**Enabling Reauthentication on a Port**

By default, ports are not automatically reauthenticated. You can enable automatic reauthentication and specify how often reauthentication attempts are made.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface type slot / port
4. switchport
5. switchport mode access
6. authentication port-control auto
7. mab [eap]
8. authentication periodic
9. authentication timer reauthenticate {seconds | server}
10. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<tr>
<td><strong>Example:</strong></td>
<td>Device(config-if)# end</td>
</tr>
</tbody>
</table>

| Purpose | Exits interface configuration mode and returns to privileged EXEC mode. |

### Specifying the Security Violation Mode

When there is a security violation on a port, the port can be shut down or traffic can be restricted. By default, the port is shut down. You can configure the period of time for which the port is shut down.

### SUMMARY STEPS

1. enable
2. configure terminal
3. interface type slot / port
4. switchport
5. switchport mode access
6. authentication port-control auto
7. mab [eap]
8. authentication violation {restrict | shutdown}
9. authentication timer restart seconds
10. end

Configuration Examples for MAC Authentication Bypass

Example: MAC Authentication Bypass Configuration

In the following example, the `mab` command has been configured to enable the MAC Authorization Bypass (MAB) feature on the specified interface. The optional `show authentication sessions` command has been enabled to display the interface configuration and the authentication instances on the interface.

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet2/1
Device(config-if)# mab
Device(config-if)# end
Device# show authentication sessions interface GigabitEthernet2/1 details
```

Example: Enabling Configurable MAB Username and Password

The following example shows how to configure the username format and password for MAC Authentication Bypass (MAB). In this example, the username format is configured as a group of 12 hexadecimal digits with no separator and the global password as `password1`.

```
Device> enable
Device# configure terminal
Device(config)# mab request format attribute 1 groupsize 2 separator : 
Device(config)# mab request format attribute 2 password1 
Device(config)# end
```

Feature Information for MAC Authentication Bypass

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Password Strength and Management for Common Criteria

The Password Strength and Management for Common Criteria feature is used to specify password policies and security mechanisms for storing, retrieving, and providing rules to specify user passwords.

For local users, the user profile and the password information with the key parameters are stored on the Cisco device, and this profile is used for local authentication of users. The user can be an administrator (terminal access) or a network user (for example, PPP users being authenticated for network access).

For remote users, where the user profile information is stored in a remote server, a third-party authentication, authorization, and accounting (AAA) server may be used for providing AAA services, both for administrative and network access.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Restrictions for Password Strength and Management for Common Criteria

Only four concurrent users can log on to the system by using vty at any moment.

Information About Password Strength and Management for Common Criteria

Password Composition Policy

The password composition policy allows you to create passwords of any combination of upper and lowercase characters, numbers, and special characters that include “!”, “@”, “#”, “$”, “%”, “^”, “&”, “*”, “(”, “)”.

Password Length Policy

The administrator has the flexibility to set the password's minimum and maximum length. The recommended minimum password length is 8 characters. The administrator can specify both the minimum (1) and the maximum (64) length for the password.

Password Lifetime Policy

The security administrator can provide a configurable option for a password to have a maximum lifetime. If the lifetime parameter is not configured, the configured password will never expire. The maximum lifetime can be configured by providing the configurable value in years, months, days, hours, minutes, and seconds. The lifetime configuration will survive across reloads as it is a part of the configuration, but every time the system reboots, the password creation time will be updated to the new time. For example, if a password is configured with a lifetime of one month and on the 29th day, the system reboots, then the password will be valid for one month after the system reboots.

Password Expiry Policy

If the user attempts to log on and if the user's password credentials have expired, then the following happens:

1. The user is prompted to set the new password after successfully entering the expired password.
2. When the user enters the new password, the password is validated against the password security policy.
3. If the new password matches the password security policy, then the AAA database is updated, and the user is authenticated with the new password.
4. If the new password does not match the password security policy, then the user is prompted again for the password. From AAA perspective, there is no restriction on the number of retries. The number of retries for password prompt in case of unsuccessful authentication is controlled by the respective terminal access interactive module. For example, for telnet, after three unsuccessful attempts, the session will be terminated.
If the password's lifetime is not configured for a user and the user has already logged on and if the security administrator configures the lifetime for that user, then the lifetime will be set in the database. When the same user is authenticated the next time, the system will check for password expiry. The password expiry is checked only during the authentication phase.

If the user has been already authenticated and logged on to the system and if the password expires, then no action will be taken. The user will be prompted to change the password only during the next authentication for the same user.

**Password Change Policy**

The new password must contain a minimum of 4 character changes from the previous password. A password change can be triggered by the following scenarios:

- The security administrator wants to change the password.
- The user is trying to get authenticated using a profile, and the password for that profile has expired.

When the security administrator changes the password security policy and the existing profile does not meet the password security policy rules, no action will be taken if the user has already logged on to the system. The user will be prompted to change the password only when the user tries to get authenticated using the profile that does not meet the password security restriction.

When the user changes the password, the lifetime parameters set by the security administrator for the old profile will be the lifetime parameters for the new password.

For noninteractive clients such as dot1x, when the password expires, appropriate error messages will be sent to the clients, and the clients must contact the security administrator to renew the password.

**User Reauthentication Policy**

Users are reauthenticated when they change their passwords.

When users change their passwords on expiry, they will be authenticated against the new password. In such cases, the actual authentication happens based on the previous credentials, and the new password is updated in the database.

---

**Note**

Users can change their passwords only when they are logging on and after the expiry of the old password; however, a security administrator can change the user's password at any time.

**Support for Framed (Noninteractive) Session**

When a client such as dot1x uses the local database for authentication, the Password Strength and Management for Common Criteria feature will be applicable; however, upon password expiry, clients will not be able to change the password. An appropriate failure message will be sent to such clients, and the user must request the security administrator to change the password.
How to Configure Password Strength and Management for Common Criteria

Configuring the Password Security Policy

Perform this task to create a password security policy and to apply the policy to a specific user profile.

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa common-criteria policy policy-name
5. char-changes number
6. max-length number
7. min-length number
8. numeric-count number
9. special-case number
10. exit
11. username username common-criteria-policy policy-name password password
12. end

</tbody>
</table>
Verifying the Common Criteria Policy

Perform this task to verify all the common criteria security policies.

**SUMMARY STEPS**

1. `enable`  
2. `show aaa common-criteria policy name policy-name`  
3. `show aaa common-criteria policy all`

**DETAILED STEPS**

**Step 1  enable**  
Enables privileged EXEC mode.

**Example:**  
```
Device> enable
```

**Step 2  show aaa common-criteria policy name policy-name**  
Displays the password security policy information for a specific policy.

**Example:**  
```
Device# show aaa common-criteria policy name policy1
```

Policy name: policy1  
Minimum length: 1  
Maximum length: 64  
Upper Count: 20  
Lower Count: 20  
Numeric Count: 5  
Special Count: 2  
Number of character changes 4  
Valid forever. User tied to this policy will not expire.

**Step 3  show aaa common-criteria policy all**  
Displays password security policy information for all the configured policies.

**Example:**  
```
Device# show aaa common-criteria policy all
```

Policy name: policy1  
Minimum length: 1  
Maximum length: 64  
Upper Count: 20  
Lower Count: 20  
Numeric Count: 5  
Special Count: 2  
Number of character changes 4
Configuration Examples for Password Strength and Management for Common Criteria

Example: Password Strength and Management for Common Criteria

The following example shows how to create a common criteria security policy and apply the specific policy to a user profile:

Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa common-criteria policy policy1
Device(config-cc-policy)# char-changes 4
Device(config-cc-policy)# max-length 20
Device(config-cc-policy)# min-length 6
Device(config-cc-policy)# numeric-count 2
Device(config-cc-policy)# special-case 2
Device(config-cc-policy)# exit
Device(config)# username user1 common-criteria-policy policy1 password password1
Device(config)# end

AAA-SERVER-MIB Set Operation

The AAA-SERVER-MIB Set Operation feature allows the authentication, authorization, and accounting (AAA) server configuration to be extended or expanded by using the CISCO-AAA-SERVER-MIB to create and add new AAA servers, modify the “KEY” under the CISCO-AAA-SERVER-MIB, and delete the AAA server configuration.

- Finding Feature Information, on page 1037
- Prerequisites for AAA-SERVER-MIB Set Operation, on page 1037
- Restrictions for AAA-SERVER-MIB Set Operation, on page 1038
- Information About AAA-SERVER-MIB Set Operation, on page 1038
- How to Configure AAA-SERVER-MIB Set Operation, on page 1038
- Configuration Examples for AAA-SERVER-MIB Set Operation, on page 1039
- Additional References for AAA-SERVER-MIB Set Operation, on page 1041

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AAA-SERVER-MIB Set Operation

AAA must have been enabled on the router, that is, the `aaa new-model` command must have been configured. If this configuration has not been accomplished, the set operation fails.
Restrictions for AAA-SERVER-MIB Set Operation

Currently, the CISCO SNMP set operation is supported only for the RADIUS protocol. Therefore, only RADIUS servers in global configuration mode can be added, modified, or deleted.

Information About AAA-SERVER-MIB Set Operation

CISCO-AAA-SERVER-MIB

The CISCO-AAA-SERVER-MIB provides that statistics reflect both the state of the AAA server operation with the server itself and of AAA communications with external servers. The CISCO-AAA-SERVER-MIB provides the following information:

- Statistics for each AAA operation
- Status of servers that are providing AAA functions
- Identities of external AAA servers

CISCO-AAA-SERVER-MIB Set Operation

With the SET operation, you can do the following:

- Create or add a new AAA server.
- Modify the KEY under the CISCO-AAA-SERVER-MIB. This “secret key” is used for secure connectivity to the AAA server, which is present with the network access server (NAS) and the AAA server.
- Delete the AAA server configuration.

How to Configure AAA-SERVER-MIB Set Operation

Configuring AAA-SERVER-MIB Set Operations

No special configuration is required for this feature. The Simple Network Management Protocol (SNMP) framework can be used to manage MIBs. See the Additional References section for a reference to configuring SNMP.

Verifying SNMP Values

SNMP values can be verified by performing the following steps.

SUMMARY STEPS

1. enable
2. `show running-config | include radius-server host`
3. `show aaa servers`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>`show running-config</td>
<td>include radius-server host`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>`Device# show running-config</td>
<td>include radius-server host`</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>show aaa servers</code></td>
<td>Displays information about the number of requests sent to and received from authentication, authorization, and accounting (AAA) servers.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# show aaa servers</code></td>
<td></td>
</tr>
</tbody>
</table>

**Configuration Examples for AAA-SERVER-MIB Set Operation**

**RADIUS Server Configuration and Server Statistics Example**

The following sample output shows the RADIUS server configuration and server statistics before and after the set operation.

**Before the Set Operation**

```
Device# show running-config | include radius-server host
!
The following line is for server 1.
radius-server host 172.19.192.238 auth-port 2095 acct-port 2096 key cisco2
!
The following line is for server 2.
radius-server host 172.19.192.238 auth-port 1645 acct-port 1646
```

**Server Statistics**

```
Device# show aaa servers
RADIUS: id 2, priority 1, host 172.19.192.238, auth-port 2095, acct-port 2096
State: current UP, duration 25s, previous duration 0s
    Dead: total time 0s, count 7
Authen: request 8, timeouts 8
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 2
Author: request 0, timeouts 0
```
SNMP Get Operation to Check the Configuration and Statistics of the RADIUS Servers

AAA-SERVER5:/users/smetri> get many 10.0.1.42 casConfigTable
casAddress.2.2 = 172.19.192.238
casAddress.2.3 = 172.19.192.238
casAuthenPort.2.2 = 2095
casAuthenPort.2.3 = 1645
casAcctPort.2.2 = 2096
casAcctPort.2.3 = 1646
casKey.2.2 =
casKey.2.3 =
! The following line shows priority for server 1.
casPriority.2.2 = 1
! The following line shows priority for server 2.
casPriority.2.3 = 2
casConfigRowStatus.2.2 = active(1)
casConfigRowStatus.2.3 = active(1)
AAA-SERVER5:/users/smetri>

SNMP Set Operation

The key of the existing RADIUS server is being changed. The index “1” is being used. That index acts as a wildcard for addition, deletion, or modification of any entries.

Change the key for server 1:=>
AAA-SERVER5:/users/smetri> setany -v2c 10.0.1.42 public casAddress.2.1 -i 172.19.192.238
casAuthenPort.2.1 = 2095 casAcctPort.2.1 = 2096 casKey.2.1 = king
casAddress.2.1 = 172.19.192.238
casAuthenPort.2.1 = 2095
casAcctPort.2.1 = 2096
casKey.2.1 = king
AAA-SERVER5:/users/smetri>

After the Set Operation

After the above SNMP set operation, the configurations on the device change. The following output shows the output after the set operation.

Device# show running-config | include radius-server host
Additional References for AAA-SERVER-MIB Set Operation

The following sections provide references related to the AAA-SERVER-MIB Set Operation feature.

Feature Information for AAA-SERVER-MIB Set Operation

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 119: Feature Information for AAA-SERVER-MIB Set Operation

</tbody>
</table>
CHAPTER 53

Configuring Secure Shell

The Secure Shell (SSH) feature is an application and a protocol that provides a secure replacement to the Berkeley r-tools. The protocol secures sessions using standard cryptographic mechanisms, and the application can be used similarly to the Berkeley rexec and rsh tools. Two versions of SSH are available: SSH Version 1 and SSH Version 2.

- Finding Feature Information, on page 1043
- Prerequisites for Configuring Secure Shell, on page 1043
- Restrictions for Configuring Secure Shell, on page 1044
- Information About Configuring Secure Shell, on page 1044
- How to Configure Secure Shell, on page 1047
- Configuration Examples for Secure Shell, on page 1058
- Additional References for Secure Shell, on page 1060
- Feature Information for Configuring Secure Shell, on page 1060

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.
- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adleman (RSA) key pair.
• SCP relies on SSH for security.
• SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
• A user must have appropriate authorization to use SCP.
• A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the `copy` command. An authorized administrator can also do this from a workstation.
• The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.
• Configure a hostname and host domain for your device by using the `hostname` and `ip domain-name` commands in global configuration mode.

Restrictions for Configuring Secure Shell

The following are restrictions for configuring the device for secure shell.
• The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
• SSH supports only the execution-shell application.
• The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
• The device supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
• When using SCP, you cannot enter the password into the `copy` command. You must enter the password when prompted.
• The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.
• The `-l` keyword and userid : {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.
• To authenticate clients with freeradius over RADSEC, you should generate an RSA key longer than 1024 bit. Use the `crypto key generate rsa general-keys exportable label label-name` command to achieve this.

Information About Configuring Secure Shell

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).
SSH and Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

---

Note

The SSH client functionality is available only when the SSH server is enabled.

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

RSA Authentication Support

Rivest, Shamir, and Adleman (RSA) authentication available in Secure Shell (SSH) clients is not supported on the SSH server for Cisco software by default.

SSL Configuration Guidelines

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.
Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note

When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Secure Copy Protocol

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the device can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

How Secure Copy Works

The behavior of Secure Copy (SCP) is similar to that of remote copy (RCP), which comes from the Berkeley r-tools suite (Berkeley university’s own set of networking applications), except that SCP relies on Secure Shell (SSH) for security. In addition, SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so that the device can determine whether the user has the correct privilege level.

SCP allows a user only with a privilege level of 15 to copy any file that exists in the Cisco IOS File System (IFS) to and from a device by using the copy command. An authorized administrator may also perform this action from a workstation.

Note

Enable the SCP option while using the pscp.exe file with the Cisco software.

Reverse Telnet

Reverse telnet allows you to telnet to a certain port range and connect to terminal or auxiliary lines. Reverse telnet has often been used to connect a Cisco device that has many terminal lines to the consoles of other
Cisco devices. Telnet makes it easy to reach the device console from anywhere simply by telnet to the terminal server on a specific line. This telnet approach can be used to configure a device even if all network connectivity to that device is disconnected. Reverse telnet also allows modems that are attached to Cisco devices to be used for dial-out (usually with a rotary device).

Reverse SSH

Reverse telnet can be accomplished using SSH. Unlike reverse telnet, SSH provides for secure connections. The Reverse SSH Enhancements feature provides you with a simplified method of configuring SSH. Using this feature, you no longer have to configure a separate line for every terminal or auxiliary line on which you want to enable SSH. The previous method of configuring reverse SSH limited the number of ports that can be accessed to 100. The Reverse SSH Enhancements feature removes the port number limitation.

How to Configure Secure Shell

Setting Up the Device to Run SSH

Follow the procedure given below to set up your Device to run SSH:

**Before you begin**
Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. hostname hostname
4. ip domain-name domain_name
5. crypto key generate rsa
6. end
7. show running-config
8. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Configuring the SSH Server

Follow the procedure given below to configure the SSH server:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>hostname hostname</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config)# hostname your_hostname</code>&lt;br&gt;<strong>Note</strong> Follow this procedure only if you are configuring the Device as an SSH server.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>ip domain-name domain_name</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config)# ip domain-name your_domain</code>&lt;br&gt;Configures a host domain for your Device.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>crypto key generate rsa</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config)# crypto key generate rsa</code>&lt;br&gt;Enables the SSH server for local and remote authentication on the Device and generates an RSA key pair. Generating an RSA key pair for the Device automatically enables SSH. We recommend that a minimum modulus size of 1024 bits. When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.&lt;br&gt;<strong>Note</strong> Follow this procedure only if you are configuring the Device as an SSH server.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config)# end</code>&lt;br&gt;Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>show running-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# show running-config</code>&lt;br&gt;Verifies your entries.</td>
</tr>
</tbody>
</table>
| **Step 8** | **copy running-config startup-config**<br>**Example:**<br>`Device# copy running-config startup-config`<br>(Optional) Saves your entries in the configuration file.
This procedure is only required if you are configuring the Device as an SSH server.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip ssh version [1 | 2]`
4. `ip ssh {timeout seconds | authentication-retries number}`
5. Use one or both of the following:
   - `line vty line_number[ ending_line_number]`
   - `transport input ssh`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `ip ssh version [1</td>
<td>2]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip ssh version 1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `ip ssh {timeout seconds</td>
<td>authentication-retries number}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip ssh timeout 90</code></td>
<td></td>
</tr>
</tbody>
</table>

Example: If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.
## Invoking an SSH Client

Perform this task to invoke the Secure Shell (SSH) client. The SSH client runs in user EXEC mode and has no specific configuration tasks.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication-retries 2</td>
<td>the connection is established, the Device uses the default time-out values of the CLI-based sessions. By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.</td>
</tr>
</tbody>
</table>

• Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5. Repeat this step when configuring both parameters.

### Step 5
Use one or both of the following:

• `line vty line_number [ending_line_number]`
  • `transport input ssh`

**Example:**

Device(config)# line vty 1 10

or

Device(config-line)# transport input ssh

(Optional) Configures the virtual terminal line settings. 

• Enters line configuration mode to configure the virtual terminal line settings. For `line_number` and `ending_line_number`, specify a pair of lines. The range is 0 to 15.

• Specifies that the Device prevent non-SSH Telnet connections. This limits the router to only SSH connections.

### Step 6
**end**

**Example:**

Device(config-line)# end

Returns to privileged EXEC mode.

### Step 7
**show running-config**

**Example:**

Device# show running-config

Verifies your entries.

### Step 8
**copy running-config startup-config**

**Example:**

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
SUMMARY STEPS

1. enable
2. ssh -l username -vrf vrf-name ip-address

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| ssh -l username -vrf vrf-name ip-address | Invokes the SSH client to connect to an IP host or address in the specified virtual routing and forwarding (VRF) instance. |
| Example:          |         |
| Device# ssh -l user1 -vrf vrf1 192.0.2.1 |         |

Troubleshooting Tips

- If your Secure Shell (SSH) configuration commands are rejected as illegal commands, you have not successfully generated an Rivest, Shamir, and Adleman (RSA) key pair for your device. Make sure that you have specified a hostname and domain. Then use the `crypto key generate rsa` command to generate an RSA key pair and enable the SSH server.

- When configuring the RSA key pair, you might encounter the following error messages:
  - No hostname specified.
    You must configure a hostname for the device using the `hostname` global configuration command.
  - No domain specified.
    You must configure a host domain for the device using the `ip domain-name` global configuration command.

- The number of allowable SSH connections is limited to the maximum number of vty's configured for the device. Each SSH connection uses a vty resource.

- SSH uses either local security or the security protocol that is configured through AAA on your device for user authentication. When configuring Authentication, Authorization, and Accounting (AAA), you must ensure that AAA is disabled on the console for user authentication. AAA authorization is disabled on the console by default. If AAA authorization is enabled on the console, disable it by configuring the `no aaa authorization console` command during the AAA configuration stage.

Configuring Reverse SSH for Console Access

To configure reverse SSH console access on the SSH server, perform the following steps.
SUMMARY STEPS

1. enable
2. configure terminal
3. line line-number ending-line-number
4. no exec
5. login authentication listname
6. transport input ssh
7. exit
8. exit
9. ssh -l userid \{number\} \{ip-address\}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
Example:  
Device> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
| **Step 3** line line-number ending-line-number | Identifies a line for configuration and enters line configuration mode.  
Example:  
Device# line 1 3 |
| **Step 4** no exec | Disables EXEC processing on a line.  
Example:  
Device(config-line)# no exec |
| **Step 5** login authentication listname | Defines a login authentication mechanism for the lines.  
Example:  
Device(config-line)# login authentication default |
| Note | The authentication method must use a username and password. |
| **Step 6** transport input ssh | Defines which protocols to use to connect to a specific line of the device.  
Example:  
Device(config-line)# transport input ssh |
| Note | The ssh keyword must be used for the Reverse SSH Enhancements feature. |
| **Step 7** exit | Exits line configuration mode.  
Example: |
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-line)# exit</td>
<td>Exits global configuration mode.</td>
</tr>
</tbody>
</table>

#### Step 8

**exit**

**Example:**

Device(config)# exit

#### Step 9

**ssh -l userid :{number} {ip-address}**

**Example:**

Device# ssh -l lab:1 router.example.com

---

### Configuring Reverse SSH for Modem Access

In this configuration, reverse SSH is being configured on a modem used for dial-out lines. To get any of the dial-out modems, you can use any SSH client and start a SSH session as shown (in Step 10) to get to the next available modem from the rotary device.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. line line-number ending-line-number
4. no exec
5. login authentication listname
6. rotary group
7. transport input ssh
8. exit
9. exit
10. ssh -l userid :rotary {number} {ip-address}
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
Example:  
Device> enable |  
- Enter your password if prompted. |
| Step 2 | `configure terminal` | Enters global configuration mode.  
Example:  
Device# configure terminal | |
| Step 3 | `line line-number ending-line-number` | Identifies a line for configuration and enters line configuration mode.  
Example:  
Device# line 1 200 | |
| Step 4 | `no exec` | Disables EXEC processing on a line.  
Example:  
Device(config-line)# no exec | |
| Step 5 | `login authentication listname` | Defines a login authentication mechanism for the lines.  
Example:  
Device(config-line)# login authentication default  
Note: The authentication method must use a username and password. | |
| Step 6 | `rotary group` | Defines a group of lines consisting of one or more virtual terminal lines or one auxiliary port line.  
Example:  
Device(config-line)# rotary 1 | |
| Step 7 | `transport input ssh` | Defines which protocols to use to connect to a specific line of the device.  
Example:  
Device(config-line)# transport input ssh  
- The `ssh` keyword must be used for the Reverse SSH Enhancements feature. | |
| Step 8 | `exit` | Exits line configuration mode.  
Example:  
Device(config-line)# exit | |
| Step 9 | `exit` | Exits global configuration mode.  
Example:  
Device(config)# exit | |
### Troubleshooting Reverse SSH on the Client

To troubleshoot the reverse SSH configuration on the client (remote device), perform the following steps.

**SUMMARY STEPS**

1.  enable
2.  debug ip ssh client

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

### Troubleshooting Reverse SSH on the Server

To troubleshoot the reverse SSH configuration on the terminal server, perform the following steps. The steps may be configured in any order or independent of one another.
SUMMARY STEPS

1. enable
2. debug ip ssh
3. show ssh
4. show line

DETAILED STEPS

<table>
<thead>
<tr>

Configuring Secure Copy

To configure a Cisco device for Secure Copy (SCP) server-side functionality, perform the following steps.
### SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication login \{default | list-name\} method1 [ method2... ]
5. aaa authorization \{network | exec | commands level | reverse-access | configuration\} \{default | list-name\} [method1 [ method2... ]]
6. username name [privilege level] password encryption-type encrypted-password
7. ip scp server enable
8. exit
9. show running-config
10. debug ip scp

</tr>
</tbody>
</table>

---

**Configuration Examples for Secure Shell**

**Example: Secure Copy Configuration Using Local Authentication**

The following example shows how to configure the server-side functionality of Secure Copy (SCP). This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly in order for SCP to work.
aaa new-model
aaa authentication login default local
aaa authorization exec default local
username user1 privilege 15 password 0 lab
! SSH must be configured and functioning properly.
ip scp server enable
```

**Example: SCP Server-Side Configuration Using Network-Based Authentication**

The following example shows how to configure the server-side functionality of SCP using a network-based authentication mechanism:

```
! AAA authentication and authorization must be configured properly for SCP to work.
aaa new-model
```
aaa authentication login default group tacacs+
aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
ip ssh time-out 120
ip ssh authentication-retries 3
ip scp server enable

Example Reverse SSH Console Access

The following configuration example shows that reverse SSH has been configured for console access for terminal lines 1 through 3:

Terminal Server Configuration

line 1 3
  no exec
  login authentication default
  transport input ssh

Client Configuration

The following commands configured on the SSH client will form the reverse SSH session with lines 1, 2, and 3, respectively:

ssh -l lab:1 router.example.com
ssh -l lab:2 router.example.com
ssh -l lab:3 router.example.com

Example Reverse SSH Modem Access

The following configuration example shows that dial-out lines 1 through 200 have been grouped under rotary group 1 for modem access:

line 1 200
  no exec
  login authentication default
  rotary 1
  transport input ssh
  exit

The following command shows that reverse SSH will connect to the first free line in the rotary group:

ssh -l lab:rotary1 router.example.com

Example: Monitoring the SSH Configuration and Status

To verify that the Secure Shell (SSH) server is enabled and to display the version and configuration data for your SSH connection, use the `show ip ssh` command. The following example shows that SSH is enabled:

Device# show ip ssh

SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3
The following example shows that SSH is disabled:

```
Device# show ip ssh
%SSH has not been enabled
```

To verify the status of your SSH server connections, use the `show ssh` command. The following example shows the SSH server connections on the device when SSH is enabled:

```
Device# show ssh
```

<table>
<thead>
<tr>
<th>Connection</th>
<th>Version</th>
<th>Encryption</th>
<th>State</th>
<th>Username</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1.5</td>
<td>3DES</td>
<td>Session Started</td>
<td>guest</td>
</tr>
</tbody>
</table>

The following example shows that SSH is disabled:

```
Device# show ssh
%No SSH server connections running.
```

### Feature Information for Configuring Secure Shell

<table>
<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS Release 15.0(2)EX</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>
Starting with Cisco IOS Release 15.2(5)E, Secure Shell Version 1 (SSHv1) is deprecated.

The Reverse SSH Enhancements feature, which is supported for SSH Version 1 and 2, provides an alternative way to configure reverse Secure Shell (SSH) so that separate lines do not need to be configured for every terminal or auxiliary line on which SSH must be enabled. This feature also eliminates the rotary-group limitation.

This feature was supported on CAT4500-X, CAT4500E-SUP6E, CAT4500E-SUP6L-E, CAT4500E-SUP7E, CAT4500E-SUP7L-E.

The following command was introduced: `ssh`.

CHAPTER 54

Secure Shell Version 2 Support

The Secure Shell Version 2 Support feature allows you to configure Secure Shell (SSH) Version 2. (SSH Version 1 support was implemented in an earlier Cisco software release.) SSH runs on top of a reliable transport layer and provides strong authentication and encryption capabilities. The only reliable transport that is defined for SSH is TCP. SSH provides a means to securely access and securely execute commands on another computer over a network. The Secure Copy Protocol (SCP) feature that is provided with SSH allows for the secure transfer of files.

- Finding Feature Information, on page 1063
- Information About Secure Shell Version 2 Support, on page 1063
- How to Configure Secure Shell Version 2 Support, on page 1067
- Configuration Examples for Secure Shell Version 2 Support, on page 1081
- Additional References for Secure Shell Version 2 Support, on page 1086
- Feature Information for Secure Shell Version 2 Support, on page 1087

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Secure Shell Version 2 Support

Secure Shell Version 2

The configuration for the SSH Version 2 server is similar to the configuration for SSH Version 1. The `ip ssh version` command defines the SSH version to be configured. If you do not configure this command, SSH by default runs in compatibility mode; that is, both SSH Version 1 and SSH Version 2 connections are honored.
SSH Version 1 is a protocol that has never been defined in a standard. If you do not want your device to fall back to the undefined protocol (Version 1), you should use the `ip ssh version` command and specify Version 2.

The `ip ssh rsa keypair-name` command enables an SSH connection using the Rivest, Shamir, and Adleman (RSA) keys that you have configured. Previously, SSH was linked to the first RSA keys that were generated (that is, SSH was enabled when the first RSA key pair was generated). This behavior still exists, but by using the `ip ssh rsa keypair-name` command, you can overcome this behavior. If you configure the `ip ssh rsa keypair-name` command with a key pair name, SSH is enabled if the key pair exists or SSH will be enabled if the key pair is generated later. If you use this command to enable SSH, you are not forced to configure a hostname and a domain name, which was required in SSH Version 1 of the Cisco software.

The login banner is supported in SSH Version 2, but it is not supported in Secure Shell Version 1.

## Secure Shell Version 2 Enhancements

The SSH Version 2 Enhancements feature includes a number of additional capabilities such as supporting Virtual Routing and Forwarding (VRF)-Aware SSH, SSH debug enhancements, and Diffie-Hellman (DH) group exchange support.

The VRF-Aware SSH feature is supported depending on your release.

The Cisco SSH implementation has traditionally used 768-bit modulus, but with an increasing need for higher key sizes to accommodate DH Group 14 (2048 bits) and Group 16 (4096 bits) cryptographic applications, a message exchange between the client and the server to establish the favored DH group becomes necessary. The `ip ssh dh min size` command configures the modulus size on the SSH server. In addition to this, the `ssh` command was extended to add VRF awareness to the SSH client-side functionality through which the VRF instance name in the client is provided with the IP address to look up the correct routing table and establish a connection.

Debugging was enhanced by modifying SSH debug commands. The `debug ip ssh` command was extended to simplify the debugging process. Before the simplification of the debugging process, this command printed all debug messages related to SSH regardless of what was specifically required. The behavior still exists, but if you configure the `debug ip ssh` command with a keyword, messages are limited to information specified by the keyword.

## Secure Shell Version 2 Enhancements for RSA Keys

Cisco SSH Version 2 supports keyboard-interactive and password-based authentication methods. The SSH Version 2 Enhancements for RSA Keys feature also supports RSA-based public key authentication for the client and the server.
User authentication—RSA-based user authentication uses a private/public key pair associated with each user for authentication. The user must generate a private/public key pair on the client and configure a public key on the Cisco SSH server to complete the authentication.

An SSH user trying to establish credentials provides an encrypted signature using the private key. The signature and the user’s public key are sent to the SSH server for authentication. The SSH server computes a hash over the public key provided by the user. The hash is used to determine if the server has a matching entry. If a match is found, an RSA-based message verification is performed using the public key. Hence, the user is authenticated or denied access based on the encrypted signature.

Server authentication—While establishing an SSH session, the Cisco SSH client authenticates the SSH server by using the server host keys available during the key exchange phase. SSH server keys are used to identify the SSH server. These keys are created at the time of enabling SSH and must be configured on the client.

For server authentication, the Cisco SSH client must assign a host key for each server. When the client tries to establish an SSH session with a server, the client receives the signature of the server as part of the key exchange message. If the strict host key checking flag is enabled on the client, the client checks if it has the host key entry corresponding to the server. If a match is found, the client tries to validate the signature by using the server host key. If the server is successfully authenticated, the session establishment continues; otherwise, it is terminated and displays a “Server Authentication Failed” message.

Note
Storing public keys on a server uses memory; therefore, the number of public keys configurable on an SSH server is restricted to ten users, with a maximum of two public keys per user.

Note
RSA-based user authentication is supported by the Cisco server, but Cisco clients cannot propose public key as an authentication method. If the Cisco server receives a request from an open SSH client for RSA-based authentication, the server accepts the authentication request.

Note
For server authentication, configure the RSA public key of the server manually and configure the `ip ssh stricthostkeycheck` command on the Cisco SSH client.

SNMP Trap Generation

Depending on your release, Simple Network Management Protocol (SNMP) traps are generated automatically when an SSH session terminates if the traps have been enabled and SNMP debugging has been enabled. For information about enabling SNMP traps, see the “Configuring SNMP Support” module in the SNMP Configuration Guide.

Note
When you configure the `snmp-server host` command, the IP address must be the address of the PC that has the SSH (telnet) client and that has IP connectivity to the SSH server.
You must also enable SNMP debugging using the `debug snmp packet` command to display the traps. The trap information includes information such as the number of bytes sent and the protocol that was used for the SSH session.

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client.

```plaintext
snmp-server
snmp-server host a.b.c.d public tty
```

The following is sample output from the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

```
Switch# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password:
Switch# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2

*Jul 18 10:18:42.879: SNMP: Packet sent via UDP to 10.0.0.2
Switch#
```

### SSH Keyboard Interactive Authentication

The SSH Keyboard Interactive Authentication feature, also known as Generic Message Authentication for SSH, is a method that can be used to implement different types of authentication mechanisms. Basically, any currently supported authentication method that requires only user input can be performed with this feature. The feature is automatically enabled.

The following methods are supported:

- Password
- SecurID and hardware tokens printing a number or a string in response to a challenge sent by the server
- Pluggable Authentication Module (PAM)
- S/KEY (and other One-Time-Pads)
# How to Configure Secure Shell Version 2 Support

## Configuring a Device for SSH Version 2 Using a Hostname and Domain Name

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `hostname name`
4. `ip domain-name name`
5. `crypto key generate rsa`
6. `ip ssh [time-out seconds | authentication-retries integer]`
7. `ip ssh version [1 | 2]`
8. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

5. crypto key generate rsa
6. ip ssh pubkey-chain
7. server *server-name*
8. key-string
9. exit
10. key-hash *key-type* *key-name*
11. end
12. configure terminal
13. ip ssh stricthostkeycheck

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th><code>hostname name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# hostname host1</td>
</tr>
</tbody>
</table>

**Purpose**: Specifies the hostname.

<table>
<thead>
<tr>
<th>Step 4</th>
<th><code>ip domain-name name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(config)# ip domain-name name1</td>
</tr>
</tbody>
</table>

**Purpose**: Defines a default domain name that the Cisco software uses to complete unqualified hostnames.

<table>
<thead>
<tr>
<th>Step 5</th>
<th><code>crypto key generate rsa</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(config)# crypto key generate rsa</td>
</tr>
</tbody>
</table>

**Purpose**: Generates RSA key pairs.

<table>
<thead>
<tr>
<th>Step 6</th>
<th><code>ip ssh pubkey-chain</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(config)# ip ssh pubkey-chain</td>
</tr>
</tbody>
</table>

**Purpose**: Configures SSH-RSA keys for user and server authentication on the SSH server and enters public-key configuration mode.

<table>
<thead>
<tr>
<th>Step 7</th>
<th><code>server server-name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(conf-ssh-pubkey)# server server1</td>
</tr>
</tbody>
</table>

**Purpose**: Enables the SSH server for public-key authentication on the device and enters public-key server configuration mode.

<table>
<thead>
<tr>
<th>Step 8</th>
<th><code>key-string</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(conf-ssh-pubkey-server)# key-string</td>
</tr>
</tbody>
</table>

**Purpose**: Specifies the RSA public-key of the remote peer and enters public key data configuration mode.

**Note**: You can obtain the public key value from an open SSH client; that is, from the `.ssh/id_rsa.pub` file.

<table>
<thead>
<tr>
<th>Step 9</th>
<th><code>exit</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(conf-ssh-pubkey-data)# exit</td>
</tr>
</tbody>
</table>

**Purpose**: Exits public-key data configuration mode and enters public-key server configuration mode.

<table>
<thead>
<tr>
<th>Step 10</th>
<th><code>key-hash key-type key-name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>host1(conf-ssh-pubkey-server)# key-hash ssh-rsa key1</td>
</tr>
</tbody>
</table>

**Purpose**: (Optional) Specifies the SSH key type and version.

- The key type must be ssh-rsa for the configuration of private/public key pairs.
- This step is optional only if the `key-string` command is configured.
- You must configure either the `key-string` command or the `key-hash` command.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 11</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Exits public-key server configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>host1(conf-ssh-pubkey-server)# end</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>host1# configure terminal</td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>ip ssh stricthostkeycheck</code></td>
<td>Ensures that server authentication takes place.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>host1(config)# ip ssh stricthostkeycheck</td>
</tr>
</tbody>
</table>

### Starting an Encrypted Session with a Remote Device

The device with which you want to connect must support a Secure Shell (SSH) server that has an encryption algorithm that is supported in Cisco software. Also, you need not enable your device. SSH can be run in disabled mode.

#### SUMMARY STEPS

1. `ssh [-v {1 | 2}] [-c {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc | aes192-cbc | aes256-cbc} | -l user-id] [-l user-id:vrf-name number ip-address ip-address] [-l user-id:rotary number ip-address] [-m {hmac-md5-128 | hmac-md5-96 | hmac-sha1-160 | hmac-sha1-96}] [-o numberofpasswordprompts n] [-p port-num] {ip-addr | hostname} [command [-vrf]]`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
</tbody>
</table>
### Enabling Secure Copy Protocol on the SSH Server

The following task configures the server-side functionality for SCP. This task shows a typical configuration that allows the device to securely copy files from a remote workstation.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. ` aaa new-model`
4. ` aaa authentication login  default local`
5. ` aaa authorization exec  default local`
6. ` username name  privilege privilege-level  password password`
7. ` ip ssh time-out seconds`
8. ` ip ssh authentication-retries integer`
9. ` ip scp server enable`
10. ` exit`
11. ` debug ip scp`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Enables the AAA access control model.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```
Device# ssh -v 2 -c aes256-ctr -m hmac-sha1-96 -l user2 10.76.82.24
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aaa new-model</code></td>
<td>Sets AAA authentication at login to use the local username database for authentication.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Sets the parameters that restrict user access to a network, runs the authorization to determine if the user ID is allowed to run an EXEC shell, and specifies that the system must use the local database for authorization.</td>
</tr>
<tr>
<td><code>aaa authentication login default local</code></td>
<td>Establishes a username-based authentication system, and specifies the username, privilege level, and an unencrypted password.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Sets the minimum value for the <code>privilege-level</code> argument is 15. A privilege level of less than 15 results in the connection closing.</td>
</tr>
<tr>
<td><code>username name privilege privilege-level password</code></td>
<td>Enables the device to securely copy files from a remote workstation.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>ip ssh time-out seconds</code></td>
<td>Enables the device to securely copy files from a remote workstation.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>ip ssh authentication-retries integer</code></td>
<td>(Optional) Provides diagnostic information about SCP authentication problems.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) Provides diagnostic information about SCP authentication problems.</td>
</tr>
<tr>
<td><code>ip scp server enable</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>debug ip scp</code></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Verifying the Status of the Secure Shell Connection

SUMMARY STEPS

1. enable
2. show ssh
3. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> show ssh</td>
<td>Displays the status of SSH server connections.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show ssh</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> exit</td>
<td>Exits privileged EXEC mode and returns to user EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# exit</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for Version 1 and Version 2 connections:

```
Device# show ssh
Connection Version Encryption State Username
0 1.5 3DES Session started lab
Connection Version Mode Encryption Hmac State Username
1 2.0 IN aes128-cbc hmac-md5 Session started lab
1 2.0 OUT aes128-cbc hmac-md5 Session started lab
```

The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for a Version 2 connection with no Version 1 connection:

```
Device# show ssh
Connection Version Mode Encryption Hmac State Username
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
The following sample output from the `show ssh` command displays status of various SSH Version 1 and Version 2 connections for a Version 1 connection with no Version 2 connection:

```
Device# show ssh
Connection  Version  Encryption  State  Username
0           1.5      3DES        Session started  lab
%No SSHv2 server connections running.
```

### Verifying the Secure Shell Status

**SUMMARY STEPS**

1. `enable`
2. `show ip ssh`
3. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show ip ssh</td>
<td>Displays the version and configuration data for SSH.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show ip ssh</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> exit</td>
<td>Exits privileged EXEC mode and returns to user EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# exit</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following sample output from the `show ip ssh` command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for Version 1 and Version 2 connections:

```
Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
```
Device# `show ip ssh`

SSH Enabled - version 1.99
Authentication timeout: 120 secs; Authentication retries: 3

The following sample output from the `show ip ssh` command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 2 connection with no Version 1 connection:

Device# `show ip ssh`

SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3

The following sample output from the `show ip ssh` command displays the version of SSH that is enabled, the authentication timeout values, and the number of authentication retries for a Version 1 connection with no Version 2 connection:

Device# `show ip ssh`

3d06h: %SYS-5-CONFIG_I: Configured from console by console
SSH Enabled - version 1.5
Authentication timeout: 120 secs; Authentication retries: 3

### Monitoring and Maintaining Secure Shell Version 2

#### SUMMARY STEPS

1. `enable`
2. `debug ip ssh`
3. `debug snmp packet`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> debug ip ssh</td>
<td>Enables debugging of SSH.</td>
</tr>
<tr>
<td>Example: <code>Device# debug ip ssh</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> debug snmp packet</td>
<td>Enables debugging of every SNMP packet sent or received by the device.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Purpose
Command or Action | Purpose
---|---
Device# debug snmp packet | 

Example

The following sample output from the `debug ip ssh` command shows the connection is an SSH Version 2 connection:

```
Device# debug ip ssh

Configuration Examples for Secure Shell Version 2 Support

Example: Configuring Secure Shell Version 2

```
Device# configure terminal
Device(config)# ip ssh version 2
```

Example: Starting an Encrypted Session with a Remote Device

```
Device# ssh -v 2 -c aes256-cbc -m hmac-sha1-160 -l shaship 10.76.82.24
```

Example: Configuring Server-Side SCP

The following example shows how to configure the server-side functionality for SCP. This example also configures AAA authentication and authorization on the device. This example uses a locally defined username and password.
Example: Setting an SNMP Trap

The following example shows that an SNMP trap is set. The trap notification is generated automatically when the SSH session terminates. In the example, a.b.c.d is the IP address of the SSH client.

```bash
snmp-server
snmp-server host a.b.c.d public tty
```

The following is sample output from the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

```bash
Device1# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password: 
Device2# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
*Jul 18 10:18:42.619: SNMP: V1 Trap, ent cisco, addr 10.0.0.1, gentrap 6, spectrap 1
  local.9.3.1.1.2.1 = 6
  tcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 4
  tcpConnEntry.5.10.0.0.1.22.10.0.0.2.55246 = 1015
  tcpConnEntry.1.10.0.0.1.22.10.0.0.2.55246 = 1056
  tcpConnEntry.2.10.0.0.1.22.10.0.0.2.55246 = 1392
  local.9.2.1.18.2 = lab
*Jul 18 10:18:42.879: SNMP: Packet sent via UDP to 10.0.0.2
Device1#
```

Examples: SSH Keyboard Interactive Authentication

Example: Enabling Client-Side Debugs

The following example shows that the client-side debugs are turned on, and the maximum number of prompts is six (three for the SSH keyboard interactive authentication method and three for the password authentication method).

```bash
Password: 
Password: 
Password: 
```
Example: Enabling ChPass with a Blank Password Change

In the following example, the ChPass feature is enabled, and a blank password change is accomplished using the SSH Keyboard Interactive Authentication method. A TACACS+ access control server (ACS) is used as the back-end AAA server.

```
Device1# ssh -l cisco 10.1.1.3
Password:
Old Password: cisco
New Password: cisco123
Re-enter New password: cisco123
Device2>
```

Example: Enabling ChPass and Changing the Password on First Login

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end server. The password is changed on the first login using the SSH keyboard interactive authentication method.

```
Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
```
New Password: cisco123
Re-enter New password: cisco123

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.

Device2>

Example: Enabling ChPass and Expiring the Password After Three Logins

In the following example, the ChPass feature is enabled and TACACS+ ACS is used as the back-end AAA server. The password expires after three logins using the SSH keyboard interactive authentication method.

Device1# ssh -l cisco. 10.1.1.3
Password: cisco

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3
Password: cisco

Device2> exit

Device1# ssh -l cisco 10.1.1.3
Password: cisco

Device2> exit

[Connection to 10.1.1.3 closed by foreign host]

Device1# ssh -l cisco 10.1.1.3
Password: cisco
Your password has expired.
Enter a new one now.
New Password: cisco123
Re-enter New password: cisco123

Device2>
Example: SNMP Debugging

The following is sample output from the `debug snmp packet` command. The output provides SNMP trap information for an SSH session.

Device1# debug snmp packet
SNMP packet debugging is on
Device1# ssh -l lab 10.0.0.2
Password: lab
Device2# exit
[Connection to 10.0.0.2 closed by foreign host]
Device1#
*Jul 18 10:18:42.619: SNMP: Queuing packet to 10.0.0.2
*Jul 18 10:18:42.619: SNMP: V1 Trap, ent cisco, addr 10.0.0.1, gentrap 6, spectrap 1
local.9.3.1.1.2.1 = 6

CHAPTER 55

Configuring SSH File Transfer Protocol

Secure Shell (SSH) includes support for SSH File Transfer Protocol (SFTP), which is a new standard file transfer protocol introduced in SSHv2. This feature provides a secure and authenticated method for copying device configuration or device image files.

- Prerequisites for SSH File Transfer Protocol, on page 1089
- Restrictions for SSH File Transfer Protocol, on page 1089
- Information About SSH File Transfer Protocol, on page 1089
- How to Configure SSH File Transfer Protocol, on page 1090
- Example: Configuring SSH File Transfer Protocol, on page 1091
- Additional References, on page 1092
- Feature Information for SSH File Transfer Protocol, on page 1092

Prerequisites for SSH File Transfer Protocol

- SSH must be enabled.
- The `ip ssh source-interface interface-type interface-number` command must be configured.

Restrictions for SSH File Transfer Protocol

- The SFTP server is not supported.
- SFTP boot is not supported.
- The `sftp` option in the `install add` command is not supported.

Information About SSH File Transfer Protocol

The SFTP client functionality is provided as part of the SSH component and is always enabled on the corresponding device. Therefore, any SFTP server user with the appropriate permission can copy files to and from the device.

An SFTP client is VRF-aware; you can configure the secure FTP client to use the virtual routing and forwarding (VRF) associated with a particular source interface during connection attempts.
How to Configure SSH File Transfer Protocol

The following sections provide information about the various tasks that comprise an SFTP configuration.

Configuring SFTP

Perform the following steps:

**Before you begin**

To configure a Cisco device for SFTP client-side functionality, the `ip ssh source-interface interface-type interface-number` command must be configured first.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip ssh source-interface interface-type interface-number
4. exit
5. show running-config
6. debug ip sftp

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode. Enter your password, if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip ssh source-interface interface-type interface-number</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# ip ssh source-interface GigabitEthernet 1/0/1</td>
</tr>
<tr>
<td></td>
<td>Defines the source IP for the SSH session.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>exit</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# exit</td>
</tr>
<tr>
<td></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Perform an SFTP Copy Operation

SFTP copy takes the IP or hostname of the corresponding server if Domain Name System (DNS) is configured. To perform SFTP copy operations, use the following commands in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# <code>copy ios-file-system:file sftp://user:pwd@server-ip//filepath</code>&lt;br&gt;Or&lt;br&gt;Device# <code>copy ios-file-system: sftp:</code></td>
<td>Copies a file from the local Cisco IOS file system to the server.&lt;br&gt;Specify the username, password, IP address, and filepath of the server.</td>
</tr>
<tr>
<td>Device# <code>copy sftp://user:pwd@server-ip//filepath ios-file-system:file</code>&lt;br&gt;Or&lt;br&gt;Device# <code>copy sftp: ios-file-system:</code></td>
<td>Copies the file from the server to the local Cisco IOS file system.&lt;br&gt;Specify the username, password, IP address, and filepath of the server.</td>
</tr>
</tbody>
</table>

Example: Configuring SSH File Transfer Protocol

The following example shows how to configure the client-side functionality of SFTP:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh source-interface gigabitethernet 1/0/1
Device(config)# exit
```

CHAPTER 56

X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature uses public key algorithm (PKI) for server and user authentication, and allows the Secure Shell (SSH) protocol to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

This module describes how to configure server and user certificate profiles for a digital certificate.

- Finding Feature Information, on page 1093
- Prerequisites for X.509v3 Certificates for SSH Authentication, on page 1093
- Restrictions for X.509v3 Certificates for SSH Authentication, on page 1094
- Information About X.509v3 Certificates for SSH Authentication, on page 1094
- How to Configure X.509v3 Certificates for SSH Authentication, on page 1095
- Verifying the Server and User Authentication Using Digital Certificates, on page 1098
- Configuration Examples for X.509v3 Certificates for SSH Authentication, on page 1103
- Additional References for X.509v3 Certificates for SSH Authentication, on page 1103
- Feature Information for X.509v3 Certificates for SSH Authentication, on page 1104

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for SSH Authentication feature replaces the ip ssh server authenticate user command with the ip ssh server algorithm authentication command. Configure the default ip ssh server authenticate user command to remove the ip ssh server authenticate user command from the configuration. The IOS secure shell (SSH) server will start using the ip ssh server algorithm authentication command.

When you configure the ip ssh server authenticate user command, the following message is displayed:
SSH command accepted; but this CLI will be deprecated soon. Please move to new CLI `ip ssh server algorithm authentication`. Please configure the “default ip ssh server authenticate user” to make the CLI ineffective.

### Restrictions for X.509v3 Certificates for SSH Authentication

- The X.509v3 Certificates for SSH Authentication feature implementation is applicable only on the Cisco IOS Secure Shell (SSH) server side.
- The Cisco IOS SSH server supports only the x509v3-ssh-rsa algorithm-based certificate for server and user authentication.

### Information About X.509v3 Certificates for SSH Authentication

#### X.509v3 Certificates for SSH Authentication Overview

The Secure Shell (SSH) protocol provides a secure remote access connection to network devices. The communication between the client and server is encrypted.

There are two SSH protocols that use public key cryptography for authentication. The Transport Layer Protocol, uses a digital signature algorithm (called the public key algorithm) to authenticate the server to the client. And the User Authentication Protocol uses a digital signature to authenticate (public key authentication) the client to the server.

The validity of the authentication depends upon the strength of the linkage between the public signing key and the identity of the signer. Digital certificates, such as those in X.509 Version 3 (X.509v3), are used to provide identity management. X.509v3 uses a chain of signatures by a trusted root certification authority and intermediate certificate authorities to bind a public signing key to a specific digital identity. This implementation allows the use of a public key algorithm for server and user authentication, and allows SSH to verify the identity of the owner of a key pair via digital certificates, signed and issued by a Certificate Authority (CA).

#### Server and User Authentication Using X.509v3

For server authentication, the Secure shell (SSH) server sends its own certificate to the SSH client for verification. This server certificate is associated with the trustpoint configured in the server certificate profile (ssh-server-cert-profile-server configuration mode).

For user authentication, the SSH client sends the user's certificate to the IOS SSH server for verification. The SSH server validates the incoming user certificate using public key infrastructure (PKI) trustpoints configured in the server certificate profile (ssh-server-cert-profile-user configuration mode).

By default, certificate-based authentication is enabled for server and user at the IOS SSH server end.
OCSP Response Stapling

The Online Certificate Status Protocol (OCSP) enables applications to determine the (revocation) state of an identified certificate. This protocol specifies the data that needs to be exchanged between an application checking the status of a certificate and the server providing that status. An OCSP client issues a status request to an OCSP responder and suspends acceptance of the certificate until a response is received. An OCSP response at a minimum consists of a responseStatus field that indicates the processing status of the request.

For the public key algorithms, the key format consists of a sequence of one or more X.509v3 certificates followed by a sequence of zero or more OCSP responses.

The X.509v3 Certificate for SSH Authentication feature uses OCSP Response Stapling. By using OCSP response stapling, a device obtains the revocation information of its own certificate by contacting the OCSP server and then stapling the result along with its certificates and sending the information to the peer rather than having the peer contact the OCSP responder.

How to Configure X.509v3 Certificates for SSH Authentication

Configuring Digital Certificates for Server Authentication

SUMMARY STEPS

1. enable
2. configure terminal
3. ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}
4. ip ssh server certificate profile
5. server
6. trustpoint sign PKI-trustpoint-name
7. ocsr-response include
8. end
9. line vty line_number [ending_line_number]
10. transport input ssh

DETAILED STEPS

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 3 | `ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}` | Defines the order of host key algorithms. Only the configured algorithm is negotiated with the Secure Shell (SSH) client. **Note** The IOS SSH server must have at least one configured host key algorithm:  
  - `x509v3-ssh-rsa`—certificate-based authentication  
  - `ssh-rsa`—public key-based authentication |
| Step 4 | `ip ssh server certificate profile` | Configures server and user certificate profiles and enters SSH certificate profile configuration mode. |
| Step 5 | `server` | Configures server certificate profile and enters SSH server certificate profile server configuration mode. **Note** The server profile is used to send out the certificate of the server to the SSH client during server authentication. |
| Step 6 | `trustpoint sign PKI-trustpoint-name` | Attaches the public key infrastructure (PKI) trustpoint to the server certificate profile. **Note** The SSH server uses the certificate associated with this PKI trustpoint for server authentication. |
| Step 7 | `ocsp-response include` | (Optional) Sends the Online Certificate Status Protocol (OCSP) response or OCSP stapling along with the server certificate. **Note** By default, no OCSP response is sent along with the server certificate. |
| Step 8 | `end` | Exits SSH server certificate profile server configuration mode and returns to privileged EXEC mode. |
| Step 9 | `line vty line_number [ending_line_number]` | Enters line configuration mode to configure the virtual terminal line settings. For `line_number` and `ending_line_number`, specify a pair of lines. The range is 0 to 15. |
| Step 10 | `transport input ssh` | Specifies that the Switch prevent non-SSH Telnet connections. This limits the router to only SSH connections. |
# Configuring Digital Certificates for User Authentication

## SUMMARY STEPS

1. enable  
2. configure terminal  
3. `ip ssh server algorithm authentication {publickey | keyboard | password}`  
4. `ip ssh server algorithm publickey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}`  
5. `ip ssh server certificate profile`  
6. user  
7. trustpoint verify PKI-trustpoint-name  
8. ocsp-response required  
9. end  
10. `line vty line_number [ending_line_number]`  
11. `transport input ssh`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | Enables privileged EXEC mode.  
| Example: | • Enter your password if prompted. |
| `enable` | Switch> enable |

| **Step 2** | Enters global configuration mode. |
| Example: | Switch# configure terminal |

| **Step 3** | Defines the order of user authentication algorithms. Only the configured algorithm is negotiated with the Secure Shell (SSH) client.  
| Example: | Switch(config)# ip ssh server algorithm authentication publickey |
| `ip ssh server algorithm authentication {publickey | keyboard | password}` | • The IOS SSH server must have at least one configured user authentication algorithm.  
| | • To use the certificate method for user authentication, the `publickey` keyword must be configured. |

| **Step 4** | Defines the order of public key algorithms. Only the configured algorithm is accepted by the SSH client for user authentication.  
| Example: | Switch(config)# ip ssh server algorithm publickey x509v3-ssh-rsa |
| `ip ssh server algorithm publickey {x509v3-ssh-rsa [ssh-rsa] | ssh-rsa [x509v3-ssh-rsa]}` | The IOS SSH client must have at least one configured public key algorithm:  
| | • `x509v3-ssh-rsa`—Certificate-based authentication  
| | • `ssh-rsa`—Public-key-based authentication |
Verifying the Server and User Authentication Using Digital Certificates

SUMMARY STEPS

1. enable
2. show ip ssh
3. debug ip ssh detail
4. show log
5. debug ip packet
6. show log

DETAILED STEPS

**Step 1**  enable

Enables privileged EXEC mode.

- Enter your password if prompted.

**Example:**

Device> enable

**Step 2**  show ip ssh

Displays the currently configured authentication methods. To confirm the use of certificate-based authentication, ensure that the x509v3-ssh-rsa algorithm is the configured host key algorithm.

**Example:**

Device# show ip ssh

SSH Enabled - version 1.99
Authentication methods:publickey,keyboard-interactive,password
Authentication Publickey Algorithms:x509v3-ssh-rsa,ssh-rsa
Hostkey Algorithms:x509v3-ssh-rsa,ssh-rsa
Authentication timeout: 120 secs; Authentication retries: 3
Minimum expected Diffie Hellman key size : 1024 bits

**Step 3**  debug ip ssh detail

Turns on debugging messages for SSH details.

**Example:**

Device# debug ip ssh detail

ssh detail messages debugging is on

**Step 4**  show log

Shows the debug message log.

**Example:**

Device# show log

Syslog logging: enabled (0 messages dropped, 9 messages rate-limited, 0 flushes, 0 overruns, xml disabled, filtering disabled)

No Active Message Discriminator.
No Inactive Message Discriminator.

- Console logging: disabled

Feature Information for X.509v3 Certificates for SSH Authentication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
### Table 123: Feature Information for X.509v3 Certificates for SSH Authentication

</table>
| X.509v3 Certificates for SSH Authentication| Cisco IOS 15.2(4)E1 | The X.509v3 Certificates for SSH Authentication feature uses the X5.09v3 digital certificates in server and user authentication at the SSH server side. The following commands were introduced or modified: `ip ssh server algorithm hostkey`, `ip ssh server algorithm authentication`, and `ip ssh server certificate profile`. This feature was implemented on the following platforms:  
  - Catalyst 2960C, 2960CX, 2960P, 2960X, and 2960XR Series Switches  
  - Catalyst 3560CX and 3560X Series Switches  
  - Catalyst 3750X Series Switches  
  - Catalyst 4500E Sup7-E, Sup7L-E, Sup8-E, and 4500X Series Switches  
  - Catalyst 4900M, 4900F-E Series Switches |
Feature Information for X.509v3 Certificates for SSH Authentication
Configuring Secure Socket Layer HTTP

This feature provides Secure Socket Layer (SSL) version 3.0 support for the HTTP 1.1 server and HTTP 1.1 client within Cisco IOS software. SSL provides server authentication, encryption, and message integrity to allow secure HTTP communications. SSL also provides HTTP client authentication. HTTP over SSL is abbreviated as HTTPS.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Secure Socket Layer HTTP

Secure HTTP Servers and Clients Overview

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with https:// instead of http://.
SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as trustpoints.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.

- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

When a new certificate is enrolled, the new configuration change is not applied to the HTTPS server until the server is restarted. You can restart the server using either the CLI or by physical reboot. On restarting the server, the switch starts using the new certificate.

If a self-signed certificate has been generated, this information is included in the output of the show running-config privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.
Device# show running-config
Building configuration...

<output truncated>
You can remove this self-signed certificate by disabling the secure HTTP server and entering the no crypto pki trustpoint TP-self-signed-30890755072 global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

---

The values that follow TP self-signed depend on the serial number of the device.

---

You can use an optional command (ip http secure-client-auth) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

### CipherSuites

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL_RSA_WITH_DES_CBC_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. SSL_RSA_WITH_DES_CBC_SHA—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest

2. SSL_RSA_WITH_NULL_SHA key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
3. **SSL_RSA_WITH_NULL_MD5** key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).

4. **SSL_RSA_WITH_RC4_128_MD5**—RSA key exchange with RC4 128-bit encryption and MD5 for message digest

5. **SSL_RSA_WITH_RC4_128_SHA**—RSA key exchange with RC4 128-bit encryption and SHA for message digest

6. **SSL_RSA_WITH_3DES_EDE_CBC_SHA**—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest

7. **SSL_RSA_WITH_AES_128_CBC_SHA**—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).

8. **SSL_RSA_WITH_AES_256_CBC_SHA**—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

9. **SSL_RSA_WITH_DHE_AES_128_CBC_SHA**—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).

10. **SSL_RSA_WITH_DHE_AES_256_CBC_SHA**—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

---

**Note**

The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

---

**Default SSL Configuration**

- The standard HTTP server is enabled.
- SSL is enabled.
- No CA trustpoints are configured.
- No self-signed certificates are generated.

---

**SSL Configuration Guidelines**

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.
How to Configure Secure Socket Layer HTTP

Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter https://URL, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

```
https://209.165.129:1026
```

or

```
https://host.domain.com:1026
```

The existing `ip http access-class access-list-number` command for specifying the access-list (Only IPv4 ACLs) is going to be deprecated. You can still use this command to specify an access list to allow access to the HTTP server. Two new commands have been introduced to enable support for specifying IPv4 and IPv6 ACLs. These are `ip http access-class ipv4 access-list-name | access-list-number` for specifying IPv4 ACLs and `ip http access-class ipv6 access-list-name` for specifying IPv6 ACLs. We recommend using the new CLI to avoid receiving warning messages.

Note the following considerations for specifying access-lists:

- If you specify an access-list that does not exist, the configuration takes place but you receive the below warning message:
  
  `ACL being attached does not exist, please configure it`

- If you use the `ip http access-class` command for specifying an access-list for the HTTP server, the below warning message appears:
  
  `This CLI will be deprecated soon, Please use new CLI ip http access-class ipv4/ipv6 <access-list-name>| <access-list-number>`

- If you use `ip http access-class ipv4 access-list-name | access-list-number` or `ip http access-class ipv6 access-list-name`, and an access-list was already configured using `ip http access-class`, the below warning message appears:
  
  `Removing ip http access-class <access-list-number>`
ip http access-class access-list-number and ip http access-class ipv4 access-list-name | access-list-number share the same functionality. Each command overrides the configuration of the previous command. The following combinations between the configuration of the two commands explain the effect on the running configuration:

- If ip http access-class access-list-number is already configured and you try to configure using ip http access-class ipv4 access-list-number command, the configuration of ip http access-class access-list-number will be removed and the configuration of ip http access-class ipv4 access-list-number will be added to the running configuration.

- If ip http access-class access-list-number is already configured and you try to configure using ip http access-class ipv4 access-list-name command, the configuration of ip http access-class access-list-number will be removed and the configuration of ip http access-class ipv4 access-list-name will be added to the running configuration.

- If ip http access-class ipv4 access-list-number is already configured and you try to configure using ip http access-class access-list-name, the configuration of ip http access-class ipv4 access-list-number will be removed from configuration and the configuration of ip http access-class access-list-name will be added to the running configuration.

- If ip http access-class ipv4 access-list-name is already configured and you try to configure using ip http access-class access-list-number, the configuration of ip http access-class ipv4 access-list-name will be removed from the configuration and the configuration of ip http access-class access-list-number will be added to the running configuration.

**SUMMARY STEPS**

1. show ip http server status
2. configure terminal
3. ip http secure-server
4. ip http secure-port port-number
5. ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
6. ip http secure-client-auth
7. ip http secure-trustpoint name
8. ip http path path-name
9. ip http access-class access-list-number
10. ip http access-class { ipv4 {access-list-number | access-list-name} | ipv6 {access-list-name} }
11. ip http max-connections value
12. ip http timeout-policy idle seconds life seconds requests value
13. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** show ip http server status | (Optional) Displays the status of the HTTP server to determine if the secure HTTP server feature is supported in the software. You should see one of these lines in the output:  
Device# show ip http server status |
<table>
<thead>
<tr>

<td>10</td>
<td>`ip http access-class { ipv4 {access-list-number</td>
<td>access-list-name}</td>
</tr>
<tr>
<td>11</td>
<td><code>ip http max-connections value</code></td>
<td>(Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. We recommend that the value be at least 10 and not less. This is required for the UI to function as expected.</td>
</tr>
</tbody>
</table>
| 12   | `ip http timeout-policy idle seconds life seconds requests requests value` | (Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances:  
  - **idle**—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes).  
  - **life**—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds.  
  - **requests**—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1. |
| 13   | `end` | Returns to privileged EXEC mode. |

### Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:
Before you begin

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.

SUMMARY STEPS

1. configure terminal
2. ip http client secure-trustpoint name
3. ip http client secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
4. end

DETAILED STEPS

<table>

Configuring a CA Trustpoint

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:
SUMMARY STEPS

1. configure terminal
2. hostname hostname
3. ip domain-name domain-name
4. crypto key generate rsa
5. crypto ca trustpoint name
6. enrollment url url
7. enrollment http-proxy host-name port-number
8. crl query url
9. primary name
10. exit
11. crypto ca authentication name
12. crypto ca enroll name
13. end

Configuration Examples for Secure Socket Layer HTTP

Example: Configuring Secure Socket Layer HTTP

The following example shows a configuration session in which the secure HTTP server is enabled, the port for the secure HTTP server is configured as 1025, and the remote CA trustpoint server “CA-trust-local” is used for certification.

```
Device# show ip http server status
HTTP server status: Disabled
HTTP server port: 80
HTTP server authentication method: enable
HTTP server access class: 0
HTTP server base path:    
Maximum number of concurrent server connections allowed: 5
Server idle time-out: 600 seconds
Server life time-out: 600 seconds
Maximum number of requests allowed on a connection: 1
HTTP secure server capability: Present
HTTP secure server status: Disabled
HTTP secure server port: 443
HTTP secure server ciphersuite: 3des-ede-cbc-sha des-cbc-sha rc4-128-md5 rc4-12a
HTTP secure server client authentication: Disabled
HTTP secure server trustpoint:    

Device# configure terminal
Device(config)# ip http secure-server
Device(config)# ip http client secure-trustpoint CA-trust-local
Device(config)# ip http secure-port 1024
Invalid secure port value.
Device(config)# ip http secure-port 1025
Device(config)# ip http secure-ciphersuite rc4-128-sha rc4-128-md5
Device(config)# end

Device# show ip http serversecure status
```
HTTP secure server status: Enabled
HTTP secure server port: 1025
HTTP secure server cipher suite: rc4-128-md5 rc4-128-sha
HTTP secure server client authentication: Disabled
HTTP secure server trustpoint: CA-trust-local

In the following example, the CA trustpoint CA-trust-local is specified, and the HTTPS client is configured to use this trustpoint for client authentication requests:

Device# config terminal
Device(config)# crypto ca trustpoint CA-trust-local
Device(ca-trustpoint)# enrollment url http://example.com
Device(ca-trustpoint)# crl query ldap://example.com
Device(ca-trustpoint)# primary
Device(ca-trustpoint)# exit
Device(config)# ip http client secure-trustpoint CA-trust-local
Device(config)# end
Device# copy running-config startup-config

Glossary

**RSA**—RSA is a widely used Internet encryption and authentication system that uses public and private keys for encryption and decryption. The RSA algorithm was invented in 1978 by Ron Rivest, Adi Shamir, and Leonard Adleman. The abbreviation RSA comes from the first letter of the last names of the three original developers. The RSA algorithm is included in many applications, such as the web browsers from Microsoft and Netscape. The RSA encryption system is owned by RSA Security.

**SHA**—The Secure Hash Algorithm. SHA was developed by NIST and is specified in the Secure Hash Standard (SHS, FIPS 180). Often used as an alternative to Digest 5 algorithm.

**signatures, digital**—In the context of SSL, “signing” means to encrypt with a private key. In digital signing, one-way hash functions are used as input for a signing algorithm. In RSA signing, a 36-byte structure of two hashes (one SHA and one MD5) is signed (encrypted with the private key).

**SSL 3.0**—Secure Socket Layer version 3.0. SSL is a security protocol that provides communications privacy over the Internet. The protocol allows client and server applications to communicate in a way that is designed to prevent eavesdropping, tampering, or message forgery. SSL uses a program layer located between the Internet’s HTTP and TCP layers. SSL is included as part of most web server products and as part of most Internet browsers. The SSL 3.0 specification can be found at https://tools.ietf.org/html/rfc6101.
Certification Authority Interoperability

This chapter describes how to configure certification authority (CA) interoperability, which is provided in support of the IPSec protocol. CA interoperability permits Cisco IOS devices and CAs to communicate so that your Cisco IOS device can obtain and use digital certificates from the CA. Although IPSec can be implemented in your network without the use of a CA, using a CA provides manageability and scalability for IPSec.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites For Certification Authority

You need to have a certification authority (CA) available to your network before you configure this interoperability feature. The CA must support the Public Key Infrastructure (PKI) protocol, and the Simple Certificate Enrollment Protocol (SCEP).

Restrictions for Certification Authority

When configuring your CA, the following restrictions apply:
• This feature should be configured only when you also configure both IPsec and Internet Key Exchange (IKE) in your network.
• The Cisco IOS software does not support CA server public keys greater than 2048 bits.

Information About Certification Authority

CA Supported Standards

Without certification authority (CA) interoperability, Cisco IOS devices could not use CAs when deploying IPsec. CAs provide a manageable, scalable solution for IPSec networks.

Cisco supports the following standards with this feature:

• IPSec—IPSec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer; it uses Internet Key Exchange to handle negotiation of protocols and algorithms based on local policy, and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.
• Internet Key Exchange (IKE)—A hybrid protocol that implements Oakley and Skeme key exchanges inside the Internet Security Association Key Management Protocol (ISAKMP) framework. Although IKE can be used with other protocols, its initial implementation is with the IPsec protocol. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.
• Public-Key Cryptography Standard #7 (PKCS #7)—A standard from RSA Data Security, Inc., used to encrypt and sign certificate enrollment messages.
• Public-Key Cryptography Standard #10 (PKCS #10)—A standard syntax from RSA Data Security, Inc. for certificate requests.
• RSA Keys—RSA is the public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. RSA keys come in pairs: one public key and one private key.
• X.509v3 certificates—Certificate support that allows the IPsec-protected network to scale by providing the equivalent of a digital ID card to each device. When two devices wish to communicate, they exchange digital certificates to prove their identity (thus removing the need to manually exchange public keys with each peer or to manually specify a shared key at each peer). These certificates are obtained from a CA. X.509 is part of the X.500 standard of the ITU.

Purpose of CAs

Certificate authorities (CAs) are responsible for managing certificate requests and issuing certificates to participating IPsec network devices. These services provide centralized key management for the participating devices.

CAs simplify the administration of IPsec network devices. You can use a CA with a network containing multiple IPsec-compliant devices such as routers.

Digital signatures, enabled by public key cryptography, provide a means of digitally authenticating devices and individual users. In public key cryptography, such as the RSA encryption system, each user has a key pair containing both a public and a private key. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other. In simple terms, a signature is formed when data is encrypted with a user's private key. The receiver verifies the signature by decrypting the message with the sender's public
key. The fact that the message could be decrypted using the sender's public key indicates that the holder of the private key, the sender, must have created the message. This process relies on the receiver's having a copy of the sender's public key and knowing with a high degree of certainty that it really does belong to the sender and not to someone pretending to be the sender.

Digital certificates provide the link. A digital certificate contains information to identify a user or device, such as the name, serial number, company, department, or IP address. It also contains a copy of the entity's public key. The certificate is itself signed by a certification authority (CA), a third party that is explicitly trusted by the receiver to validate identities and to create digital certificates.

In order to validate the signature of the CA, the receiver must first know the CA's public key. Normally this process is handled out-of-band or through an operation done at installation. For instance, most web browsers are configured with the public keys of several CAs by default. The Internet Key Exchange (IKE), an essential component of IPSec, can use digital signatures to scalably authenticate peer devices before setting up security associations.

Without digital signatures, one must manually exchange either public keys or secrets between each pair of devices that use IPSec to protect communications between them. Without certificates, every new device added to the network requires a configuration change on every other device with which it communicates securely. With digital certificates, each device is enrolled with a certification authority. When two devices wish to communicate, they exchange certificates and digitally sign data to authenticate each other. When a new device is added to the network, one simply enrolls that device with a CA, and none of the other devices needs modification. When the new device attempts an IPSec connection, certificates are automatically exchanged and the device can be authenticated.

### Implementing IPsec Without CAs

Without a CA, if you want to enable IPSec services (such as encryption) between two Cisco devices, you must first ensure that each device has the key of the other device (such as an RSA public key or a shared key). This requirement means that you must manually perform one of the following operations:

- At each device, enter the RSA public key of the other device.
- At each device, specify a shared key to be used by both device.

In the above illustration, each device uses the key of the other device to authenticate the identity of the other device; this authentication always occurs when IPSec traffic is exchanged between the two devices.

If you have multiple Cisco devices in a mesh topology and wish to exchange IPsec traffic passing among all of those devices, you must first configure shared keys or RSA public keys among all of those devices.

Every time a new device is added to the IPsec network, you must configure keys between the new device and each of the existing devices. (In Figure 34, four additional two-part key configurations would be required to add a single encrypting device to the network.)

Consequently, the more devices there are that require IPSec services, the more involved the key administration becomes. This approach does not scale well for larger, more complex encrypting networks.

### Implementing IPsec With CAs

With a CA, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA, requesting a certificate for the device. When this has been accomplished, each participating device can dynamically authenticate all the other participating devices. This process is illustrated in the illustration.
To add a new IPsec device to the network, you need only configure that new device to request a certificate from the CA, instead of making multiple key configurations with all the other existing IPsec devices.

**Implementing IPsec with Multiple Root CAs**

With multiple root CAs, you no longer have to enroll a device with the CA that issued a certificate to a peer. Instead, you configure a device with multiple CAs that it trusts. Thus, a device can use a configured CA (a trusted root) to verify certificates offered by a peer that were not issued by the same CA defined in the identity of the device.

Configuring multiple CAs allows two or more devices enrolled under different domains (different CAs) to verify the identity of each other when using IKE to set up IPsec tunnels.

Through Simple Certificate Enrollment Protocol (SCEP), each device is configured with a CA (the enrollment CA). The CA issues a certificate to the device that is signed with the private key of the CA. To verify the certificates of peers in the same domain, the device is also configured with the root certificate of the enrollment CA.

To verify the certificate of a peer from a different domain, the root certificate of the enrollment CA in the domain of the peer must be configured securely in the device.

During Internet Key Exchange (IKE) phase one signature verification, the initiator will send the responder a list of its CA certificates. The responder should send the certificate issued by one of the CAs in the list. If the certificate is verified, the device saves the public key contained in the certificate on its public key ring.

With multiple root CAs, VPN users can establish trust in one domain and easily and securely distribute it to other domains. Thus, the required private communication channel between entities authenticated under different domains can occur.

**How CA Certificates Are Used by IPsec Devices**

When two IPsec devices want to exchange IPsec-protected traffic passing between them, they must first authenticate each other—otherwise, IPsec protection cannot occur. The authentication is done with IKE.

Without a CA, a device authenticates itself to the remote device using either RSA-encrypted nonces or preshared keys. Both methods require that keys must have been previously configured between the two devices.

With a CA, a device authenticates itself to the remote device by sending a certificate to the remote device and performing some public key cryptography. Each device must send its own unique certificate that was issued and validated by the CA. This process works because the certificate of each device encapsulates the public key of the device, each certificate is authenticated by the CA, and all participating devices recognize the CA as an authenticating authority. This scheme is called IKE with an RSA signature.

Your device can continue sending its own certificate for multiple IPsec sessions, and to multiple IPsec peers until the certificate expires. When its certificate expires, the device administrator must obtain a new one from the CA.

CAs can also revoke certificates for devices that will no longer participate in IPsec. Revoked certificates are not recognized as valid by other IPsec devices. Revoked certificates are listed in a certificate revocation list (CRL), which each peer may check before accepting a certificate from another peer.
Registration Authorities

Some CAs have a registration authority (RA) as part of their implementation. An RA is essentially a server that acts as a proxy for the CA so that CA functions can continue when the CA is offline.

Some of the configuration tasks described in this document differ slightly, depending on whether your CA supports an RA.

How to Configure Certification Authority

Managing NVRAM Memory Usage

Certificates and certificate revocation lists (CRLs) are used by your device when a CA is used. Normally certain certificates and all CRLs are stored locally in the NVRAM of the device, and each certificate and CRL uses a moderate amount of memory.

The following certificates are normally stored at your device:

- Certificate of your device
- Certificate of the CA
- Root certificates obtained from CA servers (all root certificates are saved in RAM after the device has been initialized)
- Two registration authority (RA) certificates (only if the CA supports an RA)

CRLs are normally stored at your device according to the following conditions:

- If your CA does not support an RA, only one CRL gets stored in the device.
- If your CA supports an RA, multiple CRLs can be stored in the device.

In some cases, storing these certificates and CRLs locally will not present any difficulty. In other cases, memory might become a problem—particularly if the CA supports an RA and a large number of CRLs have to be stored on the device. If the NVRAM is too small to store root certificates, only the fingerprint of the root certificate is saved.

To save NVRAM space, specify that certificates and CRLs should not be stored locally, but should be retrieved from the CA when needed. This alternative will save NVRAM space but could result in a slight performance impact. To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode.

If you do not enable query mode now, you can do it later even if certificates and CRLs have already been stored on the device. In this case, when you enable query mode, the stored certificates and CRLs are deleted from the device after you save the configuration. (If you copy the configuration to a TFTP site prior to enabling query mode, you can save any stored certificates and CRLs at the TFTP site.)

Before disabling query mode, perform the `copy system:running-config nvram:startup-config` command to save all current certificates and CRLs to NVRAM. Otherwise they could be lost during a reboot.

To specify that certificates and CRLs should not be stored locally on your device, but should be retrieved when required, enable query mode by using the following command in global configuration mode:

```
query mode
```

Note

Query mode may affect availability if the CA is down.
SUMMARY STEPS

1. crypto ca certificate query

DETAILED STEPS

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Step 1 crypto ca certificate query</td>
<td>Enables query mode, which causes certificates and CRLs not to be stored locally.</td>
</tr>
<tr>
<td>Example: device(config)# crypto ca certificate query</td>
<td></td>
</tr>
</tbody>
</table>

Configuring the Device Host Name and IP Domain Name

You must configure the host name and IP domain name of a device if this has not already been done. This is required because the device assigns a fully qualified domain name (FQDN) to the keys and certificates used by IPsec, and the FQDN is based on the host name and IP domain name assigned to the device. For example, a certificate named "device20.example.com" is based on a device host name of "device20" and a device IP domain name of "example.com".

SUMMARY STEPS

1. enable
2. configure terminal
3. hostname name
4. ip domain-name name
5. end

DETAILED STEPS

<tr>
<td><strong>Step 7</strong> end</td>
<td>Exits CA trustpoint configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(ca-trustpoint)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Authenticating the CA

The device must authenticate the certification authority (CA). It does this by obtaining the self-signed certificate of the CA, which contains the public key of the CA. Because the certificate of the CA is self-signed (the CA signs its own certificate) the public key of the CA should be manually authenticated by contacting the CA administrator to compare the fingerprint of the CA certificate when you perform this step.

Perform the following task to get the public key of the CA:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto pki authenticate name
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
Requesting Signed Certificates

You must obtain a signed certificate from the certification authority (CA) for each of the RSA key pairs on your device. If you generated general-purpose RSA keys, your device has only one RSA key pair and needs only one certificate. If you previously generated special-usage RSA keys, your device has two RSA key pairs and needs two certificates.

Perform the following task to request signed certificates from the CA:

### Note
If your device reboots after you have issued the `crypto pki enroll` command, but before you have received the certificates, you must reissue the command and notify the CA administrator.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto pki enroll number`
4. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>

</tbody>
</table>
Monitoring and Maintaining Certification Authority

REQUESTING A CERTIFICATE REVOCAUTION LIST

You can request a certificate revocation list (CRL) only if the certification authority (CA) does not support a registration authority (RA). The following task applies only when the CA does not support an RA.

When a device receives a certificate from a peer, your device will download a CRL from the CA. The device then checks the CRL to make sure the certificate that the peer sent has not been revoked. (If the certificate appears on the CRL, the device will not accept the certificate and will not authenticate the peer.)

A CRL can be reused with subsequent certificates until the CRL expires if query mode is off. If the device receives a peer’s certificate after the applicable CRL has expired, the device will download the new CRL.

If the device has a CRL that has not yet expired, but you suspect that the contents of the CRL are out of date, you can request that the latest CRL be downloaded immediately to replace the old CRL.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto pki crl request name
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
Querying a Certification Revocation List

You can query a certificate revocation list (CRL) only when you configure your device with a trusted root. When your device receives a certificate from a peer from another domain (with a different CA), the CRL downloaded from the CA of the device will not include certificate information about the peer. Therefore, you should check the CRL published by the configured root with the LDAP URL to ensure that the certificate of the peer has not been revoked.

If you would like CRL of the root certificate to be queried when the device reboots, you must enter the `crl query` command.

Perform the following task to query the CRL published by the configured root with the LDAP URL:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `crypto pki trustpoint name`
4. `crl query ldap://url:[port]`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
Deleting RSA Keys from a Device

Under certain circumstances you may want to delete RSA keys from your device. For example, if you believe the RSA keys were compromised in some way and should no longer be used, you should delete the keys.

SUMMARY STEPS

1. enable
2. configure terminal
3. crypto key zeroize rsa [key-pair-label]
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
Example:  
Device> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
| **Step 3** crypto key zeroize rsa [key-pair-label] | Deletes all Rivest, Shamir, and Adelman (RSA) keys from your device.  
Example:  
Device(config)# crypto key zeroize rsa |
| **Step 4** end | Exits global configuration mode and returns to privileged EXEC mode.  
Example:  
Device(config)# end |
What to do next

After you delete RSA keys from the device, you should also complete the following two additional tasks:

- Ask the CA administrator to revoke the device certificates at the CA; you must supply the challenge password that you created when you originally obtained the device certificates with the `crypto pki enroll` command.
- Manually remove the device certificates from the device configuration.

Deleting Public Keys for a Peer

Under certain circumstances you may want to delete RSA public keys of peer devices from your device configuration. For example, if you no longer trust the integrity of the public key of a peer, you should delete the key.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `crypto key pubkey-chain rsa`
4. `no named key key-name [encryption | signature]`
5. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

</tr>
<tr>
<td></td>
<td>Example:</td>
<td>mode.</td>
</tr>
<tr>
<td></td>
<td><code>Device(config-pubkey)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Deleting Certificates from the Configuration

If the need arises, you can delete certificates that are saved in your device. Your devices saves its own certificates, the certificate of the CA, and any RA certificates.

To delete the CA's certificate, you must remove the entire CA identity, which also removes all certificates associated with the CA—your router's certificate, the CA certificate, and any RA certificates.

**SUMMARY STEPS**

1. enable
2. show crypto pki certificates
3. configure terminal
4. crypto pki certificate chain *name*
5. no certificate *certificate-serial-number*
6. exit
7. no crypto pki import *name certificate*
8. exit

Access Control List Overview

Access lists filter network traffic by controlling the forwarding or blocking of packets at the interface of a device. A device examines each packet to determine whether to forward or drop that packet, based on the criteria specified in access lists.

The criteria that can be specified in an access list include the source address of the traffic, the destination address of the traffic, and the upper-layer protocol.

Some users might successfully evade basic access lists because these lists require no authentication.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Access Control Lists

Definition of an Access List

An access list is a sequential list consisting of at least one permit statement and possibly one or more deny statements. In the case of IP access lists, the statements can apply to IP addresses, upper-layer IP protocols, or other fields in IP packets. The access list is identified and referenced by a name or a number. Access list acts as a packet filter, filtering packets based on the criteria defined in the access list.
An access list may be configured, but it does not take effect until the access list is either applied to an interface, a virtual terminal line (vty), or referenced by some command that accepts an access list. Multiple commands can reference the same access list.

The following configuration example shows how to create an IP access list named branchoffices. The ACL is applied to serial interface 0 on incoming packets. No sources other than those on the networks specified by each source address and mask pair can access this interface. The destinations for packets coming from sources on network 172.20.7.0 are unrestricted. The destination for packets coming from sources on network 172.29.2.0 must be 172.25.5.4.

```
ip access-list extended branchoffices
  10 permit 172.20.7.0 0.0.0.3 any
  20 permit 172.29.2.0 0.0.0.255 host 172.25.5.4
!
interface serial 0
  ip access-group branchoffices in
```

**Functions of an Access Control List**

There are many reasons to configure access lists; for example, to restrict contents of routing updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide security for your network, which is the focus of this module.

Use access lists to provide a basic level of security for accessing your network. If you do not configure access lists on your device, all packets passing through the device are allowed access to all parts of your network.

Access lists can allow a host to access a part of your network and prevent another host from accessing the same area. In the figure below, Host A is allowed to access the Human Resources network, but Host B is prevented from accessing the Human Resources network.

You can also use access lists to define the type of traffic that is forwarded or blocked at device interfaces. For example, you can permit e-mail traffic to be routed but at the same time block all Telnet traffic.

**Purpose of IP Access Lists**

Access lists perform packet filtering to control which packets move through the network and where. Such control can help limit network traffic and restrict the access of users and devices to the network. Access lists have many uses, and therefore many commands accept a reference to an access list in their command syntax. Access lists can be used to do the following:

- Filter incoming packets on an interface.
- Filter outgoing packets on an interface.
- Restrict the contents of routing updates.
- Limit debug output based on an address or protocol.
- Control virtual terminal line access.
- Identify or classify traffic for advanced features, such as congestion avoidance, congestion management, and priority and custom queuing.
- Trigger dial-on-demand routing (DDR) calls.
Reasons to Configure ACLs

There are many reasons to configure access lists; for example, you can use access lists to restrict contents of switching updates or to provide traffic flow control. One of the most important reasons to configure access lists is to provide a basic level of security for your network by controlling access to it. If you do not configure access lists on your device, all packets passing through the device could be allowed onto all parts of your network.

An access list can allow one host to access a part of your network and prevent another host from accessing the same area. For example, by applying an appropriate access list to interfaces of a device, Host A is allowed to access the human resources network and Host B is prevented from accessing the human resources network.

You can use access lists on a device that is positioned between two parts of your network, to control traffic entering or exiting a specific part of your internal network.

To provide some security benefits of access lists, you should at least configure access lists on border devices—devices located at the edges of your networks. Such an access list provides a basic buffer from the outside network or from a less controlled area of your own network into a more sensitive area of your network.

On these border devices, you should configure access lists for each network protocol configured on the device interfaces. You can configure access lists so that inbound traffic or outbound traffic or both are filtered on an interface.

Access lists are defined on a per-protocol basis. In other words, you should define access lists for every protocol enabled on an interface if you want to control traffic flow for that protocol.

Software Processing of an Access List

The following general steps describe how the an access list is processed when it is applied to an interface, a vty, or referenced by any command. These steps apply to an access list that has 13 or fewer access list entries.

- The software receives an IP packet and tests parts of each packet being filtered against the conditions in the access list, one condition (permit or deny statement) at a time. For example, the software tests the source and destination addresses of the packet against the source and destination addresses in a permit or deny statement.

- If a packet does not match an access list statement, the packet is then tested against the next statement in the list.

- If a packet and an access list statement match, the rest of the statements in the list are skipped and the packet is permitted or denied as specified in the matched statement. The first entry that the packet matches determines whether the software permits or denies the packet. That is, after the first match, no subsequent entries are considered.

- If the access list denies a packet, the software discards the packet and returns an Internet Control Message Protocol (ICMP) Host Unreachable message.

- If no conditions match, the software drops the packet. This is because each access list ends with an unwritten, implicit deny statement. That is, if the packet has not been permitted by the time it was tested against each statement, it is denied.

An access list with more than 13 entries is processed using a trie-based lookup algorithm. This process will happen automatically; it does not need to be configured.
Access List Rules

The following rules apply to access control lists (ACLs):

• Only one access list per interface, per protocol, and per direction is allowed.

• An access list must contain at least one permit statement or all packets are denied entry into the network.

• The order in which access list conditions or match criteria are configured is important. While deciding whether to forward or block a packet, Cisco software tests the packet against each criteria statement in the order in which these statements are created. After a match is found, no more criteria statements are checked. The same permit or deny statements specified in a different order can result in a packet being passed under one circumstance and denied in another circumstance.

• If an access list is referenced by a name, but the access list does not exist, all packets pass. An interface or command with an empty access list applied to it permits all traffic into the network.

• Standard access lists and extended access lists cannot have the same name.

• Inbound access lists process packets before packets are sent to an outbound interface. Inbound access lists that have filtering criteria that deny packet access to a network saves the overhead of a route lookup. Packets that are permitted access to a network based on the configured filtering criteria are processed for routing. For inbound access lists, when you configure a permit statement, packets are processed after they are received, and when you configure a deny statement, packets are discarded.

• Outbound access lists process packets before they leave the device. Incoming packets are routed to the outbound interface and then processed by the outbound access list. For outbound access lists, when you configure a permit statement, packets are sent to the output buffer, and when you configure a deny statement, packets are discarded.

• An access list can control traffic arriving at a device or leaving a device, but not traffic originating at a device.

Helpful Hints for Creating IP Access Lists

The following tips will help you avoid unintended consequences and help you create more efficient access lists.

• Create the access list before applying it to an interface (or elsewhere), because if you apply a nonexistent access list to an interface and then proceed to configure the access list, the first statement is put into effect, and the implicit deny statement that follows could cause you immediate access problems.

• Another reason to configure an access list before applying it is because an interface with an empty access list applied to it permits all traffic.

• All access lists need at least one permit statement; otherwise, all packets are denied and no traffic passes.

• Because the software stops testing conditions after it encounters the first match (to either a permit or deny statement), you will reduce processing time and resources if you put the statements that packets are most likely to match at the beginning of the access list. Place more frequently occurring conditions before less frequent conditions.

• Organize your access list so that more specific references in a network or subnet appear before more general ones.
• Use the statement **permit any any** if you want to allow all other packets not already denied. Using the statement **permit any any** in effect avoids denying all other packets with the implicit deny statement at the end of an access list. Do not make your first access list entry **permit any any** because all traffic will get through; no packets will reach the subsequent testing. In fact, once you specify **permit any any**, all traffic not already denied will get through.

• Although all access lists end with an implicit **deny** statement, we recommend use of an explicit **deny** statement (for example, **deny ip any any**). On most platforms, you can display the count of packets denied by issuing the **show access-list** command, thus finding out more information about who your access list is disallowing. Only packets denied by explicit **deny** statements are counted, which is why the explicit **deny** statement will yield more complete data for you.

• While you are creating an access list or after it is created, you might want to delete an entry.
  • You cannot delete an entry from a numbered access list; trying to do so will delete the entire access list. If you need to delete an entry, you need to delete the entire access list and start over.
  • You can delete an entry from a named access list. Use the **no permit** or **no deny** command to delete the appropriate entry.

• In order to make the purpose of individual statements more scannable and easily understood at a glance, you can write a helpful remark before or after any statement by using the **remark** command.

• If you want to deny access to a particular host or network and find out if someone from that network or host is attempting to gain access, include the **log** keyword with the corresponding **deny** statement so that the packets denied from that source are logged for you.

• This hint applies to the placement of your access list. When trying to save resources, remember that an inbound access list applies the filter conditions before the routing table lookup. An outbound access list applies the filter conditions after the routing table lookup.

### IP Packet Fields You Can Filter to Control Access

You can use an extended access list to filter on any of the following fields in an IP packet. Source address and destination address are the two most frequently specified fields on which to base an access list:

- **Source address**—Specifies a source address to control packets coming from certain networking devices or hosts.

- **Destination address**—Specifies a destination address to control packets being sent to certain networking devices or hosts.

- **Protocol**—Specifies an IP protocol indicated by the keyword **eigrp, gre, icmp, igmp, ip, ipinip, nos, ospf, tcp, or udp**, or indicated by an integer in the range from 0 to 255 (representing an Internet protocol). If you specify a transport layer protocol (**icmp, igmp, tcp, or udp**), the command has a specific syntax.
  • Ports and non-contiguous ports—Specifies TCP or UDP ports by a port name or port number. The port numbers can be noncontiguous port numbers. Port numbers can be useful to filter Telnet traffic or HTTP traffic, for example.
  • TCP flags—Specifies that packets match any flag or all flags set in TCP packets. Filtering on specific TCP flags can help prevent false synchronization packets.

- **IP options**—Specifies IP options; one reason to filter on IP options is to prevent routers from being saturated with spurious packets containing them.
Source and Destination Addresses

Source and destination address fields in an IP packet are two typical fields on which to base an access list. Specify source addresses to control the packets being sent from certain networking devices or hosts. Specify destination addresses to control the packets being sent to certain networking devices or hosts.

Wildcard Mask for Addresses in an Access List

Address filtering uses wildcard masking to indicate to the software whether to check or ignore corresponding IP address bits when comparing the address bits in an access list entry to a packet being submitted to the access list. By carefully setting wildcard masks, you can specify one or more IP addresses for permit or deny tests.

Wildcard masking for IP address bits uses the number 1 and the number 0 to specify how the software treats the corresponding IP address bits. A wildcard mask is sometimes referred to as an inverted mask because a 1 and 0 mean the opposite of what they mean in a subnet (network) mask.

- A wildcard mask bit 0 means check the corresponding bit value; they must match.
- A wildcard mask bit 1 means ignore that corresponding bit value; they need not match.

If you do not supply a wildcard mask with a source or destination address in an access list statement, the software assumes an implicit wildcard mask of 0.0.0.0, meaning all values must match.

Unlike subnet masks, which require contiguous bits indicating network and subnet to be ones, wildcard masks allow noncontiguous bits in the mask.

The table below shows examples of IP addresses and masks from an access list, along with the corresponding addresses that are considered a match.

<table>
<thead>
<tr>
<th>Address</th>
<th>Wildcard Mask</th>
<th>Match Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>255.255.255</td>
<td>All addresses will match the access list conditions.</td>

<td>Only subnet 172.18.8.15/30 matches</td>
</tr>
<tr>
<td>10.1.2.0</td>
<td>0.254.255 (noncontiguous bits in mask)</td>
<td>Matches any even-numbered network in the range of 10.1.2.0 to 10.1.254.0</td>
</tr>
</tbody>
</table>

Access List Sequence Numbers

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within
an access list. If you wanted to insert an entry in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When you add a new entry, you specify the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

**ACL Supported Types**

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

**Supported ACLs**

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply port ACLs to a Layer 2 interface in each direction to each access list type — IPv4 and MAC.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- VLAN ACLs or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

**ACL Precedence**

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
• When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

• When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface only in inbound direction. The following access lists are supported:

• Standard IP access lists using source addresses

• Extended IP access lists using source and destination addresses and optional protocol type information

• MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

Figure 87: Using ACLs to Control Traffic in a Network

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.
You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

### Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

### Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies `permit` or `deny` and a set of conditions the packet must satisfy in order to match the ACE. The meaning of `permit` or `deny` depends on the context in which the ACL is used.

### ACEs and Fragmented and Unfragmented Traffic

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.

For TCP ACEs with L4 Ops, the fragmented packets will be dropped per RFC 1858.
• Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:

Device(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Device(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Device(config)# access-list 102 permit tcp any host 10.1.1.2
Device(config)# access-list 102 deny tcp any any

Note

In the first and second ACEs in the examples, the \texttt{eq} keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

• Packet A is a TCP packet from host 10.2.2.2., port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

• Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit). Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

• Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.
CHAPTER 60

Configuring IPv4 Access Control Lists

Access control lists (ACLs) perform packet filtering to control which packets move through the network and where. Such control provides security by helping to limit network traffic, restrict the access of users and devices to the network, and prevent traffic from leaving a network. IP access lists can reduce the chance of spoofing and denial-of-service attacks and allow dynamic, temporary user access through a firewall.

IP access lists can also be used for purposes other than security, such as bandwidth control, restricting the content of routing updates, redistributing routes, triggering dial-on-demand (DDR) calls, limiting debug output, and identifying or classifying traffic for quality of service (QoS) features. This module provides an overview of IP access lists.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring IPv4 Access Control Lists

This section lists the prerequisites for configuring network security with access control lists (ACLs).
• On switches running the LAN base feature set, VLAN maps are supported.

Restrictions for Configuring IPv4 Access Control Lists

General Network Security
The following are restrictions for configuring network security with ACLs:
• Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name.
• A standard ACL and an extended ACL cannot have the same name.
• Though visible in the command-line help strings, `appletalk` is not supported as a matching condition for the `deny` and `permit` MAC access-list configuration mode commands.
• ACL wildcard is not supported in downstream client policy.

IPv4 ACL Network Interfaces
The following restrictions apply to IPv4 ACLs to network interfaces:
• When controlling access to an interface, you can use a named or numbered ACL.
• If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.
• You do not have to enable routing to apply ACLs to Layer 2 interfaces.

MAC ACLs on a Layer 2 Interface
After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:
• You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
• A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

Note
The `mac access-group` interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

IP Access List Entry Sequence Numbering
• This feature does not support dynamic, reflexive, or firewall access lists.
Information About Configuring IPv4 Access Control Lists

ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.
- ACL logging for port ACLs and VLAN maps
Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.

This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

Table 126: Access List Numbers

<table>
<thead>
<tr>
<th>Access List Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>
<td>IP standard access list</td>
<td>Yes</td>
</tr>
<tr>
<td>100–199</td>
<td>IP extended access list</td>
<td>Yes</td>
</tr>
<tr>
<td>200–299</td>
<td>Protocol type-code access list</td>
<td>No</td>
</tr>
<tr>
<td>300–399</td>
<td>DECnet access list</td>
<td>No</td>
</tr>
<tr>
<td>400–499</td>
<td>XNS standard access list</td>
<td>No</td>
</tr>
<tr>
<td>500–599</td>
<td>XNS extended access list</td>
<td>No</td>
</tr>
<tr>
<td>600–699</td>
<td>AppleTalk access list</td>
<td>No</td>
</tr>
<tr>
<td>700–799</td>
<td>48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>800–899</td>
<td>IPX standard access list</td>
<td>No</td>
</tr>
<tr>
<td>900–999</td>
<td>IPX extended access list</td>
<td>No</td>
</tr>
<tr>
<td>1000–1099</td>
<td>IPX SAP access list</td>
<td>No</td>
</tr>
<tr>
<td>1100–1199</td>
<td>Extended 48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>1200–1299</td>
<td>IPX summary address access list</td>
<td>No</td>
</tr>
<tr>
<td>1300–1999</td>
<td>IP standard access list (expanded range)</td>
<td>Yes</td>
</tr>
<tr>
<td>2000–2699</td>
<td>IP extended access list (expanded range)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Numbered Standard IPv4 ACLs

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.
The switch always rewrites the order of standard access lists so that entries with host matches and entries with matches having a don’t care mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero don’t care masks. Therefore, in show command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to VLANs, to terminal lines, or to interfaces.

**Numbered Extended IPv4 ACLs**

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

---

**Note**

ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

These IP protocols are supported:

- Authentication Header Protocol (ahp)
- Encapsulation Security Payload (esp)
- Enhanced Interior Gateway Routing Protocol (eigrp)
- generic routing encapsulation (gre)
- Internet Control Message Protocol (icmp)
- Internet Group Management Protocol (igmp)
- any Interior Protocol (ip)
- IP in IP tunneling (ipinip)
- KA9Q NOS-compatible IP over IP tunneling (nos)
- Open Shortest Path First routing (ospf)
- Payload Compression Protocol (pcp)
- Protocol-Independent Multicast (pim)
- Transmission Control Protocol (tcp)
- User Datagram Protocol (udp)
Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

Note

The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines before configuring named ACLs:

• Numbered ACLs are also available.

• A standard ACL and an extended ACL cannot have the same name.

• You can use standard or extended ACLs (named or numbered) in VLAN maps.

Benefits of Using the Named ACL Support for Noncontiguous Ports on an Access Control Entry Feature

The Named ACL Support for Noncontiguous Ports on an Access Control Entry feature allows you to specify noncontiguous ports in a single access control entry, which greatly reduces the number of entries required in an access control list when several entries have the same source address, destination address, and protocol, but differ only in the ports.

This feature greatly reduces the number of access control entries (ACEs) required in an access control list to handle multiple entries for the same source address, destination address, and protocol. If you maintain large numbers of ACEs, use this feature to consolidate existing groups of access list entries wherever it is possible and when you create new access list entries. When you configure access list entries with noncontiguous ports, you will have fewer access list entries to maintain.

Benefits of IP Access List Entry Sequence Numbering

The ability to apply sequence numbers to IP access list entries simplifies access list changes. Prior to the IP Access List Entry Sequence Numbering feature, there was no way to specify the position of an entry within an access list. If a user wanted to insert an entry (statement) in the middle of an existing list, all of the entries after the desired position had to be removed, then the new entry was added, and then all the removed entries had to be reentered. This method was cumbersome and error prone.

This feature allows users to add sequence numbers to access list entries and resequence them. When a user adds a new entry, the user chooses the sequence number so that it is in a desired position in the access list. If necessary, entries currently in the access list can be resequenced to create room to insert the new entry.

Sequence Numbering Behavior

• For backward compatibility with previous releases, if entries with no sequence numbers are applied, the first entry is assigned a sequence number of 10, and successive entries are incremented by 10. The maximum sequence number is 2147483647. If the generated sequence number exceeds this maximum number, the following message is displayed:

Exceeded maximum sequence number.
• If the user enters an entry without a sequence number, it is assigned a sequence number that is 10 greater than the last sequence number in that access list and is placed at the end of the list.

• If the user enters an entry that matches an already existing entry (except for the sequence number), then no changes are made.

• If the user enters a sequence number that is already present, the following error message is generated:

Duplicate sequence number.

• If a new access list is entered from global configuration mode, then sequence numbers for that access list are generated automatically.

• Distributed support is provided so that the sequence numbers of entries in the Route Processor (RP) and line card are in synchronization at all times.

• Sequence numbers are not nvgened. That is, the sequence numbers themselves are not saved. In the event that the system is reloaded, the configured sequence numbers revert to the default sequence starting number and increment. The function is provided for backward compatibility with software releases that do not support sequence numbering.

• This feature works with named and numbered, standard and extended IP access lists.

Including comments in ACLs

You can use the `remark` keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the `access-list access-list-number remark` global configuration command. To remove the remark, use the `no` form of this command.

The following is an example of a remark that describes function of the subsequent deny statement:

```plaintext
ip access-list extended telnetting
  remark Do not allow host1 subnet to telnet out
  deny tcp host 172.16.2.88 any eq telnet
```

Hardware and Software Treatment of IP ACLs

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

**Note**

If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.
For router ACLs, other factors can cause packets to be sent to the CPU:

- Using the `log` keyword
- Generating ICMP unreachable messages

When traffic flows are both logged and forwarded, forwarding is done by hardware, but logging must be done by software. Because of the difference in packet handling capacity between hardware and software, if the sum of all flows being logged (both permitted flows and denied flows) is of great enough bandwidth, not all of the packets that are forwarded can be logged.

When you enter the `show ip access-lists` privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the `show platform acl counters hardware` privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Router ACLs function as follows:

- The hardware controls permit and deny actions of standard and extended ACLs (input and output) for security access control.
- If `log` has not been specified, the flows that match a `deny` statement in a security ACL are dropped by the hardware if `ip unreachables` is disabled. The flows matching a `permit` statement are switched in hardware.
- Adding the `log` keyword to an ACE in a router ACL causes a copy of the packet to be sent to the CPU for logging only. If the ACE is a `permit` statement, the packet is still switched and routed in hardware.

### Time Ranges for ACLs

You can selectively apply extended ACLs based on the time of day and the week by using the `time-range` global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The `time-range` keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).
- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

---

**Note**

The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.
IPv4 ACL Interface Considerations

When you apply the `ip access-group` interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the `ip icmp rate-limit unreachable` global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

Apply an Access Control List to an Interface

With some protocols, you can apply up to two access lists to an interface: one inbound access list and one outbound access list. With other protocols, you apply only one access list that checks both inbound and outbound packets.

If the access list is inbound, when a device receives a packet, Cisco software checks the access list’s criteria statements for a match. If the packet is permitted, the software continues to process the packet. If the packet is denied, the software discards the packet.

If the access list is outbound, after receiving and routing a packet to the outbound interface, Cisco software checks the access list’s criteria statements for a match. If the packet is permitted, the software transmits the packet. If the packet is denied, the software discards the packet.

**Note**

Access lists that are applied to interfaces on a device do not filter traffic that originates from that device.
The figure above shows that Device 2 is a bypass device that is connected to Device 1 and Device 3. An outbound access list is applied to Gigabit Ethernet interface 0/0/0 on Device 1. When you ping Device 3 from Device 1, the access list does not check for packets going outbound because the traffic is locally generated. The access list check is bypassed for locally generated packets, which are always outbound.

By default, an access list that is applied to an outbound interface for matching locally generated traffic will bypass the outbound access list check; but transit traffic is subjected to the outbound access list check.

---

**Note**
The behavior described above applies to all single-CPU platforms that run Cisco software.

---

**ACL Logging**

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the `logging console` commands controlling the syslog messages.

---

**Note**
ACL logging is only supported for RACL.

---

**Note**
Because routing is done in hardware and logging is done in software, if a large number of packets match a `permit` or `deny` ACE containing a `log` keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.
The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

How to Configure ACLs

Configuring IPv4 ACLs

Follow the procedure given below to use IP ACLs on the switch:

SUMMARY STEPS

1. Create an ACL by specifying an access list number or name and the access conditions.
2. Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

DETAILED STEPS

Step 1 Create an ACL by specifying an access list number or name and the access conditions.
Step 2 Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

Creating a Numbered Standard ACL (CLI)

Follow the procedure given below to create a numbered standard ACL:

SUMMARY STEPS

1. enable
2. configure terminal
3. access-list access-list-number {deny | permit} source source-wildcard [log]
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>

<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
</tbody>
</table>
Creating a Numbered Extended ACL (CLI)

Follow the procedure given below to create a numbered extended ACL:

SUMMARY STEPS

1. **configure terminal**
2. `access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]`
3. `access-list access-list-number {deny | permit} tcp source source-wildcard [operator port] destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]`
4. `access-list access-list-number {deny | permit} udp source source-wildcard [operator port] destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]`
5. `access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [icmp-type] [flags] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]`
6. `access-list access-list-number {deny | permit} igmp source source-wildcard destination destination-wildcard [igmp-type] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]`
7. **end**

</table>
| 10.1.1.2 any precedence 0 tos 0 log | For `protocol`, enter the name or number of an IP protocol: `ahp`, `egrp`, `esp`, `gre`, `icmp`, `igmp`, `igmp`, `ip`, `ipinip`, `nos`, `ospf`, `pcp`, `pim`, `tcp`, or `udp`, or an integer in the range 0 to 255 representing an IP protocol number. To match any Internet protocol (including ICMP, TCP, and UDP), use the keyword `ip`.  

**Note** This step includes options for most IP protocols. For additional specific parameters for TCP, UDP, ICMP, and IGMP, see the following steps.  
The `source` is the number of the network or host from which the packet is sent.  
The `source-wildcard` applies wildcard bits to the source.  
The `destination` is the network or host number to which the packet is sent.  
The `destination-wildcard` applies wildcard bits to the destination.  
Source, source-wildcard, destination, and destination-wildcard can be specified as:  
* The 32-bit quantity in dotted-decimal format.  
* The keyword `any` for 0.0.0.0 255.255.255.255 (any host).  
* The keyword `host` for a single host 0.0.0.0.  
The other keywords are optional and have these meanings:  
* `precedence`—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: `routine` (0), `priority` (1), `immediate` (2), `flash` (3), `flash-override` (4), `critical` (5), `internet` (6), `network` (7).  
* `fragments`—Enter to check non-initial fragments.  
* `tos`—Enter to match by type of service level, specified by a number from 0 to 15 or a name: `normal` (0), `max-reliability` (2), `max-throughput` (4), `min-delay` (8).  
* `log`—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or `log-input` to include the input interface in the log entry.  
* `time-range`—Specify the time-range name. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| access-list access-list-number {deny | permit} tcp source source-wildcard [operator port] destination destination-wildcard [operator port] [established] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]] | Defines an extended TCP access list and the access conditions. The parameters are the same as those described for an extended IPv4 ACL, with these exceptions: (Optional) Enter an operator and port to compare source (if positioned after source-source-wildcard) or destination (if positioned after destination destination-wildcard) port. Possible operators include eq (equal), gt (greater than), lt (less than), neq (not equal), and range (inclusive range). Operators require a port number (range requires two port numbers separated by a space). Enter the port number as a decimal number (from 0 to 65535) or the name of a TCP port. Use only TCP port numbers or names when filtering TCP. The other optional keywords have these meanings:  
  • established—Enter to match an established connection. This has the same function as matching on the ack or rst flag.  
  • flag—Enter one of these flags to match by the specified TCP header bits: ack (acknowledge), fin (finish), psh (push), rst (reset), syn (synchronize), or urg (urgent). |
| access-list access-list-number {deny | permit} udp source source-wildcard [operator port] destination destination-wildcard [operator port] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] | (Optional) Defines an extended UDP access list and the access conditions. The UDP parameters are the same as those described for TCP except that the [operator [port]] port number or name must be a UDP port number or name, and the flag and established keywords are not valid for UDP. |
| access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [icmp-type | [[icmp-type icmp-code] | [icmp-message]] [precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp] | Defines an extended ICMP access list and the access conditions. The ICMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the example: |
| Step 3 | Device(config)# access-list 101 permit tcp any any eq 500 |
| Step 4 | Device(config)# access-list 101 permit udp any any eq 100 |
| Step 5 | Device(config)# access-list 101 permit icmp any any |
### Command or Action

**Example:**

```
Device(config)# access-list 101 permit icmp any any 200
```

**Purpose**

Addition of the ICMP message type and code parameters. These optional keywords have these meanings:

- `icmp-type`—Enter to filter by ICMP message type, a number from 0 to 255.
- `icmp-code`—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.
- `icmp-message`—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name.

### Step 6

**access-list access-list-number {deny | permit} igmp source source-wildcard destination destination-wildcard [igmp-type] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]]**

**Example:**

```
Device(config)# access-list 101 permit igmp any any 14
```

(Optional) Defines an extended IGMP access list and the access conditions.

The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.

- `igmp-type`—To match IGMP message type, enter a number from 0 to 15, or enter the message name: dvmrp, host-query, host-report, pim, or trace.

### Step 7

**end**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

---

### Creating Named Standard ACLs

Follow the procedure given below to create a standard ACL using names:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip access-list standard name`
4. Use one of the following:
   - `deny {source [source-wildcard] | host source | any} [log]`
   - `permit {source [source-wildcard] | host source | any} [log]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`
## DETAILED STEPS

</table>
Creating Extended Named ACLs

Follow the procedure given below to create an extended ACL using names:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip access-list extended name
4. {deny | permit} protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> ip access-list extended name</td>
<td>Defines an extended IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 100 to 199.</td>
</tr>
<tr>
<td>Example: Device(config)# ip access-list extended 150</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> {deny</td>
<td>permit} protocol {source [source-wildcard]</td>
</tr>
</tbody>
</table>
When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use `no permit` and `no deny` access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

**What to do next**

After creating a named ACL, you can apply it to interfaces or to VLANs.

**Configuring an Access Control Entry with Noncontiguous Ports**

Perform this task to create access list entries that use noncontiguous TCP or UDP port numbers. Although this task uses TCP ports, you could use the UDP syntax of the `permit` and `deny` commands to filter noncontiguous UDP ports.

Although this task uses a `permit` command first, use the `permit` and `deny` commands in the order that achieves your filtering goals.
The ACL—Named ACL Support for Noncontiguous Ports on an Access Control Entry feature can be used only with named, extended ACLs.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip access-list extended access-list-name
4. [sequence-number] permit tcp source source-wildcard [operator port [port]] destination destination-wildcard [operator [port]] [established] [match-any] [match-all] [+] [-] flag-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]
5. [sequence-number] deny tcp source source-wildcard [operator port [port]] destination destination-wildcard [operator [port]] [established] [match-any] [match-all] [+] [-] flag-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]
6. Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the no sequence-number command to delete an entry.
7. end
8. show ip access-lists access-list-name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip access-list extended access-list-name</td>
<td>Specifies the IP access list by name and enters named access list configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip access-list extended acl-extd-1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> [sequence-number] permit tcp source source-wildcard [operator port [port]] destination destination-wildcard [operator [port]] [established] [match-any] [match-all] [+] [-] flag-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>Specifies a permit statement in named IP access list configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ext-nacl)# permit tcp any eq telnet ftp any eq 450 679</td>
<td>• Operators include lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).</td>
</tr>
<tr>
<td></td>
<td>• If the operator is positioned after the source and source-wildcard arguments, it must match the source port. If the operator is positioned after the destination and destination-wildcard arguments, it must match the destination port.</td>
</tr>
</tbody>
</table>
### Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry

Perform this task to consolidate a group of access list entries with noncontiguous ports into one access list entry.

Although this task uses TCP ports, you could use the UDP syntax of the `permit` and `deny` commands to filter noncontiguous UDP ports.

Although this task uses a `permit` command first, use the `permit` and `deny` commands in the order that achieves your filtering goals.
### SUMMARY STEPS

1. `enable`
2. `show ip access-lists access-list-name`
3. `configure terminal`
4. `ip access-list extended access-list-name`
5. `no [sequence-number] permit protocol source [source-wildcard destination destination-wildcard][option option-name] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]`
6. `[sequence-number] permit protocol source [source-wildcard destination destination-wildcard][operator port] [option option-name] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]`
7. Repeat Steps 5 and 6 as necessary, adding `permit` or `deny` statements to consolidate access list entries where possible. Use the `no sequence-number` command to delete an entry.
8. `end`
9. `show ip access-lists access-list-name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>show ip access-lists access-list-name</code></td>
<td>(Optional) Displays the contents of the IP access list.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show ip access-lists mylist1</td>
<td>- Review the output to see if you can consolidate any access list entries.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>ip access-list extended access-list-name</code></td>
<td>Specifies the IP access list by name and enters named access list configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip access-list extended mylist1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>no [sequence-number] permit protocol source [source-wildcard destination destination-wildcard][option option-name] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</code></td>
<td>Removes the redundant access list entry that can be consolidated.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ext-nacl)# no 10</td>
<td>- Repeat this step to remove entries to be consolidated because only the port numbers differ.</td>
</tr>
<tr>
<td></td>
<td>- After this step is repeated to remove the access list entries 20, 30, and 40, for example, those entries are removed because they will be consolidated into one <code>permit</code> statement.</td>
</tr>
<tr>
<td></td>
<td>- If a <code>sequence-number</code> is specified, the rest of the command syntax is optional.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>----------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Specifies a <code>permit</code> statement in named access list configuration mode.</td>
</tr>
</tbody>
</table>
| `[sequence-number] permit protocol source source-wildcard[operator port[port]] destination destination-wildcard[operator port[port]] [option option-name] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]` | • In this instance, a group of access list entries with noncontiguous ports was consolidated into one `permit` statement.  
• You can configure up to 10 ports after the `eq` and `neq` operators. |
| **Example:**                                                                      |                                                                         |
| Device(config-ext-nacl)# permit tcp any neq 45 565 632 any eq 23 45 34 43         |                                                                         |
| **Step 7**                                                                        | Allows you to revise the access list.                                   |
| Repeat Steps 5 and 6 as necessary, adding `permit` or `deny` statements to consolidate access list entries where possible. Use the `no sequence-number` command to delete an entry. |                                                                         |
| **Step 8**                                                                        | *(Optional)* Exits named access list configuration mode and returns to privileged EXEC mode. |
| `end`                                                                             |                                                                         |
| **Example:**                                                                      |                                                                         |
| Device(config-std-nacl)# end                                                       |                                                                         |
| **Step 9**                                                                        | *(Optional)* Displays the contents of the access list.                  |
| `show ip access-lists access-list-name`                                            |                                                                         |
| **Example:**                                                                      |                                                                         |
| Device# show ip access-lists mylist1                                              |                                                                         |

**Sequencing Access-List Entries and Revising the Access List**

This task shows how to assign sequence numbers to entries in a named IP access list and how to add or delete an entry to or from an access list. When completing this task, keep the following points in mind:

- Resequencing the access list entries is optional. The resequencing step in this task is shown as required because that is one purpose of this feature and this task demonstrates that functionality.

- In the following procedure, the `permit` command is shown in Step 5 and the `deny` command is shown in Step 6. However, that order can be reversed. Use the order that suits the need of your configuration.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip access-list resequence access-list-name starting-sequence-number increment`
4. `ip access-list {standard extended} access-list-name`
5. Do one of the following:
   • `sequence-number permit source source-wildcard`
   • `sequence-number permit protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]`
6. Do one of the following:
   • `sequence-number deny source source-wildcard`
7. Do one of the following:
   - sequence-number deny protocol source source-wildcard destination destination-wildcard
     [precedence precedence][tos tos] [log] [time-range time-range-name] [fragments]

8. Do one of the following:
   - sequence-number deny protocol source source-wildcard destination destination-wildcard
     [precedence precedence][tos tos] [log] [time-range time-range-name] [fragments]

9. Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.
10. end
11. show ip access-lists access-list-name

<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-ext-nacl)# 150 deny tcp any any log</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> Repeat Step 5 and/or Step 6 to add sequence number statements, as applicable.</td>
<td>Allows you to revise the access list.</td>
</tr>
</tbody>
</table>
Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 10 end</td>
<td>(Optional) Exits the configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-std-nacl)# end</td>
<td></td>
</tr>
</tbody>
</table>

| Step 11 show ip access-lists access-list-name | (Optional) Displays the contents of the IP access list. |
| Example: | |
| Device# show ip access-lists kmd1 | |

**Examples**

Review the output of the **show ip access-lists** command to see that the access list includes the new entries:

Device# show ip access-lists kmd1

Standard IP access list kmd1
100 permit 10.4.4.0, wildcard bits 0.0.0.255
105 permit 10.5.5.0, wildcard bits 0.0.0.255
115 permit 10.0.0.0, wildcard bits 0.0.0.255
130 permit 10.5.5.0, wildcard bits 0.0.0.255
145 permit 10.0.0.0, wildcard bits 0.0.0.255

**Configuring Commented IP ACL Entries**

Either use a named or numbered access list configuration. You must apply the access list to an interface or terminal line after the access list is created for the configuration to work.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip access-list {standard | extended} {name | number}
4. remark remark
5. deny protocol host host-address any eq port
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

### Configuring Time Ranges for ACLs

Follow these steps to configure a time-range parameter for an ACL:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. time-range time-range-name
4. Use one of the following:
   - absolute [start time date] [end time date]
   - periodic day-of-the-week hh:mm to [day-of-the-week] hh:mm
   - periodic \{weekdays | weekend | daily\} hh:mm to hh:mm
5. end
6. show running-config
7. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>time-range <em>time-range-name</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# time-range workhours</td>
<td>Assigns a meaningful name (for example, <em>workhours</em>) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.</td>
</tr>
</tbody>
</table>
| Step 4 | Use one of the following:  
  - *absolute* [start time date] [end time date]  
  - *periodic* day-of-the-week hh:mm to [day-of-the-week] hh:mm  
  - *periodic* {weekdays | weekend | daily} hh:mm to hh:mm<br>**Example:**<br>Device(config-time-range)# absolute start 00:00 1 Jan 2006 end 23:59 1 Jan 2006<br>or<br>Device(config-time-range)# periodic weekdays 8:00 to 12:00 | Specifies when the function it will be applied to is operational.  
  - You can use only one *absolute* statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.  
  - You can enter multiple *periodic* statements. For example, you could configure different hours for weekdays and weekends.  
  - See the example configurations. |
| Step 5 | end<br>**Example:**<br>Device(config)# end | Returns to privileged EXEC mode. |
| Step 6 | show running-config<br>**Example:**<br>Device# show running-config | Verifies your entries. |
Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. line [console | vty] line-number
4. access-class access-list-number {in | out}
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device(config)# enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 line [console</td>
<td>vty] line-number</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

Repeat the steps if you have multiple items that you want in effect at different times.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Device(config)# line console 0 | - **console**—Specifies the console terminal line. The console port is DCE.  
  - **vty**—Specifies a virtual terminal for remote console access.  
  The *line-number* is the first line number in a contiguous group that you want to configure when the line type is specified. The range is from 0 to 16. |

**Step 4** access-class *access-list-number* {in | out}  
**Example:**  
Device(config-line)# access-class 10 in

**Step 5** end  
**Example:**  
Device(config-line)# end

**Step 6** show running-config  
**Example:**  
Device# show running-config

**Step 7** copy running-config startup-config  
**Example:**  
Device# copy running-config startup-config

### Applying an IPv4 ACL to an Interface (CLI)

This section describes how to apply IPv4 ACLs to network interfaces.

Beginning in privileged EXEC mode, follow the procedure given below to control access to an interface:

**SUMMARY STEPS**

1. configure terminal  
2. interface interface-id  
3. ip access-group {access-list-number | name} {in | out}  
4. end  
5. show running-config  
6. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Identifies a specific interface for configuration, and enter interface configuration mode. The interface can be a Layer 2 interface (port ACL), or a Layer 3 interface (router ACL).</td>
</tr>
<tr>
<td><strong>interface interface-id</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config)# interface gigabitethernet1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Controls access to the specified interface.</td>
</tr>
<tr>
<td>**ip access-group {access-list-number</td>
<td>name} {in</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config-if)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Displays the access list configuration.</td>
</tr>
<tr>
<td><strong>show running-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# show running-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>copy running-config startup-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.
When you use the `ip access-group` interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

### Table 127: Commands for Displaying Access Lists and Access Groups

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show access-lists [number</td>
<td>Displays the contents of one or all current IP and MAC address access</td>
</tr>
<tr>
<td></td>
<td>name]`</td>
</tr>
<tr>
<td>`show ip access-lists [number</td>
<td>Displays the contents of all current IP access lists or a specific</td>
</tr>
<tr>
<td></td>
<td>name]`</td>
</tr>
<tr>
<td><code>show ip interface interface-id</code></td>
<td>Displays detailed configuration and status of an interface. If IP is enabled on the interface and ACLs have been applied by using the <code>ip access-group</code> interface configuration command, the access groups are included in the display.</td>
</tr>
<tr>
<td><code>show running-config [interface interface-id]</code></td>
<td>Displays the contents of the configuration file for the switch or the specified interface, including all configured MAC and IP access lists and which access groups are applied to an interface.</td>
</tr>
<tr>
<td><code>show mac access-group [interface interface-id]</code></td>
<td>Displays MAC access lists applied to all Layer 2 interfaces or the specified Layer 2 interface.</td>
</tr>
</tbody>
</table>

### Configuration Examples for ACLs

#### ACLs in a Small Networked Office

**Figure 89: Using Router ACLs to Control Traffic**

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing...
confidential payroll data. All users can access Server A, but Server B has restricted
access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

Example: Numbered ACLs

In this example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its
subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host.
Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last
line of the list shows that the switch accepts addresses on all other network 10.0.0.0 subnets. The ACL is
applied to packets entering a port.

