CHAPTER 1  Using the Command-Line Interface  1
    Information About Using the Command-Line Interface  1
        Command Modes  1
        Understanding Abbreviated Commands  3
        No and Default Forms of Commands  3
        CLI Error Messages  3
        Configuration Logging  4
        Using the Help System  4
    How to Use the CLI to Configure Features  5
        Configuring the Command History  5
            Changing the Command History Buffer Size  5
            Recalling Commands  6
            Disabling the Command History Feature  6
        Enabling and Disabling Editing Features  7
            Editing Commands Through Keystrokes  7
            Editing Command Lines That Wrap  8
        Searching and Filtering Output of show and more Commands  9
        Accessing the CLI  10
            Accessing the CLI Through a Console Connection or Through Telnet  10
            Accessing the CLI through Bluetooth  11

PART I  Interface and Hardware  13

CHAPTER 2  Configuring Interface Characteristics  15
Enabling Boot Fast 77
Disabling Boot Fast 78

CHAPTER 8

Configuring PoE 81
Restrictions for PoE 81
Information About PoE 81
  Power over Ethernet Ports 81
  Supported Protocols and Standards 81
  Powered-Device Detection and Initial Power Allocation 82
  Power Management Modes 83
How to Configure PoE 86
  Configuring a Power Management Mode on a PoE Port 86
Fast POE 88
  Configuring Fast PoE 88
Budgeting Power for Devices Connected to a PoE Port 89
  Budgeting Power to All PoE ports 90
  Budgeting Power to a Specific PoE Port 91
  Configuring Power Policing 92
Monitoring Power Status 95
Configuration Examples for Configuring PoE 95
  Budgeting Power: Example 95
Additional References 95

CHAPTER 9

Configuring 2-event Classification 97
Finding Feature Information 97
Information about 2-event Classification 97
Configuring 2-event Classification 97
  Example: Configuring 2-Event Classification 98

CHAPTER 10

Configuring EEE 101
Finding Feature Information 101
Restrictions for EEE 101
Information About EEE 102
  EEE Overview 102
Default IGMP Filtering and Throttling Configuration  119
How to Configure IGMP Snooping and MVR  119
   Enabling or Disabling IGMP Snooping on a Device  119
   Enabling or Disabling IGMP Snooping on a VLAN Interface  120
Setting the Snooping Method  121
Configuring a Multicast Router Port  123
Configuring a Host Statically to Join a Group  124
Enabling IGMP Immediate Leave  126
Configuring the IGMP Leave Timer  127
Configuring TCN-Related Commands  128
   Controlling the Multicast Flooding Time After a TCN Event  128
   Recovering from Flood Mode  130
   Disabling Multicast Flooding During a TCN Event  131
Configuring the IGMP Snooping Querier  132
Disabling IGMP Report Suppression  134
Configuring MVR Global Parameters  135
Configuring MVR Interfaces  138
Configuring IGMP Profiles  140
Applying IGMP Profiles  142
Setting the Maximum Number of IGMP Groups  143
Configuring the IGMP Throttling Action  145
Monitoring IGMP Snooping and MVR  147
   Monitoring IGMP Snooping Information  147
   Monitoring MVR  148
   Monitoring IGMP Filtering and Throttling Configuration  149
Configuration Examples for IGMP Snooping and MVR  150
   Example: Configuring IGMP Snooping Using CGMP Packets  150
   Example: Enabling a Static Connection to a Multicast Router  150
   Example: Configuring a Host Statically to Join a Group  150
   Example: Enabling IGMP Immediate Leave  150
   Example: Setting the IGMP Snooping Querier Source Address  150
   Example: Setting the IGMP Snooping Querier Maximum Response Time  150
   Example: Setting the IGMP Snooping Querier Timeout  151
   Example: Setting the IGMP Snooping Querier Feature  151
CHAPTER 12

Configuring Protocol Independent Multicast (PIM) 155

Prerequisites for PIM 155
Restrictions for PIM 156
PIMv1 and PIMv2 Interoperability 156
Restrictions for Configuring PIM Stub Routing 156
Restrictions for Configuring Auto-RP and BSR 157
Information About PIM 158
Protocol Independent Multicast 158
PIM Dense Mode 158
PIM Sparse Mode 159
Sparse-Dense Mode 159
PIM Versions 160
PIM Stub Routing 160
IGMP Helper 161
Rendezvous Points 162
Auto-RP 162
Sparse-Dense Mode for Auto-RP 163
Bootstrap Router 163
PIM Domain Border 163
Multicast Forwarding 164
Multicast Distribution Source Tree 164
Multicast Distribution Shared Tree 165
Source Tree Advantage 165
Shared Tree Advantage 166
PIM Shared Tree and Source Tree 166
Reverse Path Forwarding 168
RPF Check 168

Default PIM Routing Configuration 169

How to Configure PIM 170

Enabling PIM Stub Routing 170

Configuring a Rendezvous Point 171

Manually Assigning an RP to Multicast Groups 172

Setting Up Auto-RP in a New Internetwork 174

Adding Auto-RP to an Existing Sparse-Mode Cloud 177

Configuring Sparse Mode with a Single Static RP (CLI) 180

Preventing Join Messages to False RPs 182

Filtering Incoming RP Announcement Messages 182

Configuring PIMv2 BSR 184

Defining the PIM Domain Border 184

Defining the IP Multicast Boundary 185

Configuring Candidate BSRs 187

Configuring the Candidate RPs 189

Delaying the Use of PIM Shortest-Path Tree 190

Modifying the PIM Router-Query Message Interval 192

Verifying PIM Operations 194

Verifying IP Multicast Operation in a PIM-SM or a PIM-SSM Network 194

Using PIM-Enabled Routers to Test IP Multicast Reachability 199

Monitoring and Troubleshooting PIM 201

Monitoring PIM Information 201

Monitoring the RP Mapping and BSR Information 202

Troubleshooting PIMv1 and PIMv2 Interoperability Problems 202

Configuration Examples for PIM 203

Example: Enabling PIM Stub Routing 203

Example: Verifying PIM Stub Routing 203

Example: Manually Assigning an RP to Multicast Groups 203

Example: Configuring Auto-RP 204

Example: Defining the IP Multicast Boundary to Deny Auto-RP Information 204

Example: Filtering Incoming RP Announcement Messages 204

Example: Preventing Join Messages to False RPs 204

Example: Configuring Candidate BSRs 205
Example: Configuring Candidate RPs 205

CHAPTER 1

Using the Command-Line Interface

- Information About Using the Command-Line Interface, on page 1
- How to Use the CLI to Configure Features, on page 5

Information About Using the Command-Line Interface

Note
Search options on the GUI and CLI are case sensitive.

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, an SSH, or by using the browser.

When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as show commands, which show the current configuration status, and clear commands, which clear counters or interfaces. The user EXEC commands are not saved when the device reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the device reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.
Table 1: Command Mode Summary

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
<th>About This Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>Begin a session using Telnet, SSH, or console.</td>
<td>Device&gt;</td>
<td>Enter logout or quit</td>
<td>Use this mode to</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Change terminal settings.</td>

<td>Device(config)#</td>
<td>To exit to privileged EXEC mode, enter exit or end, or press Ctrl-Z.</td>
<td>Use this mode to configure parameters that apply to the entire device.</td>
</tr>
<tr>
<td>VLAN configuration</td>
<td>While in global configuration mode, enter the vlan vlan-id command.</td>
<td>Device(config-vlan)#</td>
<td>To exit to global configuration mode, enter the exit command.</td>
<td>Use this mode to configure VLAN parameters. When VTP mode is transparent, you</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>To return to privileged EXEC mode, press Ctrl-Z or enter end.</td>
</tr>
</tbody>
</table>
Understanding Abbreviated Commands

You need to enter only enough characters for the device to recognize the command as unique.

This example shows how to enter the `show configuration` privileged EXEC command in an abbreviated form:

```
Device# show conf
```

No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your device.
Table 2: Common CLI Error Messages

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Meaning</th>
<th>How to Get Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Ambiguous command: &quot;show con&quot;</td>
<td>You did not enter enough characters for your device to recognize the command.</td>
<td>Reenter the command followed by a question mark (?) without any space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Incomplete command.</td>
<td>You did not enter all of the keywords or values required by this command.</td>
<td>Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Invalid input detected at ‘‘’’ marker.</td>
<td>You entered the command incorrectly. The caret (^) marks the point of the error.</td>
<td>Enter a question mark (?) to display all of the commands that are available in this command mode. The possible keywords that you can enter with the command appear.</td>
</tr>
</tbody>
</table>

**Configuration Logging**

You can log and view changes to the device configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

**Note**

Only CLI or HTTP changes are logged.

**Using the Help System**

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

**SUMMARY STEPS**

1. help
2. abbreviated-command-entry ?
3. abbreviated-command-entry <Tab>
4. ?
5. command ?
6. command keyword ?

<td></td>
</tr>
</tbody>
</table>

**How to Use the CLI to Configure Features**

**Configuring the Command History**

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

**Changing the Command History Buffer Size**

By default, the device records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.
Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

**Note**
The arrow keys function only on ANSI-compatible terminals such as VT100s.

### SUMMARY STEPS
1. Ctrl-P or use the up arrow key
2. Ctrl-N or use the down arrow key
3. show history

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> terminal history [size number-of-lines]</td>
<td>Changes the number of command lines that the device records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# terminal history size 200
```

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Ctrl-P or use the up arrow key</th>
<th>Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Ctrl-N or use the down arrow key</th>
<th>Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.</th>
</tr>
</thead>
</table>

| Step 3 | show history                     | Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the terminal history global configuration command and the history line configuration command. |

<table>
<thead>
<tr>
<th>Example:</th>
<th>show history</th>
<th></th>
</tr>
</thead>
</table>

### Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.
SUMMARY STEPS

1. terminal no history

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>DISABLES THE FEATURE DURING THE CURRENT TERMINAL SESSION IN PRIVILEGED EXEC MODE.</td>
</tr>
<tr>
<td>terminal no history</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# terminal no history</td>
<td></td>
</tr>
</tbody>
</table>

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenable it.

SUMMARY STEPS

1. terminal editing
2. terminal no editing

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>REENABLES THE ENHANCED EDITING MODE FOR THE CURRENT TERMINAL SESSION IN PRIVILEGED EXEC MODE.</td>
</tr>
<tr>
<td>terminal editing</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# terminal editing</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>DISABLES THE ENHANCED EDITING MODE FOR THE CURRENT TERMINAL SESSION IN PRIVILEGED EXEC MODE.</td>
</tr>
<tr>
<td>terminal no editing</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# terminal no editing</td>
<td></td>
</tr>
</tbody>
</table>

Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

| Table 3: Editing Commands

<table>
<thead>
<tr>
<th>Editing Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-B or use the left arrow key</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>Ctrl-F or use the right arrow key</td>
<td>Moves the cursor forward one character.</td>
</tr>
</tbody>
</table>
### Ctrl-A
Moves the cursor to the beginning of the command line.

### Ctrl-E
Moves the cursor to the end of the command line.

### Esc B
Moves the cursor back one word.

### Esc F
Moves the cursor forward one word.

### Ctrl-T
Transposes the character to the left of the cursor with the character located at the cursor.

### Delete or Backspace key
Erases the character to the left of the cursor.

### Ctrl-D
Deletes the character at the cursor.

### Ctrl-K
Deletes all characters from the cursor to the end of the command line.

### Ctrl-U or Ctrl-X
Deletes all characters from the cursor to the beginning of the command line.

### Ctrl-W
Deletes the word to the left of the cursor.

### Esc D
Deletes from the cursor to the end of the word.

### Esc C
Capitalizes at the cursor.

### Esc L
Changes the word at the cursor to lowercase.

### Esc U
Capitalizes letters from the cursor to the end of the word.

### Ctrl-V or Esc Q
Designates a particular keystroke as an executable command, perhaps as a shortcut.

### Return key
Scrolls down a line or screen on displays that are longer than the terminal screen can display.

**Note** The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including show command output. You can use the Return and Space bar keystrokes whenever you see the More prompt.

### Space bar
Scrolls down one screen.

### Ctrl-L or Ctrl-R
Redisplays the current command line if the device suddenly sends a message to your screen.

---

**Editing Command Lines That Wrap**

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press Ctrl-B or the left arrow key repeatedly. You can also press Ctrl-A to immediately move to the beginning of the line.
The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

**SUMMARY STEPS**

1. access-list
2. Ctrl-A
3. Return key

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>access-list</td>
<td>Displays the global configuration command entry that extends beyond one line.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign ($) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.</td>
</tr>
<tr>
<td></td>
<td>access-list</td>
<td>Checks the complete syntax.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>The dollar sign ($) appears at the end of the line to show that the line has been scrolled to the right.</td>
</tr>
<tr>
<td></td>
<td>Return key</td>
<td>Execute the commands.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the terminal width privileged EXEC command to set the width of your terminal. Use line wrapping with the command history feature to recall and modify previous complex command entries.</td>
</tr>
</tbody>
</table>

**Searching and Filtering Output of show and more Commands**

You can search and filter the output for show and more commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.
### SUMMARY STEPS

1. \{show | more\} command \{begin | include | exclude\} regular-expression

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  {show</td>
<td>more} command {begin</td>
</tr>
</tbody>
</table>
| **Example:** Device# show interfaces | include protocol  
Vlan1 is up, line protocol is up  
Vlan10 is up, line protocol is down  
GigabitEthernet1/0/1 is up, line protocol is down  
GigabitEthernet1/0/2 is up, line protocol is up | |

### Accessing the CLI

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the stack master. You cannot manage stack members on an individual switch basis. You can connect to the stack master through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

*Note:* We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, use the `session standby ios` privileged EXEC command from the active switch to access the IOS console of the standby switch. To debug a specific stack member, use the `session switch stack-member-number` privileged EXEC command from the active switch to access the diagnostic shell of the stack member. For more information about these commands, see the switch command reference.

To debug a specific stack member, you can start a CLI session from the stack master by using the `session stack-member-number` privileged EXEC command. The stack member number is appended to the system prompt. For example, `Switch-2#` is the prompt for stack member 2 where the system prompt for the stack master is Switch. Only the `show` and `debug` commands are available in a CLI session to a specific stack member. You can also use the `remote command stack-member-number LINE` privileged EXEC command on the stack master to enable debugging on a member switch without first starting a session.

### Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the device console or connect a PC to the Ethernet management port and then power on the device, as described in the hardware installation guide that shipped with your device.
If your device is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your device must first be configured for this type of access.

You can use one of these methods to establish a connection with the device:

**Procedure**

- Connect the device console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the device hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The device must have network connectivity with the Telnet or SSH client, and the device must have an enable secret password configured.
  - The device supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
  - The device supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

### Accessing the CLI through Bluetooth

You can access the CLI through Bluetooth connectivity by pairing the switch to a computer.

**Note**

This feature is available on Cisco IOS Release 15.2(5)E2 and higher.

1. Connect a Bluetooth dongle to the USB port on your switch and power on the switch.
2. Turn on Bluetooth on your computer and discover the switch.
3. Pair the computer to the switch.
4. Connect to the switch as an access point.
   - If you are connecting from a Windows computer: Go to *Devices & Printers*, select the switch, click on the *Connect Using* tab and select *Access point*.
   - If you are connecting from a Mac computer: On the menubar, click the Bluetooth icon, hover over the switch name, and click *Connect to Network*.

Once a connection is established, you can open a management window and configure the switch.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Interface Characteristics

Interface Types

This section describes the different types of interfaces supported by the device. The rest of the chapter describes configuration procedures for physical interface characteristics.

Note

The stack ports on the rear of the stacking-capable devices are not Ethernet ports and cannot be configured.
Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN. VLANs can be formed with ports across the stack.

To configure VLANs, use the `vlan vlan-id` global configuration command to enter VLAN configuration mode. The VLAN configurations for normal-range VLANs (VLAN IDs 1 to 1005) are saved in the VLAN database. If VTP is version 1 or 2, to configure extended-range VLANs (VLAN IDs 1006 to 4094), you must first set VTP mode to transparent. Extended-range VLANs created in transparent mode are not added to the VLAN database but are saved in the device running configuration. With VTP version 3, you can create extended-range VLANs in client or server mode. These VLANs are saved in the VLAN database.

In a switch stack, the VLAN database is downloaded to all switches in a stack, and all switches in the stack build the same VLAN database. The running configuration and the saved configuration are the same for all switches in a stack.

Add ports to a VLAN by using the `switchport` interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and, if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

Switch Ports

Switch ports are Layer 2-only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port or a trunk port. You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to set the switchport mode by negotiating with the port on the other end of the link. switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the `switchport` interface configuration commands.

Access Ports

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives a tagged packet (Inter-Switch Link [ISL] or IEEE 802.1Q tagged), the packet is dropped, and the source address is not learned.

The types of access ports supported are:

- Static access ports are manually assigned to a VLAN (or through a RADIUS server for use with IEEE 802.1x).
- VLAN membership of dynamic access ports is learned through incoming packets. By default, a dynamic access port is not a member of any VLAN, and forwarding to and from the port is enabled only when the VLAN membership of the port is discovered. Dynamic access ports on the device are assigned to a
VLAN by a VLAN Membership Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch; the device cannot be a VMPS server.

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.

**Trunk Ports**

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database.

The device supports only IEEE 802.1Q trunk ports. An IEEE 802.1Q trunk port supports simultaneous tagged and untagged traffic. An IEEE 802.1Q trunk port is assigned a default port VLAN ID (PVID), and all untagged traffic travels on the port default PVID. All untagged traffic and tagged traffic with a NULL VLAN ID are assumed to belong to the port default PVID. A packet with a VLAN ID equal to the outgoing port default PVID is sent untagged. All other traffic is sent with a VLAN tag.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if VTP knows of the VLAN and if the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

**Switch Virtual Interfaces**

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing or bridging function in the system. You can associate only one SVI with a VLAN. You configure an SVI for a VLAN only to route between VLANs or to provide IP host connectivity to the device. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote device administration. Additional SVIs must be explicitly configured.

---

**Note**

You cannot delete interface VLAN 1.

SVIs provide IP host connectivity only to the system. SVIs are created the first time that you enter the `vlan` interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address.

You can also use the interface range command to configure existing VLAN SVIs within the range. The commands entered under the interface range command are applied to all existing VLAN SVIs within the range. You can enter the command `interface range create vlan x - y` to create all VLANs in the specified range that do not already exist. When the VLAN interface is created, `interface range vlan id` can be used to configure the VLAN interface.

Although the switch stack or device supports a total of 1005 VLANs and SVIs, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations.
When you create an SVI, it does not become active until it is associated with a physical port.

**SVI Autostate Exclude**

The line state of an SVI with multiple ports on a VLAN is in the up state when it meets these conditions:

- The VLAN exists and is active in the VLAN database on the device
- The VLAN interface exists and is not administratively down.
- At least one Layer 2 (access or trunk) port exists, has a link in the up state on this VLAN, and is in the spanning-tree forwarding state on the VLAN.

---

**Note**

The protocol link state for VLAN interfaces come up when the first switchport belonging to the corresponding VLAN link comes up and is in STP forwarding state.

The default action, when a VLAN has multiple ports, is that the SVI goes down when all ports in the VLAN go down. You can use the SVI autostate exclude feature to configure a port so that it is not included in the SVI line-state up-or-down calculation. For example, if the only active port on the VLAN is a monitoring port, you might configure autostate exclude on that port so that the VLAN goes down when all other ports go down. When enabled on a port, autostate exclude applies to all VLANs that are enabled on that port.

The VLAN interface is brought up when one Layer 2 port in the VLAN has had time to converge (transition from STP listening-learning state to forwarding state). This prevents features such as routing protocols from using the VLAN interface as if it were fully operational and minimizes other problems, such as routing black holes.

**EtherChannel Port Groups**

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between devices or between devices and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port or multiple access ports into one logical access port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), and the Port Aggregation Protocol (PAgP), which operate only on physical ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 2 interfaces, use the `channel-group` interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together.

**Power over Ethernet Ports**

A PoE-capable switch port automatically supplies power to one of these connected devices if the device senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

**Using the Switch USB Ports**

The device has three USB ports on the front panel — a USB mini-Type B console port and two USB Type A ports.

**USB Mini-Type B Console Port**

The device has the following console ports:

- USB mini-Type B console connection
- RJ-45 console port

Console output appears on devices connected to both ports, but console input is active on only one port at a time. By default, the USB connector takes precedence over the RJ-45 connector.

---

**Note**

Windows PCs require a driver for the USB port. See the hardware installation guide for driver installation instructions.

Use the supplied USB Type A-to-USB mini-Type B cable to connect a PC or other device to the device. The connected device must include a terminal emulation application. When the device detects a valid USB connection to a powered-on device that supports host functionality (such as a PC), input from the RJ-45 console is immediately disabled, and input from the USB console is enabled. Removing the USB connection immediately reenables input from the RJ-45 console connection. An LED on the device shows which console connection is in use.

**Console Port Change Logs**

At software startup, a log shows whether the USB or the RJ-45 console is active. Each device in a stack issues this log. Every device always first displays the RJ-45 media type.

In the sample output, Device 1 has a connected USB console cable. Because the bootloader did not change to the USB console, the first log from Device 1 shows the RJ-45 console. A short time later, the console changes and the USB console log appears. Device 2 and Device 3 have connected RJ-45 console cables.

