-signature-file.

Example:

Host% xxd -ps hello.pk7 > hello.hex

**Step 2**  Create a script that displays #Cisco Tcl Signature V1.0 in the first line and inserts a comment character (#) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “_sig” to the name of the input file.

In this example the cat command is used to display the contents of the script file named my_append.

Example:

Host% cat my_append
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
    set new_line {#}
    append new_line $line
    puts $my_new_handle $new_line
}
close $my_new_handle
close $my_handle

**Step 3**
Run the script, supplying the name of the file containing the nonbinary signature file (*nonbinary-signature-file*) as the input argument.

In this example, the *my_append* script is run with the nonbinary signature file *hello.hex* specified as input. The output file will be named *hello.hex_sig*.

**Example:**

Host% *my_append* *hello.hex*

**Step 4**
`ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

Host% *ls -l*

```plaintext
total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
-rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.hex_sig
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rwxr--r-- 1 janedoe eng12 444 Jun 13 10:22 my_append
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The *hello.hex* file contains nonbinary data (stored as a hexadecimal dump) converted from the binary signature in the signed Tcl file *hello.pk7*. The *my_append* file contains the script that inserts a comment character at the beginning of each line of the input file. The *hello.hex_sig* file is the file created by running the *my_append* script on the nonbinary signature file.

**Step 5**
`cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script`

This command appends the contents of the nonbinary signature file (*commented-nonbinary-signature-file*) to the signed Tcl file stored in DER PKCS#7 format (in the *signed-tcl-file* file). The concatenated output is written to the file *signed-tcl-script*.

**Example:**

Host% *cat* *hello* *hello.hexSig* > *hello.tcl*
Step 6: cat signed-tcl-script

This command displays the contents of the file `signed-tcl-script`, which is the concatenation of content detached from the signed Tcl file and the nonbinary signature file.

Example:

```
Host% cat hello.tcl
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"

```
Configuring the Device with a Certificate

Perform this task to configure the device with a certificate.

Before you begin
You must already have a Cisco IOS Crypto image; otherwise you cannot configure a certificate.

Procedure

Step 1 enable
Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2 configure terminal
Enters global configuration mode.

Example:

Device# configure terminal

Step 3 crypto pki trustpoint name
Declares the device is to use the Certificate Authority (CA) mytrust and enters ca-trustpoint configuration mode.

Example:

Device(config)# crypto pki trustpoint mytrust

Step 4 enrollment terminal
Specifies manual cut-and-paste certificate enrollment. When this command is enabled, the device displays the certificate request on the console terminal, allowing you to enter the issued certificate on the terminal.
**Step 5**

Exits ca-trustpoint configuration mode and returns to global configuration mode.

**Example:**

```
Device(ca-trustpoint)# exit
```

**Step 6**

**crypto pki authenticate**  

**name**

Retrieves the CA certificate and authenticates it. Check the certificate fingerprint if prompted.

**Note**

Because the CA signs its own certificate, you should manually authenticate the public key of the CA by contacting the CA administrator when you perform this command.

**Example:**

```
Device(config)# crypto pki authenticate mytrust
```

**Step 7**

At the prompt, enter the base-encoded CA certificate.

**Example:**

```
Enter the base 64 encoded CA certificate. End with a blank line or the word "quit" on a line by itself.
```

Certificate has the following attributes:

- **Fingerprint MD5:** 1E327DBB 330936EB 2FB8EACB 4FD1133E
- **Fingerprint SHA1:** EE7FF9F4 05148842 B9D50FAC D76FDC9C E0703246

% Do you accept this certificate? [yes/no]: yes

Trustpoint CA certificate accepted.

% Certificate successfully imported
**Step 8** scripting tcl secure-mode  
Enables signature verification of the interactive Tcl scripts.

Device(config)# scripting tcl secure-mode

**Step 9** scripting tcl trustpoint name *name*  
Associates an existing configured trustpoint name with a certificate to verify Tcl scripts.

Device(config)# scripting tcl trustpoint name mytrust

**Step 10** scripting tcl trustpoint untrusted {execute | safe-execute | terminate}  
(Optional) Allows the interactive Tcl scripts to run regardless of the scripts failing in the signature check or in untrusted mode using one of the three keywords: **execute**, **safe-execute**, or **terminate**.

  - **execute** --Executes Tcl scripts even if the signature verification fails. If the **execute** keyword is configured, signature verification is not at all performed.

  **Note** Use of this keyword is usually not recommended because the signature verification is not at all performed.

The **execute** keyword is provided for internal testing purposes and to provide flexibility. For example, in a situation where a certificate has expired but the other configurations are valid and you want to work with the existing configuration, then you can use the execute keyword to work around the expired certificate.

  - **safe-execute** --Allows the script to run in safe mode. You can use the tclsafe command and also enter the interactive Tcl shell safe mode to explore the safe mode Tcl commands that are available. In order to get a better understanding of what is available in this limited safe mode, use the tclsafe Exec command to explore the options.

  - **terminate** --Stops any script from running and reverts to default behavior. The default policy is to terminate. When the last trustpoint name is removed, the untrusted action is also removed. The untrusted action cannot be entered until at least one trustpoint name is configured for Tcl.

The following example shows how to execute the Tcl script in safe mode using the **safe-execute** keyword when the signature verification fails.

Device(config)# scripting tcl trustpoint untrusted safe-execute

**Step 11** exit  
Exits global configuration mode and returns to privileged EXEC mode.

Device(config)# exit

**Step 12** tclsafe
(Optional) Enables the interactive Tcl shell untrusted safe mode. This allows you to manually run Tcl commands from the Cisco command line interface in untrusted safe mode.

Device# tclsafe

Example:

---

**Verifying the Trustpoint**

To display the trustpoints that are configured in the device, use the `show crypto pki trustpoints` command.

**Procedure**

**Step 1** `enable`

This command enables privileged EXEC mode.

Example:

Device> enable

**Step 2** `show crypto pki trustpoints`

This command displays the trustpoints that are configured in the device.

Example:

Device# show crypto pki trustpoints

Trustpoint mytrust:
  Subject Name:
  eaa-janedoe@cisco.com
cn=Jane
ou=DEPT_ACCT
c=Cisco
l=San Jose
st=California
c=US
  Serial Number: 00
  Certificate configured.

---

**Verifying the Signed Tcl Script**

To verify that the Signed Tcl Script is properly running, use the `debug crypto pki transactions` command and the `tclsh` command.
Procedure

Step 1  enable
This command enables privileged EXEC mode.

Example:

Device> enable

Step 2  debug crypto pki transactions
This command display debugging messages for the trace of interaction (message type) between the CA and the device.

Example:

Device# debug crypto pki transactions

Crypto PKI Trans debugging is on

Step 3  tclsh  flash:signed-tcl-file
This command executes the Tcl script in Tcl shell.

Note  The file should be a signed Tcl file.

Example:

Device# tclsh flash:hello.tcl

hello
argc = 0
argv =
argv0 = flash:hello.tcl
tcl_interactive = 0
device#
*Apr 21 04:46:18.563: CRYPTO_PKI: locked trustpoint mytrust, refcount is 1
*Apr 21 04:46:18.563: The PKCS #7 message has 0 verified signers.
*Apr 21 04:46:18.563: CRYPTO_PKI: Success on PKCS7 verify!
*Apr 21 04:46:18.563: CRYPTO_PKI: unlocked trustpoint mytrust, refcount is 0

What to Do Next

• To get an overview of Crypto, refer to the “Part 5: Implementing and Managing a PKI” section of the Security Configuration Guide.
Configuration Examples for Signed Tcl Script

Generating a Key Pair Example

The following example shows how to generate the key pair—a private key and a public key:

**Generate a Private Key: Example**

```bash
Host% openssl genrsa -out privkey.pem 2048
Generating RSA private key, 2048 bit long modulus
........+++                                                                 
| e is 65537 (0x10001) |
| 1679 Jun 12 14:55 privkey.pem |
```

**Generate a Public Key from the Private Key**

```bash
Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
```

**Generating a Certificate Example**

The following example shows how to generate a certificate:

```bash
Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
```

You are about to be asked to enter information that will be incorporated into your certificate request.

What you are about to enter is what is called a Distinguished Name or a DN. There are quite a few fields but you can leave some blank
For some fields there will be a default value, If you enter ".", the field will be left blank.

```
-----
Country Name (2 letter code) [GB]:US
State or Province Name (full name) [Berkshire]:California
Locality Name (eg, city) [Newbury]:San Jose
Organization Name (eg, company) [My Company Ltd]:Cisco Systems, Inc.
Organizational Unit Name (eg, section) [DEPT ACCT]:
Common Name (eg, your name or your server's hostname) []:Jane
Email Address []:janedoe@company.com
```

```bash
Host% ls -l
```

```
1659 Jun 12 15:01 cert.pem
1679 Jun 12 14:55 privkey.pem
451 Jun 12 14:57 pubkey.pem
```
Signing the Tcl Scripts Example

The following example shows how to sign the Tcl scripts:

```
Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary
Host% ls -l
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

Verifying the Signature Example

The following example shows how to verify the signature:

```
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful
```

Converting the Signature with Nonbinary Data Example

The following example shows how to convert the Tcl signature with nonbinary data:

```
#Cisco Tcl Signature V1.0
Then append the signature file to the end of the file.
Host% xxd -ps hello.pk7 > hello.hex
Host% cat my_append
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
    set new_line {#}
    append new_line $line
    puts $my_new_handle $new_line
}
close $my_new_handle
close $my_handle
Host% my_append hello.hex
Host% ls -l
total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
```

Configuring the Device with a Certificate Example

The following example shows how to configure the device with a certificate:

crypto pki trustpoint mytrust
  enrollment terminal

!  
!  

crypto pki authentication mytrust
crypto pki certificate chain mytrust
certificate ca 00

### Feature Information for Signed Tcl Scripts

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Glossary

CA—certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPsec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

certificates—Electronic documents that bind a user's or device's name to its public key. Certificates are commonly used to validate a digital signature.

CRL—certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

IPsec—IP security

peer certificate—Certificate presented by a peer, which contains the peer's public key and is signed by the trustpoint CA.
PKI—public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

RA—registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

RSA keys—Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your device.

SHA1—Secure Hash Algorithm 1

SSH—secure shell

SSL—secure socket layer

Notices

The following notices pertain to this software license.

OpenSSL Open SSL Project

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

License Issues

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

OpenSSL License:

Copyright © 1998-2007 The OpenSSL Project. All rights reserved.

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. All advertising materials mentioning features or use of this software must display the following acknowledgment: “This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/)”.
4. The names “OpenSSL Toolkit” and “OpenSSL Project” must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact openssl-core@openssl.org.

5. Products derived from this software may not be called “OpenSSL” nor may “OpenSSL” appear in their names without prior written permission of the OpenSSL Project.

6. Redistributions of any form whatsoever must retain the following acknowledgment:

“This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).”

THIS SOFTWARE IS PROVIDED BY THE OpenSSL PROJECT “AS IS” AND ANY EXPRESSED OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE OpenSSL PROJECT OR ITS CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

Original SSLeay License:

Copyright © 1995-1998 Eric Young (eay@cryptsoft.com). All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com).

The implementation was written so as to conform with Netscapes SSL.

This library is free for commercial and non-commercial use as long as the following conditions are adhered to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young’s, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

3. All advertising materials mentioning features or use of this software must display the following acknowledgement:

“This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)”.
The word ‘cryptographic’ can be left out if the routines from the library being used are not cryptography-related.

1. If you include any Windows specific code (or a derivative thereof) from the apps directory (application code) you must include an acknowledgement: “This product includes software written by Tim Hudson (tjh@cryptsoft.com)”.

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. The license and distribution terms for any publicly available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License].
EEM CLI Library Command Extensions

All command-line interface (CLI) library command extensions belong to the ::cisco::eem namespace. This library provides users the ability to run CLI commands and get the output of the commands in Tcl. Users can use commands in this library to spawn an exec and open a virtual terminal channel to it, write the command to execute to the channel so that the command will be executed by exec, and read back the output of the command.

There are two types of CLI commands: interactive commands and non-interactive commands.

For interactive commands, after the command is entered, there will be a "Q&A" phase in which the device will ask for different user options, and the user is supposed to enter the answer for each question. Only after all the questions have been answered properly will the command run according to the user’s options until completion.

For noninteractive commands, once the command is entered, the command will run to completion. To run different types of commands using an EEM script, different CLI library command sequences should be used, which are documented in the "Using the CLI Library to Run a Noninteractive Command" section and in the "Using the CLI Library to Run an Interactive Command" section in the cli_write Tcl command.

The vty lines are allocated from the pool of vty lines that are configured using the line vty CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

Your release may support XML-PI. For details about the XML-PI support, the new CLI library command extensions, and some examples of how to implement XML-PI, see EEM CLI Library XML-PI Support.

cli_close

Closes the exec process and releases the vty and the specified channel handler connected to the command-line interface (CLI).

**Syntax**

```plaintext
cli_close fd tty_id
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>(Mandatory) The CLI channel handler.</td>
</tr>
<tr>
<td>tty_id</td>
<td>(Mandatory) The TTY ID returned from the cli_open command extension.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set _errno**

Cannot close the channel.

cli_exec

Writes the command to the specified channel handler to execute the command. Then reads the output of the command from the channel and returns the output.

**Syntax**

```plaintext
cli_exec fd cmd
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>(Mandatory) The command-line interface (CLI) channel handler.</td>
</tr>
<tr>
<td>cmd</td>
<td>(Mandatory) The CLI command to execute.</td>
</tr>
</tbody>
</table>

**Result String**

The output of the CLI command executed.

**Set _errno**

Error reading the channel.
**cli_get_ttyname**

Returns the real and pseudo TTY names for a given TTY ID.

**Syntax**

```c
cli_get_ttyname tty_id
```

**Arguments**

| tty_id              | (Mandatory) The TTY ID returned from the `cli_open` command extension. |

**Result String**

```c
pty %s tty %s
```

**Set _errno**

None

---

**cli_open**

Allocates a vty, creates an EXEC command-line interface (CLI) session, and connects the vty to a channel handler. Returns an array including the channel handler.

**Note**

Each call to `cli_open` initiates a Cisco IOS EXEC session that allocates a Cisco IOS vty line. The vty remains in use until the `cli_close` routine is called. The vty lines are allocated from the pool of vty lines that are configured using the `line vty` CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

**Syntax**

```c
cli_open
```

**Arguments**

None

**Result String**

```c
"tty_id (%s) pty (%d) tty (%d) fd (%d)"
```
<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tty_id</td>
<td>TTY ID.</td>
</tr>
<tr>
<td>pty</td>
<td>PTY device name.</td>
</tr>
<tr>
<td>tty</td>
<td>TTY device name.</td>
</tr>
<tr>
<td>fd</td>
<td>CLI channel handler.</td>
</tr>
</tbody>
</table>

\[\text{Set \_cerrno}\]

- Cannot get pty for EXEC.
- Cannot create an EXEC CLI session.
- Error reading the first prompt.

**cli_read**

Reads the command output from the specified command-line interface (CLI) channel handler until the pattern of the device prompt occurs in the contents read. Returns all the contents read up to the match.

**Syntax**

```plaintext
cli_read fd
```

**Arguments**

- `fd` (Mandatory) The CLI channel handler.

**Result String**

All the contents read.

**Set \_cerrno**

Cannot get device name.

---

**Note**

This Tcl command extension will block waiting for the device prompt to show up in the contents read.

**cli_read_drain**

Reads and drains the command output of the specified command-line interface (CLI) channel handler. Returns all the contents read.
### Syntax

**cli_read_drain fd**

### Arguments

- **fd** *(Mandatory)* The CLI channel handler.

### Result String

All the contents read.

### cli_read_line

**cli_read_line**

Reads one line of the command output from the specified command-line interface (CLI) channel handler. Returns the line read.

### Syntax

**cli_read_line fd**

### Arguments

- **fd** *(Mandatory)* The CLI channel handler.

### Result String

The line read.

### Set_cerrno

None

---

**Note**

This Tcl command extension will block waiting for the end of line to show up in the contents read.

### cli_read_pattern

**cli_read_pattern**

Reads the command output from the specified command-line interface (CLI) channel handler until the pattern that is to be matched occurs in the contents read. Returns all the contents read up to the match.
The pattern matching logic attempts a match by looking at the command output data as it is delivered from the Cisco IOS command. The match is always done on the most recent 256 characters in the output buffer unless there are fewer characters available, in which case the match is done on fewer characters. If more than 256 characters in the output buffer are required for the match to succeed, the pattern will not match.

Syntax

cli_read_pattern fd ptn

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>(Mandatory) The CLI channel handler.</td>
</tr>
<tr>
<td>ptn</td>
<td>(Mandatory) The pattern to be matched when reading the command output from the channel.</td>
</tr>
</tbody>
</table>

Result String

All the contents read.

Set _cerrno

None

Note

This Tcl command extension will block waiting for the specified pattern to show up in the contents read.

cli_run

Iterates over the items in the clist and assumes that each one is a command-line-interface (CLI) command to be executed in the enable mode. On success, returns the output of all executed commands and on failure, returns error from the failure.

Syntax

cli_run clist

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clist</td>
<td>(Mandatory) The list of commands to be executed.</td>
</tr>
</tbody>
</table>

Result String

Output of all the commands that are executed or an error message.
**Set _cerrno**

None.

**Sample Usage**

The following example shows how to use the `cli_run` command extension.

```text
set clist [list {sh run} {sh ver} {sh event man pol reg}]
cli_run { clist }
```

**cli_run_interactive**

Provides a sublist to the clist which has three items. On success, returns the output of all executed commands and on failure, returns error from the failure. Also uses arrays when possible as a way of making things easier to read later by keeping expect and reply separated.

**Syntax**

```text
cli_run_interactive clist
```

**Arguments**

<table>
<thead>
<tr>
<th>clist</th>
<th>(Mandatory) List of three items:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• command – Command to be executed</td>
<td></td>
</tr>
<tr>
<td>• expect – A regular expression pattern match for the expected reply prompt</td>
<td></td>
</tr>
<tr>
<td>• responses – A list of possible responses to the reply prompt constructed as an array of two items:</td>
<td></td>
</tr>
<tr>
<td>• expect– A regular expression pattern match for a possible reply prompt</td>
<td></td>
</tr>
<tr>
<td>• reply– A reply for that expected prompt</td>
<td></td>
</tr>
</tbody>
</table>

**Result String**

Output of all the commands that are executed or an error message. As each command is executed its output is appended to a result variable. Upon exhaustion of the input list, the CLI channel is closed and the aggregate result is returned.

**Set _cerrno**

None.

**Sample Usage**

The following example shows how to clear counters for interface fa0/0 use the cli_run_interactive command extension.
set cmdarr(command) "clear counters fa0/0"
set cmdarr(responses) [list]
set resps(expect) {{confirm}}
set resps(reply) "y"
lappend cmdarr(responses) [array get resps]
set rc [catch {cli_run_interactive [list [array get cmdarr]]} result]

Possible errors raised include:

- cannot get pty for exec
- cannot spawn exec
- error reading the first prompt
- error reading the channel
- cannot close channel

### cli_write

Writes the command that is to be executed to the specified CLI channel handler. The CLI channel handler executes the command.

#### Syntax

`cli_write fd cmd`

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>(Mandatory) The CLI channel handler.</td>
</tr>
<tr>
<td>cmd</td>
<td>(Mandatory) The CLI command to execute.</td>
</tr>
</tbody>
</table>

#### Result String

None

#### Set _cerrno

None

#### Sample Usage

As an example, use configuration CLI commands to bring up Ethernet interface 1/0:

```bash
if [catch {cli_open} result] {
    puts stderr $result
    exit 1
} else {
    array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
    puts stderr $result
    exit 1
}
```
if {catch {cli_exec $cli1(fd) "config t"} result} {
    puts stderr $result
    exit 1
}
if {catch {cli_exec $cli1(fd) "interface Ethernet1/0"} result} {
    puts stderr $result
    exit 1
}
if {catch {cli_exec $cli1(fd) "no shut"} result} {
    puts stderr $result
    exit 1
}
if {catch {cli_exec $cli1(fd) "end"} result} {
    puts stderr $result
    exit 1
}
if {catch {cli_close $cli1(fd) $cli1(tty_id)} result} {
    puts stderr $result
    exit 1
}

Using the CLI Library to Run a Noninteractive Command

To run a noninteractive command, use the cli_exec command extension to issue the command, and then wait for the complete output and the device prompt. For example, the following shows the use of configuration CLI commands to bring up Ethernet interface 1/0:

if {catch {cli_open} result} {
    error $result $errorInfo
} else {
    set fd $result
}
if {catch {cli_exec $fd "en"} result} {
    error $result $errorInfo
}
if {catch {cli_exec $fd "config t"} result} {
    error $result $errorInfo
}
if {catch {cli_exec $fd "interface Ethernet1/0"} result} {
    error $result $errorInfo
}
if {catch {cli_exec $fd "no shut"} result} {
    error $result $errorInfo
}
if {catch {cli_exec $fd "end"} result} {
    error $result $errorInfo
}
if {catch {cli_close $fd} result} {
    error $result $errorInfo
}

Using the CLI Library to Run an Interactive Command

To run interactive commands, three phases are needed:

- Phase 1: Issue the command using the cli_write command extension.

- Phase 2: Q&A Phase. Use the cli_read_pattern command extension to read the question (the regular pattern that is specified to match the question text) and the cli_write command extension to write back the answers alternately.
• Phase 3: Noninteractive phase. All questions have been answered, and the command will run to completion.
Use the cli_read command extension to wait for the complete output of the command and the device prompt.

For example, use CLI commands to do squeeze bootflash: and save the output of this command in the Tcl variable cmd_output.

```tcl
if [catch {cli_open} result] {
    error $result $errorInfo
} else {
    array set cli1 $result
    if [catch { cli_exec $cli1(fd) "en"} result] {
        error $result $errorInfo
    }

    # Phase 1: issue the command
    if [catch {cli_write $cli1(fd) "squeeze bootflash:"} result] {
        error $result $errorInfo
    }

    # Phase 2: Q&A phase
    # wait for prompted question:
    # All deleted files will be removed. Continue? [confirm]
    if [catch {cli_read_pattern $cli1(fd) "All deleted"} result] {
        error $result $errorInfo
    }

    # write a newline character
    if [catch {cli_write $cli1(fd) "\n"} result] {
        error $result $errorInfo
    }

    # wait for prompted question:
    # Squeeze operation may take a while. Continue? [confirm]
    if [catch {cli_read_pattern $cli1(fd) "Squeeze operation"} result] {
        error $result $errorInfo
    }

    # write a newline character
    if [catch {cli_write $cli1(fd) "\n"} result] {
        error $result $errorInfo
    }

    # Phase 3: noninteractive phase
    # wait for command to complete and the router prompt
    if [catch {cli_read $cli1(fd)} result] {
        error $result $errorInfo
    } else {
        set cmd_output $result
    }

    if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
        error $result $errorInfo
    }
}
```

The following example causes a device to be reloaded using the CLI reload command. Note that the EEM action_reload command accomplishes the same result in a more efficient manner, but this example is presented to illustrate the flexibility of the CLI library for interactive command execution.

```tcl
# 1. execute the reload command
if [catch {cli_open} result] {
    error $result $errorInfo
} else {
    array set cli1 $result
```
if [catch {cli_exec $cli1(fd) "en"} result] {
    error $result $errorInfo
}
if [catch {cli_write $cli1(fd) "reload"} result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_read_pattern $cli1(fd) ".*(System configuration has been modified. Save\? \\[yes/no\]\): )"} result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_write $cli1(fd) "no"} result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_read_pattern $cli1(fd) ".*(Proceed with reload\? \\[confirm\]\])"} result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_write $cli1(fd) "y"} result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
    error $result $errorInfo
}

EEM 4.0 CLI Library XML-PI Support

EEM CLI Library XML-PI Support

XML Programmatic Interface (XML-PI) was introduced in Cisco IOS Release 12.4(22)T. XML-PI provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support to "screen-scrape" output.