```
Device(config)# access-list 2 permit 10.48.0.3
Device(config)# access-list 2 deny 10.48.0.0 0.0.255.255
Device(config)# access-list 2 permit 10.0.0.0 0.255.255.255
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group 2 in
```

Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023.
The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of
host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
```
In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The established keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.

Examples: Named ACLs

Creating named standard and extended ACLs

This example creates a standard ACL named internet_filter and an extended ACL named marketing_group. The internet_filter ACL allows all traffic from the source address 1.2.3.4.

The marketing_group ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.
Device(config-ext-nacl)# permit icmp any any
Device(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Device(config-ext-nacl)# deny ip any any log
Device(config-ext-nacl)# exit

The Internet_filter ACL is applied to outgoing traffic and the marketing_group ACL is applied to incoming traffic on a Layer 3 port.

Device(config)# interface gigabitethernet3/0/1
Device(config-if)# no switchport
Device(config-if)# ip address 2.0.5.1 255.255.255.0
Device(config-if)# ip access-group Internet_filter out
Device(config-if)# ip access-group marketing_group in

Deleting individual ACEs from named ACLs
This example shows how you can delete individual ACEs from the named access list border-list:

Device(config)# ip access-list extended border-list
Device(config-ext-nacl)# no permit ip host 10.1.1.3 any

Example: Configuring an Access Control Entry with Noncontiguous Ports
The following access list entry can be created because up to ten ports can be entered after the eq and neq operators:

ip access-list extended aaa
permit tcp any eq telnet ftp any eq 23 45 34
end

Enter the show access-lists command to display the newly created access list entry.

Device# show access-lists aaa
Extended IP access list aaa
 10 permit tcp any eq telnet ftp any eq 23 45 34

Example: Consolidating Access List Entries with Noncontiguous Ports into One Access List Entry
The show access-lists command is used to display a group of access list entries for the access list named abc:

Device# show access-lists abc
Extended IP access list abc
 10 permit tcp any eq telnet any eq 450
 20 permit tcp any eq telnet any eq 679
 30 permit tcp any eq ftp any eq 450
 40 permit tcp any eq ftp any eq 679

Because the entries are all for the same permit statement and simply show different ports, they can be consolidated into one new access list entry. The following example shows the removal of the redundant access list entries and the creation of a new access list entry that consolidates the previously displayed group of access list entries:

ip access-list extended abc
Example Resequencing Entries in an Access List

The following example shows an access list before and after resequencing. The starting value is 1, and increment value is 2. The subsequent entries are ordered based on the increment values that users provide, and the range is from 1 to 2147483647.

When an entry with no sequence number is entered, by default it has a sequence number of 10 more than the last entry in the access list.

Example Adding an Entry with a Sequence Number

In the following example, an new entry (sequence number 15) is added to an access list:
Example Adding an Entry with No Sequence Number

The following example shows how an entry with no specified sequence number is added to the end of an access list. When an entry is added without a sequence number, it is automatically given a sequence number that puts it at the end of the access list. Because the default increment is 10, the entry will have a sequence number 10 higher than the last entry in the existing access list.

Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.1.1.1 0.0.0.255
Router(config-std-nacl)# permit 10.2.2.2 0.0.0.255
Router(config-std-nacl)# permit 10.3.3.3 0.0.0.255
Router(config-std-nacl)# show access-list
Standard IP access list resources
10 permit 10.1.1.1, wildcard bits 0.0.0.255
20 permit 10.2.2.2, wildcard bits 0.0.0.255
30 permit 10.3.3.3, wildcard bits 0.0.0.255

Router(config)# ip access-list standard resources
Router(config-std-nacl)# permit 10.4.4.4 0.0.0.255
Router(config-std-nacl)# end
Router(config)# show access-list
Standard IP access list resources
10 permit 10.1.1.1, wildcard bits 0.0.0.255
20 permit 10.2.2.2, wildcard bits 0.0.0.255
30 permit 10.3.3.3, wildcard bits 0.0.0.255
40 permit 10.4.4.4, wildcard bits 0.0.0.255

Examples: Configuring Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith workstation through
Device(config)# access-list 1 deny 171.69.3.13

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

Device(config)# access-list 100 remark Do not allow Winter to browse the web
Device(config)# access-list 100 deny host 171.69.3.85 any eq www
Device(config)# access-list 100 remark Do not allow Smith to browse the web
Device(config)# access-list 100 deny host 171.69.3.13 any eq www
In this example of a named ACL, the Jones subnet is not allowed access:

```
Device(config)# ip access-list standard prevention
Device(config-std-nacl)# remark Do not allow Jones subnet through
Device(config-std-nacl)# deny 171.69.0.0 0.0.255.255
```

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

```
Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Device(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet
```

### Examples: Using Time Ranges with ACLs

This example shows how to verify after you configure time ranges for *workhours* and to configure January 1, 2006, as a company holiday.

```
Device# show time-range
time-range entry: new_year_day_2003 (inactive)
  absolute start 00:00 01 January 2006 end 23:59 01 January 2006
time-range entry: workhours (inactive)
  periodic weekdays 8:00 to 12:00
  periodic weekdays 13:00 to 17:00
```

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

```
Device(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Device(config)# access-list 188 permit tcp any any time-range workhours
Device(config)# end
Device# show access-lists
Extended IP access list 188
  10 deny tcp any any time-range new_year_day_2006 (inactive)
  20 permit tcp any any time-range workhours (inactive)
```

This example uses named ACLs to permit and deny the same traffic.

```
Device(config)# ip access-list extended deny_access
Device(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Device(config-ext-nacl)# exit
Device(config)# ip access-list extended may_access
Device(config-ext-nacl)# permit tcp any any time-range workhours
Device(config-ext-nacl)# end
Device# show ip access-lists
Extended IP access list lpipe_default
  10 permit ip any any
Extended IP access list deny_access
  10 deny tcp any any time-range new_year_day_2006 (inactive)
Extended IP access list may_access
  10 permit tcp any any time-range workhours (inactive)
```
Examples: Time Range Applied to an IP ACL

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

Device(config)# time-range no-http
Device(config)# periodic weekdays 8:00 to 18:00
!
Device(config)# time-range udp-yes
Device(config)# periodic weekend 12:00 to 20:00
!
Device(config)# ip access-list extended strict
Device(config-ext-nacl)# deny tcp any any eq www time-range no-http
Device(config-ext-nacl)# permit udp any any time-range udp-yes
!
Device(config-ext-nacl)# exit
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group strict in

Examples: ACL Logging

Two variations of logging are supported on ACLs. The log keyword sends an informational logging message to the console about the packet that matches the entry; the log-input keyword includes the input interface in the log entry.

In this example, standard named access list stan1 denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the log keyword.

Device(config)# ip access-list standard stan1
Device(config-std-nacl)# deny 10.1.1.0 0.0.0.255 log
Device(config-std-nacl)# permit any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group stan1 in
Device(config-if)# end
Device# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
Console logging: level debugging, 37 messages logged
Monitor logging: level debugging, 0 messages logged
Buffer logging: level debugging, 37 messages logged
File logging: disabled
Trap logging: level debugging, 39 message lines logged

Log Buffer (4096 bytes):
00:00:48: NTP: authentication delay calculation problems
<output truncated>
00:09:34:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet
00:09:59:%SEC-6-IPACCESSLOGS:list stan1 denied 10.1.1.15 1 packet
00:10:11:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet

This example is a named extended access list ext1 that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.
Device(config)# ip access-list extended ext1
Device(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Device(config-ext-nacl)# deny udp any any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip access-group ext1 in

This is an example of a log for an extended ACL:

01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1 packet
01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7 packets
01:26:12:%SEC-6-IPACCESSLOGP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 1 packet
01:31:33:%SEC-6-IPACCESSLOGP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 8 packets

Note that all logging entries for IP ACLs start with %SEC-6-IPACCESSLOG with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the log-input keyword is entered:

00:04:21:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 (Vlan1 0001.42ef.a400) -> 10.1.1.61 (0/0), 1 packet

A log message for the same sort of packet using the log keyword does not include the input interface information:

00:05:47:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 -> 10.1.1.61 (0/0), 1 packet

Examples: Troubleshooting ACLs

If this ACL manager message appears and [chars] is the access-list name,

ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]

The switch has insufficient resources to create a hardware representation of the ACL. The resources include hardware memory and label space but not CPU memory. A lack of available logical operation units or specialized hardware resources causes this problem. Logical operation units are needed for a TCP flag match or a test other than eq (ne, gt, lt, or range) on TCP, UDP, or SCTP port numbers.

Use one of these workarounds:

• Modify the ACL configuration to use fewer resources.

• Rename the ACL with a name or number that alphanumerically precedes the ACL names or numbers.

To determine the specialized hardware resources, enter the show platform layer4 acl map privileged EXEC command. If the switch does not have available resources, the output shows that index 0 to index 15 are not available.
For more information about configuring ACLs with insufficient resources, see CSCsq63926 in the Bug Toolkit.

For example, if you apply this ACL to an interface:

```
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
permit tcp source source-wildcard destination destination-wildcard
```

And if this message appears:

```
ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The flag-related operators are not available. To avoid this issue,

- Move the fourth ACE before the first ACE by using `ip access-list resequence` global configuration command:

```
permit tcp source source-wildcard destination destination-wildcard
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```

or

- Rename the ACL with a name or number that alphanumerically precedes the other ACLs (for example, rename ACL 79 to ACL 1).

You can now apply the first ACE in the ACL to the interface. The switch allocates the ACE to available mapping bits in the Opselect index and then allocates flag-related operators to use the same bits in the hardware memory.

Feature Information for IPv4 Access Control Lists

<table>
<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS Release 15.0(2)EX</td>
<td>IPv4 Access Control Lists perform packet filtering to control which packets move through the network and where. Such control provides security by helping to limit network traffic, restrict the access of users and devices to the network, and prevent traffic from leaving a network. This feature was introduced.</td>
</tr>
<tr>
<td>Cisco IOS 15.2(2)E</td>
<td>The Named ACL Support for Noncontiguous Ports on an Access Control Entry feature allows you to specify noncontiguous ports in a single access control entry, which greatly reduces the number of entries required in an access control list when several entries have the same source address, destination address, and protocol, but differ only in the ports.</td>
</tr>
<tr>
<td>Cisco IOS 15.2(2)E</td>
<td>The IP Access List Entry Sequence Numbering feature helps users to apply sequence numbers to permit or deny statements and also reorder, add, or remove such statements from a named IP access list. This feature makes revising IP access lists much easier. Prior to this feature, users could add access list entries to the end of an access list only; therefore needing to add statements anywhere except the end required reconfiguring the access list entirely. The following commands were introduced or modified: deny (IP), ip access-list resequence deny (IP), permit (IP).</td>
</tr>
</tbody>
</table>
IPv6 Access Control Lists

Access lists determine what traffic is blocked and what traffic is forwarded at device interfaces and allow filtering of traffic based on source and destination addresses, and inbound and outbound traffic to a specific interface. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control. Standard IPv6 ACL functionality was extended to support traffic filtering based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control.

This module describes how to configure IPv6 traffic filtering and to control access to virtual terminal lines.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for IPv6 ACLs

The following are the prerequisites for IPv6 ACLs:

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the sdm prefer {default | dual-ipv4-and-ipv6} global configuration command.
Restrictions for IPv6 ACLs

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

• The switch does not support matching on these keywords: routing header, and undetermined-transport.
• The switch does not support reflexive ACLs (the reflect keyword).
• This release supports port ACLs, router ACLs and VLAN ACLs (VLAN maps) for IPv6.
• Output router ACLs and input port ACLs for IPv6 are supported only on switch stacks. Switches support only control plane (incoming) IPv6 ACLs.
• The switch does not apply MAC-based ACLs on IPv6 frames.
• When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
• If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:

• Fragmented frames (the fragments keyword as in IPv4) are supported
• The same statistics supported in IPv4 are supported for IPv6 ACLs.
• If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
• Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.
• Logging is supported for router ACLs, but not for port ACLs.
• The switch supports IPv6 address-matching for a full range of prefix-lengths.

Information About Configuring IPv6 ACLs

You can filter IP version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic.

Note

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the sdm prefer {default | dual-ipv4-and-ipv6} global configuration command.
ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

IPv6 ACLs Overview

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similar to how you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running IP base and LAN base feature sets.

A switch supports three types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.

- IPv6 port ACLs are supported on outbound and inbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

- VLAN ACLs or VLAN maps access-control all packets in a VLAN. You can use VLAN maps to filter traffic between devices in the same VLAN. ACL VLAN maps are applied on L2 VLANs. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv6. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets entering the VLAN are checked against the VLAN map.

The switch supports VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

Understanding IPv6 ACLs

A switch image supports two types of IPv6 ACLs:

- IPv6 router ACLs - Supported on inbound or outbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. Applied to only IPv6 packets that are routed.
**IPv6 port ACLs** - Supported on inbound traffic on Layer 2 interfaces only. Applied to all IPv6 packets entering the interface.

**Note**

If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take effect.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface.

As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

- When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

- When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

**Note**

If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

**Interactions with Other Features and Switches**

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.

- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

  You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.

- If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.

**Default Configuration for IPv6 ACLs**

The default IPv6 ACL configuration is as follows:

```
Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
```
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any nd-na sequence 40
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100

**Supported ACL Features**

IPv6 ACLs on the switch have these characteristics:

- Fragmented frames (the fragments keyword as in IPv4) are supported.
- The same statistics supported in IPv4 are supported for IPv6 ACLs.
- If the switch runs out of TCAM space, packets associated with the ACL label are forwarded to the CPU, and the ACLs are applied in software.
- Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.
- Logging is supported for router ACLs, but not for port ACLs.

**IPv6 Port-Based Access Control List Support**

The IPv6 PACL feature provides the ability to provide access control (permit or deny) on Layer 2 switch ports for IPv6 traffic. IPv6 PACLs are similar to IPv4 PACLs, which provide access control on Layer 2 switch ports for IPv4 traffic. They are supported only in the ingress direction and in hardware.

A PACL can filter ingress traffic on Layer 2 interfaces based on Layer 3 and Layer 4 header information or non-IP Layer 2 information.

**ACLs and Traffic Forwarding**

The IPv6 ACL Extensions for Hop by Hop Filtering feature allows you to control IPv6 traffic that might contain hop-by-hop extension headers. You can configure an access control list (ACL) to deny all hop-by-hop traffic or to selectively permit traffic based on protocol.

IPv6 access control lists (ACLs) determine what traffic is blocked and what traffic is forwarded at device interfaces. ACLs allow filtering based on source and destination addresses, inbound and outbound to a specific interface. Use the `ipv6 access-list` command to define an IPv6 ACL, and the `deny` and `permit` commands to configure its conditions.

The IPv6 ACL Extensions for Hop by Hop Filtering feature implements RFC 2460 to support traffic filtering in any upper-layer protocol type.
How to Configure IPv6 ACLs

Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

SUMMARY STEPS

1. enable
2. configure terminal
3. {ipv6 access-list list-name
4. {deny | permit} protocol {source-ipv6-prefix/prefix-length|any} host source-ipv6-address} [operator [port-number]] [destination-ipv6-prefix/prefix-length|any} host destination-ipv6-address] [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]
5. {deny | permit} tcp {source-ipv6-prefix/prefix-length|any} host source-ipv6-address} [operator [port-number]] [destination-ipv6-prefix/prefix-length|any} host destination-ipv6-address] [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port | protocol}] [psh] [range {port | protocol}] [rst] [routing] [sequence value] [syn] [time-range name] [urg]
6. {deny | permit} udp {source-ipv6-prefix/prefix-length|any} host source-ipv6-address} [operator [port-number]] [destination-ipv6-prefix/prefix-length|any} host destination-ipv6-address] [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port | protocol}] [routing] [sequence value] [time-range name]
7. {deny | permit} icmp {source-ipv6-prefix/prefix-length|any} host source-ipv6-address} [operator [port-number]] [destination-ipv6-prefix/prefix-length|any} host destination-ipv6-address] [operator [port-number]] [icmp-type [icmp-code]] [icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name]
8. end
9. show ipv6 access-list
10. show running-config
11. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 3**

```
ipv6 access-list list-name
```

**Example:**
```
Device(config)# ipv6 access-list example_acl_list
```

Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>purpose</th>
</tr>
</thead>
</table>
| **Step 4**

```
{deny | permit} protocol
{source-ipv6-prefix/prefix-length | any} host
source-ipv6-address [ operator [ port-number ] ]
{destination-ipv6-prefix/prefix-length | any | host}
destination-ipv6-address [ operator [ port-number ] ] [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]
```

Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions:

- For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, stcp, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.

- The `source-ipv6-prefix/prefix-length` or `destination-ipv6-prefix/prefix-length` is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

- Enter any as an abbreviation for the IPv6 prefix ::/0.

- For `host source-ipv6-address` or `destination-ipv6-address`, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.

- (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are `lt` (less than), `gt` (greater than), `eq` (equal), `neq` (not equal), and `range`.

If the operator follows the `source-ipv6-prefix/prefix-length` argument, it must match the source port. If the operator follows the `destination-ipv6-prefix/prefix-length` argument, it must match the destination port.

- (Optional) The `port-number` is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.

- (Optional) Enter `dscp` value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

- (Optional) Enter `fragments` to check noninitial fragments. This keyword is visible only if the protocol is ipv6.
### Security

#### Configuring IPv6 ACLs

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) Enter \texttt{log} to cause an logging message to be sent to the console about the packet that matches the entry. Enter \texttt{log-input} to include the input interface in the log entry. Logging is supported only for router ACLs.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter \texttt{routing} to specify that IPv6 packets be routed.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter \texttt{sequence} value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4,294,967,295.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) Enter \texttt{time-range} name to specify the time range that applies to the deny or permit statement.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

\texttt{deny} | \texttt{permit} | \texttt{tcp} | \{source-ipv6-prefix/prefix-length | any | host source-ipv6-address\} | [operator | [port-number]] | [destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address\} | [operator | [port-number]] | [ack] | [dscp value] | [established] | [fin] | [log] | [log-input] | [neq \{port | protocol\}] | [psh] | [range \{port | protocol\}] | [rst] | [routing] | [sequence value] | [syn] | [time-range name] | [urg]

(Optional) Define a TCP access list and the access conditions.

Enter \texttt{tcp} for Transmission Control Protocol. The parameters are the same as described in Step 3a, with these additional optional parameters:

- \texttt{ack}—Acknowledgment bit set.
- \texttt{established}—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.
- \texttt{fin}—Finished bit set; no more data from sender.
- \texttt{neq \{port | protocol\}}—Matches only packets that are not on a given port number.
- \texttt{psh}—Push function bit set.
- \texttt{range \{port | protocol\}}—Matches only packets in the port number range.
- \texttt{rst}—Reset bit set.
- \texttt{syn}—Synchronize bit set.
- \texttt{urg}—Urgent pointer bit set.

### Step 6

\texttt{deny} | \texttt{permit} | \texttt{udp} | \{source-ipv6-prefix/prefix-length | any | host source-ipv6-address\} | [operator | [port-number]] | [destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address\} | [operator | [port-number]] | [dscp value] | [log] | [log-input] | [neq \{port | protocol\}] | [range \{port | protocol\}] | [routing] | [sequence value] | [time-range name]]

(Optional) Define a UDP access list and the access conditions.

Enter \texttt{udp} for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the [operator | [port]] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Define an ICMP access list and the access conditions.</td>
</tr>
<tr>
<td>{deny</td>
<td>permit} icmp {source-ipv6-prefix/prefix-length</td>
</tr>
<tr>
<td>• icmp-type—Enter to filter by ICMP message type, a number from 0 to 255.</td>
<td></td>
</tr>
<tr>
<td>• icmp-code—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.</td>
<td></td>
</tr>
<tr>
<td>• icmp-message—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.</td>
<td></td>
</tr>
</tbody>
</table>

| Step 8 | end | Return to privileged EXEC mode. |
| Step 9 | show ipv6 access-list | Verify the access list configuration. |
| Step 10 | show running-config | Verifies your entries. |
| **Example:** | Device# show running-config |
| Step 11 | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| **Example:** | Device# copy running-config startup-config |

**What to do next**

Attach the IPv6 ACL to an Interface

**Attaching an IPv6 ACL to an Interface**

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.

Follow these steps to control access to an interface:
SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface interface-id**
4. **no switchport**
5. **ipv6 address ipv6-address**
6. **ipv6 traffic-filter access-list-name {in | out}**
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>If applying a router ACL, this changes the interface from Layer 2 mode (the default) to Layer 3 mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Configure an IPv6 address on a Layer 3 interface (for router ACLs).</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Apply the access list to incoming or outgoing traffic on the interface.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The out keyword is not supported for Layer 2 interfaces (port ACLs).</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Monitoring IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show access-lists</td>
<td>Displays all access lists configured on the switch.</td>
</tr>
<tr>
<td>show ipv6 access-list [access-list-name]</td>
<td>Displays all configured IPv6 access lists or the access list specified by name.</td>
</tr>
<tr>
<td>show vlan access-map [map-name]</td>
<td>Displays VLAN access map configuration.</td>
</tr>
<tr>
<td>show vlan filter [access-map access-map] vlan [vlan-id]</td>
<td>Displays the mapping between VACLs and VLANs.</td>
</tr>
</tbody>
</table>

This is an example of the output from the `show access-lists` privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch # show access-lists
Extended IP access list hello
  10 permit ip any any
IPv6 access list ipv6
  permit ipv6 any any sequence 10
```

This is an example of the output from the `show ipv6 access-list` privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
  permit tcp any any eq bgp (8 matches) sequence 10
  permit tcp any any eq telnet (15 matches) sequence 20
  permit udp any any sequence 30
IPv6 access list outbound
  deny udp any any sequence 10
  deny tcp any any eq telnet sequence 20
```

This is an example of the output from the `show vlan access-map` privileged EXEC command. The output shows VLAN access map information.

```
Switch# show vlan access-map
Vlan access-map "m1" 10
```
Match clauses:
  ipv6 address: ip2
  Action: drop

Configuring PACL Mode and Applying IPv6 PACL on an Interface

Before you begin

Before you configure the IPv6 PACL feature, you must configure an IPv6 access list. Once you have configured the IPv6 access list, you must configure the port-based access control list (PACL) mode on the specified IPv6 Layer 2 interface.

SUMMARY STEPS

1. enable
2. configure terminal
3. ipv6 access-list access-list-name
4. exit
5. interface type number
6. ipv6 traffic-filter access-list-name {in | out}
7. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable&lt;br&gt;Example: enable Device&gt; enable</td>
<td>Enables privileged EXEC mode. &lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal&lt;br&gt;Example: Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>ipv6 access-list access-list-name&lt;br&gt;Example: Device(config)# ipv6 access-list list1</td>
<td>Defines an IPv6 ACL and enters IPv6 access list configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit&lt;br&gt;Example: Device(config-ipv6-acl)# exit</td>
<td>Exits IPv6 access list configuration mode and enters global configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>interface type number&lt;br&gt;Example:</td>
<td>Specifies an interface type and number and enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>ipv6 traffic-filter access-list-name {in</td>
<td>out}&lt;br&gt;Example: Device(config-if)# ipv6 traffic-filter list1 in</td>
</tr>
</tbody>
</table>
### Purpose

**Example:**

Step 7

```
Device(config-if)# end
```

### Configuring IPv6 ACL Extensions for Hop by Hop Filtering

**SUMMARY STEPS**

1. *enable*
2. *configure terminal*
3. *ipv6 access-list access-list-name*
4. *permit protocol {source-ipv6-prefix|prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [header-number | header-type]] [dscp value] [flow-label value] [fragments] [hhb] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport]
5. *deny protocol {source-ipv6-prefix|prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [header-number | header-type]] [dscp value] [flow-label value] [fragments] [hhb] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport]
6. *end*

**DETAILED STEPS**

### Command or Action | Purpose
--- | ---
**Step 1**
**enable**
**Example:**
```
Device> enable
```
Enables privileged EXEC mode.
- Enter your password if prompted.

**Step 2**
**configure terminal**
**Example:**
```
Device# configure terminal
```
Enters global configuration mode.

**Step 3**
**ipv6 access-list access-list-name**
**Example:**
```
Device(config)# ipv6 access-list hbh-acl
```
Defines an IPv6 ACL and enters IPv6 access list configuration mode.

**Step 4**
**permit protocol {source-ipv6-prefix|prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address | auth} [operator [port-number]] [dest-option-type [header-number | header-type]] [dscp value] [flow-label value] [fragments] [hhb] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]]
**Example:**
```
```
Sets permit conditions for the IPv6 ACL.
### Command or Action

```
mh-type] [reflect name [timeout value]] [routing] [routing-type routing-number] [sequence value] [time-range name]
```

**Example:**
Device(config-ipv6-acl)# permit icmp any any dest-option-type

### Purpose

Sets deny conditions for the IPv6 ACL.

### Step 5

```
deny protocol {source-ipv6-prefix/prefix-length | any | host source-ipv6-address | auth} [operator [port-number]] [destination-ipv6-prefix/prefix-length | any host destination-ipv6-address | auth] [operator [port-number]] [dest-option-type [header-number | header-type]] [dscp value] [flow-label value] [fragments] [hhb] [log] [log-input] [mobility] [mobility-type [mh-number | mh-type]] [routing] [routing-type routing-number] [sequence value] [time-range name] [undetermined-transport]
```

**Example:**
Device(config-ipv6-acl)# deny icmp any any dest-option-type

### Step 6

```
end
```

**Example:**
Device(config-ipv6-acl)# end

### Configuration Examples for IPv6 ACLs

#### Example: Configuring IPv6 ACLs

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch(config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
```

#### Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.
Device(config-if)# no switchport
Device(config-if)# ipv6 address 2001::/64 eui-64
Device(config-if)# ipv6 traffic-filter CISCO out

Example: Configuring PACL Mode and Applying IPv6 PACL on an Interface

Device# configure terminal
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)# exit
Device(config-if)# ipv6 traffic-filter list1 in

Example: IPv6 ACL Extensions for Hop by Hop Filtering

Device(config)# ipv6 access-list hbh_acl
Device(config-ipv6-acl)# permit tcp any any hbh
Device(config-ipv6-acl)# permit tcp any any
Device(config-ipv6-acl)# permit udp any any
Device(config-ipv6-acl)# permit udp any any hbh
Device(config-ipv6-acl)# permit hbh any any
Device(config-ipv6-acl)# permit any any
Device(config-ipv6-acl)# hardware statistics
Device(config-ipv6-acl)# exit

! Assign an IP address and add the ACL on the interface.

Device(config)# interface FastEthernet3/1
Device(config-if)# ipv6 address 1001::1/64
Device(config-if)# ipv6 traffic-filter hbh_acl in
Device(config-if)# exit
Device(config)# exit
Device# clear counters
Clear "show interface" counters on all interfaces [confirm]
Device#

! Verify the configurations.

Device# show running-config interface FastEthernet3/1

Building configuration...

Current configuration : 114 bytes
!
interface FastEthernet3/1
no switchport
ipv6 address 1001::1/64
ipv6 traffic-filter hbh_acl
end

Feature Information for IPv6 Access Control Lists

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.
### Table 128: Feature Information for IPv6 Access Control Lists

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 ACL Extensions for Hop-by-Hop Filtering</td>
<td>15.1(1)SG</td>
<td>Allows you to control IPv6 traffic that might contain hop-by-hop extension headers. This feature was supported on CAT3560C, CAT3560CX, CAT3560X, CAT3750X, CAT4500- X. The following commands were introduced or modified: <strong>deny (IPv6)</strong>, <strong>permit (IPv6)</strong>.</td>
</tr>
<tr>
<td>IPv6 PACL Support</td>
<td></td>
<td>The IPv6 PACL feature permits or denies the movement of traffic between port-based interface, Layer 3 subnets, wireless or wired clients, and VLANs, or within a VLAN. This feature was supported on CAT2960, CAT2960S, CAT3560X, CAT3650, CAT3560CX, CAT4500. The following command was introduced or modified: <strong>ipv6 traffic-filter</strong>.</td>
</tr>
<tr>

</table>
ACL Support for Filtering IP Options

The ACL Support for Filtering IP Options feature describes how to use an IP access list to filter IP packets that contain IP options to prevent devices from becoming saturated with spurious packets.

This module also describes the ACL TCP Flags Filtering feature and how to use an IP access list to filter IP packets that contain TCP flags. The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for ACL Support for Filtering IP Options

Before you configure the ACL Support for Filtering IP Options feature, you must understand the concepts of the IP access lists.
Information About ACL Support for Filtering IP Options

IP Options

IP uses four key mechanisms in providing its service: Type of Service, Time to Live, Options, and Header Checksum.

The Options, commonly referred to as IP Options, provide for control functions that are required in some situations but unnecessary for the most common communications. IP Options include provisions for time stamps, security, and special routing.

IP Options may or may not appear in datagrams. They must be implemented by all IP modules (host and gateways). What is optional is their transmission in any particular datagram, not their implementation. In some environments the security option may be required in all datagrams.

The option field is variable in length. There may be zero or more options. IP Options can have one of two formats:

• Format 1: A single octet of option-type.

• Format 2: An option-type octet, an option-length octet, and the actual option-data octets.

The option-length octet counts the option-type octet, the option-length octet, and the option-data octets.

The option-type octet is viewed as having three fields: a 1-bit copied flag, a 2-bit option class, and a 5-bit option number. These fields form an 8-bit value for the option type field. IP Options are commonly referred to by their 8-bit value.

For a complete list and description of IP Options, refer to RFC 791, Internet Protocol at the following URL: http://www.faqs.org/rfcs/rfc791.html

Benefits of Filtering IP Options

• Filtering of packets that contain IP Options from the network relieves downstream devices and hosts of the load from options packets.

• This feature also minimizes load to the Route Processor (RP) for packets with IP Options that require RP processing on distributed systems. Previously, the packets were always routed to or processed by the RP CPU. Filtering the packets prevents them from impacting the RP.

Benefits of Filtering on TCP Flags

The ACL TCP Flags Filtering feature provides a flexible mechanism for filtering on TCP flags. Previously, an incoming packet was matched as long as any TCP flag in the packet matched a flag specified in the access control entry (ACE). This behavior allows for a security loophole, because packets with all flags set could get past the access control list (ACL). The ACL TCP Flags Filtering feature allows you to select any combination of flags on which to filter. The ability to match on a flag set and on a flag not set gives you a greater degree of control for filtering on TCP flags, thus enhancing security.

Because TCP packets can be sent as false synchronization packets that can be accepted by a listening port, it is recommended that administrators of firewall devices set up some filtering rules to drop false TCP packets.
The ACEs that make up an access list can be configured to detect and drop unauthorized TCP packets by allowing only the packets that have a very specific group of TCP flags set or not set. The ACL TCP Flags Filtering feature provides a greater degree of packet-filtering control in the following ways:

- You can select any desired combination of TCP flags on which to filter TCP packets.
- You can configure ACEs to allow matching on a flag that is set, as well as on a flag that is not set.

### TCP Flags

The table below lists the TCP flags, which are further described in RFC 793, *Transmission Control Protocol*.

<table>
<thead>
<tr>
<th>TCP Flag</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK</td>
<td>Acknowledge flag—Indicates that the acknowledgment field of a segment specifies the next sequence number the sender of this segment is expecting to receive.</td>
</tr>
<tr>
<td>FIN</td>
<td>Finish flag—Used to clear connections.</td>
</tr>
<tr>
<td>PSH</td>
<td>Push flag—Indicates the data in the call should be immediately pushed through to the receiving user.</td>
</tr>
<tr>
<td>RST</td>
<td>Reset flag—Indicates that the receiver should delete the connection without further interaction.</td>
</tr>
<tr>
<td>SYN</td>
<td>Synchronize flag—Used to establish connections.</td>
</tr>
<tr>
<td>URG</td>
<td>Urgent flag—Indicates that the urgent field is meaningful and must be added to the segment sequence number.</td>
</tr>
</tbody>
</table>

### How to Configure ACL Support for Filtering IP Options

#### Filtering Packets That Contain IP Options

Complete these steps to configure an access list to filter packets that contain IP options and to verify that the access list has been configured correctly.

- The ACL Support for Filtering IP Options feature can be used only with named, extended ACLs.
- Resource Reservation Protocol (RSVP) Multiprotocol Label Switching Traffic Engineering (MPLS TE), Internet Group Management Protocol Version 2 (IGMPV2), and other protocols that use IP options packets may not function in drop or ignore mode if this feature is configured.
- On most Cisco devices, a packet with IP options is not switched in hardware, but requires control plane software processing (primarily because there is a need to process the options and rewrite the IP header), so all IP packets with IP options will be filtered and switched in software.
SUMMARY STEPS

1. enable
2. configure terminal
3. ip access-list extended access-list-name
4. [sequence-number] deny protocol source source-wildcard destination destination-wildcard [option option-value] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]
5. [sequence-number] permit protocol source source-wildcard destination destination-wildcard [option option-value] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]
6. Repeat Step 4 or Step 5 as necessary.
7. end
8. show ip access-lists access-list-name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 ip access-list extended access-list-name</td>
<td>Specifies the IP access list by name and enters named access list configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# ip access-list extended mylist1</td>
<td></td>
</tr>
<tr>
<td>Step 4 [sequence-number] deny protocol source source-wildcard destination destination-wildcard [option option-value] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>
<td>(Optional) Specifies a deny statement in named IP access list mode.</td>
</tr>
<tr>
<td>Example: Device(config-ext-nacl)# deny ip any any option traceroute</td>
<td>• This access list happens to use a deny statement first, but a permit statement could appear first, depending on the order of statements you need.</td>
</tr>
<tr>
<td></td>
<td>• Use the option keyword and option-value argument to filter packets that contain a particular IP Option.</td>
</tr>
<tr>
<td></td>
<td>• In this example, any packet that contains the traceroute IP option will be filtered out.</td>
</tr>
<tr>
<td></td>
<td>• Use the no sequence-number form of this command to delete an entry.</td>
</tr>
<tr>
<td>Step 5 [sequence-number] permit protocol source source-wildcard destination destination-wildcard [option option-value] [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]</td>

</tr>
</tbody>
</table>
### Filtering Packets That Contain TCP Flags

This task configures an access list to filter packets that contain TCP flags and verifies that the access list has been configured correctly.

#### Note
- TCP flag filtering can be used only with named, extended ACLs.
- The ACL TCP Flags Filtering feature is supported only for Cisco ACLs.
- Previously, the following command-line interface (CLI) format could be used to configure a TCP flag-checking mechanism:

\[\text{permit tcp any any rst} \]

The following format that represents the same access control entry (ACE) can now be used: \text{permit tcp any any match-any} \text{+rst} Both the CLI formats are accepted; however, if the new keywords \text{match-all} or \text{match-any} are chosen, they must be followed by the new flags that are prefixed with “+” or “-”. It is advisable to use only the old format or the new format in a single ACL. You cannot mix and match the old and new CLI formats.

#### Caution
If a device having ACEs with the new syntax format is reloaded with a previous version of the Cisco software that does not support the ACL TCP Flags Filtering feature, the ACEs will not be applied, leading to possible security loopholes.

### SUMMARY STEPS

1. enable
2. configure terminal
3. ip access-list extended access-list-name
4. \[sequence-number\] permit tcp source source-wildcard [operator [port]] destination destination-wildcard [operator [port]] \{established \} [match-any | match-all] \{+ | -\} flag-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]
5. \[sequence-number\] deny tcp source source-wildcard [operator [port]] destination destination-wildcard [operator [port]] \{established \} [match-any | match-all] \{+ | -\} flag-name [precedence precedence] [tos tos] [log] [time-range time-range-name] [fragments]
6. Repeat Step 4 or Step 5 as necessary, adding statements by sequence number where you planned. Use the no sequence-number command to delete an entry.

7. end

8. show ip access-lists access-list-name

</tr>
<tr>
<td>Example:</td>
<td>Device(config-ext-nacl)# deny tcp any any match-all -ack -fin</td>
</tr>
</tbody>
</table>

*See the deny(IP) command for additional command syntax to permit upper-layer protocols (ICMP, IGMP, TCP, and UDP).*
### Configuration Examples for ACL Support for Filtering IP Options

#### Example: Filtering Packets That Contain IP Options

The following example shows an extended access list named mylist2 that contains access list entries (ACEs) that are configured to permit TCP packets only if they contain the IP Options that are specified in the ACEs:

```
ip access-list extended mylist2
10 permit ip any any option eool
20 permit ip any any option record-route
30 permit ip any any option zsu
40 permit ip any any option mtup
```

The `show access-list` command has been entered to show how many packets were matched and therefore permitted:

```
Device# show ip access-list mylist2
Extended IP access list test
10 permit ip any any option eool (1 match)
20 permit ip any any option record-route (1 match)
30 permit ip any any option zsu (1 match)
40 permit ip any any option mtup (1 match)
```

#### Example: Filtering Packets That Contain TCP Flags

The following access list allows TCP packets only if the TCP flags ACK and SYN are set and the FIN flag is not set:

```
ip access-list extended aaa
    permit tcp any any match-all +ack +syn -fin
end
```

The `show access-list` command has been entered to display the ACL:

```
Device# show ip access-lists kmd1
Extended IP access list kmd1
  10 permit ip any any option eool (1 match)
  20 permit ip any any option record-route (1 match)
  30 permit ip any any option zsu (1 match)
  40 permit ip any any option mtup (1 match)
```
Device# show access-list aaa

Extended IP access list aaa
   10 permit tcp any any match-all +ack +syn -fin

Feature Information for Creating an IP Access List to Filter

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support andCisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Information for Creating an IP Access List to Filter
CHAPTER 63

VLAN Access Control Lists

VLAN access control lists (ACLs) or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet access control entries (ACEs). After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

This module provides more information about VLAN ACLs and how to configure them.

- Finding Feature Information, on page 1219
- Information About VLAN Access Control Lists, on page 1219
- How to Configure VLAN Access Control Lists, on page 1222

- Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs, on page 1235

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About VLAN Access Control Lists

VLAN Maps

VLAN ACLs or VLAN maps are used to control network traffic within a VLAN. You can apply VLAN maps to all packets that are bridged within a VLAN in the switch or switch stack. VACLs are strictly for security packet filtering and for redirecting traffic to specific physical interfaces. VACLs are not defined by direction (ingress or egress).
All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

*Figure 90: Using VLAN Maps to Control Traffic*

This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

### VLAN Map Configuration Guidelines

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.

- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.

- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.

- Logging is not supported for VLAN maps.

- When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.

- If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

### VLAN Maps with Router ACLs

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.
If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

---

**Note**

When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.

If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

---

**VLAN Maps and Router ACL Configuration Guidelines**

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:

  permit... permit... permit... deny ip any any

  or

  deny... deny... deny... permit ip any any

- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.

- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use *don't care* bits in the IP address, whenever possible.

  If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

---

**VACL Logging**

When you configure VACL logging, syslog messages are generated for denied IP packets under these circumstances:

- When the first matching packet is received.

- For any matching packets received within the last 5 minutes.

- If the threshold is reached before the 5-minute interval.
Log messages are generated on a per-flow basis. A flow is defined as packets with the same IP addresses and Layer 4 (UDP or TCP) port numbers. If a flow does not receive any packets in the 5-minute interval, that flow is removed from the cache. When a syslog message is generated, the timer and packet counter are reset.

VACL logging restrictions:
- Only denied IP packets are logged.
- Packets that require logging on the outbound port ACLs are not logged if they are denied by a VACL.

How to Configure VLAN Access Control Lists

Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Follow these steps to create a named MAC extended ACL:

SUMMARY STEPS

1. enable
2. configure terminal
3. mac access-list extended name
4. {deny | permit} {any | host source MAC address | source MAC address mask} {any | host destination MAC address | destination MAC address mask} {type mask | lsap lsap mask | aarp | amber | dec-spanning | deenet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lacv-sca | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp | 0-65535} {cos cos}
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

Applying a MAC ACL to a Layer 2 Interface

Follow these steps to apply a MAC access list to control access to a Layer 2 interface:

SUMMARY STEPS

1. configure terminal
2. configure terminal
3. interface interface-id
4. mac access-group {name} {in | out }
5. end
6. show mac access-group [interface interface-id]
7. configure terminal
8. configure terminal

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal
Example:
Device# configure terminal | Enters global configuration mode. |
| **Step 2**
configure terminal
Example:
Device# configure terminal | Enters global configuration mode. |
| **Step 3**
interface interface-id
Example:
Device(config)# interface gigabitethernet1/0/2 | Identifies a specific interface, and enter interface configuration mode. The interface must be a physical Layer 2 interface (port ACL). |
| **Step 4**
mac access-group {name} {in | out }
Example:
Device(config-if)# mac access-group mac1 in | Controls access to the specified interface by using the MAC access list. 
Port ACLs are supported in the outbound and inbound directions . |
| **Step 5**
end
Example:
Device(config-if)# end | Returns to privileged EXEC mode. |
### Configuring VLAN Maps

Follow the procedure given below to create a VLAN map and apply it to one or more VLANs:

#### Before you begin

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.

#### SUMMARY STEPS

1. `vlan access-map name [number]`
2. `match {ip | mac} address {name | number} [name | number]`
3. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):
   - `action { forward }

   ```
   Device(config-access-map)# action forward
   ```
   - `action { drop }

   ```
   Device(config-access-map)# action drop
   ```
### DETAILED STEPS

**Configuration Examples for ACLs and VLAN Maps**

### Example: Creating an ACL and a VLAN Map to Deny a Packet

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the *ip1* ACL (TCP packets) would be dropped. You first create the *ip1* ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

```
Device(config)# end
Device(config-ext-nacl)# ip access-list extended ip1
Device(config-ext-nacl)# permit tcp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 10
Device(config-access-map)# match ip address ip1
Device(config-access-map)# action drop
```

### Example: Creating an ACL and a VLAN Map to Permit a Packet

This example shows how to create a VLAN map to permit a packet. ACL *ip2* permits UDP packets and any packets that match the *ip2* ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

```
Device(config)# ip access-list extended ip2
Device(config-ext-nacl)# permit udp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 20
Device(config-access-map)# match ip address ip2
Device(config-access-map)# action forward
```

### Example: Default Action of Dropping IP Packets and Forwarding MAC Packets

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists *igmp-match* and *tcp-match*, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets
Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists \textit{good-hosts} and \textit{good-protocols}, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists \textit{tcp-match} and \textit{good-hosts} from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
Configuration Examples for Using VLAN Maps in Your Network

Example: Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point, Switch A.

If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list `http` that permits (matches) any TCP traffic on the HTTP port.

```
Device(config)# ip access-list extended http
Device(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
```
Next, create VLAN access map `map2` so that traffic that matches the `http` access list is dropped and all other IP traffic is forwarded.

```plaintext
Device(config)# vlan access-map map2 10
Device(config-access-map)# match ip address http
Device(config-access-map)# action drop
Device(config-access-map)# exit
Device(config)# ip access-list extended match_all
Device(config-ext-nacl)# permit ip any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map2 20
Device(config-access-map)# match ip address match_all
Device(config-access-map)# action forward
```

Then, apply VLAN access map `map2` to VLAN 1.

```plaintext
Device(config)# vlan filter map2 vlan 1
```

### Example: Restricting Access to a Server on Another VLAN

**Figure 92: Restricting Access to a Server on Another VLAN**

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

### Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map `SERVER1` that denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map `SERVER1` to VLAN 10.
Define the IP ACL that will match the correct packets.

```conf
Device(config)# ip access-list extended SERVER1_ACL
Device(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Device(config-ext-nacl)# exit
```

Define a VLAN map using this ACL that will drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

```conf
Device(config)# vlan access-map SERVER1_MAP
Device(config-access-map)# match ip address SERVER1_ACL
Device(config-access-map)# action drop
Device(config)# vlan access-map SERVER1_MAP 20
Device(config-access-map)# action forward
Device(config-access-map)# exit
```

Apply the VLAN map to VLAN 10.

```conf
Device(config)# vlan filter SERVER1_MAP vlan-list 10
```

Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet’s path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

**Example: ACLs and Switched Packets**

*Figure 93: Applying ACLs on Switched Packets*

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.
This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:

1. VLAN map for input VLAN
Example: ACLs and Multicast Packets

Figure 96: Applying ACLs on Multicast Packets

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.
Example: ACLs and Multicast Packets

![Diagram showing the flow of packets between VLANs with ACLs and multicast packets.]

- Information About DHCP, on page 1239
- How to Configure DHCP Features, on page 1246
- Configuring DHCP Server Port-Based Address Allocation, on page 1255

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About DHCP

DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator. The switch can act as a DHCP server.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.
DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

**Note**

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.

- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.

- The switch receives a DHCPRERELEASE or DHCPDECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.

- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.
When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allow-untrusted` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

Normally, it is not desirable to broadcast packets to wireless clients. So, DHCP snooping replaces destination broadcast MAC address (ffff.ffff.ffff) with unicast MAC address for DHCP packets that are going from server to wireless clients. The unicast MAC address is retrieved from CHADDR field in the DHCP payload. This processing is applied for server to client packets such as DHCP OFFER, DHCP ACK, and DHCP NACK messages. The `ip dhcp snooping wireless bootp-broadcast enable` can be used to revert this behavior. When the wireless BOOTP broadcast is enabled, the broadcast DHCP packets from server are forwarded to wireless clients without changing the destination MAC address.

### Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

**Note**

The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

*Figure 97: DHCP Relay Agent in a Metropolitan Ethernet Network*

When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. You can configure the remote ID and circuit ID.

If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.

The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, _Suboption Packet Formats_):

- Circuit-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit-ID type
  - Length of the circuit-ID type

- Remote-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote-ID type
  - Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet1/0/25, and so forth.

The illustration, _Suboption Packet Formats_, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option global configuration command.`
The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- **Circuit-ID suboption fields**
  - The circuit-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

- **Remote-ID suboption fields**
  - The remote-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.
Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is
updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1bdb223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 584a38f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

- The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.
- An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).
- The interface in the entry no longer exists on the system.
- The interface is a routed interface or a DHCP snooping-trusted interface.

**DHCP Snooping and Switch Stacks**

DHCP snooping is managed on the stack master. When a new switch joins the stack, the switch receives the DHCP snooping configuration from the stack master. When a member leaves the stack, all DHCP snooping address bindings associated with the switch age out.

All snooping statistics are generated on the stack master. If a new stack master is elected, the statistics counters reset.

When a stack merge occurs, all DHCP snooping bindings in the stack master are lost if it is no longer the stack master. With a stack partition, the existing stack master is unchanged, and the bindings belonging to the
partitioned switches age out. The new master of the partitioned stack begins processing the new incoming DHCP packets.

How to Configure DHCP Features

Default DHCP Snooping Configuration

Table 131: Default DHCP Configuration

<table>
<thead>
<tr>
<th>Feature</th>

</tr>
</tbody>
</table>

\(^{12}\) The switch responds to DHCP requests only if it is configured as a DHCP server.

\(^{13}\) The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.
Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

**DHCP Snooping Configuration Guidelines**

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust interface` configuration command.

- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.

- You can display DHCP snooping statistics by entering the `show ip dhcp snooping statistics` user EXEC command, and you can clear the snooping statistics counters by entering the `clear ip dhcp snooping statistics` privileged EXEC command.

**Configuring the DHCP Server**

The switch can act as a DHCP server. For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the *Cisco IOS IP Configuration Guide, Release 12.4*.

**DHCP Server and Switch Stacks**

The DHCP binding database is managed on the stack master. When a new stack master is assigned, the new master downloads the saved binding database from the TFTP server. When a switchover happens, the new active stack master will use its database file that has been synced from the old active stack master using the SSO function. The IP addresses associated with the lost bindings are released. You should configure an automatic backup by using the `ip dhcp database url [timeout seconds | write-delay seconds]` global configuration command.

**Configuring the DHCP Relay Agent**

Follow these steps to enable the DHCP relay agent on the switch:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. service dhcp
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the `ip helper-address address` interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the `ip helper-address` command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>service dhcp</td>
<td>Enables the DHCP server and relay agent on your switch. By default, this feature is enabled.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# service dhcp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy
SUMMARY STEPS

1. enable
2. configure terminal
3. interface vlan vlan-id
4. ip address ip-address subnet-mask
5. ip helper-address address
6. end
7. Use one of the following:
   - interface range port-range
   - interface interface-id
8. switchport mode access
9. switchport access vlan vlan-id
10. end
11. show running-config
12. copy running-config startup-config

Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

- You must globally enable DHCP snooping on the switch.
- Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
- If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.
- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.
- For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.
- You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.
- To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.
- The following prerequisites apply to DHCP snooping binding database configuration:
  - You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.
  - Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
  - For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.
  - To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).
  - If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.
- Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.
- If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.
- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust interface` configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.
Enabling DHCP Snooping and Option 82

Follow these steps to enable DHCP snooping on the switch:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip dhcp snooping`
4. `ip dhcp snooping vlan vlan-range`
5. `ip dhcp snooping information option`
6. `ip dhcp snooping information option format remote-id [string ASCII-string | hostname]`
7. `ip dhcp snooping information option allow-untrusted`
8. `interface interface-id`
9. `ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string`
10. `ip dhcp snooping trust`
11. `ip dhcp snooping limit rate rate`
12. `exit`
13. `ip dhcp snooping verify mac-address`
14. `end`
15. `show running-config`
16. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip dhcp snooping</code></td>
<td>Enables DHCP snooping globally.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# ip dhcp snooping</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>ip dhcp snooping vlan vlan-range</code></td>
<td>Enables DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by</td>
</tr>
<tr>
<td>Example: <code>Device(config)# ip dhcp snooping vlan 10</code></td>
<td></td>
</tr>
</tbody>
</table>
Enabling DHCP Snooping and Option 82

| Step 5 | **ip dhcp snooping information option**  
| **Example:**  
| Device(config)# ip dhcp snooping information option | Enables the switch to insert and remove DHCP relay information (option-82 field) in forwarded DHCP request messages to the DHCP server. This is the default setting. |

| Step 6 | **ip dhcp snooping information option format remote-id [string ASCII-string | hostname]  
| **Example:**  
| Device(config)# ip dhcp snooping information option format remote-id string asciiistring2 | (Optional) Configures the remote-ID suboption.  
You can configure the remote ID as:  
- String of up to 63 ASCII characters (no spaces)  
- Configured hostname for the switch  
**Note** If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration. |

| Step 7 | **ip dhcp snooping information option allow-untrusted**  
| **Example:**  
| Device(config)# ip dhcp snooping information option allow-untrusted | (Optional) If the switch is an aggregation switch connected to an edge switch, this command enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch.  
The default setting is disabled.  
**Note** Enter this command only on aggregation switches that are connected to trusted devices. |

| Step 8 | **interface interface-id**  
| **Example:**  
| Device(config)# interface gigabitethernet2/0/1 | Specifies the interface to be configured, and enter interface configuration mode. |

| Step 9 | **ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string**  
| **Example:**  
| Device(config-if)# ip dhcp snooping vlan 1 information option format-type circuit-id override string override2 | (Optional) Configures the circuit-ID suboption for the specified interface.  
Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format `vlan-mod-port`.  
You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces). |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong></td>
<td>(Optional) Use the <code>override</code> keyword when you do not want the circuit-ID suboption inserted in TLV format to define subscriber information.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip dhcp snooping trust</code></td>
<td>(Optional) Configures the interface as trusted or untrusted. Use the <code>no</code> keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# <code>ip dhcp snooping trust</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip dhcp snooping limit rate rate</code></td>
<td>(Note) We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN with DHCP snooping.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# <code>ip dhcp snooping limit rate 100</code></td>
<td></td>
</tr>
<tr>

Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

Monitoring DHCP Snooping Information

Table 132: Commands for Displaying DHCP Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip dhcp snooping</code></td>
<td>Displays the DHCP snooping configuration for a switch</td>
</tr>
<tr>
<td><code>show ip dhcp snooping binding</code></td>
<td>Displays only the dynamically configured bindings in the DHCP snooping binding database, also referred to as a binding table.</td>
</tr>
<tr>
<td><code>show ip dhcp snooping database</code></td>
<td>Displays the DHCP snooping binding database status and statistics.</td>
</tr>
<tr>
<td><code>show ip dhcp snooping statistics</code></td>
<td>Displays the DHCP snooping statistics in summary or detail form.</td>
</tr>
<tr>
<td><code>show ip source binding</code></td>
<td>Display the dynamically and statically configured bindings.</td>
</tr>
</tbody>
</table>

Note

If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.

Configuring DHCP Server Port-Based Address Allocation

Information About Configuring DHCP Server Port-Based Address Allocation

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.

When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier.
option in the DHCP packet. Clients that do not include the client identifier option are identified by the client hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

Default Port-Based Address Allocation Configuration

By default, DHCP server port-based address allocation is disabled.

Port-Based Address Allocation Configuration Guidelines

• By default, DHCP server port-based address allocation is disabled.

• To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the reserved-only DHCP pool configuration command.

Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

SUMMARY STEPS

1. enable
terminal
3. ip dhcp snooping database {flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password[@]]@]host] | [directory] image-name.tar | rcps://user@host/filename] | tftp://host/filename
4. ip dhcp snooping database timeout seconds
5. ip dhcp snooping database write-delay seconds
6. end
7. ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds
8. show ip dhcp snooping database [detail]
9. show running-config
10. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

configure terminal

Example:

Device# configure terminal

**Step 3**

ip dhcp snooping database {flash[number]:/filename | ftp://user:password@host/filename | http://[[username:password[@]]@hostname | host-ip][[directory] /image-name.tar | rcp://user@host/filename| tftp://host/filename

Example:

Device(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2

**Step 4**

ip dhcp snooping database timeout seconds

Example:

Device(config)# ip dhcp snooping database timeout 300

**Step 5**

ip dhcp snooping database write-delay seconds

Example:

Device(config)# ip dhcp snooping database write-delay 15

**Step 6**

eend

Example:

Device(config)# end

**Step 7**

ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds

Example:

Device# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gi1/1 expiry 1000

(Optional) Adds binding entries to the DHCP snooping binding database. The vlan-id range is from 1 to 4904. The seconds range is from 1 to 4294967295. Enter this command for each entry that you add.
Enabling DHCP Server Port-Based Address Allocation

Follow these steps to globally enable port-based address allocation and to automatically generate a subscriber identifier on an interface.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip dhcp use subscriber-id client-id`
4. `ip dhcp subscriber-id interface-name`
5. `interface interface-id`
6. `ip dhcp server use subscriber-id client-id`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; <code>enable</code></td>
</tr>
</tbody>
</table>

| Step 8 | show ip dhcp snooping database [detail] | Use this command when you are testing or debugging the switch. Displays the status and statistics of the DHCP snooping binding database agent. |
| Example: | Device# `show ip dhcp snooping database detail` |                                               |

| Step 9 | show running-config | Verifies your entries. |
| Example: | Device# `show running-config` |                                               |

<p>| Step 10 | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: | Device# <code>copy running-config startup-config</code> |                                               |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 2    | configure terminal  
    Example:  
    Device# configure terminal | Enters global configuration mode. |
| 3    | ip dhcp use subscriber-id client-id  
    Example:  
    Device(config)# ip dhcp use subscriber-id client-id | Configures the DHCP server to globally use the subscriber identifier as the client identifier on all incoming DHCP messages. |
| 4    | ip dhcp subscriber-id interface-name  
    Example:  
    Device(config)# ip dhcp subscriber-id interface-name | Automatically generates a subscriber identifier based on the short name of the interface.  
    A subscriber identifier configured on a specific interface takes precedence over this command. |
| 5    | interface interface-id  
    Example:  
    Device(config)# interface gigabitethernet1/0/1 | Specifies the interface to be configured, and enter interface configuration mode. |
| 6    | ip dhcp server use subscriber-id client-id  
    Example:  
    Device(config-if)# ip dhcp server use subscriber-id client-id | Configures the DHCP server to use the subscriber identifier as the client identifier on all incoming DHCP messages on the interface. |
| 7    | end  
    Example:  
    Device(config)# end | Returns to privileged EXEC mode. |
| 8    | show running-config  
    Example:  
    Device# show running-config | Verifies your entries. |
| 9    | copy running-config startup-config  
    Example:  
    Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
What to do next

After enabling DHCP port-based address allocation on the switch, use the `ip dhcp pool` global configuration command to preassign IP addresses and to associate them to clients.

Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- Finding Feature Information, on page 1263
- Information About IP Source Guard, on page 1263
- How to Configure IP Source Guard, on page 1265
- Monitoring IP Source Guard, on page 1269
- Additional References, on page 1269

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IP Source Guard

IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address in the binding table is allowed, all other traffic is denied.
The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

### IP Source Guard for Static Hosts

**Note**

Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IPSG source guard entries for static hosts attached to member ports are retained. When you enter the `show ip device tracking all` EXEC command, the IP device tracking table displays the entries as ACTIVE.

**Note**

Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.
IP Source Guard Configuration Guidelines

- You can configure static IP bindings only on nonrouted ports. If you enter the `ip source binding mac-address vlan vlan-id ip-address interface interface-id` global configuration command on a routed interface, this error message appears:

  Static IP source binding can only be configured on switch port.

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.

- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

  **Note**  
  If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

- You can enable this feature when 802.1x port-based authentication is enabled.

- When you configure IP source guard smart logging, packets with a source address other than the specified address or an address learned by DHCP are denied, and the packet contents are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled.

- In a switch stack, if IP source guard is configured on a stack member interface and you remove the the configuration of that switch by entering the `no switch stack-member-number provision` global configuration command, the interface static bindings are removed from the binding table, but they are not removed from the running configuration. If you again provision the switch by entering the `switch stack-member-number provision` command, the binding is restored.

  To remove the binding from the running configuration, you must disable IP source guard before entering the `no switch provision` command. The configuration is also removed if the switch reloads while the interface is removed from the binding table.

---

How to Configure IP Source Guard

Enabling IP Source Guard

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip verify source [mac-check ]`
5. `exit`
6. `ip source binding mac-address vlan vlan-id ip-address interface interface-id`
7. `end`
### Enabling IP Source Guard

8. show running-config
9. copy running-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal          | Enters global configuration mode. |
| Example:                               |         |
| Device# configure terminal             |         |

| **Step 3** interface interface-id     | Specifies the interface to be configured, and enters interface configuration mode. |
| Example:                               |         |
| Device(config)# interface gigabitethernet 1/0/1 |         |

| **Step 4** ip verify source [mac-check ] | Enables IP source guard with source IP address filtering. |
| Example:                               | (Optional) mac-check—Enables IP Source Guard with source IP address and MAC address filtering. |
| Device(config-if)# ip verify source    |         |

| **Step 5** exit                        | Returns to global configuration mode. |
| Example:                               |         |
| Device(config-if)# exit                |         |

| **Step 6** ip source binding mac-address vlan vlan-id ip-address interface interface-id | Adds a static IP source binding. |
| Example:                               | Enter this command for each static binding. |
| Device(config)# ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1 |         |

| **Step 7** end                         | Returns to privileged EXEC mode. |
| Example:                               |         |
| Device(config)# end                    |         |
Purpose | Command or Action | Example | Description
--- | --- | --- | ---
**Step 8** | show running-config | Device# show running-config | Verifies your entries.
**Step 9** | copy running-config startup-config | Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.

### Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port

You must configure the `ip device tracking maximum limit-number interface` configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

#### SUMMARY STEPS
1. enable
2. configure terminal
3. ip device tracking
4. interface interface-id
5. switchport mode access
6. switchport access vlan vlan-id
7. ip verify source[tracking] [mac-check ]
8. ip device tracking maximum number
9. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>

</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 3**  
**ip device tracking**  
**Example:**  
Device(config)# ip device tracking | Turns on the IP host table, and globally enables IP device tracking. |
| **Step 4**  
**interface interface-id**  
**Example:**  
Device(config)# interface gigabitethernet 1/0/1 | Enters interface configuration mode. |
| **Step 5**  
**switchport mode access**  
**Example:**  
Device(config-if)# switchport mode access | Configures a port as access. |
| **Step 6**  
**switchport access vlan vlan-id**  
**Example:**  
Device(config-if)# switchport access vlan 10 | Configures the VLAN for this port. |
| **Step 7**  
**ip verify source[tracking] [mac-check]**  
**Example:**  
Device(config-if)# ip verify source tracking mac-check | Enables IP source guard with source IP address filtering.  
(Optional) **tracking**—Enables IP source guard for static hosts.  
(Optional) **mac-check**—Enables MAC address filtering.  
The command **ip verify source tracking mac-check** enables IP source guard for static hosts with MAC address filtering. |
| **Step 8**  
**ip device tracking maximum number**  
**Example:**  
Device(config-if)# ip device tracking maximum 8 | Establishes a maximum limit for the number of static IPs that the IP device tracking table allows on the port. The range is 1 to 10. The maximum number is 10.  
**Note** You must configure the **ip device tracking maximum limit-number** interface configuration command. |
| **Step 9**  
**end**  
**Example:**  
Device(config)# end | Returns to privileged EXEC mode. |

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.

- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.
Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

- Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

  **Note**  
  Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

- A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

  Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

- The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

- The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

  The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.

  If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

- Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none` interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.

- When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.

- In the presence of vlan-bridging & IP device tracking, the cross-stack ARP packet forwarding will not work.
Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

![Figure 100: ARP Cache Poisoning](image)

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic man-in-the-middle attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets
Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan vlan-range` global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the `arp access-list acl-name` global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate {[src-mac] [dst-mac] [ip]}` global configuration command.

**Interface Trust States and Network Security**

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `ip arp inspection trust interface` configuration command.

---

**Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

---

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.
Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

**Rate Limiting of ARP Packets**

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.
The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command.

Default Dynamic ARP Inspection Configuration

<table>

</thead>
<tbody>
<tr>
<td>Dynamic ARP inspection</td>
<td>Disabled on all VLANs.</td>
</tr>
<tr>
<td>Interface trust state</td>
<td>All interfaces are untrusted.</td>
</tr>
<tr>
<td>Rate limit of incoming ARP packets</td>
<td>The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second. The rate is unlimited on all trusted interfaces. The burst interval is 1 second.</td>
</tr>
<tr>
<td>ARP ACLs for non-DHCP environments</td>
<td>No ARP ACLs are defined.</td>
</tr>
<tr>
<td>Validation checks</td>
<td>No checks are performed.</td>
</tr>
</tbody>
</table>
Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan global configuration command`. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

### Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `arp access-list acl-name`
4. `permit ip host sender-ip mac host sender-mac`
5. `exit`
6. `ip arp inspection filter arp-acl-name vlan vlan-range [static]`
7. `interface interface-id`
8. `no ip arp inspection trust`
9. `end`
10. Use the following show commands:
### Configuring ARP ACLs for Non-DHCP Environments

- `show arp access-list acl-name`
- `show ip arp inspection vlan vlan-range`
- `show ip arp inspection interfaces`

#### 11. show running-config

#### 12. copy running-config startup-config

### DETAILED STEPS

</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device&gt; enable</td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>arp access-list acl-name</td>
<td>Defines an ARP ACL, and enters ARP access-list configuration mode. By default, no ARP access lists are defined. &lt;br&gt;<strong>Note</strong> At the end of the ARP access list, there is an implicit <strong>deny ip any mac any</strong> command.</td>
</tr>
<tr>
<td>Step 4</td>
<td>permit ip host sender-ip mac host sender-mac</td>
<td>Permits ARP packets from the specified host (Host 2).&lt;br&gt;• For <code>sender-ip</code>, enter the IP address of Host 2.&lt;br&gt;• For <code>sender-mac</code>, enter the MAC address of Host 2.</td>
</tr>
<tr>
<td>Step 5</td>
<td>exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>ip arp inspection filter <code>arp-acl-name vlan vlan-range</code> [static]</td>
<td>Applies ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.&lt;br&gt;• For <code>arp-acl-name</code>, specify the name of the ACL created in Step 2.&lt;br&gt;• For <code>vlan-range</code>, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.&lt;br&gt;• (Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL. ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them.</td>
</tr>
</tbody>
</table>

| Step 7 | interface  \textit{interface-id} | Specifies Switch A interface that is connected to Switch B, and enters the interface configuration mode. |

| Step 8 | no ip arp inspection trust | Configures Switch A interface that is connected to Switch B as untrusted. By default, all interfaces are untrusted. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the \texttt{ip arp inspection vlan logging} global configuration command. |

| Step 9 | end | Returns to privileged EXEC mode. |

| Step 10 | Use the following show commands: |
|         | \begin{itemize} |
|         | \item show arp access-list \texttt{acl-name} |
|         | \item show ip arp inspection vlan \texttt{vlan-range} |
|         | \item show ip arp inspection interfaces |
|         | \end{itemize} | Verifies your entries. |

| Step 12 | copy running-config startup-config |
|         | Example: |
|         | Device\# \texttt{copy running-config startup-config} | (Optional) Saves your entries in the configuration file. |
Configuring Dynamic ARP Inspection in DHCP Environments

Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

**Note**

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

**SUMMARY STEPS**

1. enable
2. show cdp neighbors
3. configure terminal
4. ip arp inspection vlan vlan-range
5. Interface interface-id
6. ip arp inspection trust
7. end
8. show ip arp inspection interfaces
9. show ip arp inspection vlan vlan-range
10. show ip dhcp snooping binding
11. show ip arp inspection statistics vlan vlan-range
12. configure terminal
13. configure terminal

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>show cdp neighbors</td>
<td>Verify the connection between the switches.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# show cdp neighbors</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| 3    | configure terminal  
**Example:**  
Device# configure terminal | Enters global configuration mode. |
| 4    | ip arp inspection vlan vlan-range  
**Example:**  
Device(config)# ip arp inspection vlan 1 | Enable dynamic ARP inspection on a per-VLAN basis. By default, dynamic ARP inspection is disabled on all VLANs. For vlan-range, specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. Specify the same VLAN ID for both switches. |
| 5    | Interface interface-id  
**Example:**  
Device(config)# interface gigabitethernet1/0/1 | Specifies the interface connected to the other switch, and enter interface configuration mode. |
| 6    | ip arp inspection trust  
**Example:**  
Device(config-if)# ip arp inspection trust | Configures the connection between the switches as trusted. By default, all interfaces are untrusted.  
The switch does not check ARP packets that it receives from the other switch on the trusted interface. It simply forwards the packets.  
For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command. |
| 7    | end  
**Example:**  
Device(config-if)# end | Returns to privileged EXEC mode. |
| 8    | show ip arp inspection interfaces  
**Example:** | Verifies the dynamic ARP inspection configuration on interfaces. |
| 9    | show ip arp inspection vlan vlan-range  
**Example:**  
Device(config-if)# show ip arp inspection vlan 1 | Verifies the dynamic ARP inspection configuration on VLAN. |
| 10   | show ip dhcp snooping binding  
**Example:** | Verifies the DHCP bindings. |
### Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

#### Note

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the `no ip arp inspection limit` interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip arp inspection limit {rate pps [burst interval seconds] | none}`
5. `exit`
6. Use the following commands:
   - `errdisable detect cause arp-inspection`
- `errdisable recovery cause arp-inspection`
- `errdisable recovery interval interval`

7. `exit`
8. Use the following show commands:
   - `show ip arp inspection interfaces`
   - `show errdisable recovery`
9. `show running-config`
10. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>

<tr>
<td></td>
<td>none}</td>
</tr>
<tr>
<td></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td>• For <code>rate pps</code>, specify an upper limit for the number of incoming</td>
</tr>
<tr>
<td></td>
<td>packets processed per second. The range is 0 to 2048 pps.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>burst interval seconds</code>, specify the consecutive</td>
</tr>
<tr>
<td></td>
<td>interval in seconds, over which the interface is monitored for a high</td>
</tr>
<tr>
<td></td>
<td>rate of ARP packets. The range is 1 to 15.</td>
</tr>
<tr>
<td></td>
<td>• For <code>rate none</code>, specify no upper limit for the rate of incoming</td>
</tr>
<tr>
<td></td>
<td>ARP packets that can be processed.</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 6** | Use the following commands:  
  - `errdisable detect cause arp-inspection`  
  - `errdisable recovery cause arp-inspection`  
  - `errdisable recovery interval interval`  
  (Optional) Enables error recovery from the dynamic ARP inspection error-disabled state, and configure the dynamic ARP inspection recover mechanism variables.  
  By default, recovery is disabled, and the recovery interval is 300 seconds.  
  For `interval interval`, specify the time in seconds to recover from the error-disabled state. The range is 30 to 86400. |
| **Step 7** | `exit`  
  Returns to privileged EXEC mode. |
| **Step 8** | Use the following show commands:  
  - `show ip arp inspection interfaces`  
  - `show errdisable recovery`  
  Verifies your settings. |
| **Step 9** | `show running-config`  
  **Example:**  
  `Device# show running-config`  
  Verifies your entries. |
| **Step 10** | `copy running-config startup-config`  
  **Example:**  
  `Device# copy running-config startup-config`  
  (Optional) Saves your entries in the configuration file. |

### Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

#### SUMMARY STEPS

1. `enable`  
2. `configure terminal`  
3. `ip arp inspection validate {[src-mac] [dst-mac] [ip]}`  
4. `exit`  
5. `show ip arp inspection vlan vlan-range`  
6. `show running-config`  
7. `copy running-config startup-config`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Performs a specific check on incoming ARP packets. By default, no checks are performed.</td>
</tr>
<tr>
<td>ip arp inspection validate {[src-mac] [dst-mac] [ip]}</td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td>• For src-mac, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td></td>
<td>• For dst-mac, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td></td>
<td>• For ip, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses.</td>
</tr>
<tr>
<td>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Verifies your settings.</td>
</tr>
<tr>
<td>show ip arp inspection vlan vlan-range</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>show running-config</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

**Command or Action**

Device# show running-config

**Purpose**

(Optional) Saves your entries in the configuration file.

**Step 7**

**copy running-config startup-config**

*Example:*

Device# copy running-config startup-config

---

### Monitoring DAI

To monitor DAI, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection statistics</td>
<td>Clears dynamic ARP inspection statistics.</td>
</tr>
<tr>
<td>show ip arp inspection statistics [vlan vlan-range]</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
</tbody>
</table>

For the *show ip arp inspection statistics* command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

### Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
<tr>
<td>show ip arp inspection interfaces [interface-id]</td>
<td>Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.</td>
</tr>
</tbody>
</table>
**Command**

<table>
<thead>
<tr>
<th>show ip arp inspection vlan vlan-range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
</tbody>
</table>

Chapter 67

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term switch refers to a standalone switch or a switch stack.

- Finding Feature Information, on page 1289
- Information About 802.1x Port-Based Authentication, on page 1289
- How to Configure 802.1x Port-Based Authentication, on page 1322
- Monitoring 802.1x Statistics and Status, on page 1378
- Additional References for IEEE 802.1x Port-Based Authentication, on page 1378
- Feature Information for 802.1x Port-Based Authentication, on page 1379

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About 802.1x Port-Based Authentication

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Note

TACACS is not supported with 802.1x authentication.
Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

</tbody>
</table>

**Port-Based Authentication Process**

To configure IEEE 802.1X port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.

- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.

- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.

- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

**Note**

Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.
This figure shows the authentication process.

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during re-authentication. The actions are Initialize and ReAuthenticate. When the Initialize action is set (the attribute value is DEFAULT), the 802.1x session ends, and connectivity is lost during re-authentication. When the ReAuthenticate action is set (the attribute value is RADIUS-Request), the session is not affected during re-authentication.
On an interface having authentication configuration and sessions, we recommend you not to DEFAULT the interface with session in place. The console will hang if you DEFAULT a range of interfaces in a stack.

- You manually re-authenticate the client by entering the `dot1x re-authenticate interface interface-id` privileged EXEC command.

### Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the `authentication port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.
This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

This figure shows the message exchange during MAC authentication bypass.

15 Supported in Cisco IOS Release 12.2(50)SE and later.

16 For clients that do not support 802.1x authentication.

### Per-User ACLs and Filter-Ids

**Note**

You can only set any as the source in the ACL.
For any ACL configured for multiple-host mode, the source portion of statement must be any. (For example, permit icmp any host 10.10.1.1.)

Note

Using role-based ACLs as Filter-Id is not recommended.

You must specify any in the source ports of any defined ACL. Otherwise, the ACL cannot be applied and authorization fails. Single host is the only exception to support backward compatibility.

More than one host can be authenticated on MDA-enabled and multiauth ports. The ACL policy applied for one host does not affect the traffic of another host. If only one host is authenticated on a multi-host port, and the other hosts gain network access without authentication, the ACL policy for the first host can be applied to the other connected hosts by specifying any in the source address.

Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the authentication host-mode, authentication violation, and authentication timer interface configuration commands.

802.1x-specific commands begin with the dot1x keyword. For example, the authentication port-control auto interface configuration command enables authentication on an interface.

To disable dot1x on a switch, remove the configuration globally by using the no dot1x system-auth-control, and also remove it from all configured interfaces.

Note

If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

The authentication manager commands provide the same functionality as earlier 802.1x commands.

When filtering out verbose system messages generated by the authentication manager, the filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The no authentication logging verbose global configuration command filters verbose messages from the authentication manager.

- The no dot1x logging verbose global configuration command filters 802.1x authentication verbose messages.

- The no mab logging verbose global configuration command filters MAC authentication bypass (MAB) verbose messages.

Ports in Authorized and Unauthorized States

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the unauthorized state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the authorized state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

Note

CDP bypass is not supported and may cause a port to go into err-disabled state.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the authentication port-control interface configuration command and these keywords:

- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.

- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.

- **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.
Port-Based Authentication and Switch Stacks

If a switch is added to or removed from a switch stack, 802.1x authentication is not affected as long as the IP connectivity between the RADIUS server and the stack remains intact. This statement also applies if the stack master is removed from the switch stack. Note that if the stack master fails, a stack member becomes the new stack master by using the election process, and the 802.1x authentication process continues as usual.

If IP connectivity to the RADIUS server is interrupted because the switch that was connected to the server is removed or fails, these events occur:

- Ports that are already authenticated and that do not have periodic re-authentication enabled remain in the authenticated state. Communication with the RADIUS server is not required.
- Ports that are already authenticated and that have periodic re-authentication enabled (with the dot1x re-authentication global configuration command) fail the authentication process when the re-authentication occurs. Ports return to the unauthenticated state during the re-authentication process. Communication with the RADIUS server is required.

For an ongoing authentication, the authentication fails immediately because there is no server connectivity.

If the switch that failed comes up and rejoins the switch stack, the authentications might or might not fail depending on the boot-up time and whether the connectivity to the RADIUS server is re-established by the time the authentication is attempted.

To avoid loss of connectivity to the RADIUS server, you should ensure that there is a redundant connection to it. For example, you can have a redundant connection to the stack master and another to a stack member, and if the stack master fails, the switch stack still has connectivity to the RADIUS server.

802.1x Host Mode

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients.

In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

Figure 105: Multiple Host Mode Example
For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

The switch supports multidomain authentication (MDA), which allows both a data device and a voice device, such as an IP Phone (Cisco or non-Cisco), to connect to the same switch port.

### 802.1x Multiple Authentication Mode

Multiple-authentication (multiauth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multiauth port.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
- The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.
- After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.
- You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.
- The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

### Multi-auth Per User VLAN assignment

This feature is supported only on Catalyst 2960X switches running the LAN base image

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.
The number of hosts per multi-auth port is 8, however there can be more hosts.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

**Scenario one**

When a hub is connected to an access port, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behavior is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 send untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

**Scenario two**

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

**Scenario three**

When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).

---

**Note**

The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

---

**Limitation in Multi-auth Per User VLAN assignment**

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs**: Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.
• **IPv6 control packets**: In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assigns incorrect IPv6 address to itself. Such a host is unable to get access to the network.

The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports. The packet is replicated for each client in multi-auth port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

• **IP multicast**: Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANs join the multicast group. When two hosts in different VLANs join a multicast group (on the same multi-auth port), two copies of each multicast packet are sent out from that port.

### MAC Move

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port. MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on the that port.) When a MAC address moves from one port to another, the switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port. The MAC move feature applies to both voice and data hosts.

In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.

### MAC Replace

The MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the **authentication violation** interface configuration command with the **replace** keyword, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
• The authentication manager replaces the MAC address of the current data host on the port with the new
  MAC address.
• The authentication manager initiates the authentication process for the new MAC address.
• If the authentication manager determines that the new host is a voice host, the original voice host is
  removed.

If a port is in open authentication mode, any new MAC address is immediately added to the MAC address
  table.

802.1x Accounting

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep
track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor
this activity on 802.1x-enabled ports:
  • User successfully authenticates.
  • User logs off.
  • Link-down occurs.
  • Re-authentication successfully occurs.
  • Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS
server, which must be configured to log accounting messages.

802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These
AV pairs provide data for different applications. (For example, a billing application might require information
that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS
accounting packets are sent by a switch:
  • START—sent when a new user session starts
  • INTERIM—sent during an existing session for updates
  • STOP—sent when a session terminates

You can view the AV pairs that are being sent by the switch by entering the debug radius accounting
privileged EXEC command. For more information about this command, see the Cisco IOS Debug Command
Reference, Release 12.4.
This table lists the AV pairs and when they are sent are sent by the switch.

**Table 138: Accounting AV Pairs**

17 The Framed-IP-Address AV pair is sent when a valid static IP address is configured or when a Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.

### 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.
Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode in Cisco IOS Release 12.2(37)SE. In Cisco IOS Release 12.2(40)SE and later, when a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.
- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).

- If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.
- If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- Enabling port security does not impact the RADIUS server-assigned VLAN behavior.
- If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.
- If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:
  - If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, then authorization of all devices on the port is terminated and multidomain host
mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.

- If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

- If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.

- If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  - [64] Tunnel-Type = VLAN
  - [65] Tunnel-Medium-Type = 802
  - [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID
  - [83] Tunnel-Preference

Attribute [64] must contain the value `VLAN` (type 13). Attribute [65] must contain the value `802` (type 6). Attribute [81] specifies the `VLAN name` or `VLAN ID` assigned to the IEEE 802.1x-authenticated user.

### 802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch
does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the
switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence
over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes
precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port,
to which a port ACL is applied, are filtered by the port ACL. Incoming routed packets received on other ports
are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration
conflicts, you should carefully plan the user profiles stored on the RADIUS server.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes
(VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs
used for per-user ACLs are inacl#<n> for the ingress direction and outacl#<n> for the egress direction. MAC
ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It
does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server.
When the definitions are passed from the RADIUS server, they are created by using the extended naming
convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the
switch. The attribute contains the ACL number followed by .in for ingress filtering or .out for egress filtering.
If the RADIUS server does not allow the .in or .out syntax, the access list is applied to the outbound ACL by
default. The user is marked unauthorized if the Filter-Id sent from the RADIUS server is not configured on
the device. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported
only for IP ACLs numbered in the range of 1 to 199 (IP standard ACLs) and 1300 to 2699 (IP extended ACLs).

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of
RADIUS-server per-user ACLs.

You must meet the following prerequisites to configure per-user ACLs:

• Enable AAA authentication.
• Enable AAA authorization by using the network keyword to allow interface configuration from the
  RADIUS server.
• Enable 802.1x authentication.
• Configure the user profile and VSAs on the RADIUS server.
• Configure the 802.1x port for single-host mode.

---

**Note**

Per-user ACLs are supported only in single-host mode.

---

### 802.1x Authentication with Downloadable ACLs and Redirect URLs

---

**Note**

IPv6 does not support Redirect URLs.
You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication or MAC authentication bypass of the host. You can also download ACLs during web authentication.

**Note**

A downloadable ACL is also referred to as a dACL.

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode, the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.

If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.

**Note**

The limit for dACL with stacking is 64 ACEs per dACL per port. The limit without stacking is the number of available TCAM entries which varies based on the other ACL features that are active.

If there is no static ACL on a port, a dynamic auth-default ACL is created, and policies are enforced before dACLs are downloaded and applied.

**Note**

The auth-default-ACL does not appear in the running configuration.

The auth-default ACL is created when at least one host with an authorization policy is detected on the port. The auth-default ACL is removed from the port when the last authenticated session ends. You can configure the auth-default ACL for IPv4 by using the `ip access-list extended auth-default-acl` command in global configuration mode. For IPv6, use the `ipv6 access-list extended auth-default-acl` command in the global configuration mode.

**Note**

The auth-default-ACL does not support Cisco Discovery Protocol bypass in the single host mode. You must configure a static ACL on the interface to support Cisco Discovery Protocol bypass.

The 802.1x and MAB authentication methods support two authentication modes, open and closed. If there is no static ACL on a port in closed authentication mode:

- An auth-default-ACL is created.
- The auth-default-ACL allows only DHCP traffic until policies are enforced.
- When the first host authenticates, the authorization policy is applied without IP address insertion.
- When a second host is detected, the policies for the first host are refreshed, and policies for the first and subsequent sessions are enforced with IP address insertion.

If there is no static ACL on a port in open authentication mode:

- An auth-default-ACL-OPEN is created and allows all traffic.
• Policies are enforced with IP address insertion to prevent security breaches.

• Web authentication is subject to the auth-default-ACL-OPEN.

To control access for hosts with no authorization policy, you can configure a directive. The supported values for the directive are open and default. When you configure the open directive, all traffic is allowed. The default directive subjects traffic to the access provided by the port. You can configure the directive either in the user profile on the AAA server or on the switch. To configure the directive on the AAA server, use the authz-directive=openglobal command. To configure the directive on the switch, use the epm access-control open global configuration command.

**Note**

The default value of the directive is default.

If a host falls back to web authentication on a port without a configured ACL:

• If the port is in open authentication mode, the auth-default-ACL-OPEN is created.

• If the port is in closed authentication mode, the auth-default-ACL is created.

The access control entries (ACEs) in the fallback ACL are converted to per-user entries. If the configured fallback profile does not include a fallback ACL, the host is subject to the auth-default-ACL associated with the port.

**Note**

If you use a custom logo with web authentication and it is stored on an external server, the port ACL must allow access to the external server before authentication. You must either configure a static port ACL or change the auth-default-ACL to provide appropriate access to the external server.

**Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL**

The switch uses these cisco-av-pair VSAs:

• url-redirect is the HTTP or HTTPS URL.

• url-redirect-acl is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the end point. The switch then forwards the client web browser to the specified redirect address. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.

**Note**

• Traffic that matches a permit ACE in the ACL is redirected.

• Define the URL redirect ACL and the default port ACL on the switch.

If a redirect URL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.
Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS cisco-av-pair vendor-specific attributes (VSAs). This pair specifies the names of the downloadable ACLs on the Cisco Secure ACS with the #ACL#-IP-name-number attribute for IPv4 and #ACL#-.in.ipv6 attribute for IPv6.

- The *name* is the ACL name.
- The *number* is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

VLAN ID-Based MAC Authentication

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:
• Enter the `authentication event no-response action authorize vlan vlan-id` interface configuration command to allow access to the guest VLAN.

• Enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command to restart the port.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.

---

**Note**

If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

Any number of 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes. You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports **MAC authentication bypass**. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

---

### 802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN (also referred to as an **authentication failed VLAN**) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN. These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

---

**Note**

You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count...
increments when the RADIUS server replies with either an EAP failure or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.

Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a link down or EAP logoff event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the link down or EAP logoff event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports.

You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

### 802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as critical authentication or the AAA fail policy, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated.

You can configure the switch to connect those hosts to critical ports.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the critical VLAN. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the critical-authentication state, which is a special case of the authentication state.

**Note**

If critical authentication is configured on interface, then vlan used for critical authorization (critical vlan) should be active on the switch. If the critical_vlan is inactive (or) down, critical authentication session will keep trying to enable inactive vlan and fail repeatedly. This can lead to large amount of memory holding.

### Inaccessible Authentication Bypass Support on Multiple-Authentication Ports

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on multiple-authentication (multiauth) ports, use the authentication event server dead action reinitialize vlan vlan-id command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.
Inaccessible Authentication Bypass Authentication Results

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.

- If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.

- If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

Inaccessible Authentication Bypass Feature Interactions

Inaccessible authentication bypass interacts with these features:

- Guest VLAN—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 8021.x port, the features interact as follows:
  - If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
  - If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
  - If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.
  - If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.

- Restricted VLAN—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.

- 802.1x accounting—Accounting is not affected if the RADIUS servers are unavailable.

- Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.

- Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.

- Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.

In a switch stack:
• The stack master checks the status of the RADIUS servers by sending keepalive packets. When the status of a RADIUS server changes, the stack master sends the information to the stack members. The stack members can then check the status of RADIUS servers when re-authenticating critical ports.

• If the new stack master is elected, the link between the switch stack and RADIUS server might change, and the new stack immediately sends keepalive packets to update the status of the RADIUS servers. If the server status changes from dead to alive, the switch re-authenticates all switch ports in the critical-authentication state.

When a member is added to the stack, the stack master sends the member the server status.

**802.1x Critical Voice VLAN**

When an IP phone connected to a port is authenticated by the Cisco Identity Services Engine (ISE), the phone is put into the voice domain. If the ISE is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

---

**Note**

Dynamic assignment of critical voice VLAN is not supported with nested service templates. It causes the device to switch between VLANs continuously in a loop.

You can enter the `authentication event server dead action authorize voice` interface configuration command to configure the critical voice VLAN feature. When the ISE does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through Cisco Discovery Protocol (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the `switchport voice vlan vlan-id` interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

**802.1x User Distribution**

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.

• Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a
particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.

- Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured using the switch CLI. If the VLAN group name is found, the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.

**Note**
The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups.

### 802.1x User Distribution Configuration Guidelines

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

### IEEE 802.1x Authentication with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:

- **VVID** to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- **PVID** to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.
When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone.

---

**IEEE 802.1x Authentication with Port Security**

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

---

**IEEE 802.1x Authentication with Wake-on-LAN**

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the magic packet. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

---

**IEEE 802.1x Authentication with MAC Authentication Bypass**

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.
If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured. This process works for most client devices; however, it does not work for clients that use an alternate MAC address format. You can configure how MAB authentication is performed for clients with MAC addresses that deviate from the standard format or where the RADIUS configuration requires the user name and password to differ.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant and uses 802.1x authentication (not MAC authentication bypass) to authorize the interface. EAPOL history is cleared if the interface link status goes down.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is DEFAULT.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) and if the Termination-Action RADIUS attribute (Attribute[29]) action is Initialize (the attribute value is DEFAULT), the MAC authentication bypass session ends, and connectivity is lost during re-authentication. If MAC authentication bypass is enabled and the IEEE 802.1x authentication times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—You can enable MAC authentication bypass only if 802.1x authentication is enabled on the port.
- Guest VLAN—If a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.
- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.
- Port security
- Voice VLAN
- Private VLAN—You can assign a client to a private VLAN.

Cisco IOS Release 12.2(55)SE and later supports filtering of verbose MAB system messages.
Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or posture of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.
- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the DEFAULT or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.
- Set the list of VLAN number or name or VLAN group name as the value of the Tunnel Group Private ID (Attribute[81]) and the preference for the VLAN number or name or VLAN group name as the value of the Tunnel Preference (Attribute[83]). If you do not configure the Tunnel Preference, the first Tunnel Group Private ID (Attribute[81]) attribute is picked up from the list.
- View the NAC posture token, which shows the posture of the client, by using the show authentication privileged EXEC command.
- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. The IEEE 802.1X Flexible Authentication feature supports three authentication methods:

- dot1X—IEEE 802.1X authentication is a Layer 2 authentication method.
- mab—MAC-Authentication Bypass is a Layer 2 authentication method.
- webauth—Web authentication is a Layer 3 authentication method.

Using this feature, you can control which ports use which authentication methods, and you can control the failover sequencing of methods on those ports. For example, MAC authentication bypass and 802.1x can be the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

The IEEE 802.1X Flexible Authentication feature supports the following host modes:

- multi-auth—Multiauthentication allows one authentication on a voice VLAN and multiple authentications on the data VLAN.
- multi-domain—Multidomain authentication allows two authentications: one on the voice VLAN and one on the data VLAN.
Open1x Authentication

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

- Single-host mode with open authentication–Only one user is allowed network access before and after authentication.
- MDA mode with open authentication–Only one user in the voice domain and one user in the data domain are allowed.
- Multiple-hosts mode with open authentication–Any host can access the network.
- Multiple-authentication mode with open authentication–Similar to MDA, except multiple hosts can be authenticated.

Note

If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the `authentication open` interface configuration command, the port will grant access to the host irrespective of the `authentication port-control` interface configuration command.

Multidomain Authentication

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

Note

For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Follow these guidelines for configuring MDA:

- You must configure a switch port for MDA.
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.
- Voice VLAN assignment on an MDA-enabled port is supported Cisco IOS Release 12.2(40)SE and later.
- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of `device-traffic-class=voice`. Without this value, the switch treats the voice device as a data device.
- The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.
• If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.

• Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.

• A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.

• MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.

• When a data or a voice device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.

• If more than five devices are detected on the data VLAN or more than one voice device is detected on the voice VLAN while a port is unauthorized, the port is error disabled.

• When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.

• Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.

• Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.

• If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.

• We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

Limiting Login for Users

The Limiting Login feature helps Network administrators to limit the login attempt of users to a network. When a user fails to successfully login to a network within a configurable number of attempts within a configurable time limit, the user can be blocked. This feature is enabled only for local users and not for remote users. You need to configure the `aaa authentication rejected` command in global configuration mode to enable this feature.

802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms). This allows any type of device to authenticate on the port.

• 802.1x switch supplicant: You can configure a switch to act as a supplicant to another switch by using the 802.1x supplicant feature. This configuration is helpful in a scenario, where, for example, a switch
is outside a wiring closet and is connected to an upstream switch through a trunk port. A switch configured with the 802.1x switch supplicant feature authenticates with the upstream switch for secure connectivity. Once the supplicant switch authenticates successfully the port mode changes from access to trunk in an authenticator switch. In a supplicant switch you must manually configure trunk when enabling CISP.

**Note**

NEAT configuration is the only supported and qualified method to authenticate switches using 802.1x. Any other method to authenticate a network switch can result in an undefined behavior.

- If the access VLAN is configured on the authenticator switch, it becomes the native VLAN for the trunk port after successful authentication.

In the default state, when you connect a supplicant switch to an authenticator switch that has BPDU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the \texttt{dot1x supplicant controlled transient} global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the \texttt{no dot1x supplicant controlled transient} global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the \texttt{dot1x supplicant controlled transient} command on a supplicant switch when BPDU guard is enabled on the authenticator switch port with the \texttt{spanning-tree bpduguard enable} interface configuration command.

**Note**

If you globally enable BPDU guard on the authenticator switch by using the \texttt{spanning-tree portfast bpduguard default} global configuration command, entering the \texttt{dot1x supplicant controlled transient} command does not prevent the BPDU violation.

You can enable MDA or multi-auth mode on the authenticator switch interface that connects to one more supplicant switches. Multihost mode is not supported on the authenticator switch interface.

When you reboot an authenticator switch with single-host mode enabled on the interface, the interface may move to err-disabled state before authentication. To recover from err-disabled state, flap the authenticator port to activate the interface again and initiate authentication.

Use the \texttt{dot1x supplicant force-multicast} global configuration command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

- **Host Authorization:** Ensures that only traffic from authorized hosts (connecting to the switch with supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting to the supplicant switch to the authenticator switch.

- **Auto enablement:** Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs coming from supplicant switches. Configure the cisco-av-pair as \texttt{device-traffic-class=switch} at the ISE. (You can configure this under the group or the user settings.)
The `switchport nonegotiate` command is not supported on supplicant and authenticator switches with NEAT. This command should not be configured at the supplicant side of the topology. If configured on the authenticator side, the internal macros will automatically remove this command from the port.

### Voice Aware 802.1x Security

**Note**

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

### Common Session ID

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.

The session ID includes:

- The IP address of the Network Access Device (NAD)
• A monotonically increasing unique 32 bit integer
• The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 160000050000000B288508E5:

```
Device# show authentication sessions
Interface  MAC Address    Method  Domain  Status            Session ID
Fa4/0/4    0000.0000.0203 mab  DATA   Authz Success 160000050000000B288508E5
```

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 160000050000000B288508E5:

```
1w0d: %AUTHMGR-5-START: Starting 'mab' for client (0000.0000.0203) on Interface Fa4/0/4
AuditSessionID 160000050000000B288508E5
1w0d: %MAB-5-SUCCESS: Authentication successful for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %AUTHMGR-7-RESULT: Authentication result 'success' from 'mab' for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
```

The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

# How to Configure 802.1x Port-Based Authentication

## Default 802.1x Authentication Configuration

802.1x Authentication Configuration Guidelines

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.

- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

  If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

- Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

- When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

- After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x
authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (authentication timer inactivity and authentication timer reauthentication interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.

• When configuring the inaccessible authentication bypass feature, follow these guidelines:
  • The feature is supported on 802.1x port in single-host mode and multihosts mode.
  • If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
  • If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.
  • You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.
  • If the CTS links are in Critical Authentication mode and the master reloads, the policy where SGT was configured on a device will not be available on the new master. This is because the internal bindings will not be synced to the standby switch in a 3750-X switch stack.

• You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

• When wireless guest clients obtains IP from foreign client VLAN instead of anchor client VLAN, you should use the ip dhcp required command under the WLAN configuration to force clients to issue a new DHCP request. This prevents the clients from getting an incorrect IP at anchor.

• If the wired guest clients fail to get IP address after a Cisco WLC (foreign) reload, perform a shut/no shut on the ports used by the clients to reconnect them.

**MAC Authentication Bypass**

These are the MAC authentication bypass configuration guidelines:

• Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.

• If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.

• If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.

• If the port is in the authorized state, the port remains in this state until re-authorization occurs.

• You can configure a timeout period for hosts that are connected by MAC authentication bypass but are inactive. The range is 1 to 65535 seconds.
Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an 802.1x-enabled port:

- In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.

- In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.

- In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

Configuring 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as `dot1x force-unauthorized`.

Follow these steps to enable the 802.1x readiness check on the switch:

Before you begin

Follow these guidelines to enable the readiness check on the switch:

- The readiness check is typically used before 802.1x is enabled on the switch.
- If you use the `dot1x test capol-capable` privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.
- When you configure the `dot1x test capol-capable` command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
- When you configure the `dot1x test capol-capable` command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
- The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `dot1x test capol-capable [interface interface-id]`
4. `dot1x test timeout timeout`
### DETAILED STEPS

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Command:</strong> <code>enable</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device&gt; enable</code>&lt;br&gt;Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Command:</strong> <code>configure terminal</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# configure terminal</code>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Command:</strong> <code>dot1x test eapol-capable [interface interface-id]</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# dot1x test eapol-capable interface gigabitethernet1/0/13</code>&lt;br&gt;<code>DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable</code>&lt;br&gt;Enables the 802.1x readiness check on the switch.&lt;br&gt;(Optional) For <code>interface-id</code> specify the port on which to check for IEEE 802.1x readiness.&lt;br&gt;<strong>Note</strong> If you omit the optional <code>interface</code> keyword, all interfaces on the switch are tested.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Command:</strong> <code>dot1x test timeout timeout</code>&lt;br&gt;(Optional) Configures the timeout used to wait for EAPOL response. The range is from 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Command:</strong> <code>end</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device(config)# end</code>&lt;br&gt;Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Command:</strong> <code>show running-config</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# show running-config</code>&lt;br&gt;Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>Command:</strong> <code>copy running-config startup-config</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# copy running-config startup-config</code>&lt;br&gt;(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring Voice Aware 802.1x Security

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature on the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

• You enable voice aware 802.1x security by entering the `errdisable detect cause security-violation shutdown vlan` global configuration command. You disable voice aware 802.1x security by entering the `no` version of this command. This command applies to all 802.1x-configured ports in the switch.

  Note: If you do not include the `shutdown vlan` keywords, the entire port is shut down when it enters the error-disabled state.

• If you use the `errdisable recovery cause security-violation` global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the `shutdown` and `no shutdown` interface configuration commands.

• You can re-enable individual VLANs by using the `clear errdisable interface interface-id vlan [vlan-list]` privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

**SUMMARY STEPS**

1. `configure terminal`
2. `errdisable detect cause security-violation shutdown vlan`
3. `errdisable recovery cause security-violation`
4. `clear errdisable interface interface-id vlan [vlan-list]`
5. Enter the following:
   - `shutdown`
   - `no shutdown`
6. `end`
7. `show errdisable detect`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>errdisable detect cause security-violation shutdown vlan</code></td>
<td>Shut down any VLAN on which a security violation error occurs.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If the <code>shutdown vlan</code> keywords are not included, the entire port enters the error-disabled state and shuts down.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>errdisable recovery cause security-violation</code> Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 4** | `clear errdisable interface interface-id vlan [vlan-list]` (Optional) Reenable individual VLANs that have been error disabled.  
  • For `interface-id` specify the port on which to reenable individual VLANs.  
  • (Optional) For `vlan-list` specify a list of VLANs to be re-enabled. If `vlan-list` is not specified, all VLANs are re-enabled. |
| **Step 5** | Enter the following:  
  • `shutdown`  
  • `no shutdown` (Optional) Re-enable an error-disabled VLAN, and clear all error-disable indications. |
| **Step 6** | `end` Return to privileged EXEC mode. |
| **Step 7** | `show errdisable detect` Verify your entries. |

**Example**

This example shows how to configure the switch to shut down any VLAN on which a security violation error occurs:

```
Switch(config)# errdisable detect cause security-violation shutdown vlan
```

This example shows how to re-enable all VLANs that were error disabled on port Gigabit Ethernet 40/2.