```
switch-stack-1
*Mar 1 00:01:00.171: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
*Mar 1 00:01:00.431: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

```
switch-stack-2
*Mar 1 00:01:09.835: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

```
switch-stack-3
*Mar 1 00:01:10.523: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
```

When the USB cable is removed or the PC de-activates the USB connection, the hardware automatically changes to the RJ-45 console interface:
USB Type A Ports

You can configure the console type to always be RJ-45, and you can configure an inactivity timeout for the USB connector.

USB Type A Ports

The USB Type A ports provide access to external USB flash devices, also known as thumb drives or USB keys. The switch supports Cisco 64 MB, 256 MB, 512 MB, 1 GB, 4 GB, and 8 GB flash drives. You can use standard Cisco IOS command-line interface (CLI) commands to read, write, erase, and copy to or from the flash device. You can also configure the switch to boot from the USB flash drive.

For information about configuring the switch to boot from a USB flash drive, refer to the Catalyst 2960-X Switch System Management Configuration Guide.

For information about reading, writing, erasing, and copying files to or from the flash device, refer to the Catalyst 2960-X Switch Managing Cisco IOS Image Files Configuration Guide.

Interface Connections

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device.

In the following configuration example, when Host A in VLAN 20 sends data to Host B in VLAN 30, the data must go from Host A to the device, to the router, back to the device, and then to Host B.

Figure 1: Connecting VLANs with the Switch

With a standard Layer 2 switch, ports in different VLANs have to exchange information through a router.

Interface Configuration Mode

The device supports these interface types:

• Physical ports—device ports and routed ports
• VLANs—switch virtual interfaces
• Port channels—EtherChannel interfaces
You can also configure a range of interfaces.

To configure a physical interface (port), specify the interface type, module number, and device port number, and enter interface configuration mode.

- **Type**—Gigabit Ethernet (gigabitethernet or gi) for 10/100/1000 Mb/s Ethernet ports, or small form-factor pluggable (SFP) module Gigabit Ethernet interfaces (gigabitethernet or gi).

- **Stack member number**—The number that identifies the switch within the stack. The range is 1 to 8 for a stack of Catalyst 2960-X switches, and 1 to 4 for a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches. The switch number is assigned the first time the switch initializes. The default switch number, before it is integrated into a switch stack, is 1. When a switch has been assigned a stack member number, it keeps that number until another is assigned to it.

  You can use the switch port LEDs in Stack mode to identify the stack member number of a switch.

- **Module number**—The module or slot number on the switch (always 0).

- **Port number**—The interface number on the switch. The 10/100/1000 port numbers always begin at 1, starting with the far left port when facing the front of the switch, for example, gigabitethernet1/0/1 or gigabitethernet1/0/8. For a switch with 10/100/1000 ports and SFP module ports, SFP module ports are numbered consecutively following the 10/100/1000 ports.

You can identify physical interfaces by physically checking the interface location on the switch. You can also use the `show` privileged EXEC commands to display information about a specific interface or all the interfaces on the switch. The remainder of this chapter primarily provides physical interface configuration procedures.

These are examples of how to identify interfaces on a stacking-capable switch:

- To configure 10/100/1000 port 4 on a standalone device, enter this command:

  ```
  Device(config)# interface gigabitethernet1/0/4
  ```

- To configure 10/100/1000 port 4 on stack member 3, enter this command:

  ```
  Device(config)# interface gigabitethernet1/0/4
  ```

### Default Ethernet Interface Configuration

This table shows the Ethernet interface default configuration, including some features that apply only to Layer 2 interfaces.

**Table 4: Default Layer 2 Ethernet Interface Configuration**

<table>
<thead>

<tr>
<td>Native VLAN (for IEEE 802.1Q trunks)</td>
<td>VLAN 1.</td>
</tr>
</tbody>
</table>
## Interface Speed and Duplex Mode

Ethernet interfaces on the switch operate at 10, 100, or 1000 Mb/s and in either full- or half-duplex mode. In full-duplex mode, two stations can send and receive traffic at the same time. Normally, 10-Mb/s ports operate in half-duplex mode, which means that stations can either receive or send traffic.

Switch modules include Gigabit Ethernet (10/100/1000-Mb/s) ports and small form-factor pluggable (SFP) module slots supporting SFP modules.

<table>

**Note** The device might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the device through a crossover cable. This is regardless of whether auto-MIDX is enabled on the switch port.

| Power over Ethernet (PoE)                   | Enabled (auto).                                                                                     |
| Keepalive messages                          | Disabled on SFP module ports; enabled on all other ports.                                           |
**Speed and Duplex Configuration Guidelines**

When configuring an interface speed and duplex mode, note these guidelines:

- Do not disable Auto-Negotiation on PoE switches.

- Gigabit Ethernet (10/100/1000-Mb/s) ports support all speed options and all duplex options (auto, half, and full). However, Gigabit Ethernet ports operating at 1000 Mb/s do not support half-duplex mode.

- For SFP module ports, the speed and duplex CLI options change depending on the SFP module type:
  - The 1000BASE-\(x\) (where \(x\) is -BX, -CWDM, -LX, -SX, and -ZX) SFP module ports support the `nonegotiate` keyword in the `speed` interface configuration command. Duplex options are not supported.
  - The 1000BASE-T SFP module ports support the same speed and duplex options as the 10/100/1000-Mb/s ports.

- If both ends of the line support autonegotiation, we highly recommend the default setting of `auto` negotiation.

- If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do not use the `auto` setting on the supported side.

- When STP is enabled and a port is reconfigured, the device can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures.

- As best practice, we suggest configuring the speed and duplex options on a link to auto or to fixed on both the ends. If one side of the link is configured to auto and the other side is configured to fixed, the link will not be up and this is expected.

---

**Caution**

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

---

**IEEE 802.3x Flow Control**

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

---

**Note**

The switch ports can receive, but not send, pause frames.

You use the `flowcontrol` interface configuration command to set the interface’s ability to receive pause frames to `on`, `off`, or `desired`.

When set to `desired`, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.
These rules apply to flow control settings on the device:

- **receive on** (or **desired**): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.

- **receive off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

**Note**

For details on the command settings and the resulting flow control resolution on local and remote ports, see the **flowcontrol** interface configuration command in the command reference for this release.

# How to Configure Interface Characteristics

## Configuring Interfaces

These general instructions apply to all interface configuration processes.

</tbody>
</table>
| | Example: 
Device> enable | |
| **Step 2** | configure terminal | Enters global configuration mode. |
| | Example: 
Device# configure terminal | |
| **Step 3** | interface | Identifies the interface type, the device number (only on stacking-capable switches), and the number of the connector. |
| | Example: 
Device(config)# interface gigabitethernet 1/0/1 
Device(config-if)# | |
| | **Note** You do not need to add a space between the interface type and the interface number. For example, in the preceding line, you can specify either **gigabitethernet 1/0/1**, **gigabitethernet1/0/1**, **gi 1/0/1**, or **gi1/0/1**. |
| **Step 4** | Follow each **interface** command with the interface configuration commands that the interface requires. | Defines the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter **end** to return to privileged EXEC mode. |
### Adding a Description for an Interface

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `description string`
5. `end`
6. `show interfaces interface-id description`
7. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enabel</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet 1/0/2</td>
</tr>
<tr>
<td></td>
<td>Specifies the interface for which you are adding a description, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>description string</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Adds a description (up to 240 characters) for an interface.</td>
</tr>
</tbody>
</table>

---

(Optional) Configures a range of interfaces.

**Note** Interfaces configured in a range must be the same type and must be configured with the same feature options.

Displays a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.
### Configuring a Range of Interfaces

To configure multiple interfaces with the same configuration parameters, use the `interface range` global configuration command. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface range {port-range | macro macro_name}`
4. `end`
5. `show interfaces [interface-id]`
6. `copy running-config startup-config`

#### DETAILED STEPS

<table>

### Configuring and Using Interface Range Macros

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the macro keyword in the interface range macro global configuration command string, you must use the define interface-range global configuration command to define the macro.
### SUMMARY STEPS

1. enable
2. configure terminal
3. define interface-range *macro_name* *interface-range*
4. interface range macro *macro_name*
5. end
6. show running-config | include define
7. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>enable</em></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td></td>
</tr>
<tr>
<td>Device&gt; <em>enable</em></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><em>configure terminal</em></td>
<td></td>
</tr>
<tr>

</tbody>
</table>
Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface {vlan vlan-id} | {gigabitethernet interface-id} | {port-channel port-channel-number}`
4. `shutdown`
5. `no shutdown`
6. `end`
7. `show running-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>

</tbody>
</table>
### Configuring the Console Media Type

Follow these steps to set the console media type to RJ-45. If you configure the console as RJ-45, USB console operation is disabled, and input comes only through the RJ-45 connector.

This configuration applies to all switches in a stack.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `line console 0`
4. `media-type rj45`
5. `end`
6. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

### Configuring the USB Inactivity Timeout

The configurable inactivity timeout reactivates the RJ-45 console port if the USB console port is activated but no input activity occurs on it for a specified time period. When the USB console port is deactivated due to a timeout, you can restore its operation by disconnecting and reconnecting the USB cable.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. line console 0
4. usb-inactivity-timeout *timeout-minutes*
5. copy running-config startup-config
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> line console 0</td>
<td>Configures the console and enters line configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# line console 0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> usb-inactivity-timeout timeout-minutes</td>
<td>Specify an inactivity timeout for the console port. The range is 1 to 240 minutes. The default is to have no timeout configured.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-line)# usb-inactivity-timeout 30</td>
<td></td>

<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Monitoring Interface Characteristics

Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces.

*Table 5: Show Commands for Interfaces*

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces interface-number downshift module module-number</td>
<td>Displays the downshift status details of the specified interfaces and modules.</td>
</tr>
</tbody>
</table>
### Clearing and Resetting Interfaces and Counters

#### Table 6: Clear Commands for Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear counters [interface-id]</td>
<td>Clears interface counters.</td>
</tr>
<tr>
<td>clear interface interface-id</td>
<td>Resets the hardware logic on an interface.</td>
</tr>
<tr>
<td>clear line [number</td>
<td>console 0</td>
</tr>
</tbody>
</table>
The clear counters privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the show interface privileged EXEC command.

Configuration Examples for Interface Characteristics

Configuring a Range of Interfaces: Examples

This example shows how to use the interface range global configuration command to set the speed to 100 Mb/s on ports 1 to 4 on switch 1:

```
Device# configure terminal
Device(config)# interface range gigabitethernet 1/0/1 - 4
Device(config-if-range)# speed 100
```

This example shows how to use a comma to add different interface type strings to the range to enable Gigabit Ethernet ports 1 to 3 and 10-Gigabit Ethernet ports 1 and 2 to receive flow-control pause frames:

```
Device# configure terminal
Device(config)# interface range gigabitethernet1/0/1 - 3, tengigabitethernet1/1/1 - 2
Device(config-if-range)# flowcontrol receive on
```

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

Configuring and Using Interface Range Macros: Examples

This example shows how to define an interface-range named enet_list to include ports 1 and 2 on switch 1 and to verify the macro configuration:

```
Device# configure terminal
Device(config)# define interface-range enet_list gigabitethernet 1/1/1 - 2
Device(config)# end
Device# show running-config | include define
define interface-range enet_list gigabitethernet 1/1/1 - 2
```

This example shows how to create a multiple-interfacemacro named macro1:

```
Device# configure terminal
Device(config)# define interface-range macro1 gigabitethernet1/1/1 - 2, gigabitethernet1/1/5 - 7, tengigabitethernet1/1/1 -2
Device(config)# end
```

This example shows how to enter interface-range configuration mode for the interface-range macro enet_list:
Device# configure terminal
Device(config)# interface range macro enet_list
Device(config-if-range)#

This example shows how to delete the interface-range macro `enet_list` and to verify that it was deleted.

Device# configure terminal
Device(config)# no define interface-range enet_list
Device(config)# end
Device# show run | include define
Device#

**Setting Interface Speed and Duplex Mode: Example**

This example shows how to set the interface speed to 100 Mb/s and the duplex mode to half on a 10/100/1000 Mb/s port:

Device# configure terminal
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# speed 10
Device(config-if)# duplex half

This example shows how to set the interface speed to 100 Mb/s on a 10/100/1000 Mb/s port:

Device# configure terminal
Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# speed 100

**Configuring the Console Media Type: Example**

This example disables the USB console media type and enables the RJ-45 console media type.

Device# configure terminal
Device(config)# line console 0
Device(config-line)# media-type rj45

This example reverses the previous configuration and immediately activates any USB console that is connected.

Device# configure terminal
Device(config)# line console 0
Device(config-line)# no media-type rj45

**Configuring the USB Inactivity Timeout: Example**

This example configures the inactivity timeout to 30 minutes:

Device# configure terminal
Device(config)# line console 0
Device(config-line)# usb-inactivity-timeout 30

To disable the configuration, use these commands:

Device# configure terminal
Device(config)# line console 0
Device(config-line)# no usb-inactivity-timeout

If there is no (input) activity on a USB console port for the configured number of minutes, the inactivity timeout setting applies to the RJ-45 port, and a log shows this occurrence:

*Mar 1 00:47:25.625: %USB_CONSOLE-6-INACTIVITY_DISABLE: Console media-type USB disabled due to inactivity, media-type reverted to RJ45.

At this point, the only way to reactivate the USB console port is to disconnect and reconnect the cable. When the USB cable on the switch has been disconnected and reconnected, a log similar to this appears:

*Mar 1 00:48:28.640: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.

CHAPTER 3

Configuring Auto-MDIX

- Prerequisites for Auto-MDIX, on page 43
- Restrictions for Auto-MDIX, on page 43
- Information About Configuring Auto-MDIX, on page 43
- How to Configure Auto-MDIX, on page 44
- Example for Configuring Auto-MDIX, on page 45
- Additional References, on page 46
- Feature History and Information for Auto-MDIX, on page 46

Prerequisites for Auto-MDIX

Automatic medium-dependent interface crossover (auto-MDIX) is enabled by default.

Auto-MDIX is supported on all 10/100/1000-Mb/s and on 10/100/1000BASE-TX small form-factor pluggable (SFP)-module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

Restrictions for Auto-MDIX

The device might not support a pre-standard powered device—such as Cisco IP phones and access points that do not fully support IEEE 802.3af—if that powered device is connected to the device through a crossover cable. This is regardless of whether auto-MDIX is enabled on the switch port.

Information About Configuring Auto-MDIX

Auto-MDIX on an Interface

When automatic medium-dependent interface crossover (auto-MDIX) is enabled on an interface, the interface automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting devices without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other devices or repeaters. With auto-MDIX enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.
This table shows the link states that result from auto-MDIX settings and correct and incorrect cabling.

</tbody>
</table>
| **Step 4** speed auto  
Example:  
Device(config-if)# speed auto | Configures the interface to autonegotiate speed with the connected device. |
| **Step 5** duplex auto  
Example:  
Device(config-if)# duplex auto | Configures the interface to autonegotiate duplex mode with the connected device. |
| **Step 6** end  
Example:  
Device(config-if)# end | Returns to privileged EXEC mode. |
| **Step 7** copy running-config startup-config  
Example:  
Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

**Example for Configuring Auto-MDIX**

This example shows how to enable auto-MDIX on a port:

```
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# speed auto
Device(config-if)# duplex auto
Device(config-if)# mdix auto
Device(config-if)# end
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Ethernet Management Ports

When connecting a PC to the Ethernet management port, you must first assign an IP address.

Information About the Ethernet Management Port

The Ethernet management port, also referred to as the Fa0 or fastethernet0 port, is a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the device console port for network management. When managing a device stack, connect the PC to the Ethernet management port on a stack member.
Ethernet Management Port Direct Connection to a Device

Figure 2: Connecting a Switch to a PC

This figure displays how to connect the Ethernet management port to the PC for a device or a standalone device.

Ethernet Management Port Connection to Stack Devices using a Hub

In a stack with only stack devices, all the Ethernet management ports on the stack members are connected to a hub to which the PC is connected. The active link is from the Ethernet management port on the stack master through the hub, to the PC. If the active device fails and a new active device is elected, the active link is now from the Ethernet management port on the new active device to the PC.

Figure 3: Connecting a Device Stack to a PC

This figure displays how a PC uses a hub to connect to a device stack.

Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup (only in switch stacks)
- Network Assistant
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SMNP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
• Speed—10 Mb/s, 100 Mb/s, and autonegotiation
• Duplex mode—Full, half, and autonegotiation
• Loopback detection

• Cisco Discovery Protocol (CDP)
• DHCP relay agent
• IPv4 and IPv6 access control lists (ACLs)

Caution

Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the device might fail.

How to Configure the Ethernet Management Port

Disabling and Enabling the Ethernet Management Port

SUMMARY STEPS

1. configure terminal
2. interface fastethernet0
3. shutdown
4. no shutdown
5. exit

Information About LLDP, LLDP-MED, and Wired Location Service

LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, switches, and controllers). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the device supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol
runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

**LLDP Supported TLVs**

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

**LLDP and Cisco Device Stacks**

A device stack appears as a single device in the network. Therefore, LLDP discovers the device stack, not the individual stack members.

**LLDP and Cisco Medianet**

When you configure LLDP or CDP location information on a per-port basis, remote devices can send Cisco Medianet location information to the device.

**LLDP-MED**

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management and location information. By default, all LLDP-MED TLVs are enabled.

**LLDP-MED Supported TLVs**

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV
  
  Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and has enabled.

- Network policy TLV
Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect to any device, obtain its VLAN number, and then start communicating with the call control.

By defining a network-policy profile TLV, you can create a profile for voice and voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

- **Power management TLV**

  Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows devices and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

  LLDP-MED also supports an extended power TLV to advertise fine-grained power requirements, end-point power priority, and end-point and network connectivity-device power status. LLDP is enabled and power is applied to a port, the power TLV determines the actual power requirement of the endpoint device so that the system power budget can be adjusted accordingly. The device processes the requests and either grants or denies power based on the current power budget. If the request is granted, the switch updates the power budget. If the request is denied, the device turns off power to the port, generates a syslog message, and updates the power budget. If LLDP-MED is disabled or if the endpoint does not support the LLDP-MED power TLV, the initial allocation value is used throughout the duration of the connection.

  You can change power settings by entering the `power inline {auto [max max-wattage] | never | static [max max-wattage]}` interface configuration command. By default the PoE interface is in `auto` mode; If no value is specified, the maximum is allowed (30 W).

- **Inventory management TLV**

  Allows an endpoint to send detailed inventory information about itself to the device, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- **Location TLV**

  Provides location information from the device to the endpoint device. The location TLV can send this information:

  - Civic location information

    Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

  - ELIN location information

    Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

**Wired Location Service**

The device uses the location service feature to send location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint.
a wired endpoint, or a wired device or controller. The device notifies the MSE of device link up and link down events through the Network Mobility Services Protocol (NMSP) location and attachment notifications.