The benefit of using the XML-PI command extensions is to facilitate the extraction of specific output information that is generated using a CLI show command. Most show commands return many fields within the output and currently a regular expression has to be used to extract specific information that may appear in the middle of a line. XML-PI support provides a set of Tcl library functions to facilitate the parsing of output from the IOS CLI format extension in the form of:

```tcl
show < show-command > | format
```
spec-file
}

where a spec-file is a concatenation of all Spec File Entries (SFE) for each show command currently supported. As part of the XML-PI project a default spec-file will be included in the IOS Release 12.4(22)T images. The default spec-file will have a small set of commands and the SFE for the commands will have a subset of the possible tags. If no spec-file is provided with the format command, the default spec-file is used.

For more general details about XML-PI, see the "XML-PI" module.
CHAPTER 80

EEM Context Library Command Extensions

All the Tcl context library command extensions belong to the ::cisco::eem namespace.

- `context_retrieve`, on page 1735
- `context_save`, on page 1738

context_retrieve

Retrieves Tcl variable(s) identified by the given context name, and possibly the scalar variable name, the array variable name, and the array index. Retrieved information is automatically deleted.

Note

Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the `context_retrieve` command extension) should also save it again (using the `context_save` command extension).

Syntax

```
context_retrieve ctxt [var] [index_if_array]
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxt</td>
<td>(Mandatory) Context name.</td>
</tr>
<tr>
<td>var</td>
<td>(Optional) Scalar variable name or array variable name. Defaults to a null string if this argument is not specified.</td>
</tr>
<tr>
<td>index_if_array</td>
<td>(Optional) The array index.</td>
</tr>
</tbody>
</table>

Note

The `index_if_array` argument will be ignored when the `var` argument is a scalar variable.

If `var` is unspecified, retrieves the whole variable table saved in the context.
If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

If var is specified, and index_if_array is specified, and var is an array variable, retrieves the value of the specified array element.

**Result String**

Resets the Tcl global variables to the state that they were in when the save was performed.

**Set _cerrno**

- A string displaying _cerrno, _cerr_sub_num, _cerr_sub_err, _cerr_posix_err, _cerr_str due to appl_reqinfo error.
- Variable is not in the context.

**Sample Usage**

The following examples show how to use the `context_save` and `context_retrieve` command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

**Example 1: Save**

If var is unspecified or if a pattern if specified, saves multiple variables to the context.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

**Example 1: Retrieve**

If var is unspecified, retrieves multiple variables from the context.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
} if {[info exists testvarb]} {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
} if {[info exists testvarc]} {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvare]} {
    action_syslog msg "testvare exists and is $testvare"
} else {
    action_syslog msg "testvare does not exist"
} if {[info exists testvarg]} {
    action_syslog msg "testvarg exists and is $testvarg"
} else {
    action_syslog msg "testvarg does not exist"
} if {[info exists testvarh]} {
    action_syslog msg "testvarh exists and is $testvarh"
} else {
    action_syslog msg "testvarh does not exist"
} if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
} if {[info exists testvarb]} {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
} if {[info exists testvarc]} {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvare]} {
    action_syslog msg "testvare exists and is $testvare"
} else {
    action_syslog msg "testvare does not exist"
} if {[info exists testvarg]} {
    action_syslog msg "testvarg exists and is $testvarg"
} else {
    action_syslog msg "testvarg does not exist"
} if {[info exists testvarh]} {
    action_syslog msg "testvarh exists and is $testvarh"
} else {
    action_syslog msg "testvarh does not exist"
} if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
} if {[info exists testvarb]} {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
} if {[info exists testvarc]} {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvare]} {
    action_syslog msg "testvare exists and is $testvare"
} else {
    action_syslog msg "testvare does not exist"
} if {[info exists testvarg]} {
    action_syslog msg "testvarg exists and is $testvarg"
} else {
    action_syslog msg "testvarg does not exist"
} if {[info exists testvarh]} {
    action_syslog msg "testvarh exists and is $testvarh"
} else {
    action_syslog msg "testvarh does not exist"
} if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
} if {[info exists testvarb]} {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
} if {[info exists testvarc]} {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvare]} {
    action_syslog msg "testvare exists and is $testvare"
} else {
    action_syslog msg "testvare does not exist"
} if {[info exists testvarg]} {
    action_syslog msg "testvarg exists and is $testvarg"
} else {
    action_syslog msg "testvarg does not exist"
} if {[info exists testvarh]} {
    action_syslog msg "testvarh exists and is $testvarh"
} else {
    action_syslog msg "testvarh does not exist"
} if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
} if {[info exists testvarb]} {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
} if {[info exists testvarc]} {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info exists testvard]} {
    action_syslog msg "testvard exists and is $testvard"
} else {
    action_syslog msg "testvard does not exist"
} if {[info existe
Example 2: Save

If var is specified, saves the value of var.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {{catch {context_save TESTCTX testvar} errmsg}} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 2: Retrieve

If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {{catch {set testvar [context_retrieve TESTCTX testvar]} errmsg}} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {{info exists testvar}} {
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar does not exist"
}
```

Example 3: Save

If var is specified, saves the value of var even if it is an array.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch {context_save TESTCTX testvar} errmsg}} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```
Example 3: Retrieve
If var is specified, and index_if_array is not specified, and var is an array variable, retrieves the entire array.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg]
} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}

if {[info exists testvar]} {
    action_syslog msg "testvar exists and is [array get testvar]"
} else {
    action_syslog msg "testvar does not exist"
}

Example 4: Save
If var is specified, saves the value of var even if it is an array.

array set testvar "testvar1 ok testvar2 not_ok"
if {
    [catch {context_save TESTCTX testvar} errmsg]
} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}

Example 4: Retrieve
If var is specified, and index_if_array is specified, and var is an array variable, retrieves the specified array element value.

context_save
Saves Tcl variables that match a given pattern in current and global namespaces with the given context name as identification. Use this Tcl command extension to save information outside of a policy. Saved information can be retrieved by a different policy using the context_retrieve command extension.
Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the `context_retrieve` command extension) should also save it again (using the `context_save` command extension).

### Syntax

```
context_save ctxt [pattern]
```

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ctxt</code></td>
<td>(Mandatory) Context name.</td>
</tr>
</tbody>
</table>
| `pattern`| (Optional) The glob-style pattern as used by the `string match` Tcl command. If this argument is not specified, the pattern defaults to the wildcard `*`. There are three constructs used in glob patterns:  
  - `*` = all characters  
  - `?` = 1 character  
  - `[abc]` = match one of a set of characters |

### Result String

None

### Set _cerrno

A string displaying `_cerrno`, `_cerr_sub_num`, `_cerr_sub_err`, `_cerr_posix_err`, `_cerr_str` due to `appl_setinfo` error.

### Sample Usage

The following examples show how to use the `context_save` and `context_retrieve` command extension functionality to save and retrieve data. The examples are shown in `save` and `retrieve` pairs.

**Example 1: Save**

If `var` is unspecified or if a pattern if specified, saves multiple variables to the context.

```bash
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```
Example 1: Retrieve

If var is unspecified, retrieves multiple variables from the context.

```plaintext
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
{[catch {foreach {var value} [context_retrieve TESTCTX] {set $var $value}} errmsg]}
action_syslog msg "context_retrieve failed: $errmsg"
} else {
action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvara]} {
action_syslog msg "testvara exists and is $testvara"
} else {
action_syslog msg "testvara does not exist"
}
if {[info exists testvarb]} {
action_syslog msg "testvarb exists and is $testvarb"
} else {
action_syslog msg "testvarb does not exist"
}
if {[info exists testvarc]} {
action_syslog msg "testvarc exists and is $testvarc"
} else {
action_syslog msg "testvarc does not exist"
}
```

Example 2: Save

If var is specified, saves the value of var.

```plaintext
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {[catch {context_save TESTCTX testvar} errmsg]} {
action_syslog msg "context_save failed: $errmsg"
} else {
action_syslog msg "context_save succeeded"
}
```

Example 2: Retrieve

If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

```plaintext
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {set testvar [context_retrieve TESTCTX testvar]} errmsg]} {
action_syslog msg "context_retrieve failed: $errmsg"
} else {
action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
action_syslog msg "testvar exists and is $testvar"
} else {
```
Example 3: Save
If var is specified, saves the value of var even if it is an array.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch {context_save TESTCTX testvar} errmsg}} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 3: Retrieve
If var is specified, and index_if_array is not specified, and var is an array variable, retrieves the entire array.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg}} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {{info exists testvar}} {
    action_syslog msg "testvar exists and is [array get testvar]"
} else {
    action_syslog msg "testvar does not exist"
}
```

Example 4: Save
If var is specified, saves the value of var even if it is an array.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch {context_save TESTCTX testvar} errmsg}} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 4: Retrieve
If var is specified, and index_if_array is specified, and var is an array variable, retrieves the specified array element value.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {{catch {set testvar [context_retrieve TESTCTX testvar testvar1]} errmsg}} {
```
action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar doesn't exist"
}
CHAPTER 81

EEM Event Registration Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

• An optional argument is shown within square brackets, for example:

[type ?]

• A question mark ? represents a variable to be entered.

• Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

Note

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

Note

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

event_register_appl

Registers for an application event. Use this Tcl command extension to run a policy when an application event is triggered following another policy’s execution of an `event_publish` Tcl command extension; the `event_publish` command extension publishes an application event.

In order to register for an application event, a subsystem must be specified. Either a Tcl policy or the internal Embedded Event Manager (EEM) API can publish an application event. If the event is being published by a policy, the sub_system argument that is reserved for a policy is 798.

**Syntax**

```
event_register_appl [tag ?] sub_system ? type ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>sub_system</td>
<td>(Mandatory) Number assigned to the EEM policy that published the application event. The number is set to 798 because all other numbers are reserved for Cisco use. If this argument is not specified, all components are matched.</td>
</tr>
<tr>
<td>type</td>
<td>(Mandatory) Event subtype within the specified event. The sub_system and type arguments uniquely identify an application event. If this argument is not specified, all types are matched. If you specify this argument, you must choose an integer between 1 and 4294967295, inclusive. There must be a match of component and type between the <code>event_publish</code> command extension and the <code>event_register_appl</code> command extension in order for the publishing and registration to work.</td>
</tr>
</tbody>
</table>
queue_priority | (Optional) Priority level at which the script will be queued:
• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
• queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note: The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSMMM format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

If multiple conditions exist, the application event will be raised when all the conditions are satisfied.

Result String
None

Set _cerrno
No

<td>Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.</td>
</tr>
<tr>
<td>event_type</td>
<td>Type of event.</td>
</tr>
<tr>
<td>event_type_string</td>
<td>An ASCII string that represents the name of the event for this event type.</td>
</tr>
</tbody>
</table>
### event_register_cli

Registers for a CLI event. Use this Tcl command extension to run a policy when a CLI command of a specific pattern is entered based on pattern matching performed against an expanded CLI command.

#### Note

The user can enter an abbreviated CLI command, such as `sh mem summary`, and the parser will expand the command to `show memory summary` to perform the matching.

#### Note

The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe character when redirection is used.

#### Syntax

```
event_register_cli [tag?] sync yes|no skip yes|no [occurs?] [period?] pattern? [default?] [enter] [questionmark] [tab] [mode] [queue_priority low|normal|high|last] [maxrun?] [nice 0|1]
```

#### Arguments

- **tag**: (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.

- **sync**: (Mandatory) A "yes" means that the policy (the event publish) will run synchronously with the CLI command; a "no" means that the event publish will be performed asynchronously with the CLI command. The event detector will be notified when the policy completes running. The exit status of the policy indicates whether or not the CLI command should be executed: if the exit status is zero, which means that the policy is executed successfully, the CLI command will not be executed; otherwise, the CLI command will be executed.
<table>
<thead>
<tr>
<th><strong>skip</strong></th>
<th>Mandatory if the <code>sync</code> argument is &quot;no&quot; and should not exist if the <code>sync</code> argument is &quot;yes.&quot; If the <code>skip</code> argument is &quot;yes,&quot; it means that the CLI command should not be executed. If the <code>skip</code> argument is &quot;no,&quot; it means that the CLI command should be executed. <strong>Caution</strong> When the <code>skip</code> argument is &quot;yes,&quot; unintended results may be produced if the pattern match is made for configuration commands because the CLI command that matches the regular expression will not be executed.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>occurs</strong></td>
<td>(Optional) The number of occurrences before the event is raised. If this argument is not specified, the event is raised on the first occurrence. If this argument is specified, it must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td><strong>period</strong></td>
<td>(Optional) Specifies a backward looking time window in which all CLI events must occur (the occurs clause must be satisfied) in order for an event to be published (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent event is used.</td>
</tr>
<tr>
<td><strong>pattern</strong></td>
<td>(Mandatory) Specifies the regular expression used to perform the CLI command pattern match.</td>
</tr>
<tr>
<td><strong>default</strong></td>
<td>(Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds.</td>
</tr>
</tbody>
</table>
| **queue_priority** | (Optional) Priority level at which the script will be queued:  
  • `queue_priority low`--Specifies that the script is to be queued at the lowest of the three priority levels.  
  • `queue_priority normal`--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
  • `queue_priority high`--Specifies that the script is to be queued at the highest of the three priority levels.  
  • `queue_priority last`--Specifies that the script is to be queued at the lowest priority level.  
If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published. **Note** The `queue_priority` argument specifies the queuing priority, but not the execution priority, of the script being registered.  
If this argument is not specified, the default queuing priority is normal. |
<p>| <strong>enter</strong> | (Optional) Specifies to perform the event match when the user presses the Enter key. When this parameter is used, the input string will not be expanded before matching. |
| <strong>questionmark</strong> | (Optional) Specifies to perform the event match when the user presses the ? key. When this parameter is used, the input string will not be expanded before matching. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tab</td>
<td>(Optional) Specifies to perform the event match when the user presses the Tab key. When this parameter is used, the input string will not be expanded before matching.</td>
</tr>
<tr>
<td>mode</td>
<td>(Optional) Events will only be generated when the parser is in the specified parser mode. The available modes can be listed using the <code>show parser dump</code> CLI command. The mode parameter is checked when any one of the optional parameters--enter, questionmark, or tab--is specified.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the <code>nice</code> argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

If multiple conditions are specified, the CLI event will be raised when all the conditions are matched.

**Result String**

None

**Set _cerrno**

No

---

**Note**

This policy runs before the CLI command is executed. For example, suppose policy_CLI is registered to run when the `copy` command is entered. When the `copy` command is entered, the CLI event detector finds a pattern match and triggers this policy to run. When the policy execution ends, the CLI event detector determines if the `copy` command needs to be executed according to "sync", "skip" (set in the policy), and the exit status of the policy execution if needed.

<td>4 -- Unknown command up to point where a key was entered.</td>
</tr>
</tbody>
</table>

**event_register_counter**

Registers for a counter event as both a publisher and a subscriber. Use this Tcl command extension to run a policy on the basis of a named counter crossing a threshold. This event counter, as a subscriber, identifies the name of the counter to which it wants to subscribe and depends on another policy or another process to actually manipulate the counter. For example, let policyB act as a counter policy, whereas policyA (although it does not need to be a counter policy) uses `register_counter`, `counter_modify`, or `unregister_counter` Tcl command extensions to manipulate the counter defined in policyB.

**Syntax**

```
event_register_counter [tag ?] name ? entry_op gt|ge|eq|ne|lt|le entry_val ? exit_op gt|ge|eq|ne|lt|le exit_val ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) Name of the counter.</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Entry comparison operator used to compare the current counter value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.</td>
</tr>
<tr>
<td>entry_val</td>
<td>(Mandatory) Value with which the current counter value should be compared to decide if the counter event should be raised.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Mandatory) Exit comparison operator used to compare the current counter value with the exit value; if true, event monitoring for this event will be reenabled.</td>
</tr>
</tbody>
</table>
exit_val | (Mandatory) Value with which the current counter value should be compared to decide if the exit criteria are met.

queue_priority | (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note: The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Result String**
None

**Set_cerrno**

---

### event_register_gold

Registers for a Generic Online Diagnostic (GOLD) failure event. Use this Tcl command extension to run a policy on the basis of a Generic Online Diagnostic (GOLD) failure event for the specified card and subcard.

**Syntax**

```
event_register_gold card all|card_number [subcard all|subcard_number] [new_failure TRUE|FALSE] [severity_major TRUE] [severity_minor TRUE] [severity_normal TRUE] [action_notify TRUE|FALSE] [testing_type [bootup|ondemand|schedule|monitoring]] [test_name [testname]] [test_id [testnumber]] [consecutive_failure consecutive_failure_number] [platform_action [action_flag]] [maxrun?] [queue_priority low|normal|high|last] [nice 0|1]
```

**Arguments**

- **card** (Mandatory) Specifies whether all cards or one card is to be monitored:
  - card all--Specifies that all cards are to be monitored. This is the default.
  - card-number--Specifies that the card identified by the number card-number is to be monitored.

  This argument must be specified to complete the `event_register_gold` Tcl command extension.

- **subcard** (Optional) Specifies that one or more subcards are to be monitored:
  - subcard all--Specifies that all subcards are to be monitored.
  - subcard-number--Specifies that the subcard identified by the number subcard-number is to be monitored.

  If this argument is not specified, all subcards are monitored by default.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| new_failure       | Optional) Specifies event criteria based on the new test failure information from GOLD:  
• new_failure TRUE--Specifies that the event criterion for the new test failure is true from GOLD.  
• new_failure FALSE--Specifies that the event criterion for the new test failure is false from GOLD.  
If this argument is not specified, the new test failure information from GOLD is not considered in the event criteria. |
| severity_major    | Optional) Specifies that the event criteria for diagnostic result matches with the diagnostic major error from GOLD. |
| severity_minor    | Optional) Specifies that the event criteria for diagnostic result matches with diagnostic minor error from GOLD. |
| severity_normal   | Optional) Specifies that the event criteria for diagnostic result matches with diagnostic normal from GOLD. This is the default. |
| action_notify     | Optional) Specifies the event criteria based on the action notify information from GOLD:  
• action_notify TRUE--Specifies that the event criterion for the action notify is true from GOLD.  
• action_notify FALSE--Specifies that the event criterion for the action notify is false from GOLD.  
If this argument is not specified, the action notify information from GOLD is not considered in the event criteria. |
| testing_type      | Optional) Specifies the event criteria based on the testing types of the diagnostic from GOLD:  
• testing_type bootup--Specifies the diagnostic tests that are running on system bootup.  
• testing_type ondemand--Specifies the diagnostic tests that are running from CLI after the card is online.  
• testing_type schedule--Specifies the scheduled diagnostic tests.  
• testing_type monitoring--Specifies the diagnostic tests that are running periodically in the background to monitor the health of the system.  
If this argument is not specified, the testing type information from GOLD is not considered in the event criteria and the policy applies to all the diagnostic testing types. |
| test_name         | Optional) Specifies the event criteria based on the test name:  
• test_name test-name--Specifies the event criteria based on the test with the name test-name.  
If this argument is not specified, the test name information from GOLD is not considered in the event criteria. |
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>test_id</td>
<td>(Optional) Specifies the event criteria based on test ID:</td>
</tr>
<tr>
<td></td>
<td>• test_id test-id--Specifies the event criteria based on the test with the ID number test-id. The maximum value of test-id is 65535.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Because the test ID can be different for the same test on different line cards, usually the test_name keyword should be used instead. If the test ID is specified and conflicts with the specified test name, the test name overwrites the test ID.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, test ID information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>consecutive_failure</td>
<td>(Optional) Specifies the event criteria based on consecutive test failure information from GOLD:</td>
</tr>
<tr>
<td></td>
<td>• consecutive_failure consecutive-failure-number--Specifies that the event criterion is based on the occurrence of consecutive-failure-number consecutive test failures.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, consecutive test failure information from GOLD is not considered in the event criteria.</td>
</tr>
<tr>
<td>platform_action</td>
<td>(Optional) Specifies whether callback to the platform is needed when all the event criteria are matched. When callback is needed, the platform needs to register a callback function through the provided registry.</td>
</tr>
<tr>
<td></td>
<td>• platform_action action-flag-number--Specifies that, when callback to the platform is needed, specific information is specified by the platform-specific action-flag-number value. The maximum value of action-flag-number is 65535.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> It is up to the platform to determine what action needs to be taken based on the flag.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, there is no callback.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Specifies the maximum run time of the script.</td>
</tr>
<tr>
<td></td>
<td>• maxrun max-run-time-number--Specifies that the maximum run time of the script is max-run-time-number seconds. The maximum value of max-run-time-number is 4294967295 seconds.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default run time is 20 seconds.</td>
</tr>
</tbody>
</table>
queue_priority | (Optional) Priority level at which the script will be queued:

• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.

• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.

• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.

• queue_priority last-- Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note: The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

| nice | (Optional) Policy run-time priority setting:

• nice 0-- Specifies that the policy is run at the default run-time priority level.

• nice 1-- Specifies that the policy is run at a run-time priority that is less than the default priority.

If this argument is not specified, the default run-time priority is used.

### event_register_identity

Registers for an identity event. Use this Tcl command extension to generate an event when AAA authentication or authorization is successful or failure or after normal user traffic on the port is allowed to flow.

#### Syntax

```
event_register_identity [tag ?] interface ?  
[aaa-attribute ?]  
[authc {all | fail | success}]  
[authz {all | fail | success}]  
[authz-complete]  
[mac-address ?]  
[queue_priority {normal | low | high | last}]  
[maxrun ?] [nice {0 | 1}]```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>interface</td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td>aaa-attribute</td>
<td>(Optional) A regular expression that can be used to filter events by specific AAA attributes.</td>
</tr>
<tr>
<td>authc</td>
<td>(Optional) Triggers events on successful, failed or both successful and failed authentication.</td>
</tr>
<tr>
<td>authz</td>
<td>(Optional) Triggers events on successful, failed or both successful and failed authorization.</td>
</tr>
<tr>
<td>authz-complete</td>
<td>(Optional) Triggers events once the device connected to the interface is fully authenticated, authorized and normal traffic has begun to flow on that interface.</td>
</tr>
<tr>
<td>mac-address</td>
<td>(Optional) A regular expression pattern that can be used to filter events by mac addresses of the remote device.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
</tbody>
</table>
(Optional) Priority level at which the script will be queued:

- `queue_priority low` -- Specifies that the script is to be queued at the lowest of the three priority levels.
- `queue_priority normal` -- Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- `queue_priority high` -- Specifies that the script is to be queued at the highest of the three priority levels.
- `queue_priority last` -- Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

The `queue_priority` argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

---

**Result String**

None

**Set _errno**

No

**Event_reqinfo For EEM_EVENT_IDENTITY**

```
event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u event_severity %u identity_stage %u identity_status %u interface %u identity_mac %u identity_<attribute> {%s}
```
### Description

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identity_stage</td>
<td>One among authentication, authorization or authorization-complete stages.</td>
</tr>
<tr>
<td>identity_status</td>
<td>Success or one of these failure types: fail_authc, fail_aaa_server, fail_no_response, fail_timeout, fail_authz. For authorization-complete it is always success.</td>
</tr>
<tr>
<td>interface</td>
<td>The interface for the event.</td>
</tr>
<tr>
<td>identity_mac</td>
<td>The MAC address of the remote device for the event.</td>
</tr>
<tr>
<td>identity_&lt;attribute&gt;</td>
<td>For each AAA attribute, a set a dynamic variable to the value corresponding to that AAA attribute in the attribute or value list.</td>
</tr>
</tbody>
</table>

### event_register_interface

Registers for an interface counter event. Use this Tcl command extension to generate an event when specified interface counters exceed specified thresholds.