```
Switch# clear errdisable interface gigabitethernet40/2 vlan
```

You can verify your settings by entering the `show errdisable detect` privileged EXEC command.

**Configuring 802.1x Violation Modes**

You can configure an 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

• a device connects to an 802.1x-enabled port

• the maximum number of allowed about devices have been authenticated on the port

Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:
SUMMARY STEPS

1. configure terminal
2. aaa new-model
3. aaa authentication dot1x \{default\} method1
4. interface interface-id
5. switchport mode access
6. authentication violation \{shutdown | restrict | protect | replace\}
7. end

</table>
Configuring 802.1x Authentication

To allow per-user ACLs or VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the 802.1x AAA process:

Before you begin

To configure 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

SUMMARY STEPS

1. A user connects to a port on the switch.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The switch sends a start message to an accounting server.
5. Re-authentication is performed, as necessary.
6. The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.
7. The user disconnects from the port.
8. The switch sends a stop message to the accounting server.

DETAILED STEPS

<table>

<td>(Optional) Sets the port to access mode only if you configured the RADIUS server in Step 6 and Step 7. Example: Device(config-if)# switchport mode access</td>
</tr>
</tbody>
</table>
## Configuring the Switch-to-RADIUS-Server Communication

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius-server host` global configuration command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, the `radius-server retransmit`, and the `radius-server key` global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

### Before you begin

You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius-server host {hostname | ip-address} auth-port port-number key string`
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the authentication port-control interface configuration command set to auto. Use the multi-domain keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures the RADIUS server parameters.</td>
</tr>
<tr>
<td>radius-server host {hostname</td>
<td>ip-address} auth-port port-number key string</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>For hostname</td>
</tr>
<tr>
<td>Device(config)# radius-server host 125.5.5.43 auth-port 1645 key rad123</td>
<td>For auth-port port-number, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536.</td>
</tr>
<tr>
<td></td>
<td>For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</td>
</tr>
<tr>
<td></td>
<td>If you want to use multiple RADIUS servers, re-enter this command.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. authentication host-mode [multi-auth | multi-domain | multi-host | single-host]
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to which multiple hosts are indirectly attached, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> authentication host-mode [multi-auth</td>
<td>multi-domain</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# authentication host-mode multi-host</td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td>• <strong>multi-auth</strong>—Allow multiple authenticated clients on both the voice VLAN and data VLAN.</td>
</tr>
<tr>
<td></td>
<td>Note The <strong>multi-auth</strong> keyword is only available with the <strong>authentication host-mode</strong> command.</td>
</tr>
<tr>
<td></td>
<td>• <strong>multi-host</strong>—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>multi-domain</strong>—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port.</td>
</tr>
<tr>
<td></td>
<td>Note You must configure the voice VLAN for the IP phone when the host mode is set to <strong>multi-domain</strong>.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

Note: Make sure that the **authentication port-control** interface configuration command is set to **auto** for the specified interface.
Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. authentication periodic
4. authentication timer {([inactivity | reauthenticate | restart | unauthorized])} {value}
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> authentication periodic</td>
<td>Enables periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# authentication periodic</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> authentication timer {([inactivity</td>
<td>reauthenticate</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

Note: The default value is 3600 seconds. To change the value of the reauthentication timer or to have the switch use a RADIUS-provided session timeout, enter the authentication timer reauthenticate command.

The authentication timer keywords have these meanings:
Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The `authentication timer restart` interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication timer restart seconds`
4. `end`
5. `show authentication sessions interface interface-id`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

_This command affects the behavior of the switch only if periodic re-authentication is enabled._
### Purpose

Command or Action  | Purpose
--- | ---
**Step 2**  | Specifies the port to be configured, and enter interface configuration mode.

**interface interface-id**  
*Example:*

Device(config)# **interface gigabitethernet2/0/1**

**Step 3**  | Sets the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client.

**authentication timer restart** *seconds*  
*Example:*

Device(config-if)# **authentication timer restart 30**  
The range is 1 to 65535 seconds; the default is 60.

**Step 4**  | Returns to privileged EXEC mode.

**end**  
*Example:*

Device(config-if)# **end**

**Step 5**  | Verifies your entries.

**show authentication sessions interface** *interface-id*  
*Example:*

Device# **show authentication sessions interface gigabitethernet2/0/1**

**Step 6**  | (Optional) Saves your entries in the configuration file.

**copy running-config startup-config**  
*Example:*

Device# **copy running-config startup-config**

---

### Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

**SUMMARY STEPS**

1. **configure terminal**
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Setting the **Switch-to-Client Frame-Retransmission Number**

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

---

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

---

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `dot1x max-reauth-req count`
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<td></td>
</tr>
<tr>
<td><code>Device(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

**Note**
You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `switchport mode access`
4. `dot1x max-req count`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

<td>Device(config-if)# authentication violation replace</td>
</tr>
</tbody>
</table>
### Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

**Note**

In Cisco IOS XE Denali 16.3.x and Cisco IOS XE Everest 16.6.x, periodic AAA accounting updates are not supported. The switch does not send periodic interim accounting records to the accounting server. Periodic AAA accounting updates are available in Cisco IOS XE Fuji 16.9.x and later releases.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```

When the stop message is not sent successfully, this message appears:

```
00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.
```
You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. aaa accounting dot1x default start-stop group radius
4. aaa accounting system default start-stop group radius
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;Example:&lt;br&gt;Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong>&lt;br&gt;Example:&lt;br&gt;Device(config)# interface gigabitethernet1/0/3</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>aaa accounting dot1x default start-stop group radius</strong>&lt;br&gt;Example:&lt;br&gt;Device(config-if)# aaa accounting dot1x default start-stop group radius</td>
</tr>
<tr>

<td><strong>aaa accounting system default start-stop group radius</strong>&lt;br&gt;Example:&lt;br&gt;Device(config-if)# aaa accounting system default start-stop group radius</td>
</tr>
</tbody>
</table>
When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. Use one of the following:
   - switchport mode access
   - switchport mode private-vlan host
4. authentication event no-response action authorize vlan vlan-id
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
### 6. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
Example: Device# configure terminal | Enters global configuration mode. |
| **Step 2** | interface interface-id  
Example: Device(config)# interface gigabitethernet 2/0/2 | Specifies the port to be configured, and enter interface configuration mode. |
| **Step 3** | Use one of the following:  
• switchport mode access  
• switchport mode private-vlan host  
Example: Device(config-if)# switchport mode access | • Sets the port to access mode.  
• Configures the Layer 2 port as a private-VLAN host port. |
| **Step 4** | authentication port-control auto  
Example: Device(config-if)# authentication port-control auto | Enables 802.1x authentication on the port. |
| **Step 5** | authentication event fail action authorize vlan vlan-id  
Example: Device(config-if)# authentication event fail action authorize vlan 2 | Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094.  
You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. |
| **Step 6** | end  
Example: Device(config-if)# end | Returns to privileged EXEC mode. |
Configuring Number of Authentication Attempts on a Restricted VLAN

You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the `authentication event retry retry count` interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   • `switchport mode access`
   • `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
6. `authentication event retry retry count`
7. `end`

</table>
### Command or Action

| Step 6 | `dot1x critical {eapol | recovery delay milliseconds}` |
|--------|--------------------------------------------------------|
| **Example:** | Device(config)# `dot1x critical eapol`<br>Device(config)# `dot1x critical recovery delay 2000` |

### Purpose

- **idle-time time**—Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes. The default is 60 minutes (1 hour).
- **ignore-acct-port**—Disable testing on the RADIUS-server accounting port.
- **ignore-auth-port**—Disable testing on the RADIUS-server authentication port.

*For keystring,* specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.

**Note** Always configure the key as the last item in the `radius-server host` command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.

You can also configure the authentication and encryption key by using the `radius-server key {0string | 7string | string}` global configuration command.

- **Step 7** `interface interface-id` |
| **Example:** | Device(config)# `interface gigabitethernet 1/0/1` |

(Optional) Configure the parameters for inaccessible authentication bypass:

- **eapol**—Specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port.
- **recovery delay milliseconds**—Set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The range is from 1 to 10000 milliseconds. The default is 1000 milliseconds (a port can be re-initialized every second). Specify the port to be configured, and enter interface configuration mode.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td>Use these keywords to move hosts on the port if the RADIUS server is unreachable:</td>
</tr>
</tbody>
</table>
| authentication event server dead action {authorize | reinitialize} vlan vlan-id | • authorize—Move any new hosts trying to authenticate to the user-specified critical VLAN.  
• reinitialize—Move all authorized hosts on the port to the user-specified critical VLAN. |
| Example: | |
| Device(config-if)# authentication event server dead action reinitialize vlan 20 | |
| **Step 9** | Specifies the voice VLAN for the port. The voice VLAN cannot be the same as the critical data VLAN configured in Step 6. |
| switchport voice vlan vlan-id | |
| Example: | |
| Device(config-if)# switchport voice vlan | |
| **Step 10** | Configures critical voice VLAN to move data traffic on the port to the voice VLAN if the RADIUS server is unreachable. |
| authentication event server dead action authorize voice | |
| Example: | |
| Device(config-if)# authentication event server dead action authorize voice | |
| **Step 11** | (Optional) Verify your entries. |
| show authentication interface interface-id | |
| Example: | |
| Device(config-if)# do show authentication interface gigabit 1/0/1 | |
| **Step 12** | (Optional) Verify your entries. |
| copy running-config startup-config | |
| Example: | |
| Device(config-if)# do copy running-config startup-config | |

**Example**

To return to the RADIUS server default settings, use the **no radius-server dead-criteria**, the **no radius-server deadtime**, and the **no radius-server host** global configuration commands. To disable inaccessible authentication bypass, use the **no authentication event server dead action** interface configuration command. To disable critical voice VLAN, use the **no authentication event server dead action authorize voice** interface configuration command.

**Example of Configuring Inaccessible Authentication Bypass**

This example shows how to configure the inaccessible authentication bypass feature:
Device(config)# radius-server dead-criteria time 30 tries 20
Device(config)# radius-server deadtime 60
Device(config)# radius-server host 1.1.1.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234
Device(config)# dot1x critical eapol
Device(config)# interface gigabitethernet 1/0/1
dot1x critical
Device(config-if)# dot1x critical vlan 20
Device(config-if)# end

**Configuring 802.1x Authentication with WoL**

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication control-direction {both | in}
4. end
5. show authentication sessions interface interface-id
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>

<tr>
<td>Device(config-if)# authentication control-direction both</td>
<td></td>
</tr>
</tbody>
</table>

- **both**—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional.
### Purpose

- **in**—Sets the port as unidirectional. The port can send packets to the host but cannot receive packets from the host.

### Command or Action | Purpose
--- | ---
**Step 4** | Return to privileged EXEC mode.
End

#### Example:

```
Device(config-if)# end
```

### Step 5

- **show authentication sessions interface interface-id**

#### Example:

```
Device# show authentication sessions interface gigabitethernet2/0/3
```

### Step 6

- **copy running-config startup-config**

#### Example:

```
Device# copy running-config startup-config
```

### Configuring MAC Authentication Bypass

Beginning in privileged EXEC mode, follow these steps to enable MAC authentication bypass. This procedure is optional.

#### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication port-control auto`
4. `mab [eap]`
5. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| configure terminal

#### Example:

```
Device# configure terminal
```
Purpose Command or Action Purpose

**Step 2**
interface interface-id
Example:
Device(config)# interface gigabitethernet 2/0/1

Specifies the port to be configured, and enter interface configuration mode.

**Step 3**
authentication port-control auto
Example:
Device(config-if)# authentication port-control auto

Enables 802.1x authentication on the port.

**Step 4**
mab [eap]
Example:
Device(config-if)# mab

Enables MAC authentication bypass.
(Optional) Use the eap keyword to configure the switch to use EAP for authorization.

**Step 5**
end
Example:
Device(config-if)# end

Returns to privileged EXEC mode.

---

### Formatting a MAC Authentication Bypass Username and Password

Use the optional **mab request format** command to format the MAB username and password in a style accepted by the authentication server. The username and password are usually the MAC address of the client. Some authentication server configurations require the password to be different from the username.

Beginning in privileged EXEC mode, follow these steps to format MAC authentication bypass username and passwords.

#### SUMMARY STEPS

1. configure terminal
2. mab request format attribute 1 groupsize \{1 | 2 | 4 | 12\} [separator \{- | : | \} \{lowercase | uppercase\}]  
3. mab request format attribute2 \{0 | 7\} text  
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Step 2**  
`mab request format attribute 1 groupsize {1 | 2 | 4 | 12} [separator {- | : | .} {lowercase | uppercase}]`

**Example:**

Device(config)# `mab request format attribute 1 groupsize 12`

**Purpose**

Specifies the format of the MAC address in the User-Name attribute of MAB-generated Access-Request packets.

1—Sets the username format of the 12 hex digits of the MAC address.

group size—The number of hex nibbles to concatenate before insertion of a separator. A valid group size must be either 1, 2, 4, or 12.

separator—The character that separates the hex nibbles according to group size. A valid separator must be either a hyphen, colon, or period. No separator is used for a group size of 12.

{lowercase | uppercase}—Specifies if nonnumeric hex nibbles should be in lowercase or uppercase.

**Step 3**  
`mab request format attribute2 {0 | 7} text`

**Example:**

Device(config)# `mab request format attribute 2 7 A02f44E18B12`

**Purpose**

2—Specifies a custom (nondefault) value for the User-Password attribute in MAB-generated Access-Request packets.

0—Specifies a cleartext password to follow.

7—Specifies an encrypted password to follow.

`text`—Specifies the password to be used in the User-Password attribute.

**Note**

When you send configuration information in e-mail, remove type 7 password information. The `show tech-support` command removes this information from its output by default.

**Step 4**  
`end`

**Example:**

Device(config)# `end`

**Purpose**

Returns to privileged EXEC mode.

---

### Configuring 802.1x User Distribution

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

**SUMMARY STEPS**

1. configure terminal
2. `vlan group vlan-group-name vlan-list vlan-list`
3. `end`
4. `no vlan group vlan-group-name vlan-list vlan-list`
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal**</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>  Device# <strong>configure terminal</strong></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** vlan group **vlan-group-name vlan-list vlan-list** | Configures a VLAN group, and maps a single VLAN or a range of VLANs to it. |
| **Example:**  Device(config)# **vlan group eng-dept vlan-list 10** |

| **Step 3** end | Returns to privileged EXEC mode. |
| **Example:**  Device(config)# **end** |

| **Step 4** no vlan group **vlan-group-name vlan-list vlan-list** | Clears the VLAN group configuration or elements of the VLAN group configuration. |
| **Example:**  Device(config)# **no vlan group eng-dept vlan-list 10** |

Example of Configuring VLAN Groups

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```
Device(config)# vlan group eng-dept vlan-list 10
Device(config)# show vlan group group-name eng-dept
Group Name       Vlans Mapped
---------------- --------------
eng-dept         10

Device(config)# show dot1x vlan-group all
Group Name       Vlans Mapped
---------------- --------------
eng-dept         10
hr-dept          20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:

```
Device(config)# vlan group eng-dept vlan-list 30
Device(config)# show vlan group eng-dept
Group Name       Vlans Mapped
---------------- --------------
```
This example shows how to remove a VLAN from a VLAN group:

Device# no vlan group eng-dept vlan-list 10

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:

Device(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.

Device(config)# show vlan group group-name eng-dept

This example shows how to clear all the VLAN groups:

Device(config)# no vlan group end-dept vlan-list all
Device(config)# show vlan-group all

For more information about these commands, see the Cisco IOS Security Command Reference.

**Configuring NAC Layer 2 802.1x Validation**

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication event no-response action authorize vlan vlan-id
5. authentication periodic
6. authentication timer reauthenticate
7. end
8. show authentication sessions interface interface-id
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>

<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| 2    | `interface interface-id`  
**Example:**  
Device(config)# interface gigabitethernet2/0/3 | Specifies the port to be configured, and enter interface configuration mode. |
| 3    | `switchport mode access`  
**Example:**  
Device(config-if)# switchport mode access | Sets the port to access mode only if you configured the RADIUS server. |
| 4    | `authentication event no-response action authorize vlan vlan-id`  
**Example:**  
Device(config-if)# authentication event no-response action authorize vlan 8 | Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094.  
You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN, or a voice VLAN as an 802.1x guest VLAN. |
| 5    | `authentication periodic`  
**Example:**  
Device(config-if)# authentication periodic | Enables periodic re-authentication of the client, which is disabled by default. |
| 6    | `authentication timer reauthenticate`  
**Example:**  
Device(config-if)# authentication timer reauthenticate | Sets re-authentication attempt for the client (set to one hour).  
This command affects the behavior of the switch only if periodic re-authentication is enabled. |
| 7    | `end`  
**Example:**  
Device(config-if)# end | Returns to privileged EXEC mode. |
| 8    | `show authentication sessions interface interface-id`  
**Example:**  
Device# show authentication sessions interface gigabitethernet2/0/3 | Verifies your entries. |
| 9    | `copy running-config startup-config`  
**Example:** | (Optional) Saves your entries in the configuration file. |
Configuring Limiting Login for Users

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication login default local
5. aaa authentication rejected \( n \) in \( m \) ban \( x \)
6. end
7. show aaa local user blocked
8. clear aaa local user blocked username username

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:** Device> enable |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** Device# configure terminal |
| **Step 3** aaa new-model | Enables the authentication, authorization, and accounting (AAA) access control model. |
| **Example:** Device(config)# aaa new-model |
| **Step 4** aaa authentication login default local | Sets the authentication, authorization, and accounting (AAA) authentication by using the default authentication methods. |
| **Example:** Device(config)# aaa authentication login default local |
| **Step 5** aaa authentication rejected \( n \) in \( m \) ban \( x \) | Configures the time period for which an user is blocked, if the user fails to successfully login within the specified time and login attempts.  
• \( n \)—Specifies the number of times a user can try to login.  
• \( m \)—Specifies the number of seconds within which an user can try to login. |
<p>| <strong>Example:</strong> Device(config)# aaa authentication rejected 3 in 20 ban 300 |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (x) — Specifies the time period an user is banned if the user fails to successfully login.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><strong>end</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Displays the list of local users who were blocked.</td>
</tr>
<tr>
<td><strong>show aaa local user blocked</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show aaa local user blocked</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>

<td></td>
</tr>
<tr>
<td>Device# clear aaa local user blocked username user1</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

The following is sample output from the `show aaa local user blocked` command:

```
Device# show aaa local user blocked

Local-user             State
user1                  Watched (till 11:34:42 IST Feb 5 2015)
```

**Configuring an Authenticator Switch with NEAT**

Configuring this feature requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

**Note**

- The authenticator switch interface configuration must be restored to access mode by explicitly flapping it if a line card is removed and inserted in the chassis when CISP or NEAT session is active.
- The `cisco-av-pairs` must be configured as `device-traffic-class=switch` on the ISE, which sets the interface as a trunk after the supplicant is successfully authenticated.

Beginning in privileged EXEC mode, follow these steps to configure a switch as an authenticator:

**SUMMARY STEPS**

1. `configure terminal`
2. `cisp enable`
3. `interface interface-id`
4. switchport mode access
5. authentication port-control auto
6. dot1x pae authenticator
7. spanning-tree portfast
8. end
9. show running-config interface interface-id
10. copy running-config startup-config

### DETAILED STEPS

</tbody>
</table>
Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

Note
You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the show ip access-list privileged EXEC command to display the downloaded ACLs on the port.

Configuring Downloadable ACLs

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

SUMMARY STEPS

1. configure terminal
2. ip device tracking
3. aaa new-model
4. aaa authorization network default local group radius
5. radius-server vsa send authentication
6. interface interface-id
7. ip access-group acl-id in
8. show running-config interface interface-id
9. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa new-model</td>
<td></td>
</tr>
</tbody>
</table>
## Purpose

**Command or Action**

### Step 4

`aaa authorization network default local group radius`  
**Example:**  
Device(config)# `aaa authorization network default local group radius`

**Purpose:** Sets the authorization method to local. To remove the authorization method, use the `no aaa authorization network default local group radius` command.

### Step 5

`radius-server vsa send authentication`  
**Example:**  
Device(config)# `radius-server vsa send authentication`

**Purpose:** Configures the radius vsa send authentication.

### Step 6

`interface interface-id`  
**Example:**  
Device(config)# `interface gigabitethernet2/0/4`

**Purpose:** Specifies the port to be configured, and enter interface configuration mode.

### Step 7

`ip access-group acl-id in`  
**Example:**  
Device(config-if)# `ip access-group default_acl in`

**Purpose:** Configures the default ACL on the port in the input direction.  
**Note** The `acl-id` is an access list name or number.

### Step 8

`show running-config interface interface-id`  
**Example:**  
Device(config-if)# `show running-config interface gigabitethernet2/0/4`

**Purpose:** Verifies your configuration.

### Step 9

`copy running-config startup-config`  
**Example:**  
Device# `copy running-config startup-config`

**Purpose:** (Optional) Saves your entries in the configuration file.

## Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

### SUMMARY STEPS

1. `configure terminal`
2. `access-list access-list-number { deny | permit } { hostname | any | host } log`
3. `interface interface-id`
4. `ip access-group acl-id in`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>`access-list access-list-number { deny</td>
<td>permit } { hostname</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Device(config)# access-list 1 deny any log</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>interface interface-id</code></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Device(config)# interface gigabitethernet2/0/2</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>ip access-group acl-id in</code></td>
<td>Configures the default ACL on the port in the input direction.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-if)# ip access-group default_acl in</td>
<td>The acl-id is an access list name or number.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td>Returns to global configuration mode.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

Step 5

Device(config-if)# exit

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa new-model</td>
<td>Enables AAA.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**

**Example:**

Device(config)# aaa new-model

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa authorization network default group radius</td>
<td>Sets the authorization method to local. To remove the authorization method, use the <strong>no aaa authorization network default group radius</strong> command.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 7**

**Example:**

Device(config)# aaa authorization network default group radius

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip device tracking</td>
<td>Enables the IP device tracking table. To disable the IP device tracking table, use the <strong>no ip device tracking</strong> global configuration commands.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 8**

**Example:**

Device(config)# ip device tracking

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip device tracking probe [count</td>
<td>interval</td>
<td>use-svi]</td>
</tr>
</tbody>
</table>

- **count**—Sets the number of times that the switch sends the ARP probe. The range is from 1 to 5. The default is 3.
- **interval**—Sets the number of seconds that the switch waits for a response before resending the ARP probe. The range is from 30 to 300 seconds. The default is 30 seconds.
- **use-svi**—Uses the switch virtual interface (SVI) IP address as source of ARP probes.

**Step 9**

**Example:**

Device(config)# ip device tracking probe count

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>radius-server vsa send authentication</td>
<td>Configures the network access server to recognize and use vendor-specific attributes.</td>
<td>The downloadable ACL must be operational.</td>
</tr>
</tbody>
</table>

**Step 10**

**Example:**

Device(config)# radius-server vsa send authentication

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>radius-server vsa send authentication</td>
<td>Configures the network access server to recognize and use vendor-specific attributes.</td>
<td>The downloadable ACL must be operational.</td>
</tr>
</tbody>
</table>

<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Flexible Authentication Ordering

The examples used in the instructions below changes the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.

Beginning in privileged EXEC mode, follow these steps:

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication order [ dot1x | mab ] | {webauth}
5. authentication priority [ dot1x | mab ] | {webauth}
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport mode access</td>
<td>Sets the port to access mode only if you previously configured the RADIUS server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>authentication order [ dot1x</td>
<td>mab ]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# authentication order mab dot1x</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>authentication priority [ dot1x</td>
<td>mab ]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# authentication priority mab</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Open1x

Beginning in privileged EXEC mode, follow these steps to enable manual control of the port authorization state:

### SUMMARY STEPS

1. `configure terminal`  
2. `interface interface-id`  
3. `switchport mode access`  
4. `authentication control-direction {both | in}`  
5. `authentication fallback name`  
6. `authentication host-mode [multi-auth | multi-domain | multi-host | single-host]`  
7. `authentication open`  
8. `authentication order [ dot1x | mab ] | {webauth}`  
9. `authentication periodic`  
10. `authentication port-control {auto | force-authorized | force-unauthorized}`  
11. `end`

### DETAILED STEPS

</tbody>
</table>
Disabling 802.1x Authentication on the Port

You can disable 802.1x authentication on the port by using the `no dot1x pae` interface configuration command. Beginning in privileged EXEC mode, follow these steps to disable 802.1x authentication on the port. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `switchport mode access`
4. `no dot1x pae authenticator`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>switchport mode access</td>
<td>(Optional) Sets the port to access mode only if you configured the RADIUS server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Purpose</strong></td>

Configuring Web-Based Authentication

The Web-Based Authentication feature, also known as web authentication proxy, authenticates end users on host systems that do not run the IEEE 802.1x supplicant.

- Finding Feature Information, on page 1381
- Information About Web-Based Authentication, on page 1381
- How to Configure Web-Based Authentication, on page 1396
- Configuration Examples for Web-Based Authentication, on page 1412
- Additional References for Web-Based Authentication, on page 1414
- Feature Information for Web-Based Authentication, on page 1414

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Web-Based Authentication

Web-Based Authentication Overview

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication. If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.
If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.

Note
HTTPS traffic interception for central web authentication redirect is not supported.

Note
You should use global parameter-map (for method-type, custom, and redirect) only for using the same web authentication methods like consent, web consent, and webauth, for all the clients and SSIDs. This ensures that all the clients have the same web-authentication method.

If the requirement is to use Consent for one SSID and Web-authentication for another SSID, then you should use two named parameter-maps. You should configure Consent in first parameter-map and configure webauth in second parameter-map.

Note
The traceback that you receive when webauth client tries to do authentication does not have any performance or behavioral impact. It happens rarely when the context for which FFM replied back to EPM for ACL application is already dequeued (possibly due to timer expiry) and the session becomes ‘unauthorized’.

Based on where the web pages are hosted, the local web authentication can be categorized as follows:

- **Internal**—The internal default HTML pages (Login, Success, Fail, and Expire) in the controller are used during the local web authentication.

- **Customized**—The customized web pages (Login, Success, Fail, and Expire) are downloaded onto the controller and used during the local web authentication.

- **External**—The customized web pages are hosted on the external web server instead of using the in-built or custom web pages.

Based on the various web authentication pages, the types of web authentication are as follows:

- **Webauth**—This is a basic web authentication. Herein, the controller presents a policy page with the user name and password. You need to enter the correct credentials to access the network.

- **Consent or web-passthrough**—Herein, the controller presents a policy page with the Accept or Deny buttons. You need to click the Accept button to access the network.

- **Webconsent**—This is a combination of webauth and consent web authentication types. Herein, the controller presents a policy page with Accept or Deny buttons along with user name or password. You need to enter the correct credentials and click the Accept button to access the network.

### Device Roles

With web-based authentication, the devices in the network have these specific roles:

- **Client**—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with Java Script enabled.
- **Authentication server**—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.

- **Switch**—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

*Figure 107: Web-Based Authentication Device Roles*

This figure shows the roles of these devices in a network.

**Host Detection**

The switch maintains an IP device tracking table to store information about detected hosts.

- **Note** By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- **ARP based trigger**—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.
- **Dynamic ARP inspection**
- **DHCP snooping**—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.

**Session Creation**

When web-based authentication detects a new host, it creates a session as follows:

- **Reviews the exception list.**
  
  If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.

- **Reviews for authorization bypass**
  
  If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.
If the server response is access accepted, authorization is bypassed for this host. The session is established.

- Sets up the HTTP intercept ACL

If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.

## Authentication Process

When you enable web-based authentication, these events occur:

- The user initiates an HTTP session.
- The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.
- If the authentication succeeds, the switch downloads and activates the user’s access policy from the authentication server. The login success page is sent to the user.
- If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.
- If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.
- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.
- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface.
- The feature applies the downloaded timeout or the locally configured session timeout.
- If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.
- If the terminate action is default, the session is dismantled, and the applied policy is removed.

## Using Authentication Proxy

The authentication proxy feature requires some user interaction on the client host. The table below describes the interaction of the authentication proxy with the client host.

<table>
<thead>
<tr>
<th>Authentication Proxy Action with Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Triggering on HTTP connections</td>
<td>If a user is not currently authenticated at the firewall router, any HTTP connection initiated by the user triggers the authentication proxy. If the user is already authenticated, the authentication proxy is transparent to the user.</td>
</tr>
</tbody>
</table>
Authentication Proxy Action with Client | Description
--- | ---
Logging in using the login page | Triggering the authentication proxy generates an HTML-based login page. The user must enter a username and password to be authenticated with the AAA server. The Authentication Proxy Login Page figure, in the How the Authentication Proxy Works module, illustrates the authentication proxy login page.

Authenticating the user at the client | Following the login attempt, the authentication proxy action can vary depending on whether JavaScript is enabled in the browser. If JavaScript is enabled, and authentication is successful, the authentication proxy displays a message indicating the status of the authentication as shown in the Authentication Proxy Login Status Message figure, in the How the Authentication Proxy Works module. After the authentication status is displayed, the proxy automatically completes the HTTP connection.

If JavaScript is disabled, and authentication is successful, the authentication proxy generates a popup window with additional instructions for completing the connection. See the Authentication Proxy Login Status Message with JavaScript Disabled figure, in the Secure Authentication module.

If authentication is unsuccessful in any case, the user must log in again from the login page.

### When to Use the Authentication Proxy

The following are some situations in which you can use the authentication proxy:

- You want to manage access privileges on an individual (per-user) basis using the services provided by the authentication servers instead of configuring access control based on host IP address or global access policies. Authenticating and authorizing users from any host IP address also allows network administrators to configure host IP addresses using DHCP.

- You want to authenticate and authorize local users before permitting access to intranet or Internet services.

- You want to authenticate and authorize remote users before permitting access to local services.

- You want to control access for specific extranet users. For example, you might want to authenticate and authorize the financial officer of a corporate partner with one set of access privileges while authorizing the technology officer for that same partner to use another set of access privileges.

- You want to use the authentication proxy in conjunction with VPN client software to validate users and to assign specific access privileges.

- You want to use the authentication proxy in conjunction with AAA accounting to generate “start” and “stop” accounting records that can be used for billing, security, or resource allocation purposes, thereby allowing users to track traffic from the authenticated hosts.

### Applying Authentication Proxy

Apply the authentication proxy in the inbound direction at any interface on the router where you want per-user authentication and authorization. Applying the authentication proxy inbound at an interface causes it to intercept the initial connection request from an user, before that request is subjected to any other processing. If the user fails to gain authentication with the AAA server, the connection request is dropped.
How you apply the authentication proxy depends on your security policy. For example, you can block all traffic through an interface and enable the authentication proxy feature to require authentication and authorization for all user-initiated HTTP connections. Users are authorized for services only after successful authentication with the AAA server.

The authentication proxy feature also allows you to use standard access lists to specify a host or group of hosts whose initial HTTP traffic triggers the proxy.

The figure below shows the authentication proxy applied at the LAN interface with all network users required to be authenticated upon the initial connection (all traffic is blocked at each interface).

*Figure 108: Applying the Authentication Proxy at the Local Interface*

The figure below shows the authentication proxy applied at the dial-in interface with all network traffic blocked at each interface.

*Figure 109: Applying the Authentication Proxy at an Outside Interface*

**Local Web Authentication Banner**

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.

The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

- **Authentication Successful**
- **Authentication Failed**
- **Authentication Expired**

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:
• Legacy mode—Use the `ip admission auth-proxy-banner http` global configuration command.

• New-style mode—Use the `parameter-map type weauth global banner` global configuration command.

The default banner `Cisco Systems` and `Switch host-name Authentication` appear on the Login Page. `Cisco Systems` appears on the authentication result pop-up page.

*Figure 110: Authentication Successful Banner*

The banner can be customized as follows:

• Add a message, such as switch, router, or company name to the banner:
  
  • Legacy mode—Use the `ip admission auth-proxy-banner http banner-text` global configuration command.

  • New-style mode—Use the `parameter-map type weauth global banner` global configuration command.

• Add a logo or text file to the banner:
  
  • Legacy mode—Use the `ip admission auth-proxy-banner http file-path` global configuration command.

  • New-style mode—Use the `parameter-map type weauth global banner` global configuration command.
If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.

Figure 111: Customized Web Banner

Figure 112: Login Screen With No Banner
Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

- Login—Your credentials are requested.
- Success—The login was successful.
- Fail—The login failed.
- Expire—The login session has expired because of excessive login failures.

Guidelines

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the login, success, failure, and expire web pages.
- On the banner page, you can specify text in the login page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, http://www.cisco.com). An incomplete URL might cause page not found or similar errors on a web browser.
- If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).
- The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.
- If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.
- Configured web pages can be copied to the switch boot flash or flash.
- The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).
- You must configure all four pages.
- The banner page has no effect if it is configured with the web page.
- All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use web_auth_<filename> as the file name.
- The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.
Authentication Proxy Web Page Guidelines

When configuring customized authentication proxy web pages, follow these guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.

- The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.

- Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.

- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.

- To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.

- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.

- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.

- To remove the specification of a custom file, use the `no` form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as `uname` and `pwd`.

- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.
Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.

- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.

- To remove the specification of a redirection URL, use the `no` form of the command.

- If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, `http://`) followed by the URL information. If only the URL is given without `http://`, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

Web Authentication Redirection to Original URL Overview

The Web Authentication Redirection to Original URL feature enables networks to redirect guest users to the URL that they had originally requested. This feature is enabled by default and requires no configuration.

Guest networks are network connections provided by an enterprise to allow their guests to gain access to the Internet and to their own enterprise networks without compromising the security of the host enterprise. Guest users of an enterprise network can connect to the guest access network through either a wired Ethernet connection or a wireless connection.

Guest access uses a captive portal to gather all web requests made by guests and redirect these requests to one of the guest on-boarding web pages. When guests successfully complete the guest workflow, they are redirected to the page that they had originally requested.

The originally requested URL is passed as metadata along with the Cisco Identity Services Engine (ISE) guest access redirect URL. The Cisco ISE is a security policy management and control platform. It automates and simplifies access control and security compliance for wired, wireless, and VPN connectivity. The requested URL is added at the end of the Cisco ISE guest URL so that the device can send the redirect URL to the guest client. The Cisco ISE parses the URL and redirects the guest to the original URL after completing the on-boarding.

The following is an example of a redirect URL along with the original requested URL:

In this example, the URL, https://10.64.67.92:8443/guestportal/gateway?sessionId=0920269E0000000B0002426B&action=cwa is the URL for the guest portal, “&” tells the browser that what follows is a list of name value pairs, and redirect_url=http://www.cisco.com identifies the URL that the user originally requested and to which the user is redirected after completing the guest workflow.

This illustration displays the packet flow that redirects a user to the originally requested URL:
1. A user accesses a network for the first time and sends an HTTP request to access www.google.com. When the user first accesses the network, a MAC authentication bypass (MAB) is triggered and the MAC address is sent to the Cisco ISE.

2. The Cisco ISE returns a RADIUS access-accept message (even if the MAC address is not received) along with the redirect access control list (ACL), the ACL-WEBAUTH-REDIRECT message, and the guest web portal URL to the device. The RADIUS message instructs the device to open a port that is restricted based on the configured port and the redirect ACLs, for regular network traffic.

3. When the user launches a web browser, the device intercepts the HTTP traffic and redirects the browser to the Cisco ISE central web authentication (CWA) guest web portal URL; the user-requested URL is extracted and appended to the Cisco ISE guest URL.

4. When the user is authenticated, the Cisco ISE sends the Device Registration page to the user. The user enters the required information, and the page is returned to the Cisco ISE. The Cisco ISE downloads user profiles and redirects the user to the originally requested URL: www.google.com.
Web-based Authentication Interactions with Other Features

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.

- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

- Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

AAA Accounting with Authentication Proxy

Using the authentication proxy, you can generate “start” and “stop” accounting records with enough information to be used for billing and security auditing purposes. Thus, you can monitor the actions of authenticated hosts that use the authentication proxy service.

When an authentication proxy cache and associated dynamic access control lists (ACLs) are created, the authentication proxy will start to track the traffic from the authenticated host. Accounting saves data about this event in a data structure stored with the data of other users. If the accounting start option is enabled, you can generate an accounting record (a “start” record) at this time. Subsequent traffic from the authenticated host will be recorded when the dynamic ACL created by the authentication proxy receives the packets.

When an authentication proxy cache expires and is deleted, additional data, such as elapsed time, is added to the accounting information and a “stop” record is sent to the server. At this point, the information is deleted from the data structure.
The accounting records for the authentication proxy user session are related to the cache and the dynamic ACL usage.

**ACLs**

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

**Context-Based Access Control**

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

**EtherChannel**

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

**Gateway IP**

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

**LAN Port IP**

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated by using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated, and posture is validated again.

**Port Security**

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.
Default Web-Based Authentication Configuration

The following table shows the default web-based authentication configuration.

Table 143: Default Web-based Authentication Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Default value of inactivity timeout</td>
<td>3600 seconds</td>
</tr>
<tr>
<td>Inactivity timeout</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Web-Based Authentication Configuration Guidelines and Restrictions

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- External web authentication, where the switch redirects a client to a particular host or web server for displaying login message, is not supported.
- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must enable SISF-Based device tracking to use web-based authentication. By default, SISF-Based device tracking is disabled on a switch.
- You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable-host policy.
- Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.
- Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.
• Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:
  • Host name
  • Host IP address
  • Host name and specific UDP port numbers
  • IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

• When you configure the RADIUS server parameters:
  • Specify the key string on a separate command line.
  • For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
  • When you specify the key string, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
  • You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the radius-server host global configuration command. If you want to configure these options on a per-server basis, use the radius-server timeout, radius-server transmit, and the radius-server key global configuration commands.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.</td>
</tr>
</tbody>
</table>

How to Configure Web-Based Authentication

Configuring the Authentication Rule and Interfaces

Follow these steps to configure the authentication rule and interfaces:

SUMMARY STEPS

1. enable
2. configure terminal
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission name name proxy http</td>
<td>Configures an authentication rule for web-based authorization.</td>
</tr>
<tr>
<td>Example: Device(config)# ip admission name webauth1 proxy http</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> interface type slot/port</td>
<td>Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication.</td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet 1/0/1</td>
<td>type can be fastethernet, gigabit ethernet, or tengigabitethernet.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip access-group name</td>
<td>Applies the default ACL.</td>
</tr>
<tr>
<td>Example: Device(config-if)# ip access-group webauthag</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip admission name</td>
<td>Configures an authentication rule for web-based authorization for the interface.</td>
</tr>
<tr>
<td>Example: Device(config)# ip admission name</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

</table>

### Configuring Switch-to-RADIUS-Server Communication

Follow these steps to configure the RADIUS server parameters:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. ip radius source-interface vlan vlan interface number
4. radius-server host {hostname | ip-address} test username username
5. radius-server key string
6. radius-server dead-criteria tries num-tries
7. end
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`         | Enables privileged EXEC mode.  
  `Example:`  
  `Device> enable`  
  • Enter your password if prompted. |
| 2    | `configure terminal` | Enters global configuration mode.  
  `Example:`  
  `Device# configure terminal` |
| 3    | `ip radius source-interface vlan vlan interface number` | Specifies that the RADIUS packets have the IP address of the indicated interface.  
  `Example:`  
  `Device(config)# ip radius source-interface vlan 80` |
| 4    | `radius-server host {hostname | ip-address} test username username` | Specifies the host name or IP address of the remote RADIUS server.  
  The `test username username` option enables automated testing of the RADIUS server connection. The specified `username` does not need to be a valid user name.  
  The `key` option specifies an authentication and encryption key to use between the switch and the RADIUS server.  
  To use multiple RADIUS servers, reenter this command for each server.  
  `Example:`  
  `Device(config)# radius-server host 172.120.39.46 test username user1` |
| 5    | `radius-server key string` | Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.  
  `Example:`  
  `Device(config)# radius-server key rad123` |
| 6    | `radius-server dead-criteria tries num-tries` | Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive.  
  The range of `num-tries` is 1 to 100.  
  `Example:`  
  `Device(config)# radius-server dead-criteria tries 30` |
| 7    | `end` | Returns to privileged EXEC mode.  
  `Example:` |

**Purpose**

**Command or Action**

**Step 1**

- `enable`
  
  `Example:`
  
  Device> enable

**Step 2**

- `configure terminal`
  
  `Example:`
  
  Device# configure terminal

**Step 3**

- `ip radius source-interface vlan vlan interface number`
  
  `Example:`
  
  Device(config)# ip radius source-interface vlan 80

**Step 4**

- `radius-server host {hostname | ip-address} test username username`
  
  `Example:`
  
  Device(config)# radius-server host 172.120.39.46 test username user1

**Step 5**

- `radius-server key string`
  
  `Example:`
  
  Device(config)# radius-server key rad123

**Step 6**

- `radius-server dead-criteria tries num-tries`
  
  `Example:`
  
  Device(config)# radius-server dead-criteria tries 30

**Step 7**

- `end`
  
  `Example:`
### Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the Device. You can enable the server for either HTTP or HTTPS.

#### Note

The Apple pseudo-browser will not open if you configure only the `ip http secure-server` command. You should also configure the `ip http server` command.

Follow the procedure given below to enable the server for either HTTP or HTTPS:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip http server`
4. `ip http secure-server`
5. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# end</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>

### Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the Device default HTML pages during web-based authentication.

Follow these steps to specify the use of your custom authentication proxy web pages:

**Before you begin**

Store your custom HTML files on the Device flash memory.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip admission proxy http login page file device:login-filename`
4. `ip admission proxy http success page file device:success-filename`
5. `ip admission proxy http failure page file device:fail-filename`
6. `ip admission proxy http login expired page file device:expired-filename`
7. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>

### Specifying a Redirection URL for Successful Login

Follow these steps to specify a URL to which the user is redirected after authentication, effectively replacing the internal Success HTML page:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip admission proxy http success redirect `url-string`
Configuring Web-Based Authentication Parameters

Follow these steps to configure the maximum number of failed login attempts before the client is placed in a watch list for a waiting period:

SUMMARY STEPS

1. enable
2. configure terminal
3. ip admission max-login-attempts number
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission proxy http success redirect url-string</td>
<td>Specifies a URL for redirection of the user in place of the default login success page.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip admission proxy http success redirect <a href="http://www.example.com">www.example.com</a></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>

</tbody>
</table>
### Configuring a Web Authentication Local Banner

For the equivalent Session Aware Networking configuration example for this feature, see the section "Configuring a Parameter Map for Web-Based Authentication" in the chapter, "Configuring Identity Control Policies" of the book, "Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)."

Beginning in privileged EXEC mode, follow the procedure given below to configure a local banner on a switch that has web authentication configured.

#### SUMMARY STEPS

1. configure terminal
2. ip auth-proxy auth-proxy-banner http [banner-text | file-path]
3. end
4. copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip admission max-login-attempts number</td>
<td>Sets the maximum number of failed login attempts. The range is 1 to 2147483647 attempts. The default is 5.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip admission max-login-attempts 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# exit</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Web-Based Authentication without SVI

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client without creating an IP address in the routing table. These steps are optional.

You configure the web-based authentication without SVI feature to redirect the HTML login page to the client. This is done without creating an IP address in the SVI interface which then would be applied to the WebAuth enabled interface. These steps are optional.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. parameter-map type webauth global
4. l2-webauth-enabled
5. end
6. show running-config
7. copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| enable
| Example:
| Device> enable | Enables privileged EXEC mode.
<p>| • Enter your password if prompted. |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 2 | configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| Step 3 | parameter-map type webauth global  
Example:  
Device (config)# parameter-map type webauth global | Creates a parameter map and enters parameter-map webauth configuration mode. The specific configuration commands supported for a global parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the parameter-map-name argument. |
| Step 4 | l2-webauth-enabled  
Example:  
Device (config-params-parameter-map)# l2-webauth-enabled | Enables the web-based authentication without SVI feature |
| Step 5 | end  
Example:  
Device(config)# end | Returns to privileged EXEC mode. |
| Step 6 | show running-config  
Example:  
Device# show running-config | Verifies your entries. |
| Step 7 | copy running-config startup-config  
Example:  
Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

### Configuring Web-Based Authentication with VRF Aware

You configure the web-based authentication with VRF aware to redirect the HTML login page to the client. These steps are optional.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. parameter-map type webauth global
4. webauth-vrf-aware
5. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> parameter-map type webauth global</td>
<td>Creates a parameter map and enters parameter-map webauth configuration mode. The specific configuration commands supported for a global parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the parameter-map-name argument.</td>
</tr>
<tr>
<td>Example: Device (config)# parameter-map type webauth global</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> webauth-vrf-aware</td>
<td>Enables the web-based authentication VRF aware feature on SVI.</td>
</tr>
<tr>
<td>Example: Device (config-params-parameter-map)#</td>
<td></td>
</tr>
<tr>
<td>webauth-vrf-aware</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Removing Web-Based Authentication Cache Entries

Follow these steps to remove web-based authentication cache entries:

**SUMMARY STEPS**

1. `enable`
2. `clear ip auth-proxy cache { * | host ip address }
3. `clear ip admission cache { * | host ip address }

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 clear ip auth-proxy cache { *</td>
<td>host ip address }</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# clear ip auth-proxy cache 192.168.4.5</td>
<td></td>
</tr>
<tr>
<td>Step 3 clear ip admission cache { *</td>
<td>host ip address }</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# clear ip admission cache 192.168.4.5</td>
<td></td>
</tr>
</tbody>
</table>

Verifying Web-Based Authentication Status

Use the commands in this topic to display the web-based authentication settings for all interfaces or for specific ports.

**Table 144: Privileged EXEC show Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show authentication sessions method webauth</td>
<td>Displays the web-based authentication settings for all interfaces for fastethernet, gigabitethernet, or tengigabitethernet</td>
</tr>
<tr>
<td>show wireless client mac-address a.a.a detail</td>
<td>Displays the session specific wireless information and wireless states.</td>
</tr>
</tbody>
</table>
Displaying Web-Based Authentication Status

Perform this task to display the web-based authentication settings for all interfaces or for specific ports:

SUMMARY STEPS

1. show authentication sessions {interface type/ slot}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show authentication sessions interface type slot/port details</td>
<td>Displays the web-based authentication settings for the specified interface for fastethernet, gigabitethernet, or tengigabitethernet. In Session Aware Networking mode, use the show access-session interface command.</td>
</tr>
</tbody>
</table>

Example:
Step 1

**Example:**
This example shows how to view only the global web-based authentication status:

Switch# show authentication sessions

**Example:**
This example shows how to view the web-based authentication settings for gigabit interface 3/27:

Switch# show authentication sessions interface gigabitethernet 3/27

Monitoring HTTP Authentication Proxy

Perform the following task to troubleshoot your HTTP authentication proxy configuration:

SUMMARY STEPS

1. enable
2. debug ip auth-proxy detailed

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
Verifying HTTPS Authentication Proxy

To verify your HTTPS authentication proxy configuration, perform the following optional steps:

**SUMMARY STEPS**

1. enable
2. show ip auth-proxy configuration
3. show ip auth-proxy cache
4. show ip http server secure status

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>show ip auth-proxy configuration&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Device# show ip auth-proxy configuration</td>
</tr>
<tr>
<td></td>
<td>Displays the current authentication proxy configuration.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>show ip auth-proxy cache&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Device# show ip auth-proxy cache</td>
</tr>
<tr>
<td></td>
<td>Displays the list of user authentication entries.&lt;br&gt;The authentication proxy cache lists the host IP address, the source port number, the timeout value for the authentication proxy, and the state of the connection. If the authentication proxy state is HTTP_ESTAB, the user authentication was successful.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show ip http server secure status&lt;br&gt;&lt;br&gt;Example:&lt;br&gt;Device# show ip http server secure status</td>
</tr>
<tr>
<td></td>
<td>Displays HTTPS status.</td>
</tr>
</tbody>
</table>
Configuration Examples for Web-Based Authentication

Example: Configuring the Authentication Rule and Interfaces

This example shows how to enable web-based authentication on Fast Ethernet port 5/1:

```
Device(config)# ip admission name webauth1 proxy http
Device(config)# interface fastethernet 5/1
Device(config-if)# ip admission webauth1
Device(config-if)# exit
Device(config)# ip device tracking
```

This example shows how to verify the configuration:

```
Device# show ip admission status
IP admission status:
  Enabled interfaces          0
  Total sessions             0
  Init sessions              0   Max init sessions allowed 100
  Limit reached              0   Hi watermark             0
  TCP half-open connections  0   Hi watermark             0
  TCP new connections        0   Hi watermark             0
  TCP half-open + new        0   Hi watermark             0
  HTTPD1 Contexts           0   Hi watermark             0

Parameter Map: Global
  Custom Pages
    Custom pages not configured
  Banner
    Banner not configured
```

Example: AAA Configuration

```
aaa new-model
aaa authentication login default group tacacs group radius
! Set up the aaa new model to use the authentication proxy.
aaa authorization auth-proxy default group tacacs group radius
! Define the AAA servers used by the router.
aaa accounting auth-proxy default start-stop group tacacs+
! Set up authentication proxy with accounting.
tacacs-server host 172.31.54.143
tacacs-server key cisco
radius-server host 172.31.54.143
radius-server key cisco
```

Example: HTTP Server Configuration

```
! Enable the HTTP server on the router.
ip http server
! Set the HTTP server authentication method to AAA.
ip http authentication aaa
! Define standard access list 61 to deny any host.
access-list 61 deny any
```
Example: Customizing the Authentication Proxy Web Pages

This example shows how to configure custom authentication proxy web pages:

Device(config)# ip admission proxy http login page file flash:login.htm
Device(config)# ip admission proxy http success page file flash:success.htm
Device(config)# ip admission proxy http fail page file flash:fail.htm
Device(config)# ip admission proxy http login expired page flash:expired.htm

This example shows how to verify the configuration of a custom authentication proxy web pages:

Device# show ip admission configuration
Authentication proxy webpage
Login page : flash:login.htm
Success page : flash:success.htm
Fail Page : flash:fail.htm
Login expired Page : flash:expired.htm
Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Session ratelimit is 100
Authentication Proxy Watch-list is disabled
Authentication Proxy Auditing is disabled
Max Login attempts per user is 5

Example: Specifying a Redirection URL for Successful Login

Configuring redirection URL for successful login

Device(config)# ip admission proxy http success redirect www.cisco.com

Verifying redirection URL for Successful Login

This example shows how to configure a redirection URL for successful login:

Device# show ip admission status
Enabled interfaces 0
Total sessions 0
Init sessions 0 Max init sessions allowed 100
Limit reached 0 Hi watermark 0
TCP half-open connections 0 Hi watermark 0
TCP new connections 0 Hi watermark 0
TCP half-open + new 0 Hi watermark 0
HTTPD1 Contexts 0 Hi watermark 0

Parameter Map: Global
  Custom Pages
    Custom pages not configured
  Banner
    Banner not configured

## Feature Information for Web-Based Authentication

<table>
<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS Release 15.0(2)EX</td>
<td>This feature is introduced.</td>
</tr>
</tbody>
</table>
Auto Identity

The Auto Identity feature provides a set of built-in policies at global configuration and interface configuration modes. This feature is available only in Class-Based Policy Language (CPL) control policy-equivalent new-style mode. To convert all the relevant authentication commands to their CPL control policy-equivalents, use the `authentication convert-to new-style` command.

This module describes the feature and explains how to configure it.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Auto Identity

Auto Identity Overview

The Cisco Identity-Based Networking Services (IBNS) solution provides a policy and identity-based framework in which edge devices can deliver flexible and scalable services to subscribers. IBNS allows the concurrent operation of IEEE 802.1x (dot1x), MAC authentication bypass (MAB), and web authentication methods, making it possible to invoke multiple authentication methods in parallel, on a single subscriber session. These authentication methods, dot1x, authentication, authorization, and accounting (AAA), and RADIUS are available in global configuration and interface configuration modes.

The Auto Identity feature uses the Cisco Common Classification Policy Language-based configuration that significantly reduces the number of commands used to configure both authentication methods and interface-level
commands. The Auto Identity feature provides a set of built-in policies that are based on policy maps, class maps, parameter maps, and interface templates.

In global configuration mode, the **source template AI_GLOBAL_CONFIG_TEMPLATE** command enables the Auto Identity feature. In interface configuration mode, configure the **AI_MONITOR_MODE**, **AI_LOW_IMPACT_MODE**, or **AI_CLOSED_MODE** interface templates to enable the feature on interfaces.

You can configure multiple templates; however, you must bind multiple templates together using the **merge** command. If you do not bind the templates, the last configured template is used. While binding templates, if the same command is repeated in two templates with different arguments, the last configured command is used.

---

**Note**

You can also enable user-defined templates that are configured using the **template name** command in global configuration mode.

**Note**

Use the **show template interface** or **show template global** commands to display information about built-in templates. Built-in templates can be edited. Built-in template information is displayed in the output of the **show running-config** command, if the template is edited. If you delete an edited built-in template, the built-in template reverts to the default and is not deleted from the configuration. However, if you delete a user-defined template, it is deleted from the configuration.

---

**Auto Identity Global Template**

To enable the global template, configure the **source template template-name** command.

**Note**

You must configure the RADIUS server commands, because these are not automatically configured when the global template is enabled.

The following example shows how to enable the global template:

```plaintext
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 172.20.254.4 auth-port 1645 acct-port 1646
Switch(config-radius-server)# key cisco
Switch(config-radius-server)# end
```

The **AI_GLOBAL_CONFIG_TEMPLATE** automatically configures the following commands:

- dot1x system-auth-control
- aaa new-model
- aaa authentication dot1x default group radius
- aaa authorization network default group radius
- aaa authorization auth-proxy default group radius
- aaa accounting identity default start-stop group radius
- aaa accounting system default start-stop group radius
- radius-server attribute 6 on-for-login-auth
- radius-server attribute 6 support-multiple
- radius-server attribute 6 voice 1
Auto Identity Interface Templates

The following interface templates are available in the Auto Identity feature:

- **AI_MONITOR_MODE**—Passively monitors sessions that have authentication in open mode.
- **AI_LOW_IMPACT_MODE**—Similar to monitor mode, but with a configured static policy such as a port access control list (PACL).
- **AI_CLOSED_MODE**—Secure mode in which data traffic is not allowed into the network, until authentication is complete. This mode is the default.

The following commands are inbuilt in the **AI_MONITOR_MODE**:

```bash
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_LOW_IMPACT_MODE**:

```bash
switchport mode access
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
ip access-group AI_PORT_ACL in
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

The following commands are inbuilt in the **AI_CLOSED_MODE**:

```bash
switchport mode access
access-session closed
access-session port-control auto
access-session host-mode multi-auth
dot1x pae authenticator
mab
service-policy type control subscriber AI_DOT1X_MAB_POLICIES
```

Auto Identity Built-in Policies

The following five built-in policies are available in the Auto Identity feature:

- **AI_DOT1X_MAB_AUTH**—Enables flexible authentication with dot1x, and then MAC Address Bypass (MAB).
- **AI_DOT1X_MAB_POLICIES**—Enables flexible authentication with dot1x, and then MAB. Applies critical VLAN in case the Authentication, Authorization, and Accounting (AAA) server is not reachable.
- **AI_DOT1X_MAB_WEBAUTH**—Enables flexible authentication with dot1x, MAB, and then web authentication.
- **AI_NEXTGEN_AUTHBYBASS**—Skips authentication if an IP phone device is detected. Enables the **device classifier** command in global configuration mode and the **voice-vlan** command in interface configuration mode to detect the device. This is a reference policy map, and users can copy the contents of this policy map to other policy maps.
• **AI_STANDALONE_WEBAUTH**—Defines standalone web authentication.

### Auto Identity Class Maps Templates

The following built-in class maps are supported by the Auto Identity feature:

- **AI_NRH**—Specifies that the nonresponsive host (NRH) authentication method is enabled.
- **AI_WEBAUTH_METHOD**—Specifies that the web authentication method is enabled.
- **AI_WEBAUTH_FAILED**—Specifies that the web authentication method failed to authenticate.
- **AI_WEBAUTH_NO_RESP**—Specifies that the web authentication client failed to respond.
- **AI_DOT1X_METHOD**—Specifies that the dot1x method is enabled.
- **AI_DOT1X_FAILED**—Specifies that the dot1x method failed to authenticate.
- **AI_DOT1X_NO_RESP**—Specifies that the dot1x client failed to respond.
- **AI_DOT1X_TIMEOUT**—Specifies that the dot1x client stopped responding after the initial acknowledge (ACK) request.
- **AI_MAB_METHOD**—Specifies that the MAC Authentication Bypass (MAB) method is enabled.
- **AI_MAB_FAILED**—Specifies that the MAB method failed to authenticate.
- **AI_AAA_SVR_DOWN_AUTHD_HOST**—Specifies that the Authentication, Authorization, and Accounting (AAA) server is down, and the client is in authorized state.
- **AI_AAA_SVR_DOWN_UNAUTHD_HOST**—Specifies that the AAA server is down, and the client is in unauthorized state.
- **AI_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is applied.
- **AI_NOT_IN_CRITICAL_AUTH**—Specifies that the critical authentication service template is not applied.
- **AI_METHOD_DOT1XDEVICE_PHONE**—Specifies that the method is dot1x and the device type is IP phone.
- **AI_DEVICE_PHONE**—Specifies that the device type is IP phone.

### Auto Identity Parameter Maps

The following built-in parameter map templates are supported by the Auto Identity feature:

- **AI_NRH_PMAP**—Starts nonresponsive host (NRH) authentication.
- **AI_WEBAUTH_PMAP**—Starts web authentication.

### Auto Identity Service Templates

Service templates are available inside built-in policy maps. The following built-in service templates are supported by the Auto Identity feature:

- **AI_INACTIVE_TIMER**—Template to start the inactivity timer.
- **AI_CRITICAL_ACL**—Dummy template; users can configure this template as per their requirements.
How to Configure Auto Identity

Configuring Auto Identity Globally

SUMMARY STEPS

1. enable
2. configure terminal
3. sourcetemplate {AI_GLOBAL_CONFIG_TEMPLATE | template-name}
4. aaa new-model
5. radius server name
6. address ipv4 {hostname | ipv4-address}
7. key ipv4 {0 string | 7 string} string
8. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> sourcetemplate {AI_GLOBAL_CONFIG_TEMPLATE</td>
<td>template-name}</td>
</tr>
<tr>
<td>Example: Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE</td>
<td>• AI_GLOBAL_CONFIG_TEMPLATE is a built-in template.</td>
</tr>
<tr>
<td></td>
<td>• template-name is a user-defined template.</td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa new-model</td>
<td>Enables the authentication, authorization, and accounting (AAA) access control mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> radius server name</td>
<td>Specifies the name for the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# radius server ISE</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> address ipv4 {hostname</td>
<td>ipv4-address}</td>
</tr>
<tr>
<td>Example: Switch(config-radius-server)# address ipv4 10.1.1.1</td>
<td><strong>Note</strong> This command is not a part of the global template, and you must configure it.</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 7**
- `key ipv4 {0 string | 7 string} string`

**Example:**
- `Switch(config-radius-server)# key ipv4 cisco`

**Purpose**
- Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.

**Note**
- This command is not a part of the global template, and you must configure it.

**Step 8**
- `end`

**Example:**
- `Switch(config-radius-server)# end`

**Purpose**
- Exits RADIUS server configuration mode and returns to privileged EXEC mode.

### Configuring Auto Identity at an Interface Level

When you configure two interface templates, you must configure the `merge` keyword. If you do not, the last configured template is used.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`

### Configuration Examples for Auto Identity

#### Example: Configuring Auto Identity Globally

```
Switch> enable
Switch# configure terminal
Switch(config)# source template AI_GLOBAL_CONFIG_TEMPLATE
Switch(config)# aaa new-model
Switch(config)# radius server ISE
Switch(config-radius-server)# address ipv4 10.1.1.1
Switch(config-radius-server)# key ipv4 cisco
Switch(config-radius-server)# end
```

#### Example: Configuring Auto Identity at an Interface Level

```
Switch> enable
Switch# configure terminal
```
Verifying Auto Identity

Step 1  
**enable**

**Example:**

```bash
Switch> enable
```

Enables Privileged EXEC mode.

- Enter your password if prompted.

Step 2  
**show template interface source built-in all**

Displays all the configured built-in interface templates.

**Example:**

```bash
Switch# show template interface source built-in all
```

<table>

|                |          | service-policy type control subscriber AI_DOT1X_MAB_POLICIES

Step 3  
**show template global source built-in all**
Displays all the configured global built-in templates.

**Example:**

Switch# `show template global source built-in all`

Global Template Name : AI_GLOBAL_CONFIG_TEMPLATE
Modified : No
Global Template Definition : global
dot1x system-auth-control
aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
!

**Step 4**

```
show derived-config | include aaa | radius-server
```

Displays the composite results of all the configuration commands that apply to an interface, including commands that come from sources such as static templates, dynamic templates, dialer interfaces, and authentication, authorization, and accounting (AAA) per-user attributes.

**Example:**

Switch# `show derived-config | inc aaa| radius-server`

aaa new-model
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa authorization auth-proxy default group radius
aaa accounting identity default start-stop group radius
aaa accounting system default start-stop group radius
aaa session-id common
radius-server attribute 6 on-for-login-auth
radius-server attribute 6 support-multiple
radius-server attribute 6 voice 1
radius-server attribute 8 include-in-access-req
radius-server attribute 25 access-request include
radius-server host 10.25.18.42 key cisco

**Step 5**

```
show derived-config | interface type-number
```

Displays the composite results of all configuration for an interface.

**Example:**

Switch# `show derived-config | interface gigabitethernet2/0/6`

Building configuration...

Derived configuration : 267 bytes
!
interface GigabitEthernet2/0/6
switchport mode access
switchport voice vlan 100
Step 6

show access-session | interface interface-type-number details

Displays the policies applied to an interface.

Example:

Switch# show access-session interface gigabitethernet2/0/6 details

Interface: GigabitEthernet2/0/6
  MAC Address: c025.5c43.be00
  IPv6 Address: Unknown
  IPv4 Address: Unknown
  User-Name: CP-9971-SEPC0255C43BE00
  Device-type: Cisco-IP-Phone-9971
  Status: Authorized
  Domain: VOICE
  Oper host mode: multi-auth
  Oper control dir: both
  Session timeout: N/A
  Common Session ID: 091A1C5B00000017002003EE
  Acct Session ID: 0x00000005
  Handle: 0xBB00000B
  Current Policy: AI_DOT1X_MAB_POLICIES

Local Policies:

Server Policies:
  Vlan Group: Vlan: 100
  Security Policy: Must Not Secure
  Security Status: Link Unsecure

Method status list:
  Method     State
  dot1x      Authc Success

Step 7

show running-config interface type-number

Displays the contents of the current running configuration file or the configuration for an interface.

Example:

Switch# show running-config interface gigabitethernet2/0/6

Building configuration...

Current configuration : 214 bytes
!
interface GigabitEthernet2/0/6
  switchport mode access
  switchport voice vlan 100
  access-session port-control auto
Step 8  show lldp neighbor

Displays information about one or all neighboring devices discovered using the Link Layer Discovery Protocol (LLDP).

Example:

Switch# show lldp neighbor

Capability codes:
(R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
(W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
• Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
• Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
• Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

Traffic Patterns

![Figure 115: Broadcast Storm Control Example](image)

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.
Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the `storm-control` interface configuration commands to set the threshold value for each traffic type.

**How to Configure Storm Control**

**Configuring Storm Control and Threshold Levels**

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

**Note**

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

**Before you begin**

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `storm-control action {shutdown | trap}`
5. `storm-control {broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps pps [pps-low]}`
6. `end`
7. `show storm-control [interface-id] [broadcast | multicast | unicast]`
8. `copy running-config startup-config`

**DETAILED STEPS**

<td>• Select the <strong>shutdown</strong> keyword to error-disable the port during a storm.</td>
</tr>
<tr>
<td>Device(config-if)# <strong>storm-control action trap</strong></td>
<td>• Select the <strong>trap</strong> keyword to generate an SNMP trap when a storm is detected.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>**storm-control {broadcast</td>
<td>multicast</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td>Device(config-if)# <strong>storm-control unicast level 87 65</strong></td>
<td>• For <strong>level</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <strong>level-low</strong>, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00.</td>
</tr>
<tr>
<td></td>
<td>If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.</td>
</tr>
<tr>
<td></td>
<td>• For <strong>bps bps</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <em>bps-low</em>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</td>
</tr>
<tr>
<td></td>
<td>• For <em>pps pps</em>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <em>pps-low</em>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</td>
</tr>
<tr>
<td></td>
<td>For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.</td>
</tr>
</tbody>
</table>

### Step 6

**end**

**Example:**

```
Device(config-if)# end
```

Returns to privileged EXEC mode.

### Step 7

**show storm-control [interface-id] [broadcast | multicast | unicast]**

**Example:**

```
Device# show storm-control gigabitethernet 1/0/1 unicast
```

Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, details for all traffic types (broadcast, multicast and unicast) are displayed.

### Step 8

**copy running-config startup-config**

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

**Configuring Small-Frame Arrival Rate**

Incoming VLAN-tagged packets smaller than 67 bytes are considered small frames. They are forwarded by the switch, but they do not cause the switch storm-control counters to increment.

You globally enable the small-frame arrival feature on the switch and then configure the small-frame threshold for packets on each interface. Packets smaller than the minimum size and arriving at a specified rate (the threshold) are dropped since the port is error disabled.
SUMMARY STEPS

1. enable
2. configure terminal
3. errdisabled detect cause small-frame
4. errdisabled recovery interval interval
5. errdisabled recovery cause small-frame
6. interface interface-id
7. small-frame violation-rate pps
8. end
9. show interfaces interface-id
10. show running-config
11. copy running-config startup-config

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.
Information About Protected Ports

Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

Default Protected Port Configuration

The default is to have no protected ports defined.

Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

How to Configure Protected Ports

Configuring a Protected Port

Before you begin

Protected ports are not pre-defined. This is the task to configure one.

SUMMARY STEPS

1. enable
2. `configure terminal`
3. `interface interface-id`
4. `switchport protected`
5. `end`
6. `show interfaces interface-id switchport`
7. `show running-config`
8. `copy running-config startup-config`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Port Blocking

Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

Note

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.
How to Configure Port Blocking

Blocking Flooded Traffic on an Interface

Before you begin
The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

SUMMARY STEPS
1. enable
2. configure terminal
3. interface interface-id
4. switchport block multicast
5. switchport block unicast
6. end
7. show interfaces interface-id switchport
8. show running-config
9. copy running-config startup-config

Prerequisites for Port Security

Note

If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

Restrictions for Port Security

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

Information About Port Security

Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:

- Static secure MAC addresses—These are manually configured by using the switchport port-security mac-address mac-address interface configuration command, stored in the address table, and added to the switch running configuration.
• Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.

• Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

Security Violations

It is a security violation when one of these situations occurs:

• The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.

• An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

• Running diagnostic tests with port security enabled.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

• protect—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

  Note  We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

• restrict—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.
• shutdown—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command, or you can manually re-enable it by entering the **shutdown** and **no shutdown** interface configuration commands. This is the default mode.

• shutdown vlan—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs

This table shows the violation mode and the actions taken when you configure an interface for port security.

**Table 148: Security Violation Mode Actions**

<table>
<thead>
<tr>
<th>Violation Mode</th>
<th>Traffic is forwarded</th>
<th>Sends SNMP trap</th>
<th>Sends syslog message</th>
<th>Displays error message</th>
<th>Violation counter increments</th>
<th>Shuts down port</th>
</tr>
</thead>
<tbody>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>shutdown vlan</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No 20</td>
</tr>
</tbody>
</table>

18 Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.
19 The switch returns an error message if you manually configure an address that would cause a security violation.
20 Shuts down only the VLAN on which the violation occurred.

**Port Security Aging**

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

• Absolute—The secure addresses on the port are deleted after the specified aging time.

• Inactivity—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

**Port Security and Switch Stacks**

When a switch joins a stack, the new switch will get the configured secure addresses. All dynamic secure addresses are downloaded by the new stack member from the other stack members.

When a switch (either the active switch or a stack member) leaves the stack, the remaining stack members are notified, and the secure MAC addresses configured or learned by that switch are deleted from the secure MAC address table.
Default Port Security Configuration

</tr>
<tr>
<td></td>
<td>Type is absolute.</td>
</tr>
</tbody>
</table>

**Port Security Configuration Guidelines**

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.

- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

- **Note**

  Voice VLAN is only supported on access ports and not on trunk ports, even though the configuration is allowed.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.

- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the `switchport voice` and `switchport priority extend` interface configuration commands has no effect.

  When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

- The switch does not support port security aging of sticky secure MAC addresses.
This table summarizes port security compatibility with other port-based features.

**Table 150: Port Security Compatibility with Other Switch Features**

<table>

21 DTP=Dynamic Trunking Protocol  
22 A port configured with the `switchport mode dynamic` interface configuration command.  
23 A VLAN Query Protocol (VQP) port configured with the `switchport access vlan dynamic` interface configuration command.  
24 You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.

### Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
How to Configure Port Security

Enabling and Configuring Port Security

Before you begin

This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

SUMMARY STEPS

1. enable
2. configure terminal
3. port-security mac-address forbidden mac address
4. interface interface-id
5. switchport mode {access | trunk}
6. switchport voice vlan vlan-id
7. switchport port-security
8. switchport port-security [maximum value [vlan {vlan-list | {access | voice}}]]
9. switchport port-security violation {protect | restrict | shutdown | shutdown vlan}
10. switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}}]]
11. switchport port-security mac-address sticky
12. switchport port-security mac-address sticky [mac-address | vlan {vlan-id | {access | voice}}]
13. switchport port-security mac-address forbidden mac address
14. end
15. show port-security
16. show running-config
17. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.

</tr>
</tbody>
</table>
| Device(config-if)# switchport port-security maximum 20 | (Optional) vlan—sets a per-VLAN maximum value Enter one of these options after you enter the vlan keyword:  
  • vlan-list—On a trunk port, you can set a per-VLAN maximum value on a range of VLANs separated by
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchport port-security violation {protect</td>
<td>restrict</td>
</tr>
<tr>
<td>• access—On an access port, specifies the VLAN as an access VLAN.</td>
<td></td>
</tr>
<tr>
<td>• voice—On an access port, specifies the VLAN as a voice VLAN.</td>
<td></td>
</tr>
<tr>
<td>Note</td>
<td>The <strong>voice</strong> keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.</td>
</tr>
</tbody>
</table>

**Step 9**

```
Device(config-if)# switchport port-security violation restrict
```

(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:

- **protect**—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

- **restrict**—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown**—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown vlan**—Use to set the security violation mode per VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.
## Enabling and Configuring Port Security

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note</strong> When a secure port is in the error-disabled state, you can bring it out of this state by entering the <code>errdisable recovery cause psecure-violation</code> global configuration command. You can manually re-enable it by entering the <code>shutdown</code> and <code>no shutdown</code> interface configuration commands or by using the <code>clear errdisable interface vlan</code> privileged EXEC command.</td>
</tr>
</tbody>
</table>

### Step 10

```
switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}]}]

Example:
```
Device(config-if)# switchport port-security
mac-address 00:A0:C7:12:C9:25 vlan 3 voice
```

(Optional) Enters a secure MAC address for the interface. You can use this command to enter the maximum number of secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.

**Note** If you enable sticky learning after you enter this command, the secure addresses that were dynamically learned are converted to sticky secure MAC addresses and are added to the running configuration.

(Optional) `vlan`—sets a per-VLAN maximum value. Enter one of these options after you enter the `vlan` keyword:

- `vlan-id`—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used.
- `access`—On an access port, specifies the VLAN as an access VLAN.
- `voice`—On an access port, specifies the VLAN as a voice VLAN.

**Note** The `voice` keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.

### Step 11

```
switchport port-security mac-address sticky

Example:
```
Device(config-if)# switchport port-security
mac-address sticky
```

(Optional) Enables sticky learning on the interface.
### Command or Action

**Step 12**

```
switchport port-security mac-address sticky
    [mac-address | vlan {vlan-id | {access | voice}}]
```

**Example:**

```
Device(config-if)# switchport port-security
mac-address sticky 00:A0:C7:12:C9:25 vlan voice
```

**Purpose**

(Optional) Enters a sticky secure MAC address, repeating the command as many times as necessary. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned, are converted to sticky secure MAC addresses, and are added to the running configuration.

**Note**

If you do not enable sticky learning before this command is entered, an error message appears, and you cannot enter a sticky secure MAC address.

(Optional) `vlan`—sets a per-VLAN maximum value.

Enter one of these options after you enter the `vlan` keyword:

- `vlan-id`—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used.
- `access`—On an access port, specifies the VLAN as an access VLAN.
- `voice`—On an access port, specifies the VLAN as a voice VLAN.

**Note**

The `voice` keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN.

**Step 13**

```
switchport port-security mac-address forbidden mac address
```

**Example:**

```
Device(config-if)# switchport port-security
mac-address forbidden 2.2.2
```

**Purpose**

Specifies a MAC address that should be forbidden by port-security on the particular interface.

**Step 14**

```
end
```

**Example:**

```
Device(config)# end
```

**Purpose**

Returns to privileged EXEC mode.

**Step 15**

```
show port-security
```

**Example:**

```
Device# show port-security
```

**Purpose**

Verifies your entries.
Enabling and Configuring Port Security Aging

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport port-security aging {static | time time | type {absolute | inactivity}}`
5. `end`
6. `show port-security [interface interface-id] [address]`
7. `show running-config`
8. `copy running-config startup-config`

DETAILED STEPS

Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 50
Device(config-if)# switchport port-security mac-address sticky

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# switchport mode trunk
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

Device(config)# interface tengigabitethernet 1/0/1
Device(config-if)# switchport access vlan 21
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan 22
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 20
Device(config-if)# switchport port-security violation restrict
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address 0000.0000.0002
Device(config-if)# switchport port-security mac-address 0000.0000.0003
Device(config-if)# switchport port-security mac-address 0000.0000.0001 vlan voice
Device(config-if)# switchport port-security mac-address 0000.0000.0004 vlan voice
Device(config-if)# switchport port-security maximum 10 vlan access
Device(config-if)# switchport port-security maximum 10 vlan voice

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Protocol Storm Protection

Protocol Storm Protection

When a switch is flooded with Address Resolution Protocol (ARP) or control packets, high CPU utilization can cause the CPU to overload. These issues can occur:

- Routing protocol can flap because the protocol control packets are not received, and neighboring adjacencies are dropped.
- Spanning Tree Protocol (STP) reconverges because the STP bridge protocol data unit (BPDU) cannot be sent or received.
- CLI is slow or unresponsive.

Using protocol storm protection, you can control the rate at which control packets are sent to the switch by specifying the upper threshold for the packet flow rate. The supported protocols are ARP, ARP snooping, Dynamic Host Configuration Protocol (DHCP) v4, DHCP snooping, Internet Group Management Protocol (IGMP), and IGMP snooping.

When the packet rate exceeds the defined threshold, the switch drops all traffic arriving on the specified virtual port for 30 seconds. The packet rate is measured again, and protocol storm protection is again applied if necessary.
For further protection, you can manually error disable the virtual port, blocking all incoming traffic on the virtual port. You can manually enable the virtual port or set a time interval for automatic re-enabling of the virtual port.

**Note**
Excess packets are dropped on no more than two virtual ports.
Virtual port error disabling is not supported for EtherChannel and Flexlink interfaces

### Default Protocol Storm Protection Configuration

Protocol storm protection is disabled by default. When it is enabled, auto-recovery of the virtual port is disabled by default.

### How to Configure Protocol Storm Protection

#### Enabling Protocol Storm Protection

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `psp {arp | dhcp | igmp} pps value`
4. `errdisable detect cause psp`
5. `errdisable recovery interval time`
6. `end`
7. `show psp config {arp | dhcp | igmp}`

**DETAILED STEPS**

**Command or Action** | **Purpose**
---|---
**Step 1** | **enable**
Example: 
Device> `enable` **Enables privileged EXEC mode.**
• Enter your password if prompted.

**Step 2** | **configure terminal**
Example: 
 Device# `configure terminal` **Enters global configuration mode.**

**Step 3** | `psp {arp | dhcp | igmp} pps value`
Example: 
 Configures protocol storm protection for ARP, IGMP, or DHCP.

Configuring FIPS

Information About FIPS and Common Criteria, on page 1459

Information About FIPS and Common Criteria

The Federal Information Processing Standard (FIPS) certification documents for Cisco Catalyst series switches are posted on the following website:

Click the link in the Certification column to view the Consolidated Validation Certificate and the Security Policy document. The Security Policy document describes the FIPS implementation, hardware installation, firmware initialization, and software configuration procedures for FIPS operation.

Common Criteria is an international standard (ISO/IEC 15408) for computer security certification. This standard is a set of requirements, tests, and evaluation methods that ensures that the Target of Evaluation complies with a specific Protection Profile or custom Security Target. For more information, see the security target document for specific Cisco Catalyst switch models and Cisco IOS Releases at:

http://www.niap-ccevs.org/CCEVS_Products/pcl.cfm?tech_name=Network+Switch

Configuring Control Plane Policing

• Finding Feature Information, on page 1461
• Restrictions for Control Plane Policing, on page 1461
• Control Plane Policing, on page 1461
• Configuring Control Plane Policing, on page 1462
• Examples: Configuring CoPP, on page 1463

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Control Plane Policing

The following restrictions apply while Configuring Control Plane Policing:

• Only six among the following protocols can be configured simultaneously: rip, ospf-v6, eigrp-v6, rip-v6, dhcp-snoop-client-to-server, dhcp-snoop-server-to-client, ndp-router-solicitation, ndp-router-advertisement, ndp-redirect, dhcpv6-client-to-server, dhcpv6-server-to-client, igrp.

• For ospf, eigrp and ripv2 protocols, control packets which are destined to multicast Mac of the router are policed along with the "reserve-multicast-group" option.

Control Plane Policing

Configure the Control Plane Policing (CoPP) feature on a predefined set of protocols to control the flow of traffic coming to the CPU. The CoPP allows you to set a rate limit on specific protocol packets. These packets are policed, and the packets that conform to the defined rate limit are permitted into the CPU. COPP protects the packets from being routed to the CPU at an undesired rate that might impact the performance of a switch and the network. In addition, the CoPP protects the CPU from denial of service (DoS) attacks and ensures
routing stability, reachability, and packet delivery. You can use Multi-Layer Switching QoS CLI to set the rate limit and policing parameters on a specific protocol.

**Note**
CoPP is supported only on LAN BASE, IP Lite, and IP Service licenses.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on SLAs

This section lists the restrictions on SLAs.

The following are restrictions on IP SLAs network performance measurement:

- The device does not support VoIP service levels using the gatekeeper registration delay operations measurements.

- Only a Cisco IOS device can be a source for a destination IP SLAs responder.

- You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

- Switches running the IP base or LAN base feature set support only IP SLAs responder functionality and must be configured with another device that supports full IP SLAs functionality.
Information About SLAs

Cisco IOS IP Service Level Agreements (SLAs)

Cisco IOS IP SLAs send data across the network to measure performance between multiple network locations or across multiple network paths. They simulate network data and IP services and collect network performance information in real time. Cisco IOS IP SLAs generate and analyze traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLA operations can be used for troubleshooting, for problem analysis, and for designing network topologies.

Depending on the specific Cisco IOS IP SLA operations, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLA packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs are Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collect and analyze the following performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivitiy (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like Cisco Prime Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products.

Using IP SLAs can provide the following benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
  - Measurement of jitter, latency, or packet loss in the network.
  - Continuous, reliable, and predictable measurements.
• IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
• Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
• Network operation troubleshooting by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.
• Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the device supports MPLS).

Network Performance Measurement with Cisco IOS IP SLAs

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices.

*Figure 116: Cisco IOS IP SLAs Operation*

The following figure shows how IP SLAs begin when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

Related Topics

Monitoring IP SLA Operations, on page 1473

IP SLA Responder and IP SLA Control Protocol

The IP SLA responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLA request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLA Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond.
The IP SLA responder can be a Cisco IOS Layer 2, responder-configurable device. The responder does not need to support full IP SLA functionality.

The following figure shows where the Cisco IOS IP SLA responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLA operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLA packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

Figure 117: Cisco IOS IP SLAs Operation

You do not need to enable the responder on the destination device for all IP SLA operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP).

Response Time Computation for IP SLAs

Switches, controllers, and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimize these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLA test packets use time stamping to minimize the processing delays.

When the IP SLA responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

Figure 118: Cisco IOS IP SLA Responder Time Stamping

The following figure demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is
subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt level to allow for greater accuracy. 

\[
\text{RTT (Round-trip time)} = T_4 \text{ (Time stamp 4)} - T_1 \text{ (Time stamp 1)} - \Delta
\]

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

## How to Configure IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the *Cisco IOS IP SLAs Configuration Guide*. It does include several operations as examples, including configuring the responder, configuring a UDP jitter operation, which requires a responder, and configuring an ICMP echo operation, which does not require a responder. For details about configuring other operations, see the *Cisco IOS IP SLAs Configuration Guide*.

### Default Configuration

No IP SLAs operations are configured.

**Related Topics**

- Configuration Guidelines, on page 1471

### Configuration Guidelines

For information on the IP SLA commands, see the *Cisco IOS IP SLAs Command Reference, Release 12.4T* command reference.

For detailed descriptions and configuration procedures, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4TL*.

**Related Topics**

- Default Configuration, on page 1471
Configuring the IP SLA Responder

The IP SLA responder is available only on Cisco IOS software-based devices, including some Layer 2 devices that do not support full IP SLA functionality.

Follow these steps to configure the IP SLA responder on the target device (the operational target):

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip sla responder \{ tcp-connect \| udp-echo \} ipaddress ip-address port port-number
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Switch Stacks

All stack members must run the same Cisco IOS software image to ensure compatibility among stack members.

For switch stack hardware considerations, see the Catalyst 2960-X Switch Hardware Installation Guide.

Restrictions for Switch Stacks

The following are restrictions for your switch stack configuration:

- Stacking is not supported on switches running the LAN Lite image. All switches in the stack must be running the LAN Base image.
In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, the number of supported stack members is reduced from eight to four.

In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, full stack bandwidth is reduced from 80 Gbps to 40 Gbps.

In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, stack convergence time is increased from milliseconds to 1 to 2 seconds.

Auto-upgrade of stack cannot be done when one of the switches in stack is with version Cisco IOS 15.2(3)E. This means that whenever any of the switches in the stack goes into a version mismatch, and if either master is running Cisco IOS 15.2(3)E, or if a member is running Cisco 15.2(3)E, the member cannot be auto-upgraded to the required version.

Information About Switch Stacks

Switch Stack Overview

A switch stack is a set of up to eight stacking-capable switches connected through their stack ports. You can connect only one switch type in a stack, or you can connect a mix of Catalyst 2960-X and Catalyst 2960-S switches in the stack. The stack can have one of these configurations:

- Homogeneous stack—A Catalyst 2960-X stack with only Catalyst 2960-X switches as stack members. A homogenous stack can have up to 8 stack members.
- Mixed stack—A stack with a mix of Catalyst 2960-X and Catalyst 2960-S switches. A mixed stack can have up to 4 stack members, with either a Catalyst 2960-X or Catalyst 2960-S switch as the stack master.

The stack master controls the operation of the switch stack, and is the single point of stack-wide management. From the stack master, you configure:

- System-level (global) features that apply to all stack members
- Interface-level features for each stack member

The stack master contains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level settings for each stack member. Each stack member has a current copy of these files for back-up purposes.

Supported Features in a Switch Stack

The system-level features supported on the stack master are supported on the entire switch stack.

Encryption Features

If the stack master is running the cryptographic universal software image (supports encryption), the encryption features are available on the switch stack.

FlexStack-Plus

The stack members use the Cisco FlexStack-Plus technology to work together as a unified system. Layer 2 protocols support the entire switch stack as a single entity in the network.
Switch stacks running the LAN Base image do not support Layer 3 features.

The FlexStack-Plus bandwidth for a single stack port is 20 Gbps. With FlexStack-Plus technology, up to eight members can be joined into a single stack. In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, FlexStack-Plus reverts to FlexStack capabilities of 10 Gbps stack port bandwidth and a maximum of four members per stack.

### Fast Stack Convergence

When a single link in a full ring stack becomes inoperable, there is a disruption in the forwarding of packets, and the stack moves to a half ring. In a homogenous stack of Catalyst 2960-X switches, this disruption of traffic (or stack convergence time) takes milliseconds. In a mixed stack configuration, the stack takes 1 to 2 seconds to reconverge.

When a single link in a full ring stack becomes inoperable, there is a disruption in the forwarding of packets, and the stack moves to a half ring. With switches, this disruption of traffic (or stack convergence time) takes milliseconds.

### Switch Stack Membership

A switch stack has up to eight stack members connected through their stack ports. A switch stack always has one stack master.

A standalone device is a device stack with one stack member that also operates as the stack master. You can connect one standalone device to another to create a device stack containing two stack members, with one of them as the stack master. You can connect standalone devices to an existing device stack to increase the stack membership.

*Figure 119: Creating a Switch Stack from Two Standalone Switches*
Changes to Switch Stack Membership

If you replace a stack member with an identical model, the new switch functions with exactly the same configuration as the replaced switch, assuming that the new switch (referred to as the provisioned switch) is using the same member number as the replaced switch.

The operation of the switch stack continues uninterrupted during membership changes unless you remove the stack master or you add powered-on standalone switches or switch stacks.

- Adding powered-on switches (merging) causes the stack masters of the merging switch stacks to elect a stack master from among themselves. The reelected stack master retains its role and configuration as do its stack members. All remaining switches, including the former stack masters, reload and join the switch stack as stack members. They change their stack member numbers to the lowest available numbers and use the stack configuration of the reelected stack master.

- Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. This can cause:
  - An IP address conflict in your network. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks.
  - A MAC address conflict between two members in the stack. You can use the stack-mac update force command to resolve the conflict.
Make sure that you power off the switches that you add to or remove from the switch stack.

After adding or removing stack members, make sure that the switch stack is operating at full bandwidth. Press the Mode button on a stack member until the Stack mode LED is on. The last two right port LEDs on all switches in the stack should be green. Depending on the switch model, the last two right ports are 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports (10/100/1000 ports). If one or both of these LEDs are not green on any of the switches, the stack is not operating at full bandwidth.

It may take up to 4 seconds for stack convergence when a new stack member is added to the existing switch stack.

If you remove powered-on members but do not want to partition the stack:

- Power off the switches in the newly created switch stacks.
- Reconnect them to the original switch stack through their stack ports.
- Power on the switches.

For cabling and power considerations that affect switch stacks, see the Catalyst 2960-X Switch Hardware Installation Guide.

Stack Member Numbers

The stack member number (1 to 8) identifies each member in the switch stack. The member number also determines the interface-level configuration that a stack member uses. You can display the stack member number by using the `show switch` EXEC command.

A new, out-of-the-box (one that has not joined a stack or has not been manually assigned a stack member number) ships with a default stack member number of 1. When it joins a stack, its default stack member number changes to the lowest available member number in the stack.

Stack members in the same stack cannot have the same stack member number. Every stack member, including a standalone, retains its member number until you manually change the number or unless the number is already being used by another member in the stack.

- If you manually change the stack member number by using the `switch current-stack-member-number renumber new-stack-member-number` global configuration command, the new number goes into effect after that stack member resets (or after you use the `reload slot stack-member-number` privileged EXEC command) and only if that number is not already assigned to any other members in the stack. Another way to change the stack member number is by changing the _NUMBER environment variable.

  If the number is being used by another member in the stack, the selects the lowest available number in the stack.

  If you manually change the number of a stack member and no interface-level configuration is associated with that new member number, that stack member resets to its default configuration.

  You cannot use the `switch current-stack-member-number renumber new-stack-member-number` global configuration command on a provisioned. If you do, the command is rejected.

  - If you move a stack member to a different stack, the stack member retains its number only if the number is not being used by another member in the stack. If it is being used, the selects the lowest available number in the stack.
If you merge stacks, the stack of a new stack master select the lowest available numbers in the stack.

As described in the hardware installation guide, you can use the port LEDs in Stack mode to visually determine the stack member number of each stack member.

In the default mode Stack LED will blink in green color only on the stack master. However, when we scroll the Mode button to Stack option - Stack LED will glow green on all the stack members.

When mode button is scrolled to Stack option, the switch number of each stack member will be displayed as LEDs on the first five ports of that switch. The switch number is displayed in binary format for all stack members. On the switch, the amber LED indicates value 0 and green LED indicates value 1.

Example for switch number 5 (Binary - 00101):
First five LEDs glow as follows on stack member with switch number 5.

- Port-1: Amber
- Port-2: Amber
- Port-3: Green
- Port-4: Amber
- Port-5: Green

Similarly, the first five LEDs glow amber or green, depending on the switch number on all stack members.

---

**Note**

Stack port will not go down but only transmission/reception will be disabled. The log message shown below will be displayed on the console. Once the peer end network port is converted to stack port, transmission/reception on this stack port will be enabled.

```
%STACKMGR-4-HSTACK_LINK_CONFIG: Verify peer stack port setting for hstack
StackPort-1 switch 5 (hostname-switchnumber)
```

---

**Stack Member Priority Values**

A higher priority value for a stack member increases the probability of it being elected stack master and retaining its stack member number. The priority value can be 1 to 15. The default priority value is 1. You can display the stack member priority value by using the `show switch` EXEC command.

---

**Note**

We recommend assigning the highest priority value to the device that you prefer to be the stack master. This ensures that the device is reelected as the stack master if a reelection occurs.

To change the priority value for a stack member, use the `switch stack-member-number priority new priority-value` global configuration command. For more information, see the “Setting the Stack Member Priority Value” section.
The new priority value takes effect immediately but does not affect the current stack master. The new priority value helps determine which stack member is elected as the new stack master when the current stack master or the switch stack resets.

**Switch Stack Bridge ID and MAC Address**

The MAC address of the stack master determines the stack MAC address.

When the stack initializes, the MAC address of the stack master determines the bridge ID that identifies the stack in the network.

If the stack master changes, the MAC address of the new stack master determines the new bridge ID and stack MAC address.

If the entire switch stack reloads, the switch stack uses the MAC address of the stack master.

**Persistent MAC Address on the Switch Stack**

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes. During this time period, if the previous active switch rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not an active switch. If the previous active switch does not rejoin the stack during this period, the switch stack takes the MAC address of the new active switch as the stack MAC address. By default, the stack MAC address will be the MAC address of the first active switch, even if a new active switch takes over.

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes to the MAC address of the new stack master. When this feature is enabled, the stack MAC address changes in approximately 4 minutes. During this time, if the previous stack master rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not a stack master. If the previous stack master does not rejoin the stack during this period, the switch stack takes the MAC address of the new stack master as the stack MAC address.

You can also configure stack MAC persistency so that the stack MAC address never changes to the new stack master MAC address.

**Stack Master Election and Reelection**

All stack members are eligible to be the active switch or the standby switch. If the active switch becomes unavailable, the standby switch becomes the active switch.

An active switch retains its role unless one of these events occurs:

- The switch stack is reset.
- The active switch is removed from the switch stack.
- The active switch is reset or powered off.
- The active switch fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.

All stack members are eligible stack masters. If the stack master becomes unavailable, the remaining members elect a new stack master from among themselves.

The stack master is elected or reelected based on one of these factors and in the order listed:
1. The switch that is currently the stack master.
2. The switch with the highest stack member priority value.

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the stack master. This ensures that the switch is reelected as stack master if a reelection occurs.

3. The switch with the shortest start-up time.
4. The switch that has the configuration file.
5. The switch with the lowest MAC address.

**Note**

The factors for electing or reelecting a new standby switch are same as those for the active switch election or reelection, and are applied to all participating switches except the active switch.

After election, the new active switch becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new active switch election and reset.

When the previous active switch becomes available, it *does not* resume its role as the active switch.

If you power on or reset an entire switch stack, some stack members *might not* participate in the active switch election. Stack members that are powered on within the same 2-minute timeframe participate in the active switch election and have a chance to become the active switch. Stack members that are powered on after the 120-second timeframe do not participate in this initial election and become stack members. For powering considerations that affect active-switch elections, see the switch hardware installation guide.

As described in the hardware installation guide, you can use the ACTV LED on the switch to see if the switch is the active switch.

A stack master retains its role unless one of these events occurs:

- The switch stack is reset.*
- The stack master is removed from the switch stack.
- The stack master is reset or powered off.
- The stack master fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.*

In the events marked by an asterisk (*), the current stack master *might* be reelected based on the listed factors.

When you power on or reset an entire switch stack, some stack members *might not* participate in the stack master election. Stack members that are powered on within the same 20-second time frame participate in the stack master election and have a chance to become the stack master. Stack members that are powered on after the 20-second time frame do not participate in this initial election and become stack members. All stack members participate in reelections. For all powering considerations that affect stack-master elections, see the “Switch Installation” chapter in the hardware installation guide.
The new stack master becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new stack master election and reset.

After a new stack master is elected and the previous stack master becomes available, the previous stack master does not resume its role as stack master.

For all powering considerations that affect stack-master elections, see the *Catalyst 2960-X Switch Hardware Installation Guide*.

**Switch Stack Configuration Files**

The active switch has the saved and running configuration file for the switch stack. The standby switch automatically receives the synchronized running configuration file. Stack members receive synchronized copies when the running configuration file is saved into the startup configuration file. If the active switch becomes unavailable, the standby switch takes over with the current running configuration.

The stack master has the saved and running configuration files for the switch stack. All stack members periodically receive synchronized copies of the configuration files from the stack master. If the stack master becomes unavailable, any stack member assuming the role of stack master has the latest configuration files.

The configuration files record these settings:

- System-level (global) configuration settings such as IP, STP, VLAN, and SNMP settings that apply to all stack members

- Stack member interface-specific configuration settings that are specific for each stack member

---

**Note**

The interface-specific settings of the stack master are saved if the stack master is replaced without saving the running configuration to the startup configuration.

A new, out-of-box device joining a switch stack uses the system-level settings of that switch stack. If a device is moved to a different switch stack before it is powered on, that device loses its saved configuration file and uses the system-level configuration of the new switch stack. If the device is powered on as a standalone device before it joins the new switch stack, the stack will reload. When the stack reloads, the new device may become the stack master, retain its configuration and overwrite the configuration files of the other stack members.

The interface-specific configuration of each stack member is associated with the stack member number. Stack members retain their numbers unless they are manually changed or they are already used by another member in the same switch stack. If the stack member number changes, the new number goes into effect after that stack member resets.

- If an interface-specific configuration does not exist for that member number, the stack member uses its default interface-specific configuration.

- If an interface-specific configuration exists for that member number, the stack member uses the interface-specific configuration associated with that member number.

If you replace a failed member with an identical model, the replacement member automatically uses the same interface-specific configuration as the failed device. You do not need to reconfigure the interface settings. The replacement device (referred to as the provisioned device) must have the same stack member number as the failed device.
You back up and restore the stack configuration in the same way as you would for a standalone device configuration.

**Offline Configuration to Provision a Stack Member**

You can use the offline configuration feature to provision (to supply a configuration to) a new switch before it joins the switch stack. You can configure the stack member number, the switch type, and the interfaces associated with a switch that is not currently part of the stack. The configuration that you create on the switch stack is called the *provisioned configuration*. The switch that is added to the switch stack and that receives this configuration is called the *provisioned switch*.

You manually create the provisioned configuration through the `switch stack-member-number provision type` global configuration command. You must change the `stack-member-number` on the provisioned switch before you add it to the stack, and it must match the stack member number that you created for the new switch on the switch stack. The switch type in the provisioned configuration must match the switch type of the newly added switch. The provisioned configuration is automatically created when a switch is added to a switch stack and when no provisioned configuration exists.

When you configure the interfaces associated with a provisioned switch, the switch stack accepts the configuration, and the information appears in the running configuration. However, as the switch is not active, any configuration on the interface is not operational and the interface associated with the provisioned switch does not appear in the display of the specific feature. For example, VLAN configuration information associated with a provisioned switch does not appear in the `show vlan` user EXEC command output on the switch stack.

The switch stack retains the provisioned configuration in the running configuration whether or not the provisioned switch is part of the stack. You can save the provisioned configuration to the startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. The startup configuration file ensures that the switch stack can reload and can use the saved information whether or not the provisioned switch is part of the switch stack.

**Effects of Adding a Provisioned Switch to a Switch Stack**

When you add a provisioned Device to the switch stack, the stack applies either the provisioned configuration or the default configuration. This table lists the events that occur when the switch stack compares the provisioned configuration with the provisioned switch.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stack member numbers and the Device types match. 1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, and 2. If the Device type of the provisioned switch matches the Device type in the provisioned configuration on the stack.</td>
<td>The switch stack applies the provisioned configuration to the provisioned switch and adds it to the stack.</td>
</tr>
</tbody>
</table>
### Effects of Replacing a Provisioned Switch in a Switch Stack

When a provisioned switch in a switch stack fails, it is removed from the stack, and is replaced with another Device, the stack applies either the provisioned configuration or the default configuration to it. The events that occur when the switch stack compares the provisioned configuration with the provisioned switch are the same as those when you add a provisioned switch to a stack.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stack member numbers match but the Device types do not match.</td>
<td>1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, but</td>
</tr>
<tr>
<td></td>
<td>2. The Device type of the provisioned switch does not match the Device type in the provisioned configuration on the stack.</td>
</tr>
<tr>
<td></td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack. The provisioned configuration is</td>
</tr>
<tr>
<td></td>
<td>changed to reflect the new information.</td>
</tr>
<tr>
<td>The stack member number is not found in the provisioned configuration.</td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack. The provisioned configuration is</td>
</tr>
<tr>
<td></td>
<td>changed to reflect the new information.</td>
</tr>
<tr>
<td>The stack member number of the provisioned switch is not found in the provisioned configuration.</td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</td>
</tr>
</tbody>
</table>

If you add a provisioned switch that is a different type than specified in the provisioned configuration to a powered-down switch stack and then apply power, the switch stack rejects the (now incorrect) `switch stack-member-number provision type` global configuration command in the startup configuration file. However, during stack initialization, the nondefault interface configuration information in the startup configuration file for the provisioned interfaces (potentially of the wrong type) is executed. Depending on the differences between the actual Device type and the previously provisioned switch type, some commands are rejected, and some commands are accepted.

If the switch stack does not contain a provisioned configuration for a new Device, the Device joins the stack with the default interface configuration. The switch stack then adds to its running configuration with a `switch stack-member-number provision type` global configuration command that matches the new Device. For configuration information, see the **Provisioning a New Member for a Switch Stack** section.
Effects of Removing a Provisioned Switch from a Switch Stack

If you remove a provisioned switch from the switch stack, the configuration associated with the removed stack member remains in the running configuration as provisioned information. To completely remove the configuration, use the `no switch stack-member-number provision` global configuration command.

Stack Protocol Version

Each software image includes a stack protocol version. The stack protocol version has a major version number and a minor version number (for example 1.4, where 1 is the major version number and 4 is the minor version number). Both version numbers determine the level of compatibility among the stack members. You can display the stack protocol version by using the `show platform stack manager all` privileged EXEC command.

The switches with the same Cisco IOS software version have the same stack protocol version. Such switches are fully compatible, and all features function properly across the switch stack. A device with the same Cisco IOS software version as the stack master can immediately join the switch stack.

If an incompatibility exists, the fully functional stack members generate a system message that describes the cause of the incompatibility on the specific stack members. The stack master sends the message to all stack members.

For more information, see the `Major Version Number Incompatibility Among Switches` procedure and the `Minor Version Number Incompatibility Among Switches` procedure.

Major Stack Protocol Version Number Incompatibility Among Stack-Capable Switches

Device with different major Cisco IOS software versions usually have different stack protocol versions. Device with different major version numbers are incompatible and cannot exist in the same switch stack.

Minor Stack Protocol Version Number Incompatibility Among Stack-Capable Switches

Switches with the same major version number but with a different minor version number are considered partially compatible. When connected to a switch stack, a partially compatible switch enters version-mismatch (VM) mode and cannot join the stack as a fully functioning member. The software detects the mismatched software and tries to upgrade (or downgrade) the switch in VM mode with the switch stack image or with a tar file image from the switch stack flash memory. The software uses the automatic upgrade (auto-upgrade) and the automatic advise (auto-advise) features.

The port LEDs on switches in version-mismatch mode will also remain off. Pressing the Mode button does not change the LED mode.

Auto-Upgrade

The purpose of the auto-upgrade feature is to allow a switch to be upgraded to a compatible software image, so that the switch can join the switch stack.

When a new switch attempts to join a switch stack, each stack member performs compatibility checks with itself and the new switch. Each stack member sends the results of the compatibility checks to the stack master, which uses the results to determine whether the switch can join the switch stack. If the software on the new switch is incompatible with the switch stack, the new switch enters version-mismatch (VM) mode.

If the auto-upgrade feature is enabled on the existing switch stack, the stack master automatically upgrades the new switch with the same software image running on a compatible stack member. Auto-upgrade starts a few minutes after the mismatched software is detected before starting.
By default, auto-upgrade is enabled (the `boot auto-copy-sw` global configuration command is enabled). You can disable auto-upgrade by using the `no boot auto-copy-sw` global configuration command on the stack master. You can check the status of auto-upgrade by using the `show boot` privileged EXEC command and by checking the `Auto upgrade` line in the display.

Auto-upgrade includes an auto-copy process and an auto-extract process.

- Auto-copy automatically copies the software image running on any stack member to the new switch to automatically upgrade it. Auto-copy occurs if auto-upgrade is enabled, if there is enough flash memory in the new switch, and if the software image running on the switch stack is suitable for the new switch.

  **Note** A switch in VM mode might not run all released software. For example, new switch hardware is not recognized in earlier versions of software.

- Automatic extraction (auto-extract) occurs when the auto-upgrade process cannot find the appropriate software in the stack to copy to the new switch. In that case, the auto-extract process searches all switches in the stack for the tar file needed to upgrade the switch stack or the new switch. The tar file can be in any flash file system in the switch stack or in the new switch. If a tar file suitable for the new switch is found on a stack member, the process extracts the file and automatically upgrades the new switch.

The auto-upgrade (auto-copy and auto-extract) processes start a few minutes after the mismatched software is detected.

When the auto-upgrade process is complete, the new switch reloads and joins the stack as a fully functioning member. If you have both stack cables connected during the reload, network downtime does not occur because the switch stack operates on two rings.

**Auto-Advise**

The auto-advice feature is triggered when:

- The auto-upgrade feature is disabled.

- The new switch is in bundle mode and the stack is in installed mode. Auto-advice displays syslog messages about using the `software auto-upgrade` privileged EXEC command to change the new switch to installed mode.

- The stack is in bundle mode. Auto-advice displays syslog messages about booting the new switch in bundle mode so that it can join the stack.

- An auto-upgrade attempt fails because the new switch is running incompatible software. After the switch stack performs compatibility checks with the new switch, auto-advice displays syslog messages about whether the new switch can be auto-upgraded.

Auto-advice cannot be disabled. It does not give suggestions when the switch stack software and the software of the switch in version-mismatch (VM) mode do not contain the same license level.

Automatic advice (auto-advice) occurs when the auto-upgrade process cannot find appropriate stack member software to copy to the new switch. This process tells you the command (`archive copy-sw` or `archive download-sw` privileged EXEC command) and the image name (tar filename) needed to manually upgrade the switch stack or the new switch. The recommended image can be the running switch stack image or a tar file in any flash file system in the switch stack (including the new switch). If an appropriate image is not found.
in the stack flash file systems, the auto-advising process tells you to install new software on the switch stack. Auto-advising cannot be disabled, and there is no command to check its status.

Examples of Auto-Advise Messages

When you add a switch that has a different minor version number to the switch stack, the software displays messages in sequence (assuming that there are no other system messages generated by the switch).

This example shows that the switch stack detected a new switch that is running a different minor version number than the switch stack. Auto-copy starts, finds suitable software to copy from a stack member to the switch in VM mode, upgrades the switch in VM mode, and then reboots it:

*Mar 11 20:31:19.247:*STACKMGR-6-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state UP
*Mar 11 20:31:23.232:*STACKMGR-6-SWITCH_ADDED_VM: Switch 1 has been ADDED to the stack (VERSION_MISMATCH)
*Mar 11 20:31:23.291:*STACKMGR-6-SWITCH_ADDED_VM: Switch 1 has been ADDED to the stack (VERSION_MISMATCH) (Stack_1-3)
*Mar 11 20:33:23.248:*IMAGEMGR-6-AUTO_COPY_SW_INITIALIZED: Auto-copy-software process initiated for switch number(s) 1

*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
*Mar 11 20:36:15.038:*IMAGEMGR-6-AUTO_COPY_SW: Extracting images from archive into flash on switch 1...
This example shows that the switch stack detected a new switch that is running a different minor version number than the switch stack. Auto-copy starts but cannot find software in the switch stack to copy to the VM-mode switch to make it compatible with the switch stack. The auto-advice process starts and recommends that you download a tar file from the network to the switch in VM mode:

```
*Mar 1 00:04:22.537:%IMAGEMGR-6-AUTO_ADVISE_SW:archive download-sw /force-reload /overwrite /dest 1 flash1:c2960x-universalk9-mz.150-2.EX.tar
```

Auto-advice and auto-copy identify which images are running by examining the info file and by searching the directory structure on the switch stack. If you download your image by using the `copy tftp` boot loader command instead of the `archive download-sw` privileged EXEC command, the proper directory structure is not created. For more information about the info file, see the Catalyst 2960-X Switch Managing Cisco IOS Image Files Configuration Guide.
SDM Template Mismatch in Switch Stacks

The LAN Base default template is used with switches in a homogeneous stack, and the LAN Base routing template is used with switches in a mixed stack.

All stack members use the Switch Database Management (SDM) template configured on the stack master. When a new switch is added to a stack, the SDM configuration that is stored on the stack master overrides the template configured on an individual switch.

When you add a Catalyst 2960-S switch to a stack of Catalyst 2960-X switches running the LAN Base default template, the Catalyst 2960-S switch will go into SDM-mismatch mode. You must change the template of the switch stack to the LAN Base routing template.

You can use the `show switch` privileged EXEC command to see if any stack members are in SDM-mismatch mode.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM-mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition.

For more information about SDM templates, see the *Catalyst 2960-X Switch System Management Configuration Guide*.

Switch Stack Management Connectivity

You manage the switch stack and the stack member interfaces through the stack master. You can use the CLI, SNMP, and supported network management applications such as CiscoWorks. You cannot manage stack members on an individual Device basis.

Connectivity to Specific Stack Members

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug a specific stack member, you can access it from the stack master by using the `session stack-member-number` privileged EXEC command. The stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the stack master is Switch. Only the `show` and `debug` commands are available in a CLI session to a specific stack member.

To debug the standby switch, you can access it from the active switch using the `session standby ios` privileged EXEC command. To debug a specific stack member, use the `session switch stack-member-number` privileged EXEC command from the active switch to access the diagnostic shell of the stack member. Only the `show` and `debug` commands are available in a CLI session to a specific stack member.

Connectivity to the Switch Stack Through an IP Address

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the stack master or to any other stack member. You can still manage the stack through the same IP address even if you remove the stack master or any other stack member from the stack, provided there is IP connectivity.
Stack members retain their IP addresses when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP addresses of any Device that you remove from the switch stack.

For related information about switch stack configurations, see the Switch Stack Configuration Files section.

Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports

You can connect to the stack master by using one of these methods:

- You can connect a terminal or a PC to the stack master through the console port of one or more stack members.
- You can connect a PC to the stack master through the Ethernet management ports of one or more stack members. For more information about connecting to the switch stack through Ethernet management ports, see the Using the Ethernet Management Port section.

You can connect to the stack master by connecting a terminal or a PC to the stack master through the console port of one or more stack members.

Be careful when using multiple CLI sessions to the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

We recommend using only one CLI session when managing the switch stack.

How to Configure a Switch Stack

Enabling the Persistent MAC Address Feature

When you enter the command to configure this feature, a warning message appears with the consequences of your configuration. You should use this feature cautiously. Using the old stack master MAC address elsewhere in the same domain could result in lost traffic.

Follow these steps to enable persistent MAC address:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `stack-mac persistent timer [0 | time-value]`
4. `end`
5. `copy running-config startup-config`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
**enable**  
**Example:**  
Device> enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2**  
**configure terminal**  
**Example:**  
Device# configure terminal | Enters global configuration mode. |
| **Step 3**  
**stack-mac persistent timer** [0 | time-value]  
**Example:**  
Device(config)# stack-mac persistent timer 7 | Enables a time delay after a stack-master change before the stack MAC address changes to that of the new stack master. If the previous stack master rejoins the stack during this period, the stack uses that MAC address as the stack MAC address.  
You can configure the time period as 0 to 60 minutes.  
- Enter the command with no value to set the default delay of approximately 4 minutes. We recommend that you always enter a value.  
If the command is entered without a value, the time delay appears in the running-config file with an explicit timer value of 4 minutes.  
- Enter 0 to continue using the MAC address of the current stack master indefinitely.  
The stack MAC address of the previous stack master is used until you enter the no stack-mac persistent timer command, which immediately changes the stack MAC address to that of the current stack master.  
- Enter a time-value from 1 to 60 minutes to configure the time period before the stack MAC address changes to the new stack master.  
The stack MAC address of the previous stack master is used until the configured time period expires or until you enter the no stack-mac persistent timer command.  
**Note** If you enter the no stack-mac persistent timer command after a new stack master takes over, before the time expires, the switch stack moves to the current stack master MAC address. |
### Assigning a Stack Member Number

This optional task is available only from the stack master.

Follow these steps to assign a member number to a stack member:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `switch current-stack-member-number renumber new-stack-member-number`
4. `end`
5. `reload slot stack-member-number`
6. `show switch`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
### Setting the Stack Member Priority Value

This optional task is available only from the stack master.

Follow these steps to assign a priority value to a stack member:

**SUMMARY STEPS**

1. enable
2. `switch stack-member-number priority new-priority-number`
3. `show switch stack-member-number`
4. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

### Switching Stack Members

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> <code>switch current-stack-member-number renumber new-stack-member-number</code></td>
<td>Specifies the current stack member number and the new stack member number for the stack member. The range is 1 to 8. You can display the current stack member number by using the <code>show switch</code> user EXEC command.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config)# switch 3 renumber 4
```

<table>
<thead>
<tr>
<th><strong>Step 4</strong> end</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Step 5</strong> <code>reload slot stack-member-number</code></th>
<th>Resets the stack member.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> <code>reload slot 4</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Step 6</strong> <code>show switch</code></th>
<th>Verify the stack member number.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> <code>showDevice</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Step 7</strong> <code>copy running-config startup-config</code></th>
<th>(Optional) Saves your entries in the configuration file.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> <code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
### Setting the Stack Port Speed to 10 Gbps

In a mixed stack of Catalyst 2960-X and 2960-S switches, you must set the stack port speed to 10 Gbps. This task is required in a mixed stack configuration and must be run on a Catalyst 2960-X switch in the switch stack before you add a 2960-S switch to the stack. Otherwise, the switches will not stack.

#### SUMMARY STEPS

1. configure terminal
2. switch stack port-speed 10
3. end
4. copy running-config startup-config
5. reload

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><strong>switch</strong></td>
<td></td>
</tr>
<tr>
<td><strong>stack-member-number priority new-priority-number</strong></td>
<td>Specifies the stack member number and the new priority for the stack member. The stack member number range is 1 to 8. The priority value range is 1 to 15. You can display the current priority value by using the <code>show switch</code> user EXEC command. The new priority value takes effect immediately but does not affect the current stack master. The new priority value helps determine which stack member is elected as the new stack master when the current stack master or switch stack resets.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# switch 3 priority 2</td>
<td></td>

</table>
Provisioning a New Member for a Switch Stack

This optional task is available only from the stack master.

**SUMMARY STEPS**

1. `show switch`
2. `configure terminal`
3. `switch stack-member-number provision type`
4. `end`
5. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>show switch</code></td>
<td>Displays summary information about the switch stack.</td>
</tr>
<tr>
<td>Example: <code>Device# show switch</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack port-speed 10</code></td>
<td>Sets the stack port speed to 10 Gbps.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# switch stack port-speed 10</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: <code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>reload</code></td>
<td>Reloads the switch stack.</td>
</tr>
<tr>
<td>Example: <code>Device# reload</code></td>
<td></td>
</tr>
</tbody>
</table>
Removing Provisioned Switch Information

Before you begin, you must remove the provisioned switch from the stack. This optional task is available only from the stack master.

SUMMARY STEPS

1. configure terminal
2. no switch stack-member-number provision
3. end
4. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 no switch stack-member-number provision</td>
<td>Removes the provisioning information for the specified member.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# no switch 3 provision</td>
<td></td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Step 4

**copy running-config startup-config**

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

**Example**

If you are removing a provisioned switch in a stack with this configuration:

- The stack has four members
- Stack member 1 is the stack master
- Stack member 3 is a provisioned switch

and want to remove the provisioned information and to avoid receiving an error message, you can remove power from stack member 3, disconnect the StackWise-480 stack cables between the stack member 3 and switches to which it is connected, reconnect the cables between the remaining stack members, and enter the **no switch stack-member-number provision** global configuration command.

---

**Troubleshooting the Switch Stack**

### Accessing the CLI of a Specific Member

This optional task is for debugging purposes, and is available only from the stack master.

You can access all or specific members by using the `remote command {all | stack-member-number}` privileged EXEC command. The stack member number range is 1 to 8.

You can access specific members by using the `session stack-member-number` privileged EXEC command. The member number is appended to the system prompt. For example, the prompt for member 2 is **Switch-2#**, and system prompt for the stack master is **Switch#**. Enter `exit` to return to the CLI session on the stack master. Only the `show` and `debug` commands are available on a specific member.

### Temporarily Disabling a Stack Port

If a stack port is flapping and causing instability in the stack ring, to disable the port, enter the `switch stack-member-number stack port port-number disable` privileged EXEC command. To reenable the port, enter the `switch stack-member-number stack port port-number enable` command.

**Note**

Be careful when using the `switch stack-member-number stack port port-number disable` command. When you disable the stack port, the stack operates at half bandwidth.
A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state.

The stack is in the partial-ring state when the following occurs:

- All members are connected through their stack ports but some are not in the ready state.
- Some members are not connected through the stack ports.

**SUMMARY STEPS**

1. `switch stack-member-number stack port port-number disable`
2. `switch stack-member-number stack port port-number enable`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>switch stack-member-number stack port port-number disable</code>&lt;br&gt;<strong>Example:</strong> <code>Device# switch 2 stack port 1 disable</code></td>
<td>Disables the specified stack port.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>switch stack-member-number stack port port-number enable</code>&lt;br&gt;<strong>Example:</strong> <code>Device# switch 2 stack port 1 enable</code></td>
<td>Reenables the stack port.</td>
</tr>
</tbody>
</table>

When you disable a stack port and the stack is in the full-ring state, you can disable only one stack port. This message appears:

`Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]`

When you disable a stack port and the stack is in the partial-ring state, you cannot disable the port. This message appears:

`Disabling stack port not allowed with current stack configuration.`

### Reenabling a Stack Port While Another Member Starts

Stack Port 1 on Switch 1 is connected to Port 2 on Switch 4. If Port 1 is flapping, you can disable Port 1 with the `switch 1 stack port 1 disable` privileged EXEC command. While Port 1 on Switch 1 is disabled and Switch 1 is still powered on, follow these steps to reenable a stack port:

- **Step 1** Disconnect the stack cable between Port 1 on Switch 1 and Port 2 on Switch 4.
- **Step 2** Remove Switch 4 from the stack.
- **Step 3** Add a switch to replace Switch 4 and assign it switch-number 4.
- **Step 4** Reconnect the cable between Port 1 on Switch 1 and Port 2 on Switch 4 (the replacement switch).
Step 5  Reenable the link between the switches. Enter the `switch 1 stack port 1 enable` privileged EXEC command to enable Port 1 on Switch 1.

Step 6  Power on Switch 4.

---

Caution

Powering on Switch 4 before enabling the Port 1 on Switch 1 might cause one of the switches to reload.

If Switch 4 is powered on first, you might need to enter the `switch 1 stack port 1 enable` and the `switch 4 stack port 2 enable` privileged EXEC commands to bring up the link.

---

Monitoring the Device Stack

Table 153: Commands for Displaying Stack Information

<table>
<thead>
<tr>

Configuration Examples for Switch Stacks

Switch Stack Configuration Scenarios

Most of these switch stack configuration scenarios assume that at least two device are connected through their stack ports.

Table 154: Configuration Scenarios

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack master election specifically determined by existing stack masters</td>
<td>Connect two powered-on switch stacks through the StackWise-480 stack ports. Only one of the two stack masters becomes the new stack master.</td>
</tr>
</tbody>
</table>
| Stack master election specifically determined by the stack member priority value | 1. Connect two switches through their stack ports.  
2. Use the `switch stack-member-number priority new-priority-number` global configuration command to set one stack member with a higher member priority value.  
3. Restart both stack members at the same time. The stack member with the higher priority value is elected stack master. |
| Stack master election specifically determined by the configuration file  | Assuming that both stack members have the same priority value:  
1. Make sure that one stack member has a default configuration and that the other stack member has a saved (nondefault) configuration file.  
2. Restart both stack members at the same time. The stack member with the saved configuration file is elected stack master. |
| Stack master election specifically determined by the MAC address        | Assuming that both stack members have the same priority value, configuration file, and feature set, restart both stack members at the same time. The stack member with the lower MAC address is elected stack master. |
### Enabling the Persistent MAC Address Feature: Example

This example shows how to configure the persistent MAC address feature for a 7-minute time delay and to verify the configuration:

```
Device(config)# stack-mac persistent timer 7
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.
Device(config)# end
Device# show switch
Switch/Stack Mac Address : 0016.4727.a900
Mac persistency wait time: 7 mins
```

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack member number conflict</td>
<td>Assuming that one stack member has a higher priority value than the other stack member:</td>
</tr>
<tr>
<td>1. Ensure that both stack members have the same stack member number. If necessary, use the <code>switch current-stack-member-number renumber new-stack-member-number global configuration command.</code></td>
<td></td>
</tr>
<tr>
<td>2. Restart both stack members at the same time.</td>
<td></td>
</tr>
<tr>
<td>Add a stack member</td>
<td>1. Power off the new switch.</td>
</tr>
<tr>
<td>2. Through their stack ports, connect the new switch to a powered-on switch stack.</td>
<td></td>
</tr>
<tr>
<td>3. Power on the new switch.</td>
<td>The stack master is retained. The new switch is added to the switch stack.</td>
</tr>
<tr>
<td>Stack master failure</td>
<td>Remove (or power off) the stack master.</td>
</tr>
<tr>
<td>Add more than eight stack members</td>
<td>1. Through their StackWise-480 stack ports, connect nine device.</td>
</tr>
<tr>
<td>2. Power on all device.</td>
<td>Two device become stack masters. One stack master has eight stack members. The other stack master remains as a standalone device. Use the Mode button and port LEDs on the device to identify which device are stack masters and which device belong to each stack master.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Provisioning a New Member for a Switch Stack: Example

This example shows how to provision a switch with a stack member number of 2 for the switch stack. The `show running-config` command output shows the interfaces associated with the provisioned switch:

```
Device(config)# switch 2 provision switch_PID
Device(config)# end
Device# show running-config | include switch 2
switch 2 provision switch_PID
```

CHAPTER 75

FlexStack-Extended

This module describes the FlexStack-Extended feature supported on Catalyst 2960-X Series Switches with LAN Base license and Cisco Catalyst 2960-XR Series Switches.

- Restrictions for FlexStack-Extended, on page 1509
- Information About FlexStack-Extended, on page 1509
- How to Configure FlexStack-Extended, on page 1512
- Configuration Examples for FlexStack-Extended, on page 1515
- Feature Information for FlexStack-Extended, on page 1516

Restrictions for FlexStack-Extended

The following restrictions apply to the horizontal stacking of switches.

- For fiber module, both ports must be configured as either network ports or stack ports. Do not configure one port as a network port and the other as a stack port.
- Online Insertion and Removal (OIR) is possible only with the same type of port.
- To connect a switch with a FlexStack module to a switch with a hybrid module, set the speed manually. The stack speed should be set to 10G.
- If the stack module (hybrid or fiber) on a switch is replaced with a FlexStack module, the bandwidth must to be reset manually.

Information About FlexStack-Extended

FlexStack-Extended

Prior to Cisco IOS Release 15.2(6)E, stacking was supported with FlexStack-Plus module, which has two copper stack ports. Copper stack ports support short reach connectivity across local switches. FlexStack-Extended overcomes the problem of short reach connectivity by using 10G SFP+ ports to enable stacking that allows long reach stacking using optics.

The same models that support FlexStack-Plus on Cisco Catalyst 2960-X Series Switches and Cisco Catalyst 2960-XR Series Switches support FlexStack-Extended.
When you convert a network port to a stack port, it continues to work as a network port without any impact to the current running configuration until the next reload of the switch.

When you convert a stack port back to a network port, it continues to work as a stack port until the next reload. After reload, the port comes up as a network port with the default configuration.

**Note**

When uplink ports are working as stack ports, these particular uplink interfaces (for example, TenGigabitEthernet 1/1/1) are not displayed in any show command or are not available under any configuration command, unlike other network ports. These uplink interfaces are made available only after the reload of the switch; once ports are converted back to network ports.

---

**FlexStack-Extended on Catalyst 2960-X and 2960-XR Switches**

Cisco Catalyst 2960-X and 2960-XR Series Switches support FlexStack-Extended with hybrid stack and fiber stack modules, and also with 10G SFP+ front panel uplink ports.

The following models support FlexStack-Extended with hybrid stack and fiber stack modules:

- Cisco Catalyst 2960X-24PD-L
- Cisco Catalyst 2960X-24PS-L
- Cisco Catalyst 2960X-24TD-L
- Cisco Catalyst 2960X-24TS-L
- Cisco Catalyst 2960X-48FPD-L
- Cisco Catalyst 2960X-48FPS-L
- Cisco Catalyst 2960X-48LPD-L
- Cisco Catalyst 2960X-48LPS-L
- Cisco Catalyst 2960X-48TD-L
- Cisco Catalyst 2960XR-24PD-I
- Cisco Catalyst 2960XR-24PS-I
- Cisco Catalyst 2960XR-24TD-I
- Cisco Catalyst 2960XR-48FPD-I
- Cisco Catalyst 2960XR-48FPS-I
- Cisco Catalyst 2960XR-48LPD-I
- Cisco Catalyst 2960XR-48LPS-I
- Cisco Catalyst 2960XR-48TD-I

The following models support front-panel stacking:

- Cisco Catalyst 2960X-24TD-L
- Cisco Catalyst 2960X-48FPD-L
• Cisco Catalyst 2960X-48LPD-L
• Cisco Catalyst 2960X-48TD-L
• Cisco Catalyst 2960XR-24PD-I
• Cisco Catalyst 2960XR-24TD-I
• Cisco Catalyst 2960XR-48FPD-I
• Cisco Catalyst 2960XR-48LPD-I
• Cisco Catalyst 2960XR-48TD-I

A hybrid stack module has one copper stack connector and one SFP+ port. The copper port allows short-reach connectivity across the local stack of switches, and the SFP+ allows for long-reach stacking using standard optics. Hybrid-stack module ports can only be used as stack ports. The SFP+ port of the module cannot be changed to a network port.

A fiber stack module has two SFP+ interfaces, which allows for long-reach stacking using standard optics. Fiber stack ports are used either as network ports or stack ports. By default all ports on the fiber stack module are stack port. These ports can be converted to network ports.

---

**Note**

Stack fast convergence is not supported on hybrid stack and fiber stack modules.

The stack bandwidth for the following stack configuration is 40G:

- Stack using hybrid stack module.
- Stack using fiber stack module.
- Stack using FlexStack-Plus, hybrid, and fiber modules.

For more information on Installing the Switch, see the *Catalyst 2960-X and 2960-XR Switch Hardware Installation Guide* on [www.cisco.com](http://www.cisco.com).

In Cisco IOS Release 15.2(6)E, FlexStack-Extended is supported on C2960X-HYBRID-STK and C2960X-FIBER-STK modules. By default, all ports are treated as stack ports. Online Insertion and Removal (OIR) of these module (hot swappable) is supported; however, these should be replaced with the same module type. If the module is replaced by a different module type, a reload is required.

The SFP+ port in C2960X-HYBRID-STK module can only be used as a stack port.

Two 10G SFP+ stack ports in the C2960X-FIBER-STK module can be converted to network ports. Using one port as uplink and the other as a stack port is not supported. The SFP+ ports are displayed as Te1/1/1 and Te1/1/2 when converted to network ports.

All SFP+ optics supported by front panel uplink ports are supported by these modules.

## Default Port Configurations

The following section lists the default port configurations:

**Hybrid Stack**

- The default is stack port.
Fiber Stack

• The default is stack port.

FlexStack-Extended LED

The light-emitting diode (LED) behavior is the same for stack ports and network ports. The LED status is as given below:

• OFF—Cable removed/no cable/the switch is off.
• Solid green—Cable inserted and link is up.
• Blinking green—Traffic is running.
• Blinking amber—Cable is connected and the link is coming up.