The MSE starts the NMSP connection to the device, which opens a server port. When the MSE connects to the device there are a set of message exchanges to establish version compatibility and service exchange information followed by location information synchronization. After connection, the device periodically sends location and attachment notifications to the MSE. Any link up or link down events detected during an interval are aggregated and sent at the end of the interval.

When the device determines the presence or absence of a device on a link-up or link-down event, it obtains the client-specific information such as the MAC address, IP address, and username. If the client is LLDP-MED-or CDP-capable, the device obtains the serial number and UDI through the LLDP-MED location TLV or CDP.

Depending on the device capabilities, the device obtains this client information at link up:

- Slot and port specified in port connection
- MAC address specified in the client MAC address
- IP address specified in port connection
- 802.1X username if applicable
- Device category is specified as a wired station
- State is specified as new
- Serial number, UDI
- Model number
- Time in seconds since the device detected the association

Depending on the device capabilities, the device obtains this client information at link down:

- Slot and port that was disconnected
- MAC address
- IP address
- 802.1X username if applicable
- Device category is specified as a wired station
- State is specified as delete
- Serial number, UDI
- Time in seconds since the device detected the disassociation

When the device shuts down, it sends an attachment notification with the state delete and the IP address before closing the NMSP connection to the MSE. The MSE interprets this notification as disassociation for all the wired clients associated with the device.

If you change a location address on the device, the device sends an NMSP location notification message that identifies the affected ports and the changed address information.
Default LLDP Configuration

Table 8: Default LLDP Configuration

<table>
<thead>
<tr>

<tr>
<td>LLDP transmit</td>
<td>Disabled</td>
</tr>
<tr>
<td>LLDP med-tlv-select</td>
<td>Disabled to send all LLDP-MED TLVs. When LLDP is globally enabled, LLDP-MED-TLV is also enabled.</td>
</tr>
</tbody>
</table>

Restrictions for LLDP

- If the interface is configured as a tunnel port, LLDP is automatically disabled.
- If you first configure a network-policy profile on an interface, you cannot apply the `switchport voice vlan` command on the interface. If the `switchport voice vlan vlan-id` is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.
- You cannot configure static secure MAC addresses on an interface that has a network-policy profile.
- When Cisco Discovery Protocol and LLDP are both in use within the same switch, it is necessary to disable LLDP on interfaces where Cisco Discovery Protocol is in use for power negotiation. LLDP can be disabled at interface level with the commands `no lldp tlv-select power-management` or `no lldp transmit / no lldp receive`.

How to Configure LLDP, LLDP-MED, and Wired Location Service

Enabling LLDP

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `lldp run`
4. `interface interface-id`
5. `lldp transmit`
6. `lldp receive`
7. `end`
8. `show lldp`
9. `copy running-config startup-config`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
*enable*  
*Example:*  
Device> `enable` | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| **Step 2**  
`configure terminal`  
*Example:*  
Device# `configure terminal` | Enters global configuration mode. |
| **Step 3**  
`lldp run`  
*Example:*  
Device (config)# `lldp run` | Enables LLDP globally on the device. |
| **Step 4**  
`interface interface-id`  
*Example:*  
Device (config)# `interface gigabitethernet 2/0/1` | Specifies the interface on which you are enabling LLDP, and enter interface configuration mode. |
| **Step 5**  
`lldp transmit`  
*Example:*  
Device(config-if)# `lldp transmit` | Enables the interface to send LLDP packets. |
| **Step 6**  
`lldp receive`  
*Example:*  
Device(config-if)# `lldp receive` | Enables the interface to receive LLDP packets. |
| **Step 7**  
`end`  
*Example:* | Returns to privileged EXEC mode. |
### Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to send and receive.

---

**Note**

Steps 3 through 6 are optional and can be performed in any order.

---

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `lldp holdtime seconds`
4. `lldp reinit delay`
5. `lldp timer rate`
6. `lldp tlv-select`
7. `interface interface-id`
8. `lldp med-tlv-select`
9. `end`
10. `show lldp`
11. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><code>lldp holdtime seconds</code></td>
<td></td>
</tr>
<tr>
<td><code>lldp reinit delay</code></td>
<td></td>
</tr>
<tr>
<td><code>lldp timer rate</code></td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

**Example:**

Device# configure terminal

**Step 3**

**lldp holdtime seconds**

**Example:**

Device(config)# lldp holdtime 120

(Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.

The range is 0 to 65535 seconds; the default is 120 seconds.

**Step 4**

**lldp reinit delay**

**Example:**

Device(config)# lldp reinit 2

(Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.

The range is 2 to 5 seconds; the default is 2 seconds.

**Step 5**

**lldp timer rate**

**Example:**

Device(config)# lldp timer 30

(Optional) Sets the sending frequency of LLDP updates in seconds.

The range is 5 to 65534 seconds; the default is 30 seconds.

**Step 6**

**lldp tlv-select**

**Example:**

Device(config)# tlv-select

(Optional) Specifies the LLDP TLVs to send or receive.

**Step 7**

**interface interface-id**

**Example:**

Device (config)# interface gigabitethernet 2/0/1

Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.

**Step 8**

**lldp med-tlv-select**

**Example:**

Device (config-if)# lldp med-tlv-select inventory management

(Optional) Specifies the LLDP-MED TLVs to send or receive.

**Step 9**

**end**

**Example:**

Returns to privileged EXEC mode.
### Configuring LLDP-MED TLVs

By default, the device only sends LLDP packets until it receives LLDP-MED packets from the end device. It then sends LLDP packets with MED TLVs, as well. When the LLDP-MED entry has been aged out, it again only sends LLDP packets.

By using the `lldp` interface configuration command, you can configure the interface not to send the TLVs listed in the following table.

<table>
<thead>
<tr>
<th>LLDP-MED TLV</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventory-management</td>
<td>LLDP-MED inventory management TLV</td>
</tr>
<tr>
<td>location</td>
<td>LLDP-MED location TLV</td>
</tr>
<tr>
<td>network-policy</td>
<td>LLDP-MED network policy TLV</td>
</tr>
<tr>
<td>power-management</td>
<td>LLDP-MED power management TLV</td>
</tr>
</tbody>
</table>

Follow these steps to enable a TLV on an interface:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `lldp med-tlv-select`
5. `end`
6. `copy running-config startup-config`

### Configuring Network-Policy TLV

**SUMMARY STEPS**

1. enable
2. configure terminal
3. network-policy profile *profile number*
4. `{voice | voice-signaling} vlan [vlan-id {cos cvalue | dscp dvalue}] | [[dot1p |cos cvalue | dscp dvalue}] | none | untagged]
5. exit
6. interface interface-id
7. network-policy profile number
8. lldp med-tlv-select network-policy
9. end
10. show network-policy profile
11. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>

### Configuring Location TLV and Wired Location Service

Beginning in privileged EXEC mode, follow these steps to configure location information for an endpoint and to apply it to an interface.

#### SUMMARY STEPS

1. `configure terminal`
2. `location {admin-tag string | civic-location identifier {id | host} | elin-location string identifier id | custom-location identifier {id | host} | geo-location identifier {id | host}}`
3. `exit`
4. `interface interface-id`
5. `location {additional-location-information word | civic-location-id {id | host} | elin-location-id id | custom-location-id {id | host} | geo-location-id {id | host} }`
6. `end`
7. Use one of the following:
   - `show location admin-tag string`
   - `show location civic-location identifier id`
   - `show location elin-location identifier id`
8. `copy running-config startup-config`

#### DETAILED STEPS

**Step 3**

**exit**

**Example:**

Device(config-civic)# exit

Returns to global configuration mode.

**Step 4**

**interface interface-id**

**Example:**

Device(config)# interface gigabitethernet2/0/1

Specifies the interface on which you are configuring the location information, and enter interface configuration mode.

**Step 5**

**location {additional-location-information word | civic-location-id {id | host} | elim-location-id id | custom-location-id {id | host} | geo-location-id {id | host}}**

**Example:**

Device(config-if)# location elim-location-id 1

Enters location information for an interface:

• **additional-location-information**—Specifies additional information for a location or place.

• **civic-location-id**—Specifies global civic location information for an interface.

• **elim-location-id**—Specifies emergency location information for an interface.

• **custom-location-id**—Specifies custom location information for an interface.

• **geo-location-id**—Specifies geo-spatial location information for an interface.

• **host**—Specifies the host location identifier.

• **word**—Specifies a word or phrase with additional location information.

• **id**—Specifies the ID for the civic, ELIN, custom, or geo location. The ID range is 1 to 4095.

**Enabling Wired Location Service on the Device**

**Before you begin**

For wired location to function, you must first enter the **ip device tracking** global configuration command.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. nmsp notification interval {attachment | location} interval-seconds
4. end
5. show network-policy profile
6. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
  **Example:**  
  Device> `enable`  
  - Enter your password if prompted. |
| **Step 2** | `configure terminal` | Enters global configuration mode.  
  **Example:**  
  Device# `configure terminal` |
| **Step 3** | `nmsp notification interval {attachment | location} interval-seconds` | Specifies the NMSP notification interval.  
  **attachment**—Specifies the attachment notification interval.  
  **location**—Specifies the location notification interval.  
  **interval-seconds**—Duration in seconds before the device sends the MSE the location or attachment updates. The range is 1 to 30; the default is 30.  
  **Example:**  
  Device(config)# `nmsp notification interval location 10` |
| **Step 4** | `end` | Returns to privileged EXEC mode.  
  **Example:**  
  Device(config)# `end` |
| **Step 5** | `show network-policy profile` | Verifies the configuration.  
  **Example:**  
  Device# `show network-policy profile` |
| **Step 6** | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file.  
  **Example:**  
  Device# `copy running-config startup-config` |
Configuration Examples for LLDP, LLDP-MED, and Wired Location Service

Configuring Network-Policy TLV: Examples

This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```bash
# configure terminal
(config)# network-policy 1
(config-network-policy)# voice vlan 100 cos 4
(config-network-policy)# exit
(config)# interface gigabitethernet 1/0/1
(config-if)# network-policy profile 1
(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```bash
(config-network-policy)# voice vlan dot1p cos 4
(config-network-policy)# voice vlan dot1p dscp 34
```

Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service

Commands for monitoring and maintaining LLDP, LLDP-MED, and wired location service.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear lldp counters</td>
<td>Resets the traffic counters to zero.</td>
</tr>
<tr>
<td>clear lldp table</td>
<td>Deletes the LLDP neighbor information table.</td>

<tr>
<td>clear nmsp statistics</td>
<td>Clears the NMSP statistic counters.</td>
</tr>
<tr>
<td>show lldp</td>
<td>Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface.</td>
</tr>
<tr>
<td>show lldp entry entry-name</td>
<td>Displays information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.</td>
</tr>
</tbody>
</table>
### Command and Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show lldp interface [interface-id]</code></td>
<td>Displays information about interfaces with LLDP enabled. You can limit the display to a specific interface.</td>
</tr>
<tr>
<td><code>show lldp neighbors [interface-id] [detail]</code></td>
<td>Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID. You can limit the display to neighbors of a specific interface or expand the display for more detailed information.</td>
</tr>
<tr>
<td><code>show lldp traffic</code></td>
<td>Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLV's.</td>
</tr>
<tr>
<td><code>show location admin-tag string</code></td>
<td>Displays the location information for the specified administrative tag or site.</td>
</tr>
<tr>
<td><code>show location civic-location identifier id</code></td>
<td>Displays the location information for a specific global civic location.</td>
</tr>
<tr>
<td><code>show location elin-location identifier id</code></td>
<td>Displays the location information for an emergency location.</td>
</tr>
<tr>
<td><code>show network-policy profile</code></td>
<td>Displays the configured network-policy profiles.</td>
</tr>
<tr>
<td><code>show nmsp</code></td>
<td>Displays the NMSP information.</td>

</tbody>
</table>
CHAPTER 6

Configuring System MTU

• Finding Feature Information, on page 73
• Information About the MTU, on page 73
• How to Configure MTU , on page 74
• Configuration Examples for System MTU, on page 75
• Additional References for System MTU, on page 75
• Feature Information for System MTU, on page 76

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About the MTU

The default maximum transmission unit (MTU) size for frames received and transmitted on all interfaces is 1500 bytes. You can increase the MTU size for all interfaces operating at 10 or 100 Mb/s by using the system mtu global configuration command. You can increase the MTU size to support jumbo frames on all Gigabit Ethernet interfaces by using the system mtu jumbo global configuration command.

Note

The switch supports jumbo frames at CPU.

System MTU Guidelines

When configuring the system MTU values, follow these guidelines:
• The default maximum transmission unit (MTU) size for frames received and transmitted on all interfaces is 1500 bytes. You can increase the MTU size for all interfaces operating at 10 or 100 Mb/s by using the `system mtu` global configuration command. You can increase the MTU size to support jumbo frames on all Gigabit Ethernet interfaces by using the `system mtu jumbo` global configuration command.

• Gigabit Ethernet ports are not affected by the `system mtu` command; 10/100 ports are not affected by the `system mtu jumbo` command. If you do not configure the `system mtu jumbo` command, the setting of the `system mtu` command applies to all Gigabit Ethernet interfaces.

How to Configure MTU

Configuring the System MTU

Beginning in privileged EXEC mode, follow these steps to change the MTU size for all 10/100 or Gigabit Ethernet interfaces:

**SUMMARY STEPS**

1. `configure terminal`
2. `system mtu bytes`
3. `system mtu jumbo bytes`
4. `end`
5. `copy running-config startup-config`
6. `show system mtu`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> system mtu <code>bytes</code></td>
<td>(Optional) Change the MTU size for all interfaces on the switch stack that are operating at 10 or 100 Mb/s. The range is 1500 to 1998 bytes; the default is 1500 bytes.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>system mtu 2500</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> system mtu jumbo <code>bytes</code></td>
<td>(Optional) Changes the MTU size for all Gigabit Ethernet interfaces on the switch or the switch stack. The range is 1500 to 9198 bytes; the default is 1500 bytes.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>system mtu jumbo 7500</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device# copy running-config startup-config</code></td>
<td>Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show system mtu</code></td>
<td>Verifies your settings.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device# show system mtu</code></td>
<td></td>
</tr>
</tbody>
</table>

### Configuration Examples for System MTU

This example shows how to set the maximum packet size for a Gigabit Ethernet port to 7500 bytes:

```
Device(config)# system mtu 7500
Device(config)# system mtu 1900
Device(config)# system mtu jumbo 7500
Device(config)# exit
```

If you enter a value that is outside the allowed range for the specific type of interface, the value is not accepted. This example shows the response when you try to set Gigabit Ethernet interfaces to an out-of-range number:

```
Device(config)# system mtu jumbo 25000
^%
% Invalid input detected at '^' marker.
```

### Additional References for System MTU

Configuring Boot Fast

• Finding Feature Information, on page 77
• Configuring Boot Fast on the switch, on page 77

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Boot Fast on the switch

This feature, when enabled, helps the switch to Boot up fast. The Memory test is performed for a limited range, the switch Skips Filesystem check (FSCK) and Skips Post test.

Note

When Fast boot is enabled, you can still run the POST tests manually from the command line interface, once the switch has booted up, using diagnostic start command.

Enabling Boot Fast

To enable the boot fast feature, perform the following steps:

SUMMARY STEPS

1. enable
2. configure terminal
3. boot fast
4. end
## Disabling Boot Fast

To disable the boot fast feature, perform the following steps:

### SUMMARY STEPS

1. enable  
2. configure terminal  
3. no boot fast  
4. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
**enable**  
**Example:**  
Device> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Step 2**  
**configure terminal**  
**Example:**  
Device# configure terminal | Enters global configuration mode. |
| **Step 3**  
**boot fast**  
**Example:**  
Device(config)# boot fast | Enables fast boot feature  
Performs Memory test for a limited range, Skips File system check (FSCK) and Skips Post test. |
| **Step 4**  
**end**  
**Example:**  
Device(config)# end | Returns to privileged EXEC mode. |
<table>
<thead>

<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

Enters global configuration mode.

Disables the boot fast feature.

Returns to privileged EXEC mode.
CHAPTER 8

Configuring PoE

- Restrictions for PoE, on page 81
- Information About PoE, on page 81
- How to Configure PoE, on page 86
- Monitoring Power Status, on page 95
- Configuration Examples for Configuring PoE, on page 95
- Additional References, on page 95

Restrictions for PoE

Note

This feature is supported only on the LAN Base image.

Information About PoE

Power over Ethernet Ports

A PoE-capable switch port automatically supplies power to one of these connected devices if the device senses that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

Supported Protocols and Standards

The device uses these protocols and standards to support PoE:

- CDP with power consumption—The powered device notifies the device of the amount of power it is consuming. The device does not reply to the power-consumption messages. The device can only supply power to or remove power from the PoE port.
• Cisco intelligent power management—The powered device and the device negotiate through power-negotiation CDP messages for an agreed-upon power-consumption level. The negotiation allows a high-power Cisco powered device, which consumes more than 7 W, to operate at its highest power mode. The powered device first boots up in low-power mode, consumes less than 7 W, and negotiates to obtain enough power to operate in high-power mode. The device changes to high-power mode only when it receives confirmation from the device.

High-power devices can operate in low-power mode on devices that do not support power-negotiation CDP.

Cisco intelligent power management is backward-compatible with CDP with power consumption; the device responds according to the CDP message that it receives. CDP is not supported on third-party powered devices; therefore, the device uses the IEEE classification to determine the power usage of the device.

• IEEE 802.3af—The major features of this standard are powered-device discovery, power administration, disconnect detection, and optional powered-device power classification. For more information, see the standard.

### Powered-Device Detection and Initial Power Allocation

The device detects a Cisco pre-standard or an IEEE-compliant powered device when the PoE-capable port is in the no-shutdown state, PoE is enabled (the default), and the connected device is not being powered by an AC adaptor.

After device detection, the device determines the device power requirements based on its type:

• The initial power allocation is the maximum amount of power that a powered device requires. The device initially allocates this amount of power when it detects and powers the powered device. As the device receives CDP messages from the powered device and as the powered device negotiates power levels with the device through CDP power-negotiation messages, the initial power allocation might be adjusted.

• The device classifies the detected IEEE device within a power consumption class. Based on the available power in the power budget, the device determines if a port can be powered. Table 10: IEEE Power Classifications, on page 82 lists these levels.

#### Table 10: IEEE Power Classifications

<table>
<thead>
<tr>
<th>Class</th>
<th>Maximum Power Level Required from the Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (class status unknown)</td>
<td>15.4 W</td>
</tr>
<tr>
<td>1</td>
<td>4 W</td>
</tr>
<tr>
<td>2</td>
<td>7 W</td>
</tr>
<tr>
<td>3</td>
<td>15.4 W</td>
</tr>
<tr>
<td>4</td>
<td>30 W (For IEEE 802.3at Type 2 powered devices)</td>
</tr>
</tbody>
</table>

The device monitors and tracks requests for power and grants power only when it is available. The device tracks its power budget (the amount of power available on the device for PoE). The device performs power-accounting calculations when a port is granted or denied power to keep the power budget up to date.
After power is applied to the port, the device uses CDP to determine the CDP-specific power consumption requirement of the connected Cisco powered devices, which is the amount of power to allocate based on the CDP messages. The device adjusts the power budget accordingly. This does not apply to third-party PoE devices. The device processes a request and either grants or denies power. If the request is granted, the device updates the power budget. If the request is denied, the device ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. Powered devices can also negotiate with the device for more power.

With PoE+, powered devices use IEEE 802.3at and LLDP power with media dependent interface (MDI) type, length, and value descriptions (TLVs), Power-via-MDI TLVs, for negotiating power up to 30 W. Cisco pre-standard devices and Cisco IEEE powered devices can use CDP or the IEEE 802.3at power-via-MDI power negotiation mechanism to request power levels up to 30 W.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The initial allocation for Class 0, Class 3, and Class 4 powered devices is 15.4 W. When a device starts up and uses CDP or LLDP to send a request for more than 15.4 W, it can be allocated up to the maximum of 30 W.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The CDP-specific power consumption requirement is referred to as the actual power consumption requirement in the software configuration guides and command references.</td>
</tr>
</tbody>
</table>

If the device detects a fault caused by an undervoltage, overvoltage, overtemperature, oscillator-fault, or short-circuit condition, it turns off power to the port, generates a syslog message, and updates the power budget and LEDs.

The PoE feature operates the same whether or not the device is a stack member. The power budget is per device and independent of any other device in the stack. Election of a new active device does not affect PoE operation. The active device keeps track of the PoE status for all devices and ports in the stack and includes the status in output displays.

### Power Management Modes

The device supports these PoE modes:

- **auto**—The device automatically detects if the connected device requires power. If the device discovers a powered device connected to the port and if the device has enough power, it grants power, updates the power budget, turns on power to the port on a first-come, first-served basis, and updates the LEDs. For LED information, see the hardware installation guide.

  If the device has enough power for all the powered devices, they all come up. If enough power is available for all powered devices connected to the device, power is turned on to all devices. If there is not enough available PoE, or if a device is disconnected and reconnected while other devices are waiting for power, it cannot be determined which devices are granted or are denied power.

  If granting power would exceed the system power budget, the device denies power, ensures that power to the port is turned off, generates a syslog message, and updates the LEDs. After power has been denied, the device periodically rechecks the power budget and continues to attempt to grant the request for power.

  If a device being powered by the device is then connected to wall power, the device might continue to power the device. The device might continue to report that it is still powering the device whether the device is being powered by the device or receiving power from an AC power source.
If a powered device is removed, the device automatically detects the disconnect and removes power from the port. You can connect a nonpowered device without damaging it.

You can specify the maximum wattage that is allowed on the port. If the IEEE class maximum wattage of the powered device is greater than the configured maximum value, the device does not provide power to the port. If the device powers a powered device, but the powered device later requests through CDP messages more than the configured maximum value, the device removes power to the port. The power that was allocated to the powered device is reclaimed into the global power budget. If you do not specify a wattage, the device delivers the maximum value. Use the auto setting on any PoE port. The auto mode is the default setting.

- **static**—The device pre-allocates power to the port (even when no powered device is connected) and guarantees that power will be available for the port. The device allocates the port configured maximum wattage, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed to be powered when it is connected to the static port. The port no longer participates in the first-come, first-served model.

However, if the powered-device IEEE class is greater than the maximum wattage, the device does not supply power to it. If the device learns through CDP messages that the powered device is consuming more than the maximum wattage, the device shuts down the powered device.

If you do not specify a wattage, the device pre-allocates the maximum value. The device powers the port only if it discovers a powered device. Use the static setting on a high-priority interface.

- **never**—The device disables powered-device detection and never powers the PoE port even if an unpowered device is connected. Use this mode only when you want to make sure that power is never applied to a PoE-capable port, making the port a data-only port.

For most situations, the default configuration (auto mode) works well, providing plug-and-play operation. No further configuration is required. However, perform this task to configure a PoE port for a higher priority, to make it data only, or to specify a maximum wattage to disallow high-power powered devices on a port.

**Power Monitoring and Power Policing**

When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the maximum amount allocated, also referred to as the cutoff-power value.

When PoE is enabled, the device senses the real-time power consumption of the powered device. The device monitors the real-time power consumption of the connected powered device; this is called power monitoring or power sensing. The device also polices the power usage with the power policing feature.

Power monitoring is backward-compatible with Cisco intelligent power management and CDP-based power consumption. It works with these features to ensure that the PoE port can supply power to the powered device.

The device senses the real-time power consumption of the connected device as follows:

1. The device monitors the real-time power consumption on individual ports.
2. The device records the power consumption, including peak power usage. The device reports the information through the CISCO-POWER-ETHERNET-EXT-MIB.
3. If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated to the device. The maximum power consumption is also referred to as the cutoff power on a PoE port.
If the device uses more than the maximum power allocation on the port, the device can either turn off power to the port, or the device can generate a syslog message and update the LEDs (the port LED is now blinking amber) while still providing power to the device based on the device configuration. By default, power-usage policing is disabled on all PoE ports.

If error recovery from the PoE error-disabled state is enabled, the device automatically takes the PoE port out of the error-disabled state after the specified amount of time.

If error recovery is disabled, you can manually re-enable the PoE port by using the `shutdown` and `no shutdown` interface configuration commands.

4. If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the PoE port, which could adversely affect the device.

**Maximum Power Allocation (Cutoff Power) on a PoE Port**

When power policing is enabled, the device determines one of these values as the cutoff power on the PoE port in this order:

1. Manually when you set the user-defined power level that the device budgets for the port by using the `power inline consumption default wattage` global or interface configuration command

2. Manually when you set the user-defined power level that limits the power allowed on the port by using the `power inline auto max max-wattage` or the `power inline static max max-wattage` interface configuration command

3. Automatically when the device sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLDP power negotiation.

Use the first or second method in the previous list to manually configure the cutoff-power value by entering the `power inline consumption default wattage` or the `power inline [auto | static max] max-wattage` command.

You should use `power inline consumption default wattage` command to manually set the power level for a port only in situations where CDP/LLDP power negotiations are not supported.

If you do not manually configure the cutoff-power value, the device automatically determines it by using CDP power negotiation or the device IEEE classification and LLDP power negotiation. If CDP or LLDP are not enabled, the default value of 30 W is applied. However without CDP or LLDP, the device does not allow devices to consume more than 15.4 W of power because values from 15400 to 30000 mW are only allocated based on CDP or LLDP requests. If a powered device consumes more than 15.4 W without CDP or LLDP negotiation, the device might be in violation of the maximum current (I_max) limitation and might experience an I_cut fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

**Note**

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.
Power Consumption Values

You can configure the initial power allocation and the maximum power allocation on a port. However, these values are only the configured values that determine when the device should turn on or turn off power on the PoE port. The maximum power allocation is not the same as the actual power consumption of the powered device. The actual cutoff power value that the device uses for power policing is not equal to the configured power value.

When power policing is enabled, the device polices the power usage at the switch port, which is greater than the power consumption of the device. When you manually set the maximum power allocation, you must consider the power loss over the cable from the switch port to the powered device. The cutoff power is the sum of the rated power consumption of the powered device and the worst-case power loss over the cable.

We recommend that you enable power policing when PoE is enabled on your device. For example, if policing is disabled and you set the cutoff-power value by using the `power inline auto max 6300` interface configuration command, the configured maximum power allocation on the PoE port is 6.3 W (6300 mW). The device provides power to the connected devices on the port if the device needs up to 6.3 W. If the CDP-power negotiated value or the IEEE classification value exceeds the configured cutoff value, the device does not provide power to the connected device. After the device turns on power on the PoE port, the device does not police the real-time power consumption of the device, and the device can consume more power than the maximum allocated amount, which could adversely affect the device and the devices connected to the other PoE ports.

Because the device supports internal power supplies and the Cisco Redundant Power System 2300 (also referred to as the RPS 2300), the total amount of power available for the powered devices varies depending on the power supply configuration.

How to Configure PoE

Configuring a Power Management Mode on a PoE Port

When you make PoE configuration changes, the port being configured drops power. Depending on the new configuration, the state of the other PoE ports, and the state of the power budget, the port might not be powered up again. For example, port 1 is in the auto and on state, and you configure it for static mode. The device removes power from port 1, detects the powered device, and repowers the port. If port 1 is in the auto and on state and you configure it with a maximum wattage of 10 W, the device removes power from the port and then redetects the powered device. The device repowers the port only if the powered device is a class 1, class 2, or a Cisco-only powered device.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `power inline {auto [max max-wattage] | never | static [max max-wattage]}`
5. `end`
6. `show power inline [interface-id | module switch-number]`
## 7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the physical port to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td></td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures the PoE mode on the port. The keywords have these meanings:</td>
</tr>
<tr>
<td>power inline {auto [max max-wattage]</td>
<td>never</td>
</tr>
<tr>
<td>Example: Device(config-if)# power inline auto</td>
<td>- max max-wattage—Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.</td>
</tr>
<tr>
<td></td>
<td>- never—Disables device detection, and disable power to the port.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If a port has a Cisco powered device connected to it, do not use the power inline never command to configure the port. A false link-up can occur, placing the port into the error-disabled state.</td>
</tr>
<tr>
<td></td>
<td>- static—Enables powered-device detection. Pre-allocate (reserve) power for a port before the device discovers the powered device. The device reserves power for this port even when no device is connected and guarantees that power will be provided upon device detection.</td>
</tr>
</tbody>
</table>

The device allocates power to a port configured in static mode before it allocates power to a port configured in auto mode.
### Fast POE

This feature remembers the last power drawn from a particular PSE port and switches on power the moment AC power is plugged in (within 15 to 20 seconds of switching on power) without waiting for IOS to boot up. When `poe-ha` is enabled on a particular port, the switch on a recovery after power failure, provides power to the connected endpoint devices within short duration before even the IOS forwarding starts up.

This feature can be configured by the same command as `poe-ha` which is already implemented. If the user replaces the power device connected to a port when the switch is powered off, then this new device will get the power which the previous device was drawing.

---

**Note**

Fast POE is supported on Catalyst 3850 only.

---

**Note**

In case of UPOE, even though Fast POE is available on the switch side, the PD endpoints may not be able to take advantage of the same, due to the reliance on LLDP to signal the UPOE power availability. This reliance on LLDP requires that the PD endpoint still needs to wait till the IOS comes up and LLDP packet exchanges can happen, signaling the availability of UPOE power.

---

### Configuring Fast PoE

To configure Fast PoE, perform the following steps:

---

**Note**

You will need to configure the `poe-ha` command before connecting the PD, or you will need to manually shut/unshut the port after configuring `poe-ha`.

---

| Device(config-if)# end |         |

Budgeting Power for Devices Connected to a PoE Port

When Cisco powered devices are connected to PoE ports, the device uses Cisco Discovery Protocol (CDP) to determine the protocol-specific power consumption of the devices, and the device adjusts the power budget accordingly. This does not apply to IEEE third-party powered devices. For these devices, when the device grants a power request, the device adjusts the power budget according to the powered-device IEEE classification. If the powered device is a class 0 (class status unknown) or a class 3, the device budgets 15,400 mW for the device, regardless of the CDP-specific amount of power needed. If the powered device reports a higher class than its CDP-specific consumption or does not support power classification (defaults to class 0), the device can power fewer devices because it uses the IEEE class information to track the global power budget.
By using the **power inline consumption** *wattage* interface configuration command or the **power inline consumption default** *wattage* global configuration command, you can override the default power requirement specified by the IEEE classification. The difference between what is mandated by the IEEE classification and what is actually needed by the device is reclaimed into the global power budget for use by additional devices. You can then extend the device power budget and use it more effectively.

**Caution**

You should carefully plan your device power budget, enable the power monitoring feature, and make certain not to oversubscribe the power supply.

**Note**

When you manually configure the power budget, you must also consider the power loss over the cable between the device and the powered device.

### Budgeting Power to All PoE ports

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no cdp run`
4. `power inline consumption default wattage`

### Configuring Power Policing

By default, the device monitors the real-time power consumption of connected powered devices. You can configure the device to police the power usage. By default, policing is disabled.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. power inline police [action {log | errdisable}]
5. exit
6. Use one of the following:
   - errdisable detect cause inline-power
   - errdisable recovery cause inline-power
   - errdisable recovery interval interval
7. exit
8. Use one of the following:

---

**Command or Action**

<table>
<thead>
<tr>
<th>Device(config)#</th>
<th>no cdp run</th>
<th>Purpose</th>
</tr>
</thead>
</table>

**Step 4**

interface interface-id

**Example:**

Device(config)# interface gigabitethernet 1/0/1

**Purpose:** Specifies the physical port to be configured, and enter interface configuration mode.

**Step 5**

power inline consumption wattage

**Example:**

Device(config-if)# power inline consumption 5000

**Purpose:** Configures the power consumption of a powered device connected to a PoE port on the device. The range for each port is 4000 to 30000 mW (PoE+). The default is 30000 mW (PoE+).

**Step 6**

end

**Example:**

Device(config-if)# end

**Purpose:** Returns to privileged EXEC mode.

**Step 7**

show power inline consumption

**Example:**

Device# show power inline consumption

**Purpose:** Displays the power consumption data.

**Step 8**

copy running-config startup-config

**Example:**

Device# copy running-config startup-config

**Purpose:** (Optional) Saves your entries in the configuration file.
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Specifies the physical port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> power inline police [action{log</td>
<td>errdisable}]</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# power inline police</td>
<td>• <strong>power inline police</strong>—Shuts down the PoE port, turns off power to it, and puts it in the error-disabled state.</td>
</tr>
</tbody>
</table>

**Note**

You can enable error detection for the PoE error-disabled cause by using the `errdisable detect cause inline-power` global configuration command. You can also enable the timer to recover from the PoE error-disabled state by using the `errdisable recovery cause inline-power interval interval` global configuration command.

- **power inline police action errdisable**—Turns off power to the port if the real-time power consumption exceeds the maximum power allocation on the port.
- **power inline police action log**—Generates a syslog message while still providing power to the port.

If you do not enter the **action log** keywords, the default action shuts down the port and puts the port in the error-disabled state.
<table>

Configuration Examples for Configuring PoE

Budgeting Power: Example

When you enter one of the following commands,

- [no] power inline consumption default wattage global configuration command
- [no] power inline consumption wattage interface configuration command

this caution message appears:

%CAUTION: Interface Gi1/0/1: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. It is recommended to enable power policing if the switch supports it. Refer to documentation.

- Example: Configuring 2-Event Classification, on page 98

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about 2-event Classification

When a class 4 device gets detected, IOS allocates 30W without any CDP or LLDP negotiation. This means that even before the link comes up the class 4 power device gets 30W.

Also, on the hardware level the PSE does a 2-event classification which allows a class 4 PD to detect PSE capability of providing 30W from hardware, register itself and it can move up to PoE+ level without waiting for any CDP/LLDP packet exchange.

Once 2-event is enabled on a port, you need to manually shut/un-shut the port or connect the PD again to start the IEEE detection again. Power budget allocation for a class-4 device will be 30W if 2-event classification is enabled on the port, else it will be 15.4W.

Configuring 2-event Classification

To configure the switch for a 2-event Classification, perform the steps given below:
SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. power inline port 2-event
5. end

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for EEE

EEE has the following restrictions:

• Changing the EEE configuration resets the interface because the device has to restart Layer 1 autonegotiation.

• You might want to enable the Link Layer Discovery Protocol (LLDP) for devices that require longer wakeup times before they are able to accept data on their receive paths. Doing so enables the device to negotiate for extended system wakeup times from the transmitting link partner.
Information About EEE

EEE Overview

Energy Efficient Ethernet (EEE) is an IEEE 802.3az standard that is designed to reduce power consumption in Ethernet networks during idle periods.

Default EEE Configuration

How to Configure EEE

You can enable or disable EEE on an interface that is connected to an EEE-capable link partner.

Enabling or Disabling EEE

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. power efficient-ethernet auto
4. no power efficient-ethernet auto
5. end
6. copy running-config startup-config

Following are examples of the `show eee` commands:

Switch#show eee capabilities interface gigabitEthernet2/0/1
Gi2/0/1
EEE(efficient-ethernet): yes (100-Tx and 1000T auto)
Link Partner : yes (100-Tx and 1000T auto)

ASIC/Interface : EEE Capable/EEE Enabled
Switch#show eee status interface gigabitEthernet2/0/1
Gi2/0/1 is up
EEE(efficient-ethernet): Operational
Rx LPI Status : Low Power
Configuration Examples for Configuring EEE

This example shows how to enable EEE for an interface:

```
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# power efficient-ethernet auto
```

This example shows how to disable EEE for an interface:

```
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# no power efficient-ethernet auto
```

Prerequisites for Configuring IGMP Snooping and MVR

Prerequisites for IGMP Snooping

Observe these guidelines when configuring the IGMP snooping querier:

- Configure the VLAN in global configuration mode.

- Configure an IP address on the VLAN interface. When enabled, the IGMP snooping querier uses the IP address as the query source address.

- If there is no IP address configured on the VLAN interface, the IGMP snooping querier tries to use the configured global IP address for the IGMP querier. If there is no global IP address specified, the IGMP querier tries to use the VLAN device virtual interface (SVI) IP address (if one exists). If there is no SVI IP address, the device uses the first available IP address configured on the device. The first IP address available appears in the output of the `show ip interface` privileged EXEC command. The IGMP snooping querier does not generate an IGMP general query if it cannot find an available IP address on the device.

- The IGMP snooping querier supports IGMP Versions 1 and 2.

- When administratively enabled, the IGMP snooping querier moves to the nonquerier state if it detects the presence of a multicast router in the network.

- When it is administratively enabled, the IGMP snooping querier moves to the operationally disabled state under these conditions:
• IGMP snooping is disabled in the VLAN.
• PIM is enabled on the SVI of the corresponding VLAN.

Prerequisites for MVR

The following are the prerequisites for Multicast VLAN Registration (MVR):
• To use MVR, the device must be running the LAN Base image.

Restrictions for Configuring IGMP Snooping and MVR

Restrictions for IGMP Snooping

The following are the restrictions for IGMP snooping:
• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.
• IGMPv3 join and leave messages are not supported on devices running IGMP filtering or Multicast VLAN registration (MVR).
• IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.
• The IGMP configurable leave time is only supported on hosts running IGMP Version 2. IGMP version 2 is the default version for the device.

The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.
• The IGMP throttling action restriction can be applied only to Layer 2 ports. You can use `ip igmp max-groups action replace` interface configuration command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

When the maximum group limitation is set to the default (no maximum), entering the `ip igmp max-groups action {deny | replace}` command has no effect.

If you configure the throttling action and set the maximum group limitation after an interface has added multicast entries to the forwarding table, the forwarding-table entries are either aged out or removed, depending on the throttling action.

Restrictions for MVR

The following are restrictions for MVR:
• Only Layer 2 ports participate in MVR. You must configure ports as MVR receiver ports.

• Only one MVR multicast VLAN per device or device stack is supported.

• Receiver ports can only be access ports; they cannot be trunk ports. Receiver ports on a device can be in different VLANs, but should not belong to the multicast VLAN.

• The maximum number of multicast entries (MVR group addresses) that can be configured on a device (that is, the maximum number of television channels that can be received) is 256.

• MVR multicast data received in the source VLAN and leaving from receiver ports has its time-to-live (TTL) decremented by 1 in the device.

• Because MVR on the device uses IP multicast addresses instead of MAC multicast addresses, alias IP multicast addresses are allowed on the device. However, if the device is interoperating with Catalyst 3550 or Catalyst 3500 XL devices, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).

• Do not configure MVR on private VLAN ports.

• MVR is not supported when multicast routing is enabled on a device. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled, and you receive a warning message. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled, and you receive an error message.

• MVR data received on an MVR receiver port is not forwarded to MVR source ports.

• MVR does not support IGMPv3 messages.

• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

Information About IGMP Snooping and MVR

IGMP Snooping

Layer 2 devices can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN device to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the device receives an IGMP report from a host for a particular multicast group, the device adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.

Note

For more information on IP multicast and IGMP, see RFC 1112 and RFC 2236.
The multicast router sends out periodic general queries to all VLANs. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry. The device creates one entry per VLAN in the IGMP snooping IP multicast forwarding table for each group from which it receives an IGMP join request.

The device supports IP multicast group-based bridging, instead of MAC-addressed based groups. With multicast MAC address-based groups, if an IP address being configured translates (aliases) to a previously configured MAC address or to any reserved multicast MAC addresses (in the range 224.0.0.xxx), the command fails. Because the device uses IP multicast groups, there are no address aliasing issues.

The IP multicast groups learned through IGMP snooping are dynamic. However, you can statically configure multicast groups by using the `ip igmp snooping vlan vlan-id static ip_address interface interface-id` global configuration command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings.

You can configure an IGMP snooping querier to support IGMP snooping in subnets without multicast interfaces because the multicast traffic does not need to be routed.

If a port spanning-tree, a port group, or a VLAN ID change occurs, the IGMP snooping-learned multicast groups from this port on the VLAN are deleted.

These sections describe IGMP snooping characteristics:

**IGMP Versions**

The device supports IGMP version 1, IGMP version 2, and IGMP version 3. These versions are interoperable on the device. For example, if IGMP snooping is enabled and the querier's version is IGMPv2, and the device receives an IGMPv3 report from a host, then the device can forward the IGMPv3 report to the multicast router.

An IGMPv3 device can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature.

**Joining a Multicast Group**

*Figure 4: Initial IGMP Join Message*

When a host connected to the device wants to join an IP multicast group and it is an IGMP version 2 client, it sends an unsolicited IGMP join message, specifying the IP multicast group to join. Alternatively, when the device receives a general query from the router, it forwards the query to all ports in the VLAN. IGMP version 1 or version 2 hosts wanting to join the multicast group respond by sending a join message to the device. The device CPU creates a multicast forwarding-table entry for the group if it is not already present. The CPU also adds the interface where the join message was received to the forwarding-table entry. The host associated with that interface receives multicast traffic for that multicast group.
Router A sends a general query to the device, which forwards the query to ports 2 through 5, all of which are members of the same VLAN. Host 1 wants to join multicast group 224.1.2.3 and multicasts an IGMP membership report (IGMP join message) to the group. The device CPU uses the information in the IGMP report to set up a forwarding-table entry that includes the port numbers connected to Host 1 and to the router.

**Table 13: IGMP Snooping Forwarding Table**

<table>
<thead>
<tr>
<th>Destination Address</th>
<th>Type of Packet</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.1.2.3</td>
<td>IGMP</td>
<td>1, 2</td>
</tr>
</tbody>
</table>

The device hardware can distinguish IGMP information packets from other packets for the multicast group. The information in the table tells the switching engine to send frames addressed to the 224.1.2.3 multicast IP address that are not IGMP packets to the router and to the host that has joined the group.

**Figure 5: Second Host Joining a Multicast Group**

If another host (for example, Host 4) sends an unsolicited IGMP join message for the same group, the CPU receives that message and adds the port number of Host 4 to the forwarding table. Because the forwarding table directs IGMP messages only to the CPU, the message is not flooded to other ports on the device. Any known multicast traffic is forwarded to the group and not to the CPU.
Leaving a Multicast Group

The router sends periodic multicast general queries, and the device forwards these queries through all ports in the VLAN. Interested hosts respond to the queries. If at least one host in the VLAN wants to receive multicast traffic, the router continues forwarding the multicast traffic to the VLAN. The device forwards multicast group traffic only to those hosts listed in the forwarding table for that IP multicast group maintained by IGMP snooping.

When hosts want to leave a multicast group, they can silently leave, or they can send a leave message. When the device receives a leave message from a host, it sends a group-specific query to learn if any other devices connected to that interface are interested in traffic for the specific multicast group. The device then updates the forwarding table for that MAC group so that only those hosts interested in receiving multicast traffic for the group are listed in the forwarding table. If the router receives no reports from a VLAN, it removes the group for the VLAN from its IGMP cache.

Immediate Leave

The device uses IGMP snooping Immediate Leave to remove from the forwarding table an interface that sends a leave message without the device sending group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Immediate Leave ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are simultaneously in use.

Immediate Leave is only supported on IGMP version 2 hosts. IGMP version 2 is the default version for the device.

⚠️ Note ⚠️

You should use the Immediate Leave feature only on VLANs where a single host is connected to each port. If Immediate Leave is enabled on VLANs where more than one host is connected to a port, some hosts may be dropped inadvertently.

IGMP Configurable-Leave Timer

You can configure the time that the device waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 32767 milliseconds.

IGMP Report Suppression

⚠️ Note ⚠️

IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.
The device uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP report suppression is enabled (the default), the device sends the first IGMP report from all hosts for a group to all the multicast routers. The device does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the device forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers.

If the multicast router query also includes requests for IGMPv3 reports, the device forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression, all IGMP reports are forwarded to the multicast routers.

**IGMP Snooping and Device Stacks**

IGMP snooping functions across the device stack; that is, IGMP control information from one device is distributed to all devices in the stack. Regardless of the stack member through which IGMP multicast data enters the stack, the data reaches the hosts that have registered for that group.

If a device in the stack fails or is removed from the stack, only the members of the multicast group that are on that device will not receive the multicast data. All other members of a multicast group on other devices in the stack continue to receive multicast data streams. However, multicast groups that are common for both Layer 2 and Layer 3 (IP multicast routing) might take longer to converge if the active device is removed.

**Default IGMP Snooping Configuration**

This table displays the default IGMP snooping configuration for the device.

**Multicast VLAN Registration**

Multicast VLAN Registration (MVR) is designed for applications using wide-scale deployment of multicast traffic across an Ethernet ring-based service-provider network (for example, the broadcast of multiple television
channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN. It allows the single multicast VLAN to be shared in the network while subscribers remain in separate VLANs. MVR provides the ability to continuously send multicast streams in the multicast VLAN, but to isolate the streams from the subscriber VLANs for bandwidth and security reasons.

These sections describe MVR:

**MVR and IGMP**

MVR can coexist with IGMP snooping on a device.

Note

MVR assumes that subscriber ports subscribe and unsubscribe (join and leave) these multicast streams by sending out IGMP join and leave messages. These messages can originate from an IGMP version-2-compatible host with an Ethernet connection. Although MVR operates on the underlying method of IGMP snooping, the two features operate independently of each other. One can be enabled or disabled without affecting the behavior of the other feature. However, if IGMP snooping and MVR are both enabled, MVR reacts only to join and leave messages from multicast groups configured under MVR. Join and leave messages from all other multicast groups are managed by IGMP snooping.

The device CPU identifies the MVR IP multicast streams and their associated IP multicast group in the device forwarding table, intercepts the IGMP messages, and modifies the forwarding table to include or remove the subscriber as a receiver of the multicast stream, even though the receivers might be in a different VLAN from the source. This forwarding behavior selectively allows traffic to cross between different VLANs.

**Modes of Operation**

You can set the device for compatible or dynamic mode of MVR operation:

- In compatible mode, multicast data received by MVR hosts is forwarded to all MVR data ports, regardless of MVR host membership on those ports. The multicast data is forwarded only to those receiver ports that MVR hosts have joined, either by IGMP reports or by MVR static configuration. IGMP reports received from MVR hosts are never forwarded from MVR data ports that were configured in the device.

- In dynamic mode, multicast data received by MVR hosts on the device is forwarded from only those MVR data and client ports that the MVR hosts have joined, either by IGMP reports or by MVR static configuration. Any IGMP reports received from MVR hosts are also forwarded from all the MVR data ports in the host. This eliminates using unnecessary bandwidth on MVR data port links, which occurs when the device runs in compatible mode.

**MVR and Switch Stacks**

Only one MVR multicast VLAN per device or device stack is supported.

Receiver ports and source ports can be on different devices in a device stack. Multicast data sent on the multicast VLAN is forwarded to all MVR receiver ports across the stack. When a new device is added to a stack, by default it has no receiver ports.

If a device fails or is removed from the stack, only those receiver ports belonging to that device will not receive the multicast data. All other receiver ports on other devices continue to receive the multicast data.
**MVR in a Multicast Television Application**

In a multicast television application, a PC or a television with a set-top box can receive the multicast stream. Multiple set-top boxes or PCs can be connected to one subscriber port, which is a device port configured as an MVR receiver port.

*Figure 6: Multicast VLAN Registration Example*

The following is an example configuration.

In this example configuration, DHCP assigns an IP address to the set-top box or the PC. When a subscriber selects a channel, the set-top box or PC sends an IGMP report to Switch A to join the appropriate multicast. If the IGMP report matches one of the configured IP multicast group addresses, the device CPU modifies the hardware address table to include this receiver port and VLAN as a forwarding destination of the specified multicast stream when it is received from the multicast VLAN. Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports.

When a subscriber changes channels or turns off the television, the set-top box sends an IGMP leave message for the multicast stream. The device CPU sends a MAC-based general query through the receiver port VLAN.
If there is another set-top box in the VLAN still subscribing to this group, that set-top box must respond within the maximum response time specified in the query. If the CPU does not receive a response, it eliminates the receiver port as a forwarding destination for this group.

Without Immediate Leave, when the device receives an IGMP leave message from a subscriber on a receiver port, it sends out an IGMP query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency. Enable the Immediate-Leave feature only on receiver ports to which a single receiver device is connected.

MVR eliminates the need to duplicate television-channel multicast traffic for subscribers in each VLAN. Multicast traffic for all channels is only sent around the VLAN trunk once—only on the multicast VLAN. The IGMP leave and join messages are in the VLAN to which the subscriber port is assigned. These messages dynamically register for streams of multicast traffic in the multicast VLAN on the Layer 3 device. The access layer device, Switch A, modifies the forwarding behavior to allow the traffic to be forwarded from the multicast VLAN to the subscriber port in a different VLAN, selectively allowing traffic to cross between two VLANs.

IGMP reports are sent to the same IP multicast group address as the multicast data. The Switch A CPU must capture all IGMP join and leave messages from receiver ports and forward them to the multicast VLAN of the source (uplink) port, based on the MVR mode.

**Default MVR Configuration**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**IGMP Filtering and Throttling**

In some environments, for example, metropolitan or multiple-dwelling unit (MDU) installations, you might want to control the set of multicast groups to which a user on a device port can belong. You can control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan. You might also want to limit the number of multicast groups to which a user on a device port can belong.

With the IGMP filtering feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual device ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a device port, the IGMP join report requesting the stream of IP multicast
traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing. You can also set the maximum number of IGMP groups that a Layer 2 interface can join.

IGMP filtering controls only group-specific query and membership reports, including join and leave reports. It does not control general IGMP queries. IGMP filtering has no relationship with the function that directs the forwarding of IP multicast traffic. The filtering feature operates in the same manner whether CGMP or MVR is used to forward the multicast traffic.

IGMP filtering applies only to the dynamic learning of IP multicast group addresses, not static configuration. With the IGMP throttling feature, you can set the maximum number of IGMP groups that a Layer 2 interface can join. If the maximum number of IGMP groups is set, the IGMP snooping forwarding table contains the maximum number of entries, and the interface receives an IGMP join report, you can configure an interface to drop the IGMP report or to replace the randomly selected multicast entry with the received IGMP report.

---

**Note**

IGMPv3 join and leave messages are not supported on devices running IGMP filtering.

### Default IGMP Filtering and Throttling Configuration

This table displays the default IGMP filtering and throttling configuration for the device.

### How to Configure IGMP Snooping and MVR

#### Enabling or Disabling IGMP Snooping on a Device

When IGMP snooping is globally enabled or disabled, it is also enabled or disabled in all existing VLAN interfaces. IGMP snooping is enabled on all VLANs by default, but can be enabled and disabled on a per-VLAN basis.

Global IGMP snooping overrides the VLAN IGMP snooping. If global snooping is disabled, you cannot enable VLAN snooping. If global snooping is enabled, you can enable or disable VLAN snooping.
Follow these steps to globally enable IGMP snooping on the device:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip igmp snooping
4. end
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>

</table>

Setting the Snooping Method

Multicast-capable router ports are added to the forwarding table for every Layer 2 multicast entry. The switch learns of the ports through one of these methods:
• Snooping on IGMP queries, Protocol-Independent Multicast (PIM) packets, and Distance Vector Multicast Routing Protocol (DVMRP) packets.
• Listening to Cisco Group Management Protocol (CGMP) packets from other routers.
• Statically connecting to a multicast router port using the `ip igmp snooping mrouter` global configuration command.

You can configure the switch either to snoop on IGMP queries and PIM/DVMRP packets or to listen to CGMP self-join or proxy-join packets. By default, the switch snoops on PIM/DVMRP packets on all VLANs. To learn of multicast router ports through only CGMP packets, use the `ip igmp snooping vlan vlan-id mrouter learn cgmp` global configuration command. When this command is entered, the router listens to only CGMP self-join and CGMP proxy-join packets and to no other CGMP packets. To learn of multicast router ports through only PIM-DVMRP packets, use the `ip igmp snooping vlan vlan-id mrouter learn pim-dvmrp` global configuration command.

If you want to use CGMP as the learning method and no multicast routers in the VLAN are CGMP proxy-enabled, you must enter the `ip cgmp router-only` command to dynamically access the router.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `ip igmp snooping vlan vlan-id mrouter learn {cgmp | pim-dvmrp}`
4. end
5. show ip igmp snooping
6. copy running-config startup-config

---

**Configuring a Multicast Router Port**

Perform these steps to add a multicast router port (enable a static connection to a multicast router) on the device.

---

**Note**

Static connections to multicast routers are supported only on device ports.

---

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `ip igmp snooping vlan vlan-id mrouter interface interface-id`
4. end
5. `show ip igmp snooping mrouter [vlan vlan-id]`
6. copy running-config startup-config

---

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
### Configuring a Host Statically to Join a Group

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure a host on an interface.

Follow these steps to add a Layer 2 port as a member of a multicast group:

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

*Example:*

```
Device# configure terminal
```

**Purpose:** Enters global configuration mode.

**Step 3**

```
ip igmp snooping vlan vlan-id mrouter interface interface-id
```

*Example:*

```
Device(config)# ip igmp snooping vlan 5 mrouter interface gigabitethernet1/0/1
```

**Purpose:** Specifies the multicast router VLAN ID and the interface to the multicast router.

- The VLAN ID range is 1 to 1001 and 1006 to 4094.
- The interface can be a physical interface or a port channel. The port-channel range is 1 to 128.

**Note:** To remove a multicast router port from the VLAN, use the `no ip igmp snooping vlan vlan-id mrouter interface interface-id` global configuration command.

**Step 4**

```
end
```

*Example:*

```
Device(config)# end
```

**Purpose:** Returns to privileged EXEC mode.

**Step 5**

```
show ip igmp snooping mrouter [vlan vlan-id]
```

*Example:*

```
Device# show ip igmp snooping mrouter vlan 5
```

**Purpose:** Verifies that IGMP snooping is enabled on the VLAN interface.

**Step 6**

```
copy running-config startup-config
```

*Example:*

```
Device# copy running-config startup-config
```

**Purpose:** (Optional) Saves your entries in the configuration file.
SUMMARY STEPS

1. enable
2. configure terminal
3. ip igmp snooping vlan `vlan-id` static `ip_address` interface `interface-id`
4. end
5. show ip igmp snooping groups
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip igmp snooping vlan</code> <code>vlan-id</code> static <code>ip_address</code> interface <code>interface-id</code></td>
<td>Statically configures a Layer 2 port as a member of a multicast group:</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>ip igmp snooping vlan</code> <code>105</code> static <code>230.0.0.1</code> interface <code>gigabitethernet1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> To remove the Layer 2 port from the multicast group, use the <code>no ip igmp snooping vlan</code> <code>vlan-id</code> static <code>mac-address</code> interface <code>interface-id</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show <code>ip igmp snooping groups</code></td>
<td>Verifies the member port and the IP address.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show <code>ip igmp snooping groups</code></td>
<td></td>
</tr>
</tbody>
</table>
Enabling IGMP Immediate Leave

When you enable IGMP Immediate Leave, the device immediately removes a port when it detects an IGMP Version 2 leave message on that port. You should use the Immediate-Leave feature only when there is a single receiver present on every port in the VLAN.

**Note**

Immediate Leave is supported only on IGMP Version 2 hosts. IGMP Version 2 is the default version for the device.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip igmp snooping vlan vlan-id immediate-leave
4. end
5. show ip igmp snooping vlan vlan-id
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable
   
   **Example:**
   
   Device> enable | Enables privileged EXEC mode. |
   
   * Enter your password if prompted. |
| **Step 2** configure terminal
   
   **Example:**
   
   Device# configure terminal | Enters global configuration mode. |
| **Step 3** ip igmp snooping vlan vlan-id immediate-leave
   
   **Example:**
   
   Device(config)# ip igmp snooping vlan 21 | Enables IGMP Immediate Leave on the VLAN interface. |
   
   **Note** To disable IGMP Immediate Leave on a VLAN, use the no ip igmp snooping vlan vlan-id immediate-leave global configuration command. |
Configuring the IGMP Leave Timer

You can configure the leave time globally or on a per-VLAN basis. Follow these steps to enable the IGMP configurable-leave timer:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip igmp snooping last-member-query-interval time`
4. `ip igmp snooping vlan vlan-id last-member-query-interval time`
5. `end`
6. `show ip igmp snooping`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring TCN-Related Commands

#### Configuring TCN-Related Commands

</tr>
</tbody>
</table>

### Controlling the Multicast Flooding Time After a TCN Event

You can configure the number of general queries by which multicast data traffic is flooded after a topology change notification (TCN) event. If you set the TCN flood query count to 1 the flooding stops after receiving
1 general query. If you set the count to 7, the flooding continues until 7 general queries are received. Groups are relearned based on the general queries received during the TCN event.

Some examples of TCN events are when the client location is changed and the receiver is on same port that was blocked but is now forwarding, and when a port goes down without sending a leave message.

Follow these steps to configure the TCN flood query count:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip igmp snooping tcn flood query count count`
4. `end`
5. `show ip igmp snooping`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Enters global configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Specifies the number of IGMP general queries for which the multicast traffic is flooded.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>The range is 1 to 10. The default, the flooding query count is 2.</td>
</tr>
<tr>
<td><code>ip igmp snooping tcn flood query count count</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip igmp snooping tcn flood query count 3</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note** To return to the default flooding query count, use the `no ip igmp snooping tcn flood query count` global configuration command.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Verifies the TCN settings.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>show ip igmp snooping</code></td>
<td></td>
</tr>
</tbody>
</table>
Recovering from Flood Mode

When a topology change occurs, the spanning-tree root sends a special IGMP leave message (also known as global leave) with the group multicast address 0.0.0.0. However, you can enable the device to send the global leave message whether it is the spanning-tree root or not. When the router receives this special leave, it immediately sends general queries, which expedite the process of recovering from the flood mode during the TCN event. Leaves are always sent if the device is the spanning-tree root regardless of this configuration.

Follow these steps to enable sending of leave messages:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip igmp snooping tcn query solicit`
4. `end`
5. `show ip igmp snooping`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip igmp snooping tcn query solicit</td>
<td>Sends an IGMP leave message (global leave) to speed the process of recovering from the flood mode caused during a TCN event. By default, query solicitation is disabled.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>ip igmp snooping tcn query solicit</code></td>
<td></td>
</tr>
</tbody>
</table>
Disabling Multicast Flooding During a TCN Event

When the device receives a TCN, multicast traffic is flooded to all the ports until 2 general queries are received. If the device has many ports with attached hosts that are subscribed to different multicast groups, this flooding might exceed the capacity of the link and cause packet loss. Follow these steps to control TCN flooding:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. no ip igmp snooping tcn flood
5. end
6. show ip igmp snooping
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  Example:
  Device> enable | Enables privileged EXEC mode.
  • Enter your password if prompted. |
### Configuring the IGMP Snooping Querier

Follow these steps to enable the IGMP snooping querier feature in a VLAN:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip igmp snooping querier
4. `ip igmp snooping querier address ip_address`
5. `ip igmp snooping querier query-interval interval-count`
6. `ip igmp snooping querier tcn query [count count | interval interval]`
7. `ip igmp snooping querier timer expiry timeout`
8. `ip igmp snooping querier version version`
9. `end`
10. `show ip igmp snooping vlan vlan-id`
11. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td>Enables privileged EXEC mode. • Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables the IGMP snooping querier.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip igmp snooping querier</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Specifies an IP address for the IGMP snooping querier. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip igmp snooping querier address 172.16.24.1</code></td>
<td>Note The IGMP snooping querier does not generate an IGMP general query if it cannot find an IP address on the device.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Sets the interval between IGMP queriers. The range is 1 to 18000 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip igmp snooping querier query-interval 30</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Sets the time between Topology Change Notification (TCN) queries. The count range is 1 to 10. The interval range is 1 to 255 seconds.</td>

<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device(config)# ip igmp snooping querier tcn query interval 20</strong></td>
</tr>
</tbody>
</table>

**Step 7**  
**ip igmp snooping querier timer expiry** *timeout*  
**Example:**  
```
Device(config)# ip igmp snooping querier timer expiry 180
```

(Optional) Sets the length of time until the IGMP querier expires. The range is 60 to 300 seconds.

**Step 8**  
**ip igmp snooping querier version** *version*  
**Example:**  
```
Device(config)# ip igmp snooping querier version 2
```

(Optional) Selects the IGMP version number that the querier feature uses. Select 1 or 2.

**Step 9**  
**end**  
**Example:**  
```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 10**  
**show ip igmp snooping vlan** *vlan-id*  
**Example:**  
```
Device# show ip igmp snooping vlan 30
```

(Optional) Verifies that the IGMP snooping querier is enabled on the VLAN interface. The VLAN ID range is 1 to 1001 and 1006 to 4094.