#### Syntax

```tcl
event_register_interface [tag ?] name ?
parameter ? entry_op [gt|ge|eq|ne|lt|le]
entry_val ? entry_val_is_increment TRUE|FALSE
entry_type value|increment|rate
[exit_comb or|and]
[exit_op [gt|ge|eq|ne|lt|le]
[exit_val ?] [exit_val_is_increment TRUE|FALSE]
[exit_type value|increment|rate]
[exit_time ?] [poll_interval ?]
[average_factor ?] [queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) The name of the interface being monitored, for example, Ethernet 0/0. Abbreviations and spaces are not allowed.</td>
</tr>
<tr>
<td>parameter</td>
<td>(Mandatory) The name of the counter being compared as follows:</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>input_errors</td>
<td>Includes runts, giants, no buffer, CRC, frame, overrun, and ignored counts. Other input-related errors can also cause the input errors count to be increased, and some datagrams may have more than one error; therefore, this sum may not balance with the sum of enumerated input error counts.</td>
</tr>
<tr>
<td>input_errors_crc</td>
<td>Cyclic redundancy checksum generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.</td>
</tr>
<tr>
<td>input_errors_frame</td>
<td>Number of packets received incorrectly having a CRC error and a noninteger number of octets.</td>
</tr>
<tr>
<td>input_errors_overrun</td>
<td>Number of times the receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.</td>
</tr>
<tr>
<td>input_packets_dropped</td>
<td>Number of packets dropped because of a full input queue.</td>
</tr>
<tr>
<td>interface_resets</td>
<td>Number of times that an interface has been completely reset.</td>
</tr>
<tr>
<td>output_buffer_failures</td>
<td>Number of failed buffers and number of buffers swapped out.</td>
</tr>
<tr>
<td>output_buffer_swappedout</td>
<td>Number of packets swapped to DRAM.</td>
</tr>
</tbody>
</table>
parameter (continued)

- **output_errors**--Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this may not balance with the sum of the enumerated output errors, because some datagrams may have more than one error, and others may have errors that do not fall into any of the specifically tabulated categories.

- **output_errors_underrun**--Number of times that the transmitter has been running faster than the device can handle.

- **output_packets_dropped**--Number of packets dropped because of a full output queue.

- **receive_broadcasts**--Number of broadcast or multicast packets received by the interface.

- **receive_giants**--Number of packets that are discarded because they exceed the maximum packet size of the medium.

- **receive_rate_bps**--Interface receive rate in bytes per second.

- **receive_rate_pps**--Interface receive rate in packets per second.

- **receive_runs**--Number of packets that are discarded because they are smaller than the minimum packet size of the medium.

- **receive_throttle**--Number of times that the receiver on the port was disabled, possibly because of buffer or processor overload.

- **reliability**--Reliability of the interface as a fraction of 255 (255/255 is 100 percent reliability), calculated as an exponential average over 5 minutes.

- **rxload**--Receive rate of the interface as a fraction of 255 (255/255 is 100 percent).

- **transmit_rate_bps**--Interface transmit rate in bytes per second.

- **transmit_rate_pps**--Interface transmit rate in packets per second.

- **txload**--Transmit rate of the interface as a fraction of 255 (255/255 is 100 percent).

---

**entry_op**

(Mandatory) The comparison operator used to compare the current interface value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.

**entry_val**

(Mandatory) The value at which the event will be triggered.

**entry_val_is_increment**

(Mandatory) If TRUE, the entry_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true (the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the entry_val field is compared against the current counter value.

**Note** This keyword has been deprecated, and if specified, the syntax is converted into equivalent entry-type keyword syntax.
| entry-type | Specifies a type of operation to be applied to the object ID specified by the entry-val argument. Value is defined as the actual value of the entry-val argument. Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| exit_comb | (Optional) Used to indicate the combination of exit condition tests required to rearm the event trigger; if the and operator is specified, both exit value and exit time tests must be true to cause rearm; if the or operator is specified, either exit value or exit time tests can be true to cause event monitoring to be rearmed. |
| exit_op | (Optional) The comparison operator used to compare the current interface value with the exit value; if true, event monitoring for this event will be reenabled. |
| exit_val | (Optional) The value at which the event is rearmed to be monitored again. |
| exit_val_is_increment | (Optional) If TRUE, the exit_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true. A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the exit_val field is compared against the current counter value. Note: In Cisco IOS Release 12.4(20)T, this keyword is deprecated, and if specified, the syntax is converted into equivalent exit-type keyword syntax. |
| exit-type | (Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed. Value is defined as the actual value of the exit-val argument. Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| exit_time | (Optional) The time period at which the event is rearmed to be monitored again (specified in SSSSSSSSSSSSSSMMM format, where SSSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). |
poll_interval  (Optional) The frequency used to collect the samples (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 60 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). The poll interval value must not be less than 1 second. The default is 1 second.

average-factor  (Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1.

queue_priority  (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### event_register_ioswdsysmon

Registers for an IOSWDSysMon event. Use this Tcl command extension to generate an event when a Cisco IOS task exceeds specific CPU utilization or memory thresholds. A Cisco IOS task is called a Cisco IOS process in native Cisco IOS.

#### Syntax

```
event_register_ioswdsysmon [tag ?] [timewin ?] [sub12op and|or] [sub1 ?] [sub2 ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>timewin</td>
<td>(Optional) Defines the time window within which all of the subevents must occur in order for an event to be generated (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>sub12_op</td>
<td>(Optional) The combination operator for comparison between subevent 1 and subevent 2.</td>
</tr>
<tr>
<td>sub1</td>
<td>(Optional) The subevent 1 specification.</td>
</tr>
<tr>
<td>------</td>
<td>----------------------------------------</td>
</tr>
<tr>
<td>sub2</td>
<td>(Optional) The subevent 2 specification.</td>
</tr>
<tr>
<td>queue_priority</td>
<td>(Optional) Priority level at which the script will be queued:</td>
</tr>
<tr>
<td>queue_priority low</td>
<td>Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>

**Subevent Syntax**

```
cpu_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [period ?]
mem_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [is_percent TRUE|FALSE] [period ?]
```

**Subevent Arguments**

<table>
<thead>
<tr>
<th>cpu_proc</th>
<th>(Mandatory) Specifies the use of a sample collection of CPU statistics.</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>(Mandatory) Software Modularity images only. The pathname of the POSIX process that contains the Cisco IOS scheduler to be monitored. For example, /sbin/cdp2.iosproc.</td>
</tr>
<tr>
<td>taskname</td>
<td>(Mandatory) The name of the Cisco IOS task to be monitored.</td>
</tr>
<tr>
<td>op</td>
<td>(Mandatory) The comparison operator used to compare the collected usage sample with the specified value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Mandatory) The value to be compared.</td>
</tr>
</tbody>
</table>
period  (Optional) The elapsed time period for the collection samples to be averaged (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

mem_proc  (Mandatory) Specifies the use of a sample collection of memory statistics.

is_percent  (Optional) Whether the specified value is a percentage.

<tr>
<td>sec , msec</td>
<td>Elapsed time period for this measured interval.</td>
</tr>
</tbody>
</table>

**event_register_ipsla**

Registers for an event that is triggered by the `event ipsla` command. Use this Tcl command to publish an event when an IPSLA reaction is triggered. The group ID or the operation ID is required to register the event.

**Syntax**

```
event_register_ipsla [tag ?] group_name ? operation_id ? [reaction_type ?] [dest_ip_addr ?][queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>group_name</td>
<td>(Mandatory) Specifies the IP SLAs group name.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>operation_id</td>
<td>(Mandatory) Specifies the IP SLA operation ID. Number must be in the range from 1 to 2147483647.</td>
</tr>
</tbody>
</table>
| reaction_type| (Optional) Specifies the reaction to be taken for the specified IP SLAs operation. Type of IP SLAs reaction--One of the following keywords can be specified: `connectionLoss`, `icpif`, `jitterAvg`, `jitterDSAvg`, `jitterSDAvg`, `maxOfNegativeDS`, `maxOfNegativeSD`, `maxOfPositiveDS`, `maxOfPositiveSD`, `mos`, `packetLateArrival`, `packetLossDS`, `packetLossSD`, `packetMIA`, `packetOutOfSequence`, `rtt`, `timeout` or `verifyError` can be specified. Type of IP SLAs reaction. One of the following keywords can be specified:  
  - `connectionLoss`  
  - `icpif`  
  - `jitterAvg`  
  - `jitterDSAvg`  
  - `jitterSDAvg`  
  - `maxOfNegativeDS`  
  - `maxOfNegativeSD`  
  - `maxOfPositiveDS`  
  - `maxOfPositiveSD`  
  - `mos`  
  - `packetLateArrival`  
  - `packetLossDS`  
  - `packetLossSD`  
  - `packetMIA`  
  - `packetOutOfSequence`  
  - `rtt`  
  - `timeout`  
  - `verifyError` |
| dest_ip_address | (Optional) Specifies the destination IP address of the destination port for which the IP SLAs events are monitored. |
queue_priority | (Optional) Priority level at which the script will be queued:
--- | ---
| • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
| • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
| • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
| • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Result String**

None

**Set_cerrno**

No

### Event Register Mat

Registers for a MAT event. Use this Tcl command extension to generate an event when a mac-address is learned in the mac-address-table.

#### Syntax

```
event_register_identity [tag ?] interface ?
[mac-address ?]
[type {add | delete}]
[hold-down ?]
[maxrun ?]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tag</strong></td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td><strong>interface</strong></td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td><strong>mac-address</strong></td>
<td>Mandatory if the interface parameter is not specified. A regular expression pattern that can be used to filter events by mac addresses of the remote device.</td>
</tr>
</tbody>
</table>
Filter based on a mac-address-table event type of add or delete. If not specified, the event type is not used in determining whether the event should be triggered.

(Conditional) When a mac-address-table event comes in, the hold-down timer can be set to make the event to wait between 1 and 4294967295 seconds before processing the policy. If not set then the policy is not delayed in being processed.

(Conditional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

Event_reqinfo For EEM_EVENT_MAT

"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u event_severity %u notification %u intf_name %u mac_address {%s}"
event_register_neighbor_discovery

Registers for a neighbor discover event. Use this Tcl command extension to generate an event when a Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) cache entry or a interface link status changes.

Syntax

```tcl
event_register_neighbor_discovery [tag ?] interface ?
    [cdp {add | update | delete | all}]
    [lldp {add | update | delete | all}]
    [link-event]
    [line-event]
    [queue_priority {normal | low | high | last}]
    [maxrun ?] [nice {0 | 1}]
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tag</code></td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td><code>interface</code></td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td><code>cdp</code></td>
<td>Trigger an event when a matching CDP event occurs. One of the following options should be specified.</td>
</tr>
<tr>
<td><code>lldp</code></td>
<td>Trigger an event when a matching LLDP event occurs. One of the following options should be specified.</td>
</tr>
<tr>
<td><code>link-event</code></td>
<td>Trigger an event when the interface link protocol status changes.</td>
</tr>
<tr>
<td><code>line-event</code></td>
<td>Trigger an event when the interface link status changes.</td>
</tr>
</tbody>
</table>
queue_priority  (Optional) Priority level at which the script will be queued:
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

---

**event_register_nf**

Registers for an event when a NetFlow event is triggered by the `event nf` command. Use this Tcl command to publish an event when an NetFlow reaction is triggered.

**Syntax**

```
event_register_nf [tag ?] monitor_name ? event_type create|update|delete exit_event_type create|update|delete event1-event4 ? [maxrun ?] [nice 0|1]
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>monitor_name</td>
<td>(Mandatory) The name of the NetFlow monitor.</td>
</tr>
<tr>
<td>event_type</td>
<td>(Mandatory) The type of event to monitor for the create, update, and delete flow.</td>
</tr>
<tr>
<td>exit_event_type</td>
<td>(Mandatory) The event-type (create, delete, update) at which the event is rearmed to be monitored again.</td>
</tr>
<tr>
<td>event1-event4</td>
<td>(Mandatory) Specifies the event and its attributes to monitor. Valid values are <code>event1</code>, <code>event2</code>, <code>event3</code>, and <code>event4</code>. The subevent keywords can be used alone, together, or in any combination with each other, but each keyword can be used only once.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in <code>SSSSSSSSSS.MM</code> format, where <code>SSSSSSSSSS</code> must be an integer representing seconds between 0 and 4294967295, inclusive, and where <code>MMM</code> must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the <code>nice</code> argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

### Subevent Syntax

```
field ? rate_interval ? event1 only entry_value ? entry_op eq|ge|gt|le|lt|wc
(exit_value ?) [exit_op eq|ge|gt|le|lt|wc] [exit_rate_interval ? event1 only]
```

### Subevent Arguments

<table>

<tr>
<td>field</td>
<td>(Mandatory) Specifies the cache or field attribute to be monitored. One of the following attributes can be specified:</td>
</tr>
<tr>
<td>rate_interval</td>
<td>(Mandatory) Specifies the rate interval value in seconds used to calculate the rate. This field is only valid for <code>event1</code>.</td>
</tr>
<tr>
<td>entry_value</td>
<td>(Mandatory) Specifies the field or rate value.</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Specifies the field operator.</td>
</tr>
<tr>
<td></td>
<td>The comparison operator valid values are:</td>
</tr>
<tr>
<td></td>
<td>• eq  - Equal to</td>
</tr>
<tr>
<td></td>
<td>• ge  - Greater than or equal to</td>
</tr>
<tr>
<td></td>
<td>• gt  - Greater than</td>
</tr>
<tr>
<td></td>
<td>• le  - Less than or equal to</td>
</tr>
<tr>
<td></td>
<td>• lt  - Less than</td>
</tr>
<tr>
<td></td>
<td>• wc  - Wildcard</td>
</tr>
<tr>
<td>exit_value</td>
<td>(Optional) The value at which the event is</td>
</tr>
<tr>
<td></td>
<td>rearmed to be monitored again.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Optional) The comparison operator used to</td>
</tr>
<tr>
<td></td>
<td>compare the current event field or rate value</td>
</tr>
<tr>
<td></td>
<td>with the exit value; if true, event</td>
</tr>
<tr>
<td></td>
<td>monitoring for this event is reenabled.</td>
</tr>
<tr>
<td></td>
<td>The comparison operator valid values are:</td>
</tr>
<tr>
<td></td>
<td>• eq  - Equal to</td>
</tr>

</tr>
<tr>
<td></td>
<td>• lt  - Less than</td>
</tr>
<tr>
<td></td>
<td>• wc  - Wildcard</td>
</tr>
<tr>
<td>exit_rate_interval</td>
<td>(Optional) Specifies the exit rate</td>
</tr>
<tr>
<td></td>
<td>interval value in seconds used to calculate</td>
</tr>
<tr>
<td></td>
<td>the exit rate value. This field is only valid</td>
</tr>
<tr>
<td></td>
<td>for event1.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set _cerrno**

No

**Event_reqinfo**

```
"event_ID %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u event_severity %u monitor_name %u event1-event4_field %u event1-event4_value
```

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
</table>

**event_id**

Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.

**event_type**

The type of event to monitor for the create, update, and delete flow.

**event_type_string**

An ASCII string that represents the name of the event for this event type.

**event_pub_sec_event_pub_msec**

The time, in seconds and milliseconds, when the event was published to the EEM.

**event_severity**

The severity of the NetFlow event.

**monitor_name**

The name of the NetFlow monitor.

**event1-event4_field**

Specifies the event and its attributes to monitor. Valid values are event1, event2, event3, and event4.

**event1-event4_value**

Specifies the event value and its attributes to monitor. Valid values are event1, event2, event3, and event4.

---

**event_register_none**

Registers for an event that is triggered by the event manager run command. These events are handled by the None event detector that screens for this event.

**Syntax**

```
event_register_none [tag ?] [sync {yes|no}] [default ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>sync</td>
<td>(Optional) A &quot;yes&quot; or a &quot;no&quot; is required to complete this keyword.</td>
</tr>
<tr>
<td></td>
<td>- If the yes keyword is specified, the policy will run synchronously with the CLI command.</td>
</tr>
<tr>
<td></td>
<td>- If the no keyword is specified, the policy will run asynchronously with the CLI command.</td>
</tr>
<tr>
<td>default</td>
<td>(Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSSS[MIM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds.</td>
</tr>
</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

<td>The time, in seconds and milliseconds, when the event was published to the EEM.</td>
</tr>
</tbody>
</table>
### event_register_process

Registers for a process event. Use this Tcl command extension to run a policy on the basis of an event raised when a Cisco IOS Software Modularity process starts or stops. These events are handled by the System Manager event detector that screens for this event. This Tcl command extension is supported only in Software Modularity images.

#### Syntax

```plaintext
event_register_process [tag ?] abort|term|start|user_restart|user_shutdown
[sub_system ?] [version ?] [instance ?] [path ?] [node ?]
[queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

- **tag**: (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.
- **abort**: (Mandatory) Abnormal process termination. Process may abort because of exiting with a nonzero exit status, receiving a kernel-generated signal, or receiving a SIGTERM or SIGKILL signal that is not sent because of user request.
- **term**: (Mandatory) Normal process termination.
- **start**: (Mandatory) Process start.
- **user_restart**: (Mandatory) Process termination due to the process restart request from the CLI command.
- **user_shutdown**: (Mandatory) Process termination due to the process kill request from the CLI command.
- **sub_system**: (Optional) Version number of the process assigned by the version manager. Must be of the form major_number.minor_number.level. If specified, each component of the version number must be an integer between 1 and 4294967295, inclusive.
- **version**: (Optional) Number assigned to the EEM policy that published the process event. Number is set to 798 because all other numbers are reserved for Cisco use.
- **instance**: (Optional) Process instance ID. If specified, this argument must be an integer between 1 and 4294967295, inclusive.
- **path**: (Optional) Process pathname (a regular expression string). If the value of the process-name argument contains embedded blanks, enclose it in double quotation marks. Use path ".*" to match all processes.
### node
(Optional) The node name is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:

\[ \text{node<slot-number>/<cpu-number>} \]

The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is always the regular expression pattern match of * representing all applicable nodes.

### queue_priority
(Optional) Priority level at which the script will be queued:

- **queue_priority low**--Specifies that the script is to be queued at the lowest of the three priority levels.
- **queue_priority normal**--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- **queue_priority high**--Specifies that the script is to be queued at the highest of the three priority levels.
- **queue_priority last**--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

### maxrun
(Optional) Maximum run time of the script (specified in SSSSSSSSSS,[MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

### nice
(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

If an optional argument is not specified, the event matches all possible values of the argument. If multiple arguments are specified, the process event will be raised when all the conditions are matched.

<td>Name of the node that the process is on. The node name is a string that consists of the word “node” followed by two fields separated by a slash character using the following format: node slot-number / cpu-number</td>
</tr>
</tbody>
</table>

The slot-number is the hardware slot number. The cpu-number is the hardware CPU number.

---

event_register_resource

Registers for an Embedded Resource Manager (ERM) event. Use this Tcl command extension to run a policy on the basis of an ERM event report for a specified policy. ERM events are screened by the EEM Resource event detector, allowing an EEM policy to be run when a match occurs for the specified ERM policy.
## Syntax

```
event_register_resource policy policy-name [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

### Arguments

<table>
<thead>
<tr>

<td>The ERM policy ID.</td>
</tr>
</tbody>
</table>

**event_register_rf**

Registers for a Redundancy Facility (RF) event. Use this Tcl command extension to run a policy when an RF progression or status event notification occurs.

**Syntax**

```
event_register_rf [tag ?] event ?
[queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```
## Arguments

<table>
<thead>
<tr>
<th>tag</th>
<th>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>(Mandatory) Name of the RF progression or status event. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• RF_PROG_ACTIVE</td>
</tr>
<tr>
<td></td>
<td>• RF_PROG_ACTIVE_DRAIN</td>
</tr>
<tr>
<td></td>
<td>• RF_PROG_ACTIVE_FAST = 200</td>
</tr>
<tr>
<td></td>
<td>• RF_PROG_ACTIVE_PRECONFIG</td>

<td>• RF_STATUS_SWACT_INHIBIT</td>
</tr>
</tbody>
</table>
queue_priority  (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSSS MMM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

Result String
None

Set_cerrno
No

<tr>
<td>event</td>
<td>RF progression or status event notification that caused this event to be published.</td>
</tr>
</tbody>
</table>

---

### event_register_routing

Registers for an event that is triggered by the `event routing` command. These events are handled by the routing event detector to publish an event when route entries change in Routing Information Base (RIB) infrastructure. Use this Tcl command extension to run a routing policy for this script. The network IP address for the route to be monitored must be specified.