How to Configure FlexStack-Extended

The 10G SFP+ can be used either as a network port or a stack port.

• All TenGigabitEthernet ports available on the master and all members that are capable of FlexStack-Extended can be converted to network ports or stack ports.
• If any TenGigabitEthernet port is converted to a horizontal stack port, the stack port number (1 or 2) is displayed corresponding to that port.

Note

You cannot chose one stack port from the front panel and another from the back panel. Both stack ports should either be from the front panel or back panel. The following example shows how to configure hstack ports:

```
switch 1 hstack-port 1 TenGigabitEthernet 1/0/1
switch 1 hstack-port 2 TenGigabitEthernet 1/0/2
```

Configuring a Stack Port as a Network Port

You can configure both 10G stack ports as network ports.

SUMMARY STEPS

1. enable
2. configure terminal
3. no switch switch-number hstack-port stack-port
4. exit
5. reload
6. show switch hstack-ports
**DETAILED STEPS**

<table>
<thead>
<tr>

Configuration Examples for FlexStack-Extended

Examples: Configuring FlexStack-Extended

The following example shows how to convert a stack port to network port:
Device> enable
Device# configure terminal
Device(config)# no switch 1 hstack-port 1

Do you want to continue?[confirm]
New port setting will be effective after next reload

The following is sample output from the show switch hstack-ports command:

Device# show switch hstack-ports

Horizontal stack port status :
Te Ports Stack Port Operational Status Next Reload Status Media Type
--------- ------------ -------------------- ------------------- --------------
Te1/0/1 NA N/W Port N/W Port Fiber
Te1/0/2 NA N/W Port N/W Port Fiber
Te1/1/1 NA N/W Port N/W Port Fiber
Te1/1/2 NA N/W Port N/W Port Fiber

The following example shows how you can set the speed of the switch stack port:

Device> enable
Device# configure terminal
Device(config)# switch stack port-speed 10
Device(config)# end

**Feature Information for FlexStack-Extended**

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

*Table 155: Feature Information for FlexStack-Extended*

<table>
<thead>
<tr>

Information About Administering the Device

System Time and Date Management

You can manage the system time and date on your device using automatic configuration methods (RTC and NTP), or manual configuration methods.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference on Cisco.com.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- RTC
- NTP
- Manual configuration

The system clock can provide time to these services:

- User show commands
• Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

**Real Time Clock**

A real-time clock (RTC) keeps track of the current time on the switch. The switch is shipped to you with RTC set to GMT time until you reconfigure clocking parameters.

The benefits of an RTC are:

• RTC is battery-powered.

• System time is retained during power outage and at system reboot.

The RTC and NTP clocks are integrated on the switch. When NTP is enabled, the RTC time is periodically synchronized to the NTP clock to maintain accuracy.

**Network Time Protocol**

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The figure below shows a typical network example using NTP. Device A is the NTP master, with the Device B, C, and D configured in NTP server mode, in server association with Device A. Device E is configured as an NTP peer to the upstream and downstream Device, Device B and Device F, respectively.

**Figure 121: Typical NTP Network Configuration**

If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Stratum**

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.
NTP Associations

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 122: Typical NTP Network Configuration

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F.
If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Version 4

NTP version 4 is implemented on the device. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

For details about configuring NTPv4, see the Implementing NTPv4 in IPv6 chapter of the Cisco IOS IPv6 Configuration Guide, Release 12.4T.

System Name and Prompt

You configure the system name on the Device to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4 and the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4.

Stack System Name and Prompt

If you are accessing a stack member through the stack master, you must use the session stack-member-number privileged EXEC command. The stack member number range is from 1 through 8. When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

Default System Name and Prompt Configuration

The default switch system name and prompt is Switch.
DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your device, you can substitute the hostname for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a `com` domain name, so its domain name is cisco.com. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as ftp.cisco.com.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

Default DNS Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
</tbody>
</table>
| DNS servers        | No name server addresses are configured.

Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

**Note**

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4.

Default Banner Configuration

The MOTD and login banners are not configured.

MAC Address Table

The MAC address table contains address information that the device uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the device learns and then ages when it is not in use.
• Static address—A manually entered unicast address that does not age and that is not lost when the device resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

---

**Note**

For complete syntax and usage information for the commands used in this section, see the command reference for this release.

---

### MAC Address Table Creation

With multiple MAC addresses supported on all ports, you can connect any port on the device to other network devices. The device provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the device updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the device maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The device sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the device forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The device always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

### MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

### Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>
**ARP Table Management**

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.4 documentation on Cisco.com.

**How to Administer the Device**

**Configuring the Time and Date Manually**

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the device can synchronize, you do not need to manually set the system clock.

**Setting the System Clock**

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Follow these steps to set the system clock:

**SUMMARY STEPS**

1. `enable`
2. Use one of the following:
   - `clock set hh:mm:ss day month year`
   - `clock set hh:mm:ss month day year`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>clock timezone zone hours-offset [minutes-offset]</code></td>
<td>Sets the time zone.</td>
</tr>
</tbody>
</table>

### Step 2

Use one of the following:

- `clock set hh:mm:ss day month year`
- `clock set hh:mm:ss month day year`

**Example:**

```
Device# clock set 13:32:00 23 March 2013
```

Manually set the system clock using one of these formats:

- `hh:mm:ss`—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone.
- `day`—Specifies the day by date in the month.
- `month`—Specifies the month by name.
- `year`—Specifies the year (no abbreviation).

### Configuring the Time Zone

Follow these steps to manually configure the time zone:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `clock timezone zone hours-offset [minutes-offset]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3 <code>clock timezone zone hours-offset [minutes-offset]</code></td>
<td>Sets the time zone.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# clock timezone AST -3 30</code></td>
<td>Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set.</td>
</tr>
</tbody>
</table>
Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. clock summer-time zone date date month year hh:mm date month year hh:mm [offset]
4. clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>zone—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC.</td>
<td></td>
</tr>
<tr>
<td>hours-offset—Enters the hours offset from UTC.</td>
<td></td>
</tr>
<tr>
<td>(Optional) minutes-offset—Enters the minutes offset from UTC. This available where the local time zone is a percentage of an hour different from UTC.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

```
end
```

Example:

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 5**

```
show running-config
```

Example:

```
Device# show running-config
```

Verifies your entries.

**Step 6**

```
copy running-config startup-config
```

Example:

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

configure terminal

Example:

Device# configure terminal

**Step 3**

clock summer-time zone date date month year hh:mm date month year hh:mm [offset]]

Example:

Device(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00

**Step 4**

clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]

Example:

Device(config)# clock summer-time PDT recurring 10 March 2013 2:00 3 November 2013 2:00

**Step 5**

end

Example:

Returns to privileged EXEC mode.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

### Step 6

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><code>Device# show running-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Step 7

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

Follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `clock summer-time zone date [month date year hh:mm month date year hh:mm [offset]]` or `clock summer-time zone date [date month year hh:mm date month year hh:mm [offset]]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

### DETAILED STEPS

**Step 6**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example:**

`Device# copy running-config startup-config`

## Configuring a System Name

Follow these steps to manually configure a system name:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. hostname name
4. end
5. show running-config
6. copy running-config startup-config
## Setting Up DNS

If you use the device IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> hostname name</td>
<td>Configures a system name. When you set the system name,</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>it is also used as the system prompt.</td>
</tr>
<tr>
<td>Device(config)# hostname</td>
<td>The default setting is Switch.</td>
</tr>
<tr>
<td>remote-users</td>
<td>The name must follow the rules for ARPANET hostnames.</td>
</tr>
<tr>
<td></td>
<td>They must start with a letter, end with a letter or digit, and</td>
</tr>
<tr>
<td></td>
<td>have as interior characters only letters, digits, and hyphens.</td>
</tr>
<tr>
<td></td>
<td>Names can be up to 63 characters.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>remote-users(config)# end</td>
<td></td>
</tr>
<tr>
<td>remote-users#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Setting Up DNS

- **Step 1**: `enable`
  - **Example**: `Device> enable`
  - Enables privileged EXEC mode.
    - Enter your password if prompted.

- **Step 2**: `configure terminal`
  - **Example**: `Device# configure terminal`
  - Enters global configuration mode.

- **Step 3**: `hostname name`
  - **Example**: `Device(config)# hostname remote-users`
  - Configures a system name. When you set the system name, it is also used as the system prompt.
    - The default setting is Switch.
    - The name must follow the rules for ARPANET hostnames.
    - They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens.
    - Names can be up to 63 characters.

- **Step 4**: `end`
  - **Example**: `remote-users(config)# end`
  - Returns to privileged EXEC mode.

- **Step 5**: `show running-config`
  - **Example**: `Device# show running-config`
  - Verifies your entries.

- **Step 6**: `copy running-config startup-config`
  - **Example**: `Device# copy running-config startup-config`
  - (Optional) Saves your entries in the configuration file.

---

**Setting Up DNS**

If you use the device IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:
### SUMMARY STEPS

1. enable
2. configure terminal
3. ip domain-name name
4. ip name-server server-address1 [server-address2 ... server-address6]
5. ip domain-lookup [nsap | source-interface interface]
6. end
7. show running-config
8. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>

<td>Device(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the device.

Follow these steps to configure a MOTD login banner:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `banner motd c message c`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

#### Command or Action

**Step 5**

`ip domain-lookup [nsap | source-interface interface]`

**Example:**

Device(config)# ip domain-lookup

(Optional) Enables DNS-based hostname-to-address translation on your device. This feature is enabled by default.

If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).

**Step 6**

`end`

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

**Step 7**

`show running-config`

**Example:**

Device# show running-config

Verifies your entries.

**Step 8**

`copy running-config startup-config`

**Example:**

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> banner motd c message c</td>
<td>Specifies the message of the day.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# banner motd # This is a secure site. Only authorized users are allowed. For access, contact technical support. #</td>
<td>c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. message—Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Follow these steps to configure a login banner:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. banner login \textit{c message c}
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable&lt;br&gt;Example: Device&gt; enable</td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal&lt;br&gt;Example: Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>banner login \textit{c message c}&lt;br&gt;Example: Device(config)# banner login $&lt;br&gt;Access for authorized users only. Please enter your username and password.&lt;br&gt;$</td>
<td>Specifies the login message.&lt;br&gt;\textit{c}—Enters the delimiting character of your choice, for example, a pound sign (#), and press the \textbf{Return} key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.&lt;br&gt;\textit{message}—Enters a login message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>

### Configuring MAC Address Change Notification Traps

Follow these steps to configure the switch to send MAC address change notification traps to an NMS host:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr community-string notification-type { informs | traps } {version {1 | 2c | 3}} {vrf vrf instance name}`
4. `snmp-server enable traps mac-notification change`
5. `mac address-table notification change`
6. `mac address-table notification change [interval value] [history-size value]`
7. `interface interface-id`
8. `snmp trap mac-notification change {added | removed}`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>

</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Device(config)# snmp-server host 172.20.10.10 traps private mac-notification` | **• version**—Specifies the SNMP version to support. Version 1, the default, is not available with informs.  
**• community-string**—Specifies the string to send with the notification operation. Though you can set this string by using the `snmp-server host` command, we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.  
**• notification-type**—Uses the `mac-notification` keyword.  
**• vrf vrf instance name**—Specifies the VPN routing/forwarding instance for this host. |
| `Step 4 snmp-server enable traps mac-notification change` | Enables the device to send MAC address change notification traps to the NMS. |
| `Example:` | |
| `Device(config)# snmp-server enable traps mac-notification change` | |
| `Step 5 mac address-table notification change` | Enables the MAC address change notification feature. |
| `Example:` | |
| `Device(config)# mac address-table notification change` | |
| `Step 6 mac address-table notification change [interval value] [history-size value]` | Enters the trap interval time and the history table size.  
**• (Optional) interval value**—Specifies the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second.  
**• (Optional) history-size value**—Specifies the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1. |
| `Example:` | |
| `Device(config)# mac address-table notification change interval 123` | |
| `Device(config)#mac address-table notification change history-size 100` | |
| `Step 7 interface interface-id` | Enters interface configuration mode, and specifies the Layer 2 interface on which to enable the SNMP MAC address notification trap. |
| `Example:` | |
| `Device(config)# interface gigabitethernet 1/0/2` | |
| `Step 8 snmp trap mac-notification change {added | removed}` | Enables the MAC address change notification trap on the interface.  
**• Enables the trap when a MAC address is added on this interface.** |
| `Example:` | |
| `Device(config-if)# snmp trap mac-notification change added` | |
## Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Follow these steps to configure the device to send MAC address-move notification traps to an NMS host:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
4. `snmp-server enable traps mac-notification move`
5. `mac address-table notification mac-move`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt;</code> <code>enable</code></td>
<td></td>
</tr>
</tbody>
</table>

---

### Example:

**Step 9**

```
Device(config)# end
```

**Step 10**

```
Device# show running-config
```

**Step 11**

```
Device# copy running-config startup-config
```
<table>
<thead>
<tr>

<tr>
<td></td>
<td><strong>Example:</strong> <code>Device# show running-config</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

Follow these steps to configure the switch to send MAC address table threshold notification traps to an NMS host:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
4. `snmp-server enable traps mac-notification threshold`
5. `mac address-table notification threshold`
6. `mac address-table notification threshold [limit percentage] | [interval time]`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>* Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

What to do next

To disable MAC address-move notification traps, use the `no snmp-server enable traps mac-notification move` global configuration command. To disable the MAC address-move notification feature, use the `no mac address-table notification mac-move` global configuration command.

You can verify your settings by entering the `show mac address-table notification mac-move` privileged EXEC commands.

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

```shell
snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type
```

Example:

```shell
Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
```

Specifies the recipient of the trap message.
- **host-addr**—Specifies the name or address of the NMS.
- **traps** (the default)—Sends SNMP traps to the host.
- **informs**—Sends SNMP informs to the host.
- **version**—Specifies the SNMP version to support. Version 1, the default, is not available with informs.
- **community-string**—Specifies the string to send with the notification operation. You can set this string by using the `snmp-server host` command, but we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.
- **notification-type**—Uses the `mac-notification` keyword.

**Step 4**

```shell
snmp-server enable traps mac-notification threshold
```

Example:

```shell
Device(config)# snmp-server enable traps mac-notification threshold
```

Enables MAC threshold notification traps to the NMS.

**Step 5**

```shell
mac address-table notification threshold
```

Example:

```shell
Device(config)# mac address-table notification threshold
```

Enables the MAC address threshold notification feature.

**Step 6**

```shell
mac address-table notification threshold [limit percentage] [interval time]
```

Example:

```shell
Device(config)# mac address-table notification threshold interval 123
Device(config)# mac address-table notification threshold limit 78
```

Enters the threshold value for the MAC address threshold usage monitoring.
- *(Optional)* **limit percentage**—Specifies the percentage of the MAC address table use; valid values are from 1 to 100 percent. The default is 50 percent.
- *(Optional)* **interval time**—Specifies the time between notifications; valid values are greater than or equal to 120 seconds. The default is 120 seconds.

**Step 7**

```shell
end
```

Example:

```shell

```

Returns to privileged EXEC mode.
## Adding and Removing Static Address Entries

Follow these steps to add a static address:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `mac address-table static mac-addr vlan vlan-id interface interface-id`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> mac address-table static <code>mac-addr vlan vlan-id interface interface-id</code></td>
<td>Adds a static address to the MAC address table.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Configuring Unicast MAC Address Filtering

Follow these steps to configure the Device to drop a source or destination unicast static address:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. mac address-table static *mac-addr* vlan *vlan-id* drop
4. end
5. show running-config
6. copy running-config startup-config
### DETAILED STEPS

Configuration Examples for Device Administration

Example: Setting the System Clock

This example shows how to manually set the system clock:

Device# clock set 13:32:00 23 July 2013

Examples: Configuring Summer Time

This example (for daylight saving time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

Device(config)# clock summer-time PDT recurring PST date 10 March 2013 2:00 3 November 2013 2:00

This example shows how to set summer time start and end dates:

Device(config)# clock summer-time PST date 20 March 2013 2:00 20 November 2013 2:00

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

Device(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Device(config)#

This example shows the banner that appears from the previous configuration:

Unix> telnet 192.0.2.15
Trying 192.0.2.15...
Connected to 192.0.2.15.
Escape character is '^]'.
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

```
Device(config)# banner login $
Access for authorized users only. Please enter your username and password.$
Device(config)#
```

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added to the specified port:

```
Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
Device(config)# snmp-server enable traps mac-notification change
Device(config)# mac address-table notification change
Device(config)# mac address-table notification change interval 123
Device(config)# mac address-table notification change history-size 100
Device(config)# interface gigabitethernet 1/2/1
Device(config-if)# snmp trap mac-notification change added
```

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

```
Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
Device(config)# snmp-server enable traps mac-notification threshold
Device(config)# mac address-table notification threshold
Device(config)# mac address-table notification threshold interval 123
Device(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:
You cannot associate the same static MAC address to multiple interfaces. If the command is executed again with a different interface, the static MAC address is overwritten on the new interface.

Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/1/1

Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop

Performing Device Setup Configuration

Information About Performing Device Setup Configuration

Review the sections in this module before performing your initial device configuration tasks that include IP address assignments and DHCP autoconfiguration.

Boot Process

To start your device, you need to follow the procedures in the getting started guide or the hardware installation guide for installing and powering on the device and setting up the initial device configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The boot loader software performs the normal boot process and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
- Loads a default operating system software image into memory and boots up the device.

The boot loader provides access to the flash file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door operation provides enough access to the system so that if it is
necessary, you can format the flash file system, reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.

Before you can assign device information, make sure that you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match that of the device console port settings:

- **Baud rate** default is 9600.
- **Data bits** default is 8.

**Note**

- **Stop bits** default is 2 (minor).
- **Parity settings** default is none.

### Devices Information Assignment

You can assign IP information through the device setup program, through a DHCP server, or manually.

Use the device setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

**Note**

If you are using DHCP, do not respond to any of the questions in the setup program until the device receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the device configuration steps, manually configure the device. Otherwise, use the setup program described in the Boot Process section.

### Default Switch Information

<td>No default gateway is defined.</td>
</tr>
<tr>
<td>Enable secret password</td>
<td>No password is defined.</td>
</tr>
<tr>
<td>Hostname</td>
<td>The factory-assigned default hostname is Device.</td>
</tr>
</tbody>
</table>
DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The device can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your device (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your device. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

The DHCP server for your device can be on the same LAN or on a different LAN than the device. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your device and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your device.

DHCP Client Request Process

When you boot up your device, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the device. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

![Figure 123: DHCP Client and Server Message Exchange](image)

The client, Device A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.
In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DCHPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the device receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the device accepts replies from a BOOTP server and configures itself, the device broadcasts, instead of unicasts, TFTP requests to obtain the device configuration file.

The DHCP hostname option allows a group of devices to obtain hostnames and a standard configuration from the central management DHCP server. A client (device) includes in its DCHPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the hostname name global configuration command is not configured or the no hostname global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the ip address dhcp interface configuration command. In this case, if the client receives the DCHP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

**DHCP-based Autoconfiguration and Image Update**

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more devices in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new device added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

**Restrictions for DHCP-based Autoconfiguration**

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
• The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.

• The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the write memory or copy running-configuration startup-configuration privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

**DHCP Autoconfiguration**

DHCP autoconfiguration downloads a configuration file to one or more devices in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the device. It does not overwrite the bootup configuration saved in the flash, until you reload the device.

**DHCP Auto-Image Update**

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more devices in your network. The device (or devices) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

To enable a DHCP auto-image update on the device, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the device in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the device, and the new image is downloaded and installed on the device. When you reboot the device, the configuration is stored in the saved configuration on the device.

**DHCP Server Configuration Guidelines**

Follow these guidelines if you are configuring a device as a DHCP server:

• You should configure the DHCP server with reserved leases that are bound to each device by the device hardware address.

• If you want the device to receive IP address information, you must configure the DHCP server with these lease options:
  
  • IP address of the client (required)
  
  • Subnet mask of the client (required)
  
  • DNS server IP address (optional)
  
  • Router IP address (default gateway address to be used by the device) (required)

• If you want the device to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
Purpose of the TFTP Server

Based on the DHCP server configuration, the device attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the device with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the device attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the device attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the device’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the device to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual device configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
- The router-config or the ciscoetr.cfg file (These files contain commands common to all devices. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the device, or if it is to be accessed by the device through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.
Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the device.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same LAN or on a different LAN from the device. If it is on a different LAN, the device must be able to access it through a router.

How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the device obtains its configuration information in these ways:

• The IP address and the configuration filename is reserved for the device and provided in the DHCP reply (one-file read method).

  The device receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

• The IP address and the configuration filename is reserved for the device, but the TFTP server address is not provided in the DHCP reply (one-file read method).

  The device receives its IP address, subnet mask, and the configuration filename from the DHCP server. The device sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

• Only the IP address is reserved for the device and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

  The device receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the network-config or cisconet.cfg default configuration file. (If the network-config file cannot be read, the device reads the cisconet.cfg file.)

  The default configuration file contains the hostnames-to-IP-address mapping for the device. The device fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the device uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the device uses the default Switch as its hostname.

  After obtaining its hostname from the default configuration file or the DHCP reply, the device reads the configuration file that has the same name as its hostname (hostname-config or hostname.cfg, depending on whether network-config or cisconet.cfg was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.

  If the device cannot read the network-config, cisconet.cfg, or the hostname file, it reads the router-config file. If the device cannot read the router-config file, it reads the ciscortr.cfg file.
How to Control Environment Variables

With a normally operating device, you enter the boot loader mode only through the console connection. Unplug the switch power cord, then reconnect the power cord. Hold down the MODE button until you see the boot loader switch prompt.

The device boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader or any other software running on the system, functions. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

Environment variables store two kinds of data:

• Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.

• Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.
Common Environment Variables

This table describes the function of the most common environment variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Boot Loader Command</th>

<td>boot enable-break switch yes/no&lt;br&gt;This command can be issued when the flash filesystem is initialized when ENABLE_BREAK is set to yes.</td>
</tr>
</tbody>
</table>
Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

Table 160: Environment Variables for TFTP

<table>
<thead>
<tr>

<td>However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP. A reset is required for the new value to take effect.</td>
</tr>
<tr>
<td>IP_ADDRESS</td>
<td>Specifies the IP address and the subnet mask for the associated IP subnet of the switch.</td>
</tr>
<tr>
<td>DEFAULT_ROUTER</td>
<td>Specifies the IP address and subnet mask of the default gateway.</td>
</tr>
</tbody>
</table>

Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the device at a later time (for example, late at night or during the weekend when the device is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all devices in the network).

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The reload command halts the system. If the system is not set to manually boot up, it reboots itself.

If your device is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the device from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the device prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.

# How to Perform Device Setup Configuration

Using DHCP to download a new image and a new configuration to a device requires that you configure at least two devices. One device acts as a DHCP and TFTP server and the second device (client) is configured to download either a new configuration file or a new configuration file and a new image file.

## Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing device in the network so that it can support the autoconfiguration of a new device.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip dhcp pool poolname`
3. `boot filename`
4. `network network-number mask prefix-length`
5. `default-router address`
6. `option 150 address`
7. `exit`
8. `tftp-server flash:filename.text`
9. `interface interface-id`
10. `no switchport`
11. `ip address address mask`
12. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
 Configure terminal  
 **Example:**  
 Device# configure terminal |
| Enters global configuration mode. |
| **Step 2**
 Ip dhcp pool poolname  
 **Example:**  
 Device(config)# ip dhcp pool pool |
| Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode. |
| **Step 3**
 Boot filename  
 **Example:** |
<p>| Specifies the name of the configuration file that is used as a boot image. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(dhcp-config)# boot config-boot.text</code></td>
<td>Specifies the subnet network number and mask of the DHCP address pool.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>network network-number mask prefix-length</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(dhcp-config)# network 10.10.0 255.255.255.0</strong></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>default-router address</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(dhcp-config)# default-router 10.10.1.1</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>option 150 address</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(dhcp-config)# option 150 10.10.1.1</strong></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(dhcp-config)# exit</strong></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>tftp-server flash:filename.text</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config)# tftp-server flash:config-boot.text</strong></td>

<tr>
<td><strong>Step 9</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config)# interface gigabitethernet 1/0/4</strong></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>no switchport</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config-if)# no switchport</strong></td>
</tr>
</tbody>
</table>

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
### Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing device to support the installation of a new switch.

**Before you begin**

You must first create a text file (for example, `autoinstall_dhcp`) that will be uploaded to the device. In the text file, put the name of the image that you want to download (for example, `c3750e-ipservices-mz.122-44.3.SE.tar` or `c3750x-ipservices-mz.122-53.3.SE2.tar`). This image must be a tar and not a bin file.

**SUMMARY STEPS**

1. configure terminal
2. ip dhcp pool poolname
3. boot filename
4. network network-number mask prefix-length
5. default-router address
6. option 150 address
7. option 125 hex
8. copy tftp flash filename.txt
9. copy tftp flash imagename.bin
10. exit
11. tftp-server flash: config.text
12. tftp-server flash: imagename.bin
13. tftp-server flash: filename.txt
14. interface interface-id
15. no switchport
16. ip address address mask
17. end
18. copy running-config startup-config
## DETAILED STEPS

<table>

</tbody>
</table>
### Purpose

#### Command or Action

#### Step 16
`ip address address mask`
Example:
```
Device(config-if)# ip address 10.10.10.1 255.255.255.0
```
Specifies the IP address and mask for the interface.

#### Step 17
`end`
Example:
```
Device(config-if)# end
```
Returns to privileged EXEC mode.

#### Step 18
`copy running-config startup-config`
Example:
```
Device(config-if)# end
```
(Optional) Saves your entries in the configuration file.

---

### Configuring the Client to Download Files from DHCP Server

#### Note
You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.

#### SUMMARY STEPS

1. `configure terminal`
2. `boot host dhcp`
3. `boot host retry timeout timeout-value`
4. `banner config-save ^C warning-message ^C`
5. `end`
6. `show boot`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>boot host dhcp</code></td>
<td>Enables autoconfiguration with a saved configuration.</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>
## Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

### SUMMARY STEPS

1. configure terminal
2. interface vlan vlan-id
3. ip address ip-address subnet-mask
4. exit
5. ip default-gateway ip-address
6. end
7. show interfaces vlan vlan-id
8. show ip redirects

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(conf)# boot host dhcp</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 3**: boot host retry timeout timeout-value | (Optional) Sets the amount of time the system tries to download a configuration file.  
**Note**: If you do not set a timeout, the system will try indefinitely to obtain an IP address from the DHCP server. |
| Example: Device(conf)# boot host retry timeout 300 |                                                                                                                                           |
| **Step 4**: banner config-save ^C warning-message ^C | (Optional) Creates warning messages to be displayed when you try to save the configuration file to NVRAM. |
| Example: Device(config-if)# banner config-save ^C |                                                                                                                                           |
| **Step 5**: end | Returns to privileged EXEC mode.                                                                                                        |
| Example: Device(config-if)# end |                                                                                                                                           |
| **Step 6**: show boot | Verifies the configuration.                                                                                                             |
| Example: Device# show boot |                                                                                                                                           |
## DETAILED STEPS

<td>show interfaces vlan vlan-id</td>
<td>Verifies the configured IP address.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the NVRAM Buffer Size

The default NVRAM buffer size is 512 KB. In some cases, the configuration file might be too large to save to NVRAM. Typically, this occurs when you have many switches in a switch stack. You can configure the size of the NVRAM buffer to support larger configuration files. The new NVRAM buffer size is synced to all current and new member switches.

**Note**

After you configure the NVRAM buffer size, reload the switch or switch stack.

When you add a switch to a stack and the NVRAM size differs, the new switch syncs with the stack and reloads automatically.

**SUMMARY STEPS**

1. `configure terminal`
2. `boot buffersize size`
3. `end`
4. `show boot`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

**Device#**

**show interfaces vlan 99**

**Step 8**

**show ip redirects**

Example:

Device# `show ip redirects`
### Modifying the Device Startup Configuration

#### Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

**Before you begin**

Use a standalone device for this task.

**SUMMARY STEPS**

1. configure terminal
2. boot flash:/file-url
3. end
4. show boot
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal  
Example:  
Switch# configure terminal | Enters global configuration mode. |
| **Step 2**
boot flash:/file-url  
Example:  
Switch(config)# boot flash:config.text | Specifies the configuration file to load during the next boot cycle.  
*file-url*—The path (directory) and the configuration filename.  
Filenames and directory names are case-sensitive. |
| **Step 3**
extend  
Example: | Returns to privileged EXEC mode. |
### Purpose Command or Action

Switch(config)# end

### Step 4

**Example:**

Switch# show boot

Verifies your entries.
The `boot` global configuration command changes the setting of the `CONFIG_FILE` environment variable.

### Step 5

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

## Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

**Before you begin**

Use a standalone switch for this task.

### SUMMARY STEPS

1. configure terminal
2. boot manual
3. end
4. show boot
5. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enables the switch to manually boot up during the next boot cycle. |
| boot manual        |         |
| Example:           |         |
| Device(config)# boot manual |         |

| **Step 3**        | Returns to privileged EXEC mode. |
| end                |         |
| Example:           |         |
### Configuring a Scheduled Software Image Reload

This task describes how to configure your device to reload the software image at a later time.

**SUMMARY STEPS**

1. configure terminal  
2. copy running-config startup-config  
3. reload in [hh:]mm [text]  
4. reload at hh:mm [month day | day month] [text]  
5. reload cancel  
6. show reload

**DETAILED STEPS**

<table>

<tr>
<td>Device(config)# reload in 12</td>
<td></td>
<td></td>
</tr>
<tr>
<td>System configuration has been modified.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Save? [yes/no]: y</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies the time in hours and minutes for the reload to occur.</td>
<td></td>
</tr>
<tr>
<td>reload at hh: mm [month day</td>
<td>day month] [text]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config)# reload at 14:00</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Cancels a previously scheduled reload.</td>
<td></td>
</tr>
<tr>
<td>reload cancel</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config)# reload cancel</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the device.</td>
<td></td>
</tr>
<tr>
<td>show reload</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>show reload</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Monitoring Device Setup Configuration**

**Example: Verifying the Device Running Configuration**

```
Device# show running-config

  !
end

Examples: Displaying Software Install

This example displays software bootup in install mode:

switch# boot flash:/c2960x-universalk9-mz-150-2.EX/c2960x-universalk9-mz-150-2.EX.bin

Configuration Examples for Performing Device Setup

Example: Configuring a Device as a DHCP Server

Device# configure terminal
Device(config)# ip dhcp pool pool1
Device(dhcp-config)# network 10.10.10.0 255.255.255.0
Device(dhcp-config)# boot config-boot.text
Device(dhcp-config)# default-router 10.10.10.1
Device(dhcp-config)# option 150 10.10.10.1
Device(dhcp-config)# exit
Device(config)# tftp-server flash:config-boot.text
Device(config)# interface gigabitethernet 1/0/4
Device(config-if)# no switchport
Device(config-if)# ip address 10.10.10.1 255.255.255.0
Device(config-if)# end
Example: Configuring DHCP Auto-Image Update

Device# configure terminal
Device(config)# ip dhcp pool pool1
Device(dhcp-config)# network 10.10.10.0 255.255.255.0
Device(dhcp-config)# boot config-boot.text
Device(dhcp-config)# default-router 10.10.10.1
Device(dhcp-config)# option 150 10.10.10.1
Device(dhcp-config)# option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f68.6370
Device(dhcp-config)# exit
Device(config)# tftp-server flash:config-boot.text
Device(config)# tftp-server flash:image_name
Device(config)# tftp-server flash:boot-config.text
Device(config)# tftp-server flash: autoinstall dhcp
Device(config)# interface gigabitethernet 1/0/4
Device(config-if)# ip address 10.10.10.1 255.255.255.0
Device(config-if)# end

Example: Configuring a Device to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

Device# configure terminal
Device(config)# boot host dhcp
Device(config)# boot host retry timeout 300
Device(config)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot^C
Device(config)# vlan 99
Device(config-vlan)# interface vlan 99
Device(config-if)# no shutdown
Device(config-if)# end
Device# show boot
BOOT path-list:
Config file: flash:/config.text
Private Config file: flash:/private-config.text
Enable Break: no
Manual Boot: no
HELPER path-list:
NVRAM/Config file
buffer size: 32768
Timeout for Config Download: 300 seconds
Config Download via DHCP: enabled (next boot: enabled)

Example: Configuring NVRAM Buffer Size

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# boot buffersize 600000
Device(config)# end
Device# show boot
BOOT path-list :
Config file : flash:/config.text
Private Config file : flash:/private-config.text
Enable Break : no
Manual Boot : no
HELPER path-list :
Auto upgrade : yes
Auto upgrade path :
NVRAM/Config file
    buffer size: 600000
Timeout for Config Download: 300 seconds
Config Download via DHCP: enabled (next boot: enabled)
Device#

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for AVC with DNS-AS

- You have the Cisco ONE for Access license to use AVC with DNS-AS.
- You have enabled Multilayer Switch (MLS) Quality of Service (QoS).
- You have maintained metadata in the authoritative DNS server and reachability exists - before you enable AVC with DNS-AS
- The DNS-AS client can snoop forward look-up requests originating from hosts.
- To ensure DNS packet logging or snooping, you have attached the policy map to the interface, by using the service-policy input command.
Restrictions and Guidelines for AVC with DNS-AS

- Only a forward look-up is supported.
- Two DNS servers are supported (in case of a failover). One is considered the primary DNS server and the other, the secondary DNS server.
- IPv6 is not supported—AAAA requests, and IPv6 DNS servers are not supported.
- AVC with DNS-AS is supported only on physical interfaces, in the ingress direction.
- Virtual Routing and Forwarding (VRF) is not supported.
- We recommend a maximum of 300 AVC with DNS-AS applications (domain names) in the binding table, because of its effect on the ternary content addressable memory (TCAM). To know how the addition of applications affects the TCAM see the Troubleshooting AVC with DNS-AS section of this chapter.

Information About AVC with DNS-AS

The Application Visibility Control (AVC) with Domain Name System as an Authoritative Source (DNS-AS) feature (AVC with DNS-AS) provides a centralized means of controlling the identification and classification of trusted network traffic in an organization. It accomplishes this by using network metadata stored in a DNS server that is authoritative to the domain in question, to identify applications, Quality of Service (QoS) to classify the corresponding traffic and apply suitable policies, and Flexible NetFlow (FNF), to monitor and export application information to an external collector.

The feature provides:

- Application Visibility—Ensuring unambiguous visibility of applications.
  The DNS-AS mechanism snoops requests and does not require a CPU-intensive, deep packet inspection (DPI). Since traffic classification is by means of a DNS request and not DPI, this feature is compatible in scenarios where network traffic is encrypted.
- Metadata Driven—Using information about applications.
  You can program the network holistically so it behaves like a self-driving car. You now have information about all the required applications in your network, irrespective of whether traffic is encrypted or not.
- Centralized Control—Using a cross-domain application intent policy controller.
  The feature leverages an existing, universally available query-response mechanism to enable local DNS servers within an organization to act as authoritative servers and propagate application classification information to DNS-AS clients (switches) in an enterprise network.
- Control without Administrative Access—Proving alternatives to controller-based approaches.
  The feature supports scenarios where your network may be in the cloud and you may not own it. You can still control network devices across the Internet, even though you may not have administrative control of these devices.
Overview of AVC with DNS-AS

The process starts with an organization’s requirements relating to management and control of network traffic. You begin by assessing the software applications that run on the various hosts (phones, PCs etc.) in your network, the domains (websites) and applications accessed by these devices, and the business-relevance of these domains and applications in your organization.

The assessment helps you arrive at a list of domains and applications that are “trusted” by your organization, designating all remaining domains and applications as untrusted.

With DNS-AS enabled on your network and the list of trusted domains at hand, the networking devices or DNS-AS clients in your network identify which applications the network traffic belongs to or which domains are being requested. As long as the traffic is part of the trusted list, the switch requests the DNS server for metadata and IP address information. This request is sent in the form of a DNS-query. The response, once received, is cached locally until the Time-to-Live (TTL) for that resource record expires. The response is bound to the traffic and allows the DNS-AS client to now identify, classify, and forward traffic accordingly.

Key Concepts for AVC with DNS-AS

<table>
<thead>
<tr>
<th>Concept</th>
<th>Meaning or Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata (RFC6759)</td>
<td>In the context of the AVC with DNS-AS feature, this includes traffic classification information, application identification information, and business relevance information. Metadata is maintained in the form of TXT records. The following is a sample metadata record in the prescribed format: CISCO-CLS=app-name:example</td>
</tr>
<tr>
<td>Forward look-up</td>
<td>A request for an IP address or a request for an “A” record, originating from a host. Being able to snoop these forward lookups in the network traffic is fundamental to the AVC with DNS-AS feature.</td>
</tr>
<tr>
<td>Host</td>
<td>A PC or mobile where users run software applications, access websites and so on. Forward look-up requests originate from hosts.</td>
</tr>
<tr>
<td>Client or DNS-AS client</td>
<td>Networking devices throughout your network. Host traffic is always routed through such a client.</td>
</tr>
</tbody>
</table>

*Note*: This chapter deals with the configuration of the AVC with DNS-AS on Cisco Catalyst Switches that are deployed as access switches only. Throughout this document, the term client, DNS-AS client, refers to the switch where AVC with DNS-AS is enabled.

DNS-AS clients receive metadata from an authoritative DNS server and maintain a database of this information in the form of records. How long the record remains in the client’s database, is determined by the record’s TTL.
<table>
<thead>
<tr>
<th>Concept</th>
<th>Meaning or Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Binding table</td>
<td>A table that resides in the DNS-AS client and serves as a database of parsed DNS server responses [TXT records and “A” records]. Every DNS-AS client has a binding table of its own. This table not to be confused with the trusted domain list which is only a list of the trusted domains.</td>
</tr>
<tr>
<td>“A” record</td>
<td>A record containing the domain name and IP address information [Only IPv4 address]. This is one of the DNS-Server responses (the other being the TXT record) and has a predefined lifespan. A forward lookup request from a host is a request for an “A” record.</td>
</tr>
<tr>
<td>TXT DNS-AS resource record or TXT record</td>
<td>A record containing metadata. This is one of the DNS-Server responses (the other being the “A” record) and has a predefined lifespan. A TXT record is limited to 255 characters. For AVC with DNS-AS, the TXT attribute is always CISCO-CLS. Any TXT record that starts with CISCO-CLS= can be recognized as an AVC with DNS-AS message. The message format is as follows: CISCO-CLS=&lt;option&gt;:&lt;val&gt;{</td>
</tr>
<tr>
<td>Time-to-Live (TTL)</td>
<td>The lifespan of an “A” record and TXT record in the binding table. TTL values are configured on the DNS server. While a TTL accompanies both TXT and “A” record responses, the DNS client only goes by the “A” record response from the DNS server.</td>
</tr>
<tr>
<td>Authoritative DNS server</td>
<td>The go-to DNS server for all client metadata and “A” record requests. Every DNS domain has only one authoritative DNS server. Such a server maintains records of application metadata in the form of a TXT record, and only returns responses to queries about domain names that have been maintained in the required format. The following is a sample metadata record in the prescribed format: CISCO-CLS=app-name:example</td>
</tr>
</tbody>
</table>

**AVC with DNS-AS Process Flow**

The working of AVC with DNS-AS involves the DNS snooping process and the DNS-AS client process—both of which are loosely coupled, but independent processes.

**DNS Snooping Process**

**Step 1** The host initiates an “A” record request.
A user from your organization is in a meeting room in an office building. The associated DNS-AS client here is a switch (Network traffic from this meeting room is routed through this switch). The user looks up a website www.example.com, which initiates the request for an “A” record.

**Step 2**
The authoritative DNS-server responds with an “A” record response.

### DNS-AS Client Process

**Step 1**
The DNS-AS client sends a DNS query (TXT request) to the authoritative DNS server.

The DNS-AS client, which is constantly snooping for requests (that correspond with entries in the trusted domain list), finds the host’s forward look-up request. Based on the snooped result, the DNS-AS client sends a TXT request to the authoritative DNS server.

**Note**
The DNS-AS client receives a copy of the host’s “A” record request, and does not alter the host’s original request in any manner.

**Step 2**
The authoritative DNS-server responds with a TXT record response.

**Step 3**
A successful TXT response is followed by an “A” record request.

**Step 4**
The authoritative DNS-server responds with an “A” record response.

**Step 5**
The DNS-AS client parses and saves the response in its binding table.

The DNS-AS client saves the TXT record and “A” record in its binding table. The response will remain saved in the binding table for the duration specified by the TTL of the “A” record. The system automatically checks and prevents duplicate entries for a fully qualified domain name in the binding table.

The DNS-AS client uses the metadata it receives (from the DNS Server), to determine if a QoS policy should be applied. The DNS-AS client forwards information about identified applications, to FNF, enabling you to export this information.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Stacking and AVC with DNS-AS

AVC with DNS-AS supports stacking. To ensure successful stack management, the binding table database of the active stack master (also a DNS-AS client) is synchronized with the stack member (also a DNS-AS client). As long as AVC with DNS-AS is enabled, no additional user configuration is required. The binding table entries are synchronized at these times:

- The stack member comes up (bulk synchronization).
- New entries are added to the binding table database.
- One or more entries are cleared from the database.

Default Configuration for AVC with DNS-AS

DNS-AS is disabled.

How to Configure AVC with DNS-AS

Generating Metadata Streams

Application metadata is configured and saved on the local, authoritative DNS server. You configure application classification information, for each trusted domain, in a prescribed format (a metadata stream). This is the information that the server propagates to switches when queried for application metadata. When the switch sends a TXT query regarding an application, the DNS server sends the relevant metadata in the TXT response.

To generate metadata streams, perform the following task:

SUMMARY STEPS

1. Go to the: AVC Resource Record Generator.
2. Click one of the options to generate the metadata stream.
   - Generate predefined
   - Generate custom
3. Copy metadata into the corresponding TXT Resource Record of the DNS server in charge of the DNS domain that you have marked as a trusted domain.
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Helps you generate a metadata stream for an application or domain, in a TXT record format.</td>
</tr>
<tr>
<td>Go to the: <a href="#">AVC Resource Record Generator</a>.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>CISCO-CLS</td>
<td>app-name:example</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>When you enter the engine ID and selector ID for existing application names, be sure to align with the Network Based Application Recognition (NBAR) standard. Only then will the FNF exporters report with a common ID and in a consistent manner.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a DNS Server as the Authoritative Server

All DNS-AS clients in the network should be configured to send all DNS queries to one authoritative DNS server. On a Cisco Catalyst switch, perform the following task:

**SUMMARY STEPS**

1. `configure terminal`
2. `ip name-server server-address`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

  - `configure terminal`

  **Example:**

  `Device# configure terminal`

| **Step 2**

  - `ip name-server server-address`

  **Example:**

  `Device(config)# ip name-server server-address 192.0.2.1 192.0.2.2`

| • (Optional) Business Relevance (`business:`)—If you do not select yes or no, the business relevance value is set based on the app-class or app-name, in that order of priority.  

  For information about how traffic class and business relevance fields here map to QoS traffic classification, see [App-Class and QoS Traffic Mapping](#).

| **Step 2**

  Click one of the options to generate the metadata stream.

  - Generate predefined
  - Generate custom

  **Example:**

  Generate predefined

| **Step 3**

  Copy metadata into the corresponding TXT Resource Record of the DNS server in charge of the DNS domain that you have marked as a trusted domain.

  Copy and paste the metadata stream from the website, to the authoritative DNS server you are using.
Enabling AVC with DNS-AS

DNS-AS is disabled by default. To enable the feature on a Cisco Catalyst switch, perform the following task:

**SUMMARY STEPS**

1. configure terminal
2. [no] avc dns-as client enable

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** [no] avc dns-as client enable | Enables AVC with DNS-AS on the switch (DNS-AS client). The system then creates a binding table where parsed DNS server responses are stored till the TTL expires. |
| Example:                             |                                |
| Device(config)# avc dns-as client enable |                                |

**Note**

To ensure DNS packet logging or snooping, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface by using the `service-policy input` command. For more information, see Configuring QoS for AVC with DNS-AS, on page 1590.

Maintaining the List of Trusted Domains

Trusted domains are saved in every DNS-AS client where AVC with DNS-AS is enabled. When the feature is first enabled on the DNS-AS client, the list is empty. You must enter the domains that the switch should
trust. The switch snoops only for network traffic that is maintained in this list. To make entries in the trusted domain list, perform the following task:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no] avc dns-as client trusted-domains`
3. `[no] domain domain-name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>[no] avc dns-as client trusted-domains</code></td>
<td>Enters the trusted domain configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# avc dns-as client trusted-domains</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>[no] domain domain-name</code></td>
<td>Enter the domain name you would like to add to the trusted domain list. This forms part of the list of trusted domains for the DNS-AS client. All remaining domains are ignored and will follow default forwarding behavior. You can enter up to 50 domains. You can use regular expressions to match the domain name. For example, to represent all the domains for an organization, if you enter: Switch(config-trusted-domains)# domain <em>.example.</em>, the DNS-AS client matches <a href="http://www.example.com">www.example.com</a>, ftp.example.org and any other domain that pertains to the organization “example”. But use such an entry at your discretion, because it could increase the size of the binding table considerably.</td>
</tr>
<tr>
<td>Example: Device(config-trusted-domains)# domain <a href="http://www.example.com">www.example.com</a> OR Device(config-trusted-domains)# domain *example.com</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring QoS for AVC with DNS-AS**

In order to isolate and classify trusted traffic as defined in the metadata stream, you must create class maps (one for each traffic class) > define traffic-class match criteria and business-relevance match criteria > create a policy map > add the class map> set action> attach the policy map to the interface. For more information, see the Classification Overview section of the Configuring QoS chapter in this guide.

**Class Map Configuration in the Easy QoS Model**

In order to determine the number of traffic classes that should be provisioned, you can use the 12-class Easy QoS Model. This model provides a uniform, standards-based recommendations to help ensure
that QoS designs and deployments are unified and consistent across an organization. The following sample output displays class map configuration for traffic class and business relevance, according to the 12-class Easy QoS Model:

**Note**

Only in the context of the DNS-AS feature, you can specify up to two match attributes for each class.

class-map match-all VOICE
  match protocol attribute traffic-class voip-telephony
  match protocol attribute business-relevance business-relevant

class-map match-all BROADCAST-VIDEO
  match protocol attribute traffic-class broadcast-video
  match protocol attribute business-relevance business-relevant

class-map match-all REAL-TIME-INTERACTIVE
  match protocol attribute traffic-class real-time-interactive
  match protocol attribute business-relevance business-relevant

class-map match-all MULTIMEDIA-CONFERENCING
  match protocol attribute traffic-class multimedia-conferencing
  match protocol attribute business-relevance business-relevant

class-map match-all MULTIMEDIA-STREAMING
  match protocol attribute traffic-class multimedia-streaming
  match protocol attribute business-relevance business-relevant

class-map match-all SIGNALING
  match protocol attribute traffic-class signaling
  match protocol attribute business-relevance business-relevant

class-map match-all NETWORK-CONTROL
  match protocol attribute traffic-class network-control
  match protocol attribute business-relevance business-relevant

class-map match-all NETWORK-MANAGEMENT
  match protocol attribute traffic-class ops-admin-mgmt
  match protocol attribute business-relevance business-relevant

class-map match-all TRANSACTIONAL-DATA
  match protocol attribute traffic-class transactional-data
  match protocol attribute business-relevance business-relevant

class-map match-all BULK-DATA
  match protocol attribute traffic-class bulk-data
  match protocol attribute business-relevance business-relevant

class-map match-all SCAVENGER
  match protocol attribute traffic-class scavenger
  match protocol attribute business-relevance business-irrelevant

**Policy Map Definitions in the Easy QoS Model**

The following sample output displays the policy map definitions, with traffic attribute marking for all the traffic classes in the 12-class Easy QoS Model:

policy-map MARKING
  class VOICE
  set dscp ef

class BROADCAST-VIDEO
  set dscp cs5

class REAL-TIME-INTERACTIVE
  set dscp cs4

class MULTIMEDIA-CONFERENCING
  set dscp af41

class MULTIMEDIA-STREAMING
  set dscp af31
class SIGNALING
set dscp cs3
class NETWORK-CONTROL
set dscp cs6
class NETWORK-MANAGEMENT
set dscp cs2
class TRANSACTIONAL-DATA
set dscp af21
class BULK-DATA
set dscp af11
class SCAVENGER
set dscp cs1
class class-default
set dscp default

**App-Class and QoS Traffic Mapping**

The following table shows how the `app-class` field in the metadata stream maps to the 12-class Easy QoS Model of traffic classification.

<table>
<thead>
<tr>
<th>Application Class Long Text</th>
<th>Application Class Short Text</th>
<th>Corresponding QoS Traffic Class Name and Business Relevance</th>
</tr>
</thead>
</table>
| VOIP-TELEPHONY                        | VO                           | Traffic-class = voip-telephony
                                               Business-relevance = YES                      |
| BROADCAST-VIDEO                       | BV                           | Traffic-class = broadcast-video
                                               Business-relevance = YES                      |
| REALTIME-INTERACTIVE                  | RTI                          | Traffic-class = real-time-interactive
                                               Business-relevance = YES                      |
| MULTIMEDIA-CONFERENCING              | MMC                          | Traffic-class = multimedia-conferencing
                                               Business-relevance = YES                      |
| MULTIMEDIA-STREAMING                 | MMS                          | Traffic-class = multimedia-streaming
                                               Business-relevance = YES                      |
| NETWORK-CONTROL                      | NC                           | Traffic-class = network-control
                                               Business-relevance = YES                      |
| SIGNALING                            | CS                           | Traffic-class = Signaling
                                               Business-relevance = YES                      |
| OPS-ADMIN-MGMT                       | OAM                          | Traffic-class = ops-admin-mgmt
                                               Business-relevance = YES                      |
<table>
<thead>
<tr>
<th>Application Class Long Text</th>
<th>Application Class Short Text</th>
<th>Corresponding QoS Traffic Class Name and Business Relevance</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSACTIONAL-DATA</td>

<td>Traffic-class = Transactional-Data Business-relevance = YES</td>
</tr>
<tr>
<td>BULK-DATA</td>
<td>BD</td>
<td>Traffic-class = bulk-data Business-relevance = YES</td>
</tr>
<tr>
<td>BEST-EFFORT</td>
<td>BE</td>
<td>Traffic-class = &lt;no change&gt; Business-relevance = default</td>
</tr>
<tr>
<td>SCAVENGER</td>
<td>SCV</td>
<td>Traffic-Class = &lt;no change&gt; Business-relevance = NO</td>
</tr>
</tbody>
</table>

**Classifying Network Control Traffic**

The following example shows how to classify network control traffic. The corresponding metadata that should be maintained is: CISCO-CLS-app-name:example|app-class:NC|business:YES

1. Create class maps and match attributes:

   Device# configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   Device(config)# class-map NETWORK-CONTROL
   Device(config-cmap)# match protocol attribute traffic-class network-control
   Device(config-cmap)# match protocol attribute business-relevance business-relevant
   Device(config-cmap)# end

2. Create the policy map, attach the class map to it and specify priority:

   Device# configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   Device(config)# policy-map MARKING
   Device(config-pmap)# class NETWORK-CONTROL
   Device(config-pmap-c)# set dscp ef
   Device(config-pmap-c)# end

3. Attach the policy map to an interface:

   Device# configure terminal
   Enter configuration commands, one per line. End with CNTL/Z.
   Device(config)# interface tengigabitethernet 1/0/1
   Device(config-if)# service-policy input MARKING
   Device(config-if)# end

**Configuring FNF for AVC with DNS-AS**

With FNF you can gain visibility into the applications running on your network, and use FNF option templates to export application ID, description, and attribute information. You must configure these FNF settings on the DNS-AS client:

- Configure a flow record to collect nonkey field application-name, and the key fields ipv4 source address and ipv4 destination address
• Configure a flow exporter and the two option templates. Option templates fetch application information.

Option template **application-table**, exports only applications resolved by the DNS-AS client, that is, the application ID and name from the binding table. The corresponding application descriptions are from Network Based Application Recognition (NBAR) definition for standard applications. A constructed help string is used for custom applications.

Option template **application-attributes** fetches attribute information by mapping it to the application name. Where standard application names are used, the option template uses standard Network Based Application Recognition (NBAR) attribute definitions; where custom application names are used, user-defined application names and only certain attribute fields are guaranteed to carry values.

• Configure a flow monitor and apply it to an interface to enable network traffic monitoring.

FNF Interaction with DNS-AS—With every flow that is created in the flow table, the DNS-AS client resolves the application name for the flow (if the entry exists in the binding table), by using the destination IP address (and if not available), the source IP address.

At periodic, configured intervals (600 seconds, by default), FNF exports option template data, that is mapped to the corresponding application name, to an external collector.

**Option Templates**

The **application-table** and **application-attributes** option templates are supported. Option templates determine the information that is exported to an external collector.

**option application-table**

This template exports the application name, application tag, and description to the external collector.

On a device where AVC with DNS-AS is enabled, only applications resolved by the DNS-AS client are exported. But as a permanent feature, the application-table template exports applications **unclassified** and **unknown**, irrespective of whether the feature is enabled or not.

• Application Name—For custom and standard applications, this information is derived from the TXT response (**app-name**) that is saved in the binding table.

• Application Tag—The same as the application ID in the context of the AVC with DNS-AS feature. It consists of the engine ID and selector ID.

  • Engine ID or Classification Engine ID—Defines the context for the selector ID. Only these values are supported:

    • L3—IANA layer 3 protocol number (IANA_L3_STANDARD, ID: 1)
    • L4—IANA layer 4 well-known port number (IANA_L4_STANDARD, ID: 3)
    • L7—Cisco global application ID (CISCO_L7_GLOBAL, ID: 13)
    • CU—Custom protocol, (NBAR_CUSTOM, ID: 6)

  • Selector ID—Uniquely identifies the application or classification.

For standard applications, the application tag information is derived from these sources, in the given order of precedence:

1. TXT response (**app-id**)
2. The NBAR definition for standard applications (if the TXT response does not carry a value).

For custom applications, the following applies to application tag information:

- It is derived only from the TXT response (**app-id:**)
- For the engine ID, the DNS-AS client automatically uses CU—Custom protocol, (NBAR_CUSTOM, ID: 6).
- For the selector ID, the DNS-AS client allots a custom selector ID. A maximum of 120 custom applications are supported - out of which 110 are available to the DNS-AS client. Starting with selector ID value 243, IDs are assigned in descending order. When there are no remaining IDs to assign, the entry is not saved in the binding table.

- Description—This information is derived from the NBAR definition for standard applications. For custom applications, the DNS-AS client uses: User Defined Protocol <app-name>.

**option application-attributes**

This template enables the collector to map the application names (from the option application-table), to attributes. Attributes are statically assigned to each protocol or application, and are not dependent on traffic. The template supports the following attributes:

For standard applications—

- Application Tag—See the Application Tag info in the option application-table section above. The same applies here.
- Category—Groups applications based on the first level of categorization for each protocol as the match criteria. Similar applications are grouped together under one category. For example, the email category contains all email applications such as, Internet Mail Access Protocol (IMAP), Simple Mail Transfer Protocol (SMTP), Lotus Notes, and so on.
- Sub-category—Groups applications based on the second level of categorization for each protocol as the match criteria. For example, clearcase, dbase, rda, mysql and other database applications are grouped under the database group.
- Application Group—Groups the same networking applications together. For instance, Example-Messenger, Example-VoIP-messenger, and Example-VoIP-over-SIP are grouped together under the example-messenger-group
- Peer-to-peer (p2p)—Groups protocols based on whether or not they use p2p technology.
- Tunnel—Groups protocols based on whether or not a protocol tunnels the traffic of other protocols. Protocols for which the NBAR does not provide any value are categorized under the unassigned tunnel group. For example, Layer 2 Tunneling Protocols (L2TP).
- Encryption—Groups applications based on the encrypted and nonencrypted status of the applications. Protocols for which the NBAR does not provide any value are categorized under the unassigned encrypted group.
- Traffic class—Groups applications and protocols based on the traffic class they belong to. For example, all applications that have traffic class TD. Traffic class information is derived from these sources, in the given order of precedence:

1. TXT response (**app-class:**)
2. The NBAR definition for standard applications (if the TXT response does not carry a value)
   
   - Business relevance—Groups applications based on whether or not they have been marked as business-relevant. For example, all applications that have business relevance as YES. Business relevance information is derived from these sources, in the given order of precedence:
     1. TXT response (business:)
     2. The NBAR definition for standard applications (if the TXT response does not carry a value)

For custom applications—

Only these attributes of the application-attributes options template are guaranteed to carry a value:

   - Application Tag—See the Application Tag info in the option application-table section above. The same applies here.
   - Traffic class—This information is derived from the TXT response (app-class:)
   - Business relevance—This information is derived from the TXT response (business:)

Sample FNF Configuration for AVC with DNS-AS

The following example shows how you can configure FNF for AVC with DNS-AS:

Part 1: Create a flow record. As in the example, you must configure:

   - The source and destination IP addresses as key fields, in order to resolve application names.
   - The use of the application name as a nonkey field in flow record.

Additionally (not mandatory), you can also configure the number of bytes or packets in a flow as a nonkey field, to display the number of applications sent to the collector

Device# configure terminal
Device(config)# flow record example-record1
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# collect application name
Device(config-flow-record)# collect counter packets
Device(config-flow-record)# exit

Device# show flow record example-record1
flow record example-record1
match ipv4 source address
match ipv4 destination address
collect application name
collect counter packets

Part 2: Create a flow exporter.

Also configure the application-table and application-attributes option templates in the exporter. Without option templates, the collector cannot retrieve meaningful application information. At a minimum we recommend that you configure the application-table option. For attribute information, also configure the application-attribute option.

You can also change the frequency of template export in seconds (the allowed range is 1 to 86400 seconds; the default is 600 seconds).
Device(config)# flow exporter example-exporter1
Device(config-flow-exporter)# option application-table
Device(config-flow-exporter)# option application-attributes
Device(config-flow-exporter)# template data timeout 500
Device(config-flow-exporter)# exit

Device# show flow exporter example-exporter1
Flow Exporter example-exporter1:
  Description: User defined
  Export protocol: NetFlow Version 9
  Transport Configuration:
  Destination IP address: 192.0.1.254
  Source IP address: 192.51.100.2
  Transport Protocol: UDP
  Destination Port: 9995
  Source Port: 54964
  DSCP: 0x0
  TTL: 255
  Output Features: Not Used
  Options Configuration:
  application-table (timeout 500 seconds)
  application-attributes (timeout 500 seconds)

Device# show flow exporter example-exporter1 statistics
Flow Exporter example-exporter1:
  Packet send statistics (last cleared 00:00:48 ago):
  Successfully sent: 2 (924 bytes)
  Client send statistics:
  Client: Option options application-name
    Records added: 4
      - sent: 4
    Bytes added: 332
      - sent: 332
  Client: Option options application-attributes
    Records added: 2
      - sent: 2
    Bytes added: 388
      - sent: 388

Part 3: Create a flow monitor

Apply the flow monitor to an interface, to perform network traffic monitoring.

You can also apply a QoS policy to the same interface. This example applies the QoS policy created as part of the sample QoS configuration (Classifying Network Control Traffic, on page 1593)

Device# configure terminal
Device(config)# flow monitor example-monitor1
Device(config-flow-monitor)# record example-record1
Device(config-flow-monitor)# exporter example-exporter1
Device(config-flow-monitor)# exit
Device(config)# interface tengigabitethernet 1/0/1
Device(config-if)# switchport access vlan 100
Device(config-if)# switchport mode access
Device(config-if)# ip flow monitor example-monitor1 input
Device(config-if)# service-policy input MARKING
Device(config-if)# end

Device# show flow monitor
flow monitor example-monitor1
  record example-record1
exporter example-exporter1
!
Device# show interface tengigabitethernet1/0/1
interface tengigabitethernet1/0/1
    switchport access vlan 100
    switchport mode access
    ip flow monitor example-monitor1 input

Device# show flow monitor example-monitor1 cache

Monitoring AVC with DNS-AS

To display the various AVC with DNS-AS settings you have configured, use these commands in the privileged EXEC mode:

Table 161: AVC with DNS-AS Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
<th>Sample Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>show avc dns-as client status</td>
<td>Displays current status of the DNS-AS client. Use this command to know whether AVC with DNS-AS is enabled or not.</td>
<td>Example: show avc dns-as client status</td>
</tr>
<tr>
<td>show avc dns-as client trusted-domains</td>
<td>Displays list of trusted domains maintined in the binding table.</td>
<td>Example: show avc dns-as client trusted-domains</td>
</tr>
</tbody>
</table>
### Monitoring AVC with DNS-AS

: 203.0.113.125
<output truncated>

Back to Table 161: AVC with DNS-AS Monitoring Commands

Example: show avc dns-as client statistics

---

**Note**

Two DNS servers are configured in this example.

```
Device# show avc dns-as client statistics
Server details: vrf-id = 0 vrf-name = <default> ip = 192.0.2.1
AAAA Query Error packets 0
AAAA Query TX packets 0
AAAA Response RX packets 0
TXT Query Error packets 0
TXT Query TX packets 8
TXT Response RX packets 0
A Query Error packets 0
A Query TX packets 6
A Response RX packets 0
Server details: vrf-id = 0 vrf-name = <default> ip = 192.0.2.2
AAAA Query Error packets 0
AAAA Query TX packets 0
AAAA Response RX packets 0
TXT Query Error packets 0
TXT Query TX packets 2
TXT Response RX packets 0
A Query Error packets 0
A Query TX packets 4
A Response RX packets 2
Total Drop packets 0

avc_dns_as_pkts_logged = 2
avc_dns_as_q_pkts_processed = 2
```

Back to Table 161: AVC with DNS-AS Monitoring Commands

Example: show avc dns-as client name-server brief

```
Device# show avc dns-as client name-server brief

Server-IP | Vrf-name
----------------------------------------
```

---
192.0.2.1 | <default>
192.0.2.2 | <default>

Back to Table 161: AVC with DNS-AS Monitoring Commands

Example: show ip name-server

Device# show ip name-server
192.0.2.1
192.0.2.2
2001:DB8::1

Back to Table 161: AVC with DNS-AS Monitoring Commands

Example: show platform tcam utilization

Note: The relevant TCAM entry is IPv4 qos aces:

Device# show platform tcam utilization
CAM Utilization for ASIC# 0 Max Used
Masks/Values Masks/values

Unicast mac addresses: 16604/16604 24/24
IPv4 IGMP groups + multicast routes: 1072/1072 3/3
IPv4 unicast directly-connected routes: 4096/4096 4/4
IPv4 unicast indirectly-connected routes: 1280/1280 40/40
IPv6 Multicast groups: 1072/1072 18/18
IPv6 unicast directly-connected routes: 4096/4096 1/1
IPv6 unicast indirectly-connected routes: 1280/1280 32/32
IPv4 policy based routing aces: 512/512 14/14
IPv4 qos aces: 512/512 51/51
IPv4 security aces: 1024/1024 78/78
IPv6 policy based routing aces: 256/256 8/8
IPv6 qos aces: 256/256 44/44
IPv6 security aces: 512/512 18/18

Note: Allocation of TCAM entries per feature uses a complex algorithm. The above information is meant to provide an abstract view of the current TCAM utilization.

Back to Table 161: AVC with DNS-AS Monitoring Commands

Troubleshooting AVC with DNS-AS

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Causes and Solutions</th>
</tr>
</thead>
</table>
| There are no entries in the binding table. | The binding table may be empty because of either one or both of these reasons:  
| | • Metadata is not maintained in DNS server—complete task Generating Metadata Streams, on page 1586  
| | • The entry is not maintained in the trusted domain list—complete task Maintaining the List of Trusted Domains, on page 1589 |
Possible Causes and Solutions

Problem
Unsuccessful DNS snooping or packet logging.

To ensure DNS snooping and packet logging, you must attach the policy map (containing the relevant class maps that will determine traffic class) to the interface—See the example in the Configuring QoS for AVC with DNS-AS, on page 1590

The DNS server does not return correct values.

Verify that the correct DNS-AS metadata is maintained in the DNS system.

• Using Linux dig:
  
  ```
  ```

• Using Windows nslookup:
  
  ```
  C:\Windows\system32>NSLookup.exe -q=TXT www.example.org [dns-server-ip]
  www.example.org text = "CISCO-CLS=app-name:example|app-class:TD|business:YES|app-id:CU/28202"
  ```

The QoS policy you applied is removed from the port.

When the DNS-AS client recognises an application, along with saving the "A" record response in the binding table, the system utilises the TCAM to save the IP address of the application. A single application can in effect have multiple IP addresses, each utilising additional space in the TCAM. When the TCAM is exhausted, QoS policies cease to be applied.

To avoid the problem, monitor TCAM utilisation on a regular basis. Enter the show platform team utilisation command in privilege EXEC mode, to display information about TCAM availability.

The DNS-AS client ignores the QoS mapping you've defined and applies default forwarding behavior.

The DNS-AS client ignores QoS mapping and applies default forwarding behavior in these cases:

• If the match attributes that you specify for the traffic class and business relevance do not match what you have defined in the metadata stream—Check and correct as required.

• If the binding table entry is no longer active. This refers to the age of the entry—Use the show ave dns-as client binding-table command to display the age of an entry.

Feature History and Information for AVC with DNS-AS

The following table provides release information about the feature or features described in this chapter. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<table>
<thead>
<tr>
<th>Release</th>

Configuring SDM Templates

• Finding Feature Information, on page 1605
• Information About Configuring SDM Templates, on page 1605
• How to Configure SDM Templates, on page 1608
• Configuration Examples for SDM Templates, on page 1609
• Additional References for SDM Templates, on page 1611
• Feature History and Information for Configuring SDM Templates, on page 1612

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring SDM Templates

Restrictions for SDM Templates

The following are restrictions when using SDM templates:

• The default template is the only template supported on switches running the LAN Lite image.
• The LAN Base default template is used with switches in a homogeneous stack.
• The LAN Base routing template is supported only on switches running the LAN Base image.
• The LAN Base routing template is used with switches in a mixed stack.
• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.
• The default template is the only template supported on switches running the LAN Base image.

SDM Templates

You can use Switch Database Management (SDM) templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

To allocate ternary content addressable memory (TCAM) resources for different usages, the switch SDM templates prioritize system resources to optimize support for certain features. The templates supported on your device:

• Default—The default template gives balance to all functions.
• LAN Base default—The LAN Base default template is to be used with switches in a homogeneous stack.
• LAN Base routing—The LAN Base routing template supports IPv4 unicast routes for static routing SVI configuration.

The LAN Base routing template prevents other features from using the memory allocated to unicast routing. Routing must be enabled on your switch before you can use the routing template.

For more information about homogeneous and mixed stacks, see the Catalyst 2960-X Switch Stacking Configuration Guide.

After you change the template and the system reboots, you can use the show sdm prefer privileged EXEC command to verify the new template configuration. If you enter the show sdm prefer command before you enter the reload privileged EXEC command, the show sdm prefer command shows the template currently in use and the template that becomes active after a reload.

Note

• The SDM templates contain only those commands that are defined as part of the templates. If a template enables another related command that is not defined in the template, then this other command will be visible when the show running config command is entered. For example, if the SDM template enables the switchport voice vlan command, then the spanning-tree portfast edge command may also be enabled (although it is not defined on the SDM template).

If the SDM template is removed, then other such related commands are also removed and have to be reconfigured explicitly.

• SDM templates do not create VLANs. You must create the VLANs before adding commands to the SDM templates.

Default and LAN Base Templates

• Default and LAN Base routing templates—Optimizes the resources in the switch to support feature level for no routed interfaces and 255 VLANs.
• LAN Base default—Optimizes the resources in the switch to support feature level for no routed interfaces and 1024 VLANs.
Table 162: Approximate Number of Feature Resources Allowed by Templates

</tbody>
</table>
SDM Templates and Switch Stacks

All stack members use the same SDM template that is stored on the stack master. When a new switch is added to a stack, as with the switch configuration and VLAN database files, the SDM configuration that is stored on the stack master overrides the template configured on an individual switch.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition. You can use the show switch privileged EXEC command to see if any stack members are in SDM-mismatch mode.

How to Configure SDM Templates

Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. sdm prefer \{ default | lanbase-default | lanbase-routing \}
4. end
5. reload

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

| Step 3 | sdm prefer { default | lanbase-default | lanbase-routing } |
| Purpose | Specifies the SDM template to be used on the switch. The keywords have these meanings: |
| | **default**—The default template provides balance for all Layer 2, IPv4 and IPv6 functionality. |
| | **lanbase-default**—The LAN Base default template provides both IPv4 and IPv6 static routing functionality. |
| | **Note** In Catalyst 2960-X switches with Lan Base license, up to 200 OSPF routes are supported, for each IPv4 and IPv6 routes. |
| | • **lanbase-routing**—The LAN Base routing templates provide both IPv4 and IPv6 static routing functionality. |
| Example: | Use the `no sdm prefer` command to set the switch to the default template, The default template balances the use of system resources. |

| Step 4 | end |
| Purpose | Returns to privileged EXEC mode. |
| Example: | Device(config)# end |

| Step 5 | reload |
| Purpose | Reloads the operating system. |
| Example: | Device# reload |

---

## Configuration Examples for SDM Templates

### Examples: Displaying SDM Templates

This is an example output showing the default template information.

```
Device# show sdm prefer default
"default" template:
The selected template optimizes the resources in the switch to support this level of features for 0 routed interfaces and 255 VLANs.

number of unicast mac addresses: 8K
number of IPv4 IGMP groups + multicast routes: 0.375k
```
This is an example output showing the LAN Base default template information.

Device# show sdm prefer lanbase-default

"lanbase-default" template:
The selected template optimizes the resources in
the switch to support this level of features for
0 routed interfaces and 1024 VLANs.

number of unicast mac addresses: 16K
number of IPv4 IGMP groups + multicast routes: 1K
number of IPv4 unicast routes: 3K
  number of directly-connected IPv4 hosts: 2K
  number of indirect IPv4 routes: 1K
number of IPv6 multicast groups: 1K
number of directly-connected IPv6 addresses: 2K
number of indirect IPv6 unicast routes: 1K
number of IPv6 policy based routing aces: 0
number of IPv4/MAC qos aces: 0.5K
number of IPv4/MAC security aces: 0.625k
number of IPv6 qos aces: 0
number of IPv6 policy based routing aces: 0
number of IPv6 security aces: 0.625k

Device#

This is an example output showing the LAN Base routing template information.

Device# show sdm prefer lanbase-routing

"lanbase-routing" template:
The selected template optimizes the resources in
the switch to support this level of features for
0 routed interfaces and 255 VLANs.

number of unicast mac addresses: 4K
number of IPv4 IGMP groups + multicast routes: 0.375k
number of IPv4 unicast routes: 0.875k
  number of directly-connected IPv4 hosts: 0.875k
  number of indirect IPv4 routes: 80
number of IPv6 multicast groups: 0.25K
number of directly-connected IPv6 addresses: 0.75K
number of indirect IPv6 unicast routes: 32
number of IPv4 policy based routing aces: 0
number of IPv4/MAC qos aces: 0.375k
number of IPv4/MAC security aces: 0.375k
number of IPv6 policy based routing aces: 0
number of IPv6 qos aces: 0.125k
number of IPv6 security aces: 0.25k
Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

```
Device(config)# sdm prefer lanbase-routing
Device(config)# exit
Device# reload
    Proceed with reload? [confirm]
```

```
Device(config)# sdm prefer dual-ipv4-and-ipv6 default
Device(config)# exit
Device# reload
    Proceed with reload? [confirm]
```

CHAPTER 80

Configuring System Message Logs

• Restrictions for Configuring System Message Logs, on page 1613
• Information About Configuring System Message Logs, on page 1613
• How to Configure System Message Logs, on page 1616
• Monitoring and Maintaining System Message Logs, on page 1624
• Configuration Examples for System Message Logs, on page 1624
• Additional References for System Message Logs, on page 1625
• Feature History and Information For System Message Logs, on page 1626

Restrictions for Configuring System Message Logs

When the logging discriminator command is configured, the device may experience memory leak or crash. This usually happens during heavy syslog or debug output. The rate of the memory leak is dependent on the number of logs being produced. In extreme cases, the device may also crash. As a workaround, use the no logging discriminator command to disable the logging discriminator.

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.
You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch. If a standalone switch , the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port.

---

**Note**

The syslog format is compatible with 4.3 BSD UNIX.

---

### System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- `seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)`
- `seq no:timestamp: %facility-severity-MNEMONIC:description`

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- `service sequence-numbers`
- `service timestamps log datetime`
- `service timestamps log datetime [ localtime] [msec] [show-timezone]`
- `service timestamps log uptime`

---

**Table 163: System Log Message Elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seq no:</code></td>
<td>Stamps log messages with a sequence number only if the <code>service sequence-numbers</code> global configuration command is configured.</td>
</tr>
<tr>
<td><code>timestamp formats:</code></td>
<td>Date and time of the message or event. This information appears only if the `service timestamps log [datetime</td>
</tr>
<tr>
<td><code>mm/dd h h:mm:ss</code> or <code>hh:mm:ss (short uptime)</code> or <code>d h (long uptime)</code></td>
<td></td>
</tr>
<tr>
<td><code>facility</code></td>
<td>The facility to which the message refers (for example, SNMP, SYS, and so forth).</td>
</tr>
<tr>
<td><code>severity</code></td>
<td>Single-digit code from 0 to 7 that is the severity of the message.</td>
</tr>
<tr>
<td><code>MNEMONIC</code></td>
<td>Text string that uniquely describes the message.</td>
</tr>
</tbody>

Enabling Syslog Trap Messages

You can enable Syslog traps using the `snmp-server enable traps syslog` command.

After enabling Syslog traps, you have to specify the trap message severity. Use the `logging snmp-trap` command to specify the trap level. By default, the command enables severity 0 to 4. To enable all the severity level, configure the `logging snmp-trap 0 7` command.

To enable individual trap levels, configure the following commands:

- `logging snmp-trap emergencies`: Enables only severity 0 traps.
- `logging snmp-trap alert`: Enables only severity 1 traps.

Note that, along with the Syslog traps, the Syslog history should also be applied. Without this configuration, Syslog traps are not sent.

Use the `logging history informational` command to enable the Syslog history.
How to Configure System Message Logs

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. logging buffered [size]
3. logging host
4. logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]
5. end
6. terminal monitor

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> logging buffered [size]</td>
<td>Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the stack master. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# logging buffered 8192</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> logging host</td>
<td>Logs messages to a UNIX syslog server host.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# logging 125.1.1.100</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.</td>
</tr>
<tr>
<td><strong>Step 4</strong> logging file flash: filename</td>
<td>To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
</tr>
</tbody>
</table>
### Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **line [console | vty] line-number [ending-line-number]**

#### Purpose

Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the stack master.

- **filename**—Enters the log message filename.
- **max-file-size**—Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.
- **min-file-size**—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.
- **severity-level-number | type**—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.

#### Step 4

**logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]**

**Example:**

```
Device(config)# logging file flash:log_msg.txt 4096 4096 3
```

#### Step 5

**end**

**Example:**

```
Device(config)# end
```

**Step 6**

**terminal monitor**

**Example:**

```
Device# terminal monitor
```

**Logs messages to a nonconsole terminal during the current session.**

Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.
3. `logging synchronous [level [severity-level | all] | limit number-of-buffers]`

4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal

**Example:**

Device# configure terminal | Enters global configuration mode. |
| **Step 2**
line [console | vty] line-number [ending-line-number]

**Example:**

Device(config)# line console | Specifies the line to be configured for synchronous logging of messages. |

- **console** — Specifies configurations that occur through the switch console port or the Ethernet management port.
- **line vty line-number** — Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15.

You can change the setting of all 16 vty lines at once by entering:

`line vty 0 15`

You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:

`line vty 2`

When you enter this command, the mode changes to line configuration.

| **Step 3**
logging synchronous [level [severity-level | all] | limit number-of-buffers]

**Example:**

Device(config)# logging synchronous level 3 limit 1000 | Enables synchronous logging of messages. |

- (Optional) **level severity-level** — Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.
- (Optional) **level all** — Specifies that all messages are printed asynchronously regardless of the severity level.
- (Optional) **limit number-of-buffers** — Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.
Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The **logging synchronous** global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press **Return**.

To reenable message logging after it has been disabled, use the **logging on** global configuration command. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. no logging console
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>no logging console</td>
<td>Disables message logging.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# no logging console</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.
This task is optional.

SUMMARY STEPS

1. configure terminal
2. Use one of these commands:
   • service timestamps log uptime
   • service timestamps log datetime[msec | localtime | show-timezone]
3. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

Step 2 Use one of these commands:
• service timestamps log uptime
• service timestamps log datetime[msec | localtime | show-timezone]

Example:
Device(config)# service timestamps log uptime
or
Device(config)# service timestamps log datetime

Step 3 end
Example:
Device(config)# end

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.
This task is optional.
**Defining the Message Severity Level**

Limit messages displayed to the selected device by specifying the severity level of the message. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. logging console level
3. logging monitor level
4. logging trap level
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>service sequence-numbers</td>
<td>Enables sequence numbers.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# service sequence-numbers</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose Command or Action  
### Purpose

| Step 2 | logging console level  
Example:  
Device(config)# logging console 3 | Limits messages logged to the console.  
By default, the console receives debugging messages and numerically lower levels. |
|---|---|
| Step 3 | logging monitor level  
Example:  
Device(config)# logging monitor 3 | Limits messages logged to the terminal lines.  
By default, the terminal receives debugging messages and numerically lower levels. |
| Step 4 | logging trap level  
Example:  
Device(config)# logging trap 3 | Limits messages logged to the syslog servers.  
By default, syslog servers receive informational messages and numerically lower levels. |
| Step 5 | end  
Example:  
Device(config)# end | Returns to privileged EXEC mode. |

#### Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.  
This task is optional.

**SUMMARY STEPS**

1. configure terminal  
2. logging history level  
3. logging history size number  
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
Logging Messages to a UNIX Syslog Daemon

This task is optional.

Note

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX `man syslogd` command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

Before you begin

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

SUMMARY STEPS

1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Add a line to the file <code>/etc/syslog.conf</code>.</td>

Configuration Examples for System Message Logs

Example: Switch System Message

This example shows a partial switch system message on a switch:

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down 2
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
Examples: Displaying Service Timestamps Log

This example shows part of a logging display with the `service timestamps log datetime` global configuration command enabled:

```
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
```

This example shows part of a logging display with the `service timestamps log uptime` global configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)
```

This example shows part of a logging display with the sequence numbers enabled.

```
000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36) (Switch-2)
```

CHAPTER 81

Configuring Online Diagnostics

- Information About Configuring Online Diagnostics, on page 1627
- How to Configure Online Diagnostics, on page 1628
- Monitoring and Maintaining Online Diagnostics, on page 1632
- Configuration Examples for Online Diagnostic Tests, on page 1633
- Additional References for Online Diagnostics, on page 1636
- Feature History and Information for Configuring Online Diagnostics, on page 1637

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Device while the Device is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Device is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Device or switch stack and the diagnostic tests that have already run.
How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

**SUMMARY STEPS**

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive}` | Starts the diagnostic tests. |
| **Example:** |
| `Device# diagnostic start switch 2 test basic` | The `switch number` keyword is supported only on stacking switches. The range is from 1 to 8. You can specify the tests by using one of these options: |
| • `name`—Enters the name of the test. |
| • `test-id`—Enters the ID number of the test. |
| • `test-id-range`—Enters the range of test IDs by using integers separated by a comma and a hyphen. |
| • `all`—Starts all of the tests. |
| • `basic`—Starts the basic test suite. |
| • `non-disruptive`—Starts the non-disruptive test suite. |

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the `no` form of this command to remove the scheduling.

**SUMMARY STEPS**

1. `configure terminal`
### Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a Device while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Device to generate a syslog message because of a test failure, and enable a specific test.

Use the `no` form of this command to disable testing.

By default, health monitoring is disabled, but the Device generates a syslog message when a test fails.

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
**Example:**  
Device# configure terminal | Enters global configuration mode. |
| **Step 2** | diagnostic schedule switch number test `{name | test-id | test-id-range | all | basic | non-disruptive |} \{daily | on mm dd yyyy hh:mm | weekly day-of-week hh:mm}\}  
**Example:**  
Device(config)# diagnostic schedule switch 1 test 1-5 on July 3 2013 23:10 | Schedules on-demand diagnostic tests for a specific day and time.  
The `switch number` keyword is supported only on stacking switches. The range is from 1 to 8.  
When specifying the tests to be scheduled, use these options:  
- `name`—Name of the test that appears in the `show diagnostic content` command output.  
- `test-id`—ID number of the test that appears in the `show diagnostic content` command output.  
- `test-id-range`—ID numbers of the tests that appear in the `show diagnostic content` command output.  
- `all`—All test IDs.  
- `basic`—Starts the basic on-demand diagnostic tests.  
- `non-disruptive`—Starts the non-disruptive test suite.  
  You can schedule the tests as follows:  
- Daily—Use the `daily hh:mm` parameter.  
- Specific day and time—Use the `on mm dd yyyy hh:mm` parameter.  
- Weekly—Use the `weekly day-of-week hh:mm` parameter. |
Follow these steps to configure and enable the health-monitoring diagnostic tests:

SUMMARY STEPS

1. enable
2. configure terminal
3. diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day
4. diagnostic monitor syslog
5. diagnostic monitor threshold switch number number test {name | test-id | test-id-range | all} failure count count
6. diagnostic monitor switch number test {name | test-id | test-id-range | all}
7. end
8. show running-config
9. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td><strong>Step 5</strong> diagnostic monitor threshold switch number number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# diagnostic monitor threshold switch 2 test 1 failure count 20</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> diagnostic monitor switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# diagnostic monitor switch 2 test 1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 8**  
**show running-config**  
**Example:**  
`Device# show running-config`

**Step 9**  
**copy running-config startup-config**  
**Example:**  
`Device# copy running-config startup-config`

**What to do next**

Use the `no diagnostic monitor interval test [test-id | test-id-range]` global configuration command to change the interval to the default value or to zero. Use the `no diagnostic monitor syslog` command to disable generation of syslog messages when a health-monitoring test fails. Use the `diagnostic monitor threshold test [test-id | test-id-range] failure count` command to remove the failure threshold.

## Monitoring and Maintaining Online Diagnostics

### Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Device or Device stack and check the test results by using the privileged EXEC `show` commands in this table:

**Table 165: Commands for Diagnostic Test Configuration and Results**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show diagnostic contentswitch [number</td>
<td>all]`</td>
</tr>
<tr>
<td><code>show diagnostic status</code></td>
<td>Displays the currently running diagnostic tests.</td>
</tr>
<tr>
<td>`show diagnostic resultsswitch [number</td>
<td>all] [detail</td>
</tr>
<tr>
<td>`show diagnostic switch [number</td>
<td>all] [detail]`</td>
</tr>
<tr>
<td>`show diagnostic schedule switch [number</td>
<td>all]`</td>
</tr>
<tr>
<td><code>show diagnostic post</code></td>
<td>Displays the POST results. (The output is the same as the <code>show post</code> command output.)</td>
</tr>
</tbody>
</table>
Configuration Examples for Online Diagnostic Tests

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing.

SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | non-disruptive }`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Starts the diagnostic tests.</td>
</tr>
<tr>
<td>`diagnostic start switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# diagnostic start switch 2 test basic</code></td>
<td></td>
</tr>
</tbody>
</table>

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Device(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Device(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```

Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:
Device(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

Device(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30

**Displaying Online Diagnostics: Examples**

This example shows how to display the online diagnostic detailed information on a specific switch:

Device# show diagnostic switch 1 detail

Switch 1: SerialNo :

Overall Diagnostic Result for Switch 1 : UNTESTED

Test results: (. = Pass, F = Fail, U = Untested)

---

1) TestPortAsicStackPortLoopback ---> U

Error code ------------------> 3 (DIAG_SKIPPED)
Total run count --------------> 0
Last test testing type -------> n/a
Last test execution time -----> n/a
First test failure time -------> n/a
Last test failure time -------> n/a
Last test pass time ----------> n/a
Total failure count ----------> 0
Consecutive failure count ---> 0

---

2) TestPortAsicLoopback -----------> U

Error code ------------------> 3 (DIAG_SKIPPED)
Total run count --------------> 0
Last test testing type -------> n/a
Last test execution time -----> n/a
First test failure time -------> n/a
Last test failure time -------> n/a
Last test pass time ----------> n/a
Total failure count ----------> 0
Consecutive failure count ---> 0

---

3) TestPortAsicCam -----------------> U

Error code ------------------> 3 (DIAG_SKIPPED)
Total run count --------------> 0
Last test testing type -------> n/a
Last test execution time -----> n/a
First test failure time -------> n/a
Last test failure time -------> n/a
Last test pass time ----------> n/a
Total failure count ----------> 0
Consecutive failure count ---> 0
This example shows how to display the online diagnostics that are configured on a specific switch:

```bash
Device# show diagnostic content switch 3
```

Switch 1:
Diagnostics test suite attributes:

- **B/*** - Basic ondemand test / NA
- **P/V/*** - Per port test / Per device test / NA
- **D/N/*** - Disruptive test / Non-disruptive test / NA
- **S/*** - Only applicable to standby unit / NA
- **X/*** - Not a health monitoring test / NA
- **F/*** - Fixed monitoring interval test / NA
- **E/*** - Always enabled monitoring test / NA
- **A/I** - Monitoring is active / Monitoring is inactive
- **R/*** - Switch will reload after test list completion / NA
- **P/*** - will partition stack / NA

<table>
<thead>
<tr>

CHAPTER 82

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Lost or Forgotten Password on a Device

The default configuration for the device allows an end user with physical access to the device to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the device.

Note

On these devices, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.
You cannot recover encryption password key, when Cisco WLC configuration is copied from one Cisco WLC to another (in case of an RMA).

Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the Catalyst 2960-X Switch Interface and Hardware Component Configuration Guide.

Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Device port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the `shutdown` interface configuration command, and then enter the `no shutdown` interface command. You can also configure automatic recovery on the Device to recover from the error-disabled state.

On a Device, the `errdisable recovery cause loopback` and the `errdisable recovery interval seconds` global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

Monitoring PoE Port Status

- `show controllers power inline` privileged EXEC command
- `show power inline` EXEC command
- `debug ilpower` privileged EXEC command

Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the `power inline never` interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the `shutdown` and the `no shutdown` interface configuration commands.
You should not connect a Cisco powered device to a port that has been configured with the **power inline never** command.

### Ping

The Device supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- **Normal response**—The normal response (*hostname* is alive) occurs in 1 to 10 seconds, depending on network traffic.
- **Destination does not respond**—If the host does not respond, a *no-answer* message is returned.
- **Unknown host**—If the host does not exist, an *unknown host* message is returned.
- **Destination unreachable**—If the default gateway cannot reach the specified network, a *destination-unreachable* message is returned.
- **Network or host unreachable**—If there is no entry in the route table for the host or network, a *network or host unreachable* message is returned.

### Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Device in the path. When the Device detects a device in the path that does not support Layer 2 traceroute, the Device continues to send Layer 2 trace queries and lets them time out.

The Device can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

### Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
  
  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

- A Device is reachable from another Device when you can test connectivity by using the **ping privileged EXEC** command. All Device in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the **traceroute mac** or the **traceroute mac ip** privileged EXEC command on a Device that is not in the physical path from the source device to the destination device. All Device in the path must be reachable from this switch.

- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.
• If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

• If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

• The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Device uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
  • If an ARP entry exists for the specified IP address, the Device uses the associated MAC address and identifies the physical path.
  • If an ARP entry does not exist, the Device sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

• When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

• This feature is not supported in Token Ring VLANs.

**IP Traceroute**

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Device can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the Device is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate Device do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate Device is a multilayer Device that is routing a particular packet, this Device shows up as a hop in the traceroute output.

The traceroute privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP port-unreachable message.
error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

**Time Domain Reflector Guidelines**

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported only on 10/100/1000 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Device
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Device reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the Device does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
- The link is a 10-megabit or a 100-megabit link.
- The cable is a stranded cable.
- The link partner is a Cisco IP Phone.
- The link partner is not IEEE 802.3 compliant.
Debug Commands

Caution
Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.

All `debug` commands are entered in privileged EXEC mode, and most `debug` commands take no arguments.

Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Device. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Device problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Device and small form-factor pluggable (SFP) modules. The Device stores this information in the flash memory:

- CLI commands—Record of the OBFL CLI commands that are entered on a standalone Device or a switch stack member.
- Environment data—Unique device identifier (UDI) information for a standalone Device or a switch stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- Message—Record of the hardware-related system messages generated by a standalone Device or a switch stack member.
- Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone Device or a switch stack member.
- Temperature—Temperature of a standalone Device or a switch stack member.
- Uptime data—Time when a standalone Device or a switch stack member starts, the reason the Device restarts, and the length of time the Device has been running since it last restarted.
- Voltage—System voltages of a standalone Device or a switch stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Device is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the Device fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Device is restarted, there is a 10-minute delay before logging of new data begins.

Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:
You may see increased system memory usage when Cisco Catalyst 4500E Supervisor Engine 8-E is used in wireless mode.

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

Layer 3 switches:
- Dropped packets or increased latency for packets routed in software
- BGP or OSPF routing topology changes
- HSRP flapping

How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Switch software can be corrupted during an upgrade by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses the Xmodem Protocol to recover from a corrupt or wrong image file. There are many software packages that support the Xmodem Protocol, and this procedure is largely dependent on the emulation software that you are using.

This recovery procedure requires that you have physical access to the switch.

Step 1
From your PC, download the software image tar file (image_filename.tar) from Cisco.com. The Cisco IOS image is stored as a bin file in a directory in the tar file. For information about locating the software image files on Cisco.com, see the release notes.

Step 2
Extract the bin file from the tar file. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate. If you are using UNIX, follow these steps:

a) Display the contents of the tar file by using the `tar -tvf <image_filename.tar>` UNIX command.

Example:

```
unix-1% tar -tvf image_filename.tar
```
b) Locate the bin file, and extract it by using the `tar -xvf <image_filename.tar> <image_filename.bin>` UNIX command.

**Example:**
```
unix-1% tar -xvf image_filename.tar image_filename.bin
```
```
x c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin, 2928176 bytes, 5720 tape blocks
```

```
c2960x-universalk9-mz.150-2.0.66.UCP/c2960x-universalk9-mz.150-2.0.66.UCP.bin
```

**Step 3**
Connect your PC with terminal-emulation software supporting the Xmodem Protocol to the switch console port.

**Step 4**
Set the line speed on the emulation software to 9600 baud.

**Step 5**
Unplug the switch power cord.

**Step 6**
Press the **Mode** button, and at the same time reconnect the power cord to the switch. You can release the Mode button a second or two after the LED above port 1 goes off. Several lines of information about the software appear along with instructions.

**Example:**
The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software#
```
flash_init
load_helper
boot
```

**Step 7**
Initialize the flash file system.

**Example:**
```
switch: flash_init
```

**Step 8**
If you had set the console port speed to any speed other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

**Step 9**
Load any helper files.

**Example:**
```
switch: load_helper
```

**Step 10**
Start the file transfer by using the Xmodem Protocol.

**Example:**
```
switch: copy xmodem: flash:image_filename.bin
```
Step 11 After the Xmodem request appears, use the appropriate command on the terminal-emulation software to start the transfer and to copy the software image into flash memory.

Step 12 Boot the newly downloaded Cisco IOS image.

Example:

```
switch: boot flash:image_filename.bin
```

Step 13 Use the archive download-sw privileged EXEC command to download the software image to the switch or to the switch stack.

Step 14 Use the reload privileged EXEC command to restart the switch and to verify that the new software image is operating properly.

Step 15 Delete the flash:image_filename.bin file from the switch.

Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

Note

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

You enable or disable password recovery by using the service password-recovery global configuration command.

The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

Step 1 Connect a terminal or PC to the switch.

- Connect a terminal or a PC with terminal-emulation software to the switch console port.

  Or

- Connect a PC to the Ethernet management port.

Step 2 Set the line speed on the emulation software to 9600 baud.

Step 3 On a switch, power off the switch.

Step 4 Reconnect the power cord to the switch. Within 15 seconds, press the Mode button while the System LED is still flashing green. Continue pressing the Mode button until all the system LEDs turn on and remain solid, then release the Mode button.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.
• If you see a message that begins with this statement:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system.

Proceed to the "Procedure with Password Recovery Enabled" section, and follow the steps.

• If you see a message that begins with this statement:

The password-recovery mechanism has been triggered, but is currently disabled.

Proceed to the "Procedure with Password Recovery Disabled" section, and follow the steps.

**Step 5** After recovering the password, reload the switch.

On a switch:

Switch> reload
Proceed with reload? [confirm] y

---

**Procedure with Password Recovery Enabled**

If the password-recovery operation is enabled, this message appears:

The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software:

```
flash_init
load_helper
boot
```

**Step 1** Initialize the flash file system.

Device: `flash_init`

**Step 2** If you had set the console port speed to any number other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

**Step 3** Load any helper files.

Device: `load_helper`

**Step 4** Display the contents of flash memory.

Device: `dir: flash`:

Directory of flash:

```
13 drwx 192 Mar 01 2013 22:30:48  
c2960x-universalk9-mz-150-2.EX1/c2960x-universalk9-mz-150-2.EX1.bin
11 -rwx 5825 Mar 01 2013 22:31:59 config.text
```

16128000 bytes total (10003456 bytes free)
Step 5 Rename the configuration file to config.text.old
This file contains the password definition.
Device: `rename flash: config.text flash: config.text.old`

Step 6 Boot up the system.
Device: `boot`

You are prompted to start the setup program. Enter N at the prompt.
Continue with the configuration dialog?? [yes/no]: No

Step 7 At the switch prompt, enter privileged EXEC mode.
Device> `enable`
Switch#

Step 8 Rename the configuration file to its original name.
Device# `rename flash: config.text.old flash: config.text`

Note Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. Failure to follow this step can result in a lost configuration depending on how your device is set up.

Step 9 Copy the configuration file into memory
Device# `copy flash: config.text system: running-config`
Source filename [config.text]? Destination filename [running-config]?

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

Step 10 Enter global configuration mode.
Device# `configure terminal`

Step 11 Change the password.
Device(config)# `enable secret password`

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 12 Return to privileged EXEC mode.
Device(config)# `exit`
Switch#

Step 13 Write the running configuration to the startup configuration file.
Device# `copy running-config startup-config`
The new password is now in the startup configuration.

**Note** This procedure is likely to leave your switch virtual interface in a shutdown state. You can see which interface is in this state by entering the `show running-config` privileged EXEC command. To reenable the interface, enter the `interface vlan vlan-id` global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the `no shutdown` command.

**Step 14** Boot the device with the `packages.conf` file from flash.

Device: `boot flash:packages.conf`

**Step 15** Reload the switch stack.

Device: `reload`

---

**Procedure with Password Recovery Disabled**

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

⚠️ **Caution** Returning the Device to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Device and VLAN configuration files.

- If you enter **n** (no), the normal boot process continues as if the **Mode** button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue........

- If you enter **y** (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

**Step 1** Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? **Y**

**Step 2** Display the contents of flash memory:
Device: `dir flash`:

The Device file system appears.

Directory of flash:

```
13   drwx      192  Mar 01 2013 22:30:48  c2960x-universalk9-mz.150-2.0.63.UCP.bin
16128000 bytes total (10003456 bytes free)
```

**Step 3**  
Boot up the system:  
Device: `boot`

You are prompted to start the setup program. To continue with password recovery, enter `N` at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 4**  
At the Device prompt, enter privileged EXEC mode:  
Device>` enable`

**Step 5**  
Enter global configuration mode:  
Device> `configure terminal`

**Step 6**  
Change the password:  
Device(config)`# `enable secret password`

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 7**  
Return to privileged EXEC mode:  
Device(config)`# `exit  
Device`

**Note**  
Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized. The stacking feature is supported on Device running the LAN Base image.

**Step 8**  
Write the running configuration to the startup configuration file:  
Device>` copy running-config startup-config`

The new password is now in the startup configuration.

**Step 9**  
You must now reconfigure the Device. If the system administrator has the backup Device and VLAN configuration files available, you should use those.
Recovering from a Command Switch Failure

This section describes how to recover from a failed command switch. You can configure a redundant command switch group by using the Hot Standby Router Protocol (HSRP).

This feature is introduced from Cisco IOS Release 15.2(5)E2.

If you have not configured a standby command switch, and your command switch loses power or fails in some other way, management contact with the member switches is lost, and you must install a new command switch. However, connectivity between switches that are still connected is not affected, and the member switches forward packets as usual. You can manage the members as standalone switches through the console port, or, if they have IP addresses, through the other management interfaces.

You can prepare for a command switch failure by assigning an IP address to a member switch or another switch that is command-capable, making a note of the command-switch password, and cabling your cluster to provide redundant connectivity between the member switches and the replacement command switch. These sections describe two solutions for replacing a failed command switch:

- Replacing a Failed Command Switch with a Cluster Member
- Replacing a Failed Command Switch with Another Switch

These recovery procedures require that you have physical access to the switch. For information on command-capable switches, see the release notes.

Replacing a Failed Command Switch with a Cluster Member

To replace a failed command switch with a command-capable member in the same cluster, follow these steps:

**Step 1**
Disconnect the command switch from the member switches, and physically remove it from the cluster.

**Step 2**
Insert the member switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 3**
Start a CLI session on the new command switch.

You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see Catalyst 2960-X Switch Hardware Installation Guide.

**Step 4**
At the switch prompt, enter privileged EXEC mode.

`Example:`
```
Switch> enable
Switch#
```

**Step 5**
Enter the password of the failed command switch.

**Step 6**
Enter global configuration mode.

`Example:`
```
Switch# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

**Step 7**
Remove the member switch from the cluster.
Example:
Switch(config)# no cluster commander-address

**Step 8**
Return to privileged EXEC mode.

**Example:**
Switch(config)# end
Switch#

**Step 9**
Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter setup, and press Return.

**Example:**
Switch# setup

```--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '{}'.
Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system
Would you like to enter basic management setup? [yes/no]:
```

**Step 10**
Enter Y at the first prompt.

**Example:**

The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y

or

Configuring global parameters:

If this prompt does not appear, enter enable, and press Return. Enter setup, and press Return to start the setup program.

**Step 11**
Respond to the questions in the setup program.

When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

**Step 12**
When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

**Step 13**
When prompted, make sure to enable the switch as the cluster command switch, and press Return.

**Step 14**
When prompted, assign a name to the cluster, and press Return.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 15**
After the initial configuration displays, verify that the addresses are correct.

**Step 16**
If the displayed information is correct, enter Y, and press Return.

If this information is not correct, enter N, press Return, and begin again at Step 9.
Replacing a Failed Command Switch with Another Switch

To replace a failed command switch with a switch that is command-capable but not part of the cluster, follow these steps:

**Step 1**
Insert the new switch in place of the failed command switch, and duplicate its connections to the cluster members.

**Step 2**
You can access the CLI by using the console port or, if an IP address has been assigned to the switch, by using Telnet. For details about using the console port, see the switch hardware installation guide.

**Step 3**
At the switch prompt, enter privileged EXEC mode.

**Example:**
```
Switch> enable
Switch#
```

**Step 4**
Enter the password of the failed command switch.

**Step 5**
Use the setup program to configure the switch IP information. This program prompts you for IP address information and passwords. From privileged EXEC mode, enter EXEC mode, enter `setup`, and press Return.

**Example:**
```
Switch# setup
```  

--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: y
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.
Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.
Would you like to enter basic management setup? [yes/no]:

**Step 6**
Enter Y at the first prompt.

**Example:**
```
The prompts in the setup program vary depending on the member switch that you selected to be the command switch:
Continue with configuration dialog? [yes/no]: y
```
or
```
Configuring global parameters:
```

If this prompt does not appear, enter `enable`, and press Return. Enter `setup`, and press Return to start the setup program.

**Step 7**
Respond to the questions in the setup program.
When prompted for the hostname, it is limited to 28 characters and 31 characters on a member switch. Do not use -n, where n is a number, as the last characters in a hostname for any switch. When prompted for the Telnet (virtual terminal) password, it is 1 to 25 alphanumeric characters, is case sensitive, allows spaces, but ignores leading spaces.

**Step 8** When prompted for the enable secret and enable passwords, enter the passwords of the failed command switch again.

**Step 9** When prompted, make sure to enable the switch as the cluster command switch, and press Return.

**Step 10** When prompted, assign a name to the cluster, and press Return.

The cluster name can be 1 to 31 alphanumeric characters, dashes, or underscores.

**Step 11** After the initial configuration displays, verify that the addresses are correct.

**Step 12** If the displayed information is correct, enter Y, and press Return.

If this information is not correct, enter N, press Return, and begin again at Step 9.

**Step 13** Start your browser, and enter the IP address of the new command switch.

**Step 14** From the Cluster menu, select Add to Cluster to display a list of candidate switches to add to the cluster.

---

### Preventing Switch Stack Problems

To prevent switch stack problems, you should do the following:

- Make sure that the Device that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.

- Press the Mode button on a stack member until the Stack mode LED is on. The last two port LEDs on the Device should be green. Depending on the Device model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.

- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

- Manually assigning stack member numbers according to the placement of the Device in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the Device have manually assigned numbers if you add, remove, or rearrange Device later. Use the switch current-stack-member-number renumber new-stack-member-number  global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new Device functions with the exact same configuration as the replaced Device. This is also assuming the new Device is using the same member number as the replaced Device.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.

For the commands that you can use to monitor the switch stack and its members, see the Displaying Switch Stack Information section.

Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Device settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Device performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

Note

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Device, the Device software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

Note

The security error message references the GBIC_SECURITY facility. The Device supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the Device, and replace it with a Cisco module. After inserting a Cisco SFP module, use the errdisable recovery cause gbic-invalid global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Device brings the interface out of the error-disabled state and retries the operation. For more information about the errdisable recovery command, see the command reference for this release.
If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

**Monitoring SFP Module Status**

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the `show interfaces transceiver` command in the command reference for this release.

**Executing Ping**

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Device.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Though other protocol keywords are available with the <code>ping</code> command, they are not supported in this release.</td>
</tr>
</tbody>
</table>

Use this command to ping another device on the network from the Device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ping ip host</td>
<td>address`</td>
</tr>
</tbody>
</table>

| Device# ping 172.20.52.3 |

**Monitoring Temperature**

The Device monitors the temperature conditions and uses the temperature information to control the fans.

Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Device (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.

**Monitoring the Physical Path**

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:
### Executing IP Traceroute

**Note**

Though other protocol keywords are available with the `traceroute` privileged EXEC command, they are not supported in this release.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>traceroute mac [interface interface-id] {source-mac-address} [interface interface-id] {destination-mac-address} [vlan vlan-id] [detail]</code></td>
<td>Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.</td>
</tr>
<tr>
<td>`traceroute mac {source-ip-address</td>
<td>source-hostname} {destination-ip-address</td>
</tr>
</tbody>
</table>

### Running TDR and Displaying the Results

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command.

To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command.

### Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note**

Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see Configuring System Message Logging.
Using the show platform forward Command

The output from the `show platform forward` privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the Device application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Configuring OBFL

⚠️ We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command. On switches, the range for `switch-number` is from 1 to 9. Use the `message level level` parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.

- To copy the OBFL data to the local network or a specific file system, use the `copy onboard switch switch-number url url-destination` privileged EXEC command.

- To disable OBFL, use the `no hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the `clear onboard switch switch-number` privileged EXEC command.

- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

- You can enable or disable OBFL on a member switch from the stack master.

For more information about the commands in this section, see the command reference for this release.

Verifying Troubleshooting of the Software Configuration

Displaying OBFL Information

<table>

For more information, see the [Catalyst 2960-X Switch System Management Command Reference](#).

### Example: Verifying the Problem and Cause for High CPU Utilization

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```
Device# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...
<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.
### Table 168: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.”</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts.</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”</td>
</tr>
</tbody>
</table>
Scenarios for Troubleshooting the Software Configuration

Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 169: Power over Ethernet Troubleshooting Scenarios

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</td>
<td>Verify that the powered device works on another PoE port. Use the <code>show run</code>, or <code>show interface status</code> user EXEC commands to verify that the port is not shut down or error-disabled. <strong>Note</strong> Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional. Verify that <code>power inline never</code> is not configured on that interface or port. Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host. <strong>Note</strong> Cisco powered device works only with straight cable and not with crossover one. Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters. Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on. If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <code>show inline power</code> command to verify the amount of available power.</td>
</tr>
<tr>
<td>Symptom or Problem</td>
<td>Possible Cause and Solution</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>No PoE on all ports or a group of ports. Trouble is on all switch ports. Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</td>
<td>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch. If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch. Use the <code>show log</code> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes. If there are no alarms, use the <code>show interface status</code> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <code>shut</code> and <code>no shut</code> interface configuration commands to reenable the ports. Use the <code>show env power</code> and <code>show power inline</code> privileged EXEC commands to review the PoE status and power budget (available PoE). Review the running configuration to verify that <code>power inline never</code> is not configured on the ports. Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <code>shut</code> and <code>no shut</code> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected. Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port. Use the <code>show power inline</code> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on. If a powered device can power on when only one powered device is connected to the switch, enter the <code>shut</code> and <code>no shut</code> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <code>show interface status</code> and <code>show power inline</code> privileged EXEC commands to monitor inline power statistics and port status. If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</td>
</tr>

<tbody>
<tr>
<td>Cisco pre-standard powered device disconnects or resets.</td>
<td>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads.</td>
</tr>
<tr>
<td>After working normally, a Cisco phone intermittently reloads or disconnects from PoE.</td>
<td>Verify that the cable length is not more than 100 meters from the switch port to the powered device.</td>
</tr>
<tr>
<td></td>
<td>Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs.</td>
</tr>
<tr>
<td></td>
<td>Notice whether any error messages appear at the same time a disconnect occurs. Use the <code>show log</code> privileged EXEC command to review error messages.</td>
</tr>
<tr>
<td></td>
<td>Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.)</td>
</tr>
<tr>
<td></td>
<td>Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</td>
</tr>
<tr>
<td>IEEE 802.3af-compliant or IEEE 802.3at-compliant powered devices do not work on Cisco PoE switch.</td>
<td>Use the <code>show power inline</code> command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it.</td>
</tr>
<tr>
<td>A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</td>
<td>Use the <code>show interface status</code> command to verify that the switch detects the connected powered device.</td>
</tr>
<tr>
<td></td>
<td>Use the <code>show log</code> command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or inrush) current that exceeds a current-limit threshold for the port.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Troubleshooting Software

#### Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Device# ping 172.20.52.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:
!!!!!
```
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms

Table 170: Ping Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>C</td>
<td>A congestion experienced packet was received.</td>
</tr>
<tr>
<td>I</td>
<td>User interrupted test.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

To end a ping session, enter the escape sequence (Ctrl-`^X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

Example: Performing a Traceroute to an IP Host

This example shows how to perform a `traceroute` to an IP host:

```
Device# traceroute ip 192.0.2.10
Type escape sequence to abort.
Tracing the route to 192.0.2.10
  1 192.0.2.1 0 msec 0 msec 4 msec
  2 192.0.2.203 12 msec 8 msec 0 msec
  3 192.0.2.100 4 msec 0 msec 0 msec
  4 192.0.2.10 0 msec 4 msec 0 msec
```

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

Table 171: Traceroute Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>The probe timed out.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>A</td>
<td>Administratively unreachable. Usually, this output means that an access list is blocking traffic.</td>
</tr>
<tr>
<td>H</td>
<td>Host unreachable.</td>
</tr>
<tr>
<td>N</td>
<td>Network unreachable.</td>
</tr>
</tbody>
</table>
### Example: Enabling All System Diagnostics

**Caution**

Because debugging output takes priority over other network traffic, and because the `debug all` privileged EXEC command generates more output than any other `debug` command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific `debug` commands.

This command disables all-system diagnostics:

```
Device# debug all
```

The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.

Working with the Flash File System

Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the device is named flash:

As viewed from the active device, or any stack member, flash: refers to the local flash device, which is the device attached to the same device on which the file system is being viewed.

Only one user at a time can manage the software bundles and configuration files.

Displaying Available File Systems

To display the available file systems on your device, use the `show file systems` privileged EXEC command as shown in this example for a standalone device:

```
Device# show file systems
File Systems:
      Size(b)    Free(b)  Type   Flags Prefixes
    *     15998976   5135872  flash   rw  flash:
     -        -   opaque   rw   bs:
     -        -   opaque   rw   vb:
```
### Displaying Available File Systems

This example shows a device stack. In this example, the active device is stack member 1; the file system on stack member 2 is displayed as flash-2:, the file system on stack member 3 is displayed as flash-3: and so on up to stack member 8, displayed as flash-8: for a 8-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active device:

```
Device# show file systems
File Systems:

Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
</table>
| Prefixes | Alias for file system.  
|         | `crashinfo:`—Crashinfo file.  
|         | `flash:`—Flash file system.  
|         | `ftp:`—FTP server.  
|         | `http:`—HTTP server.  
|         | `https:`—Secure HTTP server.  
|         | `nvram:`—NVRAM.  
|         | `null:`—Null destination for copies. You can copy a remote file to null to find its size.  
|         | `scp:`—Session Control Protocol (SCP) server.  
|         | `system:`—Contains the system memory, including the running configuration.  
|         | `tftp:`—TFTP network server.  
|         | `usbflash0:`—USB flash memory.  
|         | `xmodem:`—Obtain the file from a network machine by using the Xmodem protocol.  
|         | `ymodem:`—Obtain the file from a network machine by using the Ymodem protocol.  

Working with the Cisco IOS File System, Configuration Files, and Software Images
Table 173: Commands for Displaying Information About Files

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir [ /all] filesystem:filename</td>
<td>Displays a list of files on a file system.</td>
</tr>
<tr>
<td>show file systems</td>
<td>Displays more information about each of the files on a file system.</td>
</tr>
<tr>
<td>show file information file-url</td>
<td>Displays information about a specific file.</td>
</tr>
<tr>
<td>show file descriptors</td>
<td>Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

### Changing Directories and Displaying the Working Directory

Follow these steps to change directories and to display the working directory:

**SUMMARY STEPS**

1. enable
2. dir filesystem:
3. cd directory_name
4. pwd
5. cd

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>dir filesystem:</td>
<td>Displays the directories on the specified file system.</td>
</tr>
<tr>
<td>Example: Device# dir flash:</td>
<td>For filesystem:, use flash: for the system board flash device.</td>
</tr>
<tr>
<td>cd directory_name</td>
<td>Navigates to the specified directory.</td>
</tr>
<tr>
<td>Example: Device# cd new_configs</td>
<td>The command example shows how to navigate to the directory named new_configs.</td>
</tr>
<tr>
<td>pwd</td>
<td>Displays the working directory.</td>
</tr>
</tbody>
</table>
Creating Directories

Beginning in privileged EXEC mode, follow these steps to create a directory:

SUMMARY STEPS

1. `dir filesystem:
2. `mkdir directory_name
3. `dir filesystem:

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>dir filesystem:</code></td>
<td>Displays the directories on the specified file system. For <code>filesystem:</code>, use flash: for the system board flash device.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# dir flash:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>mkdir directory_name</code></td>
<td>Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# mkdir new_configs</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>dir filesystem:</code></td>
<td>Verifies your entry.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# dir flash:</td>
<td></td>
</tr>
</tbody>
</table>

Removing Directories

To remove a directory with all its files and subdirectories, use the `delete /force /recursive filesystem:file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.
Copying Files

To copy a file from a source to a destination, use the `copy source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use `running-config` and `startup-config` keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (`xmodem:`, `ymodem:`) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include `ftp:`, `rcp:`, and `tftp:` and have these syntaxes:

- **FTP**—ftp://[username[:password]@location]/directory/filename
- **RCP**—rcp://[username@location]/directory/filename
- **TFTP**—tftp://[location]/directory/filename

Local writable file systems include `flash:`.

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the `copy flash: flash:` command is invalid)

Copying Files from One Device in a Stack to Another Device in the Same Stack

To copy a file from one device in a stack to another device in the same stack, use the `flash-X:` notation, where `X` is the device number.

To view all devices in a stack, use the `show switch` command in privileged EXEC mode, as in the following example of a 9-member device stack:

```
Switch#show switch
Switch/Stack Mac Address : 046c.9d01.3b80 - Local Mac Address
Mac persistency wait time: 4 mins

Switch#  Role  Mac Address  Priority  Version  State
---------+----------+-----------+----------+----------
  *1  Active  046c.9d01.3b80  15  P4B  Ready
  2  Standby  046c.9d01.0f80  13  P3C  Ready
  3  Member  046c.9d01.1180  11  P4B  Ready
  4  Member  046c.9d01.0e80  9  P3C  Ready
  5  Member  046c.9d01.4d00  7  P3C  Ready
  6  Member  046c.9d01.2800  5  P3C  Ready
  7  Member  046c.9d01.6e80  3  P4B  Ready
  8  Member  046c.9d01.8180  1  P4B  Ready
```
To view all file systems available to copy on a specific device, use the `copy` command as in the following example of a 5-member stack:

This example shows how to copy a config file stored in the flash partition of device 2 to the flash partition of device 4. It assumes that device 2 and device 4 are in the same stack.

```
Device# copy flash-2:config.txt flash-4:config.txt
```

### Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the `delete` command with the `filesystem` option. If you specify the `force` keyword, the system does not prompt you before deleting the file. However, if you do not specify the `force` keyword, the system prompts you for confirmation before deleting the file.

Use the `/recursive` keyword for deleting a directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `/force` and `/recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

If you omit the `filesystem:` option, the device uses the default device specified by the `cd` command. For `file-url`, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

---

⚠️ **Caution**

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file `myconfig` from the default flash memory device:

```
Device# delete myconfig
```

### Creating, Displaying and Extracting Files

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:

**SUMMARY STEPS**

1. `archive tar /create destination-url flash:/file-url`
2. `archive tar /table source-url`
3. `archive tar /xtract source-url flash:/file-url [dir/file...]
4. more [/ascii | /binary | /ebcdic] /file-url`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>archive tar /create destination-url flash:/file-url</code></td>
<td>Creates a file and adds files to it.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>device# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</td>
<td>For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</td>
</tr>
<tr>
<td></td>
<td>• Local flash file system syntax:</td>
</tr>
<tr>
<td></td>
<td>• flash:</td>
</tr>
<tr>
<td></td>
<td>• FTP syntax:</td>
</tr>
<tr>
<td></td>
<td>• ftp://[username][password]@[location]/directory/-filename.</td>
</tr>
<tr>
<td></td>
<td>• RCP syntax:</td>
</tr>
<tr>
<td></td>
<td>• rcp://[username]@[location]/directory/-filename.</td>
</tr>
<tr>
<td></td>
<td>• TFTP syntax:</td>
</tr>
<tr>
<td></td>
<td>• tftp://[location]/directory/-filename.</td>
</tr>
<tr>
<td></td>
<td>For flash:/file-url, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</td>
</tr>
</tbody>
</table>

**Step 2**

**archive tar /table source-url**  
**Example:**  

device# archive tar /table flash:/new-configs

Displays the contents of a file.  
For source-url, specify the source URL alias for the local or network file system. The -filename. is the file to display. These options are supported:  
• Local flash file system syntax:  
• flash:  
• FTP syntax:  
• ftp://[username][password]@[location]/directory/-filename.  
• RCP syntax:  
• rcp://[username]@[location]/directory/-filename.  
• TFTP syntax:  
• tftp://[location]/directory/-filename.  
You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear.