**Step 11**  
**copy running-config startup-config**  
**Example:**  
```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Disabling IGMP Report Suppression

Follow these steps to disable IGMP report suppression:

**SUMMARY STEPS**

1. enable  
2. configure terminal  
3. no ip igmp snooping report-suppression  
4. end  
5. show ip igmp snooping  
6. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  **Example:**  
  ```bash
  Device> enable
  ``` |
| **Step 2** configure terminal | Enters global configuration mode.  
  **Example:**  
  ```bash
  Device# configure terminal
  ``` |
| **Step 3** no ip igmp snooping report-suppression | Disables IGMP report suppression. When report suppression is disabled, all IGMP reports are forwarded to the multicast routers.  
  **Example:**  
  ```bash
  Device(config)# no ip igmp snooping report-suppression
  ``` |
| **Step 4** end | Returns to privileged EXEC mode.  
  **Example:**  
  ```bash
  Device(config)# end
  ``` |
| **Step 5** show ip igmp snooping | Verifies that IGMP report suppression is disabled.  
  **Example:**  
  ```bash
  Device# show ip igmp snooping
  ``` |
| **Step 6** copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
  **Example:**  
  ```bash
  Device# copy running-config startup-config
  ``` |

### Configuring MVR Global Parameters

You do not need to set the optional MVR parameters if you choose to use the default settings. If you want to change the default parameters (except for the MVR VLAN), you must first enable MVR.
For complete syntax and usage information for the commands used in this section, see the command reference for this release.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `mvr`
4. `mvr group ip-address [count]`
5. `mvr querytime value`
6. `mvr vlan vlan-id`
7. `mvr mode {dynamic | compatible}`
8. `end`
9. Use one of the following:
   - `show mvr`
   - `show mvr members`
10. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>

<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td><code>mvr group ip-address [count]</code></td>
<td>Configures an IP multicast address on the device or use the <code>count</code> parameter to configure a contiguous series of MVR group addresses (the range for <code>count</code> is 1 to 256; the default is 1). Any multicast data sent to this address is sent to all source ports on the device and all receiver ports that have elected to receive data on that multicast address. Each</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# mvr group 228.1.23.4</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

The multicast address would correspond to one television channel.

#### Note

To return the switch to its default settings, use the `no mvr [mode | group ip-address | querytime | vlan]` global configuration commands.

### Step 5

**Command or Action**: `mvr querytime value`  
**Example**:  
```
Device(config)# mvr querytime 10
```

(Optional) Defines the maximum time to wait for IGMP report memberships on a receiver port before removing the port from multicast group membership. The value is in units of tenths of a second. The range is 1 to 100, and the default is 5 tenths or one-half second.

### Step 6

**Command or Action**: `mvr vlan vlan-id`  
**Example**:  
```
Device(config)# mvr vlan 22
```

(Optional) Specifies the VLAN in which multicast data is received; all source ports must belong to this VLAN. The VLAN range is 1 to 1001 and 1006 to 4094. The default is VLAN 1.

### Step 7

**Command or Action**: `mvr mode {dynamic | compatible}`  
**Example**:  
```
Device(config)# mvr mode dynamic
```

(Optional) Specifies the MVR mode of operation:  
- **dynamic**—Allows dynamic MVR membership on source ports.  
- **compatible**—Is compatible with Catalyst 3500 XL and Catalyst 2900 XL devices and does not support IGMP dynamic joins on source ports.

The default is **compatible** mode.

#### Note

To return the switch to its default settings, use the `no mvr [mode | group ip-address | querytime | vlan]` global configuration commands.

### Step 8

**Command or Action**: `end`  
**Example**:  
```
Device(config)# end
```

Returns to privileged EXEC mode.

### Step 9

Use one of the following:  
- `show mvr`  
- `show mvr members`  

**Example**:  
```
Device# show mvr
```

Verifies the configuration.
### Configuring MVR Interfaces

Follow these steps to configure Layer 2 MVR interfaces:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `mvr`
4. `interface interface-id`
5. `mvr type {source | receiver}`
6. `mvr vlan vlan-id group [ip-address]`
7. `mvr immediate`
8. `end`
9. Use one of the following:
   - `show mvr`
   - `show mvr interface`
   - `show mvr members`
10. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>mvr</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device (config)# mvr</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>interface interface-id</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# interface gigabitethernet1/0/2</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>**mvr type {source</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>To return the interface to its default settings, use the **no mvr [type</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>mvr vlan vlan-id group [ip-address]</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config-if)# mvr vlan 22 group 228.1.23.4</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>In compatible mode, this command applies to only receiver ports. In dynamic mode, it applies to receiver ports and source ports. Receiver ports can also dynamically join multicast groups by using IGMP join and leave messages.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>mvr immediate</strong>&lt;br&gt;<strong>Example:</strong></td>
</tr>
</tbody>
</table>
**Configuring IGMP Profiles**

Follow these steps to create an IGMP profile:

This task is optional.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip igmp profile profile number
4. permit | deny
5. range ip multicast address
6. end
7. show ip igmp profile profile number
8. show running-config
9. copy running-config startup-config

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device(config-if)# mvr immediate</strong></td>
<td><strong>Note</strong> This command applies to only receiver ports and should only be enabled on receiver ports to which a single receiver device is connected.</td>
</tr>
</tbody>
</table>

**Step 8**  
Example:  
Device(config)# end

**Step 9**  
Use one of the following:  
- show mvr  
- show mvr interface  
- show mvr members  

Example:  
Device# show mvr interface  
Port Type Status Immediate  
Leave ---- ---- -------  
---------------  
Gi1/0/2 RECEIVER ACTIVE/DOWN ENABLED

**Step 10**  
**copy running-config startup-config**  
Example:  
Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Example:</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Example:</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp profile profile number</td>
<td>Example:</td>
<td>Assigns a number to the profile you are configuring, and enters IGMP profile configuration mode. The profile number range is 1 to 4294967295. When you are in IGMP profile configuration mode, you can create the profile by using these commands:</td>
</tr>
<tr>
<td></td>
<td>Device(config)# ip igmp profile 3</td>
<td>• deny—Specifies that matching addresses are denied; this is the default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• exit—Exits from igmp-profile configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• no—Negates a command or returns to its defaults.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• permit—Specifies that matching addresses are permitted.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• range—Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with a start and an end address.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default is for the device to have no IGMP profiles configured.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note To delete a profile, use the no ip igmp profile profile number global configuration command.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit</td>
<td>Example:</td>
<td>(Optional) Sets the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.</td>
</tr>
<tr>
<td></td>
<td>Device(config-igmp-profile)# permit</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>range</td>
<td>Example:</td>
<td>Enters the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address.</td>
</tr>
<tr>
<td>ip multicast address</td>
<td>Device(config-igmp-profile)# range 229.9.0</td>
<td>You can use the range command multiple times to enter multiple addresses or ranges of addresses.</td>
</tr>
</tbody>
</table>
To delete an IP multicast address or range of IP multicast addresses, use the `no range ip multicast address` IGMP profile configuration command.

**Step 6**

*Example:*

Device(config)# end

Returns to privileged EXEC mode.

**Step 7**

*Example:*

Device# show ip igmp profile 3

Verifies the profile configuration.

**Step 8**

*Example:*

Device# show running-config

Verifies your entries.

**Step 9**

*Example:*

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### Applying IGMP Profiles

To control access as defined in an IGMP profile, you have to apply the profile to the appropriate interfaces. You can apply IGMP profiles only to Layer 2 access ports; you cannot apply IGMP profiles to routed ports or SVIs. You cannot apply profiles to ports that belong to an EtherChannel port group. You can apply a profile to multiple interfaces, but each interface can have only one profile applied to it.

Follow these steps to apply an IGMP profile to a switch port:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip igmp filter profile number`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface interface-id</td>
<td>Specifies the physical interface, and enters interface configuration mode. The interface must be a Layer 2 port that does not belong to an EtherChannel port group.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip igmp filter profile number</td>
<td>Applies the specified IGMP profile to the interface. The range is 1 to 4294967295.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# ip igmp filter 321</td>
<td><strong>Note</strong> To remove a profile from an interface, use the <strong>no ip igmp filter profile number</strong> interface configuration command.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Setting the Maximum Number of IGMP Groups**

Follow these steps to set the maximum number of IGMP groups that a Layer 2 interface can join:
Setting the Maximum Number of IGMP Groups

**Before you begin**

This restriction can be applied to Layer 2 ports only; you cannot set a maximum number of IGMP groups on routed ports or SVIs. You also can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. ip igmp max-groups number
5. end
6. show running-config interface interface-id
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>interface interface-id</td>
<td>Specifies the interface to be configured, and enters interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or a EtherChannel interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# interface gigabitethernet1/0/2</td>
<td></td>
</tr>
<tr>
<td>4.</td>
<td>ip igmp max-groups number</td>
<td>Sets the maximum number of IGMP groups that the interface can join. The range is 0 to 4294967294. The default is to have no maximum set.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# ip igmp max-groups 20</td>
<td></td>
</tr>
<tr>
<td>5.</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

To remove the maximum group limitation and return to the default of no maximum, use the no ip igmp max-groups interface configuration command.
### Configuring the IGMP Throttling Action

After you set the maximum number of IGMP groups that a Layer 2 interface can join, you can configure an interface to replace the existing group with the new group for which the IGMP report was received.

Follow these steps to configure the throttling action when the maximum number of entries is in the forwarding table:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip igmp max-groups action {deny | replace}`
5. `end`
6. `show running-config interface interface-id`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

- `enable`
- Example:
  
  ```
  Device> enable
  ```

  Enables privileged EXEC mode.

  - Enter your password if prompted.

| **Step 2**

- `configure terminal`
- Example:
  
  ```
  Device# configure terminal
  ```

  Enters global configuration mode.
### Configuring the IGMP Throttling Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config)# interface gigabitethernet1/0/1</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>**ip igmp max-groups action {deny</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config-if)# ip igmp max-groups action replace</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config)# end</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>show running-config interface interface-id</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device# show running-config interface gigabitethernet1/0/1</strong></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>(Optional) Saves your entries in the configuration file.</strong></td>
</tr>
</tbody>
</table>
Monitoring IGMP Snooping and MVR

Monitoring IGMP Snooping Information

You can display IGMP snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for IGMP snooping.

Table 18: Commands for Displaying IGMP Snooping Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp snooping [vlan vlan-id [detail] ]</code></td>
<td>Displays the snooping configuration information for all VLANs on the device or for a specified VLAN. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>
| `show ip igmp snooping groups [count dynamic [count] | user [count]]` | Displays multicast table information for the device or about a specific parameter:  
  - `count` — Displays the total number of entries for the specified command options instead of the actual entries.  
  - `dynamic` — Displays entries learned through IGMP snooping.  
  - `user` — Displays only the user-configured multicast entries. |
| `show ip igmp snooping groups vlan vlan-id [ip_address | count | dynamic [count] | user[count]]` | Displays multicast table information for a multicast VLAN or about a specific parameter for the VLAN:  
  - `vlan-id` — The VLAN ID range is 1 to 1001 and 1006 to 4094.  
  - `count` — Displays the total number of entries for the specified command options instead of the actual entries.  
  - `dynamic` — Displays entries learned through IGMP snooping.  
  - `ip_address` — Displays characteristics of the multicast group with the specified group IP address.  
  - `user` — Displays only the user-configured multicast entries. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `show ip igmp snooping mrouter [vlan vlan-id]` | Displays information on dynamically learned and manually configured multicast router interfaces.  
**Note** When you enable IGMP snooping, the device automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.  
(Optional) Enter the `vlan vlan-id` to display information for a particular VLAN. |
| `show ip igmp snooping querier [vlan vlan-id] detail` | Displays information about the IP address and receiving port of the most-recently received IGMP query message in the VLAN and the configuration and operational state of the IGMP snooping querier in the VLAN. |

### Monitoring MVR

You can monitor MVR for the switch or for a specified interface by displaying the following MVR information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show mvr</code></td>
<td>Displays MVR status and values for the switch—whether MVR is enabled or disabled, the multicast VLAN, the maximum (256) and current (0 through 256) number of multicast groups, the query response time, and the MVR mode.</td>
</tr>
</tbody>
</table>
### Purpose

**Command**

`show mvr interface [interface-id] [members [vlan vlan-id]]`

**Purpose**

Displays all MVR interfaces and their MVR configurations.

When a specific interface is entered, displays this information:

- **Type**—Receiver or Source
- **Status**—One of these:
  - Active means the port is part of a VLAN.
  - Up/Down means that the port is forwarding or nonforwarding.
  - Inactive means that the port is not part of any VLAN.
  - Immediate Leave—Enabled or Disabled

If the `members` keyword is entered, displays all multicast group members on this port or, if a VLAN identification is entered, all multicast group members on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.

**Command**

`show mvr members [ip-address]`

**Purpose**

Displays all receiver and source ports that are members of any IP multicast group or the specified IP multicast group IP address.

### Monitoring IGMP Filtering and Throttling Configuration

You can display IGMP profile characteristics, and you can display the IGMP profile and maximum group configuration for all interfaces on the device or for a specified interface. You can also display the IGMP throttling configuration for all interfaces on the device or for a specified interface.

**Table 20: Commands for Displaying IGMP Filtering and Throttling Configuration**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp profile [profile number]</code></td>
<td>Displays the specified IGMP profile or all the IGMP profiles defined on the device.</td>
</tr>
<tr>
<td><code>show running-config [interface interface-id]</code></td>
<td>Displays the configuration of the specified interface or the configuration of all interfaces on the device, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface.</td>
</tr>
</tbody>
</table>
Configuration Examples for IGMP Snooping and MVR

Example: Configuring IGMP Snooping Using CGMP Packets

This example shows how to configure IGMP snooping to use CGMP packets as the learning method:

```bash
Device# configure terminal
Device(config)# ip igmp snooping vlan 1 mrouter learn cgmp
Device(config)# end
```

Example: Enabling a Static Connection to a Multicast Router

This example shows how to enable a static connection to a multicast router:

```bash
Device# configure terminal
Device# ip igmp snooping vlan 200 mrouter interface gigabitethernet1/0/2
Device# end
```

Example: Configuring a Host Statically to Join a Group

This example shows how to statically configure a host on a port:

```bash
Device# configure terminal
Device# ip igmp snooping vlan 105 static 0100.1212.0000 interface gigabitethernet1/0/1
Device# end
```

Example: Enabling IGMP Immediate Leave

This example shows how to enable IGMP Immediate Leave on VLAN 130:

```bash
Device# configure terminal
Device(config)# ip igmp snooping vlan 130 immediate-leave
Device(config)# end
```

Example: Setting the IGMP Snooping Querier Source Address

This example shows how to set the IGMP snooping querier source address to 10.0.0.64:

```bash
Device# configure terminal
Device(config)# ip igmp snooping querier 10.0.0.64
Device(config)# end
```

Example: Setting the IGMP Snooping Querier Maximum Response Time

This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:
Example: Setting the IGMP Snooping Querier Timeout

This example shows how to set the IGMP snooping querier timeout to 60 seconds:

```
Device# configure terminal
Device(config)# ip igmp snooping querier timeout expiry 60
Device(config)# end
```

Example: Setting the IGMP Snooping Querier Feature

This example shows how to set the IGMP snooping querier feature to Version 2:

```
Device# configure terminal
Device(config)# no ip igmp snooping querier version 2
Device(config)# end
```

Example: Configuring IGMP Profiles

This example shows how to create IGMP profile 4 allowing access to the single IP multicast address and how to verify the configuration. If the action was to deny (the default), it would not appear in the `show ip igmp profile` output display.

```
Device(config)# ip igmp profile 4
Device(config-igmp-profile)# permit
Device(config-igmp-profile)# range 229.9.9.0
Device(config-igmp-profile)# end
Device# show ip igmp profile 4
IGMP Profile 4
  permit
    range 229.9.9.0 229.9.9.0
```

Example: Applying IGMP Profile

This example shows how to apply IGMP profile 4 to a port:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip igmp filter 4
Device(config-if)# end
```

Example: Setting the Maximum Number of IGMP Groups

This example shows how to limit to 25 the number of IGMP groups that a port can join:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip igmp max-groups 25
Device(config-if)# end
```
Example: Configuring MVR Global Parameters

This example shows how to enable MVR, configure the group address, set the query time to 1 second (10 tenths), specify the MVR multicast VLAN as VLAN 22, and set the MVR mode as dynamic:

```
Device(config)# mvr
Device(config)# mvr group 228.1.23.4
Device(config)# mvr querytime 10
Device(config)# mvr vlan 22
Device(config)# mvr mode dynamic
Device(config)# end
```

Example: Configuring MVR Interfaces

This example shows how to configure a port as a receiver port, statically configure the port to receive multicast traffic sent to the multicast group address, configure Immediate Leave on the port, and verify the results:

```
Device(config)# mvr
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# mvr type receiver
Device(config-if)# mvr vlan 22 group 228.1.23.4
Device(config-if)# mvr immediate
Device(config)# end
```