**Syntax**

```
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>network</td>
<td>Specifies the network IP address. The network number can be any valid IP address or prefix.</td>
</tr>
<tr>
<td>length</td>
<td>Specifies the length of the network mask in bits. The bit mask can be a number from 0 to 32.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ge</strong> --(Optional) Specifies the minimum prefix length to be matched. The <strong>ge</strong> keyword represents greater than or equal to operator.</td>
</tr>
<tr>
<td></td>
<td>• <strong>le</strong> --(Optional) Specifies the maximum prefix length to be matched. The <strong>le</strong> keyword represents the less than or equal to operator.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ne</strong> --(Optional) Specifies the prefix length not to be matched. The <strong>ne</strong> keyword represents not equal to operator.</td>
</tr>
<tr>
<td></td>
<td>When <strong>ge</strong>, <strong>le</strong> and <strong>ne</strong> keywords are not configured, an exact match of network length is processed.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Specifies the desired policy trigger. The type options are <strong>add</strong>, <strong>remove</strong>, <strong>modify</strong>, and <strong>all</strong>. The default is <strong>all</strong>.</td>
</tr>
<tr>
<td>protocol</td>
<td>(Optional) Specifies the protocol value for the network being monitored.</td>
</tr>
<tr>
<td></td>
<td>One of the following protocols can be used: <strong>all</strong>, <strong>bgp</strong>, <strong>connected</strong>, <strong>eigrp</strong>, <strong>isis</strong>, <strong>iso-igrp</strong>, <strong>mobile</strong>, <strong>odr</strong>, <strong>ospf</strong>, <strong>rip</strong>, and <strong>static</strong>. The default is <strong>all</strong>.</td>
</tr>
</tbody>
</table>
### queue_priority
(Optional) Priority level at which the script will be queued:

- **queue_priority low**—Specifies that the script is to be queued at the lowest of the three priority levels.
- **queue_priority normal**—Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- **queue_priority high**—Specifies that the script is to be queued at the highest of the three priority levels.
- **queue_priority last**—Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

### maxrun
(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

### nice
(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### Result String
None

### Set _cerrno

</tbody>
</table>
### event_register_rpc

Registers for an event that is triggered by the EEM SSH Remote Procedure Call (RPC) command. These events are handled by the RPC event detector that screens for this event. Use this Tcl command extension to run a RPC policy for this script.

#### Syntax

```
event_register_rpc [queue_priority {normal | low | high | last}] [maxrun <sec.msec>] [nice {0 | 1}] [default <sec.msec>]
```
## Arguments

<table>
<thead>
<tr>

**event_register_snmp**

Registers for a Simple Network Management Protocol (SNMP) statistics event. Use this Tcl command extension to run a policy when a given counter specified by an SNMP object ID (oid) crosses a defined threshold.

**Syntax**

```
event_register_snmp [tag ?] oid ? get_type exact|next 
entry_op gt|ge|eq|lt|le entry_val ? 
entry_type value|increment|rate 
[exit_comb or|and]
[exit_op gt|ge|eq|lt|le] [exit_val ?] 
[exit_type value|increment|rate] 
[exit_time ?] poll_interval ? [average_factor ?] 
[queue_priority low|normal|high|last] 
[maxrun ?] [nice 0|1]
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>oid</td>
<td>(Mandatory) OID number of data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). The types of OIDs allowed are:</td>
</tr>
<tr>
<td></td>
<td>• COUNTER_TYPE</td>
</tr>
<tr>
<td></td>
<td>• COUNTER_64_TYPE</td>
</tr>
<tr>
<td></td>
<td>• GAUGE_TYPE</td>
</tr>
<tr>
<td></td>
<td>• INTEGER_TYPE</td>
</tr>
<tr>
<td></td>
<td>• OCTET_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>• OPAQUE_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>• TIME_TICKS_TYPE</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Entry comparison operator used to compare the current OID data value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.</td>
</tr>
<tr>
<td>get_type</td>
<td>(Mandatory) Type of SNMP get operation that needs to be applied to the OID specified. If the get_type argument is &quot;exact,&quot; the value of the specified OID is retrieved; if the get_type argument is &quot;next,&quot; the value of the lexicographical successor to the specified OID is retrieved.</td>
</tr>
<tr>
<td>entry_val</td>
<td>(Mandatory) Value with which the current oid data value should be compared to decide if the SNMP event should be raised.</td>
</tr>
<tr>
<td>entry_type</td>
<td>Specifies a type of operation to be applied to the object ID specified by the entry-val argument. Value is defined as the actual value of the entry-val argument. Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</td>
</tr>
<tr>
<td>exit_comb</td>
<td>(Optional) Exit combination operator used to indicate the combination of exit condition tests required to decide if the exit criteria are met so that the event monitoring can be reenabled. If it is &quot;and,&quot; both exit value and exit time tests must be passed to meet the exit criteria. If it is &quot;or,&quot; either exit value or exit time tests can be passed to meet the exit criteria. When exit_comb is &quot;and,&quot; exit_op, and exit_val (exit_time) must exist. When exit_comb is &quot;or,&quot; (exit_op and exit_val) or (exit_time) must exist.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Optional) Exit comparison operator used to compare the current oid data value with the exit value; if true, event monitoring for this event will be reenabled.</td>
</tr>
<tr>
<td>exit_val</td>
<td>(Optional) Value with which the current oid data value should be compared to decide if the exit criteria are met.</td>
</tr>
<tr>
<td>exit-type</td>
<td>(Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed. Value is defined as the actual value of the exit-val argument. Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</td>
</tr>
<tr>
<td>exit_time</td>
<td>(Optional) Number of POSIX timer units after an event is raised when event monitoring will be enabled again. Specified in SSSSSSSSSS[.MMM] format where SSSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive. MMM represents milliseconds and must be an integer number between 0 and 999.</td>
</tr>
<tr>
<td>poll_interval</td>
<td>(Mandatory) Interval between consecutive polls in POSIX timer units. Currently the interval is forced to be at least 1 second (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>average-factor</td>
<td>(Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1.</td>
</tr>
</tbody>
</table>
| queue_priority | (Optional) Priority level at which the script will be queued:  
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.  
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.  
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.  
If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.  
**Note**   The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.  
If this argument is not specified, the default queuing priority is normal. |
maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

</tbody>
</table>
event_register_snmp_notification

Registers for a Simple Network Management Protocol (SNMP) notification trap event. Use this Tcl command extension to run a policy when an SNMP trap with the specified SNMP object ID (oid) is encountered on a specific interface or address. The **snmp-server manager** CLI command must be enabled for the SNMP notifications to work using Tcl policies.

**Syntax**

```tcl
event_register_snmp_notification [tag ?] oid ? oid_val ?
    op {gt|ge|eq|ne|lt|le}
    [maxrun ?]
    [src_ip_address ?]
    [dest_ip_address ?]
    [queue_priority {normal|low|high|last}]
    [maxrun ?]
    [nice {0|1}]
    [default ?]
    [direction {incoming|outgoing}]
    [msg_op {drop|send}]
```

**Arguments**

<table>

<tr>
<td></td>
<td>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
</tbody>
</table>

If more than one script is registered with the queue_priority_last argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

**event_register_snmp_object**

Registers for a Simple Network Management Protocol (SNMP) object event. Use this Tcl command extension to replace the value when an SNMP with the specified SNMP-object ID (OID) is encountered on a specific interface or address.

**Syntax**

```tcl
event_register_snmp_object oid ?
type {int|uint|counter|counter64|gauge|ipv4||oid|string}
sync {yes|no}
skip {yes|no}
[istable {yes|no}]
[default ?]
[queue_priority {normal|low|high|last}]
[maxrun ?]
[nice {0|1}]
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| **oid** | (Mandatory) OID number of the data element in SNMP dot notation (for example, 1.3.6.1.2.1.1.0). If the specified OID ends with a dot (.), then all OIDs that start with the OID number before the dot are matched. The types of OIDs allowed are:  
  - COUNTER_TYPE  
  - COUNTER_64_TYPE  
  - GAUGE_TYPE  
  - INTEGER_TYPE  
  - OCTET_PRIM_TYPE  
  - OPAQUE_PRIM_TYPE  
  - TIME_TICKS_TYPE |
| **type** | (Mandatory) OID value type. |
| **sync** | (Mandatory) A "yes" means that the EEM policy will be notified. If the applet set_exit_status or Tcl return value is 0, then SNMP will handle the request. If the return value is 1, SNMP will use the value provided by the policy for the get request and will not process the set request. A "no" means that EEM will not be notified and SNMP will handle the request. Only one OID can be associated with a synchronous policy. However, multiple synchronous policies can be registered for the same OID. |
| **skip** | Mandatory if the sync argument is "no" and should not exist if the sync argument is "yes." If the skip argument is "yes," it means that SNMP will handle the request. If the skip argument is "no," it means that SNMP will act as if the object does not exist. |
| **istable** | (Optional) A value of "no" means the OID is scalar object, and "yes" means the OID is table object. |
| **default** | (Optional) The time period during which the SNMP Object event detector waits for the policy to exit (specified in sssssssss[.mmm] format, where sssssssss must be an integer representing seconds between 0 and 4294967295, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to process the set or get request normally by SNMP subsystem. If this argument is not specified, the default time period is set to 30 seconds. |
| **maxrun** | (Optional) Maximum run time of the script (specified in sssssssss[.mmm] format, where sssssssss must be an integer representing seconds between 0 and 31536000, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
queue_priority (Optional) Priority level at which the script will be queued:
- `queue_priority low` -- Specifies that the script is to be queued at the lowest of the three priority levels.
- `queue_priority normal` -- Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- `queue_priority high` -- Specifies that the script is to be queued at the highest of the three priority levels.
- `queue_priority last` -- Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the `queue_priority_last` argument set, these scripts will execute in the order in which the events are published.

**Note** The `queue_priority` argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

| nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0. |

**Result String**
None

**Set _cerrno**
No

**Event_reqinfo**

```

</tr>
</tbody>
</table>
## event_register_syslog

Registers for a syslog event. Use this Tcl command extension to trigger a policy when a syslog message of a specific pattern is logged after a certain number of occurrences during a certain period of time.

### Syntax

```
event_register_syslog [tag ?] [occurs ?] [period ?] pattern ?
[priority all|emergencies|alerts|critical|errors|warnings|notifications|
informational|debugging|0|1|2|3|4|5|6|7]
[queue_priority low|normal|high|last]
[severity_fatal] [severity_critical] [severity_major]
[severity_minor] [severity_warning] [severity_notification]
[severity_normal] [severity_debugging]
[maxrun ?] [nice 0|1]
```

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>occurs</td>
<td>(Optional) Number of occurrences before the event is raised; if not specified, the event is raised on the first occurrence. If specified, the value must be greater than 0.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) Time interval, in seconds and milliseconds, during which the one or more occurrences must take place in order to raise an event (specified in SSSSSSSSSS[.MMM] format where SSSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive, and where MMM represents milliseconds and must be an integer number between 0 and 999). If this argument is not specified, no period check is applied.</td>
</tr>
<tr>
<td>pattern</td>
<td>(Mandatory) A regular expression used to perform syslog message pattern match. This argument is what the policy uses to identify the logged syslog message.</td>
</tr>
<tr>
<td>priority</td>
<td>(Optional) The message priority to be screened. If this argument is specified, only messages that are at the specified logging priority level, or lower, are screened. If this argument is not specified, the default priority is 0.</td>
</tr>
</tbody>
</table>
queue_priority | (Optional) Priority level at which the script will be queued:
| • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
| • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
| • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
| • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note: The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.
	nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

severity_xxx | (Optional) The event severity to be screened. If this argument is specified, only messages that are at the specified severity level are screened. See the table titled "Severity Level Mapping For Syslog Events" for the severity level mapping for syslog events.

If multiple conditions are specified, the syslog event will be raised when all the conditions are matched.

**event_register_timer**

Creates a timer and registers for a timer event as both a publisher and a subscriber. Use this Tcl command extension when there is a need to trigger a policy that is time specific or timer based. This event timer is both an event publisher and a subscriber. The publisher part indicates the conditions under which the named timer is to go off. The subscriber part identifies the name of the timer to which the event is subscribing.

**Note**
Both the CRON and absolute time specifications work on local time.

**Syntax**

```
event_register_timer [tag ?] watchdog|countdown|absolute|cron
[name ?] [cron_entry ?]
[time ?]
[queue_priority low|normal|high|last] [maxrun ?]
[nice 0|1]
```
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>watchdog</td>
<td>(Mandatory) Watchdog timer.</td>
</tr>
<tr>
<td>countdown</td>
<td>(Mandatory) Countdown timer.</td>
</tr>
<tr>
<td>absolute</td>
<td>(Mandatory) Absolute timer.</td>
</tr>
<tr>
<td>cron</td>
<td>(Mandatory) CRON timer.</td>
</tr>
<tr>
<td>name</td>
<td>(Optional) Name of the timer.</td>
</tr>
<tr>
<td>cron_entry</td>
<td>(Optional) Must be specified if the CRON timer type is specified. Must not be specified if any other timer type is specified. A cron_entry is a partial UNIX crontab entry (the first five fields) as used with the UNIX CRON daemon. A cron_entry specification consists of a text string with five fields. The fields are separated by spaces. The fields represent the time and date when CRON timer events will be triggered. The fields are described in the table titled &quot;Time and Date When CRON Events Will Be Triggered.&quot; Ranges of numbers are allowed. Ranges are two numbers separated with a hyphen. The specified range is inclusive. For example, 8-11 for an hour entry specifies execution at hours 8, 9, 10, and 11. A field may be an asterisk (<em>), which always stands for &quot;first-last.&quot; Lists are allowed. A list is a set of numbers (or ranges) separated by commas. Examples: &quot;1,2,5,9&quot; and &quot;0-4,8-12&quot;. Step values can be used in conjunction with ranges. Following a range with &quot;/&lt;number&gt;&quot; specifies skips of the number's value through the range. For example, &quot;0-23/2&quot; can be used in the hour field to specify an event that is triggered every other hour. Steps are also permitted after an asterisk, so if you want to say &quot;every two hours&quot;, use &quot;</em>/2&quot;. Names can also be used for the month and the day of week fields. Use the first three letters of the particular day or month (case does not matter). Ranges or lists of names are not allowed. The day on which a timer event is triggered can be specified by two fields: day of month and day of week. If both fields are restricted (that is, are not *), an event will be triggered when either field matches the current time. For example, &quot;30 4 1,15 * 5&quot; would cause an event to be triggered at 4:30 a.m. on the 1st and 15th of each month, plus every Friday. Instead of the first five fields, one of seven special strings may appear. These seven special strings are described in the table titled &quot;Special Strings for cron_entry.&quot; Example 1: &quot;0 0 1,15 * 1&quot; would trigger an event at midnight on the 1st and 15th of each month, as well as on every Monday. To specify days by only one field, the other field should be set to *; &quot;0 0 * * 1&quot; would trigger an event at midnight only on Mondays. Example 2: &quot;15 16 1 * *&quot; would trigger an event at 4:15 p.m. on the first day of each month. Example 3: &quot;0 12 * * 1-5&quot; would trigger an event at noon on Monday through Friday of each week. Example 4: &quot;:@weekly&quot; would trigger an event at midnight once a week on Sunday.</td>
</tr>
</tbody>
</table>
**event_register_timer**

| time | (Optional) Must be specified if a timer type other than CRON is specified. Must not be specified if the CRON timer type is specified. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for the absolute timer, the calendar time of the expiration time. Time is specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999. An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately. |
| queue_priority | (Optional) Priority level at which the script will be queued:  
  - queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.  
  - queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
  - queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.  
  - queue_priority last--Specifies that the script is to be queued at the lowest priority level.  
  If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published. |
| maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0. |

See Also

event_register_timer_subscriber

### event_register_timer_subscriber

Registers for a timer event as a subscriber. Use this Tcl command extension to identify the name of the timer to which the event timer, as a subscriber, wants to subscribe. The event timer depends on another policy or another process to actually manipulate the timer. For example, let policyB act as a timer subscriber policy, but policyA (although it does not need to be a timer policy) uses register_timer, timer_arm, or timer_cancel Tcl command extensions to manipulate the timer referenced in policyB.

#### Syntax

```
event_register_timer_subscriber watchdog|countdown|absolute|cron
name ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>watchdog</td>
<td>(Mandatory) Watchdog timer.</td>
</tr>
<tr>
<td>countdown</td>
<td>(Mandatory) Countdown timer.</td>
</tr>
<tr>
<td>absolute</td>
<td>(Mandatory) Absolute timer.</td>
</tr>
<tr>
<td>cron</td>
<td>(Mandatory) CRON timer.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) Name of the timer.</td>
</tr>
</tbody>
</table>
consolidated platform configuration guide, cisco ios release 15.2(5)E (catalyst 2960-X switches)
### Event Register Track

Registers for a report event from the Cisco IOS Object Tracking subsystem. Use this Tcl command extension to trigger a policy on the basis of a Cisco IOS Object Tracking subsystem report for a specified object number.

#### Syntax

```
event_register_track ? [tag ?] [state up|down|any] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>? (represents a number)</th>
<th>(Mandatory) Tracked object number in the range from 1 to 500, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>state</td>
<td>(Optional) Specifies that the tracked object transition will cause an event to be raised. If <strong>up</strong> is specified, an event will be raised when the tracked object transitions from a down state to an up state. If <strong>down</strong> is specified, an event will be raised when the tracked object transitions from an up state to a down state. If <strong>any</strong> is specified, an event will be raised when the tracked object transitions to or from any state.</td>
</tr>
</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

If an optional argument is not specified, the event matches all possible values of the argument.

**event_register_wdsysmon**

Registers for a Watchdog system monitor event. Use this Tcl command extension to register for a composite event which is a combination of several subevents or conditions. For example, you can use this command to register for the combination of conditions wherein the CPU usage of a certain process is over 80 percent and the memory used by the process is greater than 50 percent of its initial allocation. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```
event_register_wdsysmon [tag ?] [timewin ?] [sub12_op and|or|andnot] [sub23_op and|or|andnot] [sub34_op and|or|andnot] [sub1 subevent-description] [sub2 subevent-description] [sub3 subevent-description] [sub4 subevent-description] [node ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

Each argument is position independent.

**Note**

Operator definitions: and (logical and operation), or (logical or operation), andnot (logical and not operation). For example, "sub12_op and" is defined as raise an event when subevent 1 and subevent 2 are true; "sub23_op or" is defined as raise an event when the condition specified in sub12_op is true or subevent 3 is true. The logic can be diagrammed using: if (((sub1 sub12_op sub2) sub23_op sub3) sub34_op sub4) is TRUE, raise event

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>timewin</td>
<td>(Optional) Time window within which all of the subevents have to occur in order for an event to be generated (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>sub12_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and subevent 2.</td>
</tr>
<tr>
<td>---------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sub23_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3.</td>
</tr>
<tr>
<td>sub34_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3 and subevent 4.</td>
</tr>
<tr>
<td>sub1</td>
<td>(Optional) Indicates that subevent 1 is specified.</td>
</tr>
<tr>
<td>subevent-description</td>
<td>(Optional) Syntax for the subevent.</td>
</tr>
<tr>
<td>sub2</td>
<td>(Optional) Indicates that subevent 2 is specified.</td>
</tr>
<tr>
<td>sub3</td>
<td>(Optional) Indicates that subevent 3 is specified.</td>
</tr>
<tr>
<td>sub4</td>
<td>(Optional) Indicates that subevent 4 is specified.</td>
</tr>
<tr>
<td>node</td>
<td>(Optional) The node name to be monitored for deadlock conditions is a string that consists of the word &quot;node&quot; followed by two fields separated by a slash character using the following format: node&lt;slot-number&gt;/&lt;cpu-number&gt; The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is the local node on which the registration is done.</td>
</tr>
<tr>
<td>queue_priority</td>
<td>(Optional) Priority level at which the script will be queued:</td>
</tr>
<tr>
<td></td>
<td>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
<tr>
<td></td>
<td>If more than one script is registered with the &quot;queue_priority last&quot; argument set, these scripts will execute in the order in which the events are published.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default queuing priority is normal.</td>
</tr>
</tbody>
</table>
### maxrun
(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

### nice
(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### Subevents
The syntax of subevent descriptions can be one of seven cases.

For arguments in subevent description, the following constraints apply on the value of number arguments:

- For dispatch_mgr, val must be an integer between 0 and 4294967295, inclusive.
- For cpu_proc and cpu_tot, val must be an integer between 0 and 100, inclusive.
- For mem_proc, mem_tot_avail, and mem_tot_used, if is_percent is FALSE, val must be an integer between 0 and 4294967295, inclusive.

1. **deadlock**

   **Arguments**

   | proname   | (Mandatory) A regular expression that specifies the process name that you wish to monitor for deadlock conditions. This subevent will ignore the time window even if it is given. |

2. **dispatch_mgr**

   **Arguments**

   | proname   | (Optional) A regular expression that specifies the process name that you wish to monitor for dispatch_manager status. |
   | op        | (Optional) Comparison operator used to compare the collected number of events with the specified value; if true, an event will be raised. |
   | val       | (Optional) The value with which the number of events that have occurred should be compared. |
   | period     | (Optional) The time period for the number of events that have occurred (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

3. **cpu_proc**

   **Arguments**

   | proname   | (Optional) A regular expression that specifies the process name that you wish to monitor for dispatch_manager status. |
   | op        | (Optional) Comparison operator used to compare the collected number of events with the specified value; if true, an event will be raised. |
   | val       | (Optional) The value with which the number of events that have occurred should be compared. |
   | period     | (Optional) The time period for the number of events that have occurred (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proname</td>
<td>(Optional) A regular expression that specifies the process name that you wish to monitor for CPU utilization conditions.</td>
</tr>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected CPU usage sample percentage with the specified percentage value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) The percentage value with which the average CPU usage during the sample period should be compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) The time period for averaging the collection of samples (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

4. cpu_tot [op gt|ge|eq|ne|lt|le] [val ?] [period ?]

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected total system CPU usage sample percentage with the specified percentage value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) The percentage value with which the average CPU usage during the sample period should be compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) The time period for averaging the collection of samples (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

5. mem_proc [proname ?] [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proname</td>
<td>(Optional) A regular expression that specifies the process name that you wish to monitor for memory usage.</td>
</tr>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected memory used with the specified value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
</tbody>
</table>
period  (Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

6. mem_tot_avail [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]

Arguments

<table>
<thead>
<tr>
<th>op</th>
<th>(Optional) Comparison operator used to compare the collected available memory with the specified value; if true, an event will be raised.</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If available memory usage has decreased from 300 KB to 150 KB within the time period, the percentage decrease is 50. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

7. mem_tot_used [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]

Arguments

<table>
<thead>
<tr>
<th>op</th>
<th>(Optional) Comparison operator used to compare the collected used memory with the specified value; if true, an event will be raised.</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
</tbody>
</table>
period | (Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

Note | This argument is mandatory if is_percent is set to TRUE; otherwise, it is optional.

Result String

None

Set_errno

No

Event_reqinfo

"event_id %u event_type %u event_type_string {%s} %u event_pub_sec %u event_pub_msec %u"
"num_subs %u"

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_id</td>
<td>Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.</td>
</tr>
<tr>
<td>event_type</td>
<td>Type of event.</td>
</tr>
<tr>
<td>event_type_string</td>
<td>An ASCII string that represents the name of the event for this event type.</td>
</tr>
<tr>
<td>event_pub_sec</td>
<td>The time, in seconds and milliseconds, when the event was published to the EEM.</td>
</tr>
<tr>
<td>event_pub_msec</td>

<tr>
<td>node</td>
<td>Name of the node that the POSIX process is on.</td>
</tr>
<tr>
<td>proname</td>
<td>POSIX process name for this subevent.</td>
</tr>
<tr>
<td>pid</td>
<td>POSIX process ID for this subevent. <strong>Note</strong> The three fields above describe the process whose CPU utilization is being monitored.</td>
</tr>
</tbody>
</table>
### For wdsysmon Subevent

If the `sec` and `msec` variables are specified as 0 or are unspecified in the event registration Tcl command extension, the process CPU utilization is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged process CPU utilization is in the given time window.