**Step 3**

**archive tar /xtract source-url flash:/file-url [dir/file...]**  
**Example:**  

device# archive tar /xtract tftp://172.20.10.30/saved. flash:/new-configs

Extracts a file into a directory on the flash file system.  
For source-url, specify the source URL alias for the local file system. The -filename. is the file from which to extract files. These options are supported:  
• Local flash file system syntax:  
• flash:  
• FTP syntax:
Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| ftp://[[username:[password]@location]directory]-filename. | • RCP syntax:  
  rcp://[[username@location]directory]-filename.  
  • TFTP syntax:  
    tftp://[[location]directory]-filename. |

For flash://file-url [dir/file...], specify the location on the local flash file system from which the file is extracted. Use the dir/file... option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.

| Step 4 | more [/ascii | /binary | /ebcdic] /file-url Example: |
|--------|-----------------|
|        | device# more     |
|        | flash:/new-configs |

Displays the contents of any readable file, including a file on a remote file system.

Working with Configuration Files

Information on Configuration Files

Configuration files contain commands entered to customize the function of the Cisco IOS software. A way to create a basic configuration file is to use the setup program or to enter the setup privileged EXEC command.

You can copy (download) configuration files from a TFTP, FTP, or RCP server to the running configuration or startup configuration of the switch. You might want to perform this for one of these reasons:

- To restore a backed-up configuration file.
- To use the configuration file for another switch. For example, you might add another switch to your network and want it to have a configuration similar to the original switch. By copying the file to the new switch, you can change the relevant parts rather than recreating the whole file.
- To load the same configuration commands on all the switches in your network so that all the switches have similar configurations.

You can copy (upload) configuration files from the switch to a file server by using TFTP, FTP, or RCP. You might perform this task to back up a current configuration file to a server before changing its contents so that you can later restore the original configuration file from the server.

The protocol you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.
Guidelines for Creating and Using Configuration Files

Creating configuration files can aid in your switch configuration. Configuration files can contain some or all of the commands needed to configure one or more switches. For example, you might want to download the same configuration file to several switches that have the same hardware configuration.

Use these guidelines when creating a configuration file:

• We recommend that you connect through the console port or Ethernet management port for the initial configuration of the switch. If you are accessing the switch through a network connection instead of through a direct connection to the console port or Ethernet management port, keep in mind that some configuration changes (such as changing the switch IP address or disabling ports) can cause a loss of connectivity to the switch.

• If no password has been set on the switch, we recommend that you set one by using the `enable secret secret-password` global configuration command.

Note

The `copy {ftp: | rcp: | tftp:} system:running-config` privileged EXEC command loads the configuration files on the switch as if you were entering the commands at the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration might not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, copy the configuration file directly to the startup configuration (by using the `copy {ftp: | rcp: | tftp:} nvram:startup-config` privileged EXEC command), and reload the switch.

Configuration File Types and Location

Startup configuration files are used during system startup to configure the software. Running configuration files contain the current configuration of the software. The two configuration files can be different. For example, you might want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration but not save the configuration by using the `copy running-config startup-config` privileged EXEC command.

The running configuration is saved in DRAM; the startup configuration is stored in the NVRAM section of flash memory.

Creating a Configuration File By Using a Text Editor

When creating a configuration file, you must list commands logically so that the system can respond appropriately. This is one method of creating a configuration file:

**SUMMARY STEPS**

1. Copy an existing configuration from a switch to a server.
2. Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.
3. Extract the portion of the configuration file with the desired commands, and save it in a new file.
4. Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).
5. Make sure the permissions on the file are set to world-read.

**DETAILED STEPS**

**Step 1**  Copy an existing configuration from a switch to a server.
**Step 2**  Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.
**Step 3**  Extract the portion of the configuration file with the desired commands, and save it in a new file.
**Step 4**  Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).
**Step 5**  Make sure the permissions on the file are set to world-read.

**Copying Configuration Files By Using TFTP**

You can configure the switch by using configuration files you create, download from another switch, or download from a TFTP server. You can copy (upload) configuration files to a TFTP server for storage.

**Preparing to Download or Upload a Configuration File By Using TFTP**

Before you begin downloading or uploading a configuration file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:
  
  tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot

  Make sure that the /etc/services file contains this line:

  tftp 69/udp

  **Note**  You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a fastboot command (on the SunOS 4.x) or a reboot command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the ping command.

- Ensure that the configuration file to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).

- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.
Before uploading the configuration file, you might need to create an empty file on the TFTP server. To create an empty file, enter the **touch** filename command, where *filename* is the name of the file you will use when uploading it to the server.

During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

**Downloading the Configuration File By Using TFTP**

To configure the switch by using a configuration file downloaded from a TFTP server, follow these steps:

**SUMMARY STEPS**

1. Copy the configuration file to the appropriate TFTP directory on the workstation.
2. Verify that the TFTP server is properly configured.
3. Log into the switch through the console port, the Ethernet management port, or a Telnet session.
4. Download the configuration file from the TFTP server to configure the switch.

**DETAILED STEPS**

**Step 1** Copy the configuration file to the appropriate TFTP directory on the workstation.

**Step 2** Verify that the TFTP server is properly configured.

**Step 3** Log into the switch through the console port, the Ethernet management port, or a Telnet session.

**Step 4** Download the configuration file from the TFTP server to configure the switch.

Specify the IP address or hostname of the TFTP server and the name of the file to download.

Use one of these privileged EXEC commands:

- `copy tftp://[location]/directory/filename system:running-config`
- `copy tftp://[location]/directory/filename nvram:startup-config`
- `copy tftp://[location]/directory/filename flash[n]:/directory/startup-config`

The configuration file downloads, and the commands are executed as the file is parsed line-by-line.

**Example**

This example shows how to configure the software from the file `tokyo-config` at IP address 172.16.2.155:

```
Switch# copy tftp://172.16.2.155/tokyo-config system:running-config
Configure using tokyo-config from 172.16.2.155? [confirm] y
Booting tokyo-config from 172.16.2.155:!!! [OK - 874/16000 bytes]
```

**Uploading the Configuration File By Using TFTP**

To upload a configuration file from a switch to a TFTP server for storage, follow these steps:
SUMMARY STEPS

1. Verify that the TFTP server is properly configured.
2. Log into the switch through the console port, the Ethernet management port, or a Telnet session.
3. Upload the switch configuration to the TFTP server. Specify the IP address or hostname of the TFTP server and the destination filename.

DETAILED STEPS

Step 1 Verify that the TFTP server is properly configured.
Step 2 Log into the switch through the console port, the Ethernet management port, or a Telnet session.
Step 3 Upload the switch configuration to the TFTP server. Specify the IP address or hostname of the TFTP server and the destination filename.

Use one of these privileged EXEC commands:

• copy system:running-config tftp://[[//location]/directory]/filename
• copy nvram:startup-config tftp://[[//location]/directory]/filename
• copy flash[n]:/directory/startup-config tftp://[[//location]/directory]/filename

The file is uploaded to the TFTP server.

Example

This example shows how to upload a configuration file from a switch to a TFTP server:

Switch# copy system:running-config tftp://172.16.2.155/tokyo-config
Write file tokyo-config on host 172.16.2.155? [confirm] y
#
Writing tokyo-config!!! [OK]

Copying a Configuration File from the Device to an FTP Server

You can copy a configuration file from the device to an FTP server.

Understanding the FTP Username and Password

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the device to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the copy EXEC command, if a username is specified.
2. The username set by the ip ftp username global configuration command, if the command is configured.
3. Anonymous.

The device sends the first valid password it encounters in the following sequence:
1. The password specified in the `copy` command, if a password is specified.

2. The password set by the `ip ftp password` command, if the command is configured.

3. The device forms a password `username @devicename.domain`. The variable `username` is the username associated with the current session, `devicename` is the configured host name, and `domain` is the domain of the device.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the device.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more information.

Use the `ip ftp username` and `ip ftp password` global configuration commands to specify a username and password for all copies. Include the username in the `copy` EXEC command if you want to specify a username for that copy operation only.

### Preparing to Download or Upload a Configuration File By Using FTP

Before you begin downloading or uploading a configuration file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the `ping` command.

- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the `ip ftp username username` global configuration command during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the `copy` command if you want to specify a username for only that copy operation.

- When you upload a configuration file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

### Downloading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using FTP:

**SUMMARY STEPS**

1. `configure terminal`
2. `ip ftp username username`
3. `ip ftp password password`
4. `end`
5. Do one of the following:
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode on the switch.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This step is required only if you override the default remote username or password (see Steps 2, 3, and 4).</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Do one of the following:</td>
<td>Using FTP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
<tr>
<td></td>
<td>• copy system:running-config ftp:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[[//[username [password ]@[location]directory ]/filename ]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• copy nvram:startup-config ftp:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[[//[username [password ]@[location]directory ]/filename ]</td>
<td></td>
</tr>
</tbody>
</table>

### Example

This example shows how to copy a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 and to load and run those commands on the switch:

```
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

This example shows how to specify a remote username of netadmin1. The software copies the configuration file host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the switch startup configuration.

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:![OK] [OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
```
Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

SUMMARY STEPS

1. configure terminal
2. ip ftp username username
3. ip ftp password password
4. end
5. Do one of the following:

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>ip ftp username username</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip ftp password password</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>Do one of the following:</td>
</tr>
<tr>
<td></td>
<td>• copy system:running-config ftp: [///[username [password @]location]directory ]filename ] or</td>
</tr>
<tr>
<td></td>
<td>• copy nvram:startup-config ftp: [///[username [password @]location]directory ]filename ]</td>
</tr>
</tbody>
</table>

Example

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

Switch# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/switch2-config
Write file switch2-config on host 172.16.101.101[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#

This example shows how to store a startup configuration file on a server by using FTP to copy the file:

Switch# configure terminal
Switch(config)# ip ftp username netadmin2
Copying Configuration Files By Using RCP

The RCP provides another method of downloading, uploading, and copying configuration files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

The RCP requires a client to send a remote username with each RCP request to a server. When you copy a configuration file from the switch to a server, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `copy` command if a username is specified.
- The username set by the `ip rcmd remote-username username` global configuration command if the command is configured.
- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.
- The switch hostname.

For a successful RCP copy request, you must define an account on the network server for the remote username. If the server has a directory structure, the configuration file is written to or copied from the directory associated with the remote username on the server. For example, if the configuration file is in the home directory of a user on the server, specify that user's name as the remote username.

Preparing to Download or Upload a Configuration File By Using RCP

Before you begin downloading or uploading a configuration file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the show users privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username global`
configuration command to be used during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the RCP username. Include the username in the copy command if you want to specify a username for only that copy operation.

- When you upload a file to the RCP server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose that the switch contains these configuration lines:

  ```
  hostname Switch1
  ip rcmd remote-username User0
  ```

  If the switch IP address translates to Switch1.company.com, the .rhosts file for User0 on the RCP server should contain this line:

  ```
  Switch1.company.com Switch1
  ```

  For more information, see the documentation for your RCP server.

### Downloading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using RCP:

**SUMMARY STEPS**

1. `configure terminal`
2. `ip rcmd remote-username username`
3. `end`
4. Do one of the following:
   - `copy rcp://[username@location]/directory/filename/system:running-config`
   - `copy rcp://[username@location]/directory/filename/nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>ip rcmd remote-username username</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Do one of the following:</td>
</tr>
<tr>
<td></td>
<td>- <code>copy rcp://[username@location]/directory/filename/system:running-config</code></td>
</tr>
<tr>
<td></td>
<td>- <code>copy rcp://[username@location]/directory/filename/nvram:startup-config</code></td>
</tr>
</tbody>
</table>
**Example**

This example shows how to copy a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 and load and run those commands on the switch:

```
Switch# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
```
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config: ![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101

This example shows how to specify a remote username of netadmin1. Then it copies the configuration file host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin1
Switch(config)# end
Switch# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file [rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config: ![OK]
Switch#
%SYS-5-CONFIG_NV: Non-volatile store configured from host2-config by rcp from 172.16.101.101
```

---

**Uploading a Configuration File By Using RCP**

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using RCP

**SUMMARY STEPS**

1. configure terminal
2. ip rcmd remote-username *username*
3. end
4. Do one of the following:
   - copy system:running-config rcp://[username@]location/directory//filename
   - copy nvram:startup-config rcp://[username@]location/directory//filename

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode on the switch. This step is required only if you override the default remote username (see Steps 2 and 3).</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip rcmd remote-username <em>username</em></td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>Do one of the following:</td>
<td>Using RCP, copy the configuration file from a switch running configuration or startup configuration file to a network server.</td>
</tr>
<tr>
<td></td>
<td>• <code>copy system:running-config rcp://[username@location]/directory[/filename]</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <code>copy nvram:startup-config rcp://[username@location]/directory[/filename]</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example**

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

Switch# `copy system:running-config rcp://netadmin1@172.16.101.101/switch2-config`
Write file switch-config on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#

This example shows how to store a startup configuration file on a server:

Switch# `configure terminal`
Switch(config)# `ip rcmd remote-username netadmin2`
Switch(config)# `end`
Switch# `copy nvram:startup-config rcp: Remote host[]? 172.16.101.101`
Name of configuration file to write [switch2-config]?
Write file switch2-config on host 172.16.101.101?[confirm]
! [OK]

**Clearing Configuration Information**

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the setup program so that you can reconfigure the switch with all new settings.

**Clearing the Startup Configuration File**

To clear the contents of your startup configuration, use the `erase nvram`: or the `erase startup-config` privileged EXEC command.

**Note**

You cannot restore the startup configuration file after it has been deleted.

**Deleting a Stored Configuration File**

To delete a saved configuration from flash memory, use the delete flash:filename privileged EXEC command. Depending on the setting of the file prompt global configuration command, you might be prompted for
confirmation before you delete a file. By default, the switch prompts for confirmation on destructive file operations. For more information about the file prompt command, see the Cisco IOS Command Reference for Release 12.4.

**Note**
You cannot restore a file after it has been deleted.

## Replacing and Rolling Back Configurations

The configuration replacement and rollback feature replaces the running configuration with any saved Cisco IOS configuration file. You can use the rollback function to roll back to a previous configuration.

### Information on Configuration Replacement and Rollback

#### Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the `configure replace` command. Before this feature was introduced, you could save copies of the running configuration using the `copy running-config destination-url` command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the `configure replace` command to revert to previous configuration states.

The `archive config` command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The `show archive` command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the `configure replace` command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.

#### Configuration Replace

The `configure replace` privileged EXEC command replaces the running configuration with any saved configuration file. When you enter the `configure replace` command, the running configuration is compared with the specified replacement configuration, and a set of configuration differences is generated. The resulting differences are used to replace the configuration. The configuration replacement operation is usually completed in no more than three passes. To prevent looping behavior no more than five passes are performed.

You can use the `copy source-url running-config` privileged EXEC command to copy a stored configuration file to the running configuration. When using this command as an alternative to the `configure replace target-url` privileged EXEC command, note these major differences:
• The `copy source-url running-config` command is a merge operation and preserves all the commands from both the source file and the running configuration. This command does not remove commands from the running configuration that are not present in the source file. In contrast, the `configure replace target-url` command removes commands from the running configuration that are not present in the replacement file and adds commands to the running configuration that are not present.

• You can use a partial configuration file as the source file for the `copy source-url running-config` command. You must use a complete configuration file as the replacement file for the `configure replace target-url` command.

**Configuration Rollback**

You can also use the `configure replace` command to roll back changes that were made since the previous configuration was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the configuration rollback capability reverts to a specific configuration based on a saved configuration file.

If you want the configuration rollback capability, you must first save the running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes by using the `configure replace target-url` command.

You can specify any saved configuration file as the rollback configuration. You are not limited to a fixed number of rollbacks, as is the case in some rollback models.

**Configuration Guidelines**

Follow these guidelines when configuring and performing configuration replacement and rollback:

• Make sure that the switch has free memory larger than the combined size of the two configuration files (the running configuration and the saved replacement configuration). Otherwise, the configuration replacement operation fails.

• Make sure that the switch also has sufficient free memory to execute the configuration replacement or rollback configuration commands.

• Certain configuration commands, such as those pertaining to physical components of a networking device (for example, physical interfaces), cannot be added or removed from the running configuration.

  • A configuration replacement operation cannot remove the `interface interface-id` command line from the running configuration if that interface is physically present on the device.

  • The `interface interface-id` command line cannot be added to the running configuration if no such interface is physically present on the device.

• When using the `configure replace` command, you must specify a saved configuration as the replacement configuration file for the running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the `copy running-config destination-url` command).

**Note**

If you generate the replacement configuration file externally, it must comply with the format of files generated by Cisco IOS devices.
Configuring the Configuration Archive

Using the `configure replace` command with the configuration archive and with the `archive config` command is optional but offers significant benefit for configuration rollback scenarios. Before using the `archive config` command, you must first configure the configuration archive. Starting in privileged EXEC mode, follow these steps to configure the configuration archive:

**SUMMARY STEPS**

1. `configure terminal`
2. `archive`
3. `path url`
4. `maximum number`
5. `time-period minutes`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>archive</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>path url</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>maximum number</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>time-period minutes</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>show running-config</code></td>
</tr>
</tbody>
</table>
Performing a Configuration Replacement or Rollback Operation

Starting in privileged EXEC mode, follow these steps to replace the running configuration file with a saved configuration file:

**SUMMARY STEPS**

1. `archive config`
2. `configure terminal`
3. Make necessary changes to the running configuration.
4. `exit`
5. `configure replace target-url [list] [force] [time seconds] [nolock]`
6. `configure confirm`
7. `copy running-config startup-config`

**DETAILED STEPS**

**Step 1** `archive config`
(Optional) Save the running configuration file to the configuration archive.

*Note* Enter the `path archive configuration` command before using this command.

**Step 2** `configure terminal`
Enter global configuration mode.

**Step 3** Make necessary changes to the running configuration.

**Step 4** `exit`
Return to privileged EXEC mode.

**Step 5** `configure replace target-url [list] [force] [time seconds] [nolock]`
Replace the running configuration file with a saved configuration file.

*target-url*—URL (accessible by the file system) of the saved configuration file that is to replace the running configuration, such as the configuration file created in `Step 2` by using the `archive config` privileged EXEC command.

*list*—Display a list of the command entries applied by the software parser during each pass of the configuration replacement operation. The total number of passes also appears.

*force*—Replace the running configuration file with the specified saved configuration file without prompting you for confirmation.

*time seconds*—Specify the time (in seconds) within which you must enter the `configure confirm` command to confirm replacement of the running configuration file. If you do not enter the `configure confirm` command within the specified time limit, the configuration replacement operation is automatically stopped. (In other words, the running configuration file is restored to the configuration that existed before you entered the `configure replace` command.)
You must first enable the configuration archive before you can use the `time` seconds command line option. 

`nolock`— Disable the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replacement operation.

**Step 6**

**configure confirm**

(Optional) Confirm replacement of the running configuration with a saved configuration file.

*Note* Use this command only if the `time` seconds keyword and argument of the `configure replace` command are specified.

**Step 7**

**copy running-config startup-config**

(Optional) Save your entries in the configuration file.

---

## Working with Software Images

### Information on Working with Software Images

This section describes how to archive (download and upload) software image files, which contain the system software, the Cisco IOS code, and the embedded device manager software.

*Note*

Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch in the stack that has an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

You can download a switch image file from a TFTP, FTP, or RCP server to upgrade the switch software. If you do not have access to a TFTP server, you can download a software image file directly to your PC or workstation by using a web browser (HTTP) and then by using the device manager or Cisco Network Assistant to upgrade your switch. For information about upgrading your switch by using a TFTP server or a web browser (HTTP), see the release notes.

You can replace the current image with the new one or keep the current image in flash memory after a download.

You upload a switch image file to a TFTP, FTP, or RCP server for backup purposes. You can use this uploaded image for future downloads to the same switch or to another of the same type.

The protocol that you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.
For a list of software images and the supported upgrade paths, see the release notes.

**Image Location on the Switch**

The Cisco IOS image is stored as a .bin file in a directory that shows the version number. A subdirectory contains the files needed for web management. The image is stored on the system board flash memory (flash:).

You can use the `show version` privileged EXEC command to see the software version that is currently running on your switch. In the display, check the line that begins with System image file is... . It shows the directory name in flash memory where the image is stored.

You can also use the `dir filesystem:` privileged EXEC command to see the directory names of other software images that might be stored in flash memory.

**File Format of Images on a Server or Cisco.com**

Software images located on a server or downloaded from Cisco.com are provided in a tar file format, which contains these files:

- An info file, which serves as a table of contents for the tar file
- One or more subdirectories containing other images and files, such as Cisco IOS images and web management files

This example shows some of the information contained in the info file. The table provides additional details about this information:

```
system_type:0x00000000:image-name
    image_family:xxxx
    stacking_number:x
    info_end:

version_suffix:xxxx
    version_directory:image-name
    image_system_type_id:0x00000000
    image_name:image-nameB.bin
    ios_image_file_size:6398464
    total_image_file_size:8133632
    image_feature:IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
    image_family:xxxx
    stacking_number:x
    board_ids:0x041100c4 0x00000000 0x00000001 0x00000003 0x00000002 0x00000000 0x00000000
    info_end
```

*Table 174: info File Description*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version_suffix</td>
<td>Specifies the Cisco IOS image version string suffix</td>
</tr>
<tr>
<td>version_directory</td>
<td>Specifies the directory where the Cisco IOS image and the HTML subdirectory are installed</td>

### Copying Image Files Using TFTP

You can download a switch image from a TFTP server or upload the image from the switch to a TFTP server. You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes; this uploaded image can be used for future downloads to the same or another switch of the same type.

#### Note

Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch with an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

### Preparing to Download or Upload an Image File By Using TFTP

Before you begin downloading or uploading an image file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the `/etc/inetd.conf` file contains this line:

  ```
tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot
  ```
Make sure that the /etc/services file contains this line:

tftp 69/udp

Note: You must restart the inetd daemon after modifying the /etc/inetd.conf and 
/etc/services files. To restart the daemon, either stop the inetd process and restart 
it, or enter a fastboot command (on the SunOS 4.x) or a reboot command (on 
Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the 
documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the 
same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the 
TFTP server by using the ping command.

- Ensure that the image to be downloaded is in the correct directory on the TFTP server (usually /tftpboot 
on a UNIX workstation).

- For download operations, ensure that the permissions on the file are set correctly. The permission on the 
file should be world-read.

- Before uploading the image file, you might need to create an empty file on the TFTP server. To create 
an empty file, enter the touch filename command, where filename is the name of the file you will use 
when uploading the image to the server.

- During upload operations, if you are overwriting an existing file (including an empty file, if you had to 
create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file 
should be world-write.

### Downloading an Image File By Using TFTP

You can download a new image file and replace the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 3 to download a new image from a TFTP server 
and overwrite the existing image. To keep the current image, go to Step 3.

**SUMMARY STEPS**

1. Copy the image to the appropriate TFTP directory on the workstation. Make sure that the TFTP server is 
   properly configured.
2. Log into the switch through the console port or a Telnet session.
3. `archive download-sw/overwrite/reload tftp: [ [/location] /directory] /image-name.tar`
4. `archive download-sw/leave-old-sw/reload tftp: [ [/location] /directory] /image-name.tar`

**DETAILED STEPS**

**Step 1** Copy the image to the appropriate TFTP directory on the workstation. Make sure that the TFTP server is properly 
configured.
Step 2  Log into the switch through the console port or a Telnet session.

Step 3  
archive download-sw /overwrite /reload tftp: [ [ //location ] /directory ] /image-name.tar
Download the image file from the TFTP server to the switch, and overwrite the current image.

- The /overwrite option overwrites the software image in flash memory with the downloaded image.
- The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For // location , specify the IP address of the TFTP server.
- For /directory/image-name.tar specify the directory (optional) and the image to download. Directory and image names are case sensitive.

Step 4  
archive download-sw /leave-old-sw /reload tftp: [ [ //location ] /directory ] /image-name.tar
Download the image file from the TFTP server to the switch, and keep the current image.

- The /leave-old-sw option keeps the old software version after a download.
- The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For //location, specify the IP address of the TFTP server.
- For /directory/image-name.tar specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the /overwrite option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note**  If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the /overwrite option.

If you specify the /leave-old-sw, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image on the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you keep the old image during the download process (you specified the /leave-old-sw keyword), you can remove it by entering the delete /force /recursive filesystem :/ file-url privileged EXEC command. For filesystem, use flash: for the system board flash device. For file-url, enter the directory name of the old image. All the files in the directory and the directory are removed.

**Note**  For the download and upload algorithms to operate properly, do not rename image names.
Uploading an Image File Using TFTP

You can upload an image from the switch to a TFTP server. You can later download this image to the switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to a TFTP server:

**SUMMARY STEPS**

1. Make sure the TFTP server is properly configured
2. Log into the switch through the console port or a Telnet session.
3. `archive upload-sw tftp://location/directory/image-name.tar`

**DETAILED STEPS**

**Step 1**
Make sure the TFTP server is properly configured

**Step 2**
Log into the switch through the console port or a Telnet session.

**Step 3**
`archive upload-sw tftp://location/directory/image-name.tar`

Upload the currently running switch image to the TFTP server.

- For `// location`, specify the IP address of the TFTP server.

- For `/directory/image-name.tar` specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The `image-name.tar` is the name of the software image to be stored on the server.

The `archive upload-sw` privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

Copying Image Files Using FTP

You can download a switch image from an FTP server or upload the image from the switch to an FTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the switch or another switch of the same type.
Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch with an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

### Preparing to Download or Upload an Image File By Using FTP

You can copy images files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy an image file from the switch to a server by using FTP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip ftp username` username global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:

- The password specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a password is specified.
- The password set by the `ip ftp password` password global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable username is the username associated with the current session, switchname is the configured hostname, and domain is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from you.

Use the `ip ftp username` and `ip ftp password` commands to specify a username and password for all copies. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.

If the server has a directory structure, the image file is written to or copied from the directory associated with the username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using FTP, do these tasks:
• Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the ping command.

• If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the show users privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the ip ftp username username global configuration command. This new name will be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the archive download-sw or archive upload-sw privileged EXEC command if you want to specify a username for that operation only.

• When you upload an image file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

### Downloading an Image File By Using FTP

You can download a new image file and overwrite the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 7 to download a new image from an FTP server and overwrite the existing image. To keep the current image, go to Step 7.

#### SUMMARY STEPS

1. Verify that the FTP server is properly configured.
2. Log into the switch through the console port or a Telnet session.
3. configure terminal
4. ip ftp username username
5. ip ftp password password
6. end
7. archive download-sw /overwrite/reload
   ftp: [ [ //username [:password]@[location] /directory] /image-name.tar
8. archive download-sw /leave-old-sw/reload
   ftp: [ [ //username [:password]@[location] /directory] /image-name.tar

#### DETAILED STEPS

**Step 1**
Verify that the FTP server is properly configured.

**Step 2**
Log into the switch through the console port or a Telnet session.

**Step 3**
configure terminal
Enter global configuration mode.

This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).
Step 4  
`ip ftp username username`
(Optional) Change the default remote username.

Step 5  
`ip ftp password password`
(Optional) Change the default password.

Step 6  
`end`
Return to privileged EXEC mode.

Step 7  
`archive download-sw /overwrite/reload ftp: [ [ //username [:password] @location ] /directory ] /image-name.tar`
Download the image file from the FTP server to the switch, and overwrite the current image.

- The `/overwrite` option overwrites the software image in flash memory with the downloaded image.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username [:password]` specify the username and password; these must be associated with an account on the FTP server.
- For `@ location`, specify the IP address of the FTP server.
- For `directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

Step 8  
`archive download-sw /leave-old-sw/reload ftp: [ [ //username [:password] @location ] /directory ] /image-name.tar`
Download the image file from the FTP server to the switch, and keep the current image.

- The `/leave-old-sw` option keeps the old software version after a download.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username [:password]` specify the username and password; these must be associated with an account on the FTP server.
- For `@ location`, specify the IP address of the FTP server.
- For `directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note**  
If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.

If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (`flash:`). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete/force/recursive filesystem :/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.
Note For the download and upload algorithms to operate properly, do not rename image names.

**Uploading an Image File By Using FTP**

You can upload an image from the switch to an FTP server. You can later download this image to the same switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an FTP server:

**SUMMARY STEPS**

1. `configure terminal`
2. `ip ftp username username`
3. `ip ftp password password`
4. `end`
5. `archive upload-swftp: [ // [username : password]@location] / directory / image-name.tar`

**DETAILED STEPS**

**Step 1**  `configure terminal`

Enter global configuration mode.

This step is required only if you override the default remote username or password (see Steps 2, 3, and 4.)

**Step 2**  `ip ftp username username`

(Optional) Change the default remote username.

**Step 3**  `ip ftp password password`

(Optional) Change the default password.

**Step 4**  `end`

Return to privileged EXEC mode.

**Step 5**  `archive upload-swftp: [ // [username : password]@location] / directory / image-name.tar`

Upload the currently running switch image to the FTP server.

- For `//username:password`, specify the username and password. These must be associated with an account on the FTP server.
- For `@location`, specify the IP address of the FTP server.
- For `/directory/image-name.tar`, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The `image-name.tar` is the name of the software image to be stored on the server.

The `archive upload-sw` command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.
For the download and upload algorithms to operate properly, do not rename image names.

Copying Image Files Using RCP

You can download a switch image from an RCP server or upload the image from the switch to an RCP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download. You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the same switch or another of the same type.

Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files. For switch stacks, the `archive download-sw` and `archive upload-sw` privileged EXEC commands can only be used through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members. To upgrade a switch with an incompatible software image, use the `archive copy-sw` privileged EXEC command to copy the software image from an existing stack member to the incompatible switch. That switch automatically reloads and joins the stack as a fully functioning member.

Preparing to Download or Upload an Image File Using RCP

RCP provides another method of downloading and uploading image files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

RCP requires a client to send a remote username on each RCP request to a server. When you copy an image from the switch to a server by using RCP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip rcmd remote-username username` global configuration command if the command is entered.
- The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.
- The switch hostname.
For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the image file is written to or copied from the directory associated with the remote username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and there is no need to set the RCP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.
- When you upload an image to the RCP to the server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server.

For example, suppose the switch contains these configuration lines:

```
hostname Switch1
ip rcmd remote-username User0
```

If the switch IP address translates to `Switch1.company.com`, the .rhosts file for User0 on the RCP server should contain this line:

```
Switch1.company.com Switch1
```

For more information, see the documentation for your RCP server.

## Downloading an Image File using RCP

You can download a new image file and replace or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 6 to download a new image from an RCP server and overwrite the existing image. To keep the current image, go to Step 6.

### SUMMARY STEPS

1. Verify that the RCP server is properly configured.
2. Log into the switch through the console port or a Telnet session.
3. `configure terminal`
4. `ip rcmd remote-username username`
5. `end`
6. `archive download-sw /overwrite/reload`
   
   ```
   rcp: [[[//username@] /location] /directory] /image-name.tar
   ```
7. `archive download-sw /leave-old-sw/reload`
   
   ```
   rcp: [[[// [username@] location] /directory] /image-name.tar
   ```
**DETAILED STEPS**

**Step 1**
Verify that the RCP server is properly configured.

**Step 2**
Log into the switch through the console port or a Telnet session.

**Step 3**
*configure terminal*

Enter global configuration mode.

This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).

**Step 4**
`ip rcmd remote-username username`

(Optional) Specify the remote username.

**Step 5**
`end`

Return to privileged EXEC mode.

**Step 6**
`archive download-sw /overwrite/reload rcp: [ //username@] /location /directory /image-name.tar`

Download the image file from the RCP server to the switch, and overwrite the current image.

- The `/overwrite` option overwrites the software image in flash memory with the downloaded image.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username` specify the username. For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username.
- For `@location`, specify the IP address of the RCP server.
- For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

**Step 7**
`archive download-sw /leave-old-sw/reload rcp: [ //username@] /location /directory /image-name.tar`

Download the image file from the FTP server to the switch, and keep the current image.

- The `/leave-old-sw` option keeps the old software version after a download.
- The `/reload` option reloads the system after downloading the image unless the configuration has been changed and not been saved.
- For `//username` specify the username. For the RCP copy request to execute, an account must be defined on the network server for the remote username.
- For `@location`, specify the IP address of the RCP server.
- For `/directory/image-name.tar`, specify the directory (optional) and the image to download. Directory and image names are case sensitive.

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note**
- If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.
If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete/force/recursive filesystem :/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

### Uploading an Image File using RCP

You can upload an image from the switch to an RCP server. You can later download this image to the same switch or to another switch of the same type.

The upload feature should be used only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an RCP server:

**SUMMARY STEPS**

1. `configure terminal`
2. `ip rcmd remote-username username`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode. This step is required only if you override the default remote username or password (see Steps 2 and 3.)</td>

| • For /directory/image-name.tar, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive.  
• The image-name.tar is the name of software image to be stored on the server. |

The **archive upload-sw** command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

**Note** For the download and upload algorithms to operate properly, do not rename image names.

---

## Copying an Image File from One Stack Member to Another

For switch stacks, the **archive download-sw** and **archive upload-sw** privileged EXEC commands can be used only through the stack master. Software images downloaded to the stack master are automatically downloaded to the rest of the stack members.

To upgrade a switch that has an incompatible software image, use the **archive copy-sw** privileged EXEC command to copy the software image from an existing stack member to the one that has incompatible software. That switch automatically reloads and joins the stack as a fully functioning member.

**Note**

To successfully use the **archive copy-sw** privileged EXEC command, you must have downloaded from a TFTP server the images for both the stack member switch being added and the stack master. You use the **archive download-sw** privileged EXEC command to perform the download.

Beginning in privileged EXEC mode from the stack member that you want to upgrade, follow these steps to copy the running image file from the flash memory of a different stack member:

**SUMMARY STEPS**

1. **archive copy-sw/destination-system destination-stack-member-number /force-reloadsource-stack-member-number**
2. **reload slot stack-member-number**
### Detailed Steps

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>archive copy-sw/destination-system</code>&lt;br&gt;<code>destination-stack-member-number</code>&lt;br&gt;<code>force-reloadsource-stack-member-number</code></td>
<td>Copy the running image file from a stack member, and then unconditionally reload the updated stack member. &lt;br&gt;&lt;br&gt;Note: At least one stack member must be running the image that is to be copied to the switch that is running the incompatible software. &lt;br&gt;&lt;br&gt;For <code>/destination-systemdestination-stack-member-number</code>, specify the number of the stack member (the destination) to which to copy the source running image file. If you do not specify this stack member number, the default is to copy the running image file to all stack members. &lt;br&gt;&lt;br&gt;Specify <code>/force-reload</code> to unconditionally force a system reload after successfully downloading the software image. &lt;br&gt;&lt;br&gt;For <code>source-stack-member-number</code>, specify the number of the stack member (the source) from which to copy the running image file. The stack member number range is 1 to 9.</td>
</tr>
</tbody>
</table>

| Step 2 | `reload slotsstack-member-number` | Reset the updated stack member, and put this configuration change into effect. |

Embedded Event Manager Overview

Embedded Event Manager (EEM) is a distributed and customized approach to event detection and recovery offered directly in a Cisco IOS device. EEM offers the ability to monitor events and take informational, corrective, or any desired EEM action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

This module contains a technical overview of EEM. EEM can be used alone, or with other network management technologies to help monitor and maintain your network. Before you begin to implement EEM, it is important that you understand the information presented in this module.

- Information About Embedded Event Manager, on page 1715
- Where to Go Next, on page 1733
- Feature Information for Embedded Event Manager 4.0 Overview, on page 1733
- Additional References, on page 1733

Information About Embedded Event Manager

Embedded Event Manager

Event tracking and management has traditionally been performed by devices external to the networking device. Embedded Event Manager (EEM) has been designed to offer event management capability directly in Cisco IOS devices. The on-device, proactive event management capabilities of EEM are useful because not all event management can be done off device because some problems compromise communication between the device and the external network management device. Capturing the state of the device during such situations can be invaluable in taking immediate recovery actions and gathering information to perform root-cause analysis. Network availability is also improved if automatic recovery actions are performed without the need to fully reboot the routing device.

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs. The EEM policies that are configured using the Cisco command-line interface (CLI) then implement recovery on the basis of the current state of the system and the actions specified in the policy for the given event.

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions
to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

Figure 124: Embedded Event Manager Core Event Detectors

- **SNMP**—The Simple Network Management Protocol (SNMP) event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.
- **Syslog**—The syslog event detector allows for screening syslog messages for a regular expression pattern match.

EEM 1.0 introduced the following actions:
- Generating prioritized syslog messages.
- Generating a Cisco Networking Services (CNS) event for upstream processing by CNS devices.

**Embedded Event Manager 1.0**

EEM 1.0 introduced the following event detectors:

- **SNMP**—The Simple Network Management Protocol (SNMP) event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.
- **Syslog**—The syslog event detector allows for screening syslog messages for a regular expression pattern match.

Note: If your network has a higher version of EEM, that version would include the previous releases of EEM version as well.
• Reloading the Cisco software.
• Switching to a secondary processor in a fully redundant hardware configuration.

**Embedded Event Manager 2.0**

EEM 2.0 introduced some new features. EEM 2.0 introduced the following event detectors:

• Application-Specific—The application-specific event detector allows any Embedded Event Manager policy to publish an event.

• Counter—The counter event detector publishes an event when a named counter crosses a specified threshold.

• Interface Counter—The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold.

• Timer—The timer event detector publishes events for the following four different types of timers: absolute-time-of-day, countdown, watchdog, and CRON.

• Watchdog System Monitor (IOSWDSysMon)—The Cisco IOS watchdog system monitor event detector publishes an event when CPU or memory utilization for a Cisco IOS process crosses a threshold.

EEM 2.0 introduced the following actions:

• Setting or modifying a named counter.
• Publishing an application-specific event
• Generating an SNMP trap.

The ability to run a Cisco defined sample policy written using Tool Command Language (Tcl) was introduced. A sample policy was provided that could be stored in the system policy directory.

**Embedded Event Manager 2.1**

EEM 2.1 introduced the following new event detectors:

• CLI—The CLI event detector screens command-line interface (CLI) commands for a regular expression match.

• None—The none event detector publishes an event when the Cisco IOS `event manager run` command executes an EEM policy.

• OIR—The online insertion and removal (OIR) event detector publishes an event when a particular hardware insertion or removal event occurs.

EEM 2.1 introduced the following actions:

• Executing a Cisco CLI command.
• Requesting system information when an event occurs.
• Sending a short e-mail.
• Manually running an EEM policy.
EEM 2.1 also permits multiple concurrent policies to be run using the new `event manager scheduler script` command. Support for SNMP event detector rate-based events is provided as is the ability to create policies using Tool Command Language (Tcl).

**Embedded Event Manager 2.1 (Software Modularity)**

EEM 2.1 (Software Modularity) is supported on Cisco Software Modularity images. EEM 2.1 (Software Modularity) introduced the following event detectors:

- **GOLD**—The Generic Online Diagnostic (GOLD) event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.

- **System Manager**—The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.

- **Watchdog System Monitor (WDSysMon)**—The Cisco Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.

EEM 2.1 for Software Modularity introduced the ability to display EEM reliability metric data for processes.

---

**Note**

EEM 2.1 for Software Modularity images also supports the resource and RF event detectors introduced in EEM 2.2, but it does not support the enhanced object tracking event detector or the actions to read and set tracked objects.

---

**Embedded Event Manager 2.2**

EEM 2.2 introduced some new features. EEM 2.2 introduced the following event detectors:

- **Enhanced Object Tracking**—The enhanced object tracking event detector publishes an event when the tracked object changes. Enhanced object tracking provides complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes.

- **Resource**—The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy.

- **RF**—The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

EEM 2.2 introduced the following actions:

- Reading the state of a tracked object.

- Setting the state of a tracked object.
Embedded Event Manager 2.3

EEM 2.3 is supported on the Cisco Catalyst 6500 Series switches and introduces enhancements to the Generic Online Diagnostics (GOLD) Event Detector on that product.

- The event gold command was enhanced with the addition of the action-notify, testing-type, test-name, test-id, consecutive-failure, platform-action, and maxrun keywords for improved reaction to GOLD test failures and conditions.

- The following platform-wide GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables:
  - Boot-up diagnostic level
  - Card index, name, serial number
  - Port counts
  - Test counts

- The following test-specific GOLD Event Detector information can be accessed through new read-only EEM built-in environment variables (available to EEM applets only):
  - Test name, attribute, total run count
  - Test result per test, port, or device
  - Total failure count, last fail time
  - Error code
  - Occurrence of consecutive failures

These enhancements result in reduced mean time to recovery (MTTR) and higher availability through improved automation and fault detection.

Embedded Event Manager 2.4

EEM 2.4 introduced the following event detectors:

- SNMP Notification—The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into the device. An SNMP notification event is generated when an incoming SNMP trap or inform message matches specified values or crosses specified thresholds.

- RPC—The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

EEM 2.4 added enhancements to the following event detectors:

- Interface counter rate-based trigger—This feature adds the ability for an interface event to be triggered based on a rate of change over a period of time. A rate can be specified both for the entry value and the exit value. This feature copies the rate-based functionality that currently exists for the SNMP event detector.

- SNMP delta value—The difference between the monitored Object Identifier (OID) value at the beginning of the monitored period and the actual OID value when the event is published will be provided in the event reqinfo data for both the SNMP event detector and the Interface Counter event detector.

EEM 2.4 introduced the following actions:
• Multiple event support—The ability to run multiple events was introduced. and **show event manager** commands were enhanced to show multiple events.

• Support for parameters—The *parameter* argument has been added to the **event manager run** command. A maximum of 15 parameters can be used.

• Display of Job IDs and completion status—Some of the **show event manager** commands were enhanced to display Job IDs and completion status.

• Bytecode support—Tcl 8 defines a specialized bytecode language (BCL) and includes a just-in-time compiler that translates Tcl scripts to BCL. Byte sequence is executed by a “virtual machine,” Tcl_ExecuteByteCode(), or TEBC for short, as often as needed. Currently EEM accepts file extensions, such as *.tcl for user policies and *.tm for system policies. Tcl standard extension for bytecode scripts are *.tbc. Now EEM will accept *.tbc as valid EEM policies.

• Registration substitution enhancement—Supports replacing multiple parameters in the event registration statement lines with a single environment variable.

• Tcl package support

---

**Embedded Event Manager 3.0**

EEM 3.0 introduced the following new event detectors:

• Custom CLI—The custom CLI event detector publishes an event to add and enhance existing CLI command syntax.

• Routing—The Routing event detector publishes an event when route entries change in the Routing Information Base (RIB).

• NetFlow—The NetFlow event detector publishes an event when a NetFlow event is triggered.

• IP SLA—The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

EEM 3.0 introduced the following features:

• Class-based scheduling—The EEM policies will be assigned a class using the *class* keyword when they are registered. EEM policies registered without a class will be assigned to the default class.

• High performance Tcl policies—Three new Tcl commands are introduced **event_completion**, **event_wait**, and **event_completion_with_wait**.

• Interactive cli support—The synchronous applets are enhanced to support interaction with the local console (TTY). Two new IOS commands, **action gets** and **action puts**, are introduced to allow users to enter and display input directly on the console.

• Variable logic for applets—The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions.

• Digital signature support—A new API performs digital signature verification for a Tcl script to check if the script is signed by Cisco before execution.

• Support authenticating e-mail servers—The **action mail** command is modified to include an optional username and password.
• SMTP IPv6 support--The keyword sourceaddr is added in Tcl e-mail templates to specify either an IPv6 or IPv4 address.

• SNMP library extensions--The EEM applet action info and Tcl sys_reqinfo_snmp commands are enhanced to include functionality for SNMP getid, inform, trap, and set-type operations.

• SNMP Notification IPv6 support--IPv6 address is supported for the source and destination IP addresses.

• CLI Library XML-PI support--Provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support.

Embedded Event Manager 3.1

EEM 3.1 introduced one new event detector:
• SNMP Object--The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

EEM 3.1 added an enhancement to the following event detector:
• SNMP Notification--The SNMP notification event detector now can wait and intercept the outgoing SNMP traps and informs.

EEM 3.1 added enhancement to the following action:
• Specify facility--The action syslog command has been enhanced to specify syslog facility.

EEM 3.1 introduces the following features:
• Provides the ability to create a short description for the registered policy--A new description command has been introduced to register policies with a brief description in Cisco IOS CLI and Tcl policies. The show event manager policy available command and the show event manager policy registered command have been enhanced to add the description keyword to display the description of the registered applet.

• Enables EEM policies to bypass AAA authorization--The event manager application command has been enhanced to provide authorization and bypass keywords to disable AAA.

• Introduces CLI Library enhancements--Provides two new commands in the CLI library: cli_run and cli_run_interactive.

Embedded Event Manager 3.2

EEM 3.2 introduced the following new event detectors:
• Neighbor Discovery--Neighbor Discovery event detector provides the ability to publish a policy to respond to automatic neighbor detection when:
  • a Cisco Discovery Protocol (CDP) cache entry is added, deleted or updated.
  • a Link Layer Discovery Protocol (LLDP) cache entry is added, deleted, or updated.
  • an interface link status changes.
• an interface line status changes.

• Identity--Identity event detector generates an event when AAA authorization and authentication is successful, when failure occurs, or after normal user traffic on the port is allowed to flow.

• Mac-Address-Table--Mac-Address-Table event detector generates an event when a MAC address is learned in the MAC address table.

The Mac-Address-Table event detector is supported only on switch platforms and can be used only on Layer 2 interfaces where MAC addresses are learned. Layer 3 interfaces do not learn addresses and devices do not usually support the mac-address-table infrastructure needed to notify EEM of a learned MAC address.

EEM 3.2 also introduces new CLI commands to support the applets to work with the new event detectors.

Embedded Event Manager 4.0

EEM 4.0 introduces the following new features:

• EEM Email Action Enhancements
  • TLS support for SMTP mail actions—The new optional secure keyword is added to the action mail CLI with tls and none keyword options. There are no updates to the corresponding Tcl Policy.
  • Custom port for SMTP mail actions—The new optional port keyword is added to the action mail CLI. In the Tcl policy, the port number can be specified by adding a line to the e-mail template.

• EEM Security Enhancements
  • Checksum-based script integrity—Where digital signature is not supported or unavailable, users can still enforce some basic integrity check on the TCL policy by using the Unix command openssl sha1. The new optional checksum, md5, and sha-1 keywords have been added to the event manager policy command.
  • Third-party digital signature support—Requires Tcl secure mode and a trustpoint to associate with the TCL scripts in order to verify the signature.
  • Script owner identification—If a policy is successfully registered with a digital signature, the owner (or signer) of the policy can be identified by using the show event manager policy registered command and checking the Dsig keyword in the show output.
  • Registration of remote Tcl policies—The new optional remote keyword has been added to the event manager policy command.

• EEM Resource Management
  • Resource consumption throttling—The new optional resource-limit keyword has been added to the event manager scheduler command.
  • Rate limiting of triggered policies per event—The new optional rate-limit keyword has been added to the event syslog command.

• EEM Usability Enhancements
  • File operations in EEM applet actions—The new CLI action file has been added to allow file selection.
  • New fields are added in EEM to track statistics of queue size, dropped events, and run-time using the show event manager statistics EXEC command. A set of new clear commands—clear event...
manager detector counters and clear event manager server counters—are introduced to clear the event manager queue counters.

- **EEM Event Detector Enhancements**
  - CLI event detector enhancement—Provides the ability to detect the session where the user enters the event cli command. Four new keywords and built-in environmental variables—*username, host, privilege, and tty*—are added to the `event cli` applet and `event_reqinfo` array names to the `event_register_cli` event detector. The `show event manager detector` EXEC command has also been modified to reflect the enhancement.
  - Syslog event detector performance enhancement—Provides the option to perform string matching on specific log message fields. The four new keywords—*facility, mnemonic, sequence, and timestamp* keywords—are added to the `action syslog` command, `event syslog` command, and to the `event_register_syslog` event detector. The `show event manager detector` EXEC command has also been modified to reflect the enhancement.

### EEM Event Detectors Available by Cisco IOS Release

EEM uses software programs known as event detectors to determine when an EEM event occurs. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. Use the table below to determine which event detectors are available in your specific Cisco IOS release. A blank entry (--) indicates that the event detector is not available: the text “Yes” indicates that the event detector is available. The event detectors shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each event detector, see the Event Detectors concept in the “Embedded Event Manager Overview” module.

**EEM Event Detectors Available by Cisco IOS Release**

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Embedded Event Manager (EEM) uses software programs known as *event detectors* to determine when an EEM event occurs. Event detectors are separate systems that provide an interface between the agent being monitored, for example Simple Network Management Protocol (SNMP), and the EEM policies where an action can be implemented. Some event detectors are available on every Cisco IOS release, but most event detectors have been introduced in a specific release. For details of which event detector is supported in each Cisco IOS release, see the EEM Event Detectors Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM contains the following event detectors.

**Application-Specific Event Detector**

The application-specific event detector allows any Embedded Event Manager policy to publish an event. When an EEM policy publishes an event it must use an EEM subsystem number of 798 with any event type. If an existing policy is registered for subsystem 798 and a specified event type, a second policy of the same event type will trigger the first policy to run when the specified event is published.

**CLI Event Detector**

The CLI event detector screens command-line interface (CLI) commands for a regular expression match. When a match is found, an event is published. The match logic is performed on the fully expanded CLI command after the command is successfully parsed and before it is executed. The CLI event detector supports three publish modes:

- **Synchronous publishing of CLI events**--The CLI command is not executed until the EEM policy exits, and the EEM policy can control whether the command is executed. The read/write variable, _exit_status, allows you to set the exit status at policy exit for policies triggered from synchronous events. If _exit_status is 0, the command is skipped, if _exit_status is 1, the command is run.

- **Asynchronous publishing of CLI events**--The CLI event is published, and then the CLI command is executed.

- **Asynchronous publishing of CLI events with command skipping**--The CLI event is published, but the CLI command is not executed.

**Counter Event Detector**

The counter event detector publishes an event when a named counter crosses a specified threshold. There are two or more participants that affect counter processing. The counter event detector can modify the counter, and one or more subscribers define the criteria that cause the event to be published. After a counter event has been published, the counter monitoring logic can be reset to start monitoring the counter immediately or it can be reset when a second threshold--called an exit value--is crossed.

**Custom CLI Event Detector**

The custom CLI event detector publishes an event to add and enhance existing CLI command syntax. When the special parser characters Tab, ? (question mark), and Enter are entered, the parser sends the input to the custom CLI event detector for processing. The custom CLI event detector then compares this input against registered strings to determine if this is a new or enhanced CLI command. Upon a match the custom CLI event detector takes appropriate actions, such as displaying help for the command if ? is entered, displaying the entire command if Tab is entered, or executing the command if Enter was entered. If a match does not occur, the parser regains control and processes the information as usual.
**Enhanced Object Tracking Event Detector**

The enhanced object tracking (EOT) event detector publishes an event when the status of a tracked object changes. Object tracking was first introduced into the Hot Standby Router Protocol (HSRP) as a simple tracking mechanism that allowed you to track the interface line-protocol state only. If the line-protocol state of the interface went down, the HSRP priority of the device was reduced, allowing another HSRP device with a higher priority to become active.

Object tracking was enhanced to provide complete separation between the objects to be tracked and the action to be taken by a client when a tracked object changes. Thus, several clients such as HSRP, VRRP, or GLBP can register their interest with the tracking process, track the same object, and each take different action when the object changes. Each tracked object is identified by a unique number that is specified on the tracking command-line interface (CLI). Client processes use this number to track a specific object. The tracking process periodically polls the tracked objects and notes any change of value. The changes in the tracked object are communicated to interested client processes, either immediately or after a specified delay. The object values are reported as either up or down.

Enhanced object tracking is now integrated with EEM to allow EEM to report on a status change of a tracked object and to allow enhanced object tracking to track EEM objects. A new type of tracking object—a stub object—is created. The stub object can be manipulated using the existing CLI commands that already allow tracked objects to be manipulated.

**GOLD Event Detector**

The GOLD event detector publishes an event when a GOLD failure event is detected on a specified card and subcard.

**Interface Counter Event Detector**

The interface counter event detector publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold. A threshold can be specified as an absolute value or an incremental value. If the incremental value is set to 50, for example, an event would be published when the interface counter increases by 50.

After an interface counter event has been published, the interface counter monitoring logic is reset using two methods. The interface counter is reset either when a second threshold—called an exit value—is crossed or when an elapsed period of time occurs.

**IP SLA Event Detector**

The IP SLA event detector publishes an event when an IP SLA reaction is triggered.

**NetFlow Event Detector**

The NetFlow event detector publishes an event when a NetFlow event is triggered.

**None Event Detector**

The none event detector publishes an event when the Cisco IOS event manager run CLI command executes an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. An EEM policy must be identified and registered to be permitted to run manually before the event manager run command will execute.
OIR Event Detector

The online insertion and removal (OIR) event detector publishes an event when one of the following hardware insertion or removal event occurs:

• A card is removed.
• A card is inserted.

Route Processors (RPs), line cards, or feature cards can be monitored for OIR events.

Resource Event Detector

The resource event detector publishes an event when the Embedded Resource Manager (ERM) reports an event for the specified policy. The ERM infrastructure tracks resource depletion and resource dependencies across processes and within a system to handle various error conditions. The error conditions are handled by providing an equitable sharing of resources between various applications. The ERM framework provides a communication mechanism for resource entities and allows communication between these resource entities from numerous locations. The ERM framework also helps in debugging CPU and memory-related issues. The ERM monitors system resource usage to better understand scalability needs by allowing you to configure threshold values for resources such as the CPU, buffers, and memory. The ERM event detector is the preferred method for monitoring resources in Cisco software but the ERM event detector is not supported in Software Modularity images. For more details about ERM, go to “Embedded Resource Manager” module.

RF Event Detector

The redundancy framework (RF) event detector publishes an event when one or more RF events occur during synchronization in a dual Route Processor (RP) system. The RF event detector can also detect an event when a dual RP system continuously switches from one RP to another RP (referred to as a ping-pong situation).

RPC Event Detector

The remote procedure call (RPC) event detector provides the ability to invoke EEM policies from outside the device over an encrypted connection using Secure Shell (SSH). The RPC event detector uses Simple Object Access Protocol (SOAP) data encoding for exchanging XML-based messages. This event detector can be used to run EEM policies and then receive output in a SOAP XML-formatted reply.

Routing Event Detector

The routing event detector publishes an event when a route entry changes in the Routing Information Base (RIB).

SNMP Event Detector

The SNMP event detector allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

SNMP Notification Event Detector

The SNMP notification event detector provides the ability to intercept SNMP trap and inform messages coming into or going out of the device. An SNMP notification event is generated when an incoming or outgoing SNMP trap or inform message matches specified values or crosses specified thresholds. The SNMP event detector can wait and intercept the outgoing SNMP traps and informs.
SNMP Object Event Detector

The Simple Network Management Protocol (SNMP) object trap event detector provides an extension to replace the value when an SNMP trap with the specified SNMP object ID (OID) is encountered on a specific interface or address.

Syslog Event Detector

The syslog event detector allows for screening syslog messages for a regular expression pattern match. The selected messages can be further qualified, requiring that a specific number of occurrences be logged within a specified time. A match on a specified event criteria triggers a configured policy action.

System Manager Event Detector

The system manager event detector generates events for Cisco IOS Software Modularity process start, normal or abnormal stop, and restart events. The events generated by the system manager allows policies to change the default behavior of the process restart.

Timer Event Detector

The timer event detector publishes events for the following four different types of timers:

- An absolute-time-of-day timer publishes an event when a specified absolute date and time occurs.
- A countdown timer publishes an event when a timer counts down to zero.
- A watchdog timer publishes an event when a timer counts down to zero and then the timer automatically resets itself to its initial value and starts to count down again.
- A CRON timer publishes an event using a UNIX standard CRON specification to indicate when the event is to be published. A CRON timer never publishes events more than once per minute.

Watchdog System Monitor (IOSWDSysMon) Event Detector for Cisco IOS

The Cisco IOS watchdog system monitor event detector publishes an event when one of the following occurs:

- CPU utilization for a Cisco IOS task crosses a threshold.
- Memory utilization for a Cisco IOS task crosses a threshold.

Note

Cisco IOS processes are now referred to as tasks to distinguish them from Cisco IOS Software Modularity processes.

Two events may be monitored at the same time, and the event publishing criteria can be specified to require one event or both events to cross their specified thresholds.

Watchdog System Monitor (WDSysMon) Event Detector for Cisco IOS Software Modularity

The Cisco IOS Software Modularity watchdog system monitor event detector detects infinite loops, deadlocks, and memory leaks in Cisco IOS Software Modularity processes.
EEM Actions Available by Cisco IOS Release

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some actions are available in every Cisco IOS release, but most actions have been introduced in a specific release. Use the table below to determine which actions are available in your specific Cisco IOS release. A blank entry (--) indicates that the action is not available; the text “Yes” indicates that the action is available. The actions shown in the table are supported in later releases of the same Cisco IOS release train. For more details on each action, see the Embedded Event Manager Actions concept in the “Embedded Event Manager Overview” module.

Embedded Event Manager Actions

The CLI-based corrective actions that are taken when event detectors report events enable a powerful on-device event management mechanism. Some EEM actions are available on every Cisco IOS release, but most EEM actions have been introduced in a specific release. For details of which EEM action is supported in each Cisco IOS release, see the EEM Actions Available by Cisco IOS Release concept in the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” or the “Writing Embedded Event Manager Policies Using Tcl” modules. EEM supports the following actions:

- Executing a Cisco IOS command-line interface (CLI) command.
- Generating a CNS event for upstream processing by Cisco CNS devices.
- Setting or modifying a named counter.
- Switching to a secondary processor in a fully redundant hardware configuration.
- Requesting system information when an event occurs.
- Sending a short e-mail.
- Manually running an EEM policy.
- Publishing an application-specific event.
- Reloading the Cisco software.
- Generating an SNMP trap.
- Generating prioritized syslog messages.
- Reading the state of a tracked object.
- Setting the state of a tracked object.

EEM action CLI commands contain an EEM action label that is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumeric sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

Embedded Event Manager Environment Variables

EEM allows environment variables to be used in EEM policies. Tool Command Language (Tcl) allows global variables to be defined that are known to all procedures within a Tcl script. EEM allows environment variables to be defined using a CLI command, the event manager environment command, for use within an EEM policy. All EEM environment variables are automatically assigned to Tcl global variables before a Tcl script is run. There are three different types of environment variables associated with Embedded Event Manager:

- User-defined--Defined by you if you create an environment variable in a policy that you have written.
- Cisco-defined--Defined by Cisco for a specific sample policy.
- Cisco built-in (available in EEM applets)--Defined by Cisco and can be read only or read/write. The read only variables are set by the system before an applet starts to execute. The single read/write variable, _exit_status, allows you to set the exit status at policy exit for policies triggered from synchronous events.
Cisco-defined environment variables (see the table below) and Cisco system-defined environment variables may apply to one specific event detector or to all event detectors. Environment variables that are user-defined or defined by Cisco in a sample policy are set using the event manager environment command. Variables that are used in the EEM policy must be defined before you register the policy. A Tcl policy contains a section called “Environment Must Define” that can be defined to check that any required environment variables are defined before the policy runs.

Cisco built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write, and these variables may apply to one specific event detector or to all event detectors. For more details and a table listing the Cisco system-defined variables, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

Cisco-defined environment variables begin with an underscore character (_). We strongly recommend that customers avoid the same naming convention to prevent naming conflicts.

The table below describes the Cisco-defined variables used in the sample EEM policies. Some of the environment variables do not have to be specified for the corresponding sample policy to run and these are marked as optional.

**Table 177: Cisco-Defined Environmental Variables and Examples**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_config_cmd1</td>
<td>The first configuration command that is executed.</td>
<td>interface Ethernet1/0</td>
</tr>
<tr>
<td>_config_cmd2</td>
<td>(Optional) The second configuration command that is executed.</td>
<td>no shutdown</td>
</tr>
<tr>
<td>_crash_reporter_debug</td>
<td>(Optional) A value that identifies whether debug information for tm_crash_reporter.tcl will be enabled.</td>
<td>1</td>
</tr>
<tr>
<td>_crash_reporter_url</td>
<td>The URL location to which the crash report is sent.</td>
<td><a href="http://www.yourdomain.com/">http://www.yourdomain.com/</a> fm/interface_tm.cgi</td>
</tr>
<tr>
<td>_cron_entry</td>
<td>A CRON specification that determines when the policy will run. See the “Writing Embedded Event Manager Policies Using Tcl” module for more information about how to specify a cron entry.</td>
<td>0-59/1 0-23/1 * * 0-7</td>
</tr>
<tr>
<td>_email_server</td>
<td>A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.</td>
<td>mailserver.yourdomain.com</td>
</tr>
<tr>
<td>_email_to</td>
<td>The address to which e-mail is sent.</td>
<td><a href="mailto:engineer@yourdomain.com">engineer@yourdomain.com</a></td>
</tr>
<tr>
<td>_email_from</td>

<tr>
<td>_email_ipaddr</td>
<td>The source IP address of the recipient.</td>
<td>209.165.201.1 or (IPv6 address) 2001:0DB8::1</td>
</tr>
<tr>
<td>_info_snmp_oid</td>
<td>The SNMP object ID.</td>
<td>1.3.6.1.2.1.2 or iso.internet.mgmt.mib-2.interfaces</td>
</tr>
<tr>
<td>_info_snmp_value</td>
<td>The value string of the associated SNMP data element.</td>
<td></td>
</tr>
<tr>
<td>_show_cmd</td>
<td>The CLI show command to be executed when the policy is run.</td>
<td>show version</td>
</tr>
<tr>
<td>_syslog_pattern</td>
<td>A regular expression pattern match string that is used to compare syslog messages to determine when the policy runs.</td>
<td>.*UPDOWN.<em>FastEthernet 0/0.</em></td>
</tr>
<tr>
<td>_tm_fsys_usage_cron</td>
<td>(Optional) A CRON specification that is used in the event_register keyword extension. If unspecified, the _tm_fsys_usage.tcl policy is triggered once per minute.</td>
<td>0-59/1 0-23/1 * * 0-7</td>
</tr>
<tr>
<td>_tm_fsys_usage_debug</td>
<td>(Optional) When this variable is set to a value of 1, disk usage information is displayed for all entries in the system.</td>
<td>1</td>
</tr>
<tr>
<td>_tm_fsys_usage_freebytes</td>
<td>(Optional) Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed.</td>
<td>disk2:98000000</td>
</tr>
<tr>
<td>_tm_fsys_usage_percent</td>
<td>(Optional) Disk usage percentage thresholds for systems or specific prefixes. If disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems.</td>
<td>nvrnam:25 disk2:5</td>
</tr>
</tbody>
</table>

**Embedded Event Manager Policy Creation**

EEM is a policy driven process in which the EEM policy engine receives notifications when faults and other events occur in the Cisco software system. Embedded Event Manager policies implement recovery based on the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

Although there are some EEM CLI configuration and show commands, EEM is implemented through the creation of policies. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tcl.

The creation of an EEM policy involves:

- Selecting the event for which the policy is run.
• Defining the event detector options associated with logging and responding to the event.
• Defining the environment variables, if required.
• Choosing the actions to be performed when the event occurs.

There are two ways to create an EEM policy. The first method is to write applets using CLI commands, and the second method is to write Tcl scripts. Cisco provides enhancements to Tcl in the form of Tcl command extensions that facilitate the development of EEM policies. Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. When a policy is registered with the Embedded Event Manager, the software examines the policy and registers it to be run when the specified event occurs. Policies can be unregistered or suspended. Both types of policies can be used to implement EEM in your network.

For details on writing EEM policies using the Cisco IOS CLI, go to “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

For details on writing EEM policies using Tcl, go to “Writing Embedded Event Manager Policies Using Tcl” module.

Where to Go Next

• If you want to write EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

• If you want to write EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

Feature Information for Embedded Event Manager 4.0 Overview

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Writing EEM Policies Using the Cisco IOS CLI

- Before writing EEM policies, you should be familiar with the concepts explained in the “Embedded Event Manager Overview” module.

- If the `action cns-event` command is used, access to a Cisco Networking Services (CNS) Event gateway must be configured.

- If the `action force-switchover` command is used, a secondary processor must be configured on the device.

- If the `action snmp-trap` command is used, the `snmp-server enable traps event-manager` command must be enabled to permit SNMP traps to be sent from the Cisco IOS device to the SNMP server. Other relevant `snmp-server` commands must also be configured; for details see the `action snmp-trap` command page.

Information About Writing EEM Policies Using the Cisco IOS CLI

Embedded Event Manager Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or a threshold is reached. An EEM policy is an entity that defines an event and the actions to be
taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

**EEM Applet**

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In applet configuration mode, three types of configuration statements are supported. The **event** commands are used to specify the event criteria to trigger the applet to run, the **action** commands are used to specify an action to perform when the EEM applet is triggered, and the **set** command is used to set the value of an EEM applet variable. Currently only the _exit_status variable is supported for the set command.

Only one **event** configuration command is allowed within an applet configuration. When applet configuration mode is exited and no **event** command is present, a warning is displayed stating that no event is associated with this applet. If no event is specified, this applet is not considered registered. When no action is associated with this applet, events are still triggered but no actions are performed. Multiple **action** configuration commands are allowed within an applet configuration. Use the **show event manager policy registered** command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

The action configuration commands are uniquely identified using the **label** argument, which can be any string value. Actions are sorted in ascending alphanumeric key sequence using the **label** argument as the sort key, and they are run using this sequence.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the **event** and **action** commands that are entered and registers the applet to be run when a specified event occurs.

**EEM Script**

Scripts are defined off the networking device using an ASCII editor. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM policy involves:

- Selecting the event for which the policy is run.
- Defining the event detector options associated with logging and responding to the event.
- Choosing the actions to be followed when the event occurs.

Cisco provides enhancements to Tcl in the form of keyword extensions that facilitate the development of EEM policies. The main categories of keywords identify the detected event, the subsequent action, utility information, counter values, and system information. For more details about writing EEM policies using Tcl, see the “Writing Embedded Event Manager Policies Using Tcl” module.

**Embedded Event Manager Built-In Environment Variables Used in EEM Applets**

EEM built-in environment variables are a subset of the Cisco-defined environment variables and the built-in variables are available to EEM applets only. The built-in variables can be read-only or can be read and write
and these variables may apply to one specific event detector or to all event detectors. The table below lists
the Cisco built-in environment variables that are read-only alphabetically by event detector and subevent.

Table 179: EEM Built-In Environment Variables (Read Only)

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Events</td>
<td></td>
</tr>
<tr>
<td>_event_id</td>
<td>Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.</td>
</tr>
<tr>
<td>_event_type</td>
<td>Type of event.</td>
</tr>
<tr>
<td>_event_type_string</td>
<td>An ASCII string identifier of the event type that triggered the event.</td>
</tr>
<tr>
<td>_event_pub_sec _event_pub_msec</td>
<td>The time, in seconds and milliseconds, at which the event was published to the EEM.</td>
</tr>
<tr>
<td>_event_severity</td>
<td>The severity of the event.</td>
</tr>
<tr>
<td>Application-Specific Event Detector</td>
<td></td>
</tr>
<tr>
<td>_application_component_id</td>
<td>The event application component identifier.</td>
</tr>
<tr>
<td>_application_data1</td>
<td>The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published.</td>
</tr>
<tr>
<td>_application_data2</td>
<td>The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published.</td>
</tr>
<tr>
<td>_application_data3</td>
<td>The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published.</td>
</tr>
<tr>
<td>_application_data4</td>
<td>The value of an environment variable, character text, or a combination of the two to be passed to an application-specific event when the event is published.</td>
</tr>
<tr>
<td>_application_sub_system</td>
<td>The event application subsystem number.</td>
</tr>
<tr>
<td>_application_type</td>
<td>The type of application.</td>
</tr>
<tr>
<td>CLI Event Detector</td>
<td></td>
</tr>
<tr>
<td>_cli_msg</td>
<td>The fully expanded message that triggered the CLI event.</td>
</tr>
<tr>
<td>_cli_msg_count</td>
<td>The number of times that a message match occurred before the event was published.</td>
</tr>
<tr>
<td>Environment Variable</td>

Enhanced Object Tracking Event Detector

| `_track_number`       | The number of the tracked object. |
| `_track_state`        | The state of the tracked object; down or up. |

GOLD Event Detector

| `_action_notify`      | The action notify information in a GOLD event flag; either false or true. |
| `_event_severity`     | The event severity which can be one of the following; normal, minor, or major. |

| `_gold_bl`            | The boot diagnostic level, which can be one of the following values: |
|                       | • 0: complete diagnostic |
|                       | • 1: minimal diagnostic |
|                       | • 2: bypass diagnostic |

<p>| <code>_gold_card</code>          | The card on which a GOLD failure event was detected. |
| <code>_gold_ef testnum</code>    | Consecutive failure, where testnum is the test number. For example, _gold_ef3 is the EEM built-in environment variable for consecutive failure of test 3. |
| <code>_gold_ci</code>            | Card index. |
| <code>_gold_cn</code>            | Card name. |
| <code>_gold_ec testnum</code>    | Test error code, where testnum is the test number. For example, _gold_ec3 is the EEM built-in environment variable for the error code of test 3. |
| <code>_gold_if testnum</code>    | Last fail time, where testnum is the test number. For example, _gold_if3 is the EEM built-in variable for the last fail time of test 3. |
|                       | The time-stamp format is mmm dd yyyy hh:mm:ss. For example, Mar 11 2005 08:47:00. |
| <code>_gold_new_failure</code>   | The new test failure information in a GOLD event flag; either true or false. |</p>
<table>
<thead>
<tr>
<th>Environment Variable</th>

### EEM Environment Variables

EEM environment variables for EEM policies are defined using the EEM `event manager environment` configuration command. By convention, all Cisco EEM environment variables begin with “_”. In order to avoid future conflict, customers are urged not to define new variables that start with “_”.

You can display the EEM environment variables set on your system by using the `show event manager environment` privileged EXEC command.

For example, you can create EEM policies that can send e-mails when an event occurs. The table below describes the e-mail-specific environment variables that can be used in EEM policies.
Table 180: EEM E-mail-Specific Environmental Variables

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_email_server</td>
<td>A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.</td>
<td>The e-mail server name--Mailservename-- can be in any one of the following template formats: • username:password@host • username@host • host</td>
</tr>
<tr>
<td>_email_to</td>
<td>The address to which e-mail is sent.</td>
<td><a href="mailto:engineering@example.com">engineering@example.com</a></td>
</tr>
<tr>
<td>_email_from</td>
<td>The address from which e-mail is sent.</td>
<td><a href="mailto:devtest@example.com">devtest@example.com</a></td>
</tr>
<tr>
<td>_email_cc</td>
<td>The address to which the e-mail is copied.</td>
<td><a href="mailto:manager@example.com">manager@example.com</a></td>
</tr>
</tbody>
</table>

Alphabetical Order of EEM Action Labels

An EEM action label is a unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric (lexicographical) key sequence using the label as the sort key. If you are using numbers as labels be aware that alphanumerical sorting will sort 10.0 after 1.0, but before 2.0, and in this situation we recommend that you use numbers such as 01.0, 02.0, and so on, or use an initial letter followed by numbers.

SUMMARY STEPS

1. enable
2. show event manager environment [all] variable-name
3. configure terminal
4. event manager environment variable-name string
5. Repeat Alphabetical Order of EEM Action Labels for all the required environment variables.
6. event manager applet applet-name
7. Do one of the following:
   - event snmp oid oid-value get-type {exact|next} entry-op operator entry-val entry-value[exit-comb|and] [exit-op operator] [exit-val exit-value] [exit-time exit-time-value] poll-interval poll-int-value
8. action label cli command cli-string [pattern pattern-string]
9. action label syslog [priority priority-level] msg msg-text facility string
10. action label mail server server-address to to-address from from-address [cc cc-address] subject subject body body-text
11. Add more action commands as required.
12. end
## Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **en** | Enables privileged EXEC mode.  
• Enter your password if prompted.  |
| **Example:** | `Device> enable` | |
| **Step 2** | **show event manager environment** [all] *variable-name* | (Optional) Displays the name and value of EEM environment variables.  
• The optional all keyword displays all the EEM environment variables.  
• The optional *variable-name* argument displays information about the specified environment variable.  |
| **Example:** | `Device# show event manager environment all` | |
| **Step 3** | **configure terminal** | Enters global configuration mode.  |
| **Example:** | `Device# configure terminal` | |
| **Step 4** | **event manager environment** *variable-name* *string* | Configures the value of the specified EEM environment variable.  
• In this example, the environment variable that holds the e-mail address to which e-mail is sent is set to engineering@example.com.  |
| **Example:** | `Device(config)# event manager environment _email_to engineering@example.com` | |
| **Step 5** | Repeat **Alphabetical Order of EEM Action Labels** for all the required environment variables. | Repeat **Alphabetical Order of EEM Action Labels** to configure all the environment variables required by the policy to be registered in **Alphabetical Order of EEM Action Labels**.  |
| **Step 6** | **event manager applet** *applet-name* | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode.  |
| **Example:** | `Device(config)# event manager applet memory-fail` | |
| **Step 7** | Do one of the following:  
• **event snmp oid** *oid-value* **get-type** {exact|next} **entry-op** *operator* **entry-val** *entry-value*[**exit-comb** and]** **exit-op** *operator* **exit-val** *exit-value* **exit-time** *exit-time-value* **poll-interval** *poll-int-value* | Specifies the event criteria that cause the EEM applet to run.  
• In this example, an EEM event is triggered when free memory falls below the value of 5120000.  
• Exit criteria are optional, and if not specified, event monitoring is reenabled immediately.  |
<p>| <strong>Example:</strong> | <code>Device(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000 poll-interval 90</code> | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 8**  
  action label cli command cli-string [pattern pattern-string]  
  **Example:**  
  Device(config-applet)# action 1.0 cli command "enable"  
  **Example:**  
  Device(config-applet)# action 2.0 cli command "clear counters Ethernet0/1" pattern "confirm"  
  **Example:**  
  Device(config-applet)# action 3.0 cli command "y" | Specifies the action of executing a Cisco IOS CLI command when an EEM applet is triggered.  
  The **pattern** keyword is optional and is used only when the command string solicits input. The **action cli** command ends when the solicited prompt as specified in the optional **pattern** keyword is received. You are required to specify a regular expression pattern that will match the next solicited prompt. Specification of an incorrect pattern will cause the **action cli** command to wait forever until the applet execution times out due to the maxrun timer expiration.  
  - The action taken is to specify an EEM applet to run when the **pattern** keyword specifies the **confirm** argument for the **clear counters Ethernet0/1** command. In this case the command string solicits input, such as “confirm,” which has to be completed with a “yes” or a “no” input. |
| **Step 9**  
  action label syslog [priority priority-level] msg msg-text facility string  
  **Example:**  
  Device(config-applet)# action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $_snmp_oid_val bytes"  
  **Example:**  
  Device(config-applet)# action 1.0 syslog priority errors facility EEM-FAC message “TEST MSG” | Specifies the action to be taken when an EEM applet is triggered.  
  In this example, the action taken is to write a message to syslog.  
  - The optional **priority** keyword specifies the priority level of the syslog messages. If selected, the **priority-level** argument must be defined.  
  - The **msg-text** argument can be character text, an environment variable, or a combination of the two.  
  - The **facility** keyword specifies the location of generated message  
  - The **string** argument can be character text, an environment variable, or a combination of the two. |
| **Step 10**  
  action label mail server server-address to to-address from from-address [cc cc-address] subject subject body body-text  
  **Example:**  
  Device(config-applet)# action 2.0 mail server 192.168.1.10 to engineering@example.com from devtest@example.com subject "Memory failure" body "Memory exhausted; current available memory is $_snmp_oid_val bytes" | Specifies the action of sending a short e-mail when an EEM applet is triggered.  
  - The **server-address** argument specifies the fully qualified domain name of the e-mail server to be used to forward the e-mail.  
  - The **to-address** argument specifies the e-mail address where the e-mail is to be sent.  
  - The **from-address** argument specifies the e-mail address from which the e-mail is sent.  
  - The **subject** argument specifies the subject line content of the e-mail as an alphanumeric string. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The <strong>body-text</strong> argument specifies the text content of the e-mail as an alphanumeric string.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 11**
Add more action commands as required.  

**Step 12**

**Example:**

```
Device(config-applet)# end
```

**Troubleshooting Tips**

Use the `debug event manager` command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution as the volume of generated output can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

**Registering and Defining an EEM Tcl Script**

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

**Before you begin**

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided--see the details in the Sample EEM Policies, on page 1829 to see which policies are available for the Cisco IOS release image that you are using--and these sample policies are stored in the system policy directory.

**SUMMARY STEPS**

1. `enable`
2. `show event manager environment [all] variable-name`
3. `configure terminal`
4. `event manager environment variable-name string`
5. Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script.
6. `event manager policy policy-filename [type {system|user}] [trap]`
7. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
**enable**        | Enables privileged EXEC mode.                                           |
**Example:**
```
Device> enable
```

• Enter your password if prompted.
### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th>show event manager environment [all] variable-name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# show event manager environment all</td>
</tr>
</tbody>
</table>

(Optional) Displays the name and value of EEM environment variables.
- The optional **all** keyword displays all the EEM environment variables.
- The optional **variable-name** argument displays information about the specified environment variable.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
</tbody>
</table>

Enters global configuration mode.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>event manager environment variable-name string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6</td>
</tr>
</tbody>
</table>

Configures the value of the specified EEM environment variable.
- In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day.

| Step 5 | Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script. |

| Step 6 | event manager policy policy-filename [type {system | user}] [trap] |
|--------|---------------------------------------------------------------|
| Example: | Device(config)# event manager policy tm_cli_cmd.tcl type system |

Registers the EEM policy to be run when the specified event defined within the policy occurs.
- Use the **system** keyword to register a Cisco-defined system policy.
- Use the **user** keyword to register a user-defined system policy.
- Use the **trap** keyword to generate an SNMP trap when the policy is triggered.
- In this example, the sample EEM policy named tm_cli_cmd.tcl is registered as a system policy.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# exit</td>
</tr>
</tbody>
</table>

Exits global configuration mode and returns to privileged EXEC mode.

### Examples

In the following example, the **show event manager environment** privileged EXEC command is used to display the name and value of all EEM environment variables.
Unregistering Embedded Event Manager Policies

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

**SUMMARY STEPS**

1. `enable`
2. `show event manager policy registered [description [policy-name] | detailed policy-filename [system | user] | [event-type event-name] [system | user] [time-ordered | name-ordered]]`
3. `configure terminal`
4. `no event manager policy policy-filename`
5. `exit`
6. Repeat Step 2 to ensure that the policy has been removed.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2** `show event manager policy registered` | (Optional) Displays the EEM policies that are currently registered. |
| Example: `Device# show event manager policy registered` | • The optional `system` and `user` keywords display the registered system and user policies. |
| Optional `system` and `user` keywords display the registered system and user policies. |
| • If no keywords are specified, EEM registered policies for all event types are displayed in time order. |

| **Step 3** `configure terminal` | Enters global configuration mode.                                      |
| Example: `Device# configure terminal` |

| **Step 4** `no event manager policy policy-filename` | Removes the EEM policy from the configuration, causing the policy to be unregistered. |
| Example: `Device(config)# no event manager policy IPSLAping1` |
### Suspending All Embedded Event Manager Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them might be necessary for reasons of temporary performance or security.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td>exit</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config)# exit
```

Exits global configuration mode and returns to privileged EXEC mode.

<table>
<thead>
<tr>
<th><strong>Step 6</strong></th>
<th>Repeat Step 2 to ensure that the policy has been removed.</th>
</tr>
</thead>
</table>

**Example:**

```
Device# show event manager policy registered
```

Examples

In the following example, the `show event manager policy registered` privileged EXEC command is used to display the two EEM applets that are currently registered:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system snmp Off Fri Aug 12 17:42:52 2005 IPSLAping1
   oid (1.3.6.1.4.1.9.9.42.1.2.9.1.6.4) get-type exact entry-op eq entry-val (1)
   exit-op eq exit-val (2) poll-interval 90.000
   action 1.0 syslog priority critical msg "Server IPecho Failed: OID=$_snmp_oid_val"
   action 1.1 snmp-trap strdata "EEM detected server reachability failure to 10.1.88.9"
   action 1.2 publish-event sub-system 88000101 type 1 arg1 "10.1.88.9" arg2 "IPSLAEcho"
   arg3 "fail"
   action 1.3 counter name _IPSLA1F op inc value 1
2 applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val (5120000)
   poll-interval 90
   action 1.0 syslog priority critical msg Memory exhausted; current available memory is
   $_snmp_oid_val bytes
   action 2.0 force-switchover
```

In the following example, the `show event manager policy registered` privileged EXEC command is used to show that applet IPSLAping1 has been removed after entering the `no event manager policy` command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system snmp Off Thu Sep 15 05:57:16 2005 memory-fail
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val (5120000)
   poll-interval 90
   action 1.0 syslog priority critical msg Memory exhausted; current available memory is
   $_snmp_oid_val bytes
   action 2.0 force-switchover
```

### Suspending All Embedded Event Manager Policy Execution

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them might be necessary for reasons of temporary performance or security.
### SUMMARY STEPS

1. `enable`
2. `show event manager policy registered [description [policy-name] | detailed policy-filename [system | user] | [event-type event-name] [system | user] [time-ordered | name-ordered]]`
3. `configure terminal`
4. `event manager scheduler suspend`
5. `exit`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable`  
   **Example:**  
   Device> enable | Enables privileged EXEC mode.  
   - Enter your password if prompted. |
| **Step 2** | `show event manager policy registered [description [policy-name] | detailed policy-filename [system | user] | [event-type event-name] [system | user] [time-ordered | name-ordered]]`  
   **Example:**  
   Device# show event manager policy registered | (Optional) Displays the EEM policies that are currently registered.  
   - The optional `system` and `user` keywords display the registered system and user policies.  
   - If no keywords are specified, EEM registered policies for all event types are displayed in time order. |
| **Step 3** | `configure terminal`  
   **Example:**  
   Device# configure terminal | Enters global configuration mode. |
| **Step 4** | `event manager scheduler suspend`  
   **Example:**  
   Device(config)# event manager scheduler suspend | Immediately suspends the execution of all EEM policies. |
| **Step 5** | `exit`  
   **Example:**  
   Device(config)# exit | Exits global configuration mode and returns to privileged EXEC mode. |

### Displaying Embedded Event Manager History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. event manager history size {events | traps} [size]
4. exit
5. show event manager history events [detailed] [maximum number]
6. show event manager history traps {server | policy}

DETAILED STEPS

Step 1
enable
Enables privileged EXEC mode. Enter your password if prompted.
Example:
Device> enable

Step 2
configure terminal
Enters global configuration mode.
Example:
Device# configure terminal

Step 3
event manager history size {events | traps} [size]
Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:
Example:
Device(config)# event manager history size events 30

Step 4
exit
Exits global configuration mode and returns to privileged EXEC mode.
Example:
Device(config)# exit

Step 5
show event manager history events [detailed] [maximum number]
Use this command to display detailed information about each EEM event, for example:
Example:
Device# show event manager history events

<table>
<thead>
<tr>
<th>No.</th>
<th>Time of Event</th>
<th>Event Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fri Aug 13 21:42:57</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>2</td>
<td>Fri Aug 13 22:20:29</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>3</td>
<td>Wed Aug 18 21:54:48</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>4</td>
<td>Wed Aug 18 22:06:38</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>5</td>
<td>Wed Aug 18 22:30:58</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>6</td>
<td>Wed Aug 18 22:34:58</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>7</td>
<td>Wed Aug 18 22:51:18</td>
<td>snmp</td>
<td>applet: SAAping1</td>
</tr>
<tr>
<td>8</td>
<td>Wed Aug 18 22:51:18</td>
<td>application</td>
<td>applet: CustApp1</td>
</tr>
</tbody>
</table>

Step 6
show event manager history traps {server | policy}
Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy. In the following example, the EEM SNMP traps that were triggered from within an EEM policy are displayed.

**Example:**

```
Device# show event manager history traps policy
No. Time Trap Type Name
1 Wed Aug18 22:30:58 2004 policy EEM Policy Director
2 Wed Aug18 22:34:58 2004 policy EEM Policy Director
3 Wed Aug18 22:51:18 2004 policy EEM Policy Director
```

## Displaying Embedded Event Manager Registered Policies

Perform this optional task to display registered EEM policies.

**SUMMARY STEPS**

1. `enable`
2. `show event manager policy registered [event-type event-name] [time-ordered| name-ordered]`

**DETAILED STEPS**

### Step 1 `enable`

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

### Step 2 `show event manager policy registered [event-type event-name] [time-ordered| name-ordered]`

Use this command with the `time-ordered` keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
No. Type Event Type Time Registered Name
1 applet snmp Thu May30 05:57:16 2004 memory-fail
oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val
{5120000} poll-interval 90
action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $_snmp_oid_val bytes"
    action 2.0 force-switchover
2 applet syslog Wed Jul16 00:05:17 2004 intf-down
pattern {.*UPDOWN.*Ethernet1/0.*}
action 1.0 cns-event msg "Interface state change: $_syslog_msg"
```

Use this command with the `name-ordered` keyword to display information about currently registered policies sorted by name, for example:

**Example:**

```
```
Device# show event manager policy registered name-ordered
No. Type Event Type Time Registered Name
1 applet syslog Wed Jul16 00:05:17 2004 intf-down
   pattern {.*UPDOWN.*Ethernet1/0.*}
   action 1.0 cns-event msg "Interface state change: $_syslog_msg"
2 applet snmp Thu May30 05:57:16 2004 memory-fail
   oid {1.3.6.1.4.1.9.9.48.1.1.1.6.1} get-type exact entry-op lt entry-val
   {5120000} poll-interval 90
   action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $_snmp_oid_val bytes"
   action 2.0 force-switchover

Use this command with the event-type and event-name arguments, for example:

Example:

Device# show event manager policy registered event-type syslog
No. Type Event Type Time Registered Name
1 applet syslog Wed Jul16 00:05:17 2004 intf-down
   pattern {.*UPDOWN.*Ethernet1/0.*}
   action 1.0 cns-event msg "Interface state change: $_syslog_msg"

Configuring Event SNMP Notification

Perform this task to configure SNMP notifications.

**Before you begin**

- SNMP event manager must be configured using the `snmp-server manager` command.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `event manager applet applet-name`
4. `event [tag event-tag] snmp-notification oid oid-string oid-val comparison-value op operator [maxrun maxruntime-number] [src-ip-address ip-address] [dest-ip-address ip-address] [default seconds] [direction {incoming | outgoing}] [msg-op {drop | send}]`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring Multiple Event Support

The multiple event support feature adds the ability to register multiple events in the EEM server. The multiple event support involves one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The event parameters are specified in the CLI commands. The data structure to handle multiple events contains multiple event identifiers and correlation logic. This data is used to register multiple events in the EEM Server.

### Setting the Event Configuration Parameters

The `trigger` command enters the trigger applet configuration mode and specifies the multiple event configuration statements for EEM applets. The trigger statement is used to relate multiple event statement using the `tag` argument specified in each event statement. The events are raised based on the specified parameters.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `event manager applet applet-name`
4. `event [tag event-tag] cli pattern regular-expression sync {yes | no} skip {yes | no} {occurs num-occurrences} [period period-value] [maxrun maxruntime-number]`
5. `trigger [occurs occurs-value] [period period-value] [period-start period-start-value] [delay delay-value]`

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>

<tr>
<td>Specifies a complex event correlation in the trigger mode for an EEM applet.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> When &quot;and&quot; is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> attribute tag event-tag [occurs occurs-value]</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-applet)# attribute tag 1.0 occurs 1</td>
<td></td>
</tr>
<tr>
<td>Specifies up to eight attribute statements to build a complex event for an EEM applet.</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

Command or Action

<table>
<thead>
<tr>
<th>Step 8</th>
<th>action label cli command cli-string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-applet)# action 1.0 cli command “show pattern”</td>
</tr>
</tbody>
</table>

**Specifies the action of executing a CLI command when an EEM applet is triggered.**

**Examples**

In the following example, applet is run if the `show bgp all` CLI command and any syslog message that contains the string “COUNT” occurred within a period 60 seconds.

```plaintext
event manager applet delay 50
event tag 1.0 cli pattern "show bgp all" sync yes occurs 32 period 60 maxrun 60
evend tag 2.0 syslog pattern "COUNT"
trigger occurs 1 delay 50
correlate event 1.0 or event 2.0
attribute tag 1.0 occurs 1
attribute tag 2.0 occurs 1
action 1.0 cli command "show pattern"
action 2.0 cli command "enable"
action 3.0 cli command "config terminal"
action 4.0 cli command " ip route 192.0.2.0 255.255.255.224 192.0.2.12"
action 91.0 cli command "exit"
action 99.0 cli command "show ip route | incl 192.0.2.5"
```

### Configuring EEM Class-Based Scheduling

To schedule Embedded Event Manager (EEM) policies and set policy scheduling options, perform this task. In this task, two EEM execution threads are created to run applets assigned to the default class.

The EEM policies will be assigned a class using the `class` keyword when they are registered. EEM policies registered without a class will be assigned to the default class. Threads that have default class, will service the default class when the thread is available for work. Threads that are assigned specific class letters will service any policy with a matching class letter when the thread is available for work.

If there is no EEM execution thread available to run the policy in the specified class and a scheduler rule for the class is configured, the policy will wait until a thread of that class is available for execution. Synchronous policies that are triggered from the same input event should be scheduled in the same execution thread.

### SUMMARY STEPS

1. enable
2. configure terminal
3. event manager scheduler {applet | axp | call-home} thread class class-options number thread-number
4. exit
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>

<td><strong>Step 4</strong> exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Holding a Scheduled EEM Policy Event or Event Queue

To hold a scheduled EEM policy event or event queue in the EEM scheduler, perform this task. In this task, all pending EEM policies are displayed. A policy identified using a job ID of 2 is held in the EEM scheduler, and the final step shows that the policy with a job ID of 2 has changed status from pending to held.

### SUMMARY STEPS

1. enable
2. show event manager policy pending [queue-type{applet | call-home | axp | script} class class-options | detailed]
3. event manager scheduler hold {all | policy job-id | queue-type {applet | call-home | axp | script} class class-options} [processor {rp_primary | rp_standby}]
4. show event manager policy pending [queue-type{applet | call-home | axp | script} class class-options | detailed]

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2**
*show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options | detailed]*

**Example:**

```
Device# show event manager policy pending
```

- **Step 3**
*event manager scheduler hold {all policy job-id | queue-type {applet | call-home | axp | script} class class-options} [processor {rp_primary | rp_standby}]*

**Example:**

```
Device# event manager scheduler hold policy 2
```

- **Step 4**
*show event manager policy pending [queue-type {applet | call-home | axp | script} class class-options | detailed]*

**Example:**

```
Device# show event manager policy pending
```

### Examples

The following example shows how to view all pending EEM policies and to hold the EEM policy with a job ID of 2.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

```
Device# event manager scheduler hold policy 2
```

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 held Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

### Resuming Execution of EEM Policy Events or Event Queues

To resume the execution of specified EEM policies, perform this task. In this task, the policy that was put on hold in the Holding a Scheduled EEM Policy Event or Event Queue task is now allowed to resume execution.

### SUMMARY STEPS

1. enable
2. show event manager policy pending
3. event manager scheduler release {all | policy policy-id | queue-type {applet | call-home | axp | script}} class class-options [processor {rp_primary | rp_standby}]
4. show event manager policy pending
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. <em>Enter your password if prompted.</em></td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show event manager policy pending</td>
<td>Displays the pending and held EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager scheduler release { all</td>
<td>policy policy-id</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# event manager scheduler release policy 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> show event manager policy pending</td>
<td>Displays the status of the EEM policy resumed in Step 3 as pending, along with other pending policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to view all pending EEM policies, to specify the policy that will resume execution, and to see that the policy is now back in a pending status.

```
Device# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 held Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
Router# event manager scheduler release policy 2
Router# show event manager policy pending
no. job id status time of event event type name
1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three
```

### Clearing Pending EEM Policy Events or Event Queues

Perform this task to clear EEM policies that are executing or pending execution. In this task, the EEM policy with a job ID of 2 is cleared from the pending queue. The `show event manager policy pending` command is used to display the policies that are pending before and after the policy is cleared.
### SUMMARY STEPS

1. enable
2. show event manager policy pending
3. event manager scheduler clear {all | policy job-id | queue-type {applet | call-home | axp | script} class class-options} [processor {rp_primary | rp_standby}]
4. show event manager policy pending

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> show event manager policy pending</td>
<td>Displays the pending EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td>- Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager scheduler clear {all</td>
<td>policy job-id</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# event manager scheduler clear policy 2</td>
<td>- In this example, the EEM policy with a job ID of 2 is cleared from the pending queue.</td>
</tr>
<tr>
<td><strong>Step 4</strong> show event manager policy pending</td>
<td>Displays all the pending EEM policies except the policy cleared in Step 3.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show event manager policy pending</td>
<td>- Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to clear the EEM policy with a job ID of 2 that was pending execution. The **show** commands are used to display the policies that are pending before and after the policy is cleared.

```
Device# show event manager policy pending
no. job id status time of event event type name
 1 1 pend Thu Sep 7 02:54:04 2006 syslog applet: one
 2 2 pend Thu Sep 7 02:54:04 2006 syslog applet: two
 3 3 pend Thu Sep 7 02:54:04 2006 syslog applet: three

Device# event manager scheduler clear policy 2
Device# show event manager policy pending
```
Modifying the Scheduling Parameters of EEM Policy Events or Event Queues

To modify the scheduling parameters of the EEM policies, perform this task. The `show event manager policy pending` command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the `show event manager policy pending` command shows all policies assigned as class A.

**SUMMARY STEPS**

1. `enable`
2. `show event manager policy pending`
3. `event manager scheduler modify {all | policy job-id | queue-type {applet | call-home | axp | script} | class class-options} [queue-priority {high | last | low | normal}] [processor {rp_primary | rp_standby}]`
4. `show event manager policy pending`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 show event manager policy pending</td>
<td>Displays the pending EEM policies.</td>
</tr>
<tr>
<td>Example: Device# show event manager policy pending</td>
<td></td>
</tr>
<tr>
<td>Step 3 event manager scheduler modify {all</td>
<td>policy job-id</td>
</tr>
<tr>
<td>Example: Device# event manager scheduler modify all class A</td>
<td></td>
</tr>
<tr>
<td>Step 4 show event manager policy pending</td>
<td>Displays the EEM policies modified in Step 3 along with other pending policies.</td>
</tr>
<tr>
<td>Example: Device# show event manager policy pending</td>
<td></td>
</tr>
</tbody>
</table>

*Note* Only the syntax applicable to this task is used in this example. For more details, see the Cisco IOS Network Management Command Reference.
Examples

The following example shows how to modify the scheduling parameters of the EEM policies. In this example, the `show event manager policy pending` command displays policies that are assigned to the B or default class. All the currently pending policies are then changed to class A. After the configuration modification, the `show event manager policy pending` command verifies that all policies are now assigned as class A.

```
Device# show event manager policy pending
no. class status time of event event type name
1  default pend Thu Sep  7 02:54:04 2006 syslog applet: one
2  default pend Thu Sep  7 02:54:04 2006 syslog applet: two
3     B    pend Thu Sep  7 02:54:04 2006 syslog applet: three

Device# event manager scheduler modify all class A
Device# show event manager policy pending
no. class status time of event event type name
1     A    pend Thu Sep  7 02:54:04 2006 syslog applet: one
2     A    pend Thu Sep  7 02:54:04 2006 syslog applet: two
3     A    pend Thu Sep  7 02:54:04 2006 syslog applet: three
```

Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the `show event manager policy active` command.

**SUMMARY STEPS**

1. `show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]`

**DETAILED STEPS**

```
show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]
```

This command displays only the running EEM policies. This command includes `class`, `detailed` and `queue-type` optional keywords. The following is sample output from this command:

```
Example:

Device# show event manager policy active
no. job id p s status time of event event type name
1  12598 N A running Mon Oct29 20:49:37 2007 timer watchdog loop.tcl
2  12609 N A running Mon Oct29 20:49:42 2007 timer watchdog loop.tcl
3  12620 N A running Mon Oct29 20:49:46 2007 timer watchdog loop.tcl
4  12650 N A running Mon Oct29 20:49:59 2007 timer watchdog loop.tcl
5  12842 N A running Mon Oct29 20:51:13 2007 timer watchdog loop.tcl
default class - 6 applet events
no. job id p s status time of event event type name
1  15852 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
2  15853 N A running Mon Oct29 21:11:09 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
3  15854 N A running Mon Oct29 21:11:10 2007 counter WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
4  15855 N A running Mon Oct29 21:11:10 2007 timer watchdog WDOG_SYSLOG_CNTR_TRACK_INTF_APPL
```
Verifying Class-Based Active EEM Policies

To verify the active or the running EEM policies, use the `show event manager policy active` command.

**SUMMARY STEPS**

1. `show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]`

**DETAILED STEPS**

```
show event manager policy active [queue-type {applet|call-home|axp|script} class class-options | detailed]
```

This command displays only the running EEM policies. This command includes `class`, `detailed` and `queue-type` optional keywords. The following is sample output from this command:

**Example:**

```
Device# show event manager policy active
no. job id p s status time of event event type name
1 12598 N A running Mon Oct29 20:49:37 2007 timer watchdog loop.tcl
2 12609 N A running Mon Oct29 20:49:42 2007 timer watchdog loop.tcl
3 12620 N A running Mon Oct29 20:49:46 2007 timer watchdog loop.tcl
4 12650 N A running Mon Oct29 20:49:59 2007 timer watchdog loop.tcl
5 12842 N A running Mon Oct29 20:51:13 2007 timer watchdog loop.tcl
default class - 6 applet events

```

Verifying Pending EEM Policies

To verify the EEM policies that are pending for execution, use the `show event manager policy pending` command. Use the optional keywords to specify EEM class-based scheduling options.

**SUMMARY STEPS**

1. `show event manager policy pending [queue-type {applet|call-home|axp|script} class class-options | detailed]`

**DETAILED STEPS**

```
show event manager policy pending [queue-type {applet|call-home|axp|script} class class-options | detailed]
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
This command displays only the pending policies. This command includes `class`, `detailed` and `queue-type` optional keywords. The following is sample output from this command:

**Example:**

```
Device# show event manager policy pending
no. job id  p  s status time of event event type name
1 12851  N A  pend Mon Oct29 20:51:18 2007 timer watchdog loop.tcl
2 12868  N A  pend Mon Oct29 20:51:24 2007 timer watchdog loop.tcl
3 12873  N A  pend Mon Oct29 20:51:27 2007 timer watchdog loop.tcl
4 12907  N A  pend Mon Oct29 20:51:41 2007 timer watchdog loop.tcl
5 13100  N A  pend Mon Oct29 20:52:55 2007 timer watchdog loop.tcl
```

**Configuring EEM Applet (Interactive CLI) Support**

The synchronous applets are enhanced to support interaction with the local console (tty) using two commands, `action gets` and `action puts`, and these commands allow users to enter and display input directly on the console. The output for synchronous applets will bypass the system logger. The local console will be opened by the applets and serviced by the corresponding synchronous Event Detector pty. Synchronous output will be directed to the opened console.

**Reading and Writing Input from the Active Console for Synchronous EEM Applets**

Use the following tasks to implement EEM applet interactive CLI support:

**Reading Input from the Active Console**

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an `event_reqinfo` call, and store the given console information for use by the `action gets` command.

The `action gets` command reads a line of the input from the active console and stores the input in the variable. The trailing new line will not be returned.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **event manager applet** `applet-name`
4. **event none**
5. **action label** `gets` `variable`
6. **action label** `syslog` [priority `priority-level`] `msg` `msg-text`
7. **exit**

**DETAILED STEPS**

<table>
<thead>
<tr>

<td>Registers the applet with the EEM and enters applet configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# event manager applet action</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>event none</td>
<td>Specifies that an EEM policy is to be registered with the EEM and can be run manually.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-applet)# event none</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>action <em>label</em> gets <em>variable</em></td>
<td>Gets input from the local console in a synchronous applet and stores the value in the given variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-applet)# action label2 gets input</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>action <em>label</em> syslog [priority <em>priority-level</em>] <em>msg</em> <em>msg-text</em></td>
<td>Specifies the action to be taken when an EEM applet is triggered.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
| Device(config-applet)# action label3 syslog msg "Input entered was "$input"

<table>
<thead>
<tr>
<th><strong>Step 7</strong></th>
<th>Exits applet configuration mode and returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-applet)# exit</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to get the input from the local tty in a synchronous applet and store the value.

```
Device(config)# event manager applet action
Device(config-applet)# event none
Device(config-applet)# action label2 gets input
Device(config-applet)# action label3 syslog msg "Input entered was "$input"
```
Writing Input to the Active Console

When a synchronous policy is triggered, the related console is stored in the publish information specification. The policy director will query this information in an event_reqinfo call, and store the given console information for use by the action puts command.

The action puts command will write the string to the active console. A new line will be displayed unless the nonewline keyword is specified. The output from the action puts command for a synchronous applet is displayed directly to the console, bypassing the system logger. The output of the action puts command for an asynchronous applet is directed to the system logger.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager applet applet-name
4. event none
5. action label regexp string-pattern string-input [string-match [string-submatch1] [string-submatch2] [string-submatch3]]
6. action label puts [nonewline] string
7. exit
8. event manager run applet-name

</table>
### Configuring SNMP Library Extensions

Depending on your release, the SNMP Library Extensions feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

### SNMP Get and Set Operations

The SNMP Library Extensions feature extends the EEM applet `action info` and Tcl `sys_reqinfo_snmp` commands to include functionality for SNMP get-one, get-next, getid and set-any operations.
SNMP Get Operation

The SNMP event manager performs the SNMP get operation to retrieve one or more variables for the managed objects. Using the **action info type snmp oid get-type** and **action info type snmp getid** commands, you can configure the SNMP event manager to send an SNMP get request by specifying the variables to retrieve, and the IP address of the agent.

For example, if you want to retrieve the variable with the OID value of 1.3.6.1.2.1.1.1, you should specify the variable value, that is 1.3.6.1.2.1.1.1. If the specified values do not match, a trap will be generated and an error message will be written to the syslog history.

The **action info type snmp oid get-type** command specifies the type of the get operation to be performed. To retrieve the exact variable, the get operation type should be specified as **exact**. To retrieve a lexicographical successor of the specified OID value, the get operation type should be set to **next**.

The table below shows the built-in variables, in which the values retrieved from SNMP get operation are stored.

**Table 181: Built-in Variables for action info type snmp oid Command**

<table>
<thead>
<tr>
<th>Built-in Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_oid</td>
<td>The SNMP object ID.</td>
</tr>
<tr>
<td>_info_snmp_value</td>
<td>The value string of the associated SNMP data element.</td>
</tr>
</tbody>
</table>

GetID Operation

The **action info type snmp getid** command retrieves the following variables from the SNMP entity:

- sysDescr.0
- sysObjectID.0
- sysUpTime.0
- sysContact.0
- sysName.0
- sysLocation.0

The table below shows the built-in variables, in which the values retrieved from the SNMP getID operation are stored.

**Table 182: Built-in Variables for action info type snmp getid Command**

<table>
<thead>
<tr>
<th>Built-in Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_syslocation_oid</td>
<td>The OID value of the sysLocation variable.</td>
</tr>
<tr>
<td>_info_snmp_syslocation_value</td>
<td>The value string for the sysLocation variable.</td>
</tr>
<tr>
<td>_info_snmp_sysdescr_oid</td>
<td>The OID value of the sysDescr variable.</td>
</tr>
<tr>
<td>_info_snmp_sysdescr_value</td>
<td>The value string for the sysDescr variable.</td>
</tr>
<tr>
<td>_info_snmp_sysobjectid_oid</td>
<td>The OID value of the sysObjectId variable.</td>
</tr>
</tbody>
</table>
### Built-in Variable

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_info_snmp_sysobjectid_value</td>
</tr>
<tr>
<td>The value string for the sysObjectID variable.</td>
</tr>
<tr>
<td>_info_snmp_sysuptime_oid</td>
</tr>
<tr>
<td>The OID value of the sysUptime variable.</td>
</tr>
<tr>
<td>_info_snmp_sysuptime_value</td>
</tr>
<tr>
<td>The value string for the sysUptime variable.</td>
</tr>
<tr>
<td>_info_snmp_syscontact_oid</td>
</tr>
<tr>
<td>The OID value of the sysContact variable.</td>
</tr>
<tr>
<td>_info_snmp_syscontact_value</td>
</tr>
<tr>
<td>The value string for the sysContact variable.</td>
</tr>
</tbody>
</table>

The get operation requests can be sent to both local and remote hosts.

### SNMP Set Operation

All SNMP variables are assigned a default value in the MIB view. The SNMP event manager can modify the value of these MIB variables through set operation. The set operation can be performed only on the system that allows read-write access.

To perform a set operation, you must specify the type of the variable and the value associated with it.

The table below shows the valid OID types and values for each OID type.

### Table 183: OID Type and Value for Set Operation

<table>
<thead>
<tr>
<th>OID Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counter32</td>
<td>A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>gauge</td>
<td>A 32-bit number with a minimum value of 0. For example, the interface speed on a device is measured using a gauge object type. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>integer</td>
<td>A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a device interface, 1 represents up and 2 represents down. Integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
<tr>
<td>ipv4</td>
<td>IP version 4 address. IPv4 address in dotted decimal notation is valid.</td>
</tr>
<tr>
<td>octet string</td>
<td>An octet string in hexadecimal notation used to represent physical addresses. Text strings are valid.</td>
</tr>
<tr>
<td>string</td>
<td>An octet string in text notation used to represent text strings. Text strings are valid.</td>
</tr>
<tr>
<td>OID Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>unsigned32</td>
<td>A 32-bit number used to represent decimal value. Unsigned integer value in the range from 0 to 4294967295 is valid.</td>
</tr>
</tbody>
</table>

The set operation can be carried out on both local and remote hosts.

**SNMP Traps and Inform Requests**

Traps are SNMP notifications that alert the SNMP manager or the NMS to a network condition. SNMP inform requests refer to the SNMP notifications that alert the SNMP manager to a network condition and request for confirmation of receipt from the SNMP manager.

An SNMP event occurs when SNMP MIB object ID values are sampled, or when the SNMP counter crosses a defined threshold. If the notifications are enabled and configured for such events, the SNMP traps or inform messages generated. An SNMP notification event is triggered when an SNMP trap or inform message is received by the event manager server.

To send an SNMP trap or inform message when an Embedded Event Manager (EEM) applet is triggered, the `action info type snmp trap` and `action info type snmp inform` commands are used. The CISCO-EMBEDDED-EVENT-MGR-MIB.my is used to define the trap and inform messages.

**Configuring EEM Applet for SNMP Get and Set Operations**

While registering a policy with the event manager server, the actions associated with an SNMP event can be configured.

Perform this task to configure EEM applet for SNMP set and get operations.

**Before you begin**

- SNMP event manager must be configured using the `snmp-server manager` command.
- The SNMP community string should be set by using the `snmp-server community` command to enable access to the SNMP entity.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `event manager applet applet-name`
4. Do one of the following:
   - `event snmp oid oid-value get-type {exact | next} entry-op operator entry-val entry-val[exit-comb and] [exit-op operator] [exit-val exit-value] [exit-time exit-time-value] poll-interval poll-int-value`
5. `action label info type snmp oid oid-value get-type {exact | next} [community community-string] [ipaddr ip-address]`
6. `action label info type snmp oid oid-value set-type oid-type oid-type-value community community-string [ipaddr ip-address]`
7. `action label info type snmp getid oid-value [community community-string] [ipaddr ip-address]`
8. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
Example:  
Device> enable |  
• Enter your password if prompted. |
| Step 2 | configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| Step 3 | event manager applet *applet-name*  
Example:  
Device(config)# event manager applet snmp | Registers the applet with the event manager server and enters applet configuration mode. |
| Step 4 | Do one of the following:  
• event snmp oid *oid-value* get-type {exact | next}  
  entry-op *operator* entry-val *entry-value* [exit-comb | and] [exit-op *operator*] [exit-val *exit-value*]  
  [exit-time *exit-time-value*] [poll-interval *poll-int-value*]  
Example:  
Device(config-applet)# event snmp oid  
Example:  
1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact  
Example:  
entry-op lt entry-val 5120000 poll-interval 90 | Specifies the event criteria that cause the EEM applet to run.  
• In this example, an EEM event is triggered when free memory falls below the value of 5120000.  
• Exit criteria are optional, and if not specified, event monitoring is reenabled immediately. |
| Step 5 | action label info type snmp oid *oid-value* get-type {exact | next} [community *community-string*] [ipaddr *ip-address*]  
Example:  
Device(config-applet)# action 1.3 info type  
Example:  
snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type  
Example:  
exact community public ipaddr 172.17.16.69 | Specifies the type of get operation to perform.  
• In this example, the type of get operation is specified as exact and community string is specified as public. |
### Configuring EEM Applet for SNMP OID Notifications

Perform this task to configure SNMP notifications.

#### Before you begin

- SNMP event manager must be configured using the `snmp-server manager` command and SNMP agents must be configured to send and receive SNMP traps generated for an EEM policy.

- SNMP traps and informs must be enabled by using the `snmp-server enable traps event-manager` and `snmp-server enable traps` commands, to allow traps and inform requests to be sent from the device to the event manager server.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. **event manager applet** <code>applet-name</code>
4. Do one of the following:
   ```
   • event snmp oid <code>oid-value</code> get-type <code>{exact | next}</code> entry-op <code>operator</code> entry-val
     entry-value[exit-comb | and | exit-op <code>operator</code> entry-val]
   poll-interval poll-int-value
   ```
5. **action label info type snmp var** <code>variable-name oid oid-value oid-type oid-type-value</code>
6. **action label info type snmp trap** <code>enterprise-oid enterprise-oid-value generic-trapnum
   generic-trap-number specific-trapnum specific-trap-number trap-oid trap-oid-value trap-var
   trap-variable</code>
7. **action label info type snmp inform** <code>trap-oid trap-oid-value trap-var trap-variable community
   community-string ipaddr ip-address</code>
8. **exit**

</tr>
</tbody>
</table>
| `action label info type snmp var variable-name oid oid-value oid-type oid-type-value` | Specifies the instance of a managed object and its value.  
- In this example, the `sysDescr.0` variable is used. |
| **Example:** | 
| `Device(config-applet)# action 1.3 info type` | 
| `snmp var sysDescr.0 oid` | 
| `1.3.6.1.4.1.9.9.48.1.1.1.6.1 integer 4220` | 
| **Step 6** | | 
| `action label info type snmp trap enterprise-oid enterprise-oid-value generic-trapnum specific-trapnum specific-trap-number trap-oid trap-oid-value trap-var trap-variable` | Generates an SNMP trap when the EEM applet is triggered.  
- In this example, the `authenticationFailure` trap is generated. |
| **Note** | The specific trap number refers to the enterprise-specific trap, which is generated when an enterprise event occurs. If the generic trap number is not set to 6, the specific trap number you specify will be used to generate traps. |
| **Example:** | 
| `Device(config-applet)# action 1.4 info type` | 
| `snmp trap enterprise-oid 1.3.6.1.4.1.1` | 
| `1.3.6.1.4.1.1.226.0.2.1 trap-var sysUpTime.0` | 
| **Step 7** | | 
| `action label info type snmp inform trap-oid trap-oid-value trap-var trap-variable community community-string ipaddr ip-address` | Generates an SNMP inform request when the EEM applet is triggered.  
- In this example, the inform request is generated for the `sysUpTime.0` variable. |
| **Example:** | 
| `Device(config-applet)# action 1.4 info type` | 
| `snmp inform trap-oid 1.3.6.1.4.1.1.226.0.2.1` | 
| `172.69.16.2` |
## Configuring Variable Logic for EEM Applets

The Variable Logic for EEM Applets feature adds the ability to apply conditional logic within EEM applets. Before variable logic is introduced, applets have a linear structure where each action is executed in the order in which they are configured when the event is triggered. Conditional logic introduces a control structure that can change the flow of actions within applets depending on conditional expressions. Each control structure can contain a list of applet actions including looping and if/else actions which determine if the structure is executed or not.

The information in applet configuration mode is presented as background to set the context for the action commands.

To provide a consistent user interface between the Tool Command Language (Tcl) and the applet (CLI) based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl based implementation.
- Event specification data is written using the CLI applet submode configuration statements in the applet-based implementation.

Applet configuration mode is entered using the event manager applet command. In applet configuration mode the config prompt changes to (config-applet)#. In applet configuration mode two types of config statements are supported:

- **event** - used to specify the event criteria to cause this applet to run.
- **action** - used to specify a built-in action to perform.

Multiple **action** applet config commands are allowed within an applet configuration. If no **action** applet config command is present, a warning is displayed, upon exit, stating no statements are associated with this applet. When no statements are associated with this applet, events get triggered but no action is taken. If no commands are specified in applet configuration mode, the applet will be removed upon exit. The exit applet config command is used to exit from applet configuration mode.

Depending on your release, the Variable Logic for EEM Applets feature allows you to perform the following configurations.

### Prerequisites

To use this feature, you must be running Cisco IOS Release 12.4(22)T or a later release.

### Configuring Variable Logic for EEM Applets

EEM 3.0 adds new applet action commands to permit simple variable logic within applets.

To configure the variable logic using action commands perform the following tasks.
Specifying a Loop of Conditional Blocks

To specify a loop of a conditional block when an EEM applet is triggered, perform this task. In this task, a conditional loop is set to check if the value of the variable is less than 10. If the value of the variable is less than 10, then the message ‘i is $i’ is written to the syslog.

Note
Depending on your release, the set (EEM) command is replaced by the action set command. See the action label set command for more information. If the set (EEM) command is entered in certain releases, the IOS parser translates the set command to the action label set command.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. action label set
5. action label while string_op1 operator string_op2
6. Add any action as required.
7. action label end

</table>
Specifying if else Conditional Blocks

To specify the beginning of an if conditional statement followed by an else conditional statement, perform this task. The if or else conditional statements can be used in conjunction with each other or separately. In this task, the value of a variable is set to 5. An if conditional block is then specified to check if the value of the variable is less than 10. Provided the if conditional block is satisfied, an action command to output the message ‘x is less than 10’ is specified.