```
Device# show mvr interface
Port Type Status Immediate Leave
---- ---- ------- ---------------
Gi1/0/2 RECEIVER ACTIVE/DOWN ENABLED
```

Prerequisites for PIM

Before you begin the PIM configuration process, decide which PIM mode to use. This is based on the applications you intend to support on your network. Use the following guidelines:

- In general, if the application is one-to-many or many-to-many in nature, then PIM-SM can be used successfully.
- For optimal one-to-many application performance, SSM is appropriate but requires IGMP version 3 support.

Before you configure PIM stub routing, check that you have met these conditions:

- You must have IP multicast routing configured on both the stub router and the central router. You must also have PIM mode (dense-mode, sparse-mode, or sparse-dense-mode) configured on the uplink interface of the stub router.
- You must also configure Enhanced Interior Gateway Routing Protocol (EIGRP) stub routing on the device.
- The PIM stub router does not route the transit traffic between the distribution routers. Unicast (EIGRP) stub routing enforces this behavior. You must configure unicast stub routing to assist the PIM stub router behavior.
Restrictions for PIM

PIMv1 and PIMv2 Interoperability

To avoid misconfiguring multicast routing on your device, review the information in this section.

The Cisco PIMv2 implementation provides interoperability and transition between Version 1 and Version 2, although there might be some minor problems.

You can upgrade to PIMv2 incrementally. PIM Versions 1 and 2 can be configured on different routers and multilayer devices within one network. Internally, all routers and multilayer devices on a shared media network must run the same PIM version. Therefore, if a PIMv2 device detects a PIMv1 device, the Version 2 device downgrades itself to Version 1 until all Version 1 devices have been shut down or upgraded.

PIMv2 uses the BSR to discover and announce RP-set information for each group prefix to all the routers and multilayer devices in a PIM domain. PIMv1, together with the Auto-RP feature, can perform the same tasks as the PIMv2 BSR. However, Auto-RP is a standalone protocol, separate from PIMv1, and is a proprietary Cisco protocol. PIMv2 is a standards track protocol in the IETF.

---

Note

We recommend that you use PIMv2. The BSR function interoperates with Auto-RP on Cisco routers and multilayer devices.

When PIMv2 devices interoperate with PIMv1 devices, Auto-RP should have already been deployed. A PIMv2 BSR that is also an Auto-RP mapping agent automatically advertises the RP elected by Auto-RP. That is, Auto-RP sets its single RP on every router or multilayer device in the group. Not all routers and devices in the domain use the PIMv2 hash function to select multiple RPs.

Sparse-mode groups in a mixed PIMv1 and PIMv2 region are possible because the Auto-RP feature in PIMv1 interoperates with the PIMv2 RP feature. Although all PIMv2 devices can also use PIMv1, we recommend that the RPs be upgraded to PIMv2. To ease the transition to PIMv2, we recommend:

- Using Auto-RP throughout the region.
- Configuring sparse-dense mode throughout the region.

If Auto-RP is not already configured in the PIMv1 regions, configure Auto-RP.

Restrictions for Configuring PIM Stub Routing

- The IP services image contains complete multicast routing.
- Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM protocol is not supported in access domains.
- In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a device that is configured with PIM stub routing.
- The redundant PIM stub router topology is not supported. Only the nonredundant access router topology is supported by the PIM stub feature.
Restrictions for Configuring Auto-RP and BSR

Take into consideration your network configuration, and the following restrictions when configuring Auto-RP and BSR:

Restrictions for Configuring Auto-RP

The following are restrictions for configuring Auto-RP (if used in your network configuration):

• If you configure PIM in sparse mode or sparse-dense mode and do not configure Auto-RP, you must manually configure an RP.

• If routed interfaces are configured in sparse mode, Auto-RP can still be used if all devices are configured with a manual RP address for the Auto-RP groups.

• If routed interfaces are configured in sparse mode and you enter the `ip pim autorp listener` global configuration command, Auto-RP can still be used even if all devices are not configured with a manual RP address for the Auto-RP groups.

Restrictions for Configuring BSR

The following are the restrictions for configuring BSR (if used in your network configuration):

• Configure the candidate BSRs as the RP-mapping agents for Auto-RP.

• For group prefixes advertised through Auto-RP, the PIMv2 BSR mechanism should not advertise a subrange of these group prefixes served by a different set of RPs. In a mixed PIMv1 and PIMv2 domain, have backup RPs serve the same group prefixes. This prevents the PIMv2 DRs from selecting a different RP from those PIMv1 DRs, due to the longest match lookup in the RP-mapping database.

Restrictions and Guidelines for Configuring Auto-RP and BSR

The following are restrictions for configuring Auto-RP and BSR (if used in your network configuration):

• If your network is all Cisco routers and multilayer devices, you can use either Auto-RP or BSR.

• If you have non-Cisco routers in your network, you must use BSR.

• If you have Cisco PIMv1 and PIMv2 routers and multilayer devices and non-Cisco routers, you must use both Auto-RP and BSR. If your network includes routers from other vendors, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 device. Ensure that no PIMv1 device is located in the path a between the BSR and a non-Cisco PIMv2 device.

Note

There are two approaches to using PIMv2. You can use Version 2 exclusively in your network or migrate to Version 2 by employing a mixed PIM version environment.

• Because bootstrap messages are sent hop-by-hop, a PIMv1 device prevents these messages from reaching all routers and multilayer devices in your network. Therefore, if your network has a PIMv1 device in it and only Cisco routers and multilayer devices, it is best to use Auto-RP.
• If you have a network that includes non-Cisco routers, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 router or multilayer device. Ensure that no PIMv1 device is on the path between the BSR and a non-Cisco PIMv2 router.

• If you have non-Cisco PIMv2 routers that need to interoperate with Cisco PIMv1 routers and multilayer devices, both Auto-RP and a BSR are required. We recommend that a Cisco PIMv2 device be both the Auto-RP mapping agent and the BSR.

Information About PIM

Protocol Independent Multicast

The Protocol Independent Multicast (PIM) protocol maintains the current IP multicast service mode of receiver-initiated membership. PIM is not dependent on a specific unicast routing protocol; it is IP routing protocol independent and can leverage whichever unicast routing protocols are used to populate the unicast routing table, including Enhanced Interior Gateway Routing Protocol (EIGRP), Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), and static routes. PIM uses unicast routing information to perform the multicast forwarding function.

Although PIM is called a multicast routing protocol, it actually uses the unicast routing table to perform the reverse path forwarding (RPF) check function instead of building up a completely independent multicast routing table. Unlike other routing protocols, PIM does not send and receive routing updates between routers.

PIM can operate in dense mode or sparse mode. The router can also handle both sparse groups and dense groups at the same time. The mode determines how the router populates its multicast routing table and how the router forwards multicast packets it receives from its directly connected LANs.

For information about PIM forwarding (interface) modes, see the following sections:

PIM Dense Mode

PIM dense mode (PIM-DM) uses a push model to flood multicast traffic to every corner of the network. This push model is a method for delivering data to the receivers without the receivers requesting the data. This method is efficient in certain deployments in which there are active receivers on every subnet in the network.

In dense mode, a router assumes that all other routers want to forward multicast packets for a group. If a router receives a multicast packet and has no directly connected members or PIM neighbors present, a prune message is sent back to the source. Subsequent multicast packets are not flooded to this router on this pruned branch. PIM builds source-based multicast distribution trees.

PIM-DM initially floods multicast traffic throughout the network. Routers that have no downstream neighbors prune back the unwanted traffic. This process repeats every 3 minutes.

Routers accumulate state information by receiving data streams through the flood and prune mechanism. These data streams contain the source and group information so that downstream routers can build up their multicast forwarding table. PIM-DM supports only source trees—that is, \((S,G)\) entries—and cannot be used to build a shared distribution tree.

---

**Note**

Dense mode is not often used and its use is not recommended. For this reason it is not specified in the configuration tasks in related modules.
PIM Sparse Mode

PIM sparse mode (PIM-SM) uses a pull model to deliver multicast traffic. Only network segments with active receivers that have explicitly requested the data will receive the traffic.

Sparse mode interfaces are added to the multicast routing table only when periodic Join messages are received from downstream routers, or when a directly connected member is on the interface. When forwarding from a LAN, sparse mode operation occurs if an RP is known for the group. If so, the packets are encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense mode fashion. If the multicast traffic from a specific source is sufficient, the first hop router of the receiver may send Join messages toward the source to build a source-based distribution tree.

PIM-SM distributes information about active sources by forwarding data packets on the shared tree. Because PIM-SM uses shared trees (at least, initially), it requires the use of a rendezvous point (RP). The RP must be administratively configured in the network. See the Rendezvous Points, on page 162 section for more information.

In sparse mode, a router assumes that other routers do not want to forward multicast packets for a group, unless there is an explicit request for the traffic. When hosts join a multicast group, the directly connected routers send PIM Join messages toward the RP. The RP keeps track of multicast groups. Hosts that send multicast packets are registered with the RP by the first hop router of that host. The RP then sends Join messages toward the source. At this point, packets are forwarded on a shared distribution tree. If the multicast traffic from a specific source is sufficient, the first hop router of the host may send Join messages toward the source to build a source-based distribution tree.

Sources register with the RP and then data is forwarded down the shared tree to the receivers. The edge routers learn about a particular source when they receive data packets on the shared tree from that source through the RP. The edge router then sends PIM (S,G) Join messages toward that source. Each router along the reverse path compares the unicast routing metric of the RP address to the metric of the source address. If the metric for the source address is better, it will forward a PIM (S,G) Join message toward the source. If the metric for the RP is the same or better, then the PIM (S,G) Join message will be sent in the same direction as the RP. In this case, the shared tree and the source tree would be considered congruent.

If the shared tree is not an optimal path between the source and the receiver, the routers dynamically create a source tree and stop traffic from flowing down the shared tree. This behavior is the default behavior in software. Network administrators can force traffic to stay on the shared tree by using the ip pim spt-threshold infinity command.

PIM-SM scales well to a network of any size, including those with WAN links. The explicit join mechanism prevents unwanted traffic from flooding the WAN links.

Sparse-Dense Mode

If you configure either sparse mode or dense mode on an interface, then sparseness or denseness is applied to the interface as a whole. However, some environments might require PIM to run in a single region in sparse mode for some groups and in dense mode for other groups.

An alternative to enabling only dense mode or only sparse mode is to enable sparse-dense mode. In this case, the interface is treated as dense mode if the group is in dense mode; the interface is treated in sparse mode if the group is in sparse mode. You must have an RP if the interface is in sparse-dense mode and you want to treat the group as a sparse group.

If you configure sparse-dense mode, the idea of sparseness or denseness is applied to the groups for which the router is a member.
Another benefit of sparse-dense mode is that Auto-RP information can be distributed in a dense mode; yet, multicast groups for user groups can be used in a sparse mode manner. Therefore there is no need to configure a default RP at the leaf routers.

When an interface is treated in dense mode, it is populated in the outgoing interface list of a multicast routing table when either of the following conditions is true:

- Members or DVMRP neighbors are on the interface.
- There are PIM neighbors and the group has not been pruned.

When an interface is treated in sparse mode, it is populated in the outgoing interface list of a multicast routing table when either of the following conditions is true:

- Members or DVMRP neighbors are on the interface.
- An explicit Join message has been received by a PIM neighbor on the interface.

### PIM Versions

PIMv2 includes these improvements over PIMv1:

- A single, active rendezvous point (RP) exists per multicast group, with multiple backup RPs. This single RP compares to multiple active RPs for the same group in PIMv1.
- A bootstrap router (BSR) provides a fault-tolerant, automated RP discovery and distribution function that enables routers and multilayer devices to dynamically learn the group-to-RP mappings.
- Sparse mode and dense mode are properties of a group, as opposed to an interface.

**Note**

We strongly recommend using sparse-dense mode as opposed to either sparse mode or dense mode only.

- PIM join and prune messages have more flexible encoding for multiple address families.
- A more flexible hello packet format replaces the query packet to encode current and future capability options.
- Register messages sent to an RP specify whether they are sent by a border router or a designated router.
- PIM packets are no longer inside IGMP packets; they are standalone packets.

### PIM Stub Routing

The PIM stub routing feature, available in all of the device software images, reduces resource usage by moving routed traffic closer to the end user.

The PIM stub routing feature supports multicast routing between the distribution layer and the access layer. It supports two types of PIM interfaces, uplink PIM interfaces, and PIM passive interfaces. A routed interface configured with the PIM passive mode does not pass or forward PIM control traffic, it only passes and forwards IGMP traffic.
In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a device that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IP multicast routing and configure only the device as a PIM stub router. The device does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the device. The device uplink port cannot be used with SVIs. If you need PIM for an SVI uplink port, you should upgrade to the IP Services feature set.

You must also configure EIGRP stub routing when configuring PIM stub routing on the device.

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM asset and designated router election mechanisms are not supported on the PIM passive interfaces. Only the nonredundant access router topology is supported by the PIM stub feature. By using a nonredundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

**Figure 7: PIM Stub Router Configuration**

In the following figure, the Device A routed uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source 200.1.1.3.

**IGMP Helper**

PIM stub routing moves routed traffic closer to the end user and reduces network traffic. You can also reduce traffic by configuring a stub router (switch) with the IGMP helper feature.

You can configure a stub router (switch) with the `ip igmp helper-address ip-address` interface configuration command to enable the switch to send reports to the next-hop interface. Hosts that are not directly connected to a downstream router can then join a multicast group sourced from an upstream network. The IGMP packets from a host wanting to join a multicast stream are forwarded upstream to the next-hop device when this feature.
is configured. When the upstream central router receives the helper IGMP reports or leaves, it adds or removes the interfaces from its outgoing interface list for that group.

### Rendezvous Points

A rendezvous point (RP) is a role that a device performs when operating in Protocol Independent Multicast (PIM) Sparse Mode (SM). An RP is required only in networks running PIM SM. In the PIM-SM model, only network segments with active receivers that have explicitly requested multicast data will be forwarded the traffic.

This method of delivering multicast data is in contrast to PIM Dense Mode (PIM DM). In PIM DM, multicast traffic is initially flooded to all segments of the network. Routers that have no downstream neighbors or directly connected receivers prune back the unwanted traffic.

An RP acts as the meeting place for sources and receivers of multicast data. In a PIM-SM network, sources must send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree. By default, when the first hop device of the receiver learns about the source, it will send a Join message directly to the source, creating a source-based distribution tree from the source to the receiver. This source tree does not include the RP unless the RP is located within the shortest path between the source and receiver.

In most cases, the placement of the RP in the network is not a complex decision. By default, the RP is needed only to start new sessions with sources and receivers. Consequently, the RP experiences little overhead from traffic flow or processing. In PIM version 2, the RP performs less processing than in PIM version 1 because sources must only periodically register with the RP to create state.

### Auto-RP

In the first version of PIM-SM, all leaf routers (routers directly connected to sources or receivers) were required to be manually configured with the IP address of the RP. This type of configuration is also known as static RP configuration. Configuring static RPs is relatively easy in a small network, but it can be laborious in a large, complex network.

Following the introduction of PIM-SM version 1, Cisco implemented a version of PIM-SM with the Auto-RP feature. Auto-RP automates the distribution of group-to-RP mappings in a PIM network. Auto-RP has the following benefits:

- Configuring the use of multiple RPs within a network to serve different groups is easy.
- Auto-RP allows load splitting among different RPs and arrangement of RPs according to the location of group participants.
- Auto-RP avoids inconsistent, manual RP configurations that can cause connectivity problems.

Multiple RPs can be used to serve different group ranges or serve as backups to each other. For Auto-RP to work, a router must be designated as an RP-mapping agent, which receives the RP-announcement messages from the RPs and arbitrates conflicts. The RP-mapping agent then sends the consistent group-to-RP mappings to all other routers. Thus, all routers automatically discover which RP to use for the groups they support.

---

**Note**

If you configure PIM in sparse mode or sparse-dense mode and do not configure Auto-RP, you must statically configure an RP.
If router interfaces are configured in sparse mode, Auto-RP can still be used if all routers are configured with a static RP address for the Auto-RP groups.

To make Auto-RP work, a router must be designated as an RP mapping agent, which receives the RP announcement messages from the RPs and arbitrates conflicts. The RP mapping agent then sends the consistent group-to-RP mappings to all other routers by dense mode flooding. Thus, all routers automatically discover which RP to use for the groups they support. The Internet Assigned Numbers Authority (IANA) has assigned two group addresses, 224.0.1.39 and 224.0.1.40, for Auto-RP. One advantage of Auto-RP is that any change to the RP designation must be configured only on the routers that are RPs and not on the leaf routers. Another advantage of Auto-RP is that it offers the ability to scope the RP address within a domain. Scoping can be achieved by defining the time-to-live (TTL) value allowed for the Auto-RP advertisements.

Each method for configuring an RP has its own strengths, weaknesses, and level of complexity. In conventional IP multicast network scenarios, we recommend using Auto-RP to configure RPs because it is easy to configure, well-tested, and stable. The alternative ways to configure an RP are static RP, Auto-RP, and bootstrap router.

**Sparse-Dense Mode for Auto-RP**

A prerequisite of Auto-RP is that all interfaces must be configured in sparse-dense mode using the `ip pim sparse-dense-mode` interface configuration command. An interface configured in sparse-dense mode is treated in either sparse mode or dense mode of operation, depending on which mode the multicast group operates. If a multicast group has a known RP, the interface is treated in sparse mode. If a group has no known RP, by default the interface is treated in dense mode and data will be flooded over this interface. (You can prevent dense-mode fallback; see the module “Configuring Basic IP Multicast.”)

To successfully implement Auto-RP and prevent any groups other than 224.0.1.39 and 224.0.1.40 from operating in dense mode, we recommend configuring a “sink RP” (also known as “RP of last resort”). A sink RP is a statically configured RP that may or may not actually exist in the network. Configuring a sink RP does not interfere with Auto-RP operation because, by default, Auto-RP messages supersede static RP configurations. We recommend configuring a sink RP for all possible multicast groups in your network, because it is possible for an unknown or unexpected source to become active. If no RP is configured to limit source registration, the group may revert to dense mode operation and be flooded with data.

**Bootstrap Router**

Another RP selection model called bootstrap router (BSR) was introduced after Auto-RP in PIM-SM version 2. BSR performs similarly to Auto-RP in that it uses candidate routers for the RP function and for relaying the RP information for a group. RP information is distributed through BSR messages, which are carried within PIM messages. PIM messages are link-local multicast messages that travel from PIM router to PIM router. Because of this single hop method of disseminating RP information, TTL scoping cannot be used with BSR. A BSR performs similarly as an RP, except that it does not run the risk of reverting to dense mode operation, and it does not offer the ability to scope within a domain.

**PIM Domain Border**

As IP multicast becomes more widespread, the chance of one PIMv2 domain bordering another PIMv2 domain increases. Because two domains probably do not share the same set of RPs, BSR, candidate RPs, and candidate BSRs, you need to constrain PIMv2 BSR messages from flowing into or out of the domain. Allowing messages to leak across the domain borders could adversely affect the normal BSR election mechanism and elect a
single BSR across all bordering domains and comingle candidate RP advertisements, resulting in the election of RPs in the wrong domain.

**Multicast Forwarding**

Forwarding of multicast traffic is accomplished by multicast-capable routers. These routers create distribution trees that control the path that IP multicast traffic takes through the network in order to deliver traffic to all receivers.

Multicast traffic flows from the source to the multicast group over a distribution tree that connects all of the sources to all of the receivers in the group. This tree may be shared by all sources (a shared tree) or a separate distribution tree can be built for each source (a source tree). The shared tree may be one-way or bidirectional.

Before describing the structure of source and shared trees, it is helpful to explain the notations that are used in multicast routing tables. These notations include the following:

- \((S,G)\) = (unicast source for the multicast group G, multicast group G)
- \((*,G)\) = (any source for the multicast group G, multicast group G)

The notation of \((S,G)\), pronounced “S comma G,” enumerates a shortest path tree where S is the IP address of the source and G is the multicast group address.

Shared trees are \((*,G)\) and the source trees are \((S,G)\) and always routed at the sources.

**Multicast Distribution Source Tree**

The simplest form of a multicast distribution tree is a source tree. A source tree has its root at the source host and has branches forming a spanning tree through the network to the receivers. Because this tree uses the shortest path through the network, it is also referred to as a shortest path tree (SPT).

The figure shows an example of an SPT for group 224.1.1.1 rooted at the source, Host A, and connecting two receivers, Hosts B and C.
Using standard notation, the SPT for the example shown in the figure would be (192.168.1.1, 224.1.1.1).

The (S,G) notation implies that a separate SPT exists for each individual source sending to each group—which is correct.

**Multicast Distribution Shared Tree**

Unlike source trees that have their root at the source, shared trees use a single common root placed at some chosen point in the network. This shared root is called a rendezvous point (RP).

The following figure shows a shared tree for the group 224.2.2.2 with the root located at Router D. This shared tree is unidirectional. Source traffic is sent towards the RP on a source tree. The traffic is then forwarded down the shared tree from the RP to reach all of the receivers (unless the receiver is located between the source and the RP, in which case it will be serviced directly).

*Figure 8: Shared Tree*

In this example, multicast traffic from the sources, Hosts A and D, travels to the root (Router D) and then down the shared tree to the two receivers, Hosts B and C. Because all sources in the multicast group use a common shared tree, a wildcard notation written as (*,G), pronounced “star comma G,” represents the tree. In this case, * means all sources, and G represents the multicast group. Therefore, the shared tree shown in the figure would be written as (*, 224.2.2.2).

Both source trees and shared trees are loop-free. Messages are replicated only where the tree branches. Members of multicast groups can join or leave at any time; therefore the distribution trees must be dynamically updated. When all the active receivers on a particular branch stop requesting the traffic for a particular multicast group, the routers prune that branch from the distribution tree and stop forwarding traffic down that branch. If one receiver on that branch becomes active and requests the multicast traffic, the router will dynamically modify the distribution tree and start forwarding traffic again.

**Source Tree Advantage**

Source trees have the advantage of creating the optimal path between the source and the receivers. This advantage guarantees the minimum amount of network latency for forwarding multicast traffic. However,
this optimization comes at a cost. The routers must maintain path information for each source. In a network that has thousands of sources and thousands of groups, this overhead can quickly become a resource issue on the routers. Memory consumption from the size of the multicast routing table is a factor that network designers must take into consideration.

**Shared Tree Advantage**

Shared trees have the advantage of requiring the minimum amount of state in each router. This advantage lowers the overall memory requirements for a network that only allows shared trees. The disadvantage of shared trees is that under certain circumstances the paths between the source and receivers might not be the optimal paths, which might introduce some latency in packet delivery. For example, in the figure above the shortest path between Host A (source 1) and Host B (a receiver) would be Router A and Router C. Because we are using Router D as the root for a shared tree, the traffic must traverse Routers A, B, D and then C. Network designers must carefully consider the placement of the rendezvous point (RP) when implementing a shared tree-only environment.

In unicast routing, traffic is routed through the network along a single path from the source to the destination host. A unicast router does not consider the source address; it considers only the destination address and how to forward the traffic toward that destination. The router scans through its routing table for the destination address and then forwards a single copy of the unicast packet out the correct interface in the direction of the destination.

In multicast forwarding, the source is sending traffic to an arbitrary group of hosts that are represented by a multicast group address. The multicast router must determine which direction is the upstream direction (toward the source) and which one is the downstream direction (or directions) toward the receivers. If there are multiple downstream paths, the router replicates the packet and forwards it down the appropriate downstream paths (best unicast route metric)—which is not necessarily all paths. Forwarding multicast traffic away from the source, rather than to the receiver, is called Reverse Path Forwarding (RPF). RPF is described in the following section.

**PIM Shared Tree and Source Tree**

By default, members of a group receive data from senders to the group across a single data-distribution tree rooted at the RP.
The following figure shows this type of shared-distribution tree. Data from senders is delivered to the RP for distribution to group members joined to the shared tree.

If the data rate warrants, leaf routers (routers without any downstream connections) on the shared tree can use the data distribution tree rooted at the source. This type of distribution tree is called a shortest-path tree or source tree. By default, the software devices to a source tree upon receiving the first data packet from a source.

This process describes the move from a shared tree to a source tree:

1. A receiver joins a group; leaf Router C sends a join message toward the RP.
2. The RP puts a link to Router C in its outgoing interface list.
3. A source sends data; Router A encapsulates the data in a register message and sends it to the RP.
4. The RP forwards the data down the shared tree to Router C and sends a join message toward the source. At this point, data might arrive twice at Router C, once encapsulated and once natively.
5. When data arrives natively (unencapsulated) at the RP, it sends a register-stop message to Router A.
6. By default, reception of the first data packet prompts Router C to send a join message toward the source.
7. When Router C receives data on (S, G), it sends a prune message for the source up the shared tree.
8. The RP deletes the link to Router C from the outgoing interface of (S, G). The RP triggers a prune message toward the source.

Join and prune messages are sent for sources and RPs. They are sent hop-by-hop and are processed by each PIM device along the path to the source or RP. Register and register-stop messages are not sent hop-by-hop. They are sent by the designated router that is directly connected to a source and are received by the RP for the group.

Multiple sources sending to groups use the shared tree. You can configure the PIM device to stay on the shared tree.
The change from shared to source tree happens when the first data packet arrives at the last-hop router. This change depends upon the threshold that is configured by using the `ip pim spt-threshold` global configuration command.

The shortest-path tree requires more memory than the shared tree but reduces delay. You may want to postpone its use. Instead of allowing the leaf router to immediately move to the shortest-path tree, you can specify that the traffic must first reach a threshold.

You can configure when a PIM leaf router should join the shortest-path tree for a specified group. If a source sends at a rate greater than or equal to the specified kbps rate, the multilayer switch triggers a PIM join message toward the source to construct a source tree (shortest-path tree). If the traffic rate from the source drops below the threshold value, the leaf router switches back to the shared tree and sends a prune message toward the source.

You can specify to which groups the shortest-path tree threshold applies by using a group list (a standard access list). If a value of 0 is specified or if the group list is not used, the threshold applies to all groups.

**Reverse Path Forwarding**

In unicast routing, traffic is routed through the network along a single path from the source to the destination host. A unicast router does not consider the source address; it considers only the destination address and how to forward the traffic toward that destination. The router scans through its routing table for the destination network and then forwards a single copy of the unicast packet out the correct interface in the direction of the destination.

In multicast forwarding, the source is sending traffic to an arbitrary group of hosts that are represented by a multicast group address. The multicast router must determine which direction is the upstream direction (toward the source) and which one is the downstream direction (or directions) toward the receivers. If there are multiple downstream paths, the router replicates the packet and forwards it down the appropriate downstream paths (best unicast route metric)—which is not necessarily all paths. Forwarding multicast traffic away from the source, rather than to the receiver, is called Reverse Path Forwarding (RPF). RPF is an algorithm used for forwarding multicast datagrams.

Protocol Independent Multicast (PIM) uses the unicast routing information to create a distribution tree along the reverse path from the receivers towards the source. The multicast routers then forward packets along the distribution tree from the source to the receivers. RPF is a key concept in multicast forwarding. It enables routers to correctly forward multicast traffic down the distribution tree. RPF makes use of the existing unicast routing table to determine the upstream and downstream neighbors. A router will forward a multicast packet only if it is received on the upstream interface. This RPF check helps to guarantee that the distribution tree will be loop-free.

**RPF Check**

When a multicast packet arrives at a router, the router performs an RPF check on the packet. If the RPF check succeeds, the packet is forwarded. Otherwise, it is dropped.

For traffic flowing down a source tree, the RPF check procedure works as follows:

1. The router looks up the source address in the unicast routing table to determine if the packet has arrived on the interface that is on the reverse path back to the source.

2. If the packet has arrived on the interface leading back to the source, the RPF check succeeds and the packet is forwarded out the interfaces present in the outgoing interface list of a multicast routing table entry.

3. If the RPF check in Step 2 fails, the packet is dropped.
The figure shows an example of an unsuccessful RPF check.

*Figure 10: RPF Check Fails*

![Diagram of RPF Check Fails]

As the figure illustrates, a multicast packet from source 151.10.3.21 is received on serial interface 0 (S0). A check of the unicast route table shows that S1 is the interface this router would use to forward unicast data to 151.10.3.21. Because the packet has arrived on interface S0, the packet is discarded.

The figure shows an example of a successful RPF check.

*Figure 11: RPF Check Succeeds*

![Diagram of RPF Check Succeeds]

In this example, the multicast packet has arrived on interface S1. The router refers to the unicast routing table and finds that S1 is the correct interface. The RPF check passes, and the packet is forwarded.

## Default PIM Routing Configuration

This table displays the default PIM routing configuration for the device.

*Table 21: Default Multicast Routing Configuration*

</tbody>
</table>

### Configuring a Rendezvous Point

You must have a rendezvous point (RP), if the interface is in sparse-dense mode and if you want to handle the group as a sparse group. You can use these methods:

- By manually assigning an RP to multicast groups.
- As a standalone, Cisco-proprietary protocol separate from PIMv1, which includes:
  - Setting up Auto-RP in a new internetwork
  - Adding Auto-RP to an existing sparse-mode cloud
  - Preventing join messages to false RPs
  - Filtering incoming RP announcement messages
• By using a standards track protocol in the Internet Engineering Task Force (IETF), which includes configuring PIMv2 BSR.

Note
You can use Auto-RP, BSR, or a combination of both, depending on the PIM version that you are running and the types of routers in your network. For information about working with different PIM versions in your network, see the PIMv1 and PIMv2 Interoperability section.

Manually Assigning an RP to Multicast Groups

If the rendezvous point (RP) for a group is learned through a dynamic mechanism (such as Auto-RP or BSR), you need not perform this task for that RP.

Senders of multicast traffic announce their existence through register messages received from the source first-hop router (designated router) and forwarded to the RP. Receivers of multicast packets use RPs to join a multicast group by using explicit join messages.

Note
RPs are not members of the multicast group; they serve as a meeting place for multicast sources and group members.

You can configure a single RP for multiple groups defined by an access list. If there is no RP configured for a group, the multilayer device responds to the group as dense and uses the dense-mode PIM techniques.

This procedure is optional.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip pim rp-address ip-address [access-list-number] [override]
4. access-list access-list-number {deny | permit} source [source-wildcard]
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Device# configure terminal**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip pim rp-address ip-address [access-list-number] [override]</td>
<td>Configures the address of a PIM RP. By default, no PIM RP address is configured. You must configure the IP address of RPs on all routers and multilayer devices (including the RP).</td>
</tr>
</tbody>
</table>

**Step 3**

**Example:**