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the process CPU utilization is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged process CPU utilization is in the given time window.</td>
</tr>
<tr>
<td>sec msec</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>sec</code> and <code>msec</code> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

**For cpu_tot Subevent**

```
"{type %s node {%s} value %u sec %ld msec %ld}"
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td>node</td>
<td>Name of the node on which the total CPU utilization is being monitored.</td>
</tr>
<tr>
<td>value</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total CPU utilization is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total CPU utilization is in the given time window.</td>
</tr>
<tr>
<td>sec msec</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>sec</code> and <code>msec</code> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

**For mem_proc Subevent**

```
"{type %s node {%s} procname {%s} pid %u is_percent %s value %u diff %d sec %ld msec %ld}"
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td>node</td>
<td>Name of the node that the POSIX process is on.</td>
</tr>
<tr>
<td>procname</td>
<td>POSIX process name for this subevent.</td>
</tr>
<tr>
<td>pid</td>
<td>POSIX process ID for this subevent.</td>
</tr>
<tr>
<td>Note</td>
<td>The three fields above describe the process whose memory usage is being monitored.</td>
</tr>
<tr>
<td>Subevent Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>is_percent</strong></td>
<td>Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).</td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the process used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged process used memory utilization is in the given time window.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>diff</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the oldest and latest process used memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>sec msec</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>sec</code> and <code>msec</code> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

If the **is_percent** argument is FALSE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is the process used memory in the latest sample.
- **diff** is 0.
- **sec** and **msec** are both 0.

If the **is_percent** argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is the averaged process used memory sample value in the specified time window.
- **diff** is 0.
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest samples in this time window.

If the **is_percent** argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is 0.
- **diff** is the percentage difference between the oldest and latest process used memory samples in the specified time window.
- **sec** and **msec** are the actual time difference between the time stamps of the oldest and latest process used memory samples in this time window.
If the `is_percent` argument is TRUE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- `value` is 0.
- `diff` is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample.
- `sec` and `msec` are the actual time difference between the time stamps of the first process used memory sample ever collected and the latest process used memory sample.

For mem_tot_avail Subevent

```
"(type %s node {%s} is_percent %s used %u avail %u diff %d sec %ld msec %ld)"
```

<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of wdsysmon subevent.</td>
</tr>
<tr>
<td>node</td>
<td>Name of the node for which the total available memory is being monitored.</td>
</tr>
<tr>
<td>is_percent</td>
<td>Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).</td>
</tr>
<tr>
<td>used</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total used memory utilization is in the given time window.</td>
</tr>
<tr>
<td>avail</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>avail</code> is in the latest total available memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>avail</code> is the total available memory utilization in the specified time window.</td>
</tr>
<tr>
<td>diff</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the oldest and latest total available memory utilization in the specified time window.</td>
</tr>
<tr>
<td>sec msec</td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, they are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

If the `is_percent` argument is FALSE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- `used` is the total used memory in the latest sample.
- `avail` is the total available memory in the latest sample.
- `diff` is 0.
• sec and msec are both 0.

If the is_percent argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

• used is 0.

• avail is the averaged total available memory sample value in the specified time window.

• diff is 0.

• sec and msec are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the is_percent argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

• used is 0.

• avail is 0.

• diff is the percentage difference between the oldest and latest total available memory samples in the specified time window.

• sec and msec are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the is_percent argument is TRUE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

• used is 0.

• avail is 0.

• diff is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample.

• sec and msec are the actual time difference between the time stamps of the first total available memory sample ever collected and the latest total available memory sample.

**For mem_tot_used Subevent**

"{type %s node {%s} is_percent %s used %u avail %u diff %d sec %ld msec %ld}"
<table>
<thead>
<tr>
<th>Subevent Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>used</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the total used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged total used memory utilization is in the given time window.</td>
</tr>
<tr>
<td><strong>avail</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>avail</code> is in the latest total used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>avail</code> is the total used memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>diff</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>diff</code> is the percentage difference between the oldest and latest total used memory utilization in the specified time window.</td>
</tr>
<tr>
<td><strong>sec msec</strong></td>
<td>If the <code>sec</code> and <code>msec</code> variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the <code>sec</code> and <code>msec</code> variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.</td>
</tr>
</tbody>
</table>

If the `is_percent` argument is `FALSE`, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- `used` is the total used memory in the latest sample,
- `avail` is the total available memory in the latest sample,
- `diff` is 0,
- `sec` and `msec` are both 0,

If the `is_percent` argument is `FALSE`, and a time window is specified as greater than zero in the event registration Tcl command extension:

- `used` is the averaged total used memory sample value in the specified time window,
- `avail` is 0,
- `diff` is 0,
- `sec` and `msec` are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window,

If the `is_percent` argument is `TRUE`, and a time window is specified as greater than zero in the event registration Tcl command extension:

- `used` is 0.
- `avail` is 0.
• **diff** is the percentage difference between the oldest and latest total used memory samples in the specified time window.

• **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window.

If the **is_percent** argument is TRUE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

• **used** is 0.

• **avail** is 0.

• **diff** is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample.

• **sec** and **msec** are the actual time difference between the time stamps of the first total used memory sample ever collected and the latest total used memory sample.

---

**Note**

Inside a subevent description, each argument is position independent.
event_register_wdsysmon
EEM Event Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  `[type?]`

- A question mark ? represents a variable to be entered.

- Choices between arguments are represented by pipes, for example:

  `priority low|normal|high`

---

**Note**
For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**
Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- `event_completion`, on page 1827
- `event_completion_with_wait`, on page 1828
- `event_publish`, on page 1829
- `event_wait`, on page 1832

---

**event_completion**

Sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the `return_code` of this event instance.

**Syntax**

```
event_completion status ?
```
Arguments

| status | (Mandatory) Exit status (return_code) of this event instance. A value of zero indicates no error and any other integer value indicates an error. |

Result String
None

Set _cerrno
No

**event_completion_with_wait**

The `event_completion_with_wait` command combines the two commands `event_completion` and `event_wait` into a single command for ease of use.

The `event_completion` command sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the `return_code` of this event instance.

The `event_wait` places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If `event_wait` policy is invoked before `event_completed` policy, an error results and the policy exits.

Syntax

`event_completion_with_wait status ? [refresh_vars]`

Arguments

| status | (Mandatory) exit_status (return_code) of this event instance. A value of zero indicates no error. Any other integer value indicates an error. |
| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

Result String
None

Set _cerrno
Yes

Sample Usage
Here is a similar example as above using this single command:

```
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```
set i 1
while {1 == 1} { # Start high performance policy loop
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s"
       $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
action_syslog msg "event $i serviced" priority info
if {$i == 5} {
    action_syslog msg "Exiting after servicing 5 events" priority info
    exit 0
}
incr i
array set _event_state_arr [event_completion_with_wait status 0 refresh_vars 1]
if {$_event_state_arr(event_state) != 0} {
    action_syslog msg "Exiting: failed event_state " \
       "$event_state_arr(event_state)" priority info
    exit 0
}
}

---

**Note**
The running configuration output is the same as the event_publish Tcl command.

---

**event_publish**

Publishes an application-specific event.

**Syntax**

```
event_publish sub_system ? type ? [arg1 ?] [arg2 ?] [arg3 ?] [arg4 ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sub_system</td>
<td>(Mandatory) Number assigned to the EEM policy that published the application-specific event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td>type</td>
<td>(Mandatory) Event subtype within the specified component. The sub_system and type arguments uniquely identify an application event. Must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>[arg1 ?]-[arg4 ?]</td>
<td>(Optional) Four pieces of application event publisher string data.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set _cerrno**

Yes
(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

Sample Usage

This example demonstrates how to use the event_publish Tcl command extension to execute a script \( n \) times repeatedly to perform some function (for example, to measure the amount of CPU time taken by a given group of Tcl statements). This example uses two Tcl scripts.

Script1 publishes a type 9999 EEM event to cause Script2 to run for the first time. Script1 is registered as a none event and is run using the Cisco IOS CLI event manager run command. Script2 is registered as an EEM application event of type 9999, and this script checks to see if the application publish arg1 data (the iteration number) exceeds the EEM environment variable test_iterations value. If the test_iterations value is exceeded, the script writes a message and exits; otherwise the script executes the remaining statements and reschedules another run. To measure the CPU utilization for Script2, use a value of test_iterations that is a multiple of 10 to calculate the amount of average CPU time used by Script2.

To run the Tcl scripts, enter the following Cisco IOS commands:

```bash
configure terminal
event manager environment test_iterations 100
  event manager policy script1.tcl
  event manager policy script2.tcl
end
event manager run script1.tcl
```

The Tcl script Script2 will be executed 100 times. If you execute the script without the extra processing and derive the average CPU utilization, and then add the extra processing and repeat the test, you can subtract the former CPU utilization from the later CPU utilization to determine the average for the extra processing.

Script1 (script1.tcl)

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
# Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
  set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \$
  $cerr_sub_num $cerr_sub_err $cerr_posix_err $cerr_str]
  error $result
}

action_syslog priority info msg "EEM application_publish test start"
if {($cerrno != 0) { 
  set result [format \"component=%s; subsys err=%s; posix err=%s;\n%s" \$
  $cerr_sub_num $cerr_sub_err $cerr_posix_err $cerr_str]
  error $result
}

# Cause the first iteration to run.
event_publish sub_system 798 type 9999 arg1 0
if {($cerrno != 0) { 
  set result [format \"component=%s; subsys err=%s; posix err=%s;\n%s" \$
  $cerr_sub_num $cerr_sub_err $cerr_posix_err $cerr_str]
```

"component=%s; subsys err=%s; posix err=%s;\n%s"
```
error $result
)

Script2 (script2.tcl)

::cisco::eem::event_register_appl sub_system 798 type 9999

# Check if all the required environment variables exist.
# If any required environment variable does not exist, print out an error msg and quit.
if {![info exists test_iterations]} {
    set result "Policy cannot be run: variable test_iterations has not been set"
    error $result $errorInfo
}

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

# Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s"$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}

# Data1 contains the arg1 value used to publish this event.
set iter [lindex $arr_einfo(data1) 0]

# Use the arg1 info from the previous run to determine when to end.
if {$iter >= $test_iterations} {
    # Log a message.
    action_syslog priority info msg "EEM application_publish test end"
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s"$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    }
    exit 0
}

set iter [expr $iter + 1]

# Log a message.
set msg [format "EEM application_publish test iteration %s" $iter]
action_syslog priority info msg $msg
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s"$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}

# Do whatever processing that you want to measure here.

# Cause the next iteration to run. Note that the iteration is passed to the
# next operation as arg1.
event_publish sub_system 798 type 9999 arg1 $iter
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s"$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
**event_wait**

Places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If event_wait policy is invoked before event_completed policy, an error results and the policy exits.

**Syntax**

```
event_wait [refresh_vars]
```

**Arguments**

| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

**Result String**

None

**Set_cerrno**

No

**Sample Usage**

The event_wait event detector returns an array type value with a single element named event_state. Event_state is a value sent back from the EEM Server indicating whether or not an error has occurred in processing the event. An example of an error here would be if the user configured event_wait before configuring event_completion when handling the event instance.

The following sample output shows the use of both event_completion and event_wait Tcl commands:

```cisco::eem::event_register_syslog tag el occurs 1 pattern CLEAR maxrun 0
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set i 1
while {1 == 1} { # Start high performance policy loop
    array set arr_einfo [event_reqinfo]
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s\n%s" \
                $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    }
    action_syslog msg "event $i serviced" priority info
    if {$_i == 5} {
        action_syslog msg "Exiting after servicing 5 events" priority info
        exit 0
    }
    incr i
    event_completion status 0
    array set _event_state_arr [event_wait refresh_vars 0]
    if {$_event_state_arr(event_state) != 0} {
        action_syslog msg "Exiting: failed event_state \
                    $event_state_arr(event_state)" priority info
    }
}```
exit 0
}
)

Here is an example of the running configuration:

Also while an event has been serviced and is waiting for the next event to come in show event manager policy active command will display the following output:

Device#show event manager policy active
Key: p - Priority   :L - Low, H - High, N - Normal, Z - Last
     s - Scheduling node :A - Active, S - Standby
default class - i script event
no. job id  p s status time of event event type name
1 11 N A wait Mon Oct20 14:15:24 2008 syslog
high_perf_example.tcl

In the above example the status is wait. This indicates that the policy is waiting for the next event to come in.
CHAPTER 83

EEM Library Debug Command Extensions

- cli_debug, on page 1835
- smtp_debug, on page 1835

cli_debug

Prints a command-line interface (CLI) debug statement to syslog. This Tcl command extension is used to print a CLI debug statement to syslog if the debug event manager tcl cli_library Cisco IOS CLI command is in effect.

Syntax

cli_debug spec_string debug_string

Arguments

<table>
<thead>
<tr>
<th>spec_string</th>
<th>(Mandatory) The spec_string argument is used to indicate the type of debug statement.</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug_string</td>
<td>(Mandatory) The debug_string argument is used to indicate the debugging text.</td>
</tr>
</tbody>
</table>

Result String
None

Set _cerrno
No

smtp_debug

Prints a Simple Mail Transfer Protocol (SMTP) debug statement to syslog. This Tcl command extension prints a SMTP debug statement to syslog if the debug event manager tcl smtp_library Cisco IOS command-line interface (CLI) command is in effect.
Syntax

smtp_debug spec_string debug_string

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spec_string</td>
<td>(Mandatory) The spec_string argument is used to indicate the type of debug statement.</td>
</tr>
<tr>
<td>debug_string</td>
<td>(Mandatory) The debug_string argument is used to indicate the debugging text.</td>
</tr>
</tbody>
</table>

Result String

None

Set _cerrno

No
EEM Multiple Event Support Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  [type ?]

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

    priority low|normal|high

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- attribute, on page 1837
- correlate, on page 1838
- trigger, on page 1839

attribute

Specifies a complex event.

Syntax

attribute tag ? [occurs ?]
Arguments

tag | Specifies a tag using the event-tag argument that can be used with the attribute command to associate an event.

occurs | (Optional) Specifies the number of occurrences before an EEM event is triggered. If not specified, an EEM event is triggered on the first occurrence. The range is from 1 to 4294967295.

Result String
None

Set _cerrno
No

correlate

Builds a single complex event and allows boolean logic to relate events and tracked objects.

Syntax

correlate event ? track ? [andnot | and | or] event ? track ?

Arguments

event | Specifies the event that can be used with the trigger command to support multiple event statements within a script.
If the event associated with the event-tag argument occurs for the number of times specified by the trigger command, the result is true. If not, the result is false.

track | Specifies the event object number for tracking. The range is from 1 to 500.
If the tracked object is set, the result of the evaluation is true. If the tracked object is not set or is undefined, the result of the evaluation is false. This result is regardless of the state of the object.

andnot | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is not executed.

and | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is executed.

Note | When "and" is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes.

or | (Optional) Specifies that if event 1 occurs the action is executed, or else if event 2 and event 3 occur together the action is executed.
trigger

Specifies the multiple event configuration ability of Embedded Event Manager (EEM) events. A multiple event is one that can involve one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The events are raised based on the specified parameters.

Syntax

```
trigger [occurs ?] [period ?] [period-start ?] [delay ?]
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>occurs</td>
<td>(Optional) Specifies the number of times the total correlation occurs before an EEM event is raised. When a number is not specified, an EEM event is raised on the first occurrence. The range is from 1 to 4294967295.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) Time interval in seconds and optional milliseconds, during which the one or more occurrences must take place. This is specified in the format sssssssssssmmm, where sssssssssss must be an integer number representing seconds between 0 and 4294967295, inclusive and mmm represents milliseconds and must be an integer number between 0 to 999.</td>
</tr>
<tr>
<td>period-start</td>
<td>(Optional) Specifies the start of an event correlation window. If not specified, event monitoring is enabled after the first CRON period occurs.</td>
</tr>
<tr>
<td>delay</td>
<td>(Optional) Specifies the number of seconds and optional milliseconds after which an event will be raised if all the conditions are true (specified in the format sssssssssssmmm, where sssssssssss must be an integer number representing seconds between 0 and 4294967295, inclusive and mmm represents milliseconds and must be an integer number between 0 to 999).</td>
</tr>
</tbody>
</table>

Set_cerrno

No
EEM SMTP Library Command Extensions

All Simple Mail Transfer Protocol (SMTP) library command extensions belong to the ::cisco::lib namespace. To use this library, the user needs to provide an e-mail template file. The template file can include Tcl global variables so that the e-mail service and the e-mail text can be configured through the event manager environment Cisco IOS command-line interface (CLI) configuration command. There are commands in this library to substitute the global variables in the e-mail template file and to send the desired e-mail context with the To address, CC address, From address, and Subject line properly configured using the configured e-mail server.

E-Mail Template

The e-mail template file has the following format:

Based on RFC 2554, the SMTP e-mail server name--Mailservername-- can be in any one of the following template formats: username:password@host, username@host, or host.

Note

Mailservername: <space><the list of candidate SMTP server addresses>
From:<space><the e-mail address of sender> 
To:<space><the list of e-mail addresses of recipients>
Cc:<space><the list of e-mail addresses that the e-mail will be copied to>
Sourceaddr:<space><the IP addresses of the recipients>
Subject:<subject line>
<a blank line>
<body>

Note that the template normally includes Tcl global variables for configuration.

In a Tcl policy, the port number can be specified by a "Port" line in the e-mail template. If port is not specified, the default port of 25 is used.

Below is a sample e-mail template file:

Mailservername: $_email_server
From: $_email_from
To: $email_to
Cc: $email_cc
smtp_send_email

Given the text of an e-mail template file with all global variables already substituted, sends the e-mail out using Simple Mail Transfer Protocol (SMTP). The e-mail template specifies the candidate mail server addresses, To addresses, CC addresses, From address, subject line, and e-mail body.

Note

A list of candidate e-mail servers can be provided so that the library will try to connect the servers on the list one by one until it can successfully connect to one of them.

Syntax

smtp_send_email text

Arguments

| text | (Mandatory) The text of an e-mail template file with all global variables already substituted. |

Result String

None

Set _cerrno

- Wrong 1st line format--Mailservername:list of server names.
- Wrong 2nd line format--From:from-address.
- Wrong 3rd line format--To:list of to-addresses.
- Wrong 4th line format--CC:list of cc-addresses.
- Error connecting to mail server:--$sock closed by remote server (where $sock is the name of the socket opened to the mail server).
- Error connecting to mail server:--$sock reply code is $k instead of the service ready greeting (where $sock is the name of the socket opened to the mail server; $k is the reply code of $sock).
- Error connecting to mail server:--cannot connect to all the candidate mail servers.
- Error disconnecting from mail server:--$sock closed by remote server (where $sock is the name of the socket opened to the mail server).
Sample Scripts

After all needed global variables in the e-mail template are defined:

```tcl
if [catch {smtp_subst [file join $tcl_library email_template_sm]} result] {
    puts stderr $result
    exit 1
}

if [catch {smtp_send_email $result} result] {
    puts stderr $result
    exit 1
}
```

smtp_subst

Given an e-mail template file `e-mail_template`, substitutes each global variable in the file by its user-defined value. Returns the text of the file after substitution.

Syntax

```tcl
smtp_subst email_template
```

Arguments

| e-mail_template | (Mandatory) Name of an e-mail template file in which global variables need to be substituted by a user-defined value. An example filename could be `/disk0://example.template` which represents a file named example.template in a top-level directory on an ATA flash disk in slot 0. |

Result String

The text of the e-mail template file with all the global variables substituted.

Set _cerrno

- cannot open e-mail template file
- cannot close e-mail template file
smtp_subst
CHAPTER 86

EEM System Information Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

• An optional argument is shown within square brackets, for example:

[type ?]

• A question mark ? represents a variable to be entered.

• Choices between arguments are represented by pipes, for example:

priority low|normal|high

---

**Note**

All EEM system information commands--sys_reqinfo_xxx--have the Set _cerrno section set to yes.

---

**Note**

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- `sys_reqinfo_cli_freq`, on page 1846
- `sys_reqinfo_cli_history`, on page 1847
- `sys_reqinfo_cpu_all`, on page 1847
- `sys_reqinfo_crash_history`, on page 1848
- `sys_reqinfo_mem_all`, on page 1849
- `sys_reqinfo_proc`, on page 1850
- `sys_reqinfo_proc_all`, on page 1852
- `sys_reqinfo_routername`, on page 1852
- `sys_reqinfo_snmp`, on page 1853
- `sys_reqinfo_syslog_freq`, on page 1854
sys_reqinfo_cli_freq

Queries the frequency information of all command-line interface (CLI) events.

Syntax

sys_reqinfo_cli_freq

Arguments

None

Result String

rec_list {{CLI frequency string 0},{CLI frequency str 1}, ...}

Where each CLI frequency string is:

time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u period_sec %ld period_msec %ld

pattern {%s}

MarksthestartoftheCLIeventfrequencylist.rec_list

Last timewhenthisisCLIeventwasraised.time_sec
time_msec

NumberoftimesthataCLIcommandmatchesthepatternspecifiedbythisCLI

eventspecification.match_count

NumberoftimesthatthisCLIeventwasraised.therfollowingfieldsareinformation

abouttheCLIeventspecification:

- sync--A "yes" means that event publish should be performed sychronously. The event detector will be notified when the Event Manager Server has completed publishing the event. The Event Manager Server will return a code that indicates whether or not the CLI command should be executed.

- skip--A "yes" means that the CLI command should not be executed if the sync flag is not set.

raise_count

NumberoftimesthatthisCLIeventwasraised.

occurs Numberofoccurrencesbeforeaneventisraised;ifthisargumentisnotspecified,
an event is raised on the first occurrence.

period_sec period_msec

NumberofoccurrencesmustoccurwithinthisnumberofPOSIXtimerunitsin

order to raise event; if this argument is not specified, it does not apply.

pattern Regular expression used to perform CLI command pattern matching.

Set _cerrno

Yes
sys_reqinfo_cli_history

Queries the history of command-line interface (CLI) commands.

Syntax

sys_reqinfo_cli_history

Arguments

None

Result String

rec_list {{CLI history string 0}, {CLI history str 1},...}
Where each CLI history string is:

time_sec %ld time_msec %ld cmd {%s}

Marksthe start of the CLI command history list.

<table>
<thead>
<tr>
<th>rec_list</th>
<th>Marks the start of the CLI command history list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_sec</td>
<td>Time when the CLI command was run.</td>
</tr>
<tr>
<td>time_msec</td>
<td></td>
</tr>
<tr>
<td>cmd</td>
<td>Text of the CLI command.</td>
</tr>
</tbody>
</table>

Set_cerrno

Yes

sys_reqinfo_cpu_all

Queries the CPU utilization of the top processes (both POSIX processes and IOS processes) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

Syntax

sys_reqinfo_cpu_all order cpu_used [sec ?] [msec ?] [num ?]

Arguments

<table>
<thead>
<tr>
<th>order</th>
<th>(Mandatory) Order used for sorting the CPU utilization of processes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpu_used</td>
<td>(Mandatory) Specifies that the average CPU utilization, for the specified time window, will be sorted in descending order.</td>
</tr>
</tbody>
</table>
(Optional) The time period, in seconds and milliseconds, during which the average CPU utilization is calculated. Must be integers in the range from 0 to 4294967295. If not specified, or if both sec and msec are specified as 0, the most recent CPU sample is used.

(Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

Result String

rec_list {{process CPU info string 0},{process CPU info string 1}, ...}

Where each process CPU info string is:

pid %u name {%s} cpu_used %u

Mark the start of the process CPU information list.

pid
Process ID.

name
Process name.

cpu_used
Specifies that if sec and msec are specified with a number greater than zero, the average percentage is calculated from the process CPU utilization during the specified time period. If sec and msec are both zero or not specified, the average percentage is calculated from the process CPU utilization in the latest sample.

Set _cerno
Yes

sys_reqinfo_crash_history

Queries the crash information of all processes that have ever crashed. This Tcl command extension is supported only in Software Modularity images.

Syntax

sys_reqinfo_crash_history

Arguments

None

Result String

rec_list {{crash info string 0},{crash info string 1}, ...}

Where each crash info string is:

job_id %u name {%s} respawn_count %u fail_count %u dump_count %u inst_id %d exit_status 0x%x exit_type %d proc_state {%s} component_id 0x%x crash_time_sec %ld crash_time_msec %ld
### job_id
System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.

### name
Process name.

### respawn_count
Total number of restarts for the process.

### fail_count
Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.

### dump_count
Number of core dumps performed.

### inst_id
Process instance ID.

### exit_status
Last exit status of the process.

### exit_type
Last exit type.

### proc_state
Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_rnode, stop, waitEOltimer, wait_rnode, wait_spawntimer, wait_tpl.

### component_id
Version manager assigned component ID for the component to which the process belongs.

### crash_time_sec crash_time_msec
Seconds and milliseconds since January 1, 1970, which represent the last time the process crashed.

---

### Set_cerrno
Yes

---

### sys_reqinfo_mem_all
Queries the memory usage of the top processes (both POSIX and IOS) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

#### Syntax

```
sys_reqinfo_mem_all order allocates|increase|used [sec ?] [msec ?] [num ?]
```

#### Arguments

- **order** (Mandatory) Order used for sorting the memory usage of processes.
- **allocates** (Mandatory) Specifies that the memory usage is sorted by the number of process allocations during the specified time window, and in descending order.
- **increase** (Mandatory) Specifies that the memory usage is sorted by the percentage of process memory increase during the specified time window, and in descending order.
- **used** (Mandatory) Specifies that the memory usage is sorted by the current memory used by the process.
sec msec (Optional) The time period, in seconds and milliseconds, during which the process memory usage is calculated. Must be integers in the range from 0 to 4294967295. If both sec and msec are specified and are nonzero, the number of allocations is the difference between the number of allocations in the oldest and latest samples collected in the time period. The percentage is calculated as the the percentage difference between the memory used in the oldest and latest samples collected in the time period. If not specified, or if both sec and msec are specified as 0, the first sample ever collected is used as the oldest sample; that is, the time period is set to be the time from startup until the current moment.

num (Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

**Result String**

rec_list {{process mem info string 0}, {process mem info string 1}, ...}

Where each process mem info string is:

pid %u name {%s} deltaAllocs %d initial_alloc %u current_alloc %u percent_increase %d

<table>
<thead>
<tr>
<th>rec_list</th>
<th>Marks the start of the process memory usage information list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pid</td>
<td>Process ID.</td>
</tr>
<tr>
<td>name</td>
<td>Process name.</td>
</tr>
<tr>
<td>deltaAllocs</td>
<td>Specifies the difference between the number of allocations in the oldest and latest samples collected in the time period.</td>
</tr>
<tr>
<td>initial_alloc</td>
<td>Specifies the amount of memory, in kilobytes, used by the process at the start of the time period.</td>
</tr>
<tr>
<td>current_alloc</td>
<td>Specifies the amount of memory, in kilobytes, currently used by the process.</td>
</tr>
<tr>
<td>percent_increase</td>
<td>Specifies the percentage difference between the memory used in the oldest and latest samples collected in the time period. The percentage difference can be expressed as current_alloc minus initial_alloc times 100 and divided by initial_alloc.</td>
</tr>
</tbody>
</table>

**Set _cerrno**

Yes

### sys_reqinfo_proc

Queries the information about a single POSIX process. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

sys_reqinfo_proc job_id ?
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_id</td>
<td>(Mandatory) System manager assigned job ID for the process. Must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

### Result String

```
job_id %u component_id 0x%x name {%s} helper_name {%s} helper_path {%s} path {%s}
node_name {%s} is_respawn %u is_mandatory %u is_hold %u dump_option %d
max_dump_count %u respawn_count %u fail_count %u dump_count %u
last_respawn_sec %ld last_respawn_msec %ld inst_id %u proc_state %s
level %d exit_status 0x%x exit_type %d
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_id</td>
<td>System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>component_id</td>
<td>Version manager assigned component ID for the component to which the process belongs.</td>
</tr>
<tr>
<td>name</td>
<td>Process name.</td>
</tr>
<tr>
<td>helper_name</td>
<td>Helper process name.</td>
</tr>
<tr>
<td>helper_path</td>
<td>Executable path of the helper process.</td>
</tr>
<tr>
<td>path</td>
<td>Executable path of the process.</td>
</tr>
<tr>
<td>node_name</td>
<td>System manager assigned node name for the node to which the process belongs.</td>
</tr>
<tr>
<td>is_respawn</td>
<td>Flag that specifies that the process can be respawned.</td>
</tr>
<tr>
<td>is_mandatory</td>
<td>Flag that specifies that the process must be alive.</td>
</tr>
<tr>
<td>is_hold</td>
<td>Flag that specifies that the process is spawned until called by the API.</td>
</tr>
<tr>
<td>dump_option</td>
<td>Core dumping options.</td>
</tr>
<tr>
<td>max_dump_count</td>
<td>Maximum number of core dumping permitted.</td>
</tr>
<tr>
<td>respawn_count</td>
<td>Total number of restarts for the process.</td>
</tr>
<tr>
<td>fail_count</td>
<td>Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.</td>
</tr>
<tr>
<td>dump_count</td>
<td>Number of core dumps performed.</td>
</tr>
<tr>
<td>last_respawn_sec</td>
<td>Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the last time the process was started.</td>
</tr>
<tr>
<td>last_respawn_msec</td>
<td>Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the last time the process was started.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Process instance ID.</td>
</tr>
<tr>
<td>proc_state</td>
<td>Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_mod, stop, waitEOltimer, wait_mode, wait_sapwntimer, wait_tpl.</td>
</tr>
</tbody>
</table>
### sys_reqinfo_proc_all

Queries the information of all POSIX processes. This Tcl command extension is supported only in Software Modularity images.

#### Syntax

```
sys_reqinfo_proc_all
```

#### Arguments

None

#### Result String

```
rec_list {{process info string 0}, {process info string 1},...}
```
Where each process info string is the same as the result string of the `sysreq_info_proc` Tcl command extension.

Set `_cerrno`

Yes

### sys_reqinfo_routername

Queries the device name.

#### Syntax

```
sys_reqinfo_routername
```

#### Arguments

None

#### Result String

```
routername %s
```
Where routernameln is the name of the device.

**Set _cerrno**

Yes

---

**sys_reqinfo_snmp**

Queries the value of the entity specified by a Simple Network Management Protocol (SNMP) object ID.

**Syntax**

```
sys_reqinfo_snmp oid ? get_type exact|next
```

**Arguments**

<table>
<thead>
<tr>
<th>oid</th>
<th>(Mandatory) SNMP OID in dot notation (for example, 1.3.6.1.2.1.2.1.0).</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_type</td>
<td>(Mandatory) Type of SNMP get operation that needs to be applied to the specified oid. If the get_type is &quot;exact,&quot; the value of the specified oid is retrieved; if the get_type is &quot;next,&quot; the value of the lexicographical successor to the specified oid is retrieved.</td>
</tr>
</tbody>
</table>

**Result String**

```
oid {%s} value {%s}
```

<table>
<thead>
<tr>
<th>oid</th>
<th>SNMP OID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value string of the associated SNMP data element.</td>
</tr>
</tbody>
</table>

---

**Set _cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 37)  FH_ENOSNMPDATA  (can't retrieve data from SNMP)

This error means that there was no data for the SNMP object type.

(_cerr_sub_err = 51)  FH_ESTATSTYP  (invalid statistics data type)

This error means that the SNMP statistics data type was invalid.
(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)

This error means that the event detector was unavailable.

**sys_reqinfo_syslog_freq**

Queries the frequency information of all syslog events.

**Syntax**

```
sys_reqinfo_syslog_freq
```

**Arguments**

None

**Result String**

```
rec_list {{event frequency string 0}, {log freq str 1}, ...}
```

Where each event frequency string is:

```
time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u
period_sec %ld period_msec %ld pattern {%s}
```

<table>
<thead>
<tr>
<th>time_sec</th>
<th>time_msec</th>
<th>Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the time the last event was raised.</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_count</td>
<td></td>
<td>Number of times that a syslog message matches the pattern specified by this syslog event specification since event registration.</td>
</tr>
<tr>
<td>raise_count</td>
<td></td>
<td>Number of times that this syslog event was raised.</td>
</tr>
<tr>
<td>occurs</td>
<td></td>
<td>Number of occurrences needed in order to raise the event; if not specified, the event is raised on the first occurrence.</td>
</tr>
<tr>
<td>period_sec</td>
<td>period_msec</td>
<td>Number of occurrences must occur within this number of POSIX timer units in order to raise the event; if not specified, the period check does not apply.</td>
</tr>
<tr>
<td>pattern</td>
<td></td>
<td>Regular expression used to perform syslog message pattern matching.</td>
</tr>
</tbody>
</table>

**Set _cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 9)  FH_EMEMORY  (insufficient memory for request)
This error means that an internal EEM request for memory failed.

\(_\text{cerr}\_\text{sub}\_\text{err} = 22\)  \(\text{FH\_ENULLPTR}\)  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

\(_\text{cerr}\_\text{sub}\_\text{err} = 45\)  \(\text{FH\_ESEQNUM}\)  (sequence or workset number out of sync)

This error means that the event detector sequence or workset number was invalid.

\(_\text{cerr}\_\text{sub}\_\text{err} = 46\)  \(\text{FH\_EREEMPTY}\)  (registration list is empty)

This error means that the event detector registration list was empty.

\(_\text{cerr}\_\text{sub}\_\text{err} = 54\)  \(\text{FH\_EFDUNAVAIL}\)  (connection to event detector unavailable)

This error means that the event detector was unavailable.

**sys_reqinfo_syslog_history**

Queries the history of the specified syslog message.

**Syntax**

sys_reqinfo_syslog_history

**Arguments**

None

**Result String**

rec_list {{log hist string 0}, {log hist str 1}, ...}

Where each log hist string is:

```
time_sec %ld time_msec %ld msg {%s}
```

- time_sec: Seconds and milliseconds since January 1, 1970, which represent the time the message was logged.
- time_msec: Time in milliseconds.
- msg: Syslog message.

**Set _cerrno**

Yes

\(_\text{cerr}\_\text{sub}\_\text{err} = 2\)  \(\text{FH\_ESYSERR}\)  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.
(_cerr_sub_err = 22)  FH_ENULLPTR (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 44)  FH_EHISTEMPTY (history list is empty)
This error means that the history list was empty.

(_cerr_sub_err = 45)  FH_ESEQNUM (sequence or workset number out of sync)
This error means that the event detector sequence or workset number was invalid.

(_cerr_sub_err = 54)  FH_EFNAVAIL (connection to event detector unavailable)
This error means that the event detector was unavailable.
CHAPTER 87

EEM Utility Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  [type ?]

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

    priority low|normal|high

---

**Note**

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- appl_read, on page 1858
- appl_reqinfo, on page 1858
- appl_setinfo, on page 1859
- counter_modify, on page 1860
- description, on page 1861
- fts_get_stamp, on page 1862
- register_counter, on page 1863
- register_timer, on page 1864
- timer_arm, on page 1866
- timer_cancel, on page 1867
- unregister_counter, on page 1868
appl_read

Reads Embedded Event Manager (EEM) application volatile data. This Tcl command extension provides support for reading EEM application volatile data. EEM application volatile data can be published by a Cisco software process that uses the EEM application publish API. EEM application volatile data cannot be published by an EEM policy.

Note

Currently there are no Cisco software processes that publish application volatile data.

Syntax

appl_read name ? length ?

Arguments

<table>
<thead>
<tr>
<th>name</th>
<th>(Mandatory) Name of the application published string data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>length</td>
<td>(Mandatory) Length of the string data to read. Must be an integer number between 1 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

Result String

data %s

Where data is the application published string data to be read.

Set _cerrno

Yes

(_cerr_sub_err - 2)   FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err - 7)   FH_ENOSUCHKEY (could not find key)

This error means that the application event detector info key or other ID was not found.

(_cerr_sub_err - 9)   FH_EMEMORY (insufficient memory for request)

This error means that an internal EEM request for memory failed.

appl_reqinfo

Retrieves previously saved information from the Embedded Event Manager (EEM). This Tcl command extension provides support for retrieving information from EEM that has been previously saved with a unique
key, which must be specified in order to retrieve the information. Note that retrieving the information deletes it from EEM. It must be resaved if it is to be retrieved again.

Syntax

appl_reqinfo key ?

Arguments

key (Mandatory) The string key of the data.

Result String

data %s

Where data is the application string data to be retrieved.

Set_cerrno

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = ?)  FH_ENOSUCHKEY  (could not find key)

This error means that the application event detector info key or other ID was not found.

appl_setinfo

Saves information in the Embedded Event Manager (EEM). This Tcl command extension provides support for saving information in the Embedded Event Manager that can be retrieved later by the same policy or by another policy. A unique key must be specified. This key allows the information to be retrieved later.

Syntax

appl_setinfo key ? data ?

Arguments

key (Mandatory) The string key of the data.
data (Mandatory) The application string data to save.

Result String

None
Set _cerrno

Yes

(_cerr_sub_err = 2)    FH_ESYSERR   (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 8)    FH_EDUPLICATEKEY   (duplicate appl info key)
This error means that the application event detector info key or other ID was a duplicate.

(_cerr_sub_err = 9)    FH_EMEMORY   (insufficient memory for request)
This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 34)    FH_EMAXLEN   (maximum length exceeded)
This error means that the object length or number exceeded the maximum.

(_cerr_sub_err = 43)    FH_EBADLENGTH   (bad API length)
This error means that the API message length was invalid.

counter_modify

Modifies a counter value.

Syntax

counter_modify event_id ? val ? op nop|set|inc|dec

Arguments

<table>
<thead>
<tr>
<th>event_id</th>
<th>(Mandatory) The counter event ID returned by the register_counter Tcl command extension. Must be an integer between 0 and 4294967295, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>(Mandatory)</td>
</tr>
</tbody>
</table>

Note: Mandatory except when the op nop argument value combination is specified.

- If op is set, this argument represents the counter value that is to be set.
- If op is inc, this argument is the value by which to increment the counter.
- If op is dec, this argument is the value by which to decrement the counter.
op | (Mandatory)  
---|---
| • nop--Retrieves the current counter value.  
| • set--Sets the counter value to the given value.  
| • inc--Increments the counter value by the given value.  
| • dec--Decrements the counter value by the given value.

**Result String**

val_remain %d

Where val_remain is the current value of the counter.

**Set _cerrno**

Yes

(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 30) FH_ECTBADOPER (bad counter threshold operator)

This error means that the counter event detector set or modify operator was invalid.

description

Provides a brief description of the registered policy.

**Syntax**

description ?

**Arguments**

| line | (Optional) Brief description of the policy consisting of 1 to 240 characters. |
Result String

None

Set _cerrno

Yes

Sample Usage

The description statement is entered by the author of the policy. It can appear before or after any event registration statement in Tcl. The policy can have only one description.

Note

Registration of a policy with more than one description statement will fail.

The following example shows how a brief description is provided for the `event_register_syslog` policy:

```tcl
::cisco::eem::description "This Tcl command looks for the word count in syslog messages."
::cisco::eem::event_register_syslog tag 1 ...
::cisco::eem::event_register_snmp_object tag 2 ...
::cisco::eem::trigger {
    ::cisco::eem::correlate event 1 and event 2
    ::cisco::eem::attribute tag 1 occurs 1
    ::cisco::eem::attribute tag 2 occurs 1
}
```

fts_get_stamp

Returns the time period elapsed since the last software boot. Use this Tcl command extension to return the number of nanoseconds since boot in an array "nsec nnnn" where nnnn is the number of nanoseconds.

Syntax

```tcl
fts_get_stamp
```

Arguments

None

Result String

```tcl
nsec %d
```

Where nsec is the number of nanoseconds since boot.

Set _cerrno

No
**register_counter**

Registers a counter and returns a counter event ID. This Tcl command extension is used by a counter publisher to perform this registration before using the event ID to manipulate the counter.

**Syntax**

```tcl
register_counter name ?
```

**Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Mandatory) The name of the counter to be manipulated.</td>
</tr>
</tbody>
</table>

**Result String**