Following the if conditional block, an else conditional block is specified. Provided the if conditional block is not satisfied, an action command to output the message ‘x is greater than 10’ is specified.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager applet applet-name
4. action label set variable-name variable-value
5. action label if [stringop1] {eq | gt | ge | lt | le | ne} [stringop2]
6. Add any action as required.
7. action label else
8. Add any action as required.
9. end

**Example:**

Device(config-applet)# end

### Specifying foreach Iterating Statements

To specify a conditional statement that iterates over an input string using the delimiter as a tokenizing pattern, perform this task. The foreach iteration statement is used to iterate through a collection to get the desired information. The delimiter is a regular expression pattern string. The token found in each iteration is assigned to the given iterator variable. All arithmetic calculations are performed as long integers with out any checks for overflow. In this task, the value of the variable x is set to 5. An iteration statement is set to run through...
the input string red, blue, green, orange. For every element in the input string, a corresponding message is displayed on the screen.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager applet  
4. action label foreach  
5. Specify any action command
6. action label end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable  
Device> enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2** | configure terminal  
Device# configure terminal | Enters global configuration mode. |
| **Step 3** | event manager applet  applet-name  
Device(config)# event manager applet iteration | Registers the applet with the Embedded Event Manager (EEM) and enters applet configuration mode. |
| **Step 4** | action label foreach  
Device(config-applet)# action 2.0 foreach iterator "red blue green orange" | Iterates over an input string using the delimiter as a tokenizing pattern.  
- In this example, the iteration is run through the elements of the input string - red, blue, green and orange. |
| **Step 5** | Specify any action command  
Device(config-applet)# action 3.0 puts "Iterator is $iterator" | Performs the action as indicated by the action command.  
- In this example, the following message is displayed on the screen:  
  - Iterator is red  
  - Iterator is blue  
  - Iterator is green  
  - Iterator is orange |
Using Regular Expressions

To match a regular expression pattern with an input string, perform this task. Using regular expressions, you can specify the rules for a set of possible strings to be matched.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **event manager applet** *applet-name*
4. **action label** *regexp* *string-pattern* *string-input* [*string-match* [string-submatch1] [string-submatch2] [string-submatch3]]

**DETAILED STEPS**

<table>
<thead>

---

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
and the description for code 1 is “reply to the request”. When the return code from the applet replies to the request, a value is specified in the applet for the object using **action snmp-object-value** command.

- The **type** keyword specifies the type of object.
- The **value** argument is the value of the object.
- The skip keyword specifies whether to skip CLI command execution.
- The **default** keyword specifies the time to process the SET or GET request normally by the applet. If the **default** keyword is not specified, the default time period is set to 30 seconds.
- The **milliseconds** argument is the time period during which the SNMP Object event detector waits for the policy to exit.
- The **maxrun** keyword specifies the maximum runtime of the applet. If the **maxrun** keyword is specified, the maxruntime-number value must be specified. If the **maxrun** keyword is not specified, the default applet run time is 20 seconds.
- The **milliseconds** argument is the maximum runtime of the apple in milliseconds. If the argument is not specified, the default 20-second run-time limit is used.

**Step 5**

**Example:**

Device(config)# exit

**Disabling AAA Authorization**

Perform this task to allow EEM policies to bypass AAA authorization when triggered.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. event manager applet  
   applet-name [authorization bypass] [class class-options] [trap]
4. exit
DETAILED STEPS

```

---

**Configuration Examples for Writing Embedded Event Manager Policies Using Tcl**

**Embedded Event Manager Applet Configuration Examples**

The following examples show how to create an EEM applet for some of the EEM event detectors. These examples follow steps outlined in the Registering and Defining an Embedded Event Manager Applet, on page 1749.
**Application-Specific Event Detector**

The following example shows how a policy named EventPublish_A runs every 20 seconds and publishes an event type numbered 1 to an EEM subsystem numbered 798. The subsystem value of 798 specifies that a publish event has occurred from an EEM policy. A second policy named EventPublish_B is registered to run when the EEM event type 1 occurs with subsystem 798. When the EventPublish_B policy runs, it sends a message to syslog containing data passed as an argument from the EventPublish_A policy.

```plaintext
event manager applet EventPublish_A
  event timer watchdog time 20.0
  action 1.0 syslog msg "Applet EventPublish_A"
  action 2.0 publish-event sub-system 798 type 1 arg1 twenty
  exit

event manager applet EventPublish_B
  event application sub-system 798 type 1
  action 1.0 syslog msg "Applet EventPublish_B arg1 $_application_data1"
```

**CLI Event Detector**

The following example shows how to specify an EEM applet to run when the Cisco IOS `write memory` CLI command is run. The applet provides a notification that this event has occurred via a syslog message. In the example, the `sync` keyword is configured with the `yes` argument, and this means that the event detector is notified when this policy completes running. The exit status of the policy determines whether the CLI command will be executed. In this example, the policy exit status is set to one and the CLI command runs.

```plaintext
event manager applet cli-match
  event cli pattern "write mem.*" sync yes
  action 1.0 syslog msg "$cli_msg Command Executed"
  set 2.0 _exit_status 1
```

The following example shows an applet which matches the `cli` pattern with the test argument. When `show access-list test` is entered, the CLI event detector matches the test argument, and the applet is triggered. The debug event manager detector `cli` output is added to show num_matches is set to one.

```plaintext
! event manager applet EEM-PIPE-TEST
  event cli pattern "test" sync yes
  action 1.0 syslog msg "Pattern matched!"
!
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: command_string=show access-lists test
*Aug 23 23:19:59.827: check_eem_cli_policy_handler: num_matches = 1, response_code = 4
```

---

**Note**

The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe (|) character when redirection is used.

The following example shows that when `show version | include test` is entered, the applet fails to trigger because the CLI event detector does not match on characters entered after the pipe (|) character and the debug event manager detector `cli` output shows num_matches is set to zero.

```plaintext
```
**Counter Event Detector and Timer Event Detector**

The following example shows that the EventCounter_A policy is configured to run once a minute and to increment a well-known counter called critical_errors. A second policy--EventCounter_B--is registered to be triggered when the well-known counter called critical_errors exceeds a threshold of 3. When the EventCounter_B policy runs, it resets the counter to 0.

```plaintext
event manager applet EventCounter_A
event timer watchdog time 60.0
  action 1.0 syslog msg "EventCounter_A"
  action 2.0 counter name critical_errors op inc value 1
  exit

event manager applet EventCounter_B
  event counter name critical_errors entry-op gt entry-val 3 exit-op lt exit-val 3
  action 1.0 syslog msg "EventCounter_B"
  action 2.0 counter name critical_errors op set value 0
```

**Interface Counter Event Detector**

The following example shows how a policy named EventInterface is triggered every time the receive_throttle counter for Fast Ethernet interface 0/0 is incremented by 5. The polling interval to check the counter is specified to run once every 90 seconds.

```plaintext
event manager applet EventInterface
  event interface name FastEthernet0/0 parameter receive_throttle entry-op ge entry-val 5
  entry-val-is-increment true poll-interval 90
  action 1.0 syslog msg "Applet EventInterface"
```

**Resource Event Detector**

The following example shows how to specify event criteria based on an ERM event report for a policy defined to report high CPU usage:

```plaintext
event manager applet policy-one
  event resource policy cpu-high
  action 1.0 syslog msg "CPU high at $resource_current_value percent"
```

**RF Event Detector**

The RF event detector is only available on networking devices that contain dual Route Processors (RPs). The following example shows how to specify event criteria based on an RF state change notification:

```plaintext
event manager applet start-rf
  event rf event rf_prog_initialization
  action 1.0 syslog msg "rf state rf_prog_initialization reached"
```

**RPC Event Detector**

The RPC event detector allows an outside entity to make a Simple Object Access Protocol (SOAP) request to the device and invokes a defined EEM policy or script. The following example shows how an EEM applet called Event_RPC is being registered to run an EEM script:

```plaintext
event manager applet Event_RPC
  event rpc
  action print puts "hello there"
```
The following example shows the format of the SOAP request and reply message:

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP:Body>
    <run_eemscript>
      <script_name>Event_RPC</script_name>
    </run_eemscript>
  </SOAP:Body>
</SOAP:Envelope>
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP:Body>
    <run_eemscript_response>
      <return_code>0</return_code>
      <output></output>
    </run_eemscript_response>
  </SOAP:Body>
</SOAP:Envelope>
```

SNMP Event Detector

The following example shows how to specify an EEM applet to run when the CPU usage is greater than 75 percent. When the EEM applet runs, the CLI commands `enable` and `show cpu processes` are run, and an e-mail containing the result of the `show cpu processes` command is sent to an engineer.

```plaintext
event manager applet snmpcpuge75
  event snmp oid 1.3.6.1.4.1.9.9.109.1.1.1.1.6.1 get-type exact entry-op ge entry-val 75
  poll-interval 10
  action 1.0 cli command "enable"
  action 2.0 cli command "show process cpu"
  action 3.0 mail server "192.168.1.146" to "engineer@cisco.com" from "devtest@cisco.com"
  subject "B25 PBX Alert" body "$_cli_result"
```

The next example is more complex and shows how to configure an EEM applet that causes a switch to the secondary (redundant) Route Processor (RP) when the primary RP runs low on memory. This example illustrates a method for taking preventative action against a software fault that causes a memory leak. The action taken here is designed to reduce downtime by switching over to a redundant RP when a possible memory leak is detected.

The figure below shows a dual RP device that is running an EEM image. An EEM applet has been registered through the CLI using the `event manager applet` command. The applet will run when the available memory on the primary RP falls below the specified threshold of 5,120,000 bytes. The applet actions are to write a message to syslog that indicates the number of bytes of memory available and to switch to the secondary RP.

**Figure 125: Dual RP Topology**

The commands used to register the policy are shown below.

```plaintext
event manager applet memory-demo
  event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000
  poll-interval 90
  action 1.0 syslog priority critical msg "Memory exhausted; current available memory is
The registered applet is displayed using the `show event manager policy registered` command:

```
Device# show event manager policy registered
No. Type Event Type Time Registered Name
1 applet snmp Thu Jan30 05:57:16 2003 memory-demo
   oid (1.3.6.1.4.1.9.9.48.1.1.1.6.1) get-type exact entry-op lt entry-val (5120000)
   poll-interval 90
   action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $snmp_oid_val bytes"
   action 2.0 force-switchover
```

For the purpose of this example, a memory depletion is forced on the device, and a series of `show memory` commands are executed to watch the memory deplete:

```
Device# show memory
Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212348444 119523060 92825384 92825384 92365916
Fast 53565260 131080 70360 60720 60720 60668
Device# show memory
Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212364664 164509492 47855172 47855172 47169340
Fast 53565260 131080 70360 60720 60720 60668
Device# show memory
Head Total(b) Used(b) Free(b) Lowest(b) Largest(b)
Processor 53585260 212369492 179488300 32881192 32881192 32127556
Fast 53565260 131080 70360 60720 60720 60668
```

When the threshold is reached, an EEM event is triggered. The applet named memory-demo runs, causing a syslog message to be written to the console and a switch to be made to the secondary RP. The following messages are logged:

```
00:08:31: %HA_EM-2-LOG: memory-demo: Memory exhausted; current available memory is 4484196 bytes
00:08:31: %HA_EM-6-FMS_SWITCH_HARDWARE: fh_io_msg: Policy has requested a hardware switchover
```

The following is partial output from the `show running-config` command on both the primary RP and the secondary (redundant) RP:

```
redundancy
 mode sso
 .
 .
 !
 event manager applet memory-demo
   event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000 poll-interval 90
   action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $snmp_oid_val bytes"
   action 2.0 force-switchover
```

**SNMP Notification Event Detector**

The following example shows how to configure the `snmp-server community` public RW and `snmp-server manager` commands before `event snmp-notification` is configured.
snmp-server community public RW
snmp-server manager

The following example shows how an EEM applet called SNMP_Notification is being registered to run an EEM script when the device receives an SNMP notification on destination IP address 192.168.1.1 for object ID 1 whose value equals 10.

```
event manager applet SNMP_Notification
  event snmp-notification dest_ip_address 192.168.1.1 oid 1 op eq oid-value 10
  action 1 policy eem_script
```

**Syslog Event Detector**

The following example shows how to specify an EEM applet to run when syslog identifies that Ethernet interface 1/0 is down. The applet sends a message about the interface to syslog.

```
event manager applet interface-down
  event syslog pattern ".*UPDOWN.*Ethernet1/0.*" occurs 4
  action 1.0 syslog msg "Ethernet interface 1/0 changed state 4 times"
```

### Configuration Examples for Embedded Event Manager Applet

#### Example Identity Event Detector

The following example shows how a policy named “EventIdentity” is triggered every time the authentication on the Fast Ethernet interface 0 is success.

```
event manager applet EventIdentity
  event identity interface FastEthernet0 authc success
  action 1.0 syslog msg "Applet EventIdentity"
```

#### Example MAT Event Detector

The following example shows how a policy named “EventMat” is triggered every time a mac-address is learned in the mac-address-table.

```
event manager applet EventMat
  event mat interface FastEthernet0
  action 1.0 syslog msg "Applet EventMat"
```

#### Example Neighbor-Discovery Event Detector

The following example shows how a policy named “EventNeighbor” is triggered when a Cisco Discovery Protocol (CDP) cache entry changes.

```
event manager applet EventNeighbor
  event neighbor-discovery interface FastEthernet0 cdp all
  action 1.0 syslog msg "Applet EventNeighbor"
```
Embedded Event Manager Manual Policy Execution Examples

The following examples show how to use the none event detector to configure an EEM policy (applet or script) to be run manually.

Using the event manager run Command

This example shows how to run a policy manually using the `event manager run` command. The policy is registered using the `event none` command under applet configuration mode and then run from global configuration mode using the `event manager run` command.

```yaml
event manager applet manual-policy
  event none
    action 1.0 syslog msg "Manual-policy triggered"
  end
! event manager run manual-policy
```

Using the action policy Command

This example shows how to run a policy manually using the `action policy` command. The policy is registered using the `event none` command under applet configuration mode, and then the policy is executed using the `action policy` command in applet configuration mode.

```yaml
event manager applet manual-policy
  event none
    action 1.0 syslog msg "Manual-policy triggered"
    exit
! event manager applet manual-policy-two
  event none
    action 1.0 policy manual-policy
  end
! event manager run manual-policy-two
```

Embedded Event Manager Watchdog System Monitor (Cisco IOS) Event Detector Configuration Example

The following example shows how to configure three EEM applets to demonstrate how the Cisco IOS watchdog system monitor (IOSWDSysMon) event detector works.

Watchdog System Monitor Sample1 Policy

The first policy triggers an applet when the average CPU usage for the process named IP Input is greater than or equal to 1 percent for 10 seconds:

```yaml
event manager applet IOSWD_Sample1
  event ioswdsysmon sub1 cpu-proc taskname "IP Input" op ge val 1 period 10
  action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
```
Watchdog System Monitor Sample2 Policy

The second policy triggers an applet when the total amount of memory used by the process named Net Input is greater than 100 kb:

```
event manager applet IOSWD_Sample2
  event ioswdsysmon sub1 mem-proc taskname "Net Input" op gt val 100 is-percent false
  action 1.0 syslog msg "IOSWD_Sample2 Policy Triggered"
```

Watchdog System Monitor Sample3 Policy

The third policy triggers an applet when the total amount of memory used by the process named IP RIB Update has increased by more than 50 percent over the sample period of 60 seconds:

```
event manager applet IOSWD_Sample3
  event ioswdsysmon sub1 mem-used taskname "IP RIB Update" op gt val 50 is-percent true period 60
  action 1.0 syslog msg "IOSWD_Sample3 Policy Triggered"
```

The three policies are configured, and then repetitive large pings are made to the networking device from several workstations, causing the networking device to register some usage. This will trigger policies 1 and 2, and the console will display the following messages:

```
00:42:23: %HA_EM-6-LOG: IOSWD_Sample1: IOSWD_Sample1 Policy Triggered
00:42:47: %HA_EM-6-LOG: IOSWD_Sample2: IOSWD_Sample2 Policy Triggered
```

To view the policies that are registered, use the `show event manager policy registered` command:

```
Device# show event manager policy registered
No. Class Type Event Type Trap Time Registered Name
1 applet system ioswdsysmon Off Fri Jul 23 02:27:28 2004 IOSWD_Sample1
  sub1 cpu_util {taskname {IP Input} op ge val 1 period 10.000 }
  action 1.0 syslog msg "IOSWD_Sample1 Policy Triggered"
2 applet system ioswdsysmon Off Fri Jul 23 02:23:52 2004 IOSWD_Sample2
  sub1 mem_used {taskname {Net Input} op gt val 100 is_percent FALSE}
  action 1.0 syslog msg "IOSWD_Sample2 Policy Triggered"
3 applet system ioswdsysmon Off Fri Jul 23 03:07:38 2004 IOSWD_Sample3
  sub1 mem_used {taskname {IP RIB Update} op gt val 50 is_percent TRUE period 60.000 }
  action 1.0 syslog msg "IOSWD_Sample3 Policy Triggered"
```

Configuration SNMP Library Extensions Examples

SNMP Get Operations Examples

The following example shows how to send a get request to the local host.

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
  1.3.6.1.2.1.1.1.1.0 get-type exact entry-op
  lt entry-val
  5120000 poll-interval
  90
Device(config-applet)# action 1.3 info type snmp oid
  1.3.6.1.2.1.1.1.1.0 get-type exact
  community
   public
Device(config-applet)# action 1.3 info type snmp oid
```
1.3.6.1.2.1.1.4.0 get-type next community
public

The following log message will be written to the SNMP event manager log:

1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0

The following example shows how to send a get request to a remote host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp oid
1.3.6.1.2.1.1.4.0 get-type next community
public ipaddr
172.17.16.69
Device(config-applet)# action 1.3 info type snmp getid
1.3.6.1.2.1.1.1.0 community
public ipaddr
172.17.16.69

The following log message is written to the SNMP event manager log:

1d03h:%HA_EM-6-LOG: lg: 1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgn: 1.3.6.1.2.1.1.5.0

SNMP GetID Operations Examples

The following example shows how to send a getid request to the local host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.2.1.1.1.0 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp getid
community

The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=1.3.6.1.2.1.1.3.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_value=10131676
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_value=YYY

The following example shows how to send a getid request to a remote host.
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid 1.3.6.1.2.1.1.1.0 get-type exact entry-op lt entry-val 5120000 poll-interval 90
Device(config-applet)# action 1.3 info type snmp getid 1.3.6.1.2.1.1.1.0 community public ipaddr 172.17.16.69

The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_oid=1.3.6.1.2.1.1.5.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysname_value=jubjub.cisco.com
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_oid=1.3.6.1.2.1.1.6.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syslocation_value=
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysdescr_oid=1.3.6.1.2.1.1.1.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_oid=1.3.6.1.2.1.1.2.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysobjectid_value=products.222
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_sysuptime_oid=10131676
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_oid=1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lgid: _info_snmp_syscontact_value=YYY

Set Operations Examples

The following example shows how to perform a set operation on the local host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid 1.3.6.1.2.1.1.1.0 get-type exact entry-op lt entry-val 5120000 poll-interval 90
Device(config-applet)# action 1.3 info type snmp oid 1.3.6.1.2.1.1.4.0 set-type integer 5 sysName.0 community public

The following log message is written to the SNMP event manager log:

1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX

The following example shows how to perform a set operation on a remote host.

Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid 1.3.6.1.2.1.1.1.0 get-type exact entry-op lt entry-val 5120000 poll-interval 90
Device(config-applet)# action 1.3 info type snmp oid 1.3.6.1.2.1.1.4.0 set-type integer 5 sysName.0 community public ipaddr 172.17.16.69
The following log message is written to the SNMP event manager log:

```
1d04h:%HA_EM-6-LOG: lset: 1.3.6.1.2.1.1.4.0
1d04h:%HA_EM-6-LOG: lset: XXX
```

### Generating SNMP Notifications Examples

The following example shows how to configure SNMP traps for the sysUpTime.0 variable:

```
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt
entry-val 512000 poll-interval 90
Device(config-applet)# action 1.3 info type snmp var
sysUpTime.0 oid
1.3.6.1.4.1.9.9.43.1.1.6.1.3.41 integer 2
Device(config-applet)# action 1.4 info type snmp trap
enterprise-oid ciscoSyslogMIB.2 generic-trapnum
6 specific-trapnum
1 trap-oid
1.3.6.1.4.1.9.9.41.2.0.1 trap-var
sysUpTime.0
```

The following output is generated if the debug snmp packets command is enabled:

```
Device# debug snmp packets
1d04h: SNMP: Queuing packet to 172.69.16.2
1d04h: SNMP: V1 Trap, ent ciscoSyslogMIB.2, addr 172.19.rap 1
clogHistoryEntry.3 = 4
clogHistoryEntry.6 = 9999
1d04h: SNMP: Queuing packet to 172.19.208.130
1d04h: SNMP: V1 Trap, ent ciscoSyslogMIB.2, addr 172.19.rap 1
clogHistoryEntry.3 = 4
clogHistoryEntry.6 = 9999
1d04h: SNMP: Packet sent via UDP to 172.69.16.2
1d04h: SNMP: Packet sent via UDP to 172.69.16.2
infra-view10:

Enterprise Specific trap.
Enterprise Specific trap: 1
Time Ticks: 10191453
clogHistSeverity = error(4)
clogHistTimestamp = 9999
```

The following example shows how to configure SNMP inform requests for the sysUpTime.0 variable:
Device(config)# event manager applet snmp
Device(config-applet)# event snmp oid
1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
lt entry-val
5120000 poll-interval
90
Device(config-applet)# action 1.3 info type snmp var
sysUpTime.0 oid
1.3.6.1.4.1.9.9.43.1.1.6.1.3.41 integer
2
Device(config-applet)# action 1.4 info type snmp inform
trap-oid
1.3.6.1.4.1.9.9.43.2.0.1 trap-var
sysUpTime.0 community
public ipaddr
172.19.209.24

The following output is generated if the debug snmp packets command is enabled:

Device# debug snmp packets
1d04h: SNMP: Inform request, reqid 24, errstat 0, erridx 0
sysUpTime.0 = 10244391
snmpTrapOID.0 = ciscoConfigManMIB.2.0.1
ccmHistoryEventEntry.3.40 = 1
1d04h: SNMP: Packet sent via UDP to 172.19.209.24.162
1d04h: SNMP: Packet received via UDP from 172.19.209.24 on FastEthernet0/0
1d04h: SNMP: Response, reqid 24, errstat 0, erridx 0
1d04h: SNMP: Response, reqid 24, errstat 0, erridx 0
1d04h: SNMP: Inform request, reqid 25, errstat 0, erridx 0

5d04h: SNMP: Inform request, reqid 25, errstat 0, erridx 0

Configuring Variable Logic for EEM Applets Examples

The following sections provide examples on some selected action commands. For information on all the action commands supporting variable logic within applets, see the table below.

In this example, conditional loops **while**, **if** and **foreach** are used to print data. Other action commands such as **action divide**, **action increment** and **action puts** are used to define the actions to be performed when the conditions are met.

```
event manager applet printdata
```
event none
action 100 set colors "red green blue"
action 101 set shapes "square triangle rectangle"
action 102 set i "1"
action 103 while $i lt 6
action 104 divide $i 2
action 105 if $_remainder eq 1
action 106 foreach _iterator "$colors"
action 107 puts nonewline "$_iterator 
action 108 end
action 109 puts ""
action 110 else
action 111 foreach _iterator "$shapes"
action 112 puts nonewline "$_iterator 
action 113 end
action 114 puts ""
action 115 end
action 116 increment i
action 117 end

When the event manager applet ex is run, the following output is obtained:

event manager run printdata
red green blue
square triangle rectangle
red green blue
square triangle rectangle
red green blue

In this example, two environment variables poll_interface and max_rx_rate are set to F0/0 and 3 respectively. Every 30 seconds there is a poll on an interface for rx rate. If the rx rate is greater than the threshold, a syslog message is displayed.

This applet makes use of the foreach conditional statement to poll the interface, the if conditional block to compare the value under RXPS with max_rx_rate that was set in the EEM environment variable.

event manager environment poll_interfaces F0/0
event manager environment max_rx_rate 3
ev man app check Rx_rate
ev timer watchdog name rx_timer time 30
action 100 foreach int $poll_interfaces
action 101 cli command "en"
action 102 cli command "show int $int summ | beg ------"
action 103 foreach line $_cli_result "\n"
action 105 regexp ".*[0-9]+[0-9]+[0-9]+[0-9]+[0-9]+([0-9]+)\s+.*" $line
junk rxps
action 106 if $_regexp_result eq 1
action 107 if $rxps gt $max_rx_rate
action 108 syslog msg "Warning rx rate for $int is > than threshold. Current value is $rxps
(threshold is $max_rx_rate)"
action 109 end
action 110 end
action 111 end
action 112 end

Example syslog message:

Oct 16 09:29:26.153: %HA_EM-6-LOG: c: Warning rx rate for F0/0 is > than threshold. Current value is 4 (threshold is 3)
The output of show int F0/0 summ is of the format:
#show int f0/0 summ

*: interface is up
IHQ: pkts in input hold queue  IQD: pkts dropped from input queue
OQD: pkts dropped from output queue
RXBS: rx rate (bits/sec)  RXPS: rx rate (pkts/sec)
TXBS: tx rate (bits/sec)  TXPS: tx rate (pkts/sec)
TRTL: throttle count

<table>
<thead>

To use other action commands supporting variable logic within applets, use the commands listed in the table below.

**Table 184: Available action commands**

<table>
<thead>
<tr>
<th>Action Commands</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>action add</td>
<td>Adds the value of two variables when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action append</td>
<td>Appends the given value to the current value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action break</td>
<td>Causes an immediate exit from a loop of actions when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action comment</td>
<td>Adds comments to an applet when an EEM applet is triggered</td>
</tr>
<tr>
<td>action context retrieve</td>
<td>Retrieves variables identified by a given set of context name keys when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action context save</td>
<td>Saves information across multiple policy triggers when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action continue</td>
<td>Continues with a loop of actions when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action decrement</td>
<td>Decrements the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action divide</td>
<td>Divides the dividend value by the given divisor value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action else</td>
<td>Specifies the beginning of else conditional action block in if / else conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action elseif</td>
<td>Identifies the beginning of the else conditional action block in the else / if conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td><strong>Action Commands</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>action end</td>
<td>Specifies the identification of the end of an conditional action block in the if/else and while conditional action block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action exit</td>
<td>Specifies an immediate exit from the running applet configuration when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action foreach</td>
<td>Specifies the iteration of an input string using the delimiter as a tokenizing pattern, when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action gets</td>
<td>Gets an input from the local TTY in a synchronous applet and store the value in the given variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action if</td>
<td>Specifies the identification of the beginning of an if conditional block when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action if goto</td>
<td>Instructs the applet to jump to a given label if the specified condition is true when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action increment</td>
<td>Increments the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type interface-names</td>
<td>Specifies the action of obtaining interface names when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp getid</td>
<td>Retrieves the individual variables from a Simple Network Management Protocol (SNMP) entity during the SNMP get operation.</td>
</tr>
<tr>
<td>action info type snmp inform</td>
<td>Sends an SNMP inform requests when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp oid</td>
<td>Specifies the type of SNMP get operation and the object to retrieve during the SNMP set operation, when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp trap</td>
<td>Sends SNMP trap requests when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action info type snmp var</td>
<td>Creates a variable for an SNMP object identifier (OID) and its value from an EEM applet</td>
</tr>
<tr>
<td>action multiply</td>
<td>Specifies the action of multiplying the variable value with a specified given integer value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action puts</td>
<td>Enables the action of printing data directly to the local tty when an EEM applet is triggered.</td>
</tr>
<tr>
<td>Action Commands</td>
<td>Purpose</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>action regexp</td>
<td>Specifies the action of matching a regular expression pattern on an input string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action set (EEM)</td>
<td>Specifies the action of setting the value of a variable when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string compare</td>
<td>Specifies the action of comparing two unequal strings when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string equal</td>
<td>Specifies the action of verifying whether or not two strings are equal when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string first</td>
<td>Specifies the action of returning the index on the first occurrence of string1 within string2 when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string index</td>
<td>Specifies the action of returning the characters specified at a given index value when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string last</td>
<td>Specifies the action of returning the index on the last occurrence of string1 within string 2 when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string length</td>
<td>Specifies the action of returning the number of characters in a string when the EEM applet is triggered.</td>
</tr>
<tr>
<td>action string match</td>
<td>Specifies the action of returning 1 to the $_string_result, if the string matches the pattern when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string range</td>
<td>Specifies the action of storing a range of characters in a string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string replace</td>
<td>Specifies the action of storing a new string by replacing range of characters in the specified string when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string tolower</td>
<td>Specifies the action of storing specific range of characters of a string in lowercase when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string toupper</td>
<td>Specifies the action of storing specific range of characters of a string in uppercase when an EEM applet is triggered.</td>
</tr>
<tr>
<td>action string trim</td>
<td>Specifies the action to trim a string when an EEM applet is triggered.</td>
</tr>
</tbody>
</table>
### Configuring Event SNMP-Object Examples

The following example shows the SET operation and the value to set is in \$_snmp_value and it is managed by the script. The example below saves the oid and its value as contexts to be retrieved later.

```plaintext
event manager applet snmp-object1
description "APPLET SNMP-OBJ-1"
  event snmp-object oid 1.3.6.1.2.1.31.1.1.1.18 type string sync no skip no istable yes
default 0
  action 1 syslog msg "SNMP-OBJ1:TRIGGERED" facility "SNMP_OBJ"
  action 2 context save key myoid variable "_snmp_oid"
  action 3 context save key myvalue variable "_snmp_value"
```

### Configuring Description of an EEM Applet Examples

The following example shows how to add or modify the description for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP):

```plaintext
event manager applet test
description "This applet looks for the word count in syslog messages"
  event syslog pattern "count"
  action 1 syslog msg hi
```

Feature Information for Writing EEM 4.0 Policies Using the Cisco IOS CLI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 86

Writing Embedded Event Manager Policies Using Tcl

This module describes how software developers can write and customize Embedded Event Manager (EEM) policies using Tool command language (Tcl) scripts to handle Cisco software faults and events. EEM is a policy-driven process by means of which faults in the Cisco software system are reported through a defined application programing interface (API). The EEM policy engine receives notifications when faults and other events occur. EEM policies implement recovery on the basis of the current state of the system and the actions specified in the policy for a given event. Recovery actions are triggered when the policy is run.

• Prerequisites for Writing Embedded Event Manager Policies Using Tcl, on page 1811
• Information About Writing Embedded Event Manager Policies Using Tcl, on page 1811
• How to Write Embedded Event Manager Policies Using Tcl, on page 1818
• Configuration Examples for Writing Embedded Event Manager Policies Using Tcl, on page 1847
• Additional References, on page 1868

Prerequisites for Writing Embedded Event Manager Policies Using Tcl

• Before writing EEM policies, you should be familiar with the “Embedded Event Manager Overview” module.

• If you want to write EEM policies using the command-line interface (CLI) commands, you should be familiar with the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

Information About Writing Embedded Event Manager Policies Using Tcl

EEM Policies

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or reach a threshold. An EEM policy is an entity that defines an event and the actions to be taken
when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the command-line interface (CLI) configuration. A script is a form of policy that is written in Tool Command Language (Tcl).

**EEM Applet**

An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs. In EEM applet configuration mode, three types of configuration statements are supported. The event commands are used to specify the event criteria to trigger the applet to run, the action commands are used to specify an action to perform when the EEM applet is triggered, and the `set` command is used to set the value of an EEM applet variable. Currently only the `_exit_status` variable is supported for the `set` command.

Only one event configuration command is allowed within an applet configuration. When applet configuration submode is exited and no event command is present, a warning is displayed stating that no event is associated with the applet. If no event is specified, the applet is not considered registered. When no action is associated with the applet, events are still triggered but no actions are performed. Multiple action configuration commands are allowed within an applet configuration. Use the `show event manager policy registered` command to display a list of registered applets.

Before modifying an EEM applet, be aware that the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. It is safe to modify the applet without unregistering it, because changes are written to a temporary file. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

Action configuration commands within an applet are uniquely identified using the `label` argument, which can be any string value. Actions are sorted within an applet in ascending alphanumerical sequence using the `label` argument as the sort key, and they are run using this sequence. The same `label` argument can be used in different applets; the labels must be unique only within one applet.

The Embedded Event Manager schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

For more details about writing EEM policies using the Cisco IOS CLI, see the “Writing Embedded Event Manager Policies Using the Cisco IOS CLI” module.

**EEM Script**

All Embedded Event Manager scripts are written in Tcl. Tcl is a string-based command language that is interpreted at runtime. The version of Tcl supported is Tcl version 8.3.4 plus added script support. Scripts are defined using an ASCII editor on another device, not on the networking device. The script is then copied to the networking device and registered with EEM. Tcl scripts are supported by EEM. As an enforced rule, Embedded Event Manager policies are short-lived run time routines that must be interpreted and executed in less than 20 seconds of elapsed time. If more than 20 seconds of elapsed time are required, the maxrun parameter may be specified in the event_register statement to specify any desired value.

EEM policies use the full range of the Tcl language’s capabilities. However, Cisco provides enhancements to the Tcl language in the form of Tcl command extensions that facilitate the writing of EEM policies. The main categories of Tcl command extensions identify the detected event, the subsequent action, utility information, counter values, and system information.

EEM allows you to write and implement your own policies using Tcl. Writing an EEM script involves:
• Selecting the event Tcl command extension that establishes the criteria used to determine when the policy is run.
• Defining the event detector options associated with detecting the event.
• Choosing the actions to implement recovery or respond to the detected event.

EEM Policy Tcl Command Extension Categories

There are different categories of EEM policy Tcl command extensions.

<table>
<thead>
<tr>
<th>Category</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>EEM event Tcl command extensions (three types: event information, event registration, and event publish)</td>
<td>This category is represented by the event_register_xxx family of event-specific commands. There is a separate event information Tcl command extension in this category as well: event_reqinfo. This is the command used in policies to query the EEM for information about an event. There is also an EEM event publish Tcl command extension event_publish&gt; that publishes an application-specific event.</td>
</tr>
<tr>
<td>EEM action Tcl command extensions</td>
<td>These Tcl command extensions (for example, action_syslog) are used by policies to respond to or recover from an event or fault. In addition to these extensions, developers can use the Tcl language to implement any action desired.</td>
</tr>
<tr>
<td>EEM utility Tcl command extensions</td>
<td>These Tcl command extensions are used to retrieve, save, set, or modify application information, counters, or timers.</td>
</tr>
<tr>
<td>EEM system information Tcl command extensions</td>
<td>This category is represented by the sys_reqinfo_xxx family of system-specific information commands. These commands are used by a policy to gather system information.</td>
</tr>
<tr>
<td>EEM context Tcl command extensions</td>
<td>These Tcl command extensions are used to store and retrieve a Tcl context (the visible variables and their values).</td>
</tr>
</tbody>
</table>

Note: The Tcl command extensions available in each of these categories for use in all EEM policies are described in later sections in this document.

General Flow of EEM Event Detection and Recovery

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, the core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs.
When an event or fault is detected, Embedded Event Manager determines from the event publishers—an example would be the OIR events publisher in the figure below—if a registration for the encountered fault or event has occurred. EEM matches the event registration information with the event data itself. A policy registers for the detected event with the Tcl command extension `event_register xxx`. The event information Tcl command extension `event_reqinfo` is used in the policy to query the Embedded Event Manager for information about the detected event.

**Figure 126: Embedded Event Manager Core Event Detectors**

**Safe-Tcl**

Safe-Tcl is a safety mechanism that allows untrusted Tcl scripts to run in an interpreter that was created in the safe mode. The safe interpreter has a restricted set of commands that prevent accessing some system resources and harming the host and other applications. For example, it does not allow commands to access critical Cisco IOS file system directories.

Cisco-defined scripts run in full Tcl mode, but user-defined scripts run in Safe-Tcl mode. Safe-Tcl allows Cisco to disable or customize individual Tcl commands. For more details about Tcl commands, go to [http://www.tcl.tk/man/](http://www.tcl.tk/man/).

The following list of Tcl commands are restricted with a few exceptions. Restrictions are noted against each command or command keyword:

- **cd** — Change directory is not allowed to one of the restricted Cisco directory names.
• **encoding** -- The commands **encoding names**, **encoding convertfrom**, and **encoding convertto** are permitted. The **encoding system** command with no arguments is permitted, but the **encoding system** command with the ?encoding? keyword is not permitted.

• **exec** -- Not permitted.

• **fconfigure** -- Permitted.

• **file** -- The following are permitted:
  
  • file dirname
  • file exists
  • file extension
  • file isdirectory
  • file join
  • file pathtype
  • file rootname
  • file split
  • file stat
  • file tail

• **file** -- The following are not permitted:

  • file atime
  • file attributes
  • file channels
  • file copy
  • file delete
  • file executable
  • file isfile
  • file link
  • file lstat
  • file mkdir
  • file mtime
  • file nativenename
  • file normalize
  • file owned
  • file readable
  • file readlink
  • file rename
  • file rootname
  • file separator
  • file size
  • file system
  • file type
  • file volumes
  • file writable

• **glob** -- The **glob** command is not permitted when searching in one of the restricted Cisco directories. Otherwise, it is permitted.
• **load** -- Only files that are in the user policy directory or the user library directory are permitted to be loaded. Static packages (for example, libraries that consist of C code) are not permitted to be loaded with the **load** command.

• **open** -- The **open** command is not allowed for a file that is located in one of the restricted Cisco directories.

• **pwd** -- The **pwd** command is not permitted.

• **socket** -- The **socket** command is permitted.

• **source** -- The **source** command is permitted for files that are in the user policy directory or the user library directory.

### Bytecode Support for EEM 2.4

EEM 2.4 introduces bytecode language (BCL) support by accepting files with the standard bytecode script extension .tbc. Tcl version 8.3.4 defines a BCL and includes a compiler that translates Tcl scripts into BCL. Valid EEM policy file extensions in EEM 2.4 for user and system policies are .tcl (Tcl Text files) and .tbc (Tcl bytecode files).

Storing Tcl scripts in bytecode improves the execution speed of the policy because the code is precompiled, creates a smaller policy size, and obscures the policy code. Obfuscation makes it a little more difficult to modify scripts and hides logic to preserve intellectual property rights.

Support for bytecode is being added to provide another option for release of supported and trusted code. We recommend that you only run well understood, or trusted and supported software on network devices. To generate Tcl bytecode for IOS EEM support, use TclPro versions 1.4 or 1.5.

To translate a Tcl script to bytecode you can use procomp, part of Free TclPro Compiler, or Active State Tcl Development Kit. When a Tcl script is compiled using procomp, the code is scrambled and a .tbc file is generated. The bytecode files are platform-independent and can be generated on any operating system on which TclPro is available, including Windows, Linux, and UNIX. Procomp is part of TclPro and available from [http://www.tcl.tk/software/tclpro](http://www.tcl.tk/software/tclpro).

### Registration Substitution

In addition to regular Tcl substitution, EEM 2.3 permits the substitution of an individual parameter in an EEM event registration statement line with an environment variable.

EEM 2.4 introduces the ability to replace multiple parameters in event registration statement lines with a single environment variable.

---

**Note**

Only the first environment variable supports multiple parameter substitution. Individual parameters can still be specified with additional environment variables after the initial variable.

To illustrate the substitution, a single environment variable, $eem_syslog_statement is configured as:

```
::cisco::eem::event_register_syslog pattern COUNT
```

Using the registration substitution, the $eem_syslog_statement environment variable is used in the following EEM user policy:
$_eem_syslog_statement occurs $._eem_occurs_val
action syslog "this is test 3"

Environment variables must be defined before a policy using them is registered. To define the $._eem_syslog_statement environment variable:

Device(config)# event manager environment eem_syslog_statement
::cisco::eem::event_register_syslog pattern COUNT
Device(config)# event manager environment eem_occurs_val 2

Cisco File Naming Convention for EEM

All Embedded Event Manager policy names, policy support files (for example, e-mail template files), and library filenames are consistent with the Cisco file naming convention. In this regard, Embedded Event Manager policy filenames adhere to the following specification:

- An optional prefix--Mandatory.--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl_text.tcl.
- A filename body part containing a two-character abbreviation (see the table below) for the first event specified; an underscore part; and a descriptive field part that further identifies the policy.
- A filename suffix part defined as .tcl.

Embedded Event Manager e-mail template files consist of a filename prefix of email_template, followed by an abbreviation that identifies the usage of the e-mail template.

Embedded Event Manager library filenames consist of a filename body part containing the descriptive field that identifies the usage of the library, followed by _lib, and a filename suffix part defined as .tcl.

How to Write Embedded Event Manager Policies Using Tcl

Registering and Defining an EEM Tcl Script

Perform this task to configure environment variables and register an EEM policy. EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When an EEM policy is registered, the software examines the policy and registers it to be run when the specified event occurs.

Before you begin

You must have a policy available that is written in the Tcl scripting language. Sample policies are provided—see the details in the Sample EEM Policies, on page 1829 to see which policies are available for the Cisco IOS release image that you are using—and these sample policies are stored in the system policy directory.

SUMMARY STEPS

1. enable
2. show event manager environment [all] variable-name]
3. configure terminal
4. event manager environment variable-name string
5. Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script.
6. event manager policy policy-filename [type {system user}] [trap]
7. exit

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | Enables privileged EXEC mode.  
  - Example:
    Device> enable  
  - Enter your password if prompted. |
| **Step 2**        | (Optional) Displays the name and value of EEM environment variables.  
  - Example:
    Device# show event manager environment all  
  - The optional all keyword displays all the EEM environment variables.  
  - The optional variable-name argument displays information about the specified environment variable. |
| **Step 3**        | Enters global configuration mode.  
  - Example:
    Device# configure terminal |
| **Step 4**        | Configures the value of the specified EEM environment variable.  
  - Example:
    Device(config)# event manager environment _cron_entry 0-59/2 0-23/1 * * 0-6  
  - In this example, the software assigns a CRON timer environment variable to be set to the second minute of every hour of every day. |
| **Step 5**        | Repeat Registering and Defining an EEM Tcl Script to configure all the environment variables required by the policy to be registered in Registering and Defining an EEM Tcl Script. |
| **Step 6**        | Registers the EEM policy to be run when the specified event defined within the policy occurs.  
  - Example:
    Device(config)# event manager policy tm_cli_cmd.tcl  
  - Use the system keyword to register a Cisco-defined system policy.  
  - Use the user keyword to register a user-defined system policy.  
  - Use the trap keyword to generate an SNMP trap when the policy is triggered.  
  - In this example, the sample EEM policy named tm_cli_cmd.tcl is registered as a system policy. |
| **Step 7**        | Exits global configuration mode and returns to privileged EXEC mode.  
  - Example:
    Device(config)# exit |
Examples

In the following example, the `show event manager environment` privileged EXEC command is used to display the name and value of all EEM environment variables.

```
Device# show event manager environment all
No. Name Value
1  _cron_entry 0-59/2 0-23/1 * * 0-6
2  _show_cmd show ver
3  _syslog_pattern .*UPDOWN.*Ethernet1/0.*
4  _config_cmd1 interface Ethernet1/0
5  _config_cmd2 no shut
```

Displaying EEM Registered Policies

Perform this optional task to display EEM registered policies.

**SUMMARY STEPS**

1. `enable`
2. `show event manager policy registered [event-type event-name] [time-ordered| name-ordered] [detailed policy-filename]`

**DETAILED STEPS**

**Step 1**

`enable`

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device> enable

**Step 2**

`show event manager policy registered [event-type event-name] [time-ordered| name-ordered] [detailed policy-filename]`

Use this command with the `time-ordered` keyword to display information about currently registered policies sorted by time, for example:

**Example:**

```
Device# show event manager policy registered time-ordered
No. Type Event Type Trap Time Registered Name
1  system timer cron Off Wed May11 01:43:18 2005 tm_cli_cmd.tcl
  name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
  nice 0 priority normal maxrun 240
2  system syslog Off Wed May11 01:43:28 2005 sl_intf_down.tcl
  occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
  nice 0 priority normal maxrun 90
3  system proc abort Off Wed May11 01:43:38 2005 pr_cdp_abort.tcl
  instance 1 path {cdp2_iosproc}
  nice 0 priority normal maxrun 20
```

Use this command with the `name-ordered` keyword to display information about currently registered policies sorted by name, for example:
Example:

Device# show event manager policy registered name-ordered

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Trap</th>
<th>Time</th>
<th>Registered Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>system</td>
<td>proc abort</td>
<td>Off</td>
<td>Wed May11 01:43:38</td>
<td>pr_cdp_abort.tcl instance 1 path {cdp2.iosproc} nice 0 priority normal maxrun 20</td>
</tr>
<tr>
<td>2</td>
<td>system</td>
<td>syslog</td>
<td>Off</td>
<td>Wed May11 01:43:28</td>
<td>sl_intf_down.tcl occurs 1 pattern {.*UPDOWN.<em>Ethernet1/0.</em>} nice 0 priority normal maxrun 90</td>
</tr>
<tr>
<td>3</td>
<td>system</td>
<td>timer cron</td>
<td>Off</td>
<td>Wed May11 01:43:18</td>
<td>tm_cli_cmd.tcl name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7} nice 0 priority normal maxrun 240</td>
</tr>
</tbody>
</table>

Use this command with the `event-type` keyword to display information about currently registered policies for the event type specified in the `event-name` argument, for example:

Example:

Device# show event manager policy registered event-type syslog

<table>
<thead>
<tr>
<th>No.</th>
<th>Type</th>
<th>Event Type</th>
<th>Time</th>
<th>Registered Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>system</td>
<td>syslog</td>
<td>Wed May11 01:43:28</td>
<td>sl_intf_down.tcl occurs 1 pattern {.*UPDOWN.<em>Ethernet1/0.</em>} nice 0 priority normal maxrun 90</td>
</tr>
</tbody>
</table>

---

**Unregistering EEM Policies**

Perform this task to remove an EEM policy from the running configuration file. Execution of the policy is canceled.

**SUMMARY STEPS**

1. enable
2. show event manager policy registered [event-type event-name][system] [user] [time-ordered] name-ordered] [detailed policy-filename]
3. configure terminal
4. no event manager policy policy-filename
5. exit
6. Repeat **Unregistering EEM Policies** to ensure that the policy has been removed.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>show event manager policy registered [event-type event-name][system] [user] [time-ordered] name-ordered] [detailed policy-filename]</td>
<td>(Optional) Displays the EEM policies that are currently registered.</td>
</tr>
</tbody>
</table>
### Unregistering EEM Policies

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| Device# show event manager policy registered | • The optional `system` or `user` keyword displays the registered system or user policies.  
• If no keywords are specified, EEM registered policies for all event types are displayed in time order. |

#### Step 3

**configure terminal**

*Example:*

Device# configure terminal

Enters global configuration mode.

#### Step 4

**no event manager policy  policy-filename**

*Example:*

Device(config)# no event manager policy pr_cdp_abort.tcl

Removes the EEM policy from the configuration, causing the policy to be unregistered.

• In this example, the `no` form of the command is used to unregister a specified policy.

#### Step 5

**exit**

*Example:*

Device(config)# exit

Exits global configuration mode and returns to privileged EXEC mode.

#### Step 6

Repeat Unregistering EEM Policies to ensure that the policy has been removed.

*Example:*

Device# show event manager policy registered

---

### Examples

In the following example, the `show event manager policy registered` privileged EXEC command is used to display the three EEM policies that are currently registered:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:43:18 2005 tm_cli_cmd.tcl
   name (crontimer2) cron entry {0-59/1 0-23/1 * * 0-7}
   nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:43:28 2005 sl_intf_down.tcl
   occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
   nice 0 priority normal maxrun 90.000
3 system proc abort Off Tue Oct11 01:43:38 2005 pr_cdp_abort.tcl
   instance 1 path {cdp2.iosproc}
   nice 0 priority normal maxrun 20.000
```

After the current policies are displayed, it is decided to delete the `pr_cdp_abort.tcl` policy using the `no` form of the `event manager policy` command:

```
Device# configure terminal
```
Device(config)# no event manager policy pr_cdp_abort.tcl
Device(config)# exit

The *show event manager policy registered* privileged EXEC command is entered again to display the EEM policies that are currently registered. The policy pr_cdp_abort.tcl is no longer registered.

Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Tue Oct11 01:45:17 2005 tm_cli_cmd.tcl
   name {crontimer2} cron entry {0-59/1 0-23/1 * * 0-7}
   nice 0 priority normal maxrun 240.000
2 system syslog Off Tue Oct11 01:45:27 2005 sl_intf_down.tcl
   occurr 1 pattern {.*UPDOWN.*Ethernet1/0.*}
   nice 0 priority normal maxrun 90.000

**Suspending EEM Policy Execution**

Perform this task to immediately suspend the execution of all EEM policies. Suspending policies, instead of unregistering them, might be necessary for reasons of temporary performance or security.

**SUMMARY STEPS**

1. enable
2. show event manager policy registered [event-type event-name][system|user] [time-ordered]
3. configure terminal
4. event manager scheduler suspend
5. exit

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
Example:  
Device> enable |
| Step 2 | show event manager policy registered [event-type event-name][system|user] [time-ordered] [name-ordered] [detailed policy-filename] | (Optional) Displays the EEM policies that are currently registered.  
Example:  
Device# show event manager policy registered |
| Step 3 | configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
Managing EEM Policies

Perform this task to specify a directory to use for storing user library files or user-defined EEM policies.

### Table

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> event manager scheduler suspend</td>
<td>Immediately suspends the execution of all EEM policies.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# event manager scheduler suspend</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

In the following example, the `show event manager policy registered` privileged EXEC command is used to display all the EEM registered policies:

```
Device# show event manager policy registered
No. Type Event Type Trap Time Registered Name
1 system timer cron Off Sat Oct 11 01:43:18 2003 tm_cli_cmd.tcl
   name (crontimer2) cron entry [0-59/1 0-23/1 * * 0-7]
   nice 0 priority normal maxrun 240.000
2 system syslog Off Sat Oct 11 01:43:28 2003 sl_intf_down.tcl
   occurs 1 pattern {.*UPDOWN.*Ethernet1/0.*}
   nice 0 priority normal maxrun 90.000
3 system proc abort Off Sat Oct 11 01:43:38 2003 pr_cdp_abort.tcl
   instance 1 path {cdp2.iosproc}
   nice 0 priority normal maxrun 20.000
```

The `event manager scheduler suspend` command is entered to immediately suspend the execution of all EEM policies:

```
Device# configure terminal
Device(config)# event manager scheduler suspend
*Nov 2 15:34:39.000: %HA_EM-6-FMS_POLICY_EXEC: fh_io_msg: Policy execution has been suspended
```

### Managing EEM Policies

Perform this task to specify a directory to use for storing user library files or user-defined EEM policies.

#### Note

This task applies only to EEM policies that are written using Tcl scripts.

### SUMMARY STEPS

1. **enable**
2. **show event manager directory user [library|policy]**
3. **configure terminal**
4. **event manager directory user [library path|policy path]**
5. **exit**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt;</code> <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>(Optional) Displays the directory to use for storing EEM user library or policy files.</td>
</tr>
<tr>
<td>`show event manager directory user [library</td>
<td>policy]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>- The optional <code>policy</code> keyword displays the directory to use for user-defined EEM policies.</td>
</tr>
<tr>
<td><code>Device# show event manager directory user library</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies a directory to use for storing user library files or user-defined EEM policies.</td>
</tr>
<tr>
<td>`event manager directory user {library path</td>
<td>policy path}`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# event manager directory user library disk0:/user_library</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# event manager directory user library bootflash:/user_library</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>exit</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# exit</code></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the **show event manager directory user** privileged EXEC command is used to display the directory, if it exists, to use for storing EEM user library files:

```
Device# show event manager directory user library
disk0:/user_library
```

```
Device# show event manager directory user library
bootflash:/user_library
```
Modifying History Table Size and Displaying EEM History Data

Perform this optional task to change the size of the history tables and to display EEM history data.

SUMMARY STEPS

1. enable
2. configure terminal
3. event manager history size {events | traps} [size]
4. exit
5. show event manager history events [detailed] [maximum number]
6. show event manager history traps [server | policy]

DETAILED STEPS

**Step 1**  enable
Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device> enable

**Step 2**  configure terminal
Enters global configuration mode.

**Example:**

Device# configure terminal

**Step 3**  event manager history size {events | traps} [size]
Use this command to change the size of the EEM event history table or the size of the EEM SNMP trap history table. In the following example, the size of the EEM event history table is changed to 30 entries:

**Example:**

Device(config)# event manager history size events 30

**Step 4**  exit
Exits global configuration mode and returns to privileged EXEC mode.

**Example:**

Device(config)# exit

**Step 5**  show event manager history events [detailed] [maximum number]
Use this command to display information about each EEM event that has been triggered.

**Example:**

Device# show event manager history events
No. Time of Event Event Type Name
Step 6  
show event manager history traps [server | policy]

Use this command to display the EEM SNMP traps that have been sent either from the EEM server or from an EEM policy.

Example:

<table>
<thead>
<tr>
<th>No.</th>
<th>Time</th>
<th>Trap Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fri Sep 9 13:48:40 2005</td>
<td>server</td>
<td>applet: four</td>
</tr>
<tr>
<td>2</td>
<td>Fri Sep 9 13:57:03 2005</td>
<td>policy</td>
<td>script: no_snmp_test.tcl</td>
</tr>
</tbody>
</table>

Displaying Software Modularity Process Reliability Metrics Using EEM

Perform this optional task to display reliability metrics for Cisco IOS Software Modularity processes. The show event manager metric processes command is supported only in Software Modularity images.

SUMMARY STEPS

1. enable
2. show event manager metric process {all} process-name

DETAILED STEPS

Step 1  
enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2  
show event manager metric process {all} process-name

Use this command to display the reliability metric data for processes. The system keeps a record of when processes start and end, and this data is used as the basis for reliability analysis. In this partial example, the first and last entries showing the metric data for the processes on all the cards inserted in the system are displayed.

Example:

Device# show event manager metric process all

process name: devc-pty, instance: 1
sub_system id: 0, version: 00.00.0000
last event type: process start
recent start time: Fri Oct10 20:34:40 2005
recent normal end time: n/a
Troubleshooting Tips

Use the `debug event manager` command in privileged EXEC mode to troubleshoot EEM command operations. Use any debugging command with caution because the volume of output generated can slow or stop the device operations. We recommend that this command be used only under the supervision of a Cisco engineer.

Modifying the Sample EEM Policies

Perform this task to modify one of the sample policies. Cisco software contains some sample policies in the images that contain the Embedded Event Manager. Developers of EEM policies may modify these policies by customizing the event for which the policy is to be run and the options associated with logging and responding to the event. In addition, developers may select the actions to be implemented when the policy runs.
Sample EEM Policies

Cisco includes a set of sample policies shown in the table below. You can copy the sample policies to a user directory and then modify the policies, or you can write your own policies. Tcl is currently the only Cisco-supported scripting language for policy creation. Tcl policies can be modified using a text editor such as Emacs. Policies must execute within a defined number of seconds of elapsed time, and the time variable can be configured within a policy. The default is currently 20 seconds.

The table below describes the sample EEM policies.

Table 188: Sample EEM Policy Descriptions

<table>
<thead>
<tr>
<th>Name of Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pr_cdp_abort.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for cdp2.iosproc process abort events. It will log a message to SYSLOG and send an e-mail with the details of the abort.</td>
</tr>
<tr>
<td>pr_crash_reporter.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for all process abort events. When an event occurs, the policy will send crash information, including the crashdump file, to the specified URL where a CGI script processes the data.</td>
</tr>
<tr>
<td>pr_iprouting_abort.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy monitors for iprouting.iosproc process abort events. It will log a message to SYSLOG and send an e-mail with the details of the abort.</td>
</tr>
<tr>
<td>sl_intf_down.tcl</td>
<td>This policy runs when a configurable syslog message is logged. It will execute a configurable CLI command and e-mail the results.</td>
</tr>
<tr>
<td>tm_cli_cmd.tcl</td>
<td>This policy runs using a configurable CRON entry. It will execute a configurable CLI command and e-mail the results.</td>
</tr>
<tr>
<td>tm_crash_history.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy runs at midnight every day and e-mails a process crash history report to a specified e-mail address.</td>
</tr>
<tr>
<td>tm_crash_reporter.tcl</td>
<td>This policy runs 5 seconds after it is registered. If the policy is saved in the configuration, it will also run each time that the device is reloaded. The policy will prompt for the reload reason. If the reload was due to a crash, the policy will search for the latest crashinfo file and send this information to a specified URL location.</td>
</tr>
<tr>
<td>tm_fsys_usage.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message will be displayed if disk space usage crosses configurable thresholds.</td>
</tr>
<tr>
<td>wd_mem_reporter.tcl</td>
<td>Introduced with Cisco Software Modularity images. This policy reports on low system memory conditions when the amount of memory available falls below 20 percent of the initial available system memory. A syslog message will be displayed and, optionally, an e-mail will be sent.</td>
</tr>
</tbody>
</table>

For more details about the sample policies available and how to run them, see the EEM Event Detector Demo Examples, on page 1847.
SUMMARY STEPS

1. enable
2. show event manager policy available detailed policy-filename
3. Cut and paste the contents of the sample policy displayed on the screen to a text editor.
4. Edit the policy and save it with a new filename.
5. Copy the new file back to the device flash memory.
6. configure terminal
7. event manager directory user {library path|policy path}
8. event manager policy policy-filename [type {system user} ] [trap]

DETAILED STEPS

---

Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable

Step 2 show event manager policy available detailed policy-filename

Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The detailed keyword was introduced for the show event manager policy available and the show event manager policy registered commands. Depending on your release, you may need to copy one of the two Tcl scripts from the configuration examples section in this document (see the Programming Policies with Tcl Sample Scripts Example, on page 1855). In the following example, details about the sample policy tm_cli_cmd.tcl are displayed on the screen.

Example:

Device# show event manager policy available detailed tm_cli_cmd.tcl

Step 3 Cut and paste the contents of the sample policy displayed on the screen to a text editor.

Use the edit and copy functions to move the contents from the device to a text editor on another device.

Step 4 Edit the policy and save it with a new filename.

Use the text editor to modify the policy as a Tcl script. For file naming conventions, see the Cisco File Naming Convention for EEM, on page 1817.

Step 5 Copy the new file back to the device flash memory.

Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Configuration Fundamentals Configuration Guide.

Step 6 configure terminal

Enters global configuration mode.

Example:
Step 7  `event manager directory user {library path|policy path}`

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on disk0 is specified as the directory for storing user library files.

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the user_library directory on bootflash is specified as the directory for storing user library files.

**Example:**

```
Device(config)# event manager directory user library disk0:/user_library
Device(config)# event manager directory user library bootflash:/user_library
```

Step 8  `event manager policy policy-filename [type {system|user}] [trap]`

Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named test.tcl is registered as a user-defined policy.

**Example:**

```
Device(config)# event manager policy test.tcl type user
```

---

**Programming EEM Policies with Tcl**

Perform this task to help you program a policy using Tcl command extensions. We recommend that you copy an existing policy and modify it. There are two required parts that must exist in an EEM Tcl policy: the `event_register` Tcl command extension and the body. All other sections shown in the Tcl Policy Structure and Requirements, on page 1831 concept are optional.

**Tcl Policy Structure and Requirements**

All EEM policies share the same structure, shown in the figure below. There are two parts of an EEM policy that are required: the `event_register` Tcl command extension and the body. The remaining parts of the policy are optional: environment must defines, namespace import, entry status, and exit status.
The start of every policy must describe and register the event to detect using an `event_register` Tcl command extension. This part of the policy schedules the running of the policy. The following example Tcl code shows how to register the `event_register_timer` Tcl command extension:

::cisco::eem::event_register_timer cron name crontimer2 cron_entry $_cron_entry maxrun 240

The environment must defines section is optional and includes the definition of environment variables. The following example Tcl code shows how to check for, and define, some environment variables.

```tcl
# Check if all the env variables that we need exist. # If any of them does not exist, print out an error msg and quit.
if {![info exists _email_server]} {
    set result "Policy cannot be run: variable _email_server has not been set"
    error $result $errorInfo
}
if {![info exists _email_from]} {
    set result "Policy cannot be run: variable _email_from has not been set"
    error $result $errorInfo
}
if {![info exists _email_to]} {
    set result "Policy cannot be run: variable _email_to has not been set"
    error $result $errorInfo
}
```

The namespace import section is optional and defines code libraries. The following example Tcl code shows how to configure a namespace import section.

```tcl
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```

The body of the policy is a required structure and might contain the following:

- The `event_reqinfo` event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as `action_syslog`, that are used to specify EEM specific actions.
• The system information Tcl command extensions, such as `sys_reqinfo_routernam`, that are used to obtain general system information.

• Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.

• The `context_save` and `context_retrieve` Tcl command extensions that are used to save Tcl variables for use by other policies.

The following example Tcl code shows the code to query an event and log a message as part of the body section.

```tcl
# Query the event info and log a message.
array set arr_einfo [event_reqinfo]
if {$_errno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
             $cerr_sub_num $cerr_sub_err $cerr_posix_err $cerr_str]
    error $result
}
global timer_type timer_time_sec
set timer_type $arr_einfo(timer_type)
set timer_time_sec $arr_einfo(timer_time_sec)

# Log a message.
set msg [format "timer event: timer type %s, time expired %s" 
         $timer_type [clock format $timer_time_sec]]
action_syslog priority info msg $msg
if {$_errno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" 
                $cerr_sub_num $cerr_sub_err $cerr_posix_err $cerr_str]
    error $result
}
```

**EEM Entry Status**

The entry status part of an EEM policy is used to determine if a prior policy has been run for the same event, and to determine the exit status of the prior policy. If the `_entry_status` variable is defined, a prior policy has already run for this event. The value of the `_entry_status` variable determines the return code of the prior policy.

Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

**EEM Exit Status**

When a policy finishes running its code, an exit value is set. The exit value is used by the Embedded Event Manager to determine whether or not to apply the default action for this event, if any. A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.
EEM Policies and Cisco Error Number

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable _cerrno. Whenever _cerrno is set, four other Tcl global variables are derived from _cerrno and are set along with it (_cerr_sub_num, _cerr_sub_err, _cerr_posix_err, and _cerr_str).

For example, the action_syslog command in the example below sets these global variables as a side effect of the command execution:

```tcl
action_syslog priority warning msg "A sample message generated by action_syslog"
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
```

_cerrno: 32-Bit Error Return Values

The _cerrno set by a command can be represented as a 32-bit integer of the following form:

```
XYSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSSS
```

For example, the following error return value might be returned from an EEM Tcl command extension:

```
862439AE
```

This number is interpreted as the following 32-bit value:

```
10001100010001000100011101011110
```

This 32-bit integer is divided up into the five variables shown in the table below.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XY</td>
<td>The error class (indicates the severity of the error). This variable corresponds to the first two bits in the 32-bit error return value; 10 in the case above, which indicates CERR_CLASS_WARNING: See the table below for the four possible error class encodings specific to this variable.</td>
</tr>
<tr>
<td>SSSSSSSSSSSSSSS</td>
<td>The subsystem number that generated the most recent error (13 bits = 8192 values). This is the next 13 bits of the 32-bit sequence, and its integer value is contained in $_cerr_sub_num.</td>
</tr>
<tr>
<td>EEEEEEEE</td>
<td>The subsystem specific error number (8 bits = 256 values). This segment is the next 8 bits of the 32-bit sequence, and the string corresponding to this error number is contained in $_cerr_sub_err.</td>
</tr>
<tr>
<td>PPPPPPPP</td>
<td>The pass-through POSIX error code (9 bits = 512 values). This represents the last of the 32-bit sequence, and the string corresponding to this error code is contained in $_cerr_posix_err.</td>
</tr>
</tbody>
</table>

Error Class Encodings for XY

<table>
<thead>
<tr>
<th>XY</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>CERR_CLASS_FATAL</td>
</tr>
<tr>
<td>01</td>
<td>CERR_CLASS_LOG</td>
</tr>
<tr>
<td>10</td>
<td>CERR_CLASS_WARNING</td>
</tr>
<tr>
<td>11</td>
<td>CERR_CLASS_ERROR</td>
</tr>
</tbody>
</table>
The first variable, XY, references the possible error class encodings shown in the table below.

### Table 190: Error Class Encodings

<table>
<thead>
<tr>
<th>Value</th>
<th>Error Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>CERR_CLASS_SUCCESS</td>
</tr>
<tr>
<td>01</td>
<td>CERR_CLASS_INFO</td>
</tr>
<tr>
<td>10</td>
<td>CERR_CLASS_WARNING</td>
</tr>
<tr>
<td>11</td>
<td>CERR_CLASS_FATAL</td>
</tr>
</tbody>
</table>

An error return value of zero means SUCCESS.

### SUMMARY STEPS

1. **enable**
2. **show event manager policy available detailed** `policy-filename`
3. Cut and paste the contents of the sample policy displayed on the screen to a text editor.
4. Define the required **event_register** Tcl command extension.
5. Add the appropriate namespace under the `::cisco` hierarchy.
6. Program the must defines section to check for each environment variable that is used in this policy.
7. Program the body of the script.
8. Check the entry status to determine if a policy has previously run for this event.
9. Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.
10. Set Cisco Error Number `_cerrno` Tcl global variables.
11. Save the Tcl script with a new filename, and copy the Tcl script to the device.
12. **configure terminal**
13. **event manager directory user** `{library path} policy path`
14. **event manager policy** `policy-filename [type {system user}] [trap]`
15. Cause the policy to execute, and observe the policy.
16. Use debugging techniques if the policy does not execute correctly.

### DETAILED STEPS

**Step 1**  
**enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 2**  
**show event manager policy available detailed** `policy-filename`

Displays the actual specified sample policy including details about the environment variables used by the policy and instructions for running the policy. The `detailed` keyword was introduced for the **show event manager policy available** and the **show event manager policy registered** commands. Depending on your release, you must copy one of the two Tcl scripts from the configuration examples section in this document (see the Programming Policies with Tcl Sample Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Scripts Example, on page 1855). In the following example, details about the sample policy tm_cli_cmd.tcl are displayed on the screen.

**Example:**

```bash
Device# show event manager policy available detailed tm_cli_cmd.tcl
```

**Step 3**

Cut and paste the contents of the sample policy displayed on the screen to a text editor.

Use the edit and copy functions to move the contents from the device to a text editor on another device. Use the text editor to edit the policy as a Tcl script.

**Step 4**

Define the required `event_register` Tcl command extension.

Choose the appropriate `event_register` Tcl command extension from the table below for the event that you want to detect, and add it to the policy.

**Table 191: EEM Event Registration Tcl Command Extensions**

<table>
<thead>
<tr>
<th>Event Registration Tcl Command Extensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_register_appl</td>
</tr>
<tr>
<td>event_register_cli</td>
</tr>
<tr>
<td>event_register_counter</td>
</tr>
<tr>
<td>event_register_gold</td>
</tr>
<tr>
<td>event_register_interface</td>
</tr>
<tr>
<td>event_register_iowdsysmon</td>
</tr>
<tr>
<td>event_register_ipsla</td>
</tr>
<tr>
<td>event_register_nf</td>
</tr>
<tr>
<td>event_register_none</td>
</tr>
<tr>
<td>event_register_oir</td>
</tr>
<tr>
<td>event_register_process</td>
</tr>
<tr>
<td>event_register_resource</td>
</tr>
<tr>
<td>event_register_rf</td>
</tr>
<tr>
<td>event_register_routing</td>
</tr>
<tr>
<td>event_register_rpc</td>
</tr>
<tr>
<td>event_register_snmp</td>
</tr>
<tr>
<td>event_register_snmp_notification</td>
</tr>
<tr>
<td>event_register_snmp_object</td>
</tr>
</tbody>
</table>
**Event Registration Tcl Command Extensions**

- event_register_syslog
- event_register_timer
- event_register_timer_subscriber
- event_register_track
- event_register_wdsysmon

**Step 5**

Add the appropriate namespace under the ::cisco hierarchy.

Policy developers can use the new namespace ::cisco in Tcl policies in order to group all the extensions used by Cisco IOS EEM. There are two namespaces under the ::cisco hierarchy, and the table below shows which category of EEM Tcl command extension belongs under each namespace.

**Table 192: Cisco IOS EEM Namespace Groupings**

<table>
<thead>
<tr>
<th>Namespace</th>
<th>Category of Tcl Command Extension</th>
</tr>
</thead>
<tbody>
<tr>
<td>::cisco::eem</td>
<td>EEM event registration</td>
</tr>
<tr>
<td></td>
<td>EEM event information</td>
</tr>
<tr>
<td></td>
<td>EEM event publish</td>
</tr>
<tr>
<td></td>
<td>EEM action</td>
</tr>
<tr>
<td></td>
<td>EEM utility</td>
</tr>
<tr>
<td></td>
<td>EEM context library</td>
</tr>
<tr>
<td></td>
<td>EEM system information</td>
</tr>
<tr>
<td></td>
<td>CLI library</td>
</tr>
<tr>
<td>::cisco::lib</td>
<td>SMTP library</td>
</tr>
</tbody>
</table>

**Note**

Make sure that you import the appropriate namespaces or use the qualified command names when using the above commands.

**Step 6**

Program the must defines section to check for each environment variable that is used in this policy.

This is an optional step. Must defines are a section of the policy that tests whether any EEM environment variables that are required by the policy are defined before the recovery actions are taken. The must defines section is not required if the policy does not use any EEM environment variables. EEM environment variables for EEM scripts are Tcl global variables that are defined external to the policy before the policy is run. To define an EEM environment variable, use the Embedded Event Manager configuration command `event manager environment` CLI command. By convention all Cisco EEM environment variables begin with “_” (an underscore). In order to avoid future conflict, customers are urged not to define new variables that start with “_”.

**Note**

You can display the Embedded Event Manager environment variables set on your system by using the `show event manager environment` privileged EXEC command.
For example, Embedded Event Manager environment variables defined by the sample policies include e-mail variables. The sample policies that send e-mail must have the variables shown in the table below set in order to function properly. The table below describes the e-mail-specific environment variables used in the sample EEM policies.

Table 193: E-mail-Specific Environmental Variables Used by the Sample Policies

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| _email_server        | A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail. | The e-mail server name can be in any one of the following template formats:  
  • username:password@host  
  • username@host  
  • host |
| _email_to            | The address to which e-mail is sent. | engineering@example.com |
| _email_from          | The address from which e-mail is sent. | devtest@example.com |
| _email_cc            | The address to which the e-mail must be copied. | manager@example.com |

The following example of a must define section shows how to program a check for e-mail-specific environment variables.

Example of Must Defines

**Example:**

```tcl
if { ![info exists _email_server] } {
    set result \
        "Policy cannot be run: variable _email_server has not been set"
    error $result $errorInfo
}
if { ![info exists _email_from] } {
    set result \
        "Policy cannot be run: variable _email_from has not been set"
    error $result $errorInfo
}
if { ![info exists _email_to] } {
    set result \
        "Policy cannot be run: variable _email_to has not been set"
    error $result $errorInfo
}
if { ![info exists _email_cc] } {
    set result \
        "Policy cannot be run: variable _email_cc has not been set"
    error $result $errorInfo
}
```

**Step 7** Program the body of the script.

In this section of the script, you can define any of the following:

- The **event_reqinfo** event information Tcl command extension that is used to query the EEM for information about the detected event.
- The action Tcl command extensions, such as **action_syslog**, that are used to specify EEM specific actions.
• The system information Tcl command extensions, such as `sys_reqinfo_routername`, that are used to obtain general system information.

• The `context_save` and `context_retrieve` Tcl command extensions that are used to save Tcl variables for use by other policies.

• Use of the SMTP library (to send e-mail notifications) or the CLI library (to run CLI commands) from a policy.

**Step 8**
Check the entry status to determine if a policy has previously run for this event.

If the prior policy is successful, the current policy may or may not require execution. Entry status designations may use one of three possible values: 0 (previous policy was successful), Not=0 (previous policy failed), and Undefined (no previous policy was executed).

**Step 9**
Check the exit status to determine whether or not to apply the default action for this event, if a default action exists.

A value of zero means do not perform the default action. A value of nonzero means perform the default action. The exit status will be passed to subsequent policies that are run for the same event.

**Step 10**
Set Cisco Error Number (_cerrno) Tcl global variables.

Some EEM Tcl command extensions set a Cisco Error Number Tcl global variable _cerrno. Whenever _cerrno is set, four other Tcl global variables are derived from _cerrno and are set along with it (_cerr_sub_num, _cerr_sub_err, _cerr_posix_err, and _cerr_str).

For example, the `action_syslog` command in the example below sets these global variables as a side effect of the command execution:

**Example:**

```
action_syslog priority warning msg "A sample message generated by action_syslog
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str] 
    error $result
}
```

**Step 11**
Save the Tcl script with a new filename, and copy the Tcl script to the device.

Embedded Event Manager policy filenames adhere to the following specification:

• An optional prefix--Mandatory.--indicating, if present, that this is a system policy that should be registered automatically at boot time if it is not already registered. For example: Mandatory.sl_text.tcl.

• A filename body part containing a two-character abbreviation (see EEM Policies and Cisco Error Number, on page 1834) for the first event specified; an underscore character part; and a descriptive field part further identifying the policy.

• A filename suffix part defined as .tcl.

For more details, see the Cisco File Naming Convention for EEM, on page 1817.

Copy the file to the flash file system on the device--typically disk0:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Cisco IOS Configuration Fundamentals Configuration Guide.

Copy the file to the flash file system on the device--typically bootflash:. For more details about copying files, see the “Using the Cisco IOS File System” chapter in the Cisco IOS Configuration Fundamentals Configuration Guide.

**Step 12**
`configure terminal`
Enters global configuration mode.

**Example:**

Device# configure terminal

**Step 13**  
`event manager directory user {library path|policy path}`

Specifies a directory to use for storing user library files or user-defined EEM policies. In the following example, the `user_library` directory on disk0 is specified as the directory for storing user library files.

Example:

```
Device(config)# event manager directory user library disk0:/user_library
```

```
Device(config)# event manager directory user library bootflash:/user_library
```

**Step 14**  
`event manager policy  policy-filename [type {system|user}] [trap]`

Registers the EEM policy to be run when the specified event defined within the policy occurs. In the following example, the new EEM policy named `cl_mytest.tcl` is registered as a user-defined policy.

**Example:**

```
Device(config)# event manager policy cl_mytest.tcl type user
```

**Step 15**

Cause the policy to execute, and observe the policy.

To test that the policy runs, generate the conditions that will cause the policy to execute and observe that the policy runs as expected.

**Step 16**

Use debugging techniques if the policy does not execute correctly.

Use the Cisco IOS `debug event manager` CLI command with its various keywords to debug issues. Refer to the Troubleshooting Tips, on page 1840 for details about using Tcl-specific keywords.

---

**Troubleshooting Tips**

- Use the `debug event manager tcl commands` CLI command to debug issues with Tcl extension commands. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands they are passing to the CLI are valid.

- The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. Use the `debug event manager tcl cli-library` CLI command to debug issues with the CLI library.

- The SMTP library allows users to send e-mail messages to an SMTP e-mail server. Use the `debug event manager tcl smtp_library` CLI command to debug issues with the SMTP library. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands they are passing to the SMTP library are valid.
• Tcl is a flexible language that allows you to override commands. For example, you can modify the set command and create a version of the set command that displays a message when a scalar variable is set. When the set command is entered in a policy, a message is displayed anytime a scalar variable is set, and this provides a way to debug scalar variables. To view an example of this debugging technique, see the Tracing Tcl set Command Operations Example, on page 1866.

To view examples of the some of these debugging techniques, see the Debugging Embedded Event Manager Policies Examples, on page 1864.

Creating an EEM User Tcl Library Index

Perform this task to create an index file that contains a directory of all the procedures contained in a library of Tcl files. This task allows you to test library support in EEM Tcl. In this task, a library directory is created to contain the Tcl library files, the files are copied into the directory, and an index tclIndex) is created that contains a directory of all the procedures in the library files. If the index is not created, the Tcl procedures will not be found when an EEM policy is run that references a Tcl procedure.

**SUMMARY STEPS**

1. On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.
2. tclsh
3. auto_mkindex directory_name *.tcl
4. Copy the Tcl library files and the tclIndex file to the directory used for storing user library files on the target device.
5. Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.
6. enable
7. configure terminal
8. event manager directory user library path
9. event manager directory user policy path
10. event manager policy policy-name [type {system | user} [trap ]
11. event manager run policy-name

**DETAILED STEPS**

**Step 1**

On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl library files into the directory.

The following example files can be used to create a tclIndex on a workstation running the Tcl shell:

lib1.tcl

**Example:**

```tcl
proc test1 {} {
    puts "In procedure test1"
}
proc test2 {} {
```
puts "In procedure test2"
}

lib2.tcl

Example:

proc test3 {} {
    puts "In procedure test3"
}

Step 2
tclsh

Use this command to enter the Tcl shell.

Example:

workstation% tclsh

Step 3
auto_mkindex directory_name *.tcl

Use the auto_mkindex command to create the tclIndex file. The tclIndex file that contains a directory of all the procedures contained in the Tcl library files. We recommend that you run auto_mkindex inside a directory because there can only be a single tclIndex file in any directory and you may have other Tcl files to be grouped together. Running auto_mkindex in a directory determines which Tcl source file or files are indexed using a specific tclIndex.

Example:

workstation% auto_mkindex eem_library *.tcl

The following example TclIndex is created when the lib1.tcl and lib2.tcl files are in a library file directory and the auto_mkindex command is run.

tclIndex

Example:

# Tcl autoload index file, version 2.0
# This file is generated by the "auto_mkindex" command
# and sourced to set up indexing information for one or
# more commands. Typically each line is a command that
# sets an element in the auto_index array, where the
# element name is the name of a command and the value is
# a script that loads the command.

set auto_index(test1) [list source [file join $dir lib1.tcl]]
set auto_index(test2) [list source [file join $dir lib1.tcl]]
set auto_index(test3) [list source [file join $dir lib2.tcl]]

Step 4
Copy the Tcl library files and the tclIndex file to the directory used for storing user library files on the target device.

Step 5
Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl library support in EEM.

libtest.tcl

Example:

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

global auto_index auto_path

puts [array names auto_index]

if { [catch {test1} result]} {
    puts "calling test1 failed result = $result $auto_path"
}

if { [catch {test2} result]} {
    puts "calling test2 failed result = $result $auto_path"
}

if { [catch {test3} result]} {
    puts "calling test3 failed result = $result $auto_path"
}

**Step 6**

*enable*

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device> enable

**Step 7**

*configure terminal*

Enables global configuration mode.

**Example:**

Device# configure terminal

**Step 8**

*event manager directory user library path*

Use this command to specify the EEM user library directory; this is the directory to which the files were copied.

**Example:**

Device(config)# event manager directory user library disk2:/eem_library

**Step 9**

*event manager directory user policy path*

Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

**Example:**

Device(config)# event manager directory user policy disk2:/eem_policies

**Step 10**

*event manager policy policy-name [type {system | user} [trap ]]*

Use this command to register a user-defined EEM policy. In this example, the policy named libtest.tcl is registered.

**Example:**

Device(config)# event manager policy libtest.tcl

**Step 11**

*event manager run policy-name*
Use this command to manually run an EEM policy. In this example, the policy named libtest.tcl is run to test the Tcl support in EEM. The example output shows that the test for Tcl support in EEM was successful.

**Example:**

```
Device(config)# event manager run libtest.tcl
The following output is displayed:
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test1
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test2
01:24:37: %HA_EM-6-LOG: libtest.tcl: In procedure test3
```

---

### Creating an EEM User Tcl Package Index

Perform this task to create a Tcl package index file that contains a directory of all the Tcl packages and version information contained in a library of Tcl package files. Tcl packages are supported, depending on your release, using the Tcl `package` keyword.

Tcl packages are located in either the EEM system library directory or the EEM user library directory. When a `package require` Tcl command is executed, the user library directory is searched first for a `pkgIndex.tcl` file. If the `pkgIndex.tcl` file is not found in the user directory, the system library directory is searched. In this task, a Tcl package directory—the `pkgIndex.tcl` file—is created in the appropriate library directory using the `pkg_mkIndex` command to contain information about all of the Tcl packages contained in the directory along with version information. If the index is not created, the Tcl packages will not be found when an EEM policy is run that contains a `package require` Tcl command.

Using the Tcl package support in EEM, users can gain access to packages such as XML_RPC for Tcl. When the Tcl package index is created, a Tcl script can easily make an XML-RPC call to an external entity.

---

**Note**

Packages implemented in C programming code are not supported in EEM.

---

**SUMMARY STEPS**

1. On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.
2. `tclsh`
3. `pkg_mkindex directory_name *.tcl`
4. Copy the Tcl library files and the `pkgIndex.tcl` file to the directory used for storing user library files on the target device.
5. Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.
6. `enable`
7. `configure terminal`
8. `event manager directory user library path`
9. `event manager directory user policy path`
10. `event manager policy policy-name [type {system | user} [trap]`
11. `event manager run policy-name`
DETAILED STEPS

Step 1  On your workstation (UNIX, Linux, PC, or Mac) create a library directory and copy the Tcl package files into the directory.

Step 2  **tclsh**

Use this command to enter the Tcl shell.

**Example:**

```
workstation% tclsh
```

Step 3  **pkg_mkindex  directory_name  *.tcl**

Use the `pkg_mkindex` command to create the pkgIndex file. The pkgIndex file contains a directory of all the packages contained in the Tcl library files. We recommend that you run `pkg_mkindex` inside a directory because there can only be a single pkgIndex file in any directory and you may have other Tcl files to be grouped together. Running `pkg_mkindex` in a directory determines which Tcl package file or files are indexed using a specific pkgIndex.

**Example:**

```
workstation% pkg_mkindex eem_library  *.tcl
```

The following example pkgIndex is created when some Tcl package files are in a library file directory and the `pkg_mkindex` command is run.

```
# Tcl package index file, version 1.1
# This file is generated by the "pkg_mkIndex" command
# and sourced either when an application starts up or
# by a "package unknown" script. It invokes the
# "package ifneeded" command to set up package-related
# information so that packages will be loaded automatically
# in response to "package require" commands. When this
# script is sourced, the variable $dir must contain the
# full path name of this file's directory.
package ifneeded xmlrpc 0.3 [list source [file join $dir xmlrpc.tcl]]
```

Step 4  Copy the Tcl library files and the pkgIndex file to the directory used for storing user library files on the target device.

Step 5  Copy a user-defined EEM policy file written in Tcl to the directory used for storing user-defined EEM policies on the target device.

The directory for storing user-defined EEM policies can be the same directory used in Step 4. The following example user-defined EEM policy can be used to test the Tcl package support in EEM.

```
packageTest.tcl
```

**Example:**

```
::cisco::eem::event_register_none maxrun 1000000.000
#
# test if xmlrpc available
#
# Namespace imports
```

---

**Embedded Event Manager**

**Creating an EEM User Tcl Package Index**
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
#
package require xmlrpc
puts "Did you get an error?"

**Step 6**

`enable`

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

```
Device> enable
```

**Step 7**

`configure terminal`

Enables global configuration mode.

**Example:**

```
Device# configure terminal
```

**Step 8**

`event manager directory user library path`

Use this command to specify the EEM user library directory; this is the directory to which the files in were copied.

**Example:**

```
Device(config)# event manager directory user library disk2:/eem_library
```

**Step 9**

`event manager directory user policy path`

Use this command to specify the EEM user policy directory; this is the directory to which the file was copied.

**Example:**

```
Device(config)# event manager directory user policy disk2:/eem_policies
```

**Step 10**

`event manager policy policy-name [type {system | user} [trap]]`

Use this command to register a user-defined EEM policy. In this example, the policy named packagetest.tcl is registered.

**Example:**

```
Device(config)# event manager policy packagetest.tcl
```

**Step 11**

`event manager run policy-name`

Use this command to manually run an EEM policy. In this example, the policy named packagetest.tcl is run to test the Tcl package support in EEM.

**Example:**

```
Device(config)# event manager run packagetest.tcl
```
Configuration Examples for Writing Embedded Event Manager Policies Using Tcl

Assigning a Username for a Tcl Session Examples

The following example shows how to set a username to be associated with a Tcl session. If you are using authentication, authorization, and accounting (AAA) security and implement authorization on a command basis, you should use the `event manager session cli username` command to set a username to be associated with a Tcl session. The username is used when a Tcl policy executes a CLI command. TACACS+ verifies each CLI command using the username associated with the Tcl session that is running the policy. Commands from Tcl policies are not usually verified because the device must be in privileged EXEC mode to register the policy. In the example, the username is yourname, and this is the username that is used whenever a CLI command session is initiated from within an EEM policy.

```tcl
configure terminal
event manager session cli username yourname
end
```

EEM Event Detector Demo Examples

**EEM Sample Policy Descriptions**

This configuration example features some of the sample EEM policies:

- `ap_perf_test_base_cpu.tcl`--Is run to measure the the CPU performance of EEM policies.
- `no_perf_test_init.tcl`--Is run to measure the CPU performance of EEM policies.
- `sl_intf_down.tcl`--Is run when a configurable syslog message is logged. It executes up to two configurable CLI commands and e-mails the results.
- `tm_cli_cmd.tcl`--Is run using a configurable CRON entry. It executes a configurable CLI command and e-mails the results.
- `tm_crash_reporter.tcl`--Is run 5 seconds after it is registered and 5 seconds after the device boots up. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable `crash_reporter_url`.
- `tm_fsys_usage.tcl`--This policy runs using a configurable CRON entry and monitors disk space usage. A syslog message is displayed if disk space usage crosses configurable thresholds.

**Event Manager Environment Variables for the Sample Policies**

Event manager environment variables are Tcl global variables that are defined external to the EEM policy before the policy is registered and run. The sample policies require three of the e-mail environment variables to be set; only `email_cc` is optional. Other required and optional variable settings are outlined in the following tables.
The table below describes the EEM environment variables that must be set before the `ap_perf_test_base_cpu.tcl` sample policy is run.

**Table 194: Environment Variables Used in the `ap_perf_test_base_cpu.tcl` Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_perf_iterations</td>
<td>The number of iterations over which to run the measurement.</td>
<td>100</td>
</tr>
<tr>
<td>_perf_cmd1</td>
<td>The first non interactive CLI command that is executed as part of the measurement test. This variable is optional and need not be specified.</td>
<td>enable</td>
</tr>
<tr>
<td>_perf_cmd2</td>
<td>The second non interactive CLI command that is as part of the measurement test. To use _perf_cmd2, _perf_cmd1 must be defined. This variable is optional and need not be specified.</td>
<td>show version</td>
</tr>
<tr>
<td>_perf_cmd3</td>
<td>The third non interactive CLI command that is as part of the measurement test. To use _perf_cmd3, _perf_cmd1 must be defined. This variable is optional and need not be specified.</td>
<td>show interface counters protocol status</td>
</tr>
</tbody>
</table>

The table below describes the EEM environment variables that must be set before the `no_perf_test_init.tcl` sample policy is run.

**Table 195: Environment Variables Used in the `no_perf_test_init.tcl` Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_perf_iterations</td>
<td>The number of iterations over which to run the measurement.</td>

</tr>
<tr>
<td>_crash_reporter_debug</td>
<td>A value that identifies whether debug information for tm_crash_reporter.tcl will be enabled. This variable is optional and need not be specified.</td>
<td>1</td>
</tr>
<tr>
<td>_crash_reporter_url</td>
<td>The URL location to which the crash report is sent.</td>
<td><a href="http://www.example.com/fm/interface_tm.cgi">http://www.example.com/fm/interface_tm.cgi</a></td>
</tr>
</tbody>
</table>

The table below describes the EEM environment variables that must be set before the tm_fsys_usage.tcl sample policy is run.

**Table 199: Environment Variables Used in the tm_fsys_usage.tcl Policy**

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>_tm_fsys_usage_cron</td>
<td>A CRON specification that is used in the event_register Tcl command extension. If unspecified, the tm_fsys_usage.tcl policy is triggered once per minute. This variable is optional and need not be specified.</td>
<td>0-59/1 0-23/1 * * 0-7</td>
</tr>
<tr>
<td>_tm_fsys_usage_debug</td>
<td>When this variable is set to a value of 1, disk usage information is displayed for all entries in the system. This variable is optional and need not be specified.</td>
<td>1</td>
</tr>
</tbody>
</table>
**Environment Variable** | **Description** | **Example**
--- | --- | ---
`_tm_fsys_usage_freebytes` | Free byte threshold for systems or specific prefixes. If free space falls below a given value, a warning is displayed. This variable is optional and need not be specified. | disk2:98000000
`_tm_fsys_usage_percent` | Disk usage percentage thresholds for systems or specific prefixes. If the disk usage percentage exceeds a given percentage, a warning is displayed. If unspecified, the default disk usage percentage is 80 percent for all systems. This variable is optional and need not be specified. | nvram:25 disk2:5

**Registration of Some EEM Policies**

Some EEM policies must be unregistered and then reregistered if an EEM environment variable is modified after the policy is registered. The `event_register_XXX` statement that appears at the start of the policy contains some of the EEM environment variables, and this statement is used to establish the conditions under which the policy is run. If the environment variables are modified after the policy has been registered, the conditions may become invalid. To avoid any errors, the policy must be unregistered and then reregistered. The following variables are affected:

- `_cron_entry` in the `tm_cli_cmd.tcl` policy
- `_syslog_pattern` in the `sl_intf_down.tcl` policy

**Basic Configuration Details for All Sample Policies**

To allow e-mail to be sent from the Embedded Event Manager, the `hostname` and `ip domain-name` commands must be configured. The EEM environment variables must also be set. After a Cisco IOS image has been booted, use the following initial configuration, substituting appropriate values for your network. The environment variables for the `tm_fsys_usage` sample policy (see the table above) are all optional and are not listed here:

```
hos anyone cpu
ip domain-name example.com
event manager environment _email_server ms.example.net
event manager environment _email_to username@example.net
event manager environment _email_from engineer@example.net
event manager environment _email_cc projectgroup@example.net
event manager environment _cron_entry 0-59/2 0-23/1 * * 0-7
event manager environment _show_cmd show event manager policy registered
event manager environment _syslog_pattern .*UPDOWN.*FastEthernet0/0
event manager environment _config_cmd1 interface Ethernet1/0
event manager environment _config_cmd2 no shutdown
event manager environment _crash_reporter_debug 1
event manager environment _crash_reporter_url http://www.example.com/fm/interface_tm.cgi
end
```

**Using the Sample Policies**

This section contains the following configuration scenarios to demonstrate how to use the some sample Tcl policies:
Running the Mandatory.go_*.tcl Sample Policy

There are GOLD TCL scripts for each test which runs as a part of GOLD EEM Policy. You can modify the TCL script for the test, specify the consecutive failure count, and also change the default corrective action. For example, one could choose to power down a linecard card, instead of reset or other CLI based actions.

For each registered test, a default TCL script is available, which can be registered with the system, and matches with the default action. This can be then overridden by modifying these scripts.

The following table shows a list of the mandatory polices that GOLD installed into EEM. Each of the policies performs some sort of action such as resetting the card or disabling the port.

<table>
<thead>
<tr>
<th>GOLD Tcl Scripts</th>
<th>Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory.go_asicsync.tcl</td>
<td>TestAsicSync</td>
</tr>
<tr>
<td>Mandatory.go_bootup.tcl</td>
<td>Common for all bootup tests.</td>
</tr>
<tr>
<td>Mandatory.go_fabric.tcl</td>
<td>TestFabricHealth</td>
</tr>
<tr>
<td>Mandatory.go_fabrich0.tcl</td>
<td>TestFabricCh0Health</td>
</tr>
<tr>
<td>Mandatory.go_fabrich1.tcl</td>
<td>TestFabricCh1Health</td>
</tr>
<tr>
<td>Mandatory.go_ipsec.tcl</td>
<td>TestIPSecEncrypDecrypPkt</td>
</tr>
<tr>
<td>Mandatory.go_mac.tcl</td>
<td>TestMacNotification</td>
</tr>
<tr>
<td>Mandatory.go_nondislp.tcl</td>
<td>TestNonDisruptiveLoopback</td>
</tr>
<tr>
<td>Mandatory.go_scratchreg.tcl</td>
<td>TestScratchRegister</td>
</tr>
<tr>
<td>Mandatory.go_sprping.tcl</td>
<td>TestSPRIPInbandPing</td>
</tr>
</tbody>
</table>

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the mandatory.go_*.tcl policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy Mandatory.go_spuriousisr.tcl
end
show event manager policy registered
show event manager environment
```

Running the ap_perf_test_base_cpu.tcl and no_perf_test_init.tcl Sample Policies

These sample policies measures the CPU performance of EEM policies. The policies help find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables _perf_cmd1 and, optionally, _perf_cmd2 and _perf_cmd3.
The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, enter the `service timestamps debug datetime msec` command and then you can register the `ap_perf_test_base_cpu.tcl` and `no_perf_test_init.tcl` policies with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

The policies `ap_perf_test_base_cpu.tcl` and `no_perf_test_init.tcl` need to be registered together, as they run as a test suite. You can run the `no_perf_test_init.tcl` policy to start the tests. Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable `_perf_iterations`. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```
enable
show event manager policy registered
show event manager policy available
show event manager environment
configure terminal
  service timestamps debug datetime msec
  event manager environment _perf_iterations 100
  event manager policy ap_perf_test_base_cpu.tcl
  event manager policy no_perf_test_init.tcl
end
show event manager policy registered
show event manager policy available
show event manager environment
event manager run no_perf_test_init.tcl
```

**Running the no_perf_test_init.tcl Sample Policy**

This sample policy measures the cpu performance of EEM policies. The policy helps to find the average execution time of each EEM policy and uses the CLI library to execute the configuration commands specified in the EEM environment variables `_perf_cmd1` and, optionally, `_perf_cmd2` and `_perf_cmd3`.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the `no_perf_test_init.tcl` policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered.

Analyze the results using the syslog messages from each iteration. The total number of iteration is specified by the variable `_perf_iterations`. Take the time difference and divide it by the total number of iterations to get the average execution time of each EEM policy.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy no_perf_test_init.tcl
end
```
show event manager policy registered
show event manager environment

Running the sl_intf_down.tcl Sample Policy

This sample policy demonstrates the ability to modify the configuration when a syslog message with a specific pattern is logged. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variables _config_cmd1 and, optionally, _config_cmd2. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the enable command at the device prompt. The device enters privileged EXEC mode, where you can enter the show event manager policy registered command to verify that no policies are currently registered. The next command is the show event manager policy available command to display which policies are available to be installed. After you enter the configure terminal command to reach global configuration mode, you can register the sl_intf_down.tcl policy with EEM using the event manager policy command. Exit from global configuration mode and enter the show event manager policy registered command again to verify that the policy has been registered.

The policy runs when an interface goes down. Enter the show event manager environment command to display the current environment variable values. Unplug the cable (or configure a shutdown) for the interface specified in the_syslog_pattern EEM environment variable. The interface goes down, prompting the syslog daemon to log a syslog message about the interface being down, and the syslog event detector is called.

The syslog event detector reviews the outstanding event specifications and finds a match for interface status change. The EEM server is notified, and the server runs the policy that is registered to handle this event--sl_intf_down.tcl.

enable
show event manager policy registered
show event manager policy available
configure terminal
    event manager policy sl_intf_down.tcl
end
show event manager policy registered
show event manager environment

Running the tm_cli_cmd.tcl Sample Policy

This sample policy demonstrates the ability to periodically execute a CLI command and to e-mail the results. The CRON specification “0-59/2 0-23/1 * * 0-7” causes this policy to be run on the second minute of each hour. The policy gathers detailed information about the event and uses the CLI library to execute the configuration commands specified in the EEM environment variable _show_cmd. An e-mail message is sent with the results of the CLI command.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the enable command at the device prompt. The device enters privileged EXEC mode where you can enter the show event manager policy registered command to verify that no policies are currently registered. The next command is the show event manager policy available command to display which policies are available to be installed. After you enter the configure terminal command to reach global configuration mode, you can register the tm_cli_cmd.tcl policy with EEM using the event manager policy command. Exit from global configuration mode and enter the show event manager policy registered command to verify that the policy has been registered.
The timer event detector triggers an event for this case periodically according to the CRON string set in the EEM environment variable _cron_entry. The EEM server is notified, and the server runs the policy that is registered to handle this event--tm_cli_cmd.tcl.

```
enable
display event manager policy registered
display event manager policy available
configure terminal
  event manager policy tm_cli_cmd.tcl
end
display event manager policy registered
```

Running the tm_crash_reporter.tcl Sample Policy

This sample policy demonstrates the ability to send an HTTP-formatted crash report to a URL location. If the policy registration is saved in the startup configuration file, the policy is triggered 5 seconds after bootup. When triggered, the script attempts to find the reload reason. If the reload reason was due to a crash, the policy searches for the related crashinfo file and sends this information to a URL location specified by the user in the environment variable _crash_reporter_url. A CGI script, interface_tm.cgi, has been created to receive the URL from the tm_crash_reporter.tcl policy and save the crash information in a local database on the target URL machine.

A Perl CGI script, interface_tm.cgi, has been created and is designed to run on a machine that contains an HTTP server and is accessible by the device that runs the tm_crash_reporter.tcl policy. The interface_tm.cgi script parses the data passed into it from tm_crash_reporter.tcl and appends the crash information to a text file, creating a history of all crashes in the system. Additionally, detailed information on each crash is stored in three files in a crash database directory that is specified by the user. Another Perl CGI script, crash_report_display.cgi, has been created to display the information stored in the database created by the interface_tm.cgi script. The crash_report_display.cgi script should be placed on the same machine that contains interface_tm.cgi. The machine should be running a web browser such as Internet Explorer or Netscape. When the crash_report_display.cgi script is run, it displays the crash information in a readable format.

The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the tm_crash_reporter.tcl policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command to verify that the policy has been registered.

```
enable
display event manager policy registered
display event manager policy available
configure terminal
  event manager policy tm_crash_reporter.tcl
end
display event manager policy registered
```

Running the tm_fsys_usage.tcl Sample Policy

This sample policy demonstrates the ability to periodically monitor disk space usage and report through syslog when configurable thresholds have been crossed.
The following sample configuration demonstrates how to use this policy. Starting in user EXEC mode, enter the `enable` command at the device prompt. The device enters privileged EXEC mode, where you can enter the `show event manager policy registered` command to verify that no policies are currently registered. The next command is the `show event manager policy available` command to display which policies are available to be installed. After you enter the `configure terminal` command to reach global configuration mode, you can register the `tm_fsys_usage.tcl` policy with EEM using the `event manager policy` command. Exit from global configuration mode and enter the `show event manager policy registered` command again to verify that the policy has been registered. If you had configured any of the optional environment variables that are used in the `tm_fsys_usage.tcl` policy, the `show event manager environment` command displays the configured variables.

```
enable
show event manager policy registered
show event manager policy available
configure terminal
  event manager policy tm_fsys_usage.tcl
end
show event manager policy registered
show event manager environment
```

### Programming Policies with Tcl Sample Scripts Example

This section contains some of the sample policies that are included as EEM system policies. For more details about these policies, see the EEM Event Detector Demo Examples, on page 1847.

#### Mandatory.go_ipsec.tcl Sample Policy

The following sample policy for the `TestIPSecEncrypDecrypPkt` Test.

```
::cisco::eem::event_register_gold card all testing_type monitoring test_name TestIPSecEncrypDecrypPkt consecutive_failure 6 platform_action 0 queue_priority last
#
# GOLD TestIPSecEncrypDecrypPkt Test TCL script
#
# March 2005, Hai Qiu
#
# Copyright (c) 2005-2007 by cisco Systems, Inc.
# All rights reserved.
#
# Register for TestIPSecEncrypDecrypPkt test even
# the elements for register the event
# card [all | card #]
# sub_card [all | sub_card #]
# severity_major | severity_minor | severity_normal default : severity_normal
# new_failure [true | false] default: dont_care
# testing_type [bootup | ondemand | schedule | monitoring]
# test_name [ test name ]
# test_id [ test # ]
# consecutive_failure [ consecutive_failure # ]
# platform_action [action_flag]
# action_flag [ 0 | 1 | 2 ]
# queue_priority [ normal | low | high | last] default: normal
#
# Note:
# 1: "card" element is required. If other elements are not specified,
#   treat them as dont care, or default.
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
# 2: action_flag is platform specific. It is up to platform to
determine what action need to be taken based on the value
For Cat6k platform
# action_flag 0 : TCL script take action to reset card
# action_flag 1 : TCL script doesn't take action to reset card
# action_flag 2 : TCL script takes action to reset card for bootup diag
# when there is major error
# action_flag 3 : TCL script doesn't take action to reset card for
# bootup diag when there is major error
#
# 3: "queue_priority last" would guarantee this policy will be executed last
# if there are other EEM events in queue with queue priority other
# than "last"
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

}
}

ap_perf_test_base_cpu.tcl Sample Policy

The following sample policy measures the CPU performance of EEM policies.

::cisco::eem::event_register_appl sub_system 798 type 9999
#----------------------------------
# EEM policy used for measuring the cpu performance of EEM policies.
# # July 2005, Cisco EEM team
# # Copyright (c) 2005, 2006 by cisco Systems, Inc.
# All rights reserved.
###------------------
### Input arguments:
### arg1 $iter - current iteration count
### The following EEM environment variables are used:
### _perf_iterations (mandatory) - number of iterations over which we will run our measurement.
### Example:
### event manager environment _perf_iterations 100
### _perf_cmd1 (optional) - optional non interactive cli command to be executed as part of the measurement test.
### Example:
### event manager environment _perf_cmd1 enable
### _perf_cmd2 (optional) - optional non interactive cli command to be executed as part of the measurement test.
### To use _perf_cmd2, _perf_cmd1 MUST be defined.
### Example:
### event manager environment _perf_cmd2 show ver
### _perf_cmd3 (optional) - optional non interactive cli command to be executed as part of the measurement test.
### To use _perf_cmd3, _perf_cmd1 MUST be defined.
### Example:
### event manager environment _perf_cmd3 show int counters protocol status
### Description:
### Iterate through _perf_iterations of this policy.
### It is up to the user to calculate the average execution time based on the system timestamps.
### Optional commands _perf_cmd1, _perf_cmd2 and _perf_cmd3 are executed if defined.
### A value of 100 is a good starting point.
### Outputs:
### Console output.
### Usage example:
### >conf t
### >service timestamps debug datetime msec
### >event manager environment _perf_iterations 100
### >event manager policy ap_perf_base_cpu.tcl
### >event manager policy no_perf_test_init.tcl
### >end
### 2d19h: %SYS-5-CONFIG_I: Configured from console by console
### >event manager run no_perf_test_init.tcl
### Oct 16 14:57:17.284: %SYS-5-CONFIG_I: Configured from console by console
### >event manager run no_perf_test_init.tcl
### Oct 16 19:32:02.772: %HA_EM-6-LOG: eem_policy/no_perf_test_init.tcl: EEM performance test start
### Oct 16 19:32:03.115: %HA_EM-6-LOG:
### eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 1
### Oct 16 19:32:03.467: %HA_EM-6-LOG:
### eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 2
### ...
### Oct 16 19:32:36.936: %HA_EM-6-LOG:
### eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test iteration 100
### Oct 16 19:32:36.936: %HA_EM-6-LOG:
### eem_policy/ap_perf_test_base_cpu.tcl: EEM performance test end

The user must calculate execution time and average time of execution.
In this example, total time = 19:32:36.936 - 19:32:02.772 = 34.164
Average script execution time = 341.64 milliseconds

# check if all the env variables we need exist
# If any of them doesn't exist, print out an error msg and quit

#------------------------------------------------------------------
### The following EEM environment variables are used:
###
### _cron_entry (mandatory) - A CRON specification that determines
### when the policy will run. See the
### IOS Embedded Event Manager
documentation for more information
###

tm_cli_cmd.tcl Sample Policy

The following sample policy runs a configurable CRON entry. The policy executes a configurable Cisco IOS CLI command and e-mails the results. An optional log file can be defined to which the output is appended with a timestamp.
### Example: _cron_entry
0-59/1 0-23/1 * * 0-7

### _log_file (mandatory without _email_...)
- A filename to append the output to.
  If this variable is defined, the output is appended to the specified file with a timestamp added.

### Example: _log_file
bootflash:/my_file.log

### _email_server (mandatory without _log_file)
- A Simple Mail Transfer Protocol (SMTP) mail server used to send e-mail.

### Example: _email_server
mailserver.example.com

### _email_from (mandatory without _log_file)
- The address from which e-mail is sent.

### Example: _email_from
devtest@example.com

### _email_to (mandatory without _log_file)
- The address to which e-mail is sent.

### Example: _email_to
engineering@example.com

### _email_cc (optional)
- The address to which the e-mail must be copied.

### Example: _email_cc
manager@example.com

### _show_cmd (mandatory)
- The CLI command to be executed when the policy is run.

### Example: _show_cmd
show version

# check if all required environment variables exist

}

sl_intf_down.tcl Sample Policy

The following sample policy runs when a configurable syslog message is logged. The policy executes a configurable CLI command and e-mails the results.

::cisco::eem::event_register_syslog occurs 1 pattern $_syslog_pattern maxrun 90

#-----------------------------
# EEM policy to monitor for a specified syslog message.
# Designed to be used for syslog interface-down messages.
# When event is triggered, the given config commands will be run.
#
# July 2005, Cisco EEM team
#
# Copyright (c) 2005 by cisco Systems, Inc.
# All rights reserved.
#-----------------------------

### The following EEM environment variables are used:
###
### _syslog_pattern (mandatory) - A regular expression pattern match string
### that is used to compare syslog messages
to determine when policy runs
### Example: _syslog_pattern .*UPDOWN.*FastEthernet0/0.*
###
### _email_server (mandatory) - A Simple Mail Transfer Protocol (SMTP)
### mail server used to send e-mail.
### Example: _email_server mailserver.example.com
###
### _email_from (mandatory) - The address from which e-mail is sent.
### Example: _email_from devtest@example.com
###
### _email_to (mandatory) - The address to which e-mail is sent.
### Example: _email_to engineering@example.com
###
### _email_cc (optional) - The address to which the e-mail must
### be copied.
### Example: _email_cc manager@example.com
###
### _config_cmd1 (optional) - The first configuration command that
### is executed.
### Example: _config_cmd1 interface Ethernet1/0
###
### _config_cmd2 (optional) - The second configuration command that
### is executed.
### Example: _config_cmd2 no shutdown
###

# check if all the env variables we need exist
# If any of them doesn't exist, print out an error msg and quit
if {![info exists _email_server]} {

}

The following e-mail template file is used with the EEM sample policy above:

e-mail_template_cfg.tm
Mailservername: $_email_server
From: $_email_from
To: $_email_to
Cc: $_email_cc
Subject: From router $routername: Periodic $show_cmd Output
$cmd_output

### Debugging Embedded Event Manager Policies Examples

The following examples show how to debug the CLI library and the SMTP library.

#### Debugging the CLI Library
The CLI library allows users to run CLI commands and obtain the output of commands in Tcl. An Embedded Event Manager debug command has been provided for users of this library. The command to enable CLI library debugging is `debug event manager tcl cli_library`. When enabled, this command displays all data that is passed in and read back from the TTY session that handles the CLI interactions. This data helps ensure users that the commands that they are passing to the CLI are valid.

#### Example of the debug event manager tcl cli_library Command
This example uses the sample policy `sl_intf_down.tcl`. When triggered, `sl_intf_down.tcl` passes a configuration command to the CLI through the CLI library. The command passed in below is `show event manager environment`. This command is not a valid command in configuration mode. Without the `debug` command enabled, the output is shown below:

00:00:57:sl_intf_down.tcl[0]:config_cmds are show eve man env
00:00:57:SYS-5-CONFIG_I:Configured from console by vty0

Notice that with the output above the user would not know whether or not the command succeeded in the CLI. With the `debug event manager tcl cli_library` command enabled, the user sees the following:

01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : CTL : cli_open called.
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson>
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : IN : nelson>enable
01:17:07: sl_intf_down.tcl[0]: DEBUG(cli_lib) : OUT : nelson#
The output above shows that `show event manager environment` is an invalid command in configuration mode. The IN keyword signifies all data passed in to the TTY through the CLI library. The OUT keyword signifies all data read back from the TTY through the CLI library. The CTL keyword signifies helper functions used in the CLI library. These helper functions are used to set up and remove connections to the CLI.

### Debugging the SMTP Library

The SMTP library allows users to send e-mail messages to an SMTP e-mail server. An Embedded Event Manager `debug` command has been provided for users of this library. The command to enable SMTP library debugging is `debug event manager tcl smtp_library`. When enabled, this command displays all data that is passed in and read back from the SMTP library routines. This data helps ensure users that the commands that they are passing to the SMTP library are valid.

#### Example of the `debug event manager tcl smtp_library` Command

This example uses the sample policy `tm_cli_cmd.tcl`. When triggered, `tm_cli_cmd.tcl` runs the command `show event manager policy available system` through the CLI library. The result is then mailed to a user through the SMTP library. The output will help debug any issues related to using the SMTP library.

With the `debug event manager tcl smtp_library` command enabled, the users see the following on the console:

```
00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 220 XXXX.example.com ESMTP XXXX 1.1.0; Tue, 25 Jun 2002 14:20:39 -0700 (PDT)
00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : HELO XXXX.example.com
00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 250 XXXX.example.com Hello XXXX.example.com [XXXX], pleased to meet you
00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : MAIL FROM:<XX@example.com>
00:39:46: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 250 <XX@example.com>... Sender ok

00:39:47: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_read : 354 Enter mail, end with "." on a line by itself
00:39:47: tm_cli_cmd.tcl[0]: DEBUG(smtp_lib) : smtp_write : Date: 25 Jun 2002 14:35:00 UTC
```
Tracing Tcl set Command Operations Example

Tcl is a flexible language. One of the flexible aspects of Tcl is that you can override commands. In this example, the Tcl set command is renamed as _set and a new version of the set command is created that displays a message containing the text “setting” and appends the scalar variable that is being set. This example can be used to trace all instances of scalar variables being set.

rename set _set
proc set {var args} {
  puts [list setting $var $args]
  uplevel _set $var $args
};

When this is placed in a policy, a message is displayed anytime a scalar variable is set, for example:

02:17:58: sl_intf_down.tcl[0]: setting test_var 1

RPC Event Detector Example

TCL script (rpccli.tcl):
::cisco::eem::event_register_rpc
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
proc run_cli { clist } {
  set rbuf ""
  if {[llength $clist] < 1} {
    return -code ok $rbuf
  } else {
    set rbuf [cli execute $clist]
  }
  if {[(catch $rbuf)]} {
    return -code error $rbuf
  }
}
} else {
array set cliarr $result
}
if {{catch {cli_exec $cliarr(fd) "enable"} result}} {
    return -code error $result
}
if {{catch {cli_exec $cliarr(fd) "term length 0"} result}} {
    return -code error $result
}
foreach cmd $clist {
    if {{catch {cli_exec $cliarr(fd) $cmd} result}} {
        return -code error $result
    }
append rbuf $result
}
if {{catch {cli_close $cliarr(fd) $cliarr(tty_id)} result}} {
    puts "WARNING: $result"
}
return -code ok $rbuf
}
proc run_cli_interactive { clist } {
set rbuf ""
if {{llength $clist} < 1} {
    return -code ok $rbuf
}
if {{catch {cli_open} result}} {
    return -code error $result
} else {
array set cliarr $result
}
if {{catch {cli_exec $cliarr(fd) "enable"} result}} {
    return -code error $result
}
if {{catch {cli_exec $cliarr(fd) "term length 0"} result}} {
    return -code error $result
}
foreach cmd $clist {
    array set sendexp $cmd
    if {{catch {cli_write $cliarr(fd) $sendexp(send)} result}} {
        return -code error $result
    }
    foreach response $sendexp(responses) {
        array set resp $response
        if {{catch {cli_read_pattern $cliarr(fd) $resp(expect)} result}} {
            return -code error $result
        }
        if {{catch {cli_write $cliarr(fd) $resp(reply)} result}} {
            return -code error $result
        }
    }
    if {{catch {cli_read $cliarr(fd)} result}} {
        return -code error $result
    }
append rbuf $result
}
if {{catch {cli_close $cliarr(fd) $cliarr(tty_id)} result}} {
    puts "WARNING: $result"
}
return -code ok $rbuf
}
array set arr_einfo [event_reqinfo]
set args $arr_einfo(argc)
set cmds [list]
for { set i 0 } { $i < $args } { incr i } {
Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
```
set arg "arg${i}"
# Split each argument on the '^' character. The first element is
# the command, and each subsequent element is a prompt followed by
# a response to that prompt.
set cmdlist (split $arr_einfo($arg) "^")
set cmdarr(send) [lindex $cmdlist 0]
set cmdarr(responses) [list]
if { [expr {([llength $cmdlist] - 1) % 2} != 0] } {
    return -code 88
} else {
    set cmdarr(responses) [list]
    for { set j 1 } { $j < [llength $cmdlist] } { incr j 2 } {
        set resps(expect) [lindex $cmdlist $j]
        set resps(reply) [lindex $cmdlist [expr $j + 1]]
        lappend cmdarr(responses) [array get resps]
    }
    lappend cmdarr [array get cmdarr]
}
set rc [catch {run_cli_interactive $cmdarr} output]
if { $rc != 0 } {
    error $output $errorInfo
    return -code 88
} else {
    puts $output
}
```

Signed Tcl Scripts

The Signed Tcl Scripts feature allows you to create a certificate to generate a digital signature and sign a Tool Command Language (Tcl) script with that digital signature. This feature also allows you to work with existing scripts and certificates. The digital signature is verified for authentication and then run with trusted access to the Tcl interpreter. If the script does not contain the digital signature, the script may run in a limited mode for untrusted scripts, or may not run at all.

- Prerequisites for Signed Tcl Scripts, on page 1871
- Restrictions for Signed Tcl Scripts, on page 1871
- Information About Signed Tcl Scripts, on page 1872
- How to Configure Signed Tcl Scripts, on page 1873
- Configuration Examples for Signed Tcl Script, on page 1886
- Additional References, on page 1890
- Feature Information for Signed Tcl Scripts, on page 1891
- Glossary, on page 1891
- Notices, on page 1892

Prerequisites for Signed Tcl Scripts

For this feature to work, the Cisco public key infrastructure (PKI) configuration trustpoint commands must be enabled.

Restrictions for Signed Tcl Scripts

For this feature to work, you must be running the following:

- Cisco IOS Crypto image
- OpenSSL Version 0.9.7a or above
- Expect
Information About Signed Tcl Scripts

The Signed Tcl Scripts feature introduces security for the Tcl scripts. This feature allows you to create a certificate to generate a digital signature and sign a Tcl script with that digital signature. This certificate examines the Tcl scripts prior to running them. The script is checked for a digital signature from Cisco. In addition, third parties may also sign a script with a digital signature. You may wish to sign your own internally developed Tcl scripts or you could use a script developed by a third party. If the script contains the correct digital signature, it is believed to be authentic and runs with full access to the Tcl interpreter. If the script does not contain the digital signature, the script may be run in a limited mode, known as Safe Tcl mode, or may not run at all.

To create and use signed Tcl scripts, you should understand the following concepts:

Cisco PKI

Cisco PKI provides certificate management to support security protocols such as IP security (IPsec), secure shell (SSH), and secure socket layer (SSL). A PKI is composed of the following entities:

• Peers communicating on a secure network
• At least one certification authority (CA) that grants and maintains certificates
• Digital certificates, which contain information such as the certificate validity period, peer identity information, encryption keys that are used for secure communication, and the signature of the issuing CA
• An optional registration authority (RA) to offload the CA by processing enrollment requests
• A distribution mechanism (such as Lightweight Directory Access Protocol [LDAP] or HTTP) for certificate revocation lists (CRLs)

PKI provides you with a scalable, secure mechanism for distributing, managing, and revoking encryption and identity information in a secured data network. Every routing device participating in the secured communication is enrolled in the PKI in a process where the routing device generates a Rivest, Shamir, and Adelman (RSA) key pair (one private key and one public key) and has its identity validated by a trusted routing device (also known as a CA or trustpoint).

After each routing device enrolls in a PKI, every peer (also known as an end host) in a PKI is granted a digital certificate that has been issued by a CA. When peers must negotiate a secured communication session, they exchange digital certificates. Based on the information in the certificate, a peer can validate the identity of another peer and establish an encrypted session with the public keys contained in the certificate.

RSA Key Pair

An RSA key pair consists of a public key and a private key. When setting up your PKI, you must include the public key in the certificate enrollment request. After the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data that is sent to the device. The private key is kept on the device and used both to decrypt the data sent by peers and to digitally sign transactions when negotiating with peers.
RSA key pairs contain a key modulus value. The modulus determines the size of the RSA key. The larger the modulus, the more secure the RSA key. However, keys with large modulus values take longer to generate, and encryption and decryption operations take longer with larger keys.

Certificate and Trustpoint

A certification authority (CA), also known as a trustpoint, manages certificate requests and issues certificates to participating network devices. These services (managing certificate requests and issuing certificates) provide centralized key management for the participating devices and are explicitly trusted by the receiver to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use a CA provided by a third-party CA vendor, or you can use an internal CA, which is the Cisco Certificate Server.

How to Configure Signed Tcl Scripts

Generating a Key Pair

The key pair consists of a private key and a public key. The private key is intended to be kept private, accessible only to the creator. The public key is generated from the private key and is intended to be known to the public.

To generate a key pair, use the `openssl genrsa` command and then the `openssl rsa` command.

**SUMMARY STEPS**

1. `openssl genrsa -out private-key-file bit-length`
2. `ls -l`
3. `openssl rsa -in private-key-file -pubout -out public-key-file`
4. `ls -l`

**DETAILED STEPS**

---

**Step 1**  
`openssl genrsa -out private-key-file bit-length`

This command generates a private key that is `bit-length` bits long and writes the key to the `private-key-file` file.

```
Host% openssl genrsa -out privkey.pem 2048
```

**Example:**

Generating RSA private key, 2048 bit long modulus
...........+++ 
.................................................................................+++ 
e is 65537 (0x10001)

**Step 2**  
`ls -l`
This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 8
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
```

The privkey.pem file contains the private key generated using the `openssl genrsa` command.

**Step 3**

`openssl rsa -in private-key-file -pubout -out public-key-file`

This command generates a public key based on the specified private key in the `private-key-file` file and writes the public key to the `public-key-file` file.

**Example:**

```
Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
```

```
writing RSA key
```

**Step 4**

`ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```
Host% ls -l
```

```
total 16
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The pubkey.pem file contains the public key generated from the private key using the `openssl rsa` command.

---

### Generating a Certificate

Perform this task to generate a certificate. To generate an X.509 certificate, use the `openssl req` command.

**SUMMARY STEPS**

1. `openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`
2. `ls -l`

**DETAILED STEPS**

**Step 1**

`openssl req -new -x509 -key private-key-file -out certificate-file -days expiration-days`

This command creates an X.509 certificate, with full access to a private key that is stored in the `private-key-file` file, and stores the certificate in the `certificate-file` file. The certificate is configured to expire in `expiration-days` days.
To complete the command, enter the following Distinguished Name (DN) information when prompted:

- Country name
- State or province name
- Organization name
- Organizational unit name
- Common name
- Email address

At each prompt, text enclosed in square brackets indicates the default value that will be used if you do not enter a value before you press Enter.

This example shows how to create an X.509 certificate that has full access to the private key in the privkey.pem file. The certificate is written to the cert.pem file and will expire 1095 days after the creation date.

Example:

Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095

You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value, If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) [GB]: US
State or Province Name (full name) [Berkshire]: California
Locality Name (eg, city) [Newbury]: San Jose
Organization Name (eg, company) [My Company Ltd]: Cisco Systems, Inc.
Organizational Unit Name (eg, section) []: DEPT_ACCT
Common Name (eg, your name or your server's hostname) []: Jane
Email Address []: janedoe@company.com

Step 2

ls -l

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

Example:

Host% ls -l

total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

The cert.pem file contains the X.509 certificate created using the openssl req command.
Signing the Tcl Scripts

Perform this task to sign the Tcl scripts. You will need to sign the Tcl file and output in OpenSSL document in pkcs7 (PKCS#7) format.

To sign the Tcl file, use the `openssl smime` command with the `-sign` keyword.

**SUMMARY STEPS**

1. `openssl smime -sign -in tcl-file -out signed-tcl-file -signer certificate-file -inkey private-key-file -outform DER -binary`
2. `ls -l`

**DETAILED STEPS**

**Step 1**

`openssl smime -sign -in tcl-file -out signed-tcl-file -signer certificate-file -inkey private-key-file -outform DER -binary`

This command signs the Tcl filename `tcl-file` using the certificate stored in `certificate-file` and the private key stored in `private-key-file` file and then writes the signed Tcl file in DER PKCS#7 format to the `signed-tcl-file` file.

**Example:**

```bash
Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem -outform DER -binary
```

**Step 2**

`ls -l`

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

**Example:**

```bash
Host% ls -l
```

```
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

The `hello.pk7` file contains the signed Tcl file created by the `openssl smime` command from the unsigned Tcl file named `hello` and using the X.509 certificate in the `cert.pem` file.

---

**Verifying the Signature**

Perform this task to verify that the signature matches the data, use the `openssl smime` command with the `-verify` keyword. The original Tcl content must be provided in the input file, because the file does not have the original content.
SUMMARY STEPS

1. openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file
2. ls -l

DETAILED STEPS

Step 1

openssl smime -verify -in signed-tcl-file -CAfile certificate-file -inform DER -content tcl-file

This command verifies the signed Tcl file stored in DER PKCS#7 format in signed-tcl-file using the trusted Certificate Authority (CA) certificates in certificate-file and then writes the detached content to the file tcl-file.

The following example shows how to verify the signature with the input file hello.pk7:

Example:

Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello

puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "tcl_interactive = $tcl_interactive"
Verification successful

Note: The SSL command page describes -in filename as the input message to be encrypted or signed or the MIME message to be decrypted or verified. For more information, go to http://www.openssl.org/.

Step 2

ls -l

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

Example:

Host% ls -l

total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

The hello file contains the content detached from the signed Tcl file hello.pk7 by running the openssl smime command with the -verify keyword. If the verification was successful, the signer’s certificates are written to the X.509 certificate in the cert.pem file.

Converting the Signature into Nonbinary Data

Perform this task to convert the signature from binary to nonbinary data.
SUMMARY STEPS

1. `xxd -ps signed-tcl-file > nonbinary-signature-file`
2. Create a script that displays `#Cisco Tcl Signature V1.0` in the first line and inserts a comment character (`#`) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “_sig” to the name of the input file.
3. Run the script, supplying the name of the file containing the nonbinary signature file (`nonbinary-signature-file`) as the input argument.
4. `ls -l`
5. `cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script`

DETAILED STEPS

---

Step 1  
`xxd -ps signed-tcl-file > nonbinary-signature-file`

This command converts the signature in `signed-tcl-file` from binary to nonbinary data and stores it as a hexadecimal dump in the file `nonbinary-signature-file`.

**Example:**

```
Host% xxd -ps hello.pk7 > hello.hex
```

Step 2  
Create a script that displays `#Cisco Tcl Signature V1.0` in the first line and inserts a comment character (`#`) at the beginning of each line of the input file and writes each line to a file whose name is formed by appending the text string “_sig” to the name of the input file.

In this example the `cat` command is used to display the contents of the script file named `my_append`.

**Example:**

```
Host% cat my_append
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file ${my_file}_sig
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
foreach line [split [read $my_handle] "\n"] {
    set new_line (#)
    append new_line $line
    puts $my_new_handle $new_line
}
close $my_new_handle
close $my_handle
```

Step 3  
Run the script, supplying the name of the file containing the nonbinary signature file (`nonbinary-signature-file`) as the input argument.

In this example, the `my_append` script is run with the nonbinary signature file `hello.hex` specified as input. The output file will be named `hello.hex_sig`.
Example:

Host% my_append hello.hex

Step 4 ls -l

This command displays detailed information about each file in the current directory, including the permissions, owners, size, and when last modified.

Example:

Host% ls -l

total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 13 10:18 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:17 hello
-rw-r--r-- 1 janedoe eng12 3815 Jun 13 10:20 hello.hex
-rw-r--r-- 1 janedoe eng12 3907 Jun 13 10:22 hello.hex_sig
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rwxr--r-- 1 janedoe eng12 444 Jun 13 10:22 my_append
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

The hello.hex file contains nonbinary data (stored as a hexadecimal dump) converted from the binary signature in the signed Tcl file hello.pk7. The my_append file contains the script that inserts a comment character at the beginning of each line of the input file. The hello.hex_sig file is the file created by running the my_append script on the nonbinary signature file.

Step 5 cat signed-tcl-file commented-nonbinary-signature-file > signed-tcl-script

This command appends the contents of the nonbinary signature file (commented-nonbinary-signature-file) to the signed Tcl file stored in DER PKCS#7 format (in the signed-tcl-file file). The concatenated output is written to the file signed-tcl-script.

Example:

Host% cat hello hello.hex_sig > hello.tcl

Step 6 cat signed-tcl-script

This command displays the contents of the file signed-tcl-script, which is the concatenation of content detached from the signed Tcl file and the nonbinary signature file.

Example:

Host% cat hello.tcl

puts hello
puts "argc = $argc"
puts "argv = $argv"
puts "argv0 = $argv0"
puts "$tcl_interactive = $tcl_interactive"
#Cisco Tcl Signature V1.0
#3082075006092a864886f70d010702a08207413082073d020101310b310b308195

Configuring the Device with a Certificate

Perform this task to configure the device with a certificate.
**Before you begin**

You must already have a Cisco IOS Crypto image; otherwise you cannot configure a certificate.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. crypto pki trustpoint *name*
4. enrollment terminal
5. exit
6. crypto pki authenticate *name*
7. At the prompt, enter the base-encoded CA certificate.
8. scripting tcl secure-mode
9. scripting tcl trustpoint name *name*
10. scripting tcl trustpoint untrusted {execute | safe-execute | terminate}
11. exit
12. tclsafe

**DETAILED STEPS**

**Step 1**

**enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Example:**

Device> enable

**Step 2**

**configure terminal**

Enters global configuration mode.

**Example:**

Device# configure terminal

**Step 3**

**crypto pki trustpoint *name***

Declares the device is to use the Certificate Authority (CA) *mytrust* and enters ca-trustpoint configuration mode.

**Example:**

Device(config)# crypto pki trustpoint mytrust

**Step 4**

**enrollment terminal**

Specifies manual cut-and-paste certificate enrollment. When this command is enabled, the device displays the certificate request on the console terminal, allowing you to enter the issued certificate on the terminal.

**Example:**

Device(ca-trustpoint)# enrollment terminal
Step 5  
exit

Exits ca-trustpoint configuration mode and returns to global configuration mode.

Example:

Device(ca-trustpoint)# exit

Step 6  
crypto pki authenticate  name

Retrieves the CA certificate and authenticates it. Check the certificate fingerprint if prompted.

Note  Because the CA signs its own certificate, you should manually authenticate the public key of the CA by contacting the CA administrator when you perform this command.

Example:

Device(config)# crypto pki authenticate mytrust

Step 7  
At the prompt, enter the base-encoded CA certificate.

Example:

Enter the base 64 encoded CA certificate.
End with a blank line or the word “quit” on a line by itself

aO6ZL4Nnh/O3/89O0W7Qu/7T5l0Z6t7OBjHCvTQ5Z/sFz5Z/0oE/x5Ve8eUikDx8kJAg

Certificate has the following attributes:

Fingerprint MD5: 1E327DBB 330936EB 2FB8EACB 4FD1133E
Fingerprint SHA1: EE7FF9F4 05148842 B9D050FAC D76FDC9C E0703246
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.
% Certificate successfully imported

Step 8  
scripting tcl secure-mode

Enables signature verification of the interactive Tcl scripts.
Device(config)# scripting tcl secure-mode

**Step 9**  
*scripting tcl trustpoint name name*
Associates an existing configured trustpoint name with a certificate to verify Tcl scripts.

Device(config)# scripting tcl trustpoint name mytrust

**Step 10**  
*scripting tcl trustpoint untrusted {execute | safe-execute | terminate}*
(Optional) Allows the interactive Tcl scripts to run regardless of the scripts failing in the signature check or in untrusted mode using one of the three keywords: `execute`, `safe-execute`, or `terminate`.

- **execute** --Executes Tcl scripts even if the signature verification fails. If the `execute` keyword is configured, signature verification is not at all performed.

**Note**  
Use of this keyword is usually not recommended because the signature verification is not at all performed.

The `execute` keyword is provided for internal testing purposes and to provide flexibility. For example, in a situation where a certificate has expired but the other configurations are valid and you want to work with the existing configuration, then you can use the `execute` keyword to work around the expired certificate.

- **safe-execute** --Allows the script to run in safe mode. You can use the `telsafe` command and also enter the interactive Tcl shell safe mode to explore the safe mode Tcl commands that are available. In order to get a better understanding of what is available in this limited safe mode, use the `telsafe Exec` command to explore the options.

- **terminate** --Stops any script from running and reverts to default behavior. The default policy is to terminate. When the last trustpoint name is removed, the untrusted action is also removed. The untrusted action cannot be entered until at least one trustpoint name is configured for Tcl.

The following example shows how to execute the Tcl script in safe mode using the `safe-execute` keyword when the signature verification fails.

Device(config)# scripting tcl trustpoint untrusted safe-execute

**Step 11**  
*exit*
Exits global configuration mode and returns to privileged EXEC mode.

Device(config)# exit

**Step 12**  
*tclsafe*
(Optional) Enables the interactive Tcl shell untrusted safe mode. This allows you to manually run Tcl commands from the Cisco command line interface in untrusted safe mode.

Device# tclsafe

**Example:**
Verifying the Trustpoint

To display the trustpoints that are configured in the device, use the `show crypto pki trustpoints` command.

**SUMMARY STEPS**

1. `enable`
2. `show crypto pki trustpoints`

**DETAILED STEPS**

**Step 1** `enable`

This command enables privileged EXEC mode.

**Example:**

```
Device> enable
```

**Step 2** `show crypto pki trustpoints`

This command displays the trustpoints that are configured in the device.

**Example:**

```
Device# show crypto pki trustpoints

Trustpoint mytrust:
  Subject Name:
  ea=janedoe@cisco.com
  cn=Jane
  ou=DEPT_ACCT
  o=Cisco
  l=San Jose
  st=California
  c=US
  Serial Number: 00
  Certificate configured.
```

Verifying the Signed Tcl Script

To verify that the Signed Tcl Script is properly running, use the `debug crypto pki transactions` command and the `tclsh` command.

**SUMMARY STEPS**

1. `enable`
2. debug crypto pki transactions
3. tclsh  flash:signed-tcl-file

DETAILED STEPS

Step 1  enable
This command enables privileged EXEC mode.
Example:

Device> enable

Step 2  debug crypto pki transactions
This command displays debugging messages for the trace of interaction (message type) between the CA and the device.
Example:

Device# debug crypto pki transactions
Crypto PKI Trans debugging is on

Step 3  tclsh  flash:signed-tcl-file
This command executes the Tcl script in Tcl shell.
Note  The file should be a signed Tcl file.
Example:

Device# tclsh flash:hello.tcl

hello
argc = 0
argv =
argv0 = flash:hello.tcl
 tcl_interactive = 0
device#
*Apr 21 04:46:18.563: CRYPTO_PKI: locked trustpoint mytrust, refcount is 1
*Apr 21 04:46:18.563: The PKCS #7 message has 0 verified signers.
*Apr 21 04:46:18.563: CRYPTO_PKI: Success on PKCS7 verify!
*Apr 21 04:46:18.563: CRYPTO_PKI: unlocked trustpoint mytrust, refcount is 0

What to Do Next

• To get an overview of Crypto, refer to the “Part 5: Implementing and Managing a PKI” section of the Security Configuration Guide.
Configuration Examples for Signed Tcl Script

Generating a Key Pair Example

The following example shows how to generate the key pair—a private key and a public key:

Generate a Private Key: Example

Host% openssl genrsa -out privkey.pem 2048
Generating RSA private key, 2048 bit long modulus
.............+++.................................................................................................................................+++e is 65537 (0x10001)
Host% ls -l
total 8
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
Host%

Generate a Public Key from the Private Key

Host% openssl rsa -in privkey.pem -pubout -out pubkey.pem
writing RSA key
Host% ls -l
total 16
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem

Generating a Certificate Example

The following example shows how to generate a certificate:

Host% openssl req -new -x509 -key privkey.pem -out cert.pem -days 1095
You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value, If you enter ".", the field will be left blank.
-----
Country Name (2 letter code) [GB]:US
State or Province Name (full name) [Berkshire]:California
Locality Name (eg, city) [Newbury]:San Jose
Organization Name (eg, company) [My Company Ltd]:Cisco Systems, Inc.
Organizational Unit Name (eg, section) []:DEPT_ACCT
Common Name (eg, your name or your server's hostname) []:Jane
Email Address []:janedoe@company.com
Host% ls -l
total 24
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
Signing the Tcl Scripts Example

The following example shows how to sign the Tcl scripts:

```
Host% openssl smime -sign -in hello -out hello.pk7 -signer cert.pem -inkey privkey.pem
   -outform DER -binary
Host% ls -l
```
```
total 40
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```

Verifying the Signature Example

The following example shows how to verify the signature:

```
Host% openssl smime -verify -in hello.pk7 -CAfile cert.pem -inform DER -content hello
```
```
puts hello
puts "argv - $argv"
puts "argc - $argc"
puts "argv0 - $argv0"
puts "tcl_interactive - $tcl_interactive"
Verification successful
```

Converting the Signature with Nonbinary Data Example

The following example shows how to convert the Tcl signature with nonbinary data:

```
#Cisco Tcl Signature V1.0
Then append the signature file to the end of the file.
Host% xxd -ps hello.pk7 > hello.hex
Host% cat my_append
#!/usr/bin/env expect
set my_first {#Cisco Tcl Signature V1.0}
set newline {}
set my_file [lindex $argv 0]
set my_new_file [merge $my_file]
set my_new_handle [open $my_new_file w]
set my_handle [open $my_file r]
puts $my_new_handle $newline
puts $my_new_handle $my_first
set new_line {#}
foreach line [split [read $my_handle] "\n"] {
    set new_line {#}
    append new_line $line
    puts $my_new_handle $new_line
}
close $my_new_handle
```
```
close $my_handle
Host% my_append hello.hex
Host% ls -l
```
```
total 80
-rw-r--r-- 1 janedoe eng12 1659 Jun 12 15:01 cert.pem
-rw-r--r-- 1 janedoe eng12 115 Jun 13 10:16 hello
-rw-r--r-- 1 janedoe eng12 1876 Jun 13 10:16 hello.pk7
-rw-r--r-- 1 janedoe eng12 1679 Jun 12 14:55 privkey.pem
-rw-r--r-- 1 janedoe eng12 451 Jun 12 14:57 pubkey.pem
```
Converting the Signature with Nonbinary Data Example
Configuring the Device with a Certificate Example

The following example shows how to configure the device with a certificate:

crypto pki trustpoint mytrust
enrollment terminal
!
crypto pki authentication mytrust
crypto pki certificate chain mytrust

certificate

Feature Information for Signed Tcl Scripts

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Glossary

CA--certification authority. Service responsible for managing certificate requests and issuing certificates to participating IPsec network devices. This service provides centralized key management for the participating devices and is explicitly trusted by the receiver to validate identities and to create digital certificates.

certificates--Electronic documents that bind a user's or device's name to its public key. Certificates are commonly used to validate a digital signature.

CRL--certificate revocation list. Electronic document that contains a list of revoked certificates. The CRL is created and digitally signed by the CA that originally issued the certificates. The CRL contains dates for when the certificate was issued and when it expires. A new CRL is issued when the current CRL expires.

IPsec--IP security

peer certificate--Certificate presented by a peer, which contains the peer's public key and is signed by the trustpoint CA.
PKI—public key infrastructure. System that manages encryption keys and identity information for components of a network that participate in secured communications.

RA—registration authority. Server that acts as a proxy for the CA so that CA functions can continue when the CA is offline. Although the RA is often part of the CA server, the RA could also be an additional application, requiring an additional device to run it.

RSA keys—Public key cryptographic system developed by Ron Rivest, Adi Shamir, and Leonard Adleman. An RSA key pair (a public and a private key) is required before you can obtain a certificate for your device.

SHA1—Secure Hash Algorithm 1

SSH—secure shell

SSL—secure socket layer

EEM CLI Library Command Extensions

All command-line interface (CLI) library command extensions belong to the \:cisco\:eem namespace. This library provides users the ability to run CLI commands and get the output of the commands in Tcl. Users can use commands in this library to spawn an exec and open a virtual terminal channel to it, write the command to execute to the channel so that the command will be executed by exec, and read back the output of the command.

There are two types of CLI commands: interactive commands and non-interactive commands.

For interactive commands, after the command is entered, there will be a "Q&A" phase in which the device will ask for different user options, and the user is supposed to enter the answer for each question. Only after all the questions have been answered properly will the command run according to the user’s options until completion.

For noninteractive commands, once the command is entered, the command will run to completion. To run different types of commands using an EEM script, different CLI library command sequences should be used, which are documented in the "Using the CLI Library to Run a Noninteractive Command" section and in the "Using the CLI Library to Run an Interactive Command" section in the cli_write Tcl command.

The vty lines are allocated from the pool of vty lines that are configured using the line vty CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

Your release may support XML-PI. For details about the XML-PI support, the new CLI library command extensions, and some examples of how to implement XML-PI, see EEM CLI Library XML-PI Support.
cli_close

Closes the exec process and releases the vty and the specified channel handler connected to the command-line interface (CLI).

Syntax

\texttt{cli\_close \texttt{fd \texttt{tty\_id}}}

Arguments

\begin{tabular}{|l|l|}
\hline
\texttt{fd} & (Mandatory) The CLI channel handler. \\
\texttt{tty\_id} & (Mandatory) The TTY ID returned from the \texttt{cli\_open} command extension. \\
\hline
\end{tabular}

Result String

None

Set _cerrno

Cannot close the channel.

cli_exec

Writes the command to the specified channel handler to execute the command. Then reads the output of the command from the channel and returns the output.

Syntax

\texttt{cli\_exec \texttt{fd \texttt{cmd}}}

Arguments

\begin{tabular}{|l|l|}
\hline
\texttt{fd} & (Mandatory) The command-line interface (CLI) channel handler. \\
\texttt{cmd} & (Mandatory) The CLI command to execute. \\
\hline
\end{tabular}

Result String

The output of the CLI command executed.

Set _cerrno

Error reading the channel.
**cli_get_ttyname**

Returns the real and pseudo TTY names for a given TTY ID.

**Syntax**

```
cli_get_ttyname tty_id
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tty_id</td>
<td>(Mandatory) The TTY ID returned from the cli_open command extension.</td>
</tr>
</tbody>
</table>

**Result String**

```
pty %s tty %s
```

**Set _cerrno**

None

**cli_open**

Allocates a vty, creates an EXEC command-line interface (CLI) session, and connects the vty to a channel handler. Returns an array including the channel handler.

---

**Note**

Each call to cli_open initiates a Cisco IOS EXEC session that allocates a Cisco IOS vty line. The vty remains in use until the cli_close routine is called. The vty lines are allocated from the pool of vty lines that are configured using the line vty CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

**Syntax**

```
cli_open
```

**Arguments**

None

**Result String**

```
"tty_id {%s} pty {%d} tty {%d} fd {%d}"
```
<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tty_id</td>
<td>TTY ID.</td>
</tr>
<tr>
<td>pty</td>
<td>PTY device name.</td>
</tr>
<tr>
<td>tty</td>
<td>TTY device name.</td>
</tr>
<tr>
<td>fd</td>
<td>CLI channel handler.</td>
</tr>
</tbody>
</table>

### Set _cerrno
- Cannot get pty for EXEC.
- Cannot create an EXEC CLI session.
- Error reading the first prompt.

## cli_read

**Description**
Reads the command output from the specified command-line interface (CLI) channel handler until the pattern of the device prompt occurs in the contents read. Returns all the contents read up to the match.

### Syntax

```
cli_read fd
```

### Arguments

| fd | (Mandatory) The CLI channel handler. |

### Result String

All the contents read.

### Set _cerrno

Cannot get device name.

**Note**

This Tcl command extension will block waiting for the device prompt to show up in the contents read.

## cli_read_drain

**Description**
Reads and drains the command output of the specified command-line interface (CLI) channel handler. Returns all the contents read.
Syntax

cli_read_drain fd

Arguments

| fd   | (Mandatory) The CLI channel handler. |

Result String

All the contents read.

Set _cerrno

None

**cli_read_line**

Reads one line of the command output from the specified command-line interface (CLI) channel handler. Returns the line read.

Syntax

cli_read_line fd

Arguments

| fd   | (Mandatory) The CLI channel handler. |

Result String

The line read.

Set _cerrno

None

---

**Note**

This Tcl command extension will block waiting for the end of line to show up in the contents read.

**cli_read_pattern**

Reads the command output from the specified command-line interface (CLI) channel handler until the pattern that is to be matched occurs in the contents read. Returns all the contents read up to the match.
The pattern matching logic attempts a match by looking at the command output data as it is delivered from the Cisco IOS command. The match is always done on the most recent 256 characters in the output buffer unless there are fewer characters available, in which case the match is done on fewer characters. If more than 256 characters in the output buffer are required for the match to succeed, the pattern will not match.

**Syntax**

cli_read_pattern fd ptn

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>(Mandatory) The CLI channel handler.</td>
</tr>
<tr>
<td>ptn</td>
<td>(Mandatory) The pattern to be matched when reading the command output from the channel.</td>
</tr>
</tbody>
</table>

**Result String**

All the contents read.

**Set _cerrno**

None

---

This Tcl command extension will block waiting for the specified pattern to show up in the contents read.

---

**cli_run**

Iterates over the items in the clist and assumes that each one is a command-line-interface (CLI) command to be executed in the enable mode. On success, returns the output of all executed commands and on failure, returns error from the failure.

**Syntax**

cli_run clist

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clist</td>
<td>(Mandatory) The list of commands to be executed.</td>
</tr>
</tbody>
</table>

**Result String**

Output of all the commands that are executed or an error message.
**Set _cerrno**
None.

**Sample Usage**
The following example shows how to use the cli_run command extension.

```
set clist [list {sh run} {sh ver} {sh event man pol reg}]
cli_run { clist }
```

## cli_run_interactive

Provides a sublist to the clist which has three items. On success, returns the output of all executed commands and on failure, returns error from the failure. Also uses arrays when possible as a way of making things easier to read later by keeping expect and reply separated.

### Syntax

```
cli_run_interactive clist
```

### Arguments

<table>
<thead>
<tr>
<th>clist</th>
<th>(Mandatory) List of three items:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• command– Command to be executed</td>
</tr>
<tr>
<td></td>
<td>• expect– A regular expression pattern match for the expected reply prompt</td>
</tr>
<tr>
<td></td>
<td>• responses– A list of possible responses to the reply prompt constructed as an array of two items:</td>
</tr>
<tr>
<td></td>
<td>• expect– A regular expression pattern match for a possible reply prompt</td>
</tr>
<tr>
<td></td>
<td>• reply- A reply for that expected prompt</td>
</tr>
</tbody>
</table>

### Result String
Output of all the commands that are executed or an error message. As each command is executed its output is appended to a result variable. Upon exhaustion of the input list, the CLI channel is closed and the aggregate result is returned.

**Set _cerrno**
None.

**Sample Usage**
The following example shows how to clear counters for interface fa0/0 use the cli_run_interactive command extension.
set cmdarr(command) "clear counters fa0/0"
set cmdarr(responses) [list]
set resps(expect) {{confirm}}
set resps(reply) "y"
lappend cmdarr(responses) [array get resps]
set rc [catch {cli_run_interactive [list [array get cmdarr]]} result]

Possible errors raised include:

- cannot get pty for exec
- cannot spawn exec
- error reading the first prompt
- error reading the channel
- cannot close channel

cli_write

Writes the command that is to be executed to the specified CLI channel handler. The CLI channel handler executes the command.

Syntax

cli_write fd cmd

Arguments

<table>
<thead>
<tr>
<th>fd</th>
<th>(Mandatory) The CLI channel handler.</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmd</td>
<td>(Mandatory) The CLI command to execute.</td>
</tr>
</tbody>
</table>

Result String

None

Set _cerrno

None

Sample Usage

As an example, use configuration CLI commands to bring up Ethernet interface 1/0:

```bash
if [catch {cli_open} result] {
psects stderr $result
exit 1
} else {
array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
psects stderr $result
exit 1
}
if [catch {cli_exec $cli1(fd) "config t"} result] {
  puts stderr $result
  exit 1
}
if [catch {cli_exec $cli1(fd) "interface Ethernet1/0"} result] {
  puts stderr $result
  exit 1
}
if [catch {cli_exec $cli1(fd) "no shut"} result] {
  puts stderr $result
  exit 1
}
if [catch {cli_exec $cli1(fd) "end"} result] {
  puts stderr $result
  exit 1
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
  puts stderr $result
  exit 1
}

Using the CLI Library to Run a Noninteractive Command

To run a noninteractive command, use the cli_exec command extension to issue the command, and then wait for the complete output and the device prompt. For example, the following shows the use of configuration CLI commands to bring up Ethernet interface 1/0:

if [catch {cli_open} result] {
  error $result $errorInfo
} else {
  set fd $result
}
if [catch {cli_exec $fd "en"} result] {
  error $result $errorInfo
}
if [catch {cli_exec $fd "config t"} result] {
  error $result $errorInfo
}
if [catch {cli_exec $fd "interface Ethernet1/0"} result] {
  error $result $errorInfo
}
if [catch {cli_exec $fd "no shut"} result] {
  error $result $errorInfo
}
if [catch {cli_exec $fd "end"} result] {
  error $result $errorInfo
}
if [catch {cli_close $fd} result] {
  error $result $errorInfo
}

Using the CLI Library to Run an Interactive Command

To run interactive commands, three phases are needed:

- Phase 1: Issue the command using the cli_write command extension.
- Phase 2: Q&A Phase. Use the cli_read_pattern command extension to read the question (the regular pattern that is specified to match the question text) and the cli_write command extension to write back the answers alternately.
• Phase 3: Noninteractive phase. All questions have been answered, and the command will run to completion. Use the cli_read command extension to wait for the complete output of the command and the device prompt.

For example, use CLI commands to do squeeze bootflash: and save the output of this command in the Tcl variable cmd_output.

```tcl
if [catch {cli_open} result] {
    error $result $errorInfo
} else {
    array set cli1 $result
}
if [catch {cli_exec $cli1(fd) "en"} result] {
    error $result $errorInfo
}
# Phase 1: issue the command
if [catch {cli_write $cli1(fd) "squeeze bootflash:"} result] {
    error $result $errorInfo
}
# Phase 2: Q&A phase
# wait for prompted question:
# All deleted files will be removed. Continue? [confirm]
if [catch {cli_read_pattern $cli1(fd) "All deleted"} result] {
    error $result $errorInfo
}
# write a newline character
if [catch {cli_write $cli1(fd) "\n"} result] {
    error $result $errorInfo
}
# wait for prompted question:
# Squeeze operation may take a while. Continue? [confirm]
if [catch {cli_read_pattern $cli1(fd) "Squeeze operation"} result] {
    error $result $errorInfo
}
# write a newline character
if [catch {cli_write $cli1(fd) "\n"} result] {
    error $result $errorInfo
}
# Phase 3: noninteractive phase
# wait for command to complete and the router prompt
if [catch {cli_read $cli1(fd) } result] {
    error $result $errorInfo
} else {
    set cmd_output $result
}
if [catch {cli_close $cli1(fd) $cli1(tty_id)} result] {
    error $result $errorInfo
}
```

The following example causes a device to be reloaded using the CLI reload command. Note that the EEM action_reload command accomplishes the same result in a more efficient manner, but this example is presented to illustrate the flexibility of the CLI library for interactive command execution.

```tcl
# 1. execute the reload command
if [catch {cli_open} result] {
    error $result $errorInfo
} else {
    array set cli1 $result
```
EEM 4.0 CLI Library XML-PI Support

EEM CLI Library XML-PI Support

XML Programmatic Interface (XML-PI) was introduced in Cisco IOS Release 12.4(22)T. XML-PI provides a programmable interface which encapsulates IOS command-line interface (CLI) show commands in XML format in a consistent way across different Cisco products. Customers using XML-PI will be able to parse IOS show command output from within Tcl scripts using well-known keywords instead of having to depend on the use of regular expression support to "screen-scrape" output.

The benefit of using the XML-PI command extensions is to facilitate the extraction of specific output information that is generated using a CLI show command. Most show commands return many fields within the output and currently a regular expression has to be used to extract specific information that may appear in the middle of a line. XML-PI support provides a set of Tcl library functions to facilitate the parsing of output from the IOS CLI format extension in the form of:

```tcl
show < show-command > | format
```
spec-file
}

where a spec-file is a concatenation of all Spec File Entries (SFE) for each `show` command currently supported. As part of the XML-PI project a default spec-file will be included in the IOS Release 12.4(22)T images. The default spec-file will have a small set of commands and the SFE for the commands will have a subset of the possible tags. If no spec-file is provided with the format command, the default spec-file is used. For more general details about XML-PI, see the "XML-PI" module.
EEM Context Library Command Extensions

All the Tcl context library command extensions belong to the ::cisco::eem namespace.

- `context_retrieve`, on page 1907
- `context_save`, on page 1910

**context_retrieve**

Retrieves Tcl variable(s) identified by the given context name, and possibly the scalar variable name, the array variable name, and the array index. Retrieved information is automatically deleted.

**Note**

Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the `context_retrieve` command extension) should also save it again (using the `context_save` command extension).

**Syntax**

`context_retrieve ctxt [var] [index_if_array]`

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxt</td>
<td>(Mandatory) Context name.</td>
</tr>
<tr>
<td>var</td>
<td>(Optional) Scalar variable name or array variable name. Defaults to a null string if this argument is not specified.</td>
</tr>
<tr>
<td>index_if_array</td>
<td>(Optional) The array index.</td>
</tr>
</tbody>
</table>

**Note**

The `index_if_array` argument will be ignored when the `var` argument is a scalar variable.

If `var` is unspecified, retrieves the whole variable table saved in the context.
If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

If var is specified, and index_if_array is specified, and var is an array variable, retrieves the value of the specified array element.

**Result String**

Resets the Tcl global variables to the state that they were in when the save was performed.

**Set _cerrno**

- A string displaying _cerrno, _cerr_sub_num, _cerr_sub_err, _cerr_posix_err, _cerr_str due to appl_reqinfo error.
- Variable is not in the context.

**Sample Usage**

The following examples show how to use the `context_save` and `context_retrieve` command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

**Example 1: Save**

If var is unspecified or if a pattern if specified, saves multiple variables to the context.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

**Example 1: Retrieve**

If var is unspecified, retrieves multiple variables from the context.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
}
```
Example 2: Save
If var is specified, saves the value of var.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {{catch [context_save TESTCTX testvar] errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```

Example 2: Retrieve
If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {{catch [set testvar [context_retrieve TESTCTX testvar]] errmsg]} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {{info exists testvar]} {
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar does not exist"
}
```

Example 3: Save
If var is specified, saves the value of var even if it is an array.

```cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch [context_save TESTCTX testvar] errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```
Example 3: Retrieve

If var is specified, and index_if_array is not specified, and var is an array variable, retrieves the entire array.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg] {
        action_syslog msg "context_retrieve failed: $errmsg"
    } else {
        action_syslog msg "context_retrieve succeeded"
    }
}
if {[info exists testvar]} {
    action_syslog msg "testvar exists and is [array get testvar]"
} else {
    action_syslog msg "testvar does not exist"
}
```

Example 4: Save

If var is specified, saves the value of var even if it is an array.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not ok"
if {
    [catch {context_save TESTCTX testvar} errmsg] {
        action_syslog msg "context_save failed: $errmsg"
    } else {
        action_syslog msg "context_save succeeded"
    }
}
```

Example 4: Retrieve

If var is specified, and index_if_array is specified, and var is an array variable, retrieves the specified array element value.

```tcl
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {
    [catch {set testvar [context_retrieve TESTCTX testvar testvar1]} errmsg] {
        action_syslog msg "context_retrieve failed: $errmsg"
    } else {
        action_syslog msg "context_retrieve succeeded"
    }
}
if {[info exists testvar]} {
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar doesn't exist"
}
```

context_save

Saves Tcl variables that match a given pattern in current and global namespaces with the given context name as identification. Use this Tcl command extension to save information outside of a policy. Saved information can be retrieved by a different policy using the context_retrieve command extension.
Once saved information is retrieved, it is automatically deleted. If that information is needed by another policy, the policy that retrieves it (using the `context_retrieve` command extension) should also save it again (using the `context_save` command extension).

**Syntax**

```plaintext
context_save ctxt [pattern]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctxt</td>
<td>(Mandatory) Context name.</td>
</tr>
<tr>
<td>pattern</td>
<td>(Optional) The glob-style pattern as used by the <code>string match</code> Tcl command. If this argument is not specified, the pattern defaults to the wildcard <code>*</code>.</td>
</tr>
</tbody>
</table>

There are three constructs used in glob patterns:

- `*` = all characters
- `?` = 1 character
- `[abc]` = match one of a set of characters

**Result String**

None

**Set _cerrno**

A string displaying `_cerrno`, `_cerr_sub_num`, `_cerr_sub_err`, `_cerr_posix_err`, `_cerr_str` due to appl_setinfo error.

**Sample Usage**

The following examples show how to use the `context_save` and `context_retrieve` command extension functionality to save and retrieve data. The examples are shown in save and retrieve pairs.

**Example 1: Save**

If var is unspecified or if a pattern if specified, saves multiple variables to the context.

```plaintext
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvara 123
set testvarb 345
set testvarc 789
if {[catch {context_save TESTCTX "testvar*"} errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}
```
Example 1: Retrieve

If var is unspecified, retrieves multiple variables from the context.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {foreach {var value} [context_retrieve TESTCTX] {set $var $value}} errmsg]} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvara]} {
    action_syslog msg "testvara exists and is $testvara"
} else {
    action_syslog msg "testvara does not exist"
}
if {[info exists testvarb]} {
    action_syslog msg "testvarb exists and is $testvarb"
} else {
    action_syslog msg "testvarb does not exist"
}
if {[info exists testvarc]} {
    action_syslog msg "testvarc exists and is $testvarc"
} else {
    action_syslog msg "testvarc does not exist"
}

Example 2: Save

If var is specified, saves the value of var.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set testvar 123
if {[catch {context_save TESTCTX testvar} errmsg]} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}

Example 2: Retrieve

If var is specified and index_if_array is not specified, or if index_if_array is specified but var is a scalar variable, retrieves the value of var.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {[catch {set testvar [context_retrieve TESTCTX testvar]} errmsg]} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
    action_syslog msg "testvar exists and is $testvar"
} else {
Example 3: Save
If var is specified, saves the value of var even if it is an array.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch {context_save TESTCTX testvar} errmsg}} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}

Example 3: Retrieve
If var is specified, and index_if_array is not specified, and var is an array variable, retrieves the entire array.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {{catch {array set testvar [context_retrieve TESTCTX testvar]} errmsg}} {
    action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {{info exists testvar}} {
    action_syslog msg "testvar exists and is [array get testvar]"
} else {
    action_syslog msg "testvar does not exist"
}

Example 4: Save
If var is specified, saves the value of var even if it is an array.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
array set testvar "testvar1 ok testvar2 not_ok"
if {{catch {context_save TESTCTX testvar} errmsg}} {
    action_syslog msg "context_save failed: $errmsg"
} else {
    action_syslog msg "context_save succeeded"
}

Example 4: Retrieve
If var is specified, and index_if_array is specified, and var is an array variable, retrieves the specified array element value.

::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
if {{catch {set testvar [context_retrieve TESTCTX testvar testvar1]} errmsg}} {

action_syslog msg "context_retrieve failed: $errmsg"
} else {
    action_syslog msg "context_retrieve succeeded"
}
if {[info exists testvar]} {
    action_syslog msg "testvar exists and is $testvar"
} else {
    action_syslog msg "testvar doesn't exist"
}
CHAPTER 90

EEM Event Registration Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  [type ?]

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

  priority low|normal|high

---

**Note**
For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**
Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- event_register_resource, on page 1956
- event_register_rf, on page 1958
**event_register_appl**

Registers for an application event. Use this Tcl command extension to run a policy when an application event is triggered following another policy’s execution of an `event_publish` Tcl command extension; the `event_publish` command extension publishes an application event.

In order to register for an application event, a subsystem must be specified. Either a Tcl policy or the internal Embedded Event Manager (EEM) API can publish an application event. If the event is being published by a policy, the sub_system argument that is reserved for a policy is 798.

**Syntax**

```
event_register_appl [tag ?] sub_system ? type ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>sub_system</td>
<td>(Mandatory) Number assigned to the EEM policy that published the application event. The number is set to 798 because all other numbers are reserved for Cisco use. If this argument is not specified, all components are matched.</td>
</tr>
<tr>
<td>type</td>
<td>(Mandatory) Event subtype within the specified event. The sub_system and type arguments uniquely identify an application event. If this argument is not specified, all types are matched. If you specify this argument, you must choose an integer between 1 and 4294967295, inclusive. There must be a match of component and type between the <code>event_publish</code> command extension and the <code>event_register_appl</code> command extension in order for the publishing and registration to work.</td>
</tr>
</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:

- **queue_priority low**--Specifies that the script is to be queued at the lowest of the three priority levels.
- **queue_priority normal**--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- **queue_priority high**--Specifies that the script is to be queued at the highest of the three priority levels.
- **queue_priority last**--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

If multiple conditions exist, the application event will be raised when all the conditions are satisfied.

**Result String**

None

**Set_cerrno**

No

Event_reqinfo

<tr>
<td>event_pub_msec</td>
<td>Number assigned to the EEM policy that published the application event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td>sub_system</td>
<td>Event subtype within the specified component.</td>
</tr>
<tr>
<td>type</td>
<td>Argument data that is passed to the application-specific event when the event is published. The data is character text, an environment variable, or a combination of the two.</td>
</tr>
</tbody>
</table>

---

### event_register_cli

Registers for a CLI event. Use this Tcl command extension to run a policy when a CLI command of a specific pattern is entered based on pattern matching performed against an expanded CLI command.

#### Note

The user can enter an abbreviated CLI command, such as `sh mem summary`, and the parser will expand the command to `show memory summary` to perform the matching.

#### Note

The functionality provided in the CLI event detector only allows a regular expression pattern match on a valid IOS CLI command itself. This does not include text after a pipe character when redirection is used.

#### Syntax

```
event_register_cli [tag ?] sync yes|no skip yes|no [occurs ?] [period ?] pattern ? [default ?] [enter] [questionmark] [tab] [mode] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

#### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>sync</td>
<td>(Mandatory) A &quot;yes&quot; means that the policy (the event publish) will run synchronously with the CLI command; a &quot;no&quot; means that the event publish will be performed asynchronously with the CLI command. The event detector will be notified when the policy completes running. The exit status of the policy indicates whether or not the CLI command should be executed: if the exit status is zero, which means that the policy is executed successfully, the CLI command will not be executed; otherwise, the CLI command will be executed.</td>
</tr>
</tbody>
</table>
**skip** | Mandatory if the sync argument is "no" and should not exist if the sync argument is "yes." If the skip argument is "yes," it means that the CLI command should not be executed. If the skip argument is "no," it means that the CLI command should be executed.  
Caution | When the skip argument is "yes," unintended results may be produced if the pattern match is made for configuration commands because the CLI command that matches the regular expression will not be executed.  
--- | ---  
**occurs** | (Optional) The number of occurrences before the event is raised. If this argument is not specified, the event is raised on the first occurrence. If this argument is specified, it must be an integer between 1 and 4294967295, inclusive.  
**period** | (Optional) Specifies a backward looking time window in which all CLI events must occur (the occurs clause must be satisfied) in order for an event to be published (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent event is used.  
**pattern** | (Mandatory) Specifies the regular expression used to perform the CLI command pattern match.  
**default** | (Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds.  
**queue_priority** | (Optional) Priority level at which the script will be queued:  
- **queue_priority low**--Specifies that the script is to be queued at the lowest of the three priority levels.  
- **queue_priority normal**--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
- **queue_priority high**--Specifies that the script is to be queued at the highest of the three priority levels.  
- **queue_priority last**--Specifies that the script is to be queued at the lowest priority level.  
If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.  
**enter** | (Optional) Specifies to perform the event match when the user presses the Enter key. When this parameter is used, the input string will not be expanded before matching.  
**questionmark** | (Optional) Specifies to perform the event match when the user presses the ? key. When this parameter is used, the input string will not be expanded before matching.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tab</td>
<td>(Optional) Specifies to perform the event match when the user presses the Tab key. When this parameter is used, the input string will not be expanded before matching.</td>
</tr>
<tr>
<td>mode</td>
<td>(Optional) Events will only be generated when the parser is in the specified parser mode. The available modes can be listed using the show parser dump CLI command. The mode parameter is checked when any one of the optional parameters--enter, questionmark, or tab--is specified.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.M]M format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

If multiple conditions are specified, the CLI event will be raised when all the conditions are matched.

**Result String**

None

**Set _cerrno**

No

**Note**

This policy runs before the CLI command is executed. For example, suppose policy_CLI is registered to run when the `copy` command is entered. When the `copy` command is entered, the CLI event detector finds a pattern match and triggers this policy to run. When the policy execution ends, the CLI event detector determines if the `copy` command needs to be executed according to "sync", "skip" (set in the policy), and the exit status of the policy execution if needed.

**Event_reginfo**

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u
event_severity %u msg {%s} msg_count %d line %u key %u tty %u error_code %u"
```

<table>

<tr>
<td>event_pub_sec</td>
<td>The time, in seconds and milliseconds, at which the event was published to the EEM.</td>
</tr>
<tr>
<td>event_pub_msec</td>
<td></td>
</tr>
<tr>
<td>event_severity</td>
<td>The severity of the event.</td>
</tr>
</tbody>
</table>
**event_register_counter**

Registers for a counter event as both a publisher and a subscriber. Use this Tcl command extension to run a policy on the basis of a named counter crossing a threshold. This event counter, as a subscriber, identifies the name of the counter to which it wants to subscribe and depends on another policy or another process to actually manipulate the counter. For example, let policyB act as a counter policy, whereas policyA (although it does not need to be a counter policy) uses `register_counter`, `counter_modify`, or `unregister_counter` Tcl command extensions to manipulate the counter defined in policyB.

**Syntax**

```
event_register_counter [tag?] name ? entry_op gt|ge|eq|ne|lt|le entry_val ? exit_op gt|ge|eq|ne|lt|le exit_val ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>arg</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) Name of the counter.</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Entry comparison operator used to compare the current counter value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.</td>
</tr>
<tr>
<td>entry_val</td>
<td>(Mandatory) Value with which the current counter value should be compared to decide if the counter event should be raised.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Mandatory) Exit comparison operator used to compare the current counter value with the exit value; if true, event monitoring for this event will be reenabled.</td>
</tr>
</tbody>
</table>
### Table of Arguments

<table>

</tbody>
</table>

**event_register_gold**

Registers for a Generic Online Diagnostic (GOLD) failure event. Use this Tcl command extension to run a policy on the basis of a Generic Online Diagnostic (GOLD) failure event for the specified card and subcard.

**Syntax**

```
event_register_gold card all|card_number [subcard all|subcard_number] [new_failure TRUE|FALSE] [severity_major TRUE] [severity_minor TRUE] [severity_normal TRUE] [action_notify TRUE|FALSE] [testing_type [bootup|ondemand|schedule|monitoring]] [test_name [testname]] [test_id [testnumber]] [consecutive_failure consecutive_failure_number] [platform_action [action_flag]] [maxrun ?] [queue_priority low|normal|high|last] [nice 0|1]
```

**Arguments**

**card**

( Mandatory) Specifies whether all cards or one card is to be monitored:

- card all--Specifies that all cards are to be monitored. This is the default.
- card-number--Specifies that the card identified by the number card-number is to be monitored.

This argument must be specified to complete the event_register_gold Tcl command extension.

**subcard**

(Optional) Specifies that one or more subcards are to be monitored:

- subcard all--Specifies that all subcards are to be monitored.
- subcard-number--Specifies that the subcard identified by the number subcard-number is to be monitored.

If this argument is not specified, all subcards are monitored by default.
| new_failure | (Optional) Specifies event criteria based on the new test failure information from GOLD:  
• new_failure TRUE--Specifies that the event criterion for the new test failure is true from GOLD.  
• new_failure FALSE--Specifies that the event criterion for the new test failure is false from GOLD.  
If this argument is not specified, the new test failure information from GOLD is not considered in the event criteria. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>severity_major</td>
<td>(Optional) Specifies that the event criteria for diagnostic result matches with the diagnostic major error from GOLD.</td>
</tr>
<tr>
<td>severity_minor</td>
<td>(Optional) Specifies that the event criteria for diagnostic result matches with diagnostic minor error from GOLD.</td>
</tr>
<tr>
<td>severity_normal</td>
<td>(Optional) Specifies that the event criteria for diagnostic result matches with diagnostic normal from GOLD. This is the default.</td>
</tr>
</tbody>
</table>
| action_notify | (Optional) Specifies the event criteria based on the action notify information from GOLD:  
• action_notify TRUE--Specifies that the event criterion for the action notify is true from GOLD.  
• action_notify FALSE--Specifies that the event criterion for the action notify is false from GOLD.  
If this argument is not specified, the action notify information from GOLD is not considered in the event criteria. |
| testing_type | (Optional) Specifies the event criteria based on the testing types of the diagnostic from GOLD:  
• testing_type bootup--Specifies the diagnostic tests that are running on system bootup.  
• testing_type ondemand--Specifies the diagnostic tests that are running from CLI after the card is online.  
• testing_type schedule--Specifies the scheduled diagnostic tests.  
• testing_type monitoring--Specifies the diagnostic tests that are running periodically in the background to monitor the health of the system.  
If this argument is not specified, the testing type information from GOLD is not considered in the event criteria and the policy applies to all the diagnostic testing types. |
| test_name | (Optional) Specifies the event criteria based on the test name:  
• test_name test-name--Specifies the event criteria based on the test with the name test-name.  
If this argument is not specified, the test name information from GOLD is not considered in the event criteria. |
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| **test_id** | (Optional) Specifies the event criteria based on test ID:  
  - test_id test-id--Specifies the event criteria based on the test with the ID number test-id. The maximum value of test-id is 65535.  
  **Note** Because the test ID can be different for the same test on different line cards, usually the test_name keyword should be used instead. If the test ID is specified and conflicts with the specified test name, the test name overwrites the test ID. |
| **consecutive_failure** | (Optional) Specifies the event criteria based on consecutive test failure information from GOLD:  
  - consecutive_failure consecutive-failure-number--Specifies that the event criterion is based on the occurrence of consecutive-failure-number consecutive test failures.  
  If this argument is not specified, consecutive test failure information from GOLD is not considered in the event criteria. |
| **platform_action** | (Optional) Specifies whether callback to the platform is needed when all the event criteria are matched. When callback is needed, the platform needs to register a callback function through the provided registry:  
  - platform_action action-flag-number--Specifies that, when callback to the platform is needed, specific information is specified by the platform-specific action-flag-number value. The maximum value of action-flag-number is 65535.  
  **Note** It is up to the platform to determine what action needs to be taken based on the flag. |
| **maxrun** | (Optional) Specifies the maximum run time of the script:  
  - maxrun max-run-time-number--Specifies that the maximum run time of the script is max-run-time-number seconds. The maximum value of max-run-time-number is 4294967295 seconds.  
  If this argument is not specified, the default run time is 20 seconds. |
queue_priority | (Optional) Priority level at which the script will be queued:
| • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
| • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
| • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
| • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note  The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

nice | (Optional) Policy run-time priority setting:
| • nice 0--Specifies that the policy is run at the default run-time priority level.
| • nice 1--Specifies that the policy is run at a run-time priority that is less than the default priority.

If this argument is not specified, the default run-time priority is used.

<td>-------------</td>
</tr>
</tbody>
</table>
| bl         | The boot-up diagnostic level, which can be one of the following values:  
|            | • 0: complete diagnostic  
|            | • 1: minimal diagnostics  
|            | • 2: bypass diagnostic |
| card       | Card information for the GOLD event. |
| cf testnum | Consecutive failure, where testnum is the test number. For example, cf3 is the EEM built-in environment variable for consecutive failure of test 3. |
| ci         | Card index. |
| cn         | Card name. |
| ec testnum | Test error code, where testnum is the test number. For example, ec3 is the EEM built-in environment variable for the error code of test 3. |
| event_id   | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_pub_msec event_pub_sec | The time, in milliseconds and seconds, when the event was published to the EEM. |
| event_severity | GOLD event severity, which can be one of the following values:  
|            | • normal  
|            | • minor  
|            | • major. |
| event_type | Type of event. |
| event_type_string | An ASCII string that represents the name of the event for this event type. |
| If testnum | Last fail time, where testnum is the test number. For example, if3 is the EEM built-in variable for the last fail time of test 3. The timestamp format is mmm dd yyyy hh:mm:ss. For example, Mar 11 1960 08:47:00. |
| new_failure | The new test failure information in a GOLD event flag: true or false. |
| overall_result | The overall diagnostic result, which can be one of the following values:  
|            | • 0: OK  
|            | • 3: minor error  
|            | • 4: major error  
<p>|            | • 14: unknown result |</p>

</table>
| tt         | The testing type, which can be one of the following:  
- 1: A boot-up diagnostic  
- 2: An on-demand diagnostic  
- 3: A schedule diagnostic  
- 4: A monitoring diagnostic |

### event_register_identity

Registers for an identity event. Use this Tcl command extension to generate an event when AAA authentication or authorization is successful or failure or after normal user traffic on the port is allowed to flow.

**Syntax**

```tcl
event_register_identity [tag ?] interface ? [aaa-attribute ?] [authc {all | fail | success}] [authz {all | fail | success}] [authz-complete] [mac-address ?] [queue_priority {normal | low | high | last}] [maxrun ?] [nice {0 | 1}]```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>interface</td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td>aaa-attribute</td>
<td>(Optional) A regular expression that can be used to filter events by specific AAA attributes.</td>
</tr>
<tr>
<td>authc</td>
<td>(Optional) Triggers events on successful, failed or both successful and failed authentication.</td>
</tr>
<tr>
<td>authz</td>
<td>(Optional) Triggers events on successful, failed or both successful and failed authorization.</td>
</tr>
<tr>
<td>authz-complete</td>
<td>(Optional) Triggers events once the device connected to the interface is fully authenticated, authorized and normal traffic has begun to flow on that interface.</td>
</tr>
<tr>
<td>mac-address</td>
<td>(Optional) A regular expression pattern that can be used to filter events by mac addresses of the remote device.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
</tbody>
</table>
queue_priority | (Optional) Priority level at which the script will be queued:
- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Result String**

None

**Set _cerrno**

No

**Event_reqinfo For EEM_EVENT_IDENTITY**

```
"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u event_severity %u identity_stage %u identity_status %u interface %u identity_mac %u identity_<attribute> {%s}"

<tr>
<td>identity_&lt;attribute&gt;</td>
<td>For each AAA attribute, a set a dynamic variable to the value corresponding to that AAA attribute in the attribute or value list.</td>
</tr>
</tbody>
</table>

---

**event_register_interface**

Registers for an interface counter event. Use this Tcl command extension to generate an event when specified interface counters exceed specified thresholds.

**Syntax**

```
event_register_interface [tag ?] name ?
parameter ? entry_op [gt|ge|eq|ne|lt|le]
entry_val ? entry_val_is_increment [TRUE|FALSE]
entry_type value[increment|rate]
[exit_comb [or|and]]
[exit_op [gt|ge|eq|ne|lt|le]]
[exit_val ?] [exit_val_is_increment [TRUE|FALSE]]
[exit_type value[increment|rate]]
[exit_time ?] [poll_interval ?]
[average_factor ?] [queue_priority [low|normal|high|last]]
[maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) The name of the interface being monitored, for example, Ethernet 0/0. Abbreviations and spaces are not allowed.</td>
</tr>
<tr>
<td>parameter</td>
<td>(Mandatory) The name of the counter being compared as follows:</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>input_errors</td>
<td>Includes runts, giants, no buffer, CRC, frame, overrun, and ignored counts. Other input-related errors can also cause the input errors count to be increased, and some datagrams may have more than one error; therefore, this sum may not balance with the sum of enumerated input error counts.</td>
</tr>
<tr>
<td>input_errors_crc</td>
<td>Cyclic redundancy checksum generated by the originating LAN station or far-end device does not match the checksum calculated from the data received.</td>
</tr>
<tr>
<td>input_errors_frame</td>
<td>Number of packets received incorrectly having a CRC error and a noninteger number of octets.</td>
</tr>
<tr>
<td>input_errors_overrun</td>
<td>Number of times the receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.</td>
</tr>
<tr>
<td>input_packets_dropped</td>
<td>Number of packets dropped because of a full input queue.</td>
</tr>
<tr>
<td>interface_resets</td>
<td>Number of times that an interface has been completely reset.</td>
</tr>
<tr>
<td>output_buffer_failures</td>
<td>Number of failed buffers and number of buffers swapped out.</td>
</tr>
<tr>
<td>output_buffer_swappedout</td>
<td>Number of packets swapped to DRAM.</td>
</tr>
<tr>
<td>parameter (continued)</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>output_errors--Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this may not balance with the sum of the enumerated output errors, because some datagrams may have more than one error, and others may have errors that do not fall into any of the specifically tabulated categories.</td>
<td></td>
</tr>
<tr>
<td>output Errors Underrun--Number of times that the transmitter has been running faster than the device can handle.</td>
<td></td>
</tr>
<tr>
<td>output_packets_dropped--Number of packets dropped because of a full output queue.</td>
<td></td>
</tr>
<tr>
<td>receive_broadcasts--Number of broadcast or multicast packets received by the interface.</td>
<td></td>
</tr>
<tr>
<td>receive_giants--Number of packets that are discarded because they exceed the maximum packet size of the medium.</td>
<td></td>
</tr>
<tr>
<td>receive_rate_bps--Interface receive rate in bytes per second.</td>
<td></td>
</tr>
<tr>
<td>receive_rate_pps--Interface receive rate in packets per second.</td>
<td></td>
</tr>
<tr>
<td>receive_runs--Number of packets that are discarded because they are smaller than the minimum packet size of the medium.</td>
<td></td>
</tr>
<tr>
<td>receive_throttle--Number of times that the receiver on the port was disabled, possibly because of buffer or processor overload.</td>
<td></td>
</tr>
<tr>
<td>reliability--Reliability of the interface as a fraction of 255 (255/255 is 100 percent reliability), calculated as an exponential average over 5 minutes.</td>
<td></td>
</tr>
<tr>
<td>rxload--Receive rate of the interface as a fraction of 255 (255/255 is 100 percent).</td>
<td></td>
</tr>
<tr>
<td>transmit_rate_bps--Interface transmit rate in bytes per second.</td>
<td></td>
</tr>
<tr>
<td>transmit_rate_pps--Interface transmit rate in packets per second.</td>
<td></td>
</tr>
<tr>
<td>txload--Transmit rate of the interface as a fraction of 255 (255/255 is 100 percent).</td>
<td></td>
</tr>
</tbody>
</table>

| entry_op | (Mandatory) The comparison operator used to compare the current interface value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met. |
| entry_val | (Mandatory) The value at which the event will be triggered. |
| entry_val_is_increment | (Mandatory) If TRUE, the entry_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true (the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the entry_val field is compared against the current counter value. |

**Note** This keyword has been deprecated, and if specified, the syntax is converted into equivalent entry-type keyword syntax.
<p>| <strong>entry-type</strong> | Specifies a type of operation to be applied to the object ID specified by the entry-val argument. Value is defined as the actual value of the entry-val argument. Increment uses the entry-val field as an incremental difference and the entry-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| <strong>exit_comb</strong> | (Optional) Used to indicate the combination of exit condition tests required to rearm the event trigger; if the and operator is specified, both exit value and exit time tests must be true to cause rearm; if the or operator is specified, either exit value or exit time tests can be true to cause event monitoring to be rearmed. |
| <strong>exit_op</strong> | (Optional) The comparison operator used to compare the current interface value with the exit value; if true, event monitoring for this event will be reenabled. |
| <strong>exit_val</strong> | (Optional) The value at which the event is rearmed to be monitored again. |
| <strong>exit_val_is_increment</strong> | (Optional) If TRUE, the exit_val field is treated as an incremental difference and is compared with the difference between the current counter value and the value when the event was last true. A negative value checks the incremental difference for a counter that is decreasing. If FALSE, the exit_val field is compared against the current counter value. Note In Cisco IOS Release 12.4(20)T, this keyword is deprecated, and if specified, the syntax is converted into equivalent exit-type keyword syntax. |
| <strong>exit-type</strong> | (Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed. Value is defined as the actual value of the exit-val argument. Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| <strong>exit_time</strong> | (Optional) The time period at which the event is rearmed to be monitored again (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>poll_interval</td>
<td>(Optional) The frequency used to collect the samples (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 60 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). The poll interval value must not be less than 1 second. The default is 1 second.</td>
</tr>
<tr>
<td>average-factor</td>
<td>(Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1.</td>
</tr>
<tr>
<td>queue_priority</td>
<td>(Optional) Priority level at which the script will be queued:</td>
</tr>
<tr>
<td></td>
<td>• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.</td>
</tr>
<tr>
<td></td>
<td>• queue_priority last--Specifies that the script is to be queued at the lowest priority level.</td>
</tr>
<tr>
<td></td>
<td>If more than one script is registered with the &quot;queue_priority_last&quot; argument set, these scripts will execute in the order in which the events are published.</td>
</tr>
<tr>
<td></td>
<td>Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.</td>
</tr>
<tr>
<td></td>
<td>If this argument is not specified, the default queuing priority is normal.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set_cerrno**

No

**Event_reqinfo**

```
"event_id %u event_type %u event_type_string [%s] %u event_pub_sec %u event_pub_msec %u"
"event_severity [%s] name [%s] parameter [%s] value %d"
```
## event_register_ioswdsysmon

Registers for an IOSWDSysMon event. Use this Tcl command extension to generate an event when a Cisco IOS task exceeds specific CPU utilization or memory thresholds. A Cisco IOS task is called a Cisco IOS process in native Cisco IOS.

### Syntax

```
event_register_ioswdsysmon [tag?] [timewin?] [sub12op and|or] [sub1?] [sub2?] [queue_priority low|normal|high|last] [maxrun?] [nice 0|1]
```

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>timewin</td>
<td>(Optional) Defines the time window within which all of the subevents must occur in order for an event to be generated (specified in SSSSSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>sub12_op</td>
<td>(Optional) The combination operator for comparison between subevent 1 and subevent 2.</td>
</tr>
</tbody>
</table>
sub1  (Optional) The subevent 1 specification.

sub2  (Optional) The subevent 2 specification.

queue_priority  (Optional) Priority level at which the script will be queued:

• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.

• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.

• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.

• queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note    The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.
	nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

Subevent Syntax

cpu_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [period ?]
mem_proc path ? taskname ? op gt|ge|eq|ne|lt|le val ? [is_percent TRUE|FALSE] [period ?]

Subevent Arguments

cpu_proc  (Mandatory) Specifies the use of a sample collection of CPU statistics.

path  (Mandatory) Software Modularity images only. The pathname of the POSIX process that contains the Cisco IOS scheduler to be monitored. For example, /sbin/cdp2_iosproc.

taskname  (Mandatory) The name of the Cisco IOS task to be monitored.

op  (Mandatory) The comparison operator used to compare the collected usage sample with the specified value; if true, an event will be raised.

val  (Mandatory) The value to be compared.
**period** (Optional) The elapsed time period for the collection samples to be averaged (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

**mem_proc** (Mandatory) Specifies the use of a sample collection of memory statistics.

**is_percent** (Optional) Whether the specified value is a percentage.

**Result String**

None

**Set _cerrno**

No

**Event reqinfo**

```
"event_id %u event_type %u event_type_string {\%s} %u event_pub_sec %u event_pub_msec %u"

<tr>
<td>is_percent</td>
<td>TRUE or FALSE depending on whether the value is a percentage value.</td>
</tr>
<tr>
<td>value</td>
<td>Total memory use in KB or the actual average memory utilization for this measured interval.</td>
</tr>
<tr>
<td>diff</td>
<td>The percentage difference between the oldest sample in the measured interval and the latest sample; a negative value represents a decrease.</td>
</tr>
<tr>
<td>sec, msec</td>
<td>Elapsed time period for this measured interval.</td>
</tr>
</tbody>
</table>

---

**event_register_ipsla**

Registers for an event that is triggered by the `event ipsla` command. Use this Tcl command to publish an event when an IPSLA reaction is triggered. The group ID or the operation ID is required to register the event.

**Syntax**

```
event_register_ipsla [tag ?] group_name ? operation_id ? [reaction_type ?]  
[dest_ip_addr ?][queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>group_name</td>
<td>(Mandatory) Specifies the IP SLAs group name.</td>
</tr>
<tr>
<td><strong>operation_id</strong></td>
<td>(Mandatory) Specifies the IP SLA operation ID. Number must be in the range from 1 to 2147483647.</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>reaction_type</strong></td>
<td>(Optional) Specifies the reaction to be taken for the specified IP SLAs operation.</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

</table>

**event_register_mat**

Registers for a MAT event. Use this Tcl command extension to generate an event when a mac-address is learned in the mac-address-table.

**Syntax**

```
event_register_identity [tag ?] interface ?
    [mac-address ?]
    [type {add | delete}]
    [hold-down ?]
    [maxrun ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>interface</td>
<td>A regular expression pattern to match against interface names.</td>
</tr>
<tr>
<td>mac-address</td>
<td>Mandatory if the interface parameter is not specified. A regular expression pattern that can be used to filter events by mac addresses of the remote device.</td>
</tr>
</tbody>
</table>
Filter based on a mac-address-table event type of add or delete. If not specified, the event type is not used in determining whether the event should be triggered.

When a mac-address-table event comes in, the hold-down timer can be set to make the event to wait between 1 and 4294967295 seconds before processing the policy. If not set then the policy is not delayed in being processed.

Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 31536000, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

### event_register_nf

Registers for an event when a NetFlow event is triggered by the `event nf` command. Use this Tcl command to publish an event when an NetFlow reaction is triggered.

#### Syntax

```
event_register_nf [tag ?] monitor_name ? event_type create|update|delete exit_event_type create|update|delete event1-event4 ? [maxrun ?] [nice 0|1]
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>monitor_name</td>
<td>(Mandatory) The name of the NetFlow monitor.</td>
</tr>
<tr>
<td>event_type</td>
<td>(Mandatory) The type of event to monitor for the create, update, and delete flow.</td>
</tr>
<tr>
<td>exit_event_type</td>
<td>(Mandatory) The event-type (create, delete, update) at which the event is rearmed to be monitored again.</td>
</tr>
<tr>
<td>event1-event4</td>
<td>(Mandatory) Specifies the event and its attributes to monitor. Valid values are event1, event2, event3, and event4. The subevent keywords can be used alone, together, or in any combination with each other, but each keyword can be used only once.</td>
</tr>
<tr>
<td>maxrun</td>
<td>(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
<tr>
<td>nice</td>
<td>(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.</td>
</tr>
</tbody>
</table>

Subevent Syntax

```
field ? rate_interval ? event1 only entry_value ? entry_op eq|ge|gt|le|lt|wc
(exit_value ?) [exit_op eq|ge|gt|le|lt|wc] [exit_rate_interval ? event1 only]
```

Subevent Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>(Mandatory) Specifies the cache or field attribute to be monitored. One of the following attributes can be specified:</td>
</tr>
<tr>
<td></td>
<td>• counter {bytes</td>
</tr>
<tr>
<td></td>
<td>• datalink {dot1q</td>
</tr>
<tr>
<td></td>
<td>• flow {direction</td>
</tr>
<tr>
<td></td>
<td>• interface {input</td>
</tr>
<tr>
<td></td>
<td>• ipv4 field-type-- Specifies the IPv4 fields.</td>
</tr>
<tr>
<td></td>
<td>• ipv6 field-type-- IPv6 fields</td>
</tr>
<tr>
<td></td>
<td>• routing routing-attribute -- Specifies the routing attributes.</td>
</tr>
<tr>
<td></td>
<td>• timestamp sysuptime {first</td>
</tr>
<tr>
<td></td>
<td>• transport field-type-- Specifies the Transport layer fields.</td>
</tr>
<tr>
<td>rate_interval</td>
<td>(Mandatory) Specifies the rate interval value in seconds used to calculate the rate. This field is only valid for event1.</td>
</tr>
</tbody>
</table>
entry_value  (Mandatory) Specifies the field or rate value.

entry_op  (Mandatory) Specifies the field operator.

The comparison operator valid values are:

- **eq** - Equal to
- **ge** - Greater than or equal to
- **gt** - Greater than
- **le** - Less than or equal to
- **lt** - Less than
- **wc** - Wildcard

exit_value  (Optional) The value at which the event is rearmed to be monitored again.

exit_op  (Optional) The comparison operator used to compare the current event field or rate value with the exit value; if true, event monitoring for this event is reenabled.

The comparison operator valid values are:

- **eq** - Equal to
- **ge** - Greater than or equal to
- **gt** - Greater than
- **le** - Less than or equal to
- **lt** - Less than
- **wc** - Wildcard

exit_rate_interval  (Optional) Specifies the exit rate interval value in seconds used to calculate the exit rate value. This field is only valid for event1.

### Result String

<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
</table>

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
| event_id | Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id. |
| event_type | The type of event to monitor for the create, update, and delete flow. |
| event_type_string | An ASCII string that represents the name of the event for this event type. |
| event_pub_sec event_pub_msec | The time, in seconds and milliseconds, when the event was published to the EEM. |
| event_severity | The severity of the NetFlow event. |
| monitor_name | The name of the NetFlow monitor. |
| event1-event4_field | Specifies the event and its attributes to monitor. Valid values are event1, event2, event3, and event4. |
| event1-event4_value | Specifies the event value and its attributes to monitor. Valid values are event1, event2, event3, and event4. |

**event_register_none**

Registers for an event that is triggered by the **event manager run** command. These events are handled by the None event detector that screens for this event.

**Syntax**

```
event_register_none [tag ?] [sync {yes|no}] [default ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

| tag | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script. |
| sync | (Optional) A "yes" or a "no" is required to complete this keyword.  
  - If the yes keyword is specified, the policy will run synchronously with the CLI command.  
  - If the no keyword is specified, the policy will run asynchronously with the CLI command. |
| default | (Optional) The time period during which the CLI event detector waits for the policy to exit (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to run the command. If this argument is not specified, the default time period is set to 30 seconds. |
queue_priority (Optional) Priority level at which the script will be queued:
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSS[S].MMM format, where SSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

Result String
None

Set _cerrno
No

**event_register_oir**

Registers for an online insertion and removal (OIR) event. Use this Tcl command extension to run a policy on the basis of an event raised when a hardware card OIR occurs. These events are handled by the OIR event detector that screens for this event.

**Syntax**

```
event_register_oir [tag ?] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

| tag         | (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script. |
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Result String**

**Event Type** | **Description**
---|---
slot | Slot number for the affected card.
event | Indicates a string, removed or online, that represents either an OIR removal event or an OIR insertion event.

## event_register_process

Registers for a process event. Use this Tcl command extension to run a policy on the basis of an event raised when a Cisco IOS Software Modularity process starts or stops. These events are handled by the System Manager event detector that screens for this event. This Tcl command extension is supported only in Software Modularity images.

### Syntax

```
event_register_process [tag?] abort|term|start|user_restart|user_shutdown
[sub_system?] [version?] [instance?] [path?] [node?]
[queue_priority low|normal|high|last] [maxrun?] [nice 0|1]
```

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>abort</td>
<td>(Mandatory) Abnormal process termination. Process may abort because of exiting with a nonzero exit status, receiving a kernel-generated signal, or receiving a SIGTERM or SIGKILL signal that is not sent because of user request.</td>
</tr>
<tr>
<td>term</td>
<td>(Mandatory) Normal process termination.</td>
</tr>
<tr>
<td>start</td>
<td>(Mandatory) Process start.</td>
</tr>
<tr>
<td>user_restart</td>
<td>(Mandatory) Process termination due to the process restart request from the CLI command.</td>
</tr>
<tr>
<td>user_shutdown</td>
<td>(Mandatory) Process termination due to the process kill request from the CLI command.</td>
</tr>
<tr>
<td>sub_system</td>
<td>(Optional) Number assigned to the EEM policy that published the process event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td>version</td>
<td>(Optional) Version number of the process assigned by the version manager. Must be of the form major_number.minor_number.level. If specified, each component of the version number must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>instance</td>
<td>(Optional) Process instance ID. If specified, this argument must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>path</td>
<td>(Optional) Process pathname (a regular expression string). If the value of the process-name argument contains embedded blanks, enclose it in double quotation marks. Use path &quot;.*&quot; to match all processes.</td>
</tr>
</tbody>
</table>
node

(Optional) The node name is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:

node<slot-number>/<cpu-number>

The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is always the regular expression pattern match of * representing all applicable nodes.

queue_priority

(Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun

(Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice

(Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

If an optional argument is not specified, the event matches all possible values of the argument. If multiple arguments are specified, the process event will be raised when all the conditions are matched.

Result String

None

Set _cerrno

No

Event_reqinfo

"event_id %u event_type %u event_type_string {%s} event_pub_sec %u event_pub_msec %u"
### Event Type Description

- **event_id**: Unique number that indicates the ID for this published event. Multiple policies may be run for the same event, and each policy will have the same event_id.
- **event_type**: Type of event.
- **event_type_string**: An ASCII string that represents the name of the event for this event type.
- **event_pub_sec event_pub_msec**: The time, in seconds and milliseconds, when the event was published to the EEM.
- **sub_system**: Number assigned to the EEM policy that published the application-specific event. Number is set to 798 because all other numbers are reserved for Cisco use.
- **instance**: Process instance ID.
- **process_name**: Process name.
- **path**: Process absolute name including path.
- **exit_status**: Process last exit status.
- **respawn_count**: Number of times that the process was restarted.
- **last_respawn_sec last_respawn_msec**: The calendar time when the last restart occurred.
- **fail_count**: Number of restart attempts of the process that failed. This count will be reset to 0 when the process is successfully restarted.
- **dump_count**: Number of core dumps taken of the process.
- **node_name**: Name of the node that the process is on. The node name is a string that consists of the word "node" followed by two fields separated by a slash character using the following format:
  ```
  node slot-number / cpu-number
  ```
  The slot-number is the hardware slot number. The cpu-number is the hardware CPU number.

---

**event_register_resource**

Registers for an Embedded Resource Manager (ERM) event. Use this Tcl command extension to run a policy on the basis of an ERM event report for a specified policy. ERM events are screened by the EEM Resource event detector, allowing an EEM policy to be run when a match occurs for the specified ERM policy.
Syntax

event_register_resource policy policy-name [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]

Arguments

| policy | (Mandatory) Specifies the use of a policy. |
| policy-name | (Mandatory) Name of an ERM policy. |
| queue_priority | (Optional) Priority level at which the script will be queued: |
|  | • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels. |
|  | • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority. |
|  | • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels. |
|  | • queue_priority last--Specifies that the script is to be queued at the lowest priority level. |

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note**  The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

| maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used. |
| nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0. |

</tbody>
</table>

**event_register_routing**

Registers for an event that is triggered by the `event routing` command. These events are handled by the routing event detector to publish an event when route entries change in Routing Information Base (RIB) infrastructure. Use this Tcl command extension to run a routing policy for this script. The network IP address for the route to be monitored must be specified.

**Syntax**

```
event_register_routing [tag?] network ? length ? ge|le|ne [type add|remove|modify|all] [protocol?] [queue_priority normal|low|high|last] [maxrun?] [nice {0 | 1}]
```

**Arguments**

<table>
<thead>
<tr>
<th>tag</th>
<th>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</th>
</tr>
</thead>
<tbody>
<tr>
<td>network</td>
<td>Specifies the network IP address. The network number can be any valid IP address or prefix.</td>
</tr>
<tr>
<td>length</td>
<td>Specifies the length of the network mask in bits. The bit mask can be a number from 0 to 32.</td>
</tr>
<tr>
<td></td>
<td>- ge --(Optional) Specifies the minimum prefix length to be matched. The ge keyword represents greater than or equal to operator.</td>
</tr>
<tr>
<td></td>
<td>- le --(Optional) Specifies the maximum prefix length to be matched. The le keyword represents the less than or equal to operator.</td>
</tr>
<tr>
<td></td>
<td>- ne --(Optional) Specifies the prefix length not to be matched. The ne keyword represents not equal to operator.</td>
</tr>
<tr>
<td></td>
<td>When ge, le and ne keywords are not configured, an exact match of network length is processed.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Specifies the desired policy trigger. The type options are add, remove, modify, and all. The default is all.</td>
</tr>
<tr>
<td>protocol</td>
<td>(Optional) Specifies the protocol value for the network being monitored.</td>
</tr>
<tr>
<td></td>
<td>One of the following protocols can be used: all, bgp, connected, eigrp, isis, iso-igrp, mobile, odr, ospf, rip, and static. The default is all.</td>
</tr>
</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum runtime of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.
	nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**event_register_snmp**

Registers for a Simple Network Management Protocol (SNMP) statistics event. Use this Tcl command extension to run a policy when a given counter specified by an SNMP object ID (oid) crosses a defined threshold.

**Syntax**

```
event_register_snmp [tag?] oid? get_type exact|next
entry_op [gt|ge|eq|lt|le] entry_val?
entry_type [value|increment|rate]
[exit_comb [or|and]]
[exit_op [gt|ge|eq|lt|le] exit_val?
[exit_type [value|increment|rate]]
[exit_time?] poll_interval? [average_factor?]
[queue_priority low|normal|high|last]
[maxrun?] [nice 0|1]
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>oid</td>
<td>(Mandatory) OID number of data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). The types of OIDs allowed are:</td>
</tr>
<tr>
<td></td>
<td>• COUNTER_TYPE</td>
</tr>
<tr>
<td></td>
<td>• COUNTER_64_TYPE</td>
</tr>
<tr>
<td></td>
<td>• GAUGE_TYPE</td>
</tr>
<tr>
<td></td>
<td>• INTEGER_TYPE</td>
</tr>
<tr>
<td></td>
<td>• OCTET_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>• OPAQUE_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>• TIME_TICKS_TYPE</td>
</tr>
<tr>
<td>entry_op</td>
<td>(Mandatory) Entry comparison operator used to compare the current OID data value with the entry value; if true, an event will be raised and event monitoring will be disabled until exit criteria are met.</td>
</tr>
<tr>
<td>get_type</td>
<td>(Mandatory) Type of SNMP get operation that needs to be applied to the OID specified. If the get_type argument is &quot;exact,&quot; the value of the specified OID is retrieved; if the get_type argument is &quot;next,&quot; the value of the lexicographical successor to the specified OID is retrieved.</td>
</tr>
<tr>
<td>entry_val</td>
<td>(Mandatory) Value with which the current oid data value should be compared to decide if the SNMP event should be raised.</td>
</tr>
<tr>
<td>entry-type</td>
<td>Specifies a type of operation to be applied to the object ID specified by the entry-val argument. Value is defined as the actual value of the entry-val argument. Increment uses the entry-val field as an incremental difference and the entry-valis compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing. Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change.</td>
</tr>
<tr>
<td>exit_comb</td>
<td>(Optional) Exit combination operator used to indicate the combination of exit condition tests required to decide if the exit criteria are met so that the event monitoring can be reenabled. If it is &quot;and,&quot; both exit value and exit time tests must be passed to meet the exit criteria. If it is &quot;or,&quot; either exit value or exit time tests can be passed to meet the exit criteria. When exit_comb is &quot;and,&quot; exit_op, and exit_val (exit_time) must exist. When exit_comb is &quot;or,&quot; (exit_op and exit_val) or (exit_time) must exist.</td>
</tr>
<tr>
<td>exit_op</td>
<td>(Optional) Exit comparison operator used to compare the current oid data value with the exit value; if true, event monitoring for this event will be reenabled.</td>
</tr>
<tr>
<td>exit_val</td>
<td>(Optional) Value with which the current oid data value should be compared to decide if the exit criteria are met.</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| exit-type  | (Optional) Specifies a type of operation to be applied to the object ID specified by the exit-val argument. If not specified, the value is assumed.  
Value is defined as the actual value of the exit-val argument.  
Increment uses the exit-val field as an incremental difference and the exit-val is compared with the difference between the current counter value and the value when the event was last triggered (or the first polled sample if this is a new event). A negative value checks the incremental difference for a counter that is decreasing.  
Rate is defined as the average rate of change over a period of time. The time period is the average-factor value multiplied by the poll-interval value. At each poll interval the difference between the current sample and the previous sample is taken and recorded as an absolute value. An average of the previous average-factor value samples is taken to be the rate of change. |
| exit_time  | (Optional) Number of POSIX timer units after an event is raised when event monitoring will be enabled again. Specified in SSSSSSSSSS[.MMM] format where SSSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive. MMM represents milliseconds and must be an integer number between 0 and 999. |
| poll_interval | (Mandatory) Interval between consecutive polls in POSIX timer units. Currently the interval is forced to be at least 1 second (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). |
| average-factor | (Optional) Number in the range from 1 to 64 used to calculate the period used for rate-based calculations. The average-factor value is multiplied by the poll-interval value to derive the period in milliseconds. The minimum average factor value is 1. |
| queue_priority | (Optional) Priority level at which the script will be queued:  
• queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.  
• queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
• queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.  
• queue_priority last--Specifies that the script is to be queued at the lowest priority level.  
If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.  
Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.  
If this argument is not specified, the default queuing priority is normal. |
maxrun  (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

event_register_snmp_notification

Registers for a Simple Network Management Protocol (SNMP) notification trap event. Use this Tcl command extension to run a policy when an SNMP trap with the specified SNMP object ID (oid) is encountered on a specific interface or address. The `snmp-server manager` CLI command must be enabled for the SNMP notifications to work using Tcl policies.

Syntax

event_register_snmp_notification [tag ?] oid ? oid_val ?
op {gt|ge|eq|ne|lt|le}
[maxrun ?]
[src_ip_address ?]
[dest_ip_address ?]
[queue_priority {normal|low|high|last}]
[maxrun ?]
[nice {0|1}]
[default ?]
[direction {incoming|outgoing}]
[msg_op {drop|send}]

Arguments

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>oid</td>
<td>(Mandatory) OID number of the data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). If the specified OID ends with a dot (.), then all OIDs that start with the OID number before the dot are matched. The types of OIDs allowed are:</td>

</tr>
</tbody>
</table>

**event_register_snmp_object**

Registers for a Simple Network Management Protocol (SNMP) object event. Use this Tcl command extension to replace the value when an SNMP with the specified SNMP-object ID (OID) is encountered on a specific interface or address.

**Syntax**

```tcl
event_register_snmp_object oid ?
  type {int|uint|counter|counter64|gauge|ipv4||oid|string}
  sync {yes|no}
  skip {yes|no}
  [istable {yes|no}]
  [default ?]
  [queue_priority {normal|low|high|last}]
  [maxrun ?]
  [nice {0|1}]
```
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>oid</strong></td>
<td>(Mandatory) OID number of the data element in SNMP dot notation (for example, 1.3.6.1.2.1.2.1.0). If the specified OID ends with a dot (.), then all OIDs that start with the OID number before the dot are matched. The types of OIDs allowed are:</td>
</tr>
<tr>
<td></td>
<td>• COUNTER_TYPE</td>
</tr>
<tr>
<td></td>
<td>• COUNTER_64_TYPE</td>
</tr>
<tr>
<td></td>
<td>• GAUGE_TYPE</td>
</tr>
<tr>
<td></td>
<td>• INTEGER_TYPE</td>
</tr>
<tr>
<td></td>
<td>• OCTET_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>• OPAQUE_PRIM_TYPE</td>
</tr>
<tr>
<td></td>
<td>• TIME_TICKS_TYPE</td>
</tr>
<tr>
<td><strong>type</strong></td>
<td>(Mandatory) OID value type.</td>
</tr>
<tr>
<td><strong>sync</strong></td>
<td>(Mandatory) A &quot;yes&quot; means that the EEM policy will be notified. If the applet set_exit_status or Tcl return value is 0, then SNMP will handle the request. If the return value is 1, SNMP will use the value provided by the policy for the get request and will not process the set request. A &quot;no&quot; means that EEM will not be notified and SNMP will handle the request. Only one OID can be associated with a synchronous policy. However, multiple synchronous policies can be registered for the same OID.</td>
</tr>
<tr>
<td><strong>skip</strong></td>
<td>Mandatory if the sync argument is &quot;no&quot; and should not exist if the sync argument is &quot;yes.&quot; If the skip argument is &quot;yes,&quot; it means that SNMP will handle the request. If the skip argument is &quot;no,&quot; it means that SNMP will act as if the object does not exist.</td>
</tr>
<tr>
<td><strong>istable</strong></td>
<td>(Optional) A value of &quot;no&quot; means the OID is scalar object, and &quot;yes&quot; means the OID is table object.</td>
</tr>
<tr>
<td><strong>default</strong></td>
<td>(Optional) The time period during which the SNMP Object event detector waits for the policy to exit (specified in sssssssss[.mmm] format, where sssssssss must be an integer representing seconds between 0 and 4294967295, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If the default time period expires before the policy exits, the default action will be executed. The default action is to process the set or get request normally by SNMP subsystem. If this argument is not specified, the default time period is set to 30 seconds.</td>
</tr>
<tr>
<td><strong>maxrun</strong></td>
<td>(Optional) Maximum run time of the script (specified in sssssssss[.mmm] format, where sssssssss must be an integer representing seconds between 0 and 31536000, inclusive, and where mmm must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.</td>
</tr>
</tbody>
</table>
queue_priority  (Optional) Priority level at which the script will be queued:
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the queue_priority_last argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

nice  (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

## event_register_syslog

Registers for a syslog event. Use this Tcl command extension to trigger a policy when a syslog message of a specific pattern is logged after a certain number of occurrences during a certain period of time.

### Syntax

```
event_register_syslog [tag ?] [occurs ?] [period ?] pattern ?
[priority all|emergencies|alerts|critical|errors|warnings|notifications|
informational|debugging|0|1|2|3|4|5|6|7]
[queue_priority low|normal|high|last]
[severity_fatal] [severity_critical] [severity_major]
[severity_minor] [severity_warning] [severity_notification]
[severity_normal] [severity_debugging]
[maxrun ?] [nice 0|1]
```

### Arguments

- **tag** (Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.

- **occurs** (Optional) Number of occurrences before the event is raised; if not specified, the event is raised on the first occurrence. If specified, the value must be greater than 0.

- **period** (Optional) Time interval, in seconds and milliseconds, during which the one or more occurrences must take place in order to raise an event (specified in SSSSSSSSSSSSSSMMM format where SSSSSSSSSSS must be an integer number representing seconds between 0 and 4294967295, inclusive, and where MMM represents milliseconds and must be an integer number between 0 and 999). If this argument is not specified, no period check is applied.

- **pattern** (Mandatory) A regular expression used to perform syslog message pattern match. This argument is what the policy uses to identify the logged syslog message.

- **priority** (Optional) The message priority to be screened. If this argument is specified, only messages that are at the specified logging priority level, or lower, are screened. If this argument is not specified, the default priority is 0.
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

severity_xxx (Optional) The event severity to be screened. If this argument is specified, only messages that are at the specified severity level are screened. See the table titled "Severity Level Mapping For Syslog Events" for the severity level mapping for syslog events.

If multiple conditions are specified, the syslog event will be raised when all the conditions are matched.

**event_register_timer**

Creates a timer and registers for a timer event as both a publisher and a subscriber. Use this Tcl command extension when there is a need to trigger a policy that is time specific or timer based. This event timer is both an event publisher and a subscriber. The publisher part indicates the conditions under which the named timer is to go off. The subscriber part identifies the name of the timer to which the event is subscribing.

**Note**

Both the CRON and absolute time specifications work on local time.

**Syntax**

```
event_register_timer [tag?] watchdog|countdown|absolute|cron [name?] [cron_entry?] [time?] [queue_priority low|normal|high|last] [maxrun?] [nice 0|1]
```
# Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>watchdog</td>
<td>(Mandatory) Watchdog timer.</td>
</tr>
<tr>
<td>countdown</td>
<td>(Mandatory) Countdown timer.</td>
</tr>
<tr>
<td>absolute</td>
<td>(Mandatory) Absolute timer.</td>
</tr>
<tr>
<td>cron</td>
<td>(Mandatory) CRON timer.</td>
</tr>
<tr>
<td>name</td>
<td>(Optional) Name of the timer.</td>
</tr>
<tr>
<td>cron_entry</td>
<td>(Optional) Must be specified if the CRON timer type is specified. Must not be specified if any other timer type is specified. A cron_entry is a partial UNIX crontab entry (the first five fields) as used with the UNIX CRON daemon.</td>
</tr>
</tbody>
</table>

A cron_entry specification consists of a text string with five fields. The fields are separated by spaces. The fields represent the time and date when CRON timer events will be triggered. The fields are described in the table titled "Time and Date When CRON Events Will Be Triggered."

Ranges of numbers are allowed. Ranges are two numbers separated with a hyphen. The specified range is inclusive. For example, 8-11 for an hour entry specifies execution at hours 8, 9, 10, and 11.

A field may be an asterisk (*), which always stands for "first-last."

Lists are allowed. A list is a set of numbers (or ranges) separated by commas. Examples: "1,2,5,9" and "0-4,8-12".

Step values can be used in conjunction with ranges. Following a range with "/<number>" specifies skips of the number’s value through the range. For example, "0-23/2" can be used in the hour field to specify an event that is triggered every other hour. Steps are also permitted after an asterisk, so if you want to say "every two hours", use "*/2".

Names can also be used for the month and the day of week fields. Use the first three letters of the particular day or month (case does not matter). Ranges or lists of names are not allowed.

The day on which a timer event is triggered can be specified by two fields: day of month and day of week. If both fields are restricted (that is, are not *), an event will be triggered when either field matches the current time. For example, "30 1 15 * 5" would cause an event to be triggered at 4:30 a.m. on the 1st and 15th of each month, plus every Friday.

Instead of the first five fields, one of seven special strings may appear. These seven special strings are described in the table titled "Special Strings for cron_entry."

Example 1: "0 0 1 15 * 1" would trigger an event at midnight on the 1st and 15th of each month, as well as on every Monday. To specify days by only one field, the other field should be set to *; "0 0 * * 1" would trigger an event at midnight only on Mondays.

Example 2: "15 16 1 * *" would trigger an event at 4:15 p.m. on the first day of each month.

Example 3: "0 12 * * 1-5" would trigger an event at noon on Monday through Friday of each week.

Example 4: "@weekly" would trigger an event at midnight once a week on Sunday.
time (Optional) Must be specified if a timer type other than CRON is specified. Must not be specified if the CRON timer type is specified. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for the absolute timer, the calendar time of the expiration time. Time is specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999. An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately.

queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

See Also

event_register_timer_subscriber

event_register_timer_subscriber

Registers for a timer event as a subscriber. Use this Tcl command extension to identify the name of the timer to which the event timer, as a subscriber, wants to subscribe. The event timer depends on another policy or another process to actually manipulate the timer. For example, let policyB act as a timer subscriber policy, but policyA (although it does not need to be a timer policy) uses register_timer, timer_arm, or timer_cancel Tcl command extensions to manipulate the timer referenced in policyB.

Syntax

event_register_timer_subscriber watchdog|countdown|absolute|cron
name ? [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>watchdog</td>
<td>(Mandatory) Watchdog timer.</td>
</tr>
<tr>
<td>countdown</td>
<td>(Mandatory) Countdown timer.</td>
</tr>
<tr>
<td>absolute</td>

</tr>
<tr>
<td>cron</td>
<td>(Mandatory) CRON timer.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory) Name of the timer.</td>
</tr>
</tbody>
</table>
queue_priority (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

Note The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

**Note** An EEM policy that registers for a timer event or a counter event can act as both publisher and subscriber.

event_register_timer

**event_register_track**

Registers for a report event from the Cisco IOS Object Tracking subsystem. Use this Tcl command extension to trigger a policy on the basis of a Cisco IOS Object Tracking subsystem report for a specified object number.

**Syntax**

```
event_register_track ? [tag ?] [state up|down|any] [queue_priority low|normal|high|last] [maxrun ?] [nice 0|1]
```

**Arguments**

<table>
<thead>
<tr>
<th>? (represents a number)</th>
<th>(Mandatory) Tracked object number in the range from 1 to 500, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>state</td>
<td>(Optional) Specifies that the tracked object transition will cause an event to be raised. If <strong>up</strong> is specified, an event will be raised when the tracked object transitions from a down state to an up state. If <strong>down</strong> is specified, an event will be raised when the tracked object transitions from an up state to a down state. If <strong>any</strong> is specified, an event will be raised when the tracked object transitions to or from any state.</td>
</tr>
</tbody>
</table>
queue_priority | (Optional) Priority level at which the script will be queued:

- queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.
- queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.
- queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.
- queue_priority last--Specifies that the script is to be queued at the lowest priority level.

If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.

**Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.

If this argument is not specified, the default queuing priority is normal.

maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

If an optional argument is not specified, the event matches all possible values of the argument.

**Result String**

None

**Set _cerrno**

No

**Event reqinfo**

```
"event_id %u event_type %u event_type_string (%s) %u event_pub_sec %u event_pub_msec %u"
"track_number (%u) track_state (%s)"
```
### Event Type

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>event_pub_sec</code></td>
<td>The time, in seconds and milliseconds, when the event was published to the EEM.</td>
</tr>
<tr>
<td><code>event_pub_msec</code></td>
<td>Number of the tracked object that caused the event to be triggered.</td>
</tr>
<tr>
<td><code>track_number</code></td>
<td>State of the tracked object when the event was triggered; valid states are up or down.</td>
</tr>
</tbody>
</table>

### event_register_wdsysmon

Registers for a Watchdog system monitor event. Use this Tcl command extension to register for a composite event which is a combination of several subevents or conditions. For example, you can use this command to register for the combination of conditions wherein the CPU usage of a certain process is over 80 percent and the memory used by the process is greater than 50 percent of its initial allocation. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```tcl
event_register_wdsysmon [tag ?] [timewin ?]
[sub12_op and|or|andnot]
[sub23_op and|or|andnot]
[sub1 subevent-description]
[sub2 subevent-description]
[sub3 subevent-description]
[sub4 subevent-description] [node ?]
[queue_priority low|normal|high|last]
[maxrun ?] [nice 0|1]
```

Each argument is position independent.

**Note**

Operator definitions: and (logical and operation), or (logical or operation), andnot (logical and not operation). For example, "sub12_op and" is defined as raise an event when subevent 1 and subevent 2 are true; "sub23_op or" is defined as raise an event when the condition specified in sub12_op is true or subevent 3 is true. The logic can be diagrammed using: if (((sub1 sub12_op sub2) sub23_op sub3) sub34_op sub4) is TRUE, raise event

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>(Optional) String identifying a tag that can be used with the trigger Tcl command extension to support multiple event statements within a Tcl script.</td>
</tr>
<tr>
<td>timewin</td>
<td>(Optional) Time window within which all of the subevents have to occur in order for an event to be generated (specified in SSSSSSSSSSSM[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999).</td>
</tr>
<tr>
<td>sub12_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and subevent 2.</td>
</tr>
<tr>
<td>----------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sub23_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3.</td>
</tr>
<tr>
<td>sub34_op</td>
<td>(Optional) Combination operator for comparison between subevent 1 and 2 and subevent 3 and subevent 4.</td>
</tr>
<tr>
<td>sub1</td>
<td>(Optional) Indicates that subevent 1 is specified.</td>
</tr>
<tr>
<td>sub2</td>
<td>(Optional) Indicates that subevent 2 is specified.</td>
</tr>
<tr>
<td>sub3</td>
<td>(Optional) Indicates that subevent 3 is specified.</td>
</tr>
<tr>
<td>sub4</td>
<td>(Optional) Indicates that subevent 4 is specified.</td>
</tr>
<tr>
<td>node</td>
<td>(Optional) The node name to be monitored for deadlock conditions is a string that consists of the word &quot;node&quot; followed by two fields separated by a slash character using the following format: node&lt;slot-number&gt;/&lt;cpu-number&gt; The slot-number is the hardware slot number. The cpu-number is the hardware CPU number. For example, the SP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be specified as node0/0. The RP CPU in a Supervisor card on a Cisco Catalyst 6500 series switch located in slot 0 would be addressed as node0/1. If the node argument is not specified, the default node specification is the local node on which the registration is done.</td>
</tr>
</tbody>
</table>
| queue_priority | (Optional) Priority level at which the script will be queued:  
  • queue_priority low--Specifies that the script is to be queued at the lowest of the three priority levels.  
  • queue_priority normal--Specifies that the script is to be queued at a priority level greater than low priority but less than high priority.  
  • queue_priority high--Specifies that the script is to be queued at the highest of the three priority levels.  
  • queue_priority last--Specifies that the script is to be queued at the lowest priority level.  
  If more than one script is registered with the "queue_priority_last" argument set, these scripts will execute in the order in which the events are published.  
  **Note** The queue_priority argument specifies the queuing priority, but not the execution priority, of the script being registered.  
  If this argument is not specified, the default queuing priority is normal. |
maxrun | (Optional) Maximum run time of the script (specified in SSSSSSSSSSS\.MMM format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the default 20-second run-time limit is used.

nice | (Optional) Policy run-time priority setting. When the nice argument is set to 1, the policy is run at a run-time priority that is less than the default priority. The default value is 0.

### Subevents

The syntax of subevent descriptions can be one of seven cases.

For arguments in subevent description, the following constraints apply on the value of number arguments:

- For dispatch_mgr, val must be an integer between 0 and 4294967295, inclusive.
- For cpu_proc and cpu_tot, val must be an integer between 0 and 100, inclusive.
- For mem_proc, mem_tot_avail, and mem_tot_used, if is_percent is FALSE, val must be an integer between 0 and 4294967295, inclusive.

1. **deadlock procname ?**

#### Arguments

| procname | (Mandatory) A regular expression that specifies the process name that you wish to monitor for deadlock conditions. This subevent will ignore the time window even if it is given. |

2. **dispatch_mgr [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [period ?]**

#### Arguments

| procname | (Optional) A regular expression that specifies the process name that you wish to monitor for dispatch_manager status. |
| op | (Optional) Comparison operator used to compare the collected number of events with the specified value; if true, an event will be raised. |
| val | (Optional) The value with which the number of events that have occurred should be compared. |
| period | (Optional) The time period for the number of events that have occurred (specified in SSSSSSSSSSS\.[MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used. |

3. **cpu_proc [procname ?] [op gt|ge|eq|ne|lt|le] [val ?] [period ?]**
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proname</td>
<td>(Optional) A regular expression that specifies the process name that you wish to monitor for CPU utilization conditions.</td>
</tr>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected CPU usage sample percentage with the specified percentage value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) The percentage value with which the average CPU usage during the sample period should be compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) The time period for averaging the collection of samples (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

4. cpu_tot [op gt|ge|eq|ne|lt|le] [val ?] [period ?]

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected total system CPU usage sample percentage with the specified percentage value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) The percentage value with which the average CPU usage during the sample period should be compared.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) The time period for averaging the collection of samples (specified in SSSSSSSSSS[.MMM] format, where SSSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

5. mem_proc [proname ?] [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proname</td>
<td>(Optional) A regular expression that specifies the process name that you wish to monitor for memory usage.</td>
</tr>
<tr>
<td>op</td>
<td>(Optional) Comparison operator used to compare the collected memory used with the specified value; if true, an event will be raised.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
</tbody>
</table>
### mem_tot_avail

<table>
<thead>
<tr>
<th></th>
<th>(Optional) Comparison operator used to compare the collected available memory with the specified value; if true, an event will be raised.</th>
</tr>
</thead>
<tbody>
<tr>
<td>op</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If available memory usage has decreased from 300 KB to 150 KB within the time period, the percentage decrease is 50. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>

### Arguments

6. **mem_tot_avail** [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]

7. **mem_tot_used** [op gt|ge|eq|ne|lt|le] [val ?] [is_percent TRUE|FALSE] [period ?]

### Arguments

<table>
<thead>
<tr>
<th></th>
<th>(Optional) Comparison operator used to compare the collected used memory with the specified value; if true, an event will be raised.</th>
</tr>
</thead>
<tbody>
<tr>
<td>op</td>
<td>(Optional) A percentage or an absolute value specified in kilobytes. A percentage represents the difference between the oldest sample in the specified time period and the latest sample. If memory usage has increased from 150 KB to 300 KB within the time period, the percentage increase is 100. This is the value with which the measured value should be compared.</td>
</tr>
<tr>
<td>val</td>
<td>(Optional) If TRUE, the percentage value is collected and compared. Otherwise, the absolute value is collected and compared.</td>
</tr>
<tr>
<td>is_percent</td>
<td>(Optional) If TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
<tr>
<td>period</td>
<td>(Optional) If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSS[.MMM] format, where SSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.</td>
</tr>
</tbody>
</table>
If is_percent is set to TRUE, the time period for the percentage to be computed. Otherwise, the time period for the collection samples to be averaged (specified in SSSSSSSSSS.MMM format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). If this argument is not specified, the most recent sample is used.

Note This argument is mandatory if is_percent is set to TRUE; otherwise, it is optional.

|               | The three fields above describe the process whose memory usage is being monitored.
### Description

**Subevent Type** | **Description**  
--- | ---  
**is_percent** | Can be either TRUE or FALSE. TRUE means that the value is a percentage value; FALSE means that the value is an absolute value (may be an averaged value).  
**value** | If the `sec` and `msec` variables are specified as 0 or are unspecified in the event registration Tcl command extension, the process used memory is in the latest sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the averaged process used memory utilization is in the given time window.  
**diff** | If the `sec` and `msec` variables are specified as 0 or are unspecified in the event registration Tcl command extension, the `diff` is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample. If a time window is specified and is greater than zero in the event registration Tcl command extension, the `diff` is the percentage difference between the oldest and latest process used memory utilization in the specified time window.  
**sec msec** | If the `sec` and `msec` variables are specified as 0 or are unspecified in the event registration Tcl command extension, they are both 0. If a time window is specified and is greater than zero in the event registration Tcl command extension, the `sec` and `msec` variables are the actual time difference between the time stamps of the oldest and latest samples in this time window.  

If the **is_percent** argument is FALSE, and the **sec** and **msec** arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is the process used memory in the latest sample.  
- **diff** is 0.  
- **sec** and **msec** are both 0.

If the **is_percent** argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is the averaged process used memory sample value in the specified time window.  
- **diff** is 0.  
- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest samples in this time window.

If the **is_percent** argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

- **value** is 0.  
- **diff** is the percentage difference between the oldest and latest process used memory samples in the specified time window.  
- **sec** and **msec** are the actual time difference between the time stamps of the oldest and latest process used memory samples in this time window.
If the `is_percent` argument is TRUE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **value** is 0.
- **diff** is the percentage difference between the first process used memory sample ever collected and the latest process used memory sample.
- **sec** and **msec** are the actual time difference between the time stamps of the first process used memory sample ever collected and the latest process used memory sample.

For **mem_tot_avail** Subevent

```
"{type %s node {%s} is_percent %s used %u avail %u diff %d sec %ld msec %ld}"
```

<table>

</tr>
</tbody>
</table>

If the `is_percent` argument is FALSE, and the `sec` and `msec` arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is the total used memory in the latest sample.
- **avail** is the total available memory in the latest sample.
- **diff** is 0.
• sec and msec are both 0.

If the is_percent argument is FALSE, and a time window is specified as greater than zero in the event registration Tcl command extension:

• used is 0.

• avail is the averaged total available memory sample value in the specified time window.

• diff is 0.

• sec and msec are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the is_percent argument is TRUE, and a time window is specified as greater than zero in the event registration Tcl command extension:

• used is 0.

• avail is 0.

• diff is the percentage difference between the oldest and latest total available memory samples in the specified time window.

• sec and msec are both the actual time difference between the time stamps of the oldest and latest total available memory samples in this time window.

If the is_percent argument is TRUE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

• used is 0.

• avail is 0.

• diff is the percentage difference between the first total available memory sample ever collected and the latest total available memory sample.

• sec and msec are the actual time difference between the time stamps of the first total available memory sample ever collected and the latest total available memory sample.

- **diff** is the percentage difference between the oldest and latest total used memory samples in the specified time window.

- **sec** and **msec** are both the actual time difference between the time stamps of the oldest and latest total used memory samples in this time window.

If the **is_percent** argument is TRUE, and the sec and msec arguments are specified as 0 or are unspecified in the event registration Tcl command extension:

- **used** is 0.

- **avail** is 0.

- **diff** is the percentage difference between the first total used memory sample ever collected and the latest total used memory sample.

- **sec** and **msec** are the actual time difference between the time stamps of the first total used memory sample ever collected and the latest total used memory sample.

---

**Note**

Inside a subevent description, each argument is position independent.
event_register_wdsysmon
EEM Event Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  \[type\]

- A question mark ? represents a variable to be entered.

- Choices between arguments are represented by pipes, for example:

  priority low|normal|high

Note

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

Note

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

  - event_completion, on page 1999
  - event_completion_with_wait, on page 2000
  - event_publish, on page 2001
  - event_wait, on page 2004

event_completion

Sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the return_code of this event instance.

Syntax

event_completion status ?
Arguments

| status | (Mandatory) Exit status (return_code) of this event instance. A value of zero indicates no error and any other integer value indicates an error. |

Result String

None

Set _cerrno

No

event_completion_with_wait

The `event_completion_with_wait` command combines the two commands `event_completion` and `event_wait` into a single command for ease of use.

The `event_completion` command sends a notification to the EEM server that the policy is done servicing the event that triggered it. The event only takes a single argument which is the `return_code` of this event instance.

The `event_wait` places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If `event_wait` policy is invoked before `event_completed` policy, an error results and the policy exits.

Syntax

```
event_completion_with_wait status ? [refresh_vars]
```

Arguments

| status | (Mandatory) exit_status (return_code) of this event instance. A value of zero indicates no error. Any other integer value indicates an error. |
| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

Result String

None

Set _cerrno

Yes

Sample Usage

Here is a similar example as above using this single command:

```c
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
```
set i 1
while {1 == 1} { # Start high performance policy loop
    array set arr_einfo [event_reqinfo]
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
            $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    } action_syslog msg "event $i serviced" priority info
    if {$i == 5} {
        action_syslog msg "Exiting after servicing 5 events" priority info
        exit 0
    } incr i
    array set _event_state_arr [event_completion_with_wait status 0 refresh_vars 1]
    if {$_event_state_arr(event_state) != 0} {
        action_syslog msg "Exiting: failed event_state " \
            "$event_state_arr(event_state)" priority info
        exit 0
    }
}

The running configuration output is the same as the event_publish Tcl command.

**event_publish**

Publishes an application-specific event.

**Syntax**

```
event_publish sub_system ? type ? [arg1 ?] [arg2 ?] [arg3 ?] [arg4 ?]
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sub_system</td>
<td>(Mandatory) Number assigned to the EEM policy that published the application-specific event. Number is set to 798 because all other numbers are reserved for Cisco use.</td>
</tr>
<tr>
<td>type</td>
<td>(Mandatory) Event subtype within the specified component. The sub_system and type arguments uniquely identify an application event. Must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>[arg1 ?]-[arg4 ?]</td>
<td>(Optional) Four pieces of application event publisher string data.</td>
</tr>
</tbody>
</table>

**Result String**

None

**Set _cerrno**

Yes
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

**Sample Usage**

This example demonstrates how to use the `event_publish` Tcl command extension to execute a script \( n \) times repeatedly to perform some function (for example, to measure the amount of CPU time taken by a given group of Tcl statements). This example uses two Tcl scripts.

Script1 publishes a type 9999 EEM event to cause Script2 to run for the first time. Script1 is registered as a none event and is run using the Cisco IOS CLI `event manager run` command. Script2 is registered as an EEM application event of type 9999, and this script checks to see if the application publish arg1 data (the iteration number) exceeds the EEM environment variable `test_iterations` value. If the `test_iterations` value is exceeded, the script writes a message and exits; otherwise the script executes the remaining statements and reschedules another run. To measure the CPU utilization for Script2, use a value of `test_iterations` that is a multiple of 10 to calculate the amount of average CPU time used by Script2.

To run the Tcl scripts, enter the following Cisco IOS commands:

```bash
configure terminal
event manager environment test_iterations 100
event manager policy script1.tcl
event manager policy script2.tcl
end
event manager run script1.tcl
```

The Tcl script Script2 will be executed 100 times. If you execute the script without the extra processing and derive the average CPU utilization, and then add the extra processing and repeat the test, you can subtract the former CPU utilization from the later CPU utilization to determine the average for the extra processing.

**Script1 (script1.tcl)**

```bash
::cisco::eem::event_register_none
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
# Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;
$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str\\n"
    error $result
}
action_syslog priority info msg "EEM application_publish test start"
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;
$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str\\n"
    error $result
}
# Cause the first iteration to run.
event_publish sub_system 798 type 9999 arg1 0
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;
$_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str\\n"
    error $result
}
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Script2 (script2.tcl)

::cisco::eem::event_register_appl sub_system 798 type 9999

# Check if all the required environment variables exist.
# If any required environment variable does not exist, print out an error msg and quit.
if {![info exists test_iterations]} {
    set result
    "Policy cannot be run: variable test_iterations has not been set"
    error $result $errorInfo
}

namespace import ::cisco::eem::*
namespace import ::cisco::lib::*

# Query the event info.
array set arr_einfo [event_reqinfo]
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}

# Data1 contains the arg1 value used to publish this event.
set iter $arr_einfo(data1)

# Use the arg1 info from the previous run to determine when to end.
if {$iter >= $test_iterations} {
    # Log a message.
    action_syslog priority info msg "EEM application_publish test end"
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
            $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
        error $result
    }
    exit 0
}

set iter [expr $iter + 1]

# Log a message.
set msg [format "EEM application_publish test iteration %s" $iter]
action_syslog priority info msg $msg
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}

# Do whatever processing that you want to measure here.

# Cause the next iteration to run. Note that the iteration is passed to the
# next operation as arg1.
event_publish sub_system 798 type 9999 arg1 $iter
if {$_cerrno != 0} {
    set result [format "component=%s; subsys err=%s; posix err=%s;\n%s" \
        $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str]
    error $result
}
event_wait

Places the Tcl policy into a sleep state. When the Tcl policy receives a new signal announcing a new event, the policy is placed into a wake state and again returns to a sleep state. This loop continues. If `event_wait` policy is invoked before `event_completed` policy, an error results and the policy exits.

**Syntax**

```
event_wait [refresh_vars]
```

**Arguments**

| refresh_vars | (Optional) Indicates whether built-in and environment variables should be updated (refreshed) from the EEM Policy Director during this event instance. |

**Result String**

None

**Set _cerrno**

No

**Sample Usage**

The `event_wait` event detector returns an array type value with a single element named `event_state`. `Event_state` is a value sent back from the EEM Server indicating whether or not an error has occurred in processing the event. An example of an error here would be if the user configured `event_wait` before configuring `event_completion` when handling the event instance.

The following sample output shows the use of both `event_completion` and `event_wait` Tcl commands:

```
::cisco::eem::event_register_syslog tag e1 occurs 1 pattern CLEAR maxrun 0
namespace import ::cisco::eem::*
namespace import ::cisco::lib::*
set i 1
while {1 == 1} { # Start high performance policy loop
    array set arr_einfo [event_reqinfo]
    if {$_cerrno != 0} {
        set result [format "component=%s; subsys err=%s; posix err=%s\n%s\n%s\n%s\n%s\n"
            $_cerr_sub_num $_cerr_sub_err $_cerr_posix_err $_cerr_str
            $result]
        error $result
    }
    action_syslog msg "event $i serviced" priority info
    if {($i == 5)} {
        action_syslog msg "Exiting after servicing 5 events" priority info
        exit 0
    }
    incr i
    event_completion status 0
    array set _event_state_arr [event_wait refresh_vars 0]
    if {$_event_state_arr(event_state) != 0} {
        action_syslog msg "Exiting: failed event_state "$ event_state_arr(event_state)" priority info
    }
```
Here is an example of the running configuration:

01:02:36: %HA_EM-6-LOG: high_perf_example.tcl: Exiting after servicing 5 events
Device#

Also while an event has been serviced and is waiting for the next event to come in show event manager policy active command will display the following output:

```
Device#show event manager policy active
Key: p - Priority :L - Low, H - High, N - Normal, Z - Last
    s - Scheduling node :A - Active, S - Standby
default class - 1 script event
  no. job id p s status time of event event type name
  1 11 N A wait Mon Oct20 14:15:24 2008 syslog high_perf_example.tcl
```

In the above example the status is wait. This indicates that the policy is waiting for the next event to come in.
CHAPTER 92

EEM Library Debug Command Extensions

- cli_debug, on page 2007
- smtp_debug, on page 2007

cli_debug

Prints a command-line interface (CLI) debug statement to syslog. This Tcl command extension is used to print a CLI debug statement to syslog if the debug event manager tcl cli_library Cisco IOS CLI command is in effect.

Syntax

cli_debug spec_string debug_string

Arguments

| spec_string | (Mandatory) The spec_string argument is used to indicate the type of debug statement. |
| debug_string | (Mandatory) The debug_string argument is used to indicate the debugging text. |

Result String

None

Set _cerrno

No

smtp_debug

Prints a Simple Mail Transfer Protocol (SMTP) debug statement to syslog. This Tcl command extension prints a SMTP debug statement to syslog if the debug event manager tcl smtp_library Cisco IOS command-line interface (CLI) command is in effect.
Syntax

smtp_debug spec_string debug_string

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spec_string</td>
<td>(Mandatory) The spec_string argument is used to indicate the type of debug statement.</td>
</tr>
<tr>
<td>debug_string</td>
<td>(Mandatory) The debug_string argument is used to indicate the debugging text.</td>
</tr>
</tbody>
</table>

Result String

None

Set_errno

No
EEM Multiple Event Support Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

```
[type ?]
```

- A question mark ? represents a variable to be entered.
- Choices between arguments are represented by pipes, for example:

```
priority low|normal|high
```

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- attribute, on page 2009
- correlate, on page 2010
- trigger, on page 2011

attribute

Specifies a complex event.