```tcl
event_id %d
event_spec_id %d
```

Where *event_id* is the counter event ID for the specified counter; it can be used to manipulate the counter by the `unregister_counter` or `counter_modify` Tcl command extensions. The `event_spec_id` argument is the event specification ID for the specified counter.

**Set _cerrno**

Yes

<table>
<thead>
<tr>
<th>_cerr_sub_err</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>FH_ESYSERR (generic/unknown error from OS/system)</td>
</tr>
<tr>
<td>4</td>
<td>FH_EINITONCE (Init() is not yet done, or done twice.)</td>
</tr>
<tr>
<td>6</td>
<td>FH_EBADEVENTTYPE (unknown EEM event type)</td>
</tr>
<tr>
<td>9</td>
<td>FH_EMEMORY (insufficient memory for request)</td>
</tr>
<tr>
<td>10</td>
<td>FH_ECORRUPT (internal EEM API context is corrupt)</td>
</tr>
<tr>
<td>11</td>
<td>FH_ENOSUCHESID (unknown event specification ID)</td>
</tr>
</tbody>
</table>

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

This error means that the event type specified in the internal event specification was invalid.

This error means that an internal EEM request for memory failed.

This error means that the internal EEM API context structure is corrupt.

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.
(_cerr_sub_err = 12) FH_ENOSUCHEID (unknown event ID)
This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 16) FH_EBADFPFPTR (bad ptr to fh_p data structure)
This error means that the context pointer that is used with each EEM API call is incorrect.

(_cerr_sub_err = 17) FH_EBADADDRESS (bad API control block address)
This error means that a control block address that was passed in the EEM API was incorrect.

(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 25) FH_ESUBSEXCEED (number of subscribers exceeded)
This error means that the number of timer or counter subscribers exceeded the maximum.

(_cerr_sub_err = 26) FH_ESUBSIDXINV (invalid subscriber index)
This error means that the subscriber index was invalid.

(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
This error means that the event detector was unavailable.

(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
This error means that the EEM event detector that handles this request is not available.

---

**register_timer**

Registers a timer and returns a timer event ID. This Tcl command extension is used by a timer publisher to perform this registration before using the event ID to manipulate the timer if it does not use the `event_register_timer` command extension to register as a publisher and subscriber.

**Syntax**

`register_timer watchdog|countdown|absolute|cron name ?`

**Arguments**

- **name** (Mandatory) The name of the timer to be manipulated.

**Result String**

`event_id %u`
Where \text{event	extunderscore id} is the timer event ID for the specified timer (can be used to manipulate the timer by the \text{timer	extunderscore arm} or \text{timer	extunderscore cancel} command extensions).

**Set \text{_cerrno}**

Yes

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 2) \quad \text{FH	extunderscore ESYSERR} \quad \text{(generic/unknown error from OS/system)}
\]

This error means that the operating system reported an error. The POSIX \text{errno} value that is reported with the error should be used to determine the cause of the operating system error.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 4) \quad \text{FH	extunderscore EINITONCE} \quad \text{(Init() is not yet done, or done twice.)}
\]

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 6) \quad \text{FH	extunderscore EBADEVENTTYPE} \quad \text{(unknown EEM event type)}
\]

This error means that the event type specified in the internal event specification was invalid.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 9) \quad \text{FH	extunderscore EMEMORY} \quad \text{(insufficient memory for request)}
\]

This error means that an internal EEM request for memory failed.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 10) \quad \text{FH	extunderscore ECORRUPT} \quad \text{(internal EEM API context is corrupt)}
\]

This error means that the internal EEM API context structure is corrupt.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 11) \quad \text{FH	extunderscore ENOSUCHESID} \quad \text{(unknown event specification ID)}
\]

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 16) \quad \text{FH	extunderscore EBADFMPFTR} \quad \text{(bad ptr to fh	extunderscore p data structure)}
\]

This error means that the context pointer that is used with each EEM API call is incorrect.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 17) \quad \text{FH	extunderscore EBADAADDRESS} \quad \text{(bad API control block address)}
\]

This error means that a control block address that was passed in the EEM API was incorrect.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 22) \quad \text{FH	extunderscore ENULLPTR} \quad \text{(event detector internal error - ptr is null)}
\]

This error means that an internal EEM event detector pointer was null when it should have contained a value.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 25) \quad \text{FH	extunderscore ESUBSEXCEED} \quad \text{(number of subscribers exceeded)}
\]

This error means that the number of timer or counter subscribers exceeded the maximum.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 26) \quad \text{FH	extunderscore ESUBSIDXINV} \quad \text{(invalid subscriber index)}
\]

This error means that the subscriber index was invalid.

\[
\text{(_cerr	extunderscore sub	extunderscore err} = 54) \quad \text{FH	extunderscore EFDUNAVAIL} \quad \text{(connection to event detector unavailable)}
\]
This error means that the event detector was unavailable.

(_cerr_sub_err = 56)     FH_EFDCONNERR (event detector connection error)

This error means that the EEM event detector that handles this request is not available.

timer_arm

Arms a timer. The type could be CRON, watchdog, countdown, or absolute.

Syntax

timer_arm event_id ? cron_entry ?|time ?

Arguments

| event_id   | (Mandatory) The timer event ID returned by the register_timer command extension. Must be an integer between 0 and 4294967295, inclusive. |
| cron_entry | (Mandatory) Must exist if the timer type is CRON. Must not exist for other types of timer. CRON timer specification uses the format of the CRON table entry. |
| time       | (Mandatory) Must exist if the timer type is not CRON. Must not exist if the timer type is CRON. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for an absolute timer, the calendar time of the expiration time (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately. |

Result String

sec_remain %ld msec_remain %ld

Where sec_remain and msec_remain are the remaining time before the next expiration of the timer.

Note

A value of 0 will be returned for the sec_remain and msec_remain arguments if the timer type is CRON.

Set_cerrno

Yes

(_cerr_sub_err = 2)     FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.
(_cerr_sub_err = 6) FH_EBADEVENTTYPE (unknown EEM event type)

This error means that the event type specified in the internal event specification was invalid.

(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)

This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 12) FH_ENOSUCHEID (unknown event ID)

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 27) FH_ETMDELAYZR (zero delay time)

This error means that the time specified to arm a timer was zero.

(_cerr_sub_err = 42) FH_ENOTREGISTERED (request for event spec that is unregistered)

This error means that the event was not registered.

(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)

This error means that the event detector was unavailable.

(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)

This error means that the EEM event detector that handles this request is not available.

**timer_cancel**

Cancels a timer.

**Syntax**

timer_cancel event_id ?

**Arguments**

| event_id | (Mandatory) The timer event ID returned by the register_timer command extension. Must be an integer between 0 and 4294967295, inclusive. |
unregister_counter

Unregisters a counter. This Tcl command extension is used by a counter publisher to unregister a counter that was previously registered with the register_counter Tcl command extension.
Syntax

unregister_counter event_id ? event_spec_id ?

Arguments

| event_id | (Mandatory) Counter event ID returned by the register_counter command extension. Must be an integer between 0 and 4294967295, inclusive. |
| event_spec_id | (Mandatory) Counter event specification ID for the specified counter returned by the register_counter command extension. Must be an integer between 0 and 4294967295, inclusive. |

Result String

None

Set _cerrno

Yes

(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 11) FH_ENOSUCHESID (unknown event specification ID)
This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 26) FH_ESUBSIDXINV (invalid subscriber index)
This error means that the subscriber index was invalid.

(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
This error means that the event detector was unavailable.

(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)
This error means that the EEM event detector that handles this request is not available.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VTP

Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more switches and have those changes automatically communicated to all the other switches in the network. Without VTP, you cannot send information about VLANs to other switches.

VTP is designed to work in an environment where updates are made on a single switch and are sent through VTP to other switches in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on switches in the same domain, which would result in an inconsistency in the VLAN database.
The switch supports a total of 1000 VLANs. However, the number of routed ports, SVIs, and other configured features affects the usage of the switch hardware. If the switch is notified by VTP of a new VLAN and the switch is already using the maximum available hardware resources, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the `show vlan` user EXEC command shows the VLAN in a suspended state.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch or switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

**Restrictions for VTP**

Before adding a VTP client switch to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. If you add a switch that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

The following are restrictions for configuring VTPs:

- 1K VLAN is supported only on switches running the LAN Base image with the lanbase-default template set.

- To avoid warning messages of high CPU utilization with a normal-range VLAN configuration, we recommended to have no more than 256 VLANs.

  In such cases, approximately 10 access interfaces or 5 trunk interfaces can flap simultaneously with negligible impact to CPU utilization (if there are more interfaces that flap simultaneously, then CPU usage may be excessively high.)

**Information About VTP**

**VTP**

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP functionality is supported across the stack, and all switches in the stack maintain the same VLAN and VTP configuration inherited from the active switch. When a switch learns of a new VLAN through VTP messages or when a new VLAN is configured by the user, the new VLAN information is communicated to all switches in the stack.

When a switch joins the stack or when stacks merge, the new switches get VTP information from the active switch.
VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3.

You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

VTP Domain

A VTP domain (also called a VLAN management domain) consists of one switch or several interconnected switches or switch stacks under the same administrative responsibility sharing the same VTP domain name. A switch can be in only one VTP domain. You make global VLAN configuration changes for the domain.

By default, the switch is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the switch receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The switch then ignores advertisements with a different domain name or an earlier configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all switches in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a switch for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other switches in the domain, and they affect only the individual switch. However, configuration changes made when the switch is in this mode are saved in the switch running configuration and can be saved to the switch startup configuration file.

## VTP Modes

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
</table>
| **VTP server** | In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other switches in the same VTP domain and synchronize their VLAN configurations with other switches based on advertisements received over trunk links.  
VTP server is the default mode.  
In VTP server mode, VLAN configurations are saved in NVRAM. If the switch detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the switch cannot be returned to VTP server mode until the NVRAM is functioning. |
| **VTP client** | A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another switch in the domain that is in server mode.  
In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode. |
**VTP Mode** | **Description**
--- | ---
VTP transparent | VTP transparent switches do not participate in VTP. A VTP transparent switch does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent switches do forward VTP advertisements that they receive from other switches through their trunk interfaces. You can create, modify, and delete VLANs on a switch in VTP transparent mode.

When the switch is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other switches. In this mode, VTP mode and domain name are saved in the switch running configuration, and you can save this information in the switch startup configuration file by using the `copy running-config startup-config` privileged EXEC command.

In a switch stack, the running configuration and the saved configuration are the same for all switches in a stack.

VTP off | A switch in VTP off mode functions in the same manner as a VTP transparent switch, except that it does not forward VTP advertisements on trunks.

**Related Topics**
- Prerequisites for VTP
- Configuring VTP Mode, on page 1883
- Example: Configuring Switch as VTP Server, on page 1894

**VTP Advertisements**

Each switch in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring switches receive these advertisements and update their VTP and VLAN configurations as necessary.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
• Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:

• VLAN IDs (including IEEE 802.1Q)
• VLAN name
• VLAN type
• VLAN state
• Additional VLAN configuration information specific to the VLAN type

In VTP version 3, VTP advertisements also include the primary server ID, an instance number, and a start index.

Related Topics
Prerequisites for VTP

VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:

• Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.
• Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the switch is operating in VTP server mode.
• Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent switch inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent switch forwards a message only when the domain name matches.
• Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

Related Topics
Enabling the VTP Version, on page 1887

VTP Version 3

VTP version 3 supports these features that are not supported in version 1 or version 2:

• Enhanced authentication—You can configure the authentication as hidden or secret. When hidden, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format
in the running configuration. You must reenter the password if you enter a takeover command in the domain. When you enter the `secret` keyword, you can directly configure the password secret key.

- Support for extended range VLAN (VLANs 1006 to 4094) database propagation—VTP versions 1 and 2 propagate only VLANs 1 to 1005.

  **Note**  
  VTP pruning still applies only to VLANs 1 to 1005, and VLANs 1002 to 1005 are still reserved and cannot be modified.

- Support for any database in a domain—In addition to propagating VTP information, version 3 can propagate Multiple Spanning Tree (MST) protocol database information. A separate instance of the VTP protocol runs for each application that uses VTP.

- VTP primary server and VTP secondary servers—A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to its NVRAM.

  By default, all devices come up as secondary servers. You can enter the `vtp primary` privileged EXEC command to specify a primary server. Primary server status is only needed for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers. Primary server status is lost if the device reloads or domain parameters change, even when a password is configured on the switch.

## VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a switch floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving switches might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible switch trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each switch in the domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all switches in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

**Related Topics**

- [Enabling VTP Pruning](#), on page 1888
VTP and Switch Stacks

The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

VTP configuration is the same in all members of a switch stack. When the switch stack is in VTP server or client mode, all switches in the stack carry the same VTP configuration. When VTP mode is transparent, the stack is not taking part in VTP.

- When a switch joins the stack, it inherits the VTP and VLAN properties of the active switch.
- All VTP updates are carried across the stack.
- When VTP mode is changed in a switch in the stack, the other switches in the stack also change VTP mode, and the switch VLAN database remains consistent.

VTP version 3 functions the same on a standalone switch or a stack except when the switch stack is the primary server for the VTP database. In this case, the MAC address of the active switch is used as the primary server ID. If the active switch reloads or is powered off, a new active switch is elected.

- If you do not configure the persistent MAC address feature, when the new active switch is elected, it sends a takeover message with the new active MAC address as the primary server.
- If a persistent MAC address is configured, the new active switch waits for the configured timer value. If the previous active switch does not rejoin the stack during this time, then the new active switch issues the takeover message.

VTP Configuration Guidelines

VTP Configuration Requirements

When you configure VTP, you must configure a trunk port so that the switch can send and receive VTP advertisements to and from other switches in the domain.

VTP versions 1 and 2 do not support private VLANs. VTP version 3 does support private VLANs. If you configure private VLANs, the switch must be in VTP transparent mode. When private VLANs are configured on the switch, do not change the VTP mode from transparent to client or server mode.

VTP Settings

The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the switch running configuration file, and you can save it in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the switch resets.

When you save VTP information in the switch startup configuration file and reboot the switch, the switch configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is
ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

### Domain Names for Configuring VTP

When configuring VTP for the first time, you must always assign a domain name. You must configure all switches in the VTP domain with the same domain name. Switches in VTP transparent mode do not exchange VTP messages with other switches, and you do not need to configure a VTP domain name for them.

**Note**

If the NVRAM and DRAM storage is sufficient, all switches in a VTP domain should be in VTP server mode.

**Caution**

Do not configure a VTP domain if all switches are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one switch in the VTP domain for VTP server mode.

**Related Topics**
- Adding a VTP Client Switch to a VTP Domain, on page 1890

### Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain switches must share the same password and you must configure the password on each switch in the management domain. Switches without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a switch that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the switch accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new switch to an existing network with VTP capability, the new switch learns the domain name only after the applicable password has been configured on it.

**Caution**

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each switch in the domain.

- Configuring a VTP Version 3 Password, on page 1885
- Example: Configuring a Switch as the Primary Server, on page 1893
VTP Version

Follow these guidelines when deciding which VTP version to implement:

• All switches in a VTP domain must have the same domain name, but they do not need to run the same VTP version.

• A VTP version 2-capable switch can operate in the same VTP domain as a switch running VTP version 1 if version 2 is disabled on the version 2-capable switch (version 2 is disabled by default).

• If a switch running VTP version 1, but capable of running VTP version 2, receives VTP version 3 advertisements, it automatically moves to VTP version 2.

• If a switch running VTP version 3 is connected to a switch running VTP version 1, the VTP version 1 switch moves to VTP version 2, and the VTP version 3 switch sends scaled-down versions of the VTP packets so that the VTP version 2 switch can update its database.

• A switch running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.

• Do not enable VTP version 2 on a switch unless all of the switches in the same VTP domain are version-2-capable. When you enable version 2 on a switch, all of the version-2-capable switches in the domain enable version 2. If there is a version 1-only switch, it does not exchange VTP information with switches that have version 2 enabled.

• Cisco recommends placing VTP version 1 and 2 switches at the edge of the network because they do not forward VTP version 3 advertisements.

• If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.

• When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.

• When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.

• A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.

• Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.

• Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.

</table>

How to Configure VTP

Configuring VTP Mode

You can configure VTP mode as one of these:

- VTP server mode—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.

- VTP client mode—In VTP client mode, you cannot change its VLAN configuration. The client switch receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.

- VTP transparent mode—In VTP transparent mode, VTP is disabled on the switch. The switch does not send VTP updates and does not act on VTP updates received from other switch. However, a VTP transparent switch running VTP version 2 does forward received VTP advertisements on its trunk links.

- VTP off mode—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a switch to a different domain.
## Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>enable</em></td>
<td>Enters global configuration mode.</td>

<tr>
<td>Example:</td>
<td>Switch(config)# vtp mode server</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Sets the password for the VTP domain. The password can be 8 to 64 characters. If you configure a VTP password, the VTP domain does not function properly if you do not assign the same password to each switch in the domain.</td>
</tr>
<tr>
<td><em>vtp password password</em></td>
<td>(Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# vtp password mypassword</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><em>end</em></td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>
Configuring a VTP Version 3 Password

You can configure a VTP version 3 password on the switch.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>

Example: Configuring a Switch as the Primary Server, on page 1893

### Configuring a VTP Version 3 Primary Server

When you configure a VTP server as a VTP primary server, the takeover operation starts.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> vtp primary [vlan</td>
<td>mst] [force]</td>
</tr>
<tr>
<td><strong>Step 1 Example:</strong> Switch# vtp primary vlan force</td>
<td></td>
</tr>
</tbody>
</table>

- (Optional) **vlan**—Selects the VLAN database as the takeover feature. This is the default.
- (Optional) **mst**—Selects the multiple spanning tree (MST) database as the takeover feature.
Enabling the VTP Version

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a switch, every VTP version 2-capable switch in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each switch.

- With VTP versions 1 and 2, you can configure the version only on switches in VTP server or transparent mode. If a switch is running VTP version 3, you can change to version 2 when the switch is in client mode if no extended VLANs exist, and no hidden password was configured.

Caution

VTP version 1 and VTP version 2 are not interoperable on switches in the same VTP domain. Do not enable VTP version 2 unless every switch in the VTP domain supports version 2.

- In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.

Caution

In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>

<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Enabling VTP Pruning

#### Before you begin

VTP pruning is not designed to function in VTP transparent mode. If one or more switches in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the switch upstream to the VTP transparent switch pruning ineligible.

To configure VTP pruning on an interface, use the `switchport trunk pruning vlan` interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

<table>
<thead>
<tr>

## Configuring VTP on a Per-Port Basis

With VTP version 3, you can enable or disable VTP on a per-port basis. You can enable VTP only on ports that are in trunk mode. Incoming and outgoing VTP traffic are blocked, not forwarded.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  Example:
  
  Switch> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
  Example:
  
  Switch# configure terminal |
| **Step 3** vtp pruning | Enables pruning in the VTP administrative domain.  
  By default, pruning is disabled. You need to enable pruning on only one switch in VTP server mode.  
  Example:
  
  Switch(config)# vtp pruning |
| **Step 4** end | Returns to privileged EXEC mode.  
  Example:
  
  Switch(config)# end |
| **Step 5** show vtp status | Verifies your entries in the VTP Pruning Mode field of the display.  
  Example:
  
  Switch# show vtp status |

**Adding a VTP Client Switch to a VTP Domain**

Follow these steps to verify and reset the VTP configuration revision number on a switch before adding it to a VTP domain.
Before you begin

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a switch that has a revision number higher than the revision number in the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the `vtp mode transparent` global configuration command to disable VTP on the switch and then to change its VLAN information without affecting the other switches in the VTP domain.

**Procedure**

<table>

### Monitoring VTP

This section describes commands used to display and monitor the VTP configuration.
You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the switch.

Table 194: VTP Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp counters</td>
<td>Displays counters about VTP messages that have been sent and received.</td>
</tr>
<tr>
<td>show vtp devices [conflict]</td>
<td>Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The <code>show vtp devices</code> command does not display information when the switch is in transparent or off mode.</td>
</tr>
<tr>
<td>show vtp interface [interface-id]</td>
<td>Displays VTP status and configuration for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>show vtp password</td>
<td>Displays the VTP password. The form of the password displayed depends on whether or not the <code>hidden</code> keyword was entered and if encryption is enabled on the switch.</td>
</tr>
<tr>
<td>show vtp status</td>
<td>Displays the VTP switch configuration information.</td>
</tr>
</tbody>
</table>

Configuration Examples for VTP

Example: Configuring a Switch as the Primary Server

This example shows how to configure a switch as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

```
Switch# vtp primary vlan
Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain

VTP Database Conf Switch ID Primary Server Revision System Name
------------ ---- -------------- -------------- -------- -------------------
VLANDB      Yes 00d0.00b8.1400=00d0.00b8.1400 1 stp7

Do you want to continue (y/n) [n]? y
```

- Passwords for the VTP Domain, on page 1881
Example: Configuring Switch as VTP Server

This example shows how to configure the switch as a VTP server with the domain name `eng_group` and the password `mypassword`:

```
Switch(config)# vtp domain eng_group
Setting VTP domain name to eng_group.

Switch(config)# vtp mode server
Setting device to VTP Server mode for VLANS.

Switch(config)# vtp password mypassword
Setting device VLAN database password to mypassword.
Switch(config)# end
```

Related Topics
- Configuring VTP Mode, on page 1883
- VTP Modes, on page 1876

Example: Enabling VTP on the Interface

To enable VTP on the interface, use the `vtp` interface configuration command. To disable VTP on the interface, use the `no vtp` interface configuration command.

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# vtp
Switch(config-if)# end
```

Example: Creating the VTP Password

The follow is an example of creating the VTP password.

```
Switch(config)# vtp password mypassword hidden
Generating the secret associated to the password.
Switch(config)# end
Switch# show vtp password
VTP password: 89914640C8D90868B6A0D8103847A733
```

Where to Go Next

After configuring VTP, you can configure the following:

- VLANS
- VLAN Trunking
- VLAN Membership Policy Server (VMPS)
- Voice VLANS

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

- Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.

- The switch supports 1000 VLANs in VTP client, server, and transparent modes.
On using the LAN Base image, only the lanbase-default template supports 1000 VLANs. The remaining templates (default and lanbase-routing) only support 255 VLANs. Up to 64 VLANs are supported when the switch is running the LAN Lite image.

• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

Restrictions for VLANs

The following are restrictions for configuring VLANs:

• 1K VLAN is supported only on switches running the LAN Base image with the lanbase-default template set.

• To avoid warning messages of high CPU utilization with a normal-range VLAN configuration, we recommend that you have no more than 256 VLANs. In such cases, approximately 10 access interfaces or 5 trunk interfaces can flap simultaneously with negligible impact to CPU utilization (if there are more interfaces that flap simultaneously, then CPU usage may be excessively high.)

Information About VLANs

Logical Networks

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any switch port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a switch supporting fallback bridging. In a switch stack, VLANs can be formed with ports across the stack. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the switch is assigned manually on an interface-by-interface basis. When you assign switch interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed.

The switch can route traffic between VLANs by using switch virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.
Supported VLANs

The switch supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). In these versions, the switch must be in VTP transparent mode when you create VLAN IDs from 1006 to 4094. Cisco IOS Release 12.2(52)SE and later support VTP version 3. VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3. You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

Although the switch stack supports a total of 1,000 (normal range and extended range) VLANs, the number of configured features affects the use of the switch hardware.

---

**Note**

On using the LAN Base image, only the lanbase-default template supports 1000 VLANs. The remaining templates (default and lanbase-routing) only supports 255 VLANs. Up to 64 VLANs are supported when the switch is running the LAN Lite image.

The switch supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN. The switch supports only IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.

---

**Note**

Up to 64 spanning-tree instances are supported when the switch is running the LAN Lite image.

VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the switch learns and manages the addresses associated with the port on a per-VLAN basis.

**Table 195: Port Membership Modes and Characteristics**

<table>
<thead>
<tr>
<th>Membership Mode</th>
<th>VLAN Membership Characteristics</th>
<th>VTP Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static-access</td>
<td>A static-access port can belong to one VLAN and is manually assigned to that VLAN.</td>
<td>VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the switch or the switch stack connected to a trunk port of a second switch or switch stack.</td>
</tr>
<tr>
<td>Membership Mode</td>
<td>VLAN Membership Characteristics</td>
<td>VTP Characteristics</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Trunk (IEEE 802.1Q):</td>
<td>A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list.</td>
<td>VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other switches over trunk links.</td>
</tr>
<tr>
<td>Dynamic access</td>
<td>A dynamic-access port can belong to one VLAN (VLAN ID 1 to 4094) and is dynamically assigned by a VLAN Member Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch, for example, but never a Catalyst switch. The Catalyst switch is a VMPS client. You can have dynamic-access ports and trunk ports on the same switch, but you must connect the dynamic-access port to an end station or hub and not to another switch.</td>
<td>VTP is required. Configure the VMPS and the client with the same VTP domain name. To participate in VTP, at least one trunk port on the switch or a switch stack must be connected to a trunk port of a second switch or switch stack.</td>
</tr>
<tr>
<td>Voice VLAN</td>
<td>A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.</td>
<td>VTP is not required; it has no effect on a voice VLAN.</td>
</tr>
</tbody>
</table>

### VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the vlan.dat file (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The vlan.dat file is stored in flash memory. If the VTP mode is transparent, they are also saved in the switch running configuration file.

In a switch stack, the whole stack uses the same vlan.dat file and running configuration. On some switches, the vlan.dat file is stored in flash memory on the active switch.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the switch, the switch configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
• If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.

• In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

• From image 15.0(02)SE6, on vtp transparent and off modes, vlans get created from startup-config even if they are not applied to the interface.

Ensure that you delete the vlan.dat file along with the configuration files before you reset the switch configuration using write erase command. This ensures that the switch reboots correctly on a reset.

**Normal-Range VLAN Configuration Guidelines**

Normal-range VLANs are VLANs with IDs from 1 to 1005. VTP 1 and 2 only support normal-range VLANs.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

• Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

• VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the switch running configuration file.

• If the switch is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)

• With VTP versions 1 and 2, the switch supports VLAN IDs 1006 through 4094 only in VTP transparent mode (VTP disabled). These are extended-range VLANs and configuration options are limited. Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode. If extended VLANs are configured, you cannot convert from VTP version 3 to version 1 or 2.

• Before you can create a VLAN, the switch must be in VTP server mode or VTP transparent mode. If the switch is a VTP server, you must define a VTP domain or VTP will not function.

• The switch does not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.

• The switch supports 128 spanning tree instances. If a switch has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs.

If you have already used all available spanning-tree instances on a switch, adding another VLAN anywhere in the VTP domain creates a VLAN on that switch that is not running spanning-tree. If you have the default allowed list on the trunk ports of that switch (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent switches that all have run out
of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of switches that have used up their allocation of spanning-tree instances.

If the number of VLANs on the switch exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your switch to map multiple VLANs to a single spanning-tree instance.

- When a switch in a stack learns a new VLAN or deletes or modifies an existing VLAN (either through VTP over network ports or through the CLI), the VLAN information is communicated to all stack members.

- When a switch joins a stack or when stacks merge, VTP information (the vlan.dat file) on the new switches will be consistent with the active switch.

### Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

VTP 3 only supports extended-range VLANs.

Follow these guidelines when creating extended-range VLANs:

- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the switch is running VTP version 3.

- You cannot include extended-range VLANs in the pruning eligible range.

- For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the switch boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the switch resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.

- Although the switch stack supports a total of 1000 (normal-range and extended-range) VLANs, the number of configured features affects the use of the switch hardware. If you try to create an extended-range VLAN and there are not enough hardware resources available, an error message is generated, and the extended-range VLAN is rejected.

- In a switch stack, the whole stack uses the same running configuration and saved configuration, and extended-range VLAN information is shared across the stack.

</table>

**Default VLAN Configuration**

You can change only the MTU size and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

**Note**

The switch must be running the LAN Base image to support remote SPAN.

---

**How to Configure VLANs**

**How to Configure Normal-Range VLANs**

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:
Creating or Modifying an Ethernet VLAN

Each Ethernet VLAN in the VLAN database has a unique, 4-digit ID that can be a number from 1 to 1001. VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs. To create a normal-range VLAN to be added to the VLAN database, assign a number and name to the VLAN.