Syntax

```
attribute tag ? [occurs ?]
```
Arguments

tag | Specifies a tag using the event-tag argument that can be used with the attribute command to associate an event.

occurs | (Optional) Specifies the number of occurrences before an EEM event is triggered. If not specified, an EEM event is triggered on the first occurrence. The range is from 1 to 4294967295.

Result String
None

Set _cerrno
No

correlate

Builds a single complex event and allows boolean logic to relate events and tracked objects.

Syntax

correlate event ? track ? [andnot | and | or] event ? track ?

Arguments

event | Specifies the event that can be used with the trigger command to support multiple event statements within an script.

If the event associated with the event-tag argument occurs for the number of times specified by the trigger command, the result is true. If not, the result is false.

track | Specifies the event object number for tracking. The range is from 1 to 500.

If the tracked object is set, the result of the evaluation is true. If the tracked object is not set or is undefined, the result of the evaluation is false. This result is regardless of the state of the object.

andnot | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is not executed.

and | (Optional) Specifies that if event 1 occurs the action is executed, and if event 2 and event 3 occur together the action is executed.

Note | When "and" is used to group events such as traps or syslog messages, then the default trigger occurrence window is three minutes.

or | (Optional) Specifies that if event 1 occurs the action is executed, or else if event 2 and event 3 occur together the action is executed.
Result String
None

Set_cerrno
No

**trigger**

Specifies the multiple event configuration ability of Embedded Event Manager (EEM) events. A multiple event is one that can involve one or more event occurrences, one or more tracked object states, and a time period for the event to occur. The events are raised based on the specified parameters.

**Syntax**

`trigger [occurs ?] [period ?] [period-start ?] [delay ?]`

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>occurs</code></td>
<td>(Optional) Specifies the number of times the total correlation occurs before an EEM event is raised. When a number is not specified, an EEM event is raised on the first occurrence. The range is from 1 to 4294967295.</td>
</tr>
<tr>
<td><code>period</code></td>
<td>(Optional) Time interval in seconds and optional milliseconds, during which the one or more occurrences must take place. This is specified in the format <code>ssssssssss[.mmm]</code>, where <code>ssssssssss</code> must be an integer number representing seconds between 0 and 4294967295, inclusive and <code>mmm</code> represents milliseconds and must be an integer number between 0 to 999.</td>
</tr>
<tr>
<td><code>period-start</code></td>
<td>(Optional) Specifies the start of an event correlation window. If not specified, event monitoring is enabled after the first CRON period occurs.</td>
</tr>
<tr>
<td><code>delay</code></td>
<td>(Optional) Specifies the number of seconds and optional milliseconds after which an event will be raised if all the conditions are true (specified in the format <code>ssssssssss[.mmm]</code>, where <code>ssssssssss</code> must be an integer number representing seconds between 0 and 4294967295, inclusive and <code>mmm</code> represents milliseconds and must be an integer number between 0 to 999).</td>
</tr>
</tbody>
</table>

Result String
None

Set_cerrno
No
trigger
EEM SMTP Library Command Extensions

All Simple Mail Transfer Protocol (SMTP) library command extensions belong to the :cisco::lib namespace. To use this library, the user needs to provide an e-mail template file. The template file can include Tcl global variables so that the e-mail service and the e-mail text can be configured through the event manager environment Cisco IOS command-line interface (CLI) configuration command. There are commands in this library to substitute the global variables in the e-mail template file and to send the desired e-mail context with the To address, CC address, From address, and Subject line properly configured using the configured e-mail server.

E-Mail Template

The e-mail template file has the following format:

```
Mailservername:<space><the list of candidate SMTP server addresses>
From:<space><the e-mail address of sender>
To:<space><the list of e-mail addresses of recipients>
Cc:<space><the list of e-mail addresses that the e-mail will be copied to>
Sourceaddr:<space><the IP addresses of the recipients>
Subject:<subject line>
<a blank line>
<body>
```

Note

Based on RFC 2554, the SMTP e-mail server name--Mailservername-- can be in any one of the following template formats: username:password@host, username@host, or host.

```
Mailservername:<space><the list of candidate SMTP server addresses>
From:<space><the e-mail address of sender>
To:<space><the list of e-mail addresses of recipients>
Cc:<space><the list of e-mail addresses that the e-mail will be copied to>
Sourceaddr:<space><the IP addresses of the recipients>
Subject:<subject line>
<a blank line>
<body>
```

Note

Note that the template normally includes Tcl global variables for configuration.

In a Tcl policy, the port number can be specified by a "Port" line in the e-mail template. If port is not specified, the default port of 25 is used.

Below is a sample e-mail template file:

```
Mailservername: $_email_server
From: $_email_from
To: $_email_to
Cc: $_email_cc
```
Given the text of an e-mail template file with all global variables already substituted, sends the e-mail out using Simple Mail Transfer Protocol (SMTP). The e-mail template specifies the candidate mail server addresses, To addresses, CC addresses, From address, subject line, and e-mail body.

**Note**
A list of candidate e-mail servers can be provided so that the library will try to connect the servers on the list one by one until it can successfully connect to one of them.

**Syntax**

smtp_send_email text

**Arguments**

| **text** | (Mandatory) The text of an e-mail template file with all global variables already substituted. |

**Result String**

None

**Set _cerrno**

- Wrong 1st line format--Mailservername:list of server names.
- Wrong 2nd line format--From:from-address.
- Wrong 3rd line format--To:list of to-addresses.
- Wrong 4th line format--CC:list of cc-addresses.
- Error connecting to mail server:--$sock closed by remote server (where $sock is the name of the socket opened to the mail server).
- Error connecting to mail server:--$sock reply code is $k instead of the service ready greeting (where $sock is the name of the socket opened to the mail server; $k is the reply code of $sock).
- Error connecting to mail server:--cannot connect to all the candidate mail servers.
- Error disconnecting from mail server:--$sock closed by remote server (where $sock is the name of the socket opened to the mail server).
Sample Scripts

After all needed global variables in the e-mail template are defined:

```tcl
if [catch {smtp_subst [file join $tcl_library email_template_sm]} result] {
    puts stderr $result
    exit 1
}
if [catch {smtp_send_email $result} result] {
    puts stderr $result
    exit 1
}
```

smtp_subst

Given an e-mail template file `e-mail_template`, substitutes each global variable in the file by its user-defined value. Returns the text of the file after substitution.

Syntax

`smtp_subst e-mail_template`

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>e-mail_template</code></td>
<td>(Mandatory) Name of an e-mail template file in which global variables need to be substituted by a user-defined value. An example filename could be <code>/disk0://example.template</code> which represents a file named <code>example.template</code> in a top-level directory on an ATA flash disk in slot 0.</td>
</tr>
</tbody>
</table>

Result String

The text of the e-mail template file with all the global variables substituted.

Set _cerrno

- cannot open e-mail template file
- cannot close e-mail template file
EEM System Information Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

- An optional argument is shown within square brackets, for example:

  `[type?]`

  - A question mark ? represents a variable to be entered.
  - Choices between arguments are represented by pipes, for example:

    `priority low|normal|high`

---

**Note**

All EEM system information commands--`sys_reqinfo_xxx`--have the `Set_cerrno` section set to yes.

---

**Note**

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

---

**Note**

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

- `sys_reqinfo_cli_freq`, on page 18
- `sys_reqinfo_cli_history`, on page 19
- `sys_reqinfo_cpu_all`, on page 19
- `sys_reqinfo_crash_history`, on page 20
- `sys_reqinfo_mem_all`, on page 21
- `sys_reqinfo_proc`, on page 22
- `sys_reqinfo_proc_all`, on page 24
- `sys_reqinfo_routername`, on page 24
- `sys_reqinfo_snmp`, on page 25
- `sys_reqinfo_syslog_freq`, on page 26
sys_reqinfo_cli_freq

Queries the frequency information of all command-line interface (CLI) events.

**Syntax**

```
sys_reqinfo_cli_freq
```

**Arguments**

None

**Result String**

```
rec_list {{CLI frequency string 0},{CLI frequency str 1}, ...}
```

Where each CLI frequency string is:

```
time_sec %ld time_msec %ld match_count %u raise_count %u occurs %u period_sec %ld period_msec %ld pattern {%s}
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rec_list</td>
<td>Marks the start of the CLI event frequency list.</td>
</tr>
<tr>
<td>time_sec time_msec</td>
<td>Last time when this CLI event was raised.</td>
</tr>
<tr>
<td>match count</td>
<td>Number of times that a CLI command matches the pattern specified by this CLI event specification.</td>
</tr>
<tr>
<td>raise_count</td>
<td>Number of times that this CLI event was raised. The following fields are information about the CLI event specification:</td>
</tr>
<tr>
<td></td>
<td>* sync--A &quot;yes&quot; means that event publish should be performed synchronously. The event detector will be notified when the Event Manager Server has completed publishing the event. The Event Manager Server will return a code that indicates whether or not the CLI command should be executed.</td>
</tr>
<tr>
<td></td>
<td>* skip--A &quot;yes&quot; means that the CLI command should not be executed if the sync flag is not set.</td>
</tr>
<tr>
<td>occurs</td>
<td>Number of occurrences before an event is raised; if this argument is not specified, an event is raised on the first occurrence.</td>
</tr>
<tr>
<td>period_sec period_msec</td>
<td>Number of occurrences must occur within this number of POSIX timer units in order to raise event; if this argument is not specified, it does not apply.</td>
</tr>
<tr>
<td>pattern</td>
<td>Regular expression used to perform CLI command pattern matching.</td>
</tr>
</tbody>
</table>

**Set _cerrno**

Yes
sys_reqinfo_cli_history

Queries the history of command-line interface (CLI) commands.

Syntax

sys_reqinfo_cli_history

Arguments

None

Result String

rec_list {{CLI history string 0}, {CLI history str 1},...}

Where each CLI history string is:

time_sec time_msec cmd

| rec_list | Marks the start of the CLI command history list. |
| time_sec time_msec | Time when the CLI command was run. |
| cmd | Text of the CLI command. |

Set _errno

Yes

sys_reqinfo_cpu_all

Queries the CPU utilization of the top processes (both POSIX processes and IOS processes) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

Syntax

sys_reqinfo_cpu_all order cpu_used [sec ?] [msec ?] [num ?]

Arguments

| order | (Mandatory) Order used for sorting the CPU utilization of processes. |
| cpu_used | (Mandatory) Specifies that the average CPU utilization, for the specified time window, will be sorted in descending order. |
sec msec  (Optional) The time period, in seconds and milliseconds, during which the average CPU utilization is calculated. Must be integers in the range from 0 to 4294967295. If not specified, or if both sec and msec are specified as 0, the most recent CPU sample is used.

num  (Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

<table>
<thead>
<tr>
<th>sec msec</th>
<th>(Optional) The time period, in seconds and milliseconds, during which the average CPU utilization is calculated. Must be integers in the range from 0 to 4294967295. If not specified, or if both sec and msec are specified as 0, the most recent CPU sample is used.</th>
</tr>
</thead>
<tbody>
<tr>
<td>num</td>
<td>(Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.</td>
</tr>
</tbody>
</table>

**Result String**

`rec_list {{process CPU info string 0},{process CPU info string 1}, ...}`

Where each process CPU info string is:

`pid %u name {%s} cpu_used %u`

<table>
<thead>
<tr>
<th>rec_list</th>
<th>Marks the start of the process CPU information list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pid</td>
<td>Process ID.</td>
</tr>
<tr>
<td>name</td>
<td>Process name.</td>
</tr>
<tr>
<td>cpu_used</td>
<td>Specifies that if sec and msec are specified with a number greater than zero, the average percentage is calculated from the process CPU utilization during the specified time period. If sec and msec are both zero or not specified, the average percentage is calculated from the process CPU utilization in the latest sample.</td>
</tr>
</tbody>
</table>

**Set _cerno**

Yes

**sys_reqinfo_crash_history**

Queries the crash information of all processes that have ever crashed. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

`sys_reqinfo_crash_history`

**Arguments**

None

**Result String**

`rec_list {{crash info string 0},{crash info string 1}, ...}`

Where each crash info string is:

`job_id %u name {%s} respawn_count %u fail_count %u dump_count %u inst_id %d exit_status 0x%x exit_type %d proc_state {%s} component_id 0x%x crash_time_sec %ld crash_time_msec %ld`

<table>
<thead>
<tr>
<th>rec_list</th>
<th>Marks the start of the process CPU information list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>pid</td>
<td>Process ID.</td>
</tr>
<tr>
<td>name</td>
<td>Process name.</td>
</tr>
<tr>
<td>cpu_used</td>
<td>Specifies that if sec and msec are specified with a number greater than zero, the average percentage is calculated from the process CPU utilization during the specified time period. If sec and msec are both zero or not specified, the average percentage is calculated from the process CPU utilization in the latest sample.</td>
</tr>
<tr>
<td>job_id</td>
<td>System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>name</td>
<td>Process name.</td>
</tr>
<tr>
<td>respawn_count</td>
<td>Total number of restarts for the process.</td>
</tr>
<tr>
<td>fail_count</td>
<td>Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.</td>
</tr>
<tr>
<td>dump_count</td>
<td>Number of core dumps performed.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Process instance ID.</td>
</tr>
<tr>
<td>exit_status</td>
<td>Last exit status of the process.</td>
</tr>
<tr>
<td>exit_type</td>
<td>Last exit type.</td>
</tr>
<tr>
<td>proc_state</td>
<td>Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_rnode, stop, waitEOLtimer, wait_rnode, wait_spawntimer, wait_tpl.</td>
</tr>
<tr>
<td>component_id</td>
<td>Version manager assigned component ID for the component to which the process belongs.</td>
</tr>
<tr>
<td>crash_time_sec</td>
<td>Seconds and milliseconds since January 1, 1970, which represent the last time the process crashed.</td>
</tr>
</tbody>
</table>

**Set_cerrno**

Yes

**sys_reqinfo_mem_all**

Queries the memory usage of the top processes (both POSIX and IOS) during a specified time period and in a specified order. This Tcl command extension is supported only in Software Modularity images.

**Syntax**

```
sys_reqinfo_mem_all order allocates|increase|used [sec?] [msec?] [num?]  
```

**Arguments**

| order | (Mandatory) Order used for sorting the memory usage of processes. |
| allocates | (Mandatory) Specifies that the memory usage is sorted by the number of process allocations during the specified time window, and in descending order. |
| increase | (Mandatory) Specifies that the memory usage is sorted by the percentage of process memory increase during the specified time window, and in descending order. |
| used | (Mandatory) Specifies that the memory usage is sorted by the current memory used by the process. |
The time period, in seconds and milliseconds, during which the process memory usage is calculated. Must be integers in the range from 0 to 4294967295. If both sec and msec are specified and are nonzero, the number of allocations is the difference between the number of allocations in the oldest and latest samples collected in the time period. The percentage is calculated as the percentage difference between the memory used in the oldest and latest samples collected in the time period. If not specified, or if both sec and msec are specified as 0, the first sample ever collected is used as the oldest sample; that is, the time period is set to be the time from startup until the current moment.

(Optional) Number of entries from the top of the sorted list of processes to be displayed. Must be an integer in the range from 1 to 4294967295. Default value is 5.

Result String

rec_list {{process mem info string 0},{process mem info string 1}, ...}

Where each process mem info string is:

pid %u name {%s} delta_allocs %d initial_alloc %u current_alloc %u percent_increase %d

Set _cerrno

Yes

sys_reqinfo_proc

Queries the information about a single POSIX process. This Tcl command extension is supported only in Software Modularity images.

Syntax

sys_reqinfo_proc job_id ?
### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_id</td>
<td>(Mandatory) System manager assigned job ID for the process. Must be an integer between 1 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

### Result String

```
result_string = job_id %u component_id 0x%x name {%s} helper_name {%s} helper_path {%s} path {%s} node_name {%s} is_respawn %u is_mandatory %u is_hold %u dump_option %d max_dump_count %u respawn_count %u fail_count %u dump_count %u last_respawn_sec %ld last_respawn_msec %ld inst_id %u proc_state %s level %d exit_status 0x%x exit_type %d
```

- **job_id**: System manager assigned job ID for the process. An integer between 1 and 4294967295, inclusive.
- **component_id**: Version manager assigned component ID for the component to which the process belongs.
- **name**: Process name.
- **helper_name**: Helper process name.
- **helper_path**: Executable path of the helper process.
- **path**: Executable path of the process.
- **node_name**: System manager assigned node name for the node to which the process belongs.
- **is_respawn**: Flag that specifies that the process can be respawned.
- **is_mandatory**: Flag that specifies that the process must be alive.
- **is_hold**: Flag that specifies that the process is spawned until called by the API.
- **dump_option**: Core dumping options.
- **max_dump_count**: Maximum number of core dumping permitted.
- **respawn_count**: Total number of restarts for the process.
- **fail_count**: Number of restart attempts of the process. This count is reset to zero when the process is successfully restarted.
- **dump_count**: Number of core dumps performed.
- **last_respawn_sec**: Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the last time the process was started.
- **inst_id**: Process instance ID.
- **proc_state**: Sysmgr process states. One of the following: error, forced_stop, hold, init, ready_to_run, run, run_mode, stop, waitEOltimer, wait_mode, wait_spawntimer, wait_tpl.
sys_reqinfo_proc_all

Queries the information of all POSIX processes. This Tcl command extension is supported only in Software Modularity images.

Syntax

sys_reqinfo_proc_all

Arguments

None

Result String

rec_list {{process info string 0}, {process info string 1},...}

Where each process info string is the same as the result string of the sysreq_info_proc Tcl command extension.

sys_reqinfo_routername

Queries the device name.

Syntax

sys_reqinfo_routername

Arguments

None

Result String

routername %s
Where routename is the name of the device.

**Set _errno**

Yes

### sys_reqinfo_snmp

Queries the value of the entity specified by a Simple Network Management Protocol (SNMP) object ID.

**Syntax**

```
sys_reqinfo_snmp oid ? get_type exact|next
```

**Arguments**

<table>
<thead>
<tr>
<th>oid</th>
<th>(Mandatory) SNMP OID in dot notation (for example, 1.3.6.1.2.1.2.1.0).</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_type</td>
<td>(Mandatory) Type of SNMP get operation that needs to be applied to the specified oid. If the get_type is &quot;exact,&quot; the value of the specified oid is retrieved; if the get_type is &quot;next,&quot; the value of the lexicographical successor to the specified oid is retrieved.</td>
</tr>
</tbody>
</table>

**Result String**

oid {%s} value {%s}

<table>
<thead>
<tr>
<th>oid</th>
<th>SNMP OID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value string of the associated SNMP data element.</td>
</tr>
</tbody>
</table>

**Set _errno**

Yes

(-cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(-cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(-cerr_sub_err = 37)  FH_ENOSNMPDATA  (can't retrieve data from SNMP)

This error means that there was no data for the SNMP object type.

(-cerr_sub_err = 51)  FH_ESTATSTYP  (invalid statistics data type)

This error means that the SNMP statistics data type was invalid.
sys_reqinfo_syslog_freq

Queries the frequency information of all syslog events.

Syntax

sys_reqinfo_syslog_freq

Arguments

None

Result String

rec_list {{event frequency string 0}, {log freq str 1}, ...}

Where each event frequency string is:

<table>
<thead>
<tr>
<th>time_sec</th>
<th>time_msec</th>
<th>match_count</th>
<th>raise_count</th>
<th>occurs</th>
<th>period_sec</th>
<th>period_msec</th>
<th>pattern</th>
</tr>
</thead>
<tbody>
<tr>
<td>%ld</td>
<td>%ld</td>
<td>%u</td>
<td>%u</td>
<td>%u</td>
<td>%ld</td>
<td>%ld</td>
<td>{%s}</td>
</tr>
</tbody>
</table>

- time_sec and time_msec: Seconds and milliseconds in POSIX timer units since January 1, 1970, which represent the time the last event was raised.
- match_count: Number of times that a syslog message matches the pattern specified by this syslog event specification since event registration.
- raise_count: Number of times that this syslog event was raised.
- occurs: Number of occurrences needed in order to raise the event; if not specified, the event is raised on the first occurrence.
- period_sec and period_msec: Number of occurrences must occur within this number of POSIX timer units in order to raise the event; if not specified, the period check does not apply.
- pattern: Regular expression used to perform syslog message pattern matching.

Set _cerrno

Yes

(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)

This error means that the event detector was unavailable.

(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 9) FH_EMEMORY (insufficient memory for request)
This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 45)  FH_ESEQNUM  (sequence or workset number out of sync)
This error means that the event detector sequence or workset number was invalid.

(_cerr_sub_err = 46)  FH_EREGEMPTY  (registration list is empty)
This error means that the event detector registration list was empty.

(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)
This error means that the event detector was unavailable.

### sys_reqinfo_syslog_history

Queries the history of the specified syslog message.

**Syntax**

```bash
sys_reqinfo_syslog_history
```

**Arguments**

None

**Result String**

```bash
rec_list {{log hist string 0}, {log hist str 1}, ...}
```

Where each log hist string is:

```bash
time_sec %ld time_msec %ld msg {%s}
```

Seconds and milliseconds since January 1, 1970, which represent the time the message was logged.

**msg**  
Syslog message.

**Set _cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.
(_cerr_sub_err = 22) FH_ENULLPTR (event detector internal error - ptr is null)
This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 44) FH_EHISTEMPTY (history list is empty)
This error means that the history list was empty.

(_cerr_sub_err = 45) FH_ESEQNUM (sequence or workset number out of sync)
This error means that the event detector sequence or workset number was invalid.

(_cerr_sub_err = 54) FH_EFDUNAVAIL (connection to event detector unavailable)
This error means that the event detector was unavailable.
EEM Utility Tcl Command Extensions

The following conventions are used for the syntax documented on the Tcl command extension pages:

• An optional argument is shown within square brackets, for example:

[type ?]

• A question mark ? represents a variable to be entered.

• Choices between arguments are represented by pipes, for example:

priority low|normal|high

Note

For all EEM Tcl command extensions, if there is an error, the returned Tcl result string contains the error information.

Note

Arguments for which no numeric range is specified take an integer from -2147483648 to 2147483647, inclusive.

• appl_read, on page 2030
• appl_reqinfo, on page 2030
• appl_setinfo, on page 2031
• counter_modify, on page 2032
• description, on page 2033
• fts_get_stamp, on page 2034
• register_counter, on page 2035
• register_timer, on page 2036
• timer_arm, on page 2038
• timer_cancel, on page 2039
• unregister_counter, on page 2040
**appl_read**

Reads Embedded Event Manager (EEM) application volatile data. This Tcl command extension provides support for reading EEM application volatile data. EEM application volatile data can be published by a Cisco software process that uses the EEM application publish API. EEM application volatile data cannot be published by an EEM policy.

---

**Note**

Currently there are no Cisco software processes that publish application volatile data.

---

**Syntax**

`appl_read name ? length ?`

---

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Mandatory) Name of the application published string data.</td>
</tr>
<tr>
<td>length</td>
<td>(Mandatory) Length of the string data to read. Must be an integer number between 1 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

---

**Result String**

`data %s`

Where `data` is the application published string data to be read.

---

**Set _cerrno**

Yes

- `_cerr_sub_err = 2`  `FH_ESYSERR` (generic/unknown error from OS/system)
  
  This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

- `_cerr_sub_err = 7`  `FH_ENOSUCHKEY` (could not find key)
  
  This error means that the application event detector info key or other ID was not found.

- `_cerr_sub_err = 9`  `FH_EMEMORY` (insufficient memory for request)
  
  This error means that an internal EEM request for memory failed.

---

**appl_reqinfo**

Retrieves previously saved information from the Embedded Event Manager (EEM). This Tcl command extension provides support for retrieving information from EEM that has been previously saved with a unique
key, which must be specified in order to retrieve the information. Note that retrieving the information deletes it from EEM. It must be resaved if it is to be retrieved again.

**Syntax**

`appl_reqinfo key`?

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>(Mandatory) The string key of the data.</td>
</tr>
</tbody>
</table>

**Result String**

```data %s```

Where `data` is the application string data to be retrieved.

**Set_cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 7)  FH_ENOSUCHKEY  (could not find key)
This error means that the application event detector info key or other ID was not found.

**appl_setinfo**

Saves information in the Embedded Event Manager (EEM). This Tcl command extension provides support for saving information in the Embedded Event Manager that can be retrieved later by the same policy or by another policy. A unique key must be specified. This key allows the information to be retrieved later.

**Syntax**

`appl_setinfo key`? `data`?

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>(Mandatory) The string key of the data.</td>
</tr>
<tr>
<td>data</td>
<td>(Mandatory) The application string data to save.</td>
</tr>
</tbody>
</table>

**Result String**

None
Set _cerrno

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)
This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 8)  FH_EDUPLICATEKEY  (duplicate appl info key)
This error means that the application event detector info key or other ID was a duplicate.

(_cerr_sub_err = 9)  FH_EMEMORY  (insufficient memory for request)
This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 34)  FH_EMAXLEN  (maximum length exceeded)
This error means that the object length or number exceeded the maximum.

(_cerr_sub_err = 43)  FH_EBADLENGTH  (bad API length)
This error means that the API message length was invalid.

counter_modify

Modifies a counter value.

Syntax

counter_modify event_id ? val ? op nop|set|inc|dec

Arguments

<table>
<thead>
<tr>
<th>event_id</th>
<th>(Mandatory) The counter event ID returned by the register_counter Tcl command extension. Must be an integer between 0 and 4294967295, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>(Mandatory)</td>
</tr>
</tbody>
</table>

Note  Mandatory except when the op nop argument value combination is specified.

• If op is set, this argument represents the counter value that is to be set.
• If op is inc, this argument is the value by which to increment the counter.
• If op is dec, this argument is the value by which to decrement the counter.
<table>
<thead>
<tr>
<th>op</th>
<th>(Mandatory)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• nop--Retrieves the current counter value.</td>
</tr>
<tr>
<td></td>
<td>• set--Sets the counter value to the given value.</td>
</tr>
<tr>
<td></td>
<td>• inc--Increments the counter value by the given value.</td>
</tr>
<tr>
<td></td>
<td>• dec--Decrements the counter value by the given value.</td>
</tr>
</tbody>
</table>

**Result String**

`val_remain %d`

Where `val_remain` is the current value of the counter.

**Set _cerrno**

Yes

- `_cerr_sub_err = 2`  
  `FH_ESYSERR` (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

- `_cerr_sub_err = 11`  
  `FH_ENOSUCHESID` (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

- `_cerr_sub_err = 22`  
  `FH_ENULLPTR` (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

- `_cerr_sub_err = 30`  
  `FH_ECTBADOPER` (bad counter threshold operator)

This error means that the counter event detector set or modify operator was invalid.

**description**

Provides a brief description of the registered policy.

**Syntax**

description ?

**Arguments**

| line | (Optional) Brief description of the policy consisting of 1 to 240 characters. |
Result String
None

Set _cerrno
Yes

Sample Usage
The description statement is entered by the author of the policy. It can appear before or after any event registration statement in Tcl. The policy can have only one description.

Note
Registration of a policy with more than one description statement will fail.

The following example shows how a brief description is provided for the `event_register_syslog` policy:

```tcl
::cisco::eem::description "This Tcl command looks for the word count in syslog messages."
::cisco::eem::event_register_syslog tag 1 ...
::cisco::eem::event_register_snmp_object tag 2 ...
::cisco::eem::trigger {
  ::cisco::eem::correlate event 1 and event 2
  ::cisco::eem::attribute tag 1 occurs 1
  ::cisco::eem::attribute tag 2 occurs 1
}
```

**fts_get_stamp**

Returns the time period elapsed since the last software boot. Use this Tcl command extension to return the number of nanoseconds since boot in an array "nsec nnnn" where nnnn is the number of nanoseconds.

Syntax

```tcl
fts_get_stamp
```

Arguments
None

Result String

```tcl
nsec %d
```
Where nsec is the number of nanoseconds since boot.

Set _cerrno
No
register_counter

Registers a counter and returns a counter event ID. This Tcl command extension is used by a counter publisher to perform this registration before using the event ID to manipulate the counter.

**Syntax**

```
register_counter name ?
```

**Arguments**

- **name** (Mandatory) The name of the counter to be manipulated.

**Result String**

```
event_id %d
event_spec_id %d
```

Where `event_id` is the counter event ID for the specified counter; it can be used to manipulate the counter by the `unregister_counter` or `counter_modify` Tcl command extensions. The `event_spec_id` argument is the event specification ID for the specified counter.

**Set _cerrno**

Yes

- `_cerr_sub_err = 2`  
  FH_ESYSERR  (generic/unknown error from OS/system)

  This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

- `_cerr_sub_err = 4`  
  FH_EINITONCE  (Init() is not yet done, or done twice.)

  This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

- `_cerr_sub_err = 6`  
  FH_EBADEVENTTYPE  (unknown EEM event type)

  This error means that the event type specified in the internal event specification was invalid.

- `_cerr_sub_err = 9`  
  FH_EMEMORY  (insufficient memory for request)

  This error means that an internal EEM request for memory failed.

- `_cerr_sub_err = 10`  
  FH_ECORRUPT  (internal EEM API context is corrupt)

  This error means that the internal EEM API context structure is corrupt.

- `_cerr_sub_err = 11`  
  FH_ENOSUCHESID  (unknown event specification ID)

  This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.
This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

This error means that the context pointer that is used with each EEM API call is incorrect.

This error means that a control block address that was passed in the EEM API was incorrect.

This error means that an internal EEM event detector pointer was null when it should have contained a value.

This error means that the number of timer or counter subscribers exceeded the maximum.

This error means that the subscriber index was invalid.

This error means that the event detector was unavailable.

This error means that the EEM event detector that handles this request is not available.

**register_timer**

Registers a timer and returns a timer event ID. This Tcl command extension is used by a timer publisher to perform this registration before using the event ID to manipulate the timer if it does not use the event_register_timer command extension to register as a publisher and subscriber.

**Syntax**

```
register_timer watchdog|countdown|absolute|cron name ?
```

**Arguments**

- **name** (Mandatory) The name of the timer to be manipulated.

**Result String**

```
event_id %u
```
Where event_id is the timer event ID for the specified timer (can be used to manipulate the timer by the timer_arm or timer_cancel command extensions).

**Set _cerrno**

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 4)  FH_EINITONCE  (Init() is not yet done, or done twice.)

This error means that the request to register the specific event was made before the EEM event detector had completed its initialization.

(_cerr_sub_err = 6)  FH_EBADEVENTTYPE  (unknown EEM event type)

This error means that the event type specified in the internal event specification was invalid.

(_cerr_sub_err = 9)  FH_EMEMORY  (insufficient memory for request)

This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 10)  FH_ECORRUPT  (internal EEM API context is corrupt)

This error means that the internal EEM API context structure is corrupt.

(_cerr_sub_err = 11)  FH_ENOSUCHESID  (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 16)  FH_EBADFMPPTR  (bad ptr to fh_p data structure)

This error means that the context pointer that is used with each EEM API call is incorrect.

(_cerr_sub_err = 17)  FH_EBADADDRESS  (bad API control block address)

This error means that a control block address that was passed in the EEM API was incorrect.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 25)  FH_ESUBSEXCEED  (number of subscribers exceeded)

This error means that the number of timer or counter subscribers exceeded the maximum.

(_cerr_sub_err = 26)  FH_ESUBSIDXINV  (invalid subscriber index)

This error means that the subscriber index was invalid.

(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)
This error means that the event detector was unavailable.

(_cerr_sub_err = 56) FH_EFDCONNERR (event detector connection error)

This error means that the EEM event detector that handles this request is not available.

timer_arm

Arms a timer. The type could be CRON, watchdog, countdown, or absolute.

Syntax

timer_arm event_id ? cron_entry ?|time ?

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_id</td>
<td>(Mandatory) The timer event ID returned by the register_timer command extension. Must be an integer between 0 and 4294967295, inclusive.</td>
</tr>
<tr>
<td>cron_entry</td>
<td>(Mandatory) Must exist if the timer type is CRON. Must not exist for other types of timer. CRON timer specification uses the format of the CRON table entry.</td>
</tr>
<tr>
<td>time</td>
<td>(Mandatory) Must exist if the timer type is not CRON. Must not exist if the timer type is CRON. For watchdog and countdown timers, the number of seconds and milliseconds until the timer expires; for an absolute timer, the calendar time of the expiration time (specified in SSSSSSSSSSS[.MMM] format, where SSSSSSSSSS must be an integer representing seconds between 0 and 4294967295, inclusive, and where MMM must be an integer representing milliseconds between 0 and 999). An absolute expiration date is the number of seconds and milliseconds since January 1, 1970. If the date specified has already passed, the timer expires immediately.</td>
</tr>
</tbody>
</table>

Result String

sec_remain %ld msec_remain %ld

Where sec_remain and msec_remain are the remaining time before the next expiration of the timer.

Note

A value of 0 will be returned for the sec_remain and msec_remain arguments if the timer type is CRON.

Set _cerrno

Yes

(_cerr_sub_err = 2) FH_ESYSERR (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.
timer_cancel

Cancels a timer.

Syntax

timer_cancel event_id ?

Arguments

event_id  (Mandatory) The timer event ID returned by the register_timer command extension. Must be an integer between 0 and 4294967295, inclusive.
**Result String**

```plaintext
sec_remain %ld msec_remain %ld
```

Where `sec_remain` and `msec_remain` are the remaining time before the next expiration of the timer.

---

**Note**

A value of 0 will be returned for `sec_remain` and `msec_remain` if the timer type is CRON.

---

**Set _cerrno**

Yes

```c
(_cerr_sub_err = 2)   FH_ESYSERR  (generic/unknown error from OS/system)
```

This error means that the operating system reported an error. The POSIX `errno` value that is reported with the error should be used to determine the cause of the operating system error.

```c
(_cerr_sub_err = 6)   FH_EBADEVENTTYPE  (unknown EEM event type)
```

This error means that the event type specified in the internal event specification was invalid.

```c
(_cerr_sub_err = 7)   FH_ENOSUCHKEY   (could not find key)
```

This error means that the application event detector info key or other ID was not found.

```c
(_cerr_sub_err = 11)  FH_ENOSUCHESID  (unknown event specification ID)
```

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```c
(_cerr_sub_err = 12)  FH_ENOSUCHEID   (unknown event ID)
```

This error means that the event ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

```c
(_cerr_sub_err = 22)  FH_ENULLPTR     (event detector internal error - ptr is null)
```

This error means that an internal EEM event detector pointer was null when it should have contained a value.

```c
(_cerr_sub_err = 54)  FH_EFDUNAVAIL   (connection to event detector unavailable)
```

This error means that the event detector was unavailable.

```c
(_cerr_sub_err = 56)  FH_EFDCONNERR   (event detector connection error)
```

This error means that the EEM event detector that handles this request is not available.

---

**unregister_counter**

Unregisters a counter. This Tcl command extension is used by a counter publisher to unregister a counter that was previously registered with the `register_counter` Tcl command extension.
Syntax

unregister_counter event_id ? event_spec_id ?

Arguments

<table>
<thead>
<tr>
<th>event_id</th>
<th>(Mandatory) Counter event ID returned by the register_counter command extension. Must be an integer between 0 and 4294967295, inclusive.</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_spec_id</td>
<td>(Mandatory) Counter event specification ID for the specified counter returned by the register_counter command extension. Must be an integer between 0 and 4294967295, inclusive.</td>
</tr>
</tbody>
</table>

Result String

None

Set _cerrno

Yes

(_cerr_sub_err = 2)  FH_ESYSERR  (generic/unknown error from OS/system)

This error means that the operating system reported an error. The POSIX errno value that is reported with the error should be used to determine the cause of the operating system error.

(_cerr_sub_err = 9)  FH_EMEMORY  (insufficient memory for request)

This error means that an internal EEM request for memory failed.

(_cerr_sub_err = 11)  FH_ENOSUCHESID  (unknown event specification ID)

This error means that the event specification ID could not be matched when the event was being registered or that an event detector internal event structure is corrupt.

(_cerr_sub_err = 22)  FH_ENULLPTR  (event detector internal error - ptr is null)

This error means that an internal EEM event detector pointer was null when it should have contained a value.

(_cerr_sub_err = 26)  FH_ESUBSIDXINV  (invalid subscriber index)

This error means that the subscriber index was invalid.

(_cerr_sub_err = 54)  FH_EFDUNAVAIL  (connection to event detector unavailable)

This error means that the event detector was unavailable.

(_cerr_sub_err = 56)  FH_EFDCONNERR  (event detector connection error)

This error means that the EEM event detector that handles this request is not available.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VTP

Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more devices and have those changes automatically communicated to all the other devices in the network. Without VTP, you cannot send information about VLANs to other devices.

VTP is designed to work in an environment where updates are made on a single device and are sent through VTP to other devices in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on devices in the same domain, which would result in an inconsistency in the VLAN database.
The device supports a total of 1000 VLANs. However, the number of routed ports, SVIs, and other configured features affects the usage of the device hardware. If the device is notified by VTP of a new VLAN and the device is already using the maximum available hardware resources, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the `show vlan` user EXEC command shows the VLAN in a suspended state.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the device or device stack and that this trunk port is connected to the trunk port of another device. Otherwise, the device cannot receive any VTP advertisements.

### Restrictions for VTP

**Note**

Before adding a VTP client device to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. If you add a device that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

The following are restrictions for configuring VTPs:

- 1K VLAN is supported only on switches running the LAN Base image with the lanbase-default template set.

- To avoid warning messages of high CPU utilization with a normal-range VLAN configuration, we recommend to have no more than 256 VLANs.

In such cases, approximately 10 access interfaces or 5 trunk interfaces can flap simultaneously with negligible impact to CPU utilization (if there are more interfaces that flap simultaneously, then CPU usage may be excessively high.)

### Information About VTP

**VTP**

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP functionality is supported across the stack, and all devices in the stack maintain the same VLAN and VTP configuration inherited from the active device. When a device learns of a new VLAN through VTP messages or when a new VLAN is configured by the user, the new VLAN information is communicated to all devices in the stack.

When a device joins the stack or when stacks merge, the new devices get VTP information from the active device.
VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3.

You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

**VTP Domain**

A VTP domain (also called a VLAN management domain) consists of one device or several interconnected devices or device stacks under the same administrative responsibility sharing the same VTP domain name. A device can be in only one VTP domain. You make global VLAN configuration changes for the domain.

By default, the device is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the device receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The device then ignores advertisements with a different domain name or an earlier configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all devices in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a device for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other devices in the domain, and they affect only the individual device. However, configuration changes made when the device is in this mode are saved in the device running configuration and can be saved to the device startup configuration file.

# VTP Modes

Table 204: VTP Modes

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
</table>
| VTP server | In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other devices in the same VTP domain and synchronize their VLAN configurations with other devices based on advertisements received over trunk links.  
VTP server is the default mode.  
In VTP server mode, VLAN configurations are saved in NVRAM. If the device detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the device cannot be returned to VTP server mode until the NVRAM is functioning. |
| VTP client | A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode.  
In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode. |
<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP transparent</td>
<td>VTP transparent devices do not participate in VTP. A VTP transparent device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent devices do forward VTP advertisements that they receive from other devices through their trunk interfaces. You can create, modify, and delete VLANs on a device in VTP transparent mode. When the device is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other devices. In this mode, VTP mode and domain name are saved in the device running configuration, and you can save this information in the device startup configuration file by using the <code>copy running-config startup-config</code> privileged EXEC command. In a device stack, the running configuration and the saved configuration are the same for all devices in a stack.</td>
</tr>
<tr>
<td>VTP off</td>
<td>A device in VTP off mode functions in the same manner as a VTP transparent device, except that it does not forward VTP advertisements on trunks.</td>
</tr>
</tbody>
</table>

**VTP Advertisements**

Each device in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring devices receive these advertisements and update their VTP and VLAN configurations as necessary. Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:

• Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.

• Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the device is operating in VTP server mode.

• Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent device inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent device forwards a message only when the domain name matches.

• Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

VTP Version 3

VTP version 3 supports these features that are not supported in version 1 or version 2:

• Enhanced authentication—You can configure the authentication as hidden or secret. When hidden, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format.
VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a device floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving devices might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible device trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each device in the domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all devices in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

VTP and Device Stacks

The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

VTP configuration is the same in all members of a device stack. When the device stack is in VTP server or client mode, all devices in the stack carry the same VTP configuration. When VTP mode is transparent, the stack is not taking part in VTP.

- When a device joins the stack, it inherits the VTP and VLAN properties of the active device.
- All VTP updates are carried across the stack.
- When VTP mode is changed in a device in the stack, the other devices in the stack also change VTP mode, and the device VLAN database remains consistent.

VTP version 3 functions the same on a standalone device or a stack except when the device stack is the primary server for the VTP database. In this case, the MAC address of the active device is used as the primary server ID. If the active device reloads or is powered off, a new active device is elected.

- If you do not configure the persistent MAC address feature, when the new active device is elected, it sends a takeover message with the new active MAC address as the primary server.
- If a persistent MAC address is configured, the new active device waits for the configured timer value. If the previous active device does not rejoin the stack during this time, then the new active device issues the takeover message.

VTP Configuration Guidelines

VTP Configuration Requirements

When you configure VTP, you must configure a trunk port so that the device can send and receive VTP advertisements to and from other devices in the domain.

VTP versions 1 and 2 do not support private VLANs. VTP version 3 does support private VLANs. If you configure private VLANs, the device must be in VTP transparent mode. When private VLANs are configured on the device, do not change the VTP mode from transparent to client or server mode.

VTP Settings

The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the device running configuration file, and you can save it in the device startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the device resets.

When you save VTP information in the device startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is
ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

### Domain Names for Configuring VTP

When configuring VTP for the first time, you must always assign a domain name. You must configure all devices in the VTP domain with the same domain name. Devices in VTP transparent mode do not exchange VTP messages with other devices, and you do not need to configure a VTP domain name for them.

**Note**

If the NVRAM and DRAM storage is sufficient, all devices in a VTP domain should be in VTP server mode.

**Caution**

Do not configure a VTP domain if all devices are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one device in the VTP domain for VTP server mode.

**Related Topics**
- Adding a VTP Client to a VTP Domain, on page 2064

### Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain devices must share the same password and you must configure the password on each device in the management domain. Devices without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a device that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the device accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new device to an existing network with VTP capability, the new device learns the domain name only after the applicable password has been configured on it.

**Caution**

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each device in the domain.

**Related Topics**
- Configuring a VTP Version 3 Password, on page 2057
- Example: Configuring a Switch as the Primary Server, on page 2066
Follow these guidelines when deciding which VTP version to implement:

- All devices in a VTP domain must have the same domain name, but they do not need to run the same VTP version.

- A VTP version 2-capable device can operate in the same VTP domain as a device running VTP version 1 if version 2 is disabled on the version 2-capable device (version 2 is disabled by default).

- If a device running VTP version 1, but capable of running VTP version 2, receives VTP version 3 advertisements, it automatically moves to VTP version 2.

- If a device running VTP version 3 is connected to a device running VTP version 1, the VTP version 1 device moves to VTP version 2, and the VTP version 3 device sends scaled-down versions of the VTP packets so that the VTP version 2 device can update its database.

- A device running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.

- Do not enable VTP version 2 on a device unless all of the devices in the same VTP domain are version-2-capable. When you enable version 2 on a device, all of the version-2-capable devices in the domain enable version 2. If there is a version 1-only device, it does not exchange VTP information with devices that have version 2 enabled.

- Cisco recommends placing VTP version 1 and 2 devices at the edge of the network because they do not forward VTP version 3 advertisements.

- If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

- VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.

- When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.

- When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.

- A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.

- Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.

- Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.

- VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.

How to Configure VTP

Configuring VTP Mode

You can configure VTP mode as one of these:

- **VTP server mode**—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.

- **VTP client mode**—In VTP client mode, you cannot change its VLAN configuration. The client device receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.

- **VTP transparent mode**—In VTP transparent mode, VTP is disabled on the device. The device does not send VTP updates and does not act on VTP updates received from other device. However, a VTP transparent device running VTP version 2 does forward received VTP advertisements on its trunk links.

- **VTP off mode**—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a device to a different domain.

SUMMARY STEPS

1. enable
2. configure terminal

Enabling the VTP Version

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a device, every VTP version 2-capable device in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each device.
- With VTP versions 1 and 2, you can configure the version only on devices in VTP server or transparent mode. If a device is running VTP version 3, you can change to version 2 when the device is in client mode if no extended VLANs exist, and no hidden password was configured.
Enabling the VTP Version

Caution

VTP version 1 and VTP version 2 are not interoperable on devices in the same VTP domain. Do not enable VTP version 2 unless every device in the VTP domain supports version 2.

• In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.

• Caution

In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

SUMMARY STEPS

1. enable
2. configure terminal
3. vtp version {1 | 2 | 3}
4. end
5. show vtp status
6. copy running-config startup-config

## Enabling VTP Pruning

**Before you begin**

VTP pruning is not designed to function in VTP transparent mode. If one or more devices in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the device upstream to the VTP transparent device pruning ineligible.

To configure VTP pruning on an interface, use the `switchport trunk pruning vlan` interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vtp pruning`
4. `end`
5. `show vtp status`

Adding a VTP Client to a VTP Domain

Follow these steps to verify and reset the VTP configuration revision number on a device before adding it to a VTP domain.

**Before you begin**

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is *lower* than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a device that has a revision number higher than the revision number in the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the `vtp mode transparent` global configuration command to disable VTP on the device and then to change its VLAN information without affecting the other devices in the VTP domain.

**SUMMARY STEPS**

1. `enable`
2. `show vtp status`
3. `configure terminal`
4. `vtp domain domain-name`
5. `end`
6. `show vtp status`
7. `configure terminal`
8. `vtp domain domain-name`
9. `end`
10. `show vtp status`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>show vtp status</code></td>
<td>Checks the VTP configuration revision number.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# show vtp status</code></td>
<td></td>
</tr>
</tbody>
</table>

If the number is 0, add the device to the VTP domain. If the number is greater than 0, follow these substeps:

- Write down the domain name.
- Write down the configuration revision number.
- Continue with the next steps to reset the device configuration revision number.

**Monitoring VTP**

This section describes commands used to display and monitor the VTP configuration. You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the device.

**Table 206: VTP Monitoring Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp counters</td>
<td>Displays counters about VTP messages that have been sent and received.</td>
</tr>
<tr>
<td>show vtp devices [conflict]</td>
<td>Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The show vtp devices command does not display information when the device is in transparent or off mode.</td>
</tr>
<tr>
<td>show vtp interface [interface-id]</td>
<td>Displays VTP status and configuration for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>show vtp password</td>
<td>Displays the VTP password. The form of the password displayed depends on whether or not the hidden keyword was entered and if encryption is enabled on the device.</td>
</tr>
<tr>
<td>show vtp status</td>
<td>Displays the VTP device configuration information.</td>
</tr>
</tbody>

**Configuration Examples for VTP**

**Example: Configuring a Switch as the Primary Server**

This example shows how to configure a device as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

```
Device# vtp primary vlan
Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain

VTP Database Conf Switch ID Primary Server Revision System Name
-------------- ----- -------------- ------------- -------- --------------------
```
Example: Configuring Switch as VTP Server

This example shows how to configure the switch as a VTP server with the domain name *eng_group* and the password *mypasswd*:

```
Switch(config)# vtp domain eng_group
Setting VTP domain name to eng_group.

Switch(config)# vtp mode server
Setting device to VTP Server mode for VLANS.

Switch(config)# vtp password mypasswd
Setting device VLAN database password to mypasswd.
```

```
Switch(config)# end
```

Related Topics

- Configuring a VTP Version 3 Password, on page 2057
- Passwords for the VTP Domain, on page 2053

Example: Enabling VTP on the Interface

To enable VTP on the interface, use the *vtp* interface configuration command. To disable VTP on the interface, use the *no vtp* interface configuration command:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# vtp
Switch(config-if)# end
```

Example: Creating the VTP Password

The follow is an example of creating the VTP password:

```
Switch(config)# vtp password mypasswd hidden
Generating the secret associated to the password.
Switch(config)# end
Switch# show vtp password
VTP password: 89914640C8D90868B6A0D8103847A733
```
Where to Go Next

After configuring VTP, you can configure the following:

- VLANS
- VLAN Trunking
- VLAN Membership Policy Server (VMPS)
- Voice VLANs

Feature History and Information for VTP
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

• Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.

• The switch supports 1000 VLANs in VTP client, server, and transparent modes.
On using the LAN Base image, only the lanbase-default template supports 1000 VLANs. The remaining templates (default and lanbase-routing) only supports 255 VLANs. Up to 64 VLANs are supported when the switch is running the LAN Lite image.

- The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

**Restrictions for VLANs**

The following are restrictions for configuring VLANs:

- 1K VLAN is supported only on switches running the LAN Base image with the lanbase-default template set.

- To avoid warning messages of high CPU utilization with a normal-range VLAN configuration, we recommend that you have no more than 256 VLANs. In such cases, approximately 10 access interfaces or 5 trunk interfaces can flap simultaneously with negligible impact to CPU utilization (if there are more interfaces that flap simultaneously, then CPU usage may be excessively high.)

**Information About VLANs**

**Logical Networks**

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any device port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a device supporting fallback bridging. In a device stack, VLANs can be formed with ports across the stack. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the device is assigned manually on an interface-by-interface basis. When you assign device interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed.

The device can route traffic between VLANs by using device virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.
Supported VLANs

The switch supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

VTP version 1 and version 2 support only normal-range VLANs (VLAN IDs 1 to 1005). In these versions, the switch must be in VTP transparent mode when you create VLAN IDs from 1006 to 4094. Cisco IOS Release 12.2(52)SE and later support VTP version 3. VTP version 3 supports the entire VLAN range (VLANs 1 to 4094). Extended range VLANs (VLANs 1006 to 4094) are supported only in VTP version 3. You cannot convert from VTP version 3 to VTP version 2 if extended VLANs are configured in the domain.

Although the switch stack supports a total of 1,000 (normal range and extended range) VLANs, the number of configured features affects the use of the switch hardware.

On using the LAN Base image, only the lanbase-default template supports 1000 VLANs. The remaining templates (default and lanbase-routing) only supports 255 VLANs. Up to 64 VLANs are supported when the switch is running the LAN Lite image.

The switch supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN. The switch supports only IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.

Up to 64 spanning-tree instances are supported when the switch is running the LAN Lite image.

VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the device learns and manages the addresses associated with the port on a per-VLAN basis.

<table>
<thead>
<tr>
<th>Membership Mode</th>
<th>VLAN Membership Characteristics</th>
<th>VTP Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static-access</td>
<td>A static-access port can belong to one VLAN and is manually assigned to that VLAN.</td>
<td>VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the device or the device stack connected to a trunk port of a second device or device stack.</td>
</tr>
</tbody>
</table>
## VLAN Characteristics

### Membership Mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Characteristics</th>
<th>VTP Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trunk (IEEE 802.1Q):</td>
<td>A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list.</td>
<td>VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other devices over trunk links.</td>
</tr>
<tr>
<td>Dynamic access</td>
<td>A dynamic-access port can belong to one VLAN (VLAN ID 1 to 4094) and is dynamically assigned by a VLAN Member Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch, for example, but never a Catalyst switch. The Catalyst switch is a VMPS client. You can have dynamic-access ports and trunk ports on the same device, but you must connect the dynamic-access port to an end station or hub and not to another device.</td>
<td>VTP is required. Configure the VMPS and the client with the same VTP domain name. To participate in VTP, at least one trunk port on the device or a device stack must be connected to a trunk port of a second device or device stack.</td>
</tr>
<tr>
<td>Voice VLAN</td>
<td>A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.</td>
<td>VTP is not required; it has no effect on a voice VLAN.</td>
</tr>
</tbody>
</table>

### VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the vlan.dat file (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The vlan.dat file is stored in flash memory. If the VTP mode is transparent, they are also saved in the device running configuration file.

In a device stack, the whole stack uses the same vlan.dat file and running configuration. On some devices, the vlan.dat file is stored in flash memory on the active device.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
• If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.

• In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

• From image 15.0(02)SE6, on vtp transparent and off modes, vlans get created from startup-config even if they are not applied to the interface.

Note
Ensure that you delete the vlan.dat file along with the configuration files before you reset the switch configuration using write erase command. This ensures that the switch reboots correctly on a reset.

Normal-Range VLAN Configuration Guidelines

Normal-range VLANs are VLANs with IDs from 1 to 1005. VTP 1 and 2 only support normal-range VLANs.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

• Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

• VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the device running configuration file.

• If the device is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)

• With VTP versions 1 and 2, the device supports VLAN IDs 1006 through 4094 only in VTP transparent mode (VTP disabled). These are extended-range VLANs and configuration options are limited. Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode. If extended VLANs are configured, you cannot convert from VTP version 3 to version 1 or 2.

• Before you can create a VLAN, the device must be in VTP server mode or VTP transparent mode. If the device is a VTP server, you must define a VTP domain or VTP will not function.

• The device does not support Token Ring or FDDI media. The device does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.

• The device supports 128 spanning tree instances. If a device has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs.

If you have already used all available spanning-tree instances on a device, adding another VLAN anywhere in the VTP domain creates a VLAN on that device that is not running spanning-tree. If you have the default allowed list on the trunk ports of that device (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent devices that all have run out
of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of devices that have used up their allocation of spanning-tree instances.

If the number of VLANs on the device exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your device to map multiple VLANs to a single spanning-tree instance.

- When a device in a stack learns a new VLAN or deletes or modifies an existing VLAN (either through VTP over network ports or through the CLI), the VLAN information is communicated to all stack members.

- When a device joins a stack or when stacks merge, VTP information (the vlan.dat file) on the new devices will be consistent with the active device.

Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

VTP 3 only supports extended-range VLANs.

Follow these guidelines when creating extended-range VLANs:

- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the device is running VTP version 3.

- You cannot include extended-range VLANs in the pruning eligible range.

- For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the device boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the device resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.

- Although the device stack supports a total of 1000 (normal-range and extended-range) VLANs, the number of configured features affects the use of the switch hardware. If you try to create an extended-range VLAN and there are not enough hardware resources available, an error message is generated, and the extended-range VLAN is rejected.

- In a device stack, the whole stack uses the same running configuration and saved configuration, and extended-range VLAN information is shared across the stack.

Default VLAN Configurations

Default Ethernet VLAN Configuration

The following table displays the default configuration for Ethernet VLANs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>1</td>
<td>1 to 4094.</td>
</tr>
<tr>
<td>VLAN name</td>
<td>VLANxxxx, where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number</td>
<td>No range</td>
</tr>
<tr>
<td>IEEE 802.10 SAID</td>
<td>100001 (100000 plus the VLAN ID)</td>
<td>1 to 4294967294</td>
</tr>
<tr>
<td>IEEE 802.10 SAID</td>
<td>1500</td>
<td>576-18190</td>
</tr>
</tbody>
</table>

Note
Extended-range VLANs (VLAN IDs 1006 to 4094) are only saved in the VLAN database in VTP version 3.

Default VLAN Configuration

You can change only the MTU size and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

Note
The switch must be running the LAN Base image to support remote SPAN.

How to Configure VLANs

How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:
Creating or Modifying an Ethernet VLAN

Each Ethernet VLAN in the VLAN database has a unique, 4-digit ID that can be a number from 1 to 1001. VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs. To create a normal-range VLAN to be added to the VLAN database, assign a number and name to the VLAN.

### Note

With VTP version 1 and 2, if the device is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vlan vlan-id**
4. **name vlan-name**
5. **mtu mtu-size**
6. **remote-span**
7. **end**
8. **show vlan {name vlan-name | id vlan-id}**
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>vlan vlan-id</td>
<td>Enters a VLAN ID, and enters VLAN configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# vlan 20</td>
<td>Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN.</td>
</tr>
<tr>
<td>Note</td>
<td>The available VLAN ID range for this command is 1 to 4094.</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>name vlan-name</td>
<td>(Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the vlan-id value with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-vlan)# name test20</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>mtu mtu-size</td>
<td>(Optional) Changes the MTU size (or other VLAN characteristic).</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-vlan)# mtu 256</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>remote-span</td>
<td>(Optional) Configures the VLAN as the RSPAN VLAN for a remote SPAN session.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-vlan)# remote-span</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td>show vlan {name vlan-name</td>
<td>id vlan-id}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Deleting a VLAN

When you delete a VLAN from a device that is in VTP server mode, the VLAN is removed from the VLAN database for all devices in the VTP domain. When you delete a VLAN from a device that is in VTP transparent mode, the VLAN is deleted only on that specific device or a device stack.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

Caution

When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no vlan vlan-id**
4. **end**
5. **show vlan brief**
6. **copy running-config startup-config**

How to Configure Extended-Range VLANs

With VTP version 1 and version 2, when the switch is in VTP transparent mode (VTP disabled), you can create extended-range VLANs (in the range 1006 to 4094). VTP version supports extended-range VLANs in server or transparent move. Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any switchport commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file by using the copy running-config startup-config privileged EXEC command. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

Creating an Extended-Range VLAN

You create an extended-range VLAN in global configuration mode by entering the vlan global configuration command with a VLAN ID from 1006 to 4094. The extended-range VLAN has the default Ethernet VLAN characteristics and the MTU size, and RSPAN configuration are the only parameters you can change. See the description of the vlan global configuration command in the command reference for the default settings of all parameters. In VTP version 1 or 2, if you enter an extended-range VLAN ID when the switch is not in VTP transparent mode, an error message is generated when you exit VLAN configuration mode, and the extended-range VLAN is not created.

In VTP version 1 and 2, extended-range VLANs are not saved in the VLAN database; they are saved in the switch running configuration file. You can save the extended-range VLAN configuration in the switch startup configuration file by using the copy running-config startup-config privileged EXEC command. VTP version 3 saves extended-range VLANs in the VLAN database.

SUMMARY STEPS

1. configure terminal
2. vtp mode transparent
3. vlan vlan-id
4. mtu mtu-size
5. remote-span
6. end
7. show vlan id vlan-id
8. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| Step 2 | vtp mode transparent  
Example: | Configures the device for VTP transparent mode, disabling VTP. |
### Creating an Extended-Range VLAN

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# vtp mode transparent</code></td>
<td><strong>Note</strong> This step is not required for VTP version 3.</td>
</tr>
</tbody>
</table>

**Step 3**

**vlan vlan-id**

**Example:**

```
Device(config)# vlan 2000
Device(config-vlan)#
```

Enters an extended-range VLAN ID and enters VLAN configuration mode. The range is 1006 to 4094.

**Step 4**

**mtu mtu size**

**Example:**

```
Device(config-vlan)# mtu 1024
```

Modifies the VLAN by changing the MTU size.

**Step 5**

**remote-span**

**Example:**

```
Device(config-vlan)# remote-span
```

(Optional) Configures the VLAN as the RSPAN VLAN.

**Step 6**

**end**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 7**

**show vlan id vlan-id**

**Example:**

```
Device# show vlan id 2000
```

Verifies that the VLAN has been created.

**Step 8**

**copy running-config startup-config**

**Example:**

```
Device# copy running-config startup-config
```

Saves your entries in the device startup configuration file.

To save an extended-range VLAN configuration, you need to save the VTP transparent mode configuration and the extended-range VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it will default to VTP server mode, and the extended-range VLAN IDs will not be saved.

**Note** This step is not required for VTP version 3 because VLANs are saved in the VLAN database.
## Monitoring VLANs

### Table 209: Privileged EXEC show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show interfaces [vlan vlan-id]</strong></td>
<td>Displays characteristics for all interfaces or for the specified VLAN configured on the device.</td>
</tr>
<tr>
<td>**show vlan [brief</td>
<td>group [group-name name]</td>
</tr>
<tr>
<td></td>
<td>• <strong>brief</strong>—Displays VTP VLAN status in brief.</td>
</tr>
<tr>
<td></td>
<td>• <strong>group</strong>—Displays the VLAN group with its name and the connected VLANs that are available.</td>
</tr>
<tr>
<td></td>
<td>• <strong>id</strong>—Displays VTP VLAN status by identification number.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ifindex</strong>—Displays SNMP ifIndex.</td>
</tr>
<tr>
<td></td>
<td>• <strong>mtu</strong>—Displays VLAN MTU information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>name</strong>—Display the VTP VLAN information by specified name.</td>
</tr>
<tr>
<td></td>
<td>• <strong>remote-span</strong>—Displays the remote SPAN VLANs.</td>
</tr>
<tr>
<td></td>
<td>• <strong>summary</strong>—Displays a summary of VLAN information.</td>
</tr>
</tbody>
</table>
**Configuration Examples**

**Example: Creating a VLAN Name**

This example shows how to create Ethernet VLAN 20, name it test20, and add it to the VLAN database:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# name test20
Switch(config-vlan)# end
```

**Example: Configuring a Port as Access Port**

This example shows how to configure a port as an access port in VLAN 2:

```
```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 2
Switch(config-if)# end

Example: Creating an Extended-Range VLAN

This example shows how to create a new extended-range VLAN with all default characteristics, enter VLAN configuration mode, and save the new VLAN in the switch startup configuration file:

Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config

Where to Go Next

After configuring VLANs, you can configure the following:

• VLAN Trunking Protocol (VTP)
• VLAN trunks

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco devices connected through IEEE 802.1Q trunks, the devices maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANS.

When you connect a Cisco device to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco device combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q device. However, spanning-tree information for each VLAN is maintained by Cisco devices separated by a cloud of non-Cisco IEEE 802.1Q devices. The non-Cisco IEEE 802.1Q cloud separating the Cisco devices is treated as a single trunk link between the devices.
• Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.

• Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

Information About VLAN Trunks

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet device interfaces and another networking device such as a router or a device. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

Note

You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle.

Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

Layer 2 Interface Modes

Table 210: Layer 2 Interface Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchport mode access</td>
<td>Puts the interface (access port) into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The interface becomes a nontrunk interface regardless of whether or not the neighboring interface is a trunk interface.</td>
</tr>
</tbody>
</table>
### Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the switchport trunk allowed setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

- [Defining the Allowed VLANs on a Trunk](#), on page 2095
Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting devices. To avoid loops, STP normally blocks all but one parallel link between devices. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same device. For load sharing using STP path costs, each load-sharing link can be connected to the same device or to two different devices.

Network Load Sharing Using STP Priorities

When two ports on the same device form a loop, the device uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

Related Topics
Configuring Load Sharing Using STP Port Priorities, on page 2100

Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

Related Topics
Configuring Load Sharing Using STP Path Cost, on page 2104

Feature Interactions

Trunking interacts with other features in these ways:

• A trunk port cannot be a secure port.

• Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
  • Allowed-VLAN list.
  • STP port priority for each VLAN.
  • STP Port Fast setting.
  • Trunk status:
    If one port in a port group ceases to be a trunk, all ports cease to be trunks.

• We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
• If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

• A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

Default Layer 2 Ethernet Interface VLAN Configuration

The following table shows the default Layer 2 Ethernet interface VLAN configuration.

<td>VLAN 1</td>
</tr>
</tbody>
</table>

How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

• If you do not intend to trunk across those links, use the `switchport mode access` interface configuration command to disable trunking.

• To enable trunking to a device that does not support DTP, use the `switchport mode trunk` and `switchport nonegotiate` interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Configuring an Ethernet Interface as a Trunk Port

Configuring a Trunk Port

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the device and that this trunk port is connected to the trunk port of a second device. Otherwise, the device cannot receive any VTP advertisements.

SUMMARY STEPS

1. enable
### Configuring a Trunk Port

1. **Overview**
   - Trunking allows multiple VLANs to be carried over a single link.
   - Dynamic trunking allows automatic VLAN membership based on negotiation.

2. **Configure Terminal**
   ```
   configure terminal
   ```

3. **Interface Interface-ID**
   ```
   interface interface-id
   ```

4. **Switchport Mode**
   ```
   switchport mode {dynamic {auto | desirable} | trunk}
   ```

5. **Switchport Access VLAN**
   ```
   switchport access vlan vlan-id
   ```

6. **Switchport Trunk Native VLAN**
   ```
   switchport trunk native vlan vlan-id
   ```

7. **End**
   ```
   end
   ```

8. **Show Interfaces Interface-ID Switchport**
   ```
   show interfaces interface-id switchport
   ```

9. **Show Interfaces Interface-ID Trunk**
   ```
   show interfaces interface-id trunk
   ```

10. **Copy Running-Config Startup-Config**
    ```
    copy running-config startup-config
    ```

### Defining the Allowed VLANs on a Trunk

VLAN 1 is the default VLAN on all trunk ports in all Cisco devices, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

<table>

|                                | |
### Configuring the Native VLAN for Untagged Traffic

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the device forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Selects the trunk port for which VLANs should be pruned, and enters interface configuration mode.</td>

<td></td>
</tr>
</tbody>
</table>
If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the device sends the packet with a tag.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport trunk native vlan vlan-id`  
5. `end`
6. `show interfaces interface-id switchport`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Defines the interface that is configured as the IEEE 802.1Q trunk, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet 1/0/2</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 4** switchport trunk native vlan vlan-id | Configures the VLAN that is sending and receiving untagged traffic on the trunk port.  
For `vlan-id`, the range is 1 to 4094. |
| Example: Device(config-if)# switchport trunk native vlan 12 | |
| **Step 5** end | Returns to privileged EXEC mode. |
| Example: Device(config-if)# end | |
| **Step 6** show interfaces interface-id switchport | Verifies your entries in the Trunking Native Mode VLAN field. |
| Example: | |

### Configuring Trunk Ports for Load Sharing

**Configuring Load Sharing Using STP Port Priorities**

If your device is a member of a device stack, you must use the `spanning-tree [vlan vlan-id] cost cost` interface configuration command instead of the `spanning-tree [vlan vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

These steps describe how to configure a network with load sharing using STP port priorities.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vtp domain domain-name`
4. `vtp mode server`
5. `end`
6. `show vtp status`
7. `show vlan`
8. `configure terminal`
9. `interface interface-id`
10. `switchport mode trunk`
11. `end`
12. `show interfaces interface-id switchport`
13. Repeat the above steps on Device A for a second port in the device or device stack.
14. Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.
15. `show vlan`
16. `configure terminal`
17. `interface interface-id`
18. `spanning-tree vlan vlan-range port-priority priority-value`
19. `exit`
20. `interface interface-id`
21. `spanning-tree vlan vlan-range port-priority priority-value`
### DETAILED STEPS

*copy running-config startup-config*  
**Example:** | (Optional) Saves your entries in the configuration file. |
Configuring Load Sharing Using STP Path Cost

These steps describe how to configure a network with load sharing using STP path costs.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport mode trunk
5. exit
6. Repeat Steps 2 through 4 on a second interface in Device A or in Device A stack.
7. end
8. show running-config
9. show vlan
10. configure terminal
11. interface interface-id
12. spanning-tree vlan vlan-range cost cost-value
13. end
14. Repeat Steps 9 through 13 on the other configured trunk interface on Device A, and set the spanning-tree path cost to 30 for VLANs 8, 9, and 10.
15. exit
16. show running-config
17. copy running-config startup-config

## Configuration Examples for VLAN Trunking

### Example: Configuring a Trunk Port

The following example shows how to configure a port as an IEEE 802.1Q trunk. The example assumes that the neighbor interface is configured to support IEEE 802.1Q trunking.
Example: Removing a VLAN from a Port

This example shows how to remove VLAN 2 from the allowed VLAN list on a port:

```plaintext
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# switchport trunk allowed vlan remove 2
Switch(config-if)# end
```

Where to Go Next

After configuring VLAN trunks, you can configure the following:

- VLANs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Private VLANs

The following are prerequisites for configuring private VLANs:

- When you configure private VLANs on switches running VTP, the switch must be in VTP transparent mode.

- When configuring private VLANs on the switch, always use the default Switch Database Management (SDM) template to balance system resources between unicast routes and Layer 2 entries. If another SDM template is configured, use the sdm prefer default global configuration command to set the default template.
Secondary and Primary VLAN Configuration

Follow these guidelines when configuring private VLANs:

- Private VLANs are supported in transparent mode for VTP 1, 2 and 3. If the device is running VTP version 1 or 2, you must set VTP to transparent mode. After you configure a private VLAN, you should not change the VTP mode to client or server. VTP version 3 supports private VLANs in all modes.

- With VTP version 1 or 2, after you have configured private VLANs, use the `copy running-config startup config` privileged EXEC command to save the VTP transparent mode configuration and private-VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it defaults to VTP server mode, which does not support private VLANs. VTP version 3 does support private VLANs.

- VTP version 1 and 2 do not propagate private-VLAN configuration. You must configure private VLANs on each device where you want private-VLAN ports unless the devices are running VTP version 3, as VTP3 propagate private vlans.

- You cannot configure VLAN 1 or VLANs 1002 to 1005 as primary or secondary VLANs. Extended VLANs (VLAN IDs 1006 to 4094) can belong to private VLANs.

- A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it. An isolated or community VLAN can have only one primary VLAN associated with it.

- Although a private VLAN contains more than one VLAN, only one Spanning Tree Protocol (STP) instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

- When copying a PVLAN configuration from a tftp server and applying it on a running-config, the PVLAN association will not be formed. You will need to check and ensure that the primary VLAN is associated to all the secondary VLANs.

You can also use `configure replace flash:config_file force` instead of `copy flash:config_file running-config`.

- You can enable DHCP snooping on private VLANs. When you enable DHCP snooping on the primary VLAN, it is propagated to the secondary VLANs. If you configure DHCP on a secondary VLAN, the configuration does not take effect if the primary VLAN is already configured.

- You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs.

- Note the following considerations for sticky ARP:
  - Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out.
  - The `ip sticky-arp` global configuration command is supported only on SVIs belonging to private VLANs.
  - The `ip sticky-arp` interface configuration command is only supported on:
    - Layer 3 interfaces
• SVIs belonging to normal VLANs
• SVIs belonging to private VLANs

For more information about using the `ip sticky-arp` global configuration and the `ip sticky-arp interface` configuration commands, see the command reference for this release.

• You can configure VLAN maps on primary and secondary VLANs. However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.

• PVLANs are bidirectional. They can be applied at both the ingress and egress sides.

When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side.

Bridging

• For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.

• For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

Routing

If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

• The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port.
• The MAP of sec1 and L3 ACL of prim2 is applied in the egress port.

• For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN’s VACL is applied in the ingress direction and primary VLAN’S VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

• You can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.

• Although private VLANs provide host isolation at Layer 2, hosts can communicate with each other at Layer 3.

• Private VLANs support these Switched Port Analyzer (SPAN) features:
  • You can configure a private-VLAN port as a SPAN source port.
  • You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to separately monitor egress or ingress traffic.
Private VLAN Port Configuration

Follow these guidelines when configuring private VLAN ports:

- Use only the private VLAN configuration commands to assign ports to primary, isolated, or community VLANs. Layer 2 access ports assigned to the VLANs that you configure as primary, isolated, or community VLANs are inactive while the VLAN is part of the private VLAN configuration. Layer 2 trunk interfaces remain in the STP forwarding state.

- Do not configure ports that belong to a PAgP or LACP EtherChannel as private VLAN ports. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.

- Enable Port Fast and BPDU guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence. When enabled, STP applies the BPDU guard feature to all Port Fast-configured Layer 2 LAN ports. Do not enable Port Fast and BPDU guard on promiscuous ports.

- If you delete a VLAN used in the private VLAN configuration, the private VLAN ports associated with the VLAN become inactive.

- Private VLAN ports can be on different network devices if the devices are trunk-connected and the primary and secondary VLANs have not been removed from the trunk.

Restrictions for Private VLANs

The following are restrictions for configuring private VLANs:

- Private VLANs are only supported on switches running the IP Lite image.

Limitations with Other Features

When configuring private VLANs, remember these limitations with other features:

Note

In some cases, the configuration is accepted with no error messages, but the commands have no effect.

- Do not configure fallback bridging on switches with private VLANs.

- When IGMP snooping is enabled on the switch (the default), the switch or switch stack supports no more than 20 private VLAN domains.

- Do not configure a remote SPAN (RSPAN) VLAN as a private VLAN primary or secondary VLAN.

- Do not configure private VLAN ports on interfaces configured for these other features:
  - Dynamic-access port VLAN membership
  - Dynamic Trunking Protocol (DTP)
  - Port Aggregation Protocol (PAgP)
  - Link Aggregation Control Protocol (LACP)
- Multicast VLAN Registration (MVR)
- Voice VLAN
- Web Cache Communication Protocol (WCCP)

- You can configure IEEE 802.1x port-based authentication on a private VLAN port, but do not configure 802.1x with port security, voice VLAN, or per-user ACL on private VLAN ports.

- A private VLAN host or promiscuous port cannot be a SPAN destination port. If you configure a SPAN destination port as a private VLAN port, the port becomes inactive.

- If you configure a static MAC address on a promiscuous port in the primary VLAN, you must add the same static address to all associated secondary VLANs. If you configure a static MAC address on a host port in a secondary VLAN, you must add the same static MAC address to the associated primary VLAN. When you delete a static MAC address from a private VLAN port, you must remove all instances of the configured MAC address from the private VLAN.

  **Note**

  Dynamic MAC addresses learned in one VLAN of a private VLAN are replicated in the associated VLANs. For example, a MAC address learned in a secondary VLAN is replicated in the primary VLAN. When the original dynamic MAC address is deleted or aged out, the replicated addresses are removed from the MAC address table.

- Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs.

## Information About Private VLANs

### Private VLAN Domains

The private VLAN feature addresses two problems that service providers face when using VLANs:

- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

*Figure 128: Private VLAN Domain*

Using private VLANs addresses the scalability problem and provides IP address management benefits for service providers and Layer 2 security for customers. Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a primary VLAN and a secondary VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another.
Secondary VLANs

There are two types of secondary VLANs:

- **Isolated VLANs**—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.
- **Community VLANs**—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.

Private VLANs Ports

Private VLANs provide Layer 2 isolation between ports within the same private VLAN. Private VLAN ports are access ports that are one of these types:

- **Promiscuous**—A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports that belong to the secondary VLANs associated with the primary VLAN.
- **Isolated**—An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.
- **Community**—A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN.

Note

Trunk ports carry traffic from regular VLANs and also from primary, isolated, and community VLANs.
Primary and secondary VLANs have these characteristics:

- **Primary VLAN**—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.

- **Isolated VLAN**—A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.

- **Community VLAN**—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the device through a promiscuous port. With a promiscuous port, you can connect a wide range of devices as access points to a private VLAN. For example, you can use a promiscuous port to monitor or back up all the private VLAN servers from an administration workstation.

**Private VLANs in Networks**

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.

- Configure interfaces connected to default gateways and selected end stations (for example, backup servers) as promiscuous ports to allow all end stations access to a default gateway.

You can extend private VLANs across multiple devices by trunking the primary, isolated, and community VLANs to other devices that support private VLANs. To maintain the security of your private VLAN configuration and to avoid other use of the VLANs configured as private VLANs, configure private VLANs on all intermediate devices, including devices that have no private VLAN ports.

**IP Addressing Scheme with Private VLANs**

Assigning a separate VLAN to each customer creates an inefficient IP addressing scheme:

- Assigning a block of addresses to a customer VLAN can result in unused IP addresses.

- If the number of devices in the VLAN increases, the number of assigned address might not be large enough to accommodate them.

These problems are reduced by using private VLANs, where all members in the private VLAN share a common address space, which is allocated to the primary VLAN. Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses allocated to the primary VLAN. Subsequent IP addresses can be assigned to customer devices in different secondary VLANs, but in the same primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses.
Private VLANs Across Multiple Devices

Figure 129: Private VLANs Across Switches

As with regular VLANs, private VLANs can span multiple devices. A trunk port carries the primary VLAN and secondary VLANs to a neighboring device. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple devices is that traffic from an isolated port in Device A does not reach an isolated port on Device B.

Private VLAN Interactions with Other Features

Private VLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of the these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private VLAN broadcast forwarding depends on the port sending the broadcast:

- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).
Multicast traffic is routed or bridged across private VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLAN multicast forwarding supports the following:

- Sender can be outside the VLAN and the Receivers can be inside the VLAN domain.
- Sender can be inside the VLAN and the Receivers can be outside the VLAN domain.
- Sender and Receiver can both be in the same community vlan.

Private VLANs and SVIs

In a Layer 3 device, a device virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.

Private VLANs and Device Stacks

Private VLANs can operate within the device stack, and private-VLAN ports can reside on different stack members. However, the following changes to the stack can impact private-VLAN operation:

- If a stack contains only one private-VLAN promiscuous port and the stack member that contains that port is removed from the stack, host ports in that private VLAN lose connectivity outside the private VLAN.
- If a stack master stack that contains the only private-VLAN promiscuous port in the stack fails or leaves the stack and a new stack master is elected, host ports in a private VLAN that had its promiscuous port on the old stack master lose connectivity outside of the private VLAN.
- If two stacks merge, private VLANs on the winning stack are not affected, but private-VLAN configuration on the losing device is lost when that device reboots.

Private VLAN Configuration Tasks

To configure a private VLAN, perform these steps:

1. Set VTP mode to transparent.
2. Create the primary and secondary VLANs and associate them.
If the VLAN is not created already, the private VLAN configuration process creates it.

3. Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.

4. Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.

5. If inter-VLAN routing will be used, configure the primary SVI, and map the secondary VLANs to the primary.

6. Verify the private VLAN configuration.

Default Private VLAN Configuration

No private VLANs are configured.

How to Configure Private VLANs

Configuring and Associating VLANs in a Private VLAN

The `private-vlan` commands do not take effect until you exit VLAN configuration mode.

To configure and associate VLANs in a Private VLAN, perform these steps:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. vtp mode transparent
4. vlan vlan-id
5. private-vlan primary
6. exit
7. vlan vlan-id
8. private-vlan isolated
9. exit
10. vlan vlan-id
11. private-vlan community
12. exit
13. vlan vlan-id
14. private-vlan community
15. exit
16. vlan vlan-id
17. private-vlan association [add | remove] secondary_vlan_list
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**<br>enable | Enables privileged EXEC mode.  
* Enter your password if prompted.  
**Example:**  
Device> enabled |
| **Step 2**<br>configure terminal | Enters global configuration mode.  
**Example:**  
Device# configure terminal |
| **Step 3**<br>vtp mode transparent | Sets VTP mode to transparent (disable VTP).  
**Note** For VTP3, you can set mode to either server or transparent mode  
**Example:**  
Device(config)# vtp mode transparent |
| **Step 4**<br>vlan vlan-id | Enters VLAN configuration mode and designates or creates a VLAN that will be the primary VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.  
**Example:**  
Device(config)# vlan 20 |
| **Step 5**<br>private-vlan primary | Designates the VLAN as the primary VLAN.  
**Example:**  
Device(config-vlan)# private-vlan primary |
| **Step 6**<br>exit | Returns to global configuration mode.  
**Example:**  
Device(config-vlan)# exit |
| **Step 7**<br>vlan vlan-id | (Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be an isolated VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.  
**Example:**  
Device(config)# vlan 501 |
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 8    | `private-vlan isolated`  
   Example:  
   `Device(config-vlan)# private-vlan isolated` | Designates the VLAN as an isolated VLAN. |
| 9    | `exit`  
   Example:  
   `Device(config-vlan)# exit` | Returns to global configuration mode. |
| 10   | `vlan vlan-id`  
   Example:  
   `Device(config)# vlan 502` | (Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094. |
| 11   | `private-vlan community`  
   Example:  
   `Device(config-vlan)# private-vlan community` | Designates the VLAN as a community VLAN. |
| 12   | `exit`  
   Example:  
   `Device(config-vlan)# exit` | Returns to global configuration mode. |
| 13   | `vlan vlan-id`  
   Example:  
   `Device(config)# vlan 503` | (Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094. |
| 14   | `private-vlan community`  
   Example:  
   `Device(config-vlan)# private-vlan community` | Designates the VLAN as a community VLAN. |
| 15   | `exit`  
   Example:  
   `Device(config-vlan)# exit` | Returns to global configuration mode. |
### Command or Action

<table>
<thead>
<tr>
<th>Step 16</th>
<th><strong>vlan</strong> vlan-id</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>vlan 20</code></td>
</tr>
</tbody>
</table>

**Purpose:**
Enters VLAN configuration mode for the primary VLAN designated in Step 4.

| Step 17 | **private-vlan association** [add | remove] secondary_vlan_list |
|---------|-------------------------------|
| **Example:** | Device(config-vlan)# `private-vlan association 501-503` |

**Purpose:**
Associates the secondary VLANs with the primary VLAN. It can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.
- The `secondary_vlan_list` parameter can contain multiple community VLAN IDs but only one isolated VLAN ID.
- Enter a `secondary_vlan_list`, or use the `add` keyword with a `secondary_vlan_list` to associate secondary VLANs with a primary VLAN.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the association between secondary VLANs and a primary VLAN.
- The command does not take effect until you exit VLAN configuration mode.

<table>
<thead>
<tr>
<th>Step 18</th>
<th><strong>end</strong></th>

<th><strong>copy running-config startup-config</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# <code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

**Purpose:**
Saves your entries in the device startup configuration file.
Configuring a Layer 2 Interface as a Private VLAN Host Port

Follow these steps to configure a Layer 2 interface as a private-VLAN host port and to associate it with primary and secondary VLANs:

**Note**
Isolated and community VLANs are both secondary VLANs.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode private-vlan host`
5. `switchport private-vlan host-association primary_vlan_id secondary_vlan_id`
6. `end`
7. `show interfaces [interface-id] switchport`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>

### Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface

If the private VLAN will be used for inter-VLAN routing, you configure an SVI for the primary VLAN and map secondary VLANs to the SVI.

**Note**

Isolated and community VLANs are both secondary VLANs.

Follow these steps to map secondary VLANs to the SVI of a primary VLAN to allow Layer 3 switching of private VLAN traffic:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. interface vlan primary_vlan_id
4. private-vlan mapping [add | remove] secondary_vlan_list
5. end
6. show interface private-vlan mapping
7. copy running-config startup config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Enters interface configuration mode for the primary VLAN, and configures the VLAN as an SVI. The VLAN ID range is 2 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>

### Step 3

**interface vlan primary_vlan_id**

**Example:**

Device(config)# interface vlan 20

Maps the secondary VLANs to the Layer 3 VLAN interface of a primary VLAN to allow Layer 3 switching of private VLAN ingress traffic.

**Note** The **private-vlan mapping** interface configuration command only affects private VLAN traffic that is Layer 3 switched.

- The **secondary_vlan_list** parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.
- Enter a **secondary_vlan_list**, or use the **add** keyword with a **secondary_vlan_list** to map the secondary VLANs to a primary VLAN.
- Use the **remove** keyword with a **secondary_vlan_list** to clear the mapping between secondary VLANs and a primary VLAN.

### Step 4

**private-vlan mapping [add | remove] secondary_vlan_list**

**Example:**

Device(config-if)# private-vlan mapping 501-503

Returns to privileged EXEC mode.

### Step 5

**end**

**Example:**

Device(config)# end

Verifies the configuration.

### Step 6

**show interface private-vlan mapping**

**Example:**

Device# show interfaces private-vlan mapping

**Step 7**

**copy running-config startup config**

**Example:**

Device# copy running-config startup-config

Saves your entries in the device startup configuration file.
Monitoring Private VLANs

The following table displays the commands used to monitor private VLANs.

**Table 212: Private VLAN Monitoring Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces status</code></td>
<td>Displays the status of interfaces, including the VLANs to which they belong.</td>
</tr>
<tr>
<td><code>show vlan private-vlan [type]</code></td>
<td>Displays the private VLAN information for the Device.</td>
</tr>
<tr>
<td><code>show interface switchport</code></td>
<td>Displays private VLAN configuration on interfaces.</td>
</tr>
<tr>
<td><code>show interface private-vlan mapping</code></td>
<td>Displays information about the private VLAN mapping for VLAN SVIs.</td>
</tr>
</tbody>
</table>

Configuration Examples for Private VLANs

**Example: Configuring a Primary VLAN, Isolated VLAN, and a Community of VLANs**

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, to associate them in a private VLAN, and to verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# exit
Switch(config)# vlan 501
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 502
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 503
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan association 501-503
Switch(config-vlan)# end
Switch(config)# show vlan private vlan

Primary Secondary Type Ports
------------------------ ------------------------------------------
20 501 isolated
20 502 community
20 503 community
```
Example: Configuring an Interface as a Host Port

This example shows how to configure an interface as a private VLAN host port, associate it with a private VLAN pair, and verify the configuration:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/22
Device(config-if)# switchport mode private-vlan host
Device(config-if)# switchport private-vlan host-association 20 501
Device(config-if)# end
Device# show interfaces gigabitethernet1/0/22 switchport
Name: Gi1/0/22
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: 20 501
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: 20 501
<output truncated>
```

Example: Configuring an Interface as a Private VLAN Promiscuous Port

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport mode private-vlan promiscous
Device(config-if)# switchport private-vlan mapping 20 add 501-503
Device(config-if)# end

Use the `show vlan private-vlan` or the `show interface status` privileged EXEC command to display primary and secondary VLANs and private-VLAN ports on the Device.
```
Example: Mapping Secondary VLANs to a Primary VLAN Interface

This example shows how to map the interfaces for VLANs 501 and 502 to primary VLAN 10, which permits routing of secondary VLAN ingress traffic from private VLANs 501 and 502:

```
Device# configure terminal
Device(config)# interface vlan 20
Device(config-if)# private-vlan mapping 501-503
Device(config-if)# end
Device# show interfaces private-vlan mapping
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Secondary VLAN</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan20</td>
<td>501</td>
<td>isolated</td>
</tr>
<tr>
<td>vlan20</td>
<td>502</td>
<td>community</td>
</tr>
<tr>
<td>vlan20</td>
<td>503</td>
<td>community</td>
</tr>
</tbody>
</table>

Example: Monitoring Private VLANs

This example shows output from the `show vlan private-vlan` command:

```
Device# show vlan private-vlan
```

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>501</td>
<td>isolated</td>
<td>Gi1/0/22, Gi1/0/2</td>
</tr>
<tr>
<td>20</td>
<td>502</td>
<td>community</td>
<td>Gi1/0/2</td>
</tr>
<tr>
<td>20</td>
<td>503</td>
<td>community</td>
<td>Gi1/0/2</td>
</tr>
</tbody>
</table>

Where to Go Next

You can configure the following:

- VTP
- VLANs
- VLAN trunking
- VLAN Membership Policy Server (VMPS)
- Voice VLANs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Tunneling

The following sections list prerequisites and considerations for configuring IEEE 802.1Q and Layer 2 protocol tunneling.

IEEE 802.1Q Tunneling

Although IEEE 802.1Q tunneling works well for Layer 2 packet switching, there are incompatibilities between some Layer 2 features and Layer 3 switching.

- A tunnel port cannot be a routed port.
• IP routing is not supported on a VLAN that includes IEEE 802.1Q tunnel ports. Packets received from a tunnel port are forwarded based only on Layer 2 information. If routing is enabled on a device virtual interface (SVI) that includes tunnel ports, untagged IP packets received from the tunnel port are recognized and routed by the device. Customers can access the Internet through its native VLAN. If this access is not needed, you should not configure SVIs on VLANs that include tunnel ports.

• Fallback bridging is not supported on tunnel ports. Because all IEEE 802.1Q-tagged packets received from a tunnel port are treated as non-IP packets, if fallback bridging is enabled on VLANs that have tunnel ports configured, IP packets would be improperly bridged across VLANs. Therefore, you must not enable fallback bridging on VLANs with tunnel ports.

• Tunnel ports do not support IP access control lists (ACLs).

• Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports. MAC-based QoS is supported on tunnel ports.

• EtherChannel port groups are compatible with tunnel ports as long as the IEEE 802.1Q configuration is consistent within an EtherChannel port group.

• Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), and UniDirectional Link Detection (UDLD) are supported on IEEE 802.1Q tunnel ports.

• Dynamic Trunking Protocol (DTP) is not compatible with IEEE 802.1Q tunneling because you must manually configure asymmetrical links with tunnel ports and trunk ports.

• VLAN Trunking Protocol (VTP) does not work between devices that are connected by an asymmetrical link or devices that communicate through a tunnel.

• Loopback detection is supported on IEEE 802.1Q tunnel ports.

• When a port is configured as an IEEE 802.1Q tunnel port, spanning-tree bridge protocol data unit (BPDU) filtering is automatically enabled on the interface. Cisco Discovery Protocol (CDP) and the Layer Link Discovery Protocol (LLDP) are automatically disabled on the interface.

Information about Tunneling

IEEE 802.1Q and Layer 2 Protocol Overview

Virtual private networks (VPNs) provide enterprise-scale connectivity on a shared infrastructure, often Ethernet-based, with the same security, prioritization, reliability, and manageability requirements of private networks. Tunneling is a feature designed for service providers who carry traffic of multiple customers across their networks and are required to maintain the VLAN and Layer 2 protocol configurations of each customer without impacting the traffic of other customers.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

IEEE 802.1Q Tunneling

Business customers of service providers often have specific requirements for VLAN IDs and the number of VLANs to be supported. The VLAN ranges required by different customers in the same service-provider
network might overlap, and traffic of customers through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations and could easily exceed the VLAN limit (4096) of the IEEE 802.1Q specification.

Using the IEEE 802.1Q tunneling feature, service providers can use a single VLAN to support customers who have multiple VLANs. Customer VLAN IDs are preserved, and traffic from different customers is segregated within the service-provider network, even when they appear to be in the same VLAN. Using IEEE 802.1Q tunneling expands VLAN space by using a VLAN-in-VLAN hierarchy and retagging the tagged packets. A port configured to support IEEE 802.1Q tunneling is called a tunnel port. When you configure tunneling, you assign a tunnel port to a VLAN ID that is dedicated to tunneling. Each customer requires a separate service-provider VLAN ID, but that VLAN ID supports all of the customer’s VLANs.

Customer traffic tagged in the normal way with appropriate VLAN IDs comes from an IEEE 802.1Q trunk port on the customer device and into a tunnel port on the service-provider edge device. The link between the customer device and the edge device is asymmetric because one end is configured as an IEEE 802.1Q trunk port, and the other end is configured as a tunnel port. You assign the tunnel port interface to an access VLAN ID that is unique to each customer.

Figure 130: IEEE 802.1Q Tunnel Ports in a Service-Provider Network

Packets coming from the customer trunk port into the tunnel port on the service-provider edge device are normally IEEE 802.1Q-tagged with the appropriate VLAN ID. The tagged packets remain intact inside the device and when they exit the trunk port into the service-provider network, they are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag) that contains the VLAN ID that is unique to the customer. The original customer IEEE 802.1Q tag is preserved in the encapsulated packet. Therefore, packets entering the service-provider network are double-tagged, with the outer (metro) tag containing the customer’s access VLAN ID, and the inner VLAN ID being that of the incoming traffic.

When the double-tagged packet enters another trunk port in a service-provider core device, the outer tag is stripped as the device processes the packet. When the packet exits another trunk port on the same core device, the same metro tag is again added to the packet.
When the packet enters the trunk port of the service-provider egress device, the outer tag is again stripped as the device internally processes the packet. However, the metro tag is not added when the packet is sent out the tunnel port on the edge device into the customer network. The packet is sent as a normal IEEE 802.1Q-tagged frame to preserve the original VLAN numbers in the customer network.

In the above network figure, Customer A was assigned VLAN 30, and Customer B was assigned VLAN 40. Packets entering the edge device trunk ports with IEEE 802.1Q tags are double-tagged when they enter the service-provider network, with the outer tag containing VLAN ID 30 or 40, appropriately, and the inner tag containing the original VLAN number, for example, VLAN 100. Even if both Customers A and B have VLAN 100 in their networks, the traffic remains segregated within the service-provider network because the outer tag is different. Each customer controls its own VLAN numbering space, which is independent of the VLAN numbering space used by other customers and the VLAN numbering space used by the service-provider network.

At the outbound tunnel port, the original VLAN numbers on the customer’s network are recovered. It is possible to have multiple levels of tunneling and tagging, but the device supports only one level in this release.

If traffic coming from a customer network is not tagged (native VLAN frames), these packets are bridged or routed as normal packets. All packets entering the service-provider network through a tunnel port on an edge device are treated as untagged packets, whether they are untagged or already tagged with IEEE 802.1Q headers. The packets are encapsulated with the metro tag VLAN ID (set to the access VLAN of the tunnel port) when they are sent through the service-provider network on an IEEE 802.1Q trunk port. The priority field on the metro tag is set to the interface class of service (CoS) priority configured on the tunnel port. (The default is zero if none is configured.)

On devices, because 802.1Q tunneling is configured on a per-port basis, it does not matter whether the device is a standalone device or a stack member. All configuration is done on the stack master.

**IEEE 802.1Q Tunneling Configuration Guidelines**

When you configure IEEE 802.1Q tunneling, you should always use an asymmetrical link between the customer device and the edge device, with the customer device port configured as an IEEE 802.1Q trunk port and the edge device port configured as a tunnel port.
Assign tunnel ports only to VLANs that are used for tunneling.

Configuration requirements for native VLANs and for and maximum transmission units (MTUs) are explained in these next sections.

**Native VLANs**

When configuring IEEE 802.1Q tunneling on an edge device, you must use IEEE 802.1Q trunk ports for sending packets into the service-provider network. However, packets going through the core of the service-provider network can be carried through IEEE 802.1Q trunks, ISL trunks, or nontrunking links. When IEEE 802.1Q trunks are used in these core devices, the native VLANs of the IEEE 802.1Q trunks must not match any native VLAN of the nontrunking (tunneling) port on the same device because traffic on the native VLAN would not be tagged on the IEEE 802.1Q sending trunk port.

In the following network figure, VLAN 40 is configured as the native VLAN for the IEEE 802.1Q trunk port from Customer X at the ingress edge device in the service-provider network (Device B). Device A of Customer X sends a tagged packet on VLAN 30 to the ingress tunnel port of Device B in the service-provider network, which belongs to access VLAN 40. Because the access VLAN of the tunnel port (VLAN 40) is the same as the native VLAN of the edge device trunk port (VLAN 40), the metro tag is not added to tagged packets received from the tunnel port. The packet carries only the VLAN 30 tag through the service-provider network to the trunk port of the egress-edgedevice (Device C) and is misdirected through the egress device tunnel port to Customer Y.

*Figure 132: Potential Problems with IEEE 802.1Q Tunneling and Native VLANs*

These are some ways to solve this problem:

- Use the `vlan dot1q tag native` global configuration command to configure the edge devices so that all packets going out an IEEE 802.1Q trunk, including the native VLAN, are tagged. If the devices is configured to tag native VLAN packets on all IEEE 802.1Q trunks, the devices accepts untagged packets, but sends only tagged packets.
• Ensure that the native VLAN ID on the edge devices trunk port is not within the customer VLAN range. For example, if the trunk port carries traffic of VLANs 100 to 200, assign the native VLAN a number outside that range.

**System MTU**

The default system MTU for traffic on the device is 1500 bytes. You can configure Fast Ethernet ports on the device members in the mixed hardware device stack to support frames larger than 1500 bytes by using the `system mtu` global configuration command.

You can configure 10-Gigabit and Gigabit Ethernet ports to support frames larger than 1500 bytes by using the `system mtu jumbo` global configuration command.

The system MTU and system jumbo MTU values do not include the IEEE 802.1Q header. Because the IEEE 802.1Q tunneling feature increases the frame size by 4 bytes when the metro tag is added, you must configure all devices in the service-provider network to be able to process maximum frames by adding 4 bytes to the system MTU and system jumbo MTU sizes.

For example, the device supports a maximum frame size of 1496 bytes with one of these configurations:

- The device has a system jumbo MTU value of 1500 bytes, and the `switchport mode dot1q-tunnel` interface configuration command is configured on a 10-Gigabit or Gigabit Ethernet device port.
- The device member has a system MTU value of 1500 bytes, and the `switchport mode dot1q-tunnel` interface configuration command is configured on a Fast Ethernet port of the member.

**Default IEEE 802.1Q Tunneling Configuration**

By default, IEEE 802.1Q tunneling is disabled because the default switchport mode is dynamic auto. Tagging of IEEE 802.1Q native VLAN packets on all IEEE 802.1Q trunk ports is also disabled.

**How to Configure Tunneling**

**Configuring an IEEE 802.1Q Tunneling Port**

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport access vlan vlan-id`
5. `switchport mode dot1q-tunnel`
6. `exit`
7. `vlan dot1q tag native`
8. `end`
9. Use one of the following:
   - `show dot1q-tunnel`
   - `show running-config interface`
### DETAILED STEPS

### Configuring the SP Edge Switch

**Before you begin**

For EtherChannels, you need to configure both the SP (service-provider) edge devices and the customer devices for Layer 2 protocol tunneling.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface `interface-id`
4. switchport mode dot1q-tunnel
5. l2protocol-tunnel point-to-point [pagp | lACP | udld]
6. l2protocol-tunnel shutdown-threshold [point-to-point [pagp | lACP | udld]] value
7. l2protocol-tunnel drop-threshold [point-to-point [pagp | lACP | udld]] value
8. no cdp enable
9. spanning-tree bpdu filter enable
10. exit
11. errdisablerecoverycause l2ptguard
12. l2protocol-tunnel cos value
13. end
14. show l2protocol
15. copy running-config startup-config

**DETAILED STEPS**

## Configuring the Customer Device

### Before you begin
For EtherChannels, you need to configure both the SP edge device and the customer devices for Layer 2 protocol tunneling.

### SUMMARY STEPS
1. enable
2. configure terminal
3. interface interface-id
4. `switchport trunk encapsulation dot1q`  
5. `switchport mode trunk`  
6. `udld port`  
7. `channel-group channel-group-number mode desirable`  
8. `exit`  
9. `interface port-channel port-channel number`  
10. `shutdown`  
11. `no shutdown`  
12. `end`  
13. `show l2protocol`  
14. `copy running-config startup-config`

Configuration Examples for IEEE 802.1Q and Layer 2 Protocol Tunneling

Example: Configuring an IEEE 802.1Q Tunneling Port

The following example shows how to configure an interface as a tunnel port, enable tagging of native VLAN packets, and verify the configuration. In this configuration, the VLAN ID for the customer connected to Gigabit Ethernet interface 7 on stack member 1 is VLAN 22.

```
Switch(config)# interface gigabitethernet1/0/7
Switch(config-if)# switchport access vlan 22
% Access VLAN does not exist. Creating vlan 22
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# exit
Switch(config)# vlan dot1q tag native
Switch(config)# end
Switch# show dot1q-tunnel interface gigabitethernet1/0/7
Port
-----
Gi1/0/1Port
-----
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled
```

Examples: Configuring the SP Edge and Customer Switches

This example shows how to configure the SP edge switch 1 and edge switch 2. VLANs 17, 18, 19, and 20 are the access VLANs, Fast Ethernet interfaces 1 and 2 are point-to-point tunnel ports with PAgP and UDLD enabled, the drop threshold is 1000, and Fast Ethernet interface 3 is a trunk port.

**SP edge switch 1 configuration:**

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport access vlan 17
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point udld
Switch(config-if)# 12protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport access vlan 18
Switch(config-if)# switchport mode dot1q-tunnel
```

**SP edge switch 2 configuration:**

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport access vlan 17
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point udld
Switch(config-if)# 12protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport access vlan 18
Switch(config-if)# switchport mode dot1q-tunnel
```
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# switchport mode trunk

SP edge switch 2 configuration:

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport access vlan 19
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport access vlan 20
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# switchport mode trunk

This example shows how to configure the customer switch at Site 1. Fast Ethernet interfaces 1, 2, 3, and 4 are set for IEEE 802.1Q trunking, UDL D is enabled, EtherChannel group 1 is enabled, and the port channel is shut down and then enabled to activate the EtherChannel configuration.

Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface gigabitethernet1/0/4
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface port-channel 1
Switch(config-if)# shutdown
Switch(config-if)# no shutdown
Monitoring Tunneling Status

The following table describes the commands used to monitor tunneling status.

Table 213: Commands for Monitoring Tunneling

<table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VMPS

You should configure the VLAN Membership Policy Server (VMPS) before you configure ports as dynamic-access ports.

When you configure a port as a dynamic-access port, the spanning-tree Port Fast feature is automatically enabled for that port. The Port Fast mode accelerates the process of bringing the port into the forwarding state. The VTP management domain of the VMPS client and the VMPS server must be the same.
Restrictions for VMPS

The following are restrictions for configuring VMPS:

- IEEE 802.1x ports cannot be configured as dynamic-access ports. If you try to enable IEEE 802.1x on a dynamic-access (VQP) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

- Trunk ports cannot be dynamic-access ports, but you can enter the `switchport access vlan dynamic` interface configuration command for a trunk port. In this case, the device retains the setting and applies it if the port is later configured as an access port. You must turn off trunking on the port before the dynamic-access setting takes effect.

- Dynamic-access ports cannot be monitor ports.

- Secure ports cannot be dynamic-access ports. You must disable port security on a port before it becomes dynamic.

- Dynamic-access ports cannot be members of an EtherChannel group.

- Port channels cannot be configured as dynamic-access ports.

- The VLAN configured on the VMPS server should not be a voice VLAN.

- 1K VLAN is supported only on devices running the LAN Base image with the lanbase-default template set.

Information About VMPS

Dynamic VLAN Assignments

The VLAN Query Protocol (VQP) is used to support dynamic-access ports, which are not permanently assigned to a VLAN, but give VLAN assignments based on the MAC source addresses seen on the port. Each time an unknown MAC address is seen, the device sends a VQP query to a remote VLAN Membership Policy Server (VMPS); the query includes the newly seen MAC address and the port on which it was seen. The VMPS responds with a VLAN assignment for the port. The device cannot be a VMPS server but can act as a client to the VMPS and communicate with it through VQP.

Each time the client device receives the MAC address of a new host, it sends a VQP query to the VMPS. When the VMPS receives this query, it searches its database for a MAC-address-to-VLAN mapping. The server response is based on this mapping and whether or not the server is in open or secure mode. In secure mode, the server shuts down the port when an illegal host is detected. In open mode, the server denies the host access to the port.

If the port is currently unassigned (that is, it does not yet have a VLAN assignment), the VMPS provides one of these responses:

- If the host is allowed on the port, the VMPS sends the client a vlan-assignment response containing the assigned VLAN name and allowing access to the host.
• If the host is not allowed on the port and the VMPS is in open mode, the VMPS sends an access-denied response.

• If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a port-shutdown response.

If the port already has a VLAN assignment, the VMPS provides one of these responses:

• If the VLAN in the database matches the current VLAN on the port, the VMPS sends an access-denied response, allowing access to the host.

• If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an access-denied or a port-shutdown response, depending on the secure mode of the VMPS.

If the device receives an access-denied response from the VMPS, it continues to block traffic to and from the host MAC address. The device continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new host address. If the device receives a port-shutdown response from the VMPS, it disables the port. The port must be manually reenabled by using Network Assistant, the CLI, or SNMP.

Related Topics

Configuring Dynamic-Access Ports on VMPS Clients, on page 2153
Example: VMPS Configuration, on page 2159

Dynamic-Access Port VLAN Membership

A dynamic-access port can belong to only one VLAN with an ID from 1 to 4094. When the link comes up, the device does not forward traffic to or from this port until the VMPS provides the VLAN assignment. The VMPS receives the source MAC address from the first packet of a new host connected to the dynamic-access port and attempts to match the MAC address to a VLAN in the VMPS database.

If there is a match, the VMPS sends the VLAN number for that port. If the client device was not previously configured, it uses the domain name from the first VTP packet it receives on its trunk port from the VMPS. If the client device was previously configured, it includes its domain name in the query packet to the VMPS to obtain its VLAN number. The VMPS verifies that the domain name in the packet matches its own domain name before accepting the request and responds to the client with the assigned VLAN number for the client. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS secure mode setting).

Multiple hosts (MAC addresses) can be active on a dynamic-access port if they are all in the same VLAN; however, the VMPS shuts down a dynamic-access port if more than 20 hosts are active on the port.

If the link goes down on a dynamic-access port, the port returns to an isolated state and does not belong to a VLAN. Any hosts that come online through the port are checked again through the VQP with the VMPS before the port is assigned to a VLAN.

Dynamic-access ports can be used for direct host connections, or they can connect to a network. A maximum of 20 MAC addresses are allowed per port on the device. A dynamic-access port can belong to only one VLAN at a time, but the VLAN can change over time, depending on the MAC addresses seen.

How to Configure VMPS

Entering the IP Address of the VMPS

Note

If the VMPS is being defined for a cluster of switches, enter the address on the command switch.

Before you begin

You must first enter the IP address of the server to configure the switch as a client.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vmps server ipaddress primary`
4. `vmps server ipaddress`
5. `end`
6. `show vmps`
7. `copy running-config startup-config`

## Configuring Dynamic-Access Ports on VMPS Clients

**Caution**

Dynamic-access port VLAN membership is for end stations or hubs connected to end stations. Connecting dynamic-access ports to other switches can cause a loss of connectivity.

If you are configuring a port on a cluster member device as a dynamic-access port, first use the **rcommand** privileged EXEC command to log in to the cluster member device.
Before you begin

You must have IP connectivity to the VMPS for dynamic-access ports to work. You can test for IP connectivity by pinging the IP address of the VMPS and verifying that you get a response.

To return an interface to its default configuration, use the `default interface interface-id` interface configuration command. To return an interface to its default switchport mode (dynamic auto), use the `no switchport mode` interface configuration command. To reset the access mode to the default VLAN for the device, use the `no switchport access vlan` interface configuration command.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode access`
5. `switchport access vlan dynamic`
6. `end`
7. `show interfaces interface-id switchport`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>

</tbody>
</table>
### Reconfirming VLAN Memberships

This task confirms the dynamic-access port VLAN membership assignments that the device has received from the VMPS.

**SUMMARY STEPS**

1. `enable`
2. `vmps reconfirm`
3. `show vmps`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
### Changing the Reconfirmation Interval

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes after which reconfirmation occurs.

**Note**

If you are configuring a member device in a cluster, this parameter must be equal to or greater than the reconfirmation setting on the command device. You also must first use the `rcommand` privileged EXEC command to log in to the member device.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vmps reconfirm minutes`
4. `end`
5. `show vmps`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>

<td>Verifies the dynamic VLAN reconfirmation status.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# show vmps</code></td>
<td></td>
</tr>
</tbody>
</table>
Changing the Retry Count

Follow these steps to change the number of times that the device attempts to contact the VMPS before querying the next server.

SUMMARY STEPS

1. enable
2. configure terminal
3. vmps retry count
4. end
5. show vmps
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

Device# configure terminal

Step 3 vmps reconfirm minutes

Example:

Device(config)# vmps reconfirm 90

Sets the number of minutes between reconfirmations of the dynamic VLAN membership. The range is 1 to 120. The default is 60 minutes.

Step 4 end

Example:

Device(config)# end

Returns to privileged EXEC mode.

Step 5 show vmps

Example:

Device# show vmps

Verifies the dynamic VLAN reconfirmation status in the Reconfirm Interval field of the display.

Step 6 copy running-config startup-config

Example:

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

**Troubleshooting Dynamic-Access Port VLAN Membership**

**Problem** The VMPS shuts down a dynamic-access port under these conditions:

- **Problem** The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS shuts down the port to prevent the host from connecting to the network.
- **Problem** More than 20 active hosts reside on a dynamic-access port.

**Solution** To reenable a disabled dynamic-access port, enter the *shutdown* interface configuration command followed by the *no shutdown* interface configuration command.
Monitoring the VMPS

You can display information about the VMPS by using the `show vmps` privileged EXEC command. The device displays this information about the VMPS:

- **VMPS VQP Version**—The version of VQP used to communicate with the VMPS. The device queries the VMPS that is using VQP Version 1.
- **Reconfirm Interval**—The number of minutes the device waits before reconfirming the VLAN-to-MAC-address assignments.
- **Server Retry Count**—The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the device starts to query the secondary VMPS.
- **VMPS domain server**—The IP address of the configured VLAN membership policy servers. The device sends queries to the one marked *current*. The one marked *primary* is the primary server.
- **VMPS Action**—The result of the most recent reconfirmation attempt. A reconfirmation attempt can occur automatically when the reconfirmation interval expires, or you can force it by entering the `vmps reconfirm` privileged EXEC command or its Network Assistant or SNMP equivalent.

This is an example of output for the `show vmps` privileged EXEC command:

```
Device# show vmps
VQP Client Status:
-------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.86 (primary, current)
172.20.128.87

Reconfirmation status
---------------------
VMPS Action: other
```

Configuration Example for VMPS

Example: VMPS Configuration

*Figure 133: Dynamic Port VLAN Membership Configuration*

This network has a VMPS server switch and VMPS client switches with dynamic-access ports with this configuration:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 6500 series Switch A is the primary VMPS server.
- The Catalyst 6500 series Switch C and Switch J are secondary VMPS servers.
- End stations are connected to the clients, Switch B and Switch I.
The database configuration file is stored on the TFTP server with the IP address 172.20.22.7.

Feature History and Information for VMPS
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

- Voice VLAN configuration is only supported on device access ports; voice VLAN configuration is not supported on trunk ports.

Note

Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.
• Before you enable voice VLAN, we recommend that you enable QoS on the device by entering the `mls qos` global configuration command and configure the port trust state to trust by entering the `mls qos trust cos` interface configuration command. If you use the auto-QoS feature, these settings are automatically configured.

• You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all device interfaces.)

Restrictions for Voice VLANs

You cannot configure static secure MAC addresses in the voice VLAN.

Information About Voice VLAN

Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the device is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unequally sent, the device supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the device in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the device to trust or override the traffic priority assigned by a Cisco IP Phone.

Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the device to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the device in any of these ways:

• In the voice VLAN tagged with a Layer 2 CoS priority value
• In the access VLAN tagged with a Layer 2 CoS priority value
• In the access VLAN, untagged (no Layer 2 CoS priority value)

In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Note

Related Topics

Configuring Cisco IP Phone Voice Traffic
Example: Configuring Cisco IP Phone Voice Traffic, on page 2170
Cisco IP Phone Data Traffic

The device can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the device to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

Note

Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

- Example: Configuring the Priority of Incoming Data Frames, on page 2170

Voice VLAN Configuration Guidelines

- Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the device to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.
- The voice VLAN should be present and active on the device for the IP phone to correctly communicate on the voice VLAN. Use the `show vlan` privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.
- The Power over Ethernet (PoE) devices are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.
- The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.
- If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
  - They both use IEEE 802.1p or untagged frames.
  - The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
  - The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.
  - The Cisco IP Phone uses IEEE 802.1Q frames, and the voice VLAN is the same as the access VLAN.
- The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).
- Voice VLAN ports can also be these port types:
• Dynamic access port.
• IEEE 802.1x authenticated port.

**Note**  If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the device for up to 30 seconds.

• Protected port.
• A source or destination port for a SPAN or RSPAN session.
• Secure port.

**Note**  When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.

### Default Voice VLAN Configuration

The voice VLAN feature is disabled by default.

When the voice VLAN feature is enabled, all untagged traffic is sent according to the default CoS priority of the port.

The CoS value is not trusted for IEEE 802.1p or IEEE 802.1Q tagged traffic.

### How to Configure Voice VLAN

#### Configuring Cisco IP Phone Voice Traffic

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).

### SUMMARY STEPS

1. `enable`
2. configure terminal
3. interface interface-id
4. mls qos trust cos
5. switchport voice \{vlan \{vlan-id | dot1p | none | untagged\}\}
6. end
7. Use one of the following:
   - show interfaces interface-id switchport
   - show running-config interface interface-id
8. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>

<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
</tr>
<tr>
<td></td>
<td>Specifies the interface connected to the phone, and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>mls qos trust cos</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# mls qos trust cos</td>
</tr>
<tr>
<td></td>
<td>Configures the interface to classify incoming traffic packets by using the packet CoS value. For untagged packets, the port default CoS value is used.</td>
</tr>
<tr>
<td>Note</td>
<td>Before configuring the port trust state, you must first globally enable QoS by using the <code>mls qos</code> global configuration command.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>switchport voice {vlan {vlan-id</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# switchport voice vlan dot1p</td>
</tr>
<tr>
<td></td>
<td>Configures the voice VLAN.</td>
</tr>
<tr>
<td>• <code>vlan-id</code>—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094.</td>
<td></td>
</tr>
<tr>
<td>• <code>dot1p</code>—Configures the device to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the device drops all voice and data traffic tagged with VLAN 0. If</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the Priority of Incoming Data Frames

You can connect a PC or other data device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the device to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>configured for 802.1p</strong></td>
<td>configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5.</td>
</tr>
<tr>
<td><strong>none</strong></td>
<td>— Allows the phone to use its own configuration to send untagged voice traffic.</td>
</tr>
<tr>
<td><strong>untagged</strong></td>
<td>— Configures the phone to send untagged voice traffic.</td>
</tr>
</tbody>
</table>

**Step 6**

*Example:*

Device(config-if)# `end`

Returns to privileged EXEC mode.

**Step 7**

Use one of the following:

- `show interfaces interface-id switchport`
- `show running-config interface interface-id`

*Example:*

Device# `show interfaces gigabitethernet 1/0/1 switchport`

or

Device# `show running-config interface gigabitethernet 1/0/1`

Verifies your voice VLAN entries or your QoS and voice VLAN entries.

**Step 8**

`copy running-config startup-config`

(Optional) Saves your entries in the configuration file.
3. `interface interface-id`
4. `switchport priority extend {cos value | trust}`
5. `end`
6. `show interfaces interface-id switchport`
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device&gt; <code>enable</code></td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>interface interface-id</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# <code>interface gigabitethernet1/0/1</code></td>
<td>Specifies the interface connected to the Cisco IP Phone, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>`switchport priority extend {cos value</td>
<td>trust}<code>&lt;br&gt;**Example:**&lt;br&gt;Device(config-if)# </code>switchport priority extend trust`</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config-if)# <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show interfaces interface-id switchport</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# <code>show interfaces gigabitethernet1/0/1</code></td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>
### Monitoring Voice VLAN

To display voice VLAN configuration for an interface, use the `show interfaces interface-id switchport` privileged EXEC command.

### Configuration Examples

#### Example: Configuring Cisco IP Phone Voice Traffic

This example shows how to configure a port connected to a Cisco IP Phone to use the CoS value to classify incoming traffic and to accept voice and data priority traffic tagged with VLAN ID 0:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# switchport voice vlan dot1p
Switch(config-if)# end
```

To return the port to its default setting, use the `no switchport voice vlan` interface configuration command.

**Related Topics**

- Cisco IP Phone Voice Traffic, on page 2164

#### Example: Configuring the Priority of Incoming Data Frames

This example shows how to configure a port connected to a Cisco IP Phone to not change the priority of frames received from the PC or the attached device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

**Related Topics**
- Configuring Cisco IP Phone Voice Traffic
- Cisco IP Phone Voice Traffic, on page 2164
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport priority extend trust
Switch(config-if)# end

To return the port to its default setting, use the `no switchport priority extend` interface configuration command.

### Where to Go Next

After configuring voice VLANs, you can configure the following:
- VLANs
- VLAN Trunking
- VTP