### Note
With VTP version 1 and 2, if the switch is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

</tr>
</tbody>
</table>
| **Step 2** configure terminal | Enters global configuration mode.  
*Example:*  
Switch# configure terminal |
| **Step 3** vlan vlan-id | Enters a VLAN ID, and enters VLAN configuration mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN.  
*Note* The available VLAN ID range for this command is 1 to 4094.  
*Example:*  
Switch(config)# vlan 20 |
| **Step 4** name vlan-name | (Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the `vlan-id` value with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.  
*Example:*  
Switch(config-vlan)# name test20 |
| **Step 5** mtu mtu-size | (Optional) Changes the MTU size (or other VLAN characteristic).  
*Example:*  
Switch(config-vlan)# mtu 256 |
| **Step 6** remote-span | (Optional) Configures the VLAN as the RSPAN VLAN for a remote SPAN session.  
*Example:*  
Switch(config-vlan)# remote-span |
| **Step 7** end | Returns to privileged EXEC mode.  
*Example:*  
Switch(config)# end |
| **Step 8** show vlan {name vlan-name | id vlan-id} | Verifies your entries.  
*Example:*  
Switch# show vlan name test20 id 20 |
| **Step 9** copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
*Example:*  
Switch# copy running-config |
Deleting a VLAN

When you delete a VLAN from a switch that is in VTP server mode, the VLAN is removed from the VLAN database for all switches in the VTP domain. When you delete a VLAN from a switch that is in VTP transparent mode, the VLAN is deleted only on that specific switch or a switch stack.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

Caution

When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

Assigning Static-Access Ports to a VLAN

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td><strong>Step 4</strong> switchport access vlan vlan-id</td>
<td>Assigns the port to a VLAN. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td>Example: Switch(config-if)# switchport access vlan 2</td>
<td></td>
</tr>
</tbody>
</table>
### How to Configure Extended-Range VLANs

With VTP version 1 and version 2, when the switch is in VTP transparent mode (VTP disabled), you can create extended-range VLANs (in the range 1006 to 4094). VTP version supports extended-range VLANs in server or transparent move. Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any `switchport` commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file by using the `copy running-config startup-config` privileged EXEC command. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

### Creating an Extended-Range VLAN

You create an extended-range VLAN in global configuration mode by entering the `vlan` global configuration command with a VLAN ID from 1006 to 4094. The extended-range VLAN has the default Ethernet VLAN characteristics and the MTU size, and RSPAN configuration are the only parameters you can change. See the description of the `vlan` global configuration command in the command reference for the default settings of all parameters. In VTP version 1 or 2, if you enter an extended-range VLAN ID when the switch is not in VTP transparent mode, an error message is generated when you exit VLAN configuration mode, and the extended-range VLAN is not created.

In VTP version 1 and 2, extended-range VLANs are not saved in the VLAN database; they are saved in the switch running configuration file. You can save the extended-range VLAN configuration in the switch startup configuration file by using the `copy running-config startup-config` privileged EXEC command. VTP version 3 saves extended-range VLANs in the VLAN database.

</table>

### Configuration Examples

#### Example: Creating a VLAN Name

This example shows how to create Ethernet VLAN 20, name it test20, and add it to the VLAN database:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# name test20
Switch(config-vlan)# end
```

#### Example: Configuring a Port as Access Port

This example shows how to configure a port as an access port in VLAN 2:
Example: Creating an Extended-Range VLAN

This example shows how to create a new extended-range VLAN with all default characteristics, enter VLAN configuration mode, and save the new VLAN in the switch startup configuration file:

Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config

Where to Go Next

After configuring VLANs, you can configure the following:

- VLAN Trunking Protocol (VTP)
- VLAN trunks

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch. However, spanning-tree information for each VLAN is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.
• Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.

• Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

Information About VLAN Trunks

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet switch interfaces and another networking device such as a router or a switch. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

Note
You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle.

Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

Layer 2 Interface Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switchport mode access</code></td>
<td>Puts the interface (access port) into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The interface becomes a nontrunk interface regardless of whether or not the neighboring interface is a trunk interface.</td>
</tr>
</tbody>
</table>
### Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the switchport trunk allowed setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

- Defining the Allowed VLANs on a Trunk, on page 1921
Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting switches. To avoid loops, STP normally blocks all but one parallel link between switches. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same switch. For load sharing using STP path costs, each load-sharing link can be connected to the same switch or to two different switches.

Network Load Sharing Using STP Priorities

When two ports on the same switch form a loop, the switch uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

Related Topics

Configuring Load Sharing Using STP Port Priorities, on page 1925

Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

Related Topics

Configuring Load Sharing Using STP Path Cost, on page 1929

Feature Interactions

Trunking interacts with other features in these ways:

• A trunk port cannot be a secure port.

• Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the switch propagates the setting that you entered to all ports in the group:

  • Allowed-VLAN list.
  • STP port priority for each VLAN.
  • STP Port Fast setting.
  • Trunk status:

    If one port in a port group ceases to be a trunk, all ports cease to be trunks.

• We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

Default Layer 2 Ethernet Interface VLAN Configuration

The following table shows the default Layer 2 Ethernet interface VLAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface mode</td>
<td>switchport mode dynamic auto</td>
</tr>
<tr>
<td>Allowed VLAN range</td>
<td>VLANs 1 to 4094</td>
</tr>
<tr>
<td>VLAN range eligible for pruning</td>
<td>VLANs 2 to 1001</td>
</tr>
<tr>
<td>Default VLAN (for access ports)</td>
<td>VLAN 1</td>
</tr>
<tr>
<td>Native VLAN (for IEEE 802.1Q trunks)</td>
<td>VLAN 1</td>
</tr>
</tbody>
</table>

How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

- If you do not intend to trunk across those links, use the `switchport mode access` interface configuration command to disable trunking.

- To enable trunking to a device that does not support DTP, use the `switchport mode trunk` and `switchport nonegotiate` interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Configuring an Ethernet Interface as a Trunk Port

Configuring a Trunk Port

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the switch and that this trunk port is connected to the trunk port of a second switch. Otherwise, the switch cannot receive any VTP advertisements.
### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
Example:  
Switch> enable |  
• Enter your password if prompted. |
| Step 2 | configure terminal | Enters global configuration mode.  
Example:  
Switch# configure terminal | |
| Step 3 | interface interface-id | Specifies the port to be configured for trunking, and enters interface configuration mode.  
Example:  
Switch(config)# interface gigabitethernet 1/0/2 | |
| Step 4 | switchport mode {dynamic {auto | desirable} | trunk} | Configures the interface as a Layer 2 trunk (required only if the interface is a Layer 2 access port or tunnel port or to specify the trunking mode).  
• dynamic auto—Sets the interface to a trunk link if the neighboring interface is set to trunk or desirable mode. This is the default.  
• dynamic desirable—Sets the interface to a trunk link if the neighboring interface is set to trunk, desirable, or auto mode.  
• trunk—Sets the interface in permanent trunking mode and negotiate to convert the link to a trunk link even if the neighboring interface is not a trunk interface.  
Example:  
Switch(config-if)# switchport mode dynamic desirable | |
| Step 5 | switchport access vlan vlan-id | (Optional) Specifies the default VLAN, which is used if the interface stops trunking.  
Example:  
Switch(config-if)# switchport access vlan 200 | |
| Step 6 | switchport trunk native vlan vlan-id | Specifies the native VLAN for IEEE 802.1Q trunks.  
Example: | |
### Defining the Allowed VLANs on a Trunk

VLAN 1 is the default VLAN on all trunk ports in all Cisco switches, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

<tr>
<td>Example: Switch# show interfaces gigabitethernet 1/0/1 switchport</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Changing the Pruning-Eligible List

The pruning-eligible list applies only to trunk ports. Each trunk port has its own eligibility list. VTP pruning must be enabled for this procedure to take effect.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Selects the trunk port for which VLANs should be pruned, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet0/1</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> switchport trunk pruning vlan {add</td>
<td>except</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

For explanations about using the **add**, **except**, **none**, and **remove** keywords, see the command reference for this release.

Separate non-consecutive VLAN IDs with a comma and no spaces; use a hyphen to designate a range of IDs. Valid IDs are 2 to 1001. Extended-range VLANs (VLAN IDs 1006 to 4094) cannot be pruned.

VLANs that are pruning-ineligible receive flooded traffic.
### Configuring the Native VLAN for Untagged Traffic

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the switch forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the switch sends the packet with a tag.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>

### Configuring Trunk Ports for Load Sharing

#### Configuring Load Sharing Using STP Port Priorities

If your switch is a member of a switch stack, you must use the `spanning-tree [vlan vlan-id] cost cost` interface configuration command instead of the `spanning-tree [vlan vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

These steps describe how to configure a network with load sharing using STP port priorities.
### Procedure

<table>
<thead>

### Configuration Examples for VLAN Trunking

#### Example: Configuring a Trunk Port

The following example shows how to configure a port as an IEEE 802.1Q trunk. The example assumes that the neighbor interface is configured to support IEEE 802.1Q trunking.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)# end
```

#### Example: Removing a VLAN from a Port

This example shows how to remove VLAN 2 from the allowed VLAN list on a port:

```
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport trunk allowed vlan remove 2
Switch(config-if)# end
```

### Where to Go Next

After configuring VLAN trunks, you can configure the following:

- VLANs

- Where to Go Next, on page 1943
- Additional References, on page 1944
- Feature History and Information for VMPS, on page 1944

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VMPS

You should configure the VLAN Membership Policy Server (VMPS) before you configure ports as dynamic-access ports.

When you configure a port as a dynamic-access port, the spanning-tree Port Fast feature is automatically enabled for that port. The Port Fast mode accelerates the process of bringing the port into the forwarding state. The VTP management domain of the VMPS client and the VMPS server must be the same.
Restrictions for VMPS

The following are restrictions for configuring VMPS:

- **IEEE 802.1x** ports cannot be configured as dynamic-access ports. If you try to enable IEEE 802.1x on a dynamic-access (VQP) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
- **Trunk** ports cannot be dynamic-access ports, but you can enter the `switchport access vlan dynamic` interface configuration command for a trunk port. In this case, the switch retains the setting and applies it if the port is later configured as an access port. You must turn off trunking on the port before the dynamic-access setting takes effect.
- Dynamic-access ports cannot be monitor ports.
- Secure ports cannot be dynamic-access ports. You must disable port security on a port before it becomes dynamic.
- Dynamic-access ports cannot be members of an EtherChannel group.
- Port channels cannot be configured as dynamic-access ports.
- The VLAN configured on the VMPS server should not be a voice VLAN.
- 1K VLAN is supported only on switches running the LAN Base image with the lanbase-default template set.

Information About VMPS

Dynamic VLAN Assignments

The VLAN Query Protocol (VQP) is used to support dynamic-access ports, which are not permanently assigned to a VLAN, but give VLAN assignments based on the MAC source addresses seen on the port. Each time an unknown MAC address is seen, the switch sends a VQP query to a remote VLAN Membership Policy Server (VMPS); the query includes the newly seen MAC address and the port on which it was seen. The VMPS responds with a VLAN assignment for the port. The switch cannot be a VMPS server but can act as a client to the VMPS and communicate with it through VQP.

Each time the client switch receives the MAC address of a new host, it sends a VQP query to the VMPS. When the VMPS receives this query, it searches its database for a MAC-address-to-VLAN mapping. The server response is based on this mapping and whether or not the server is in open or secure mode. In secure mode, the server shuts down the port when an illegal host is detected. In open mode, the server denies the host access to the port.

If the port is currently unassigned (that is, it does not yet have a VLAN assignment), the VMPS provides one of these responses:

- If the host is allowed on the port, the VMPS sends the client a vlan-assignment response containing the assigned VLAN name and allowing access to the host.
• If the host is not allowed on the port and the VMPS is in open mode, the VMPS sends an access-denied response.

• If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a port-shutdown response.

If the port already has a VLAN assignment, the VMPS provides one of these responses:

• If the VLAN in the database matches the current VLAN on the port, the VMPS sends an success response, allowing access to the host.

• If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an access-denied or a port-shutdown response, depending on the secure mode of the VMPS.

If the switch receives an access-denied response from the VMPS, it continues to block traffic to and from the host MAC address. The switch continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new host address. If the switch receives a port-shutdown response from the VMPS, it disables the port. The port must be manually reenabled by using Network Assistant, the CLI, or SNMP.

Related Topics
Configuring Dynamic-Access Ports on VMPS Clients, on page 1937
Example: VMPS Configuration, on page 1942

Dynamic-Access Port VLAN Membership

A dynamic-access port can belong to only one VLAN with an ID from 1 to 4094. When the link comes up, the switch does not forward traffic to or from this port until the VMPS provides the VLAN assignment. The VMPS receives the source MAC address from the first packet of a new host connected to the dynamic-access port and attempts to match the MAC address to a VLAN in the VMPS database.

If there is a match, the VMPS sends the VLAN number for that port. If the client switch was not previously configured, it uses the domain name from the first VTP packet it receives on its trunk port from the VMPS. If the client switch was previously configured, it includes its domain name in the query packet to the VMPS to obtain its VLAN number. The VMPS verifies that the domain name in the packet matches its own domain name before accepting the request and responds to the client with the assigned VLAN number for the client. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS secure mode setting).

Multiple hosts (MAC addresses) can be active on a dynamic-access port if they are all in the same VLAN; however, the VMPS shuts down a dynamic-access port if more than 20 hosts are active on the port.

If the link goes down on a dynamic-access port, the port returns to an isolated state and does not belong to a VLAN. Any hosts that come online through the port are checked again through the VQP with the VMPS before the port is assigned to a VLAN.

Dynamic-access ports can be used for direct host connections, or they can connect to a network. A maximum of 20 MAC addresses are allowed per port on the switch. A dynamic-access port can belong to only one VLAN at a time, but the VLAN can change over time, depending on the MAC addresses seen.

How to Configure VMPS

Entering the IP Address of the VMPS

Note

If the VMPS is being defined for a cluster of switches, enter the address on the command switch.

Before you begin

You must first enter the IP address of the server to configure the switch as a client.

Procedure

### Configuring Dynamic-Access Ports on VMPS Clients

#### Caution

Dynamic-access port VLAN membership is for end stations or hubs connected to end stations. Connecting dynamic-access ports to other switches can cause a loss of connectivity.

If you are configuring a port on a cluster member switch as a dynamic-access port, first use the `rcommand` privileged EXEC command to log in to the cluster member switch.

#### Before you begin

You must have IP connectivity to the VMPS for dynamic-access ports to work. You can test for IP connectivity by pinging the IP address of the VMPS and verifying that you get a response.

#### Note

To return an interface to its default configuration, use the `default interface interface-id` interface configuration command. To return an interface to its default switchport mode (dynamic auto), use the `no switchport mode` interface configuration command. To reset the access mode to the default VLAN for the switch, use the `no switchport access vlan` interface configuration command.

</tbody>
</table>
Reconfirming VLAN Memberships

This task confirms the dynamic-access port VLAN membership assignments that the switch has received from the VMPS.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>

<tr>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>vmps reconfirm</code></td>
<td>Reconfirms dynamic-access port VLAN membership.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# vmps reconfirm</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>show vmps</code></td>
<td>Verifies the dynamic VLAN reconfirmation status.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show vmps</code></td>
<td></td>
</tr>
</tbody>
</table>

Changing the Reconfirmation Interval

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes after which reconfirmation occurs.

If you are configuring a member switch in a cluster, this parameter must be equal to or greater than the reconfirmation setting on the command switch. You also must first use the `rcommand` privileged EXEC command to log in to the member switch.
Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> vmps reconfirm minutes</td>
<td>Sets the number of minutes between reconfirmations of the dynamic VLAN membership. The range is 1 to 120. The default is 60 minutes.</td>
</tr>
<tr>
<td>Example: Switch(config)# vmps reconfirm 90</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show vmps</td>
<td>Verifies the dynamic VLAN reconfirmation status in the Reconfirm Interval field of the display.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

---

**Changing the Retry Count**

Follow these steps to change the number of times that the switch attempts to contact the VMPS before querying the next server.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
## Troubleshooting Dynamic-Access Port VLAN Membership

**Problem** The VMPS shuts down a dynamic-access port under these conditions:

- **Problem** The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS shuts down the port to prevent the host from connecting to the network.

- **Problem** More than 20 active hosts reside on a dynamic-access port.

**Solution** To reenable a disabled dynamic-access port, enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command.

---

### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
</table>
| • Enter your password if prompted. | **Example:**  
Switch> `enable` |
| Enters global configuration mode. | **Step 2**  
**Example:**  
Switch# `configure terminal` |
| Changes the retry count. The retry range is 1 to 10; the default is 3. | **Step 3**  
**Example:**  
Switch(config)# `vmps retry 5` |
| Returns to privileged EXEC mode. | **Step 4**  
**Example:**  
Switch(config)# `end` |
| Verifies your entry in the Server Retry Count field of the display. | **Step 5**  
**Example:**  
Switch# `show vmps` |
| (Optional) Saves your entries in the configuration file. | **Step 6**  
**Example:**  
Switch# `copy running-config startup-config` |
Monitoring the VMPS

You can display information about the VMPS by using the `show vmps` privileged EXEC command. The switch displays this information about the VMPS:

- **VMPS VQP Version**—The version of VQP used to communicate with the VMPS. The switch queries the VMPS that is using VQP Version 1.
- **Reconfirm Interval**—The number of minutes the switch waits before reconfirming the VLAN-to-MAC-address assignments.
- **Server Retry Count**—The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the switch starts to query the secondary VMPS.
- **VMPS domain server**—The IP address of the configured VLAN membership policy servers. The switch sends queries to the one marked *current*. The one marked *primary* is the primary server.
- **VMPS Action**—The result of the most recent reconfirmation attempt. A reconfirmation attempt can occur automatically when the reconfirmation interval expires, or you can force it by entering the `vmps reconfirm` privileged EXEC command or its Network Assistant or SNMP equivalent.

This is an example of output for the `show vmps` privileged EXEC command:

```
Switch# show vmps
VQP Client Status:
-------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.86 (primary, current)
                     172.20.128.87

Reconfirmation status
---------------------
VMPS Action:    other
```

Configuration Example for VMPS

Example: VMPS Configuration

*Figure 117: Dynamic Port VLAN Membership Configuration*

This network has a VMPS server switch and VMPS client switches with dynamic-access ports with this configuration:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 6500 series Switch A is the primary VMPS server.
- The Catalyst 6500 series Switch C and Switch J are secondary VMPS servers.
- End stations are connected to the clients, Switch B and Switch I.
The database configuration file is stored on the TFTP server with the IP address 172.20.22.7.

Where to Go Next

You can configure the following:

- VTP
- VLANs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

• Voice VLAN configuration is only supported on switch access ports; voice VLAN configuration is not supported on trunk ports.

Note

Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.
• Before you enable voice VLAN, we recommend that you enable QoS on the switch by entering the `mls qos` global configuration command and configure the port trust state to trust by entering the `mls qos trust cos` interface configuration command. If you use the auto-QoS feature, these settings are automatically configured.

• You must enable CDP on the switch port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all switch interfaces.)

Restrictions for Voice VLANs

You cannot configure static secure MAC addresses in the voice VLAN.

Information About Voice VLAN

Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the switch is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the switch supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the switch in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the switch to trust or override the traffic priority assigned by a Cisco IP Phone.

Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the switch to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the switch in any of these ways:

• In the voice VLAN tagged with a Layer 2 CoS priority value
• In the access VLAN tagged with a Layer 2 CoS priority value
• In the access VLAN, untagged (no Layer 2 CoS priority value)

In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Note

Related Topics

Configuring Cisco IP Phone Voice Traffic
Example: Configuring Cisco IP Phone Voice Traffic, on page 1952
Cisco IP Phone Data Traffic

The switch can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the switch to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

Note
Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

Voice VLAN Configuration Guidelines

- Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the switch to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.
- The voice VLAN should be present and active on the switch for the IP phone to correctly communicate on the voice VLAN. Use the `show vlan` privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.
- The Power over Ethernet (PoE) switches are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.
- The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.
- If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
  - They both use IEEE 802.1p or untagged frames.
  - The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
  - The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.
  - The Cisco IP Phone uses IEEE 802.1Q frames, and the voice VLAN is the same as the access VLAN.
- The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).
• Voice VLAN ports can also be these port types:
  • Dynamic access port.
  • IEEE 802.1x authenticated port.

Note: If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the switch for up to 30 seconds.

• Protected port.
• A source or destination port for a SPAN or RSPAN session.
• Secure port.

Note: When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.

Default Voice VLAN Configuration

The voice VLAN feature is disabled by default.

When the voice VLAN feature is enabled, all untagged traffic is sent according to the default CoS priority of the port.

The CoS value is not trusted for IEEE 802.1p or IEEE 802.1Q tagged traffic.

How to Configure Voice VLAN

Configuring Cisco IP Phone Voice Traffic

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| configure terminal | |
| Example:           | |
| Switch# configure terminal | |

| **Step 3**        | Specifies the interface connected to the phone, and enters interface configuration mode. |
| Interface interface-id | |
| Example:           | |
| Switch(config)# interface gigabitethernet 1/0/1 | |

| **Step 4**        | Configures the interface to classify incoming traffic packets by using the packet CoS value. For untagged packets, the port default CoS value is used. |
| mls qos trust cos | |
| Example:           | |
| Switch(config-if)# mls qos trust cos | |

| **Step 5**        | Configures the voice VLAN. |
| switchport voice {vlan vlan-id | dot1p | none | untagged} | |
| Example:           | |
| Switch(config-if)# switchport voice vlan dot1p | |

### Notes
- Before configuring the port trust state, you must first globally enable QoS by using the `mls qos` global configuration command.
- `vlan-id`—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094.

- `dot1p`—Configures the switch to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the switch drops all voice and data traffic tagged with VLAN 0. If configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>Allows the phone to use its own configuration to send untagged voice traffic.</td>
</tr>
<tr>
<td>untagged</td>
<td>Configures the phone to send untagged voice traffic.</td>
</tr>
</tbody>
</table>

**Step 6**  
**Example:**  
Switch(config-if)# end

Returns to privileged EXEC mode.

**Step 7**  
Use one of the following:

- `show interfaces interface-id switchport`
- `show running-config interface interface-id`

**Example:**  
Switch# show interfaces gigabitethernet 1/0/1 switchport  
or  
Switch# show running-config interface gigabitethernet 1/0/1

Verifies your voice VLAN entries or your QoS and voice VLAN entries.

**Step 8**  
`copy running-config startup-config`

**Example:**  
Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### Configuring the Priority of Incoming Data Frames

You can connect a PC or other data device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the switch to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:
## Configuring the Priority of Incoming Data Frames

</tr>
</tbody>
</table>
## Monitoring Voice VLAN

To display voice VLAN configuration for an interface, use the `show interfaces interface-id switchport` privileged EXEC command.

### Configuration Examples

#### Example: Configuring Cisco IP Phone Voice Traffic

This example shows how to configure a port connected to a Cisco IP Phone to use the CoS value to classify incoming traffic and to accept voice and data priority traffic tagged with VLAN ID 0:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# switchport voice vlan dot1p
Switch(config-if)# end
```

To return the port to its default setting, use the `no switchport voice vlan` interface configuration command.

**Related Topics**
- Configuring Cisco IP Phone Voice Traffic
- Cisco IP Phone Voice Traffic, on page 1946

#### Example: Configuring the Priority of Incoming Data Frames

This example shows how to configure a port connected to a Cisco IP Phone to not change the priority of frames received from the PC or the attached device:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport priority extend trust
Switch(config-if)# end
```

- Statement 361—VoIP and Emergency Calling Services do not Function if Power Fails, on page 1955
- Statement 1071—Warning Definition, on page 1957

Disclaimer

Cisco EnergyWise enables you to reduce energy consumption in your network by turning off the power to devices when they are not in use. If IP phones are part of your network, they can also be turned off through EnergyWise, in which case calls cannot be made or received, and the phones cannot be turned on except by the network administrator or according to rules established in EnergyWise by the network administrator. Laws in the location of your network might require phones to remain available for emergencies. It is your responsibility to identify the laws that apply and to comply with them. Even in the absence of a law, we strongly recommend that you designate certain phones that will always be on and available to make and receive emergency calls. These phones should be clearly identified, and all employees or others who might require emergency access to make or receive calls should be informed of the availability of these phones.

Statement 361—VoIP and Emergency Calling Services do not Function if Power Fails