```
Device(config)# ip pim rp-address 10.1.1.1 20 override
```

**Note**

If there is no RP configured for a group, the device treats the group as dense, using the dense-mode PIM techniques.

A PIM device can be an RP for more than one group. Only one RP address can be used at a time within a PIM domain. The access list conditions specify for which groups the device is an RP.

- For `ip-address`, enter the unicast address of the RP in dotted-decimal notation.
- (Optional) For `access-list-number`, enter an IP standard access list number from 1 to 99. If no access list is configured, the RP is used for all groups.
- (Optional) The `override` keyword indicates that if there is a conflict between the RP configured with this command and one learned by Auto-RP or BSR, the RP configured with this command prevails.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]</td>
</tr>
</tbody>
</table>

**Step 4**

**Example:**

```
Device(config)# access-list 25 permit 10.5.0.1 255.224.0.0
```

- For `access-list-number`, enter the access list number specified in Step 2.
- The `deny` keyword denies access if the conditions are matched.
- The `permit` keyword permits access if the conditions are matched.
- For `source`, enter the multicast group address for which the RP should be used.
- (Optional) For `source-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.

The access list is always terminated by an implicit deny statement for everything.
Setting Up Auto-RP in a New Internetwork

If you are setting up Auto-RP in a new internetwork, you do not need a default RP because you configure all the interfaces for sparse-dense mode.

Note

Omit Step 3 in the following procedure, if you want to configure a PIM router as the RP for the local group.

SUMMARY STEPS

1. enable
2. show running-config
3. configure terminal
4. ip pim send-rp-announce interface-id scope ttl group-list access-list-number interval seconds
5. access-list access-list-number {deny | permit} source [source-wildcard]
6. ip pim send-rp-discovery scope ttl
7. end
8. show running-config
9. show ip pim rp mapping
10. show ip pim rp
11. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>

Configuring Sparse Mode with a Single Static RP (CLI)

A rendezvous point (RP) is required in networks running Protocol Independent Multicast sparse mode (PIM-SM). In PIM-SM, traffic will be forwarded only to network segments with active receivers that have explicitly requested multicast data.

This section describes how to configure sparse mode with a single static RP.

**Before you begin**

All access lists that are needed when sparse mode is configured with a single static RP should be configured prior to beginning the configuration task.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip multicast-routing [distributed]`
4. `interface type number`
5. `ip pim sparse-mode`
6. Repeat Steps 1 through 5 on every interface that uses IP multicast.
7. `exit`
8. `ip pim rp-address rp-address [access-list] [override]`
9. `end`
10. `show ip pim [mapping] [rp-address]`
11. `show ip igmp groups [group-name | group-address | interface-type interface-number] [detail]`
12. `show ip mroute`

**DETAILED STEPS**

<table>

</table>

**Step 5**

**ip pim sparse-mode**  
Example:  
```
device(config-if)# ip pim sparse-mode
```

**Step 6**  
Repeat Steps 1 through 5 on every interface that uses IP multicast.

**Step 7**  
`exit`  
Example:  
```
device(config-if)# exit
```

**Step 8**

**ip pim rp-address**  
`rp-address [access-list] [override]`  
Example:  
```
device(config)# ip pim rp-address 192.168.0.0
```

**Step 9**

`end`  
Example:  
```
device(config)# end
```

**Step 10**

`show ip pim rp [mapping] [rp-address]`  
Example:  
```
device# show ip pim rp mapping
```

**Step 11**

`show ip igmp groups [group-name | group-address] [interface-type interface-number] [detail]`  
Example:  

---

*Note*  
If no access list is defined, the RP will map to all multicast groups, 224/4.

- The optional *access-list* argument is used to specify the number or name of a standard access list that defines the multicast groups to be statically mapped to the RP.

*Note*  
If the *override* keyword is not specified and there is RP address conflict, dynamic group-to-RP mappings will take precedence over static group-to-RP mappings.
### Preventing Join Messages to False RPs

Determine whether the `ip pim accept-rp` command was previously configured throughout the network by using the `show running-config` privileged EXEC command. If the `ip pim accept-rp` command is not configured on any device, this problem can be addressed later. In those routers or multilayer devices already configured with the `ip pim accept-rp` command, you must enter the command again to accept the newly advertised RP.

To accept all RPs advertised with Auto-RP and reject all other RPs by default, use the `ip pim accept-rp auto-rp` global configuration command.

This procedure is optional.

### Filtering Incoming RP Announcement Messages

You can add configuration commands to the mapping agents to prevent a maliciously configured router from masquerading as a candidate RP and causing problems.

This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip pim rp-announce-filter rp-list access-list-number group-list access-list-number`
4. `access-list access-list-number {deny | permit} source [source-wildcard]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

</table>
|        | Device(config)# access-list 10 permit 10.8.1.0 255.255.224.0 | • For access-list-number, enter the access list number specified in Step 2.  
• The deny keyword denies access if the conditions are matched.  
• The permit keyword permits access if the conditions are matched.  
• Create an access list that specifies from which routers and multilayer devices the mapping agent accepts candidate RP announcements (rp-list ACL).  
• Create an access list that specifies the range of multicast groups from which to accept or deny (group-list ACL).  
• For source, enter the multicast group address range for which the RP should be used.  
• (Optional) For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. |
|        |                     | The access list is always terminated by an implicit deny statement for everything. |
### Configuring PIMv2 BSR

The process for configuring PIMv2 BSR may involve the following optional tasks:

- Defining the PIM domain border
- Defining the IP multicast boundary
- Configuring candidate BSRs
- Configuring candidate RPs

#### Defining the PIM Domain Border

Perform the following steps to configure the PIM domain border. This procedure is optional.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. ip pim bsr-border
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 interface interface-id</td>
<td>Specifies the interface to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td>Step 4 ip pim bsr-border</td>
<td>Defines a PIM bootstrap message boundary for the PIM domain.</td>
</tr>
<tr>
<td>Example: Device(config-if)# ip pim bsr-border</td>
<td>Enter this command on each interface that connects to other bordering PIM domains. This command instructs the device to neither send nor receive PIMv2 BSR messages on this interface.</td>
</tr>
<tr>
<td>Note:</td>
<td>To remove the PIM border, use the no ip pim bsr-border interface configuration command.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Device# show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Defining the IP Multicast Boundary

You define a multicast boundary to prevent Auto-RP messages from entering the PIM domain. You create an access list to deny packets destined for 224.0.1.39 and 224.0.1.40, which carry Auto-RP information.
This procedure is optional.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. access-list access-list-number deny source [source-wildcard]
4. interface interface-id
5. ip multicast boundary access-list-number
6. end
7. show running-config
8. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> access-list access-list-number deny source</td>
<td>Creates a standard access list, repeating the command as many times as</td>
</tr>
<tr>
<td>[source-wildcard]</td>
<td>necessary.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)#</td>
<td></td>
</tr>
<tr>
<td>access-list 12 deny 224.0.1.39</td>
<td></td>
</tr>
<tr>
<td>access-list 12 deny 224.0.1.40</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> interface interface-id</td>
<td>Specifies the interface to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Step 5

**ip multicast boundary access-list-number**

**Example:**

Device(config-if)# ip multicast boundary 12

Configures the boundary, specifying the access list you created in Step 2.

### Step 6

**end**

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

### Step 7

**show running-config**

**Example:**

Device# show running-config

Verifies your entries.

### Step 8

**copy running-config startup-config**

**Example:**

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

**Configuring Candidate BSRs**

You can configure one or more candidate BSRs. The devices serving as candidate BSRs should have good connectivity to other devices and be in the backbone portion of the network.

This procedure is optional.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip pim bsr-candidate interface-id hash-mask-length [priority]
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

  | Enter your password if prompted. |
### Purpose

**Command or Action**

**Device**

### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th><strong>configure terminal</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| **Device**

Enters global configuration mode.

### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th><strong>ip pim bsr-candidate interface-id hash-mask-length [priority]</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| **Device**

Configures your device to be a candidate BSR.

- For **interface-id**, enter the interface on this device from which the BSR address is derived to make it a candidate. This interface must be enabled with PIM. Valid interfaces include physical ports, port channels, and VLANs.

- For **hash-mask-length**, specify the mask length (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash correspond to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter.

- (Optional) For **priority**, enter a number from 0 to 255. The BSR with the larger priority is preferred. If the priority values are the same, the device with the highest IP address is selected as the BSR. The default is 0.

### Command or Action

<table>
<thead>
<tr>
<th>Step 4</th>
<th><strong>end</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>

<tr>
<th>Step 6</th>
<th><strong>copy running-config startup-config</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| **Device**

(Optional) Saves your entries in the configuration file.
Configuring the Candidate RPs

You can configure one or more candidate RPs. Similar to BSRs, the RPs should also have good connectivity to other devices and be in the backbone portion of the network. An RP can serve the entire IP multicast address space or a portion of it. Candidate RPs send candidate RP advertisements to the BSR.

This procedure is optional.

Before you begin

When deciding which devices should be RPs, consider these options:

- In a network of Cisco routers and multilayer devices where only Auto-RP is used, any device can be configured as an RP.
- In a network that includes only Cisco PIMv2 routers and multilayer devices and with routers from other vendors, any device can be used as an RP.
- In a network of Cisco PIMv1 routers, Cisco PIMv2 routers, and routers from other vendors, configure only Cisco PIMv2 routers and multilayer devices as RPs.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip pim rp-candidate interface-id [group-list access-list-number]
4. access-list access-list-number {deny | permit} source [source-wildcard]
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| Example:                       |         |
| Device# configure terminal     |         |

| **Step 3** ip pim rp-candidate interface-id [group-list access-list-number] | Configures your device to be a candidate RP. |
| Example:                        | • For interface-id, specify the interface whose associated IP address is advertised as a candidate RP address. Valid interfaces include physical ports, port channels, and VLANs. |
| Device(config)# ip pim rp-candidate gigabitethernet |         |
### Delaying the Use of PIM Shortest-Path Tree

Perform these steps to configure a traffic rate threshold that must be reached before multicast routing is switched from the source tree to the shortest-path tree.

This procedure is optional.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/0/5 group-list 10</td>
<td>(Optional) For group-list access-list-number, enter an IP standard access list number from 1 to 99. If no group-list is specified, the device is a candidate RP for all groups.</td>
</tr>
<tr>
<td>Step 4 access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]</td>
</tr>
<tr>
<td>Example: Device(config)# access-list 10 permit 239.0.0.0 0.255.255.255</td>
<td>For access-list-number, enter the access list number specified in Step 2.</td>
</tr>
<tr>
<td></td>
<td>The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>For source, enter the number of the network or host from which the packet is being sent.</td>
</tr>
<tr>
<td></td>
<td>(Optional) For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>The access list is always terminated by an implicit deny statement for everything.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Device# show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. enable
2. configure terminal
3. access-list access-list-number {deny | permit} source [source-wildcard]
4. ip pim spt-threshold {kbps | infinity} [group-list access-list-number]
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable           | Enables privileged EXEC mode.  
|      | Example:         | • Enter your password if prompted. |
|      | Device> enable   |         |
| 2    | configure terminal | Enters global configuration mode. |
|      | Example:         |         |
|      | Device# configure terminal |         |
| 3    | access-list access-list-number {deny | permit} source [source-wildcard] | Creates a standard access list. 
|      | Example:         | • For access-list-number, the range is 1 to 99. 
|      | Device(config)# access-list 16 permit 225.0.0.0 0.255.255.255 | • The deny keyword denies access if the conditions are matched. 
|      |                  | • The permit keyword permits access if the conditions are matched. 
|      |                  | • For source, specify the multicast group to which the threshold will apply. 
|      |                  | • (Optional) For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. 
|      |                  | The access list is always terminated by an implicit deny statement for everything. |
| 4    | ip pim spt-threshold {kbps | infinity} [group-list access-list-number] | Specifies the threshold that must be reached before moving to shortest-path tree (spt). 
|      | Example:         | • For kbps, specify the traffic rate in kilobits per second. 
|      | Device(config)# ip pim spt-threshold | The default is 0 kbps. |
### Modifying the PIM Router-Query Message Interval

PIM routers and multilayer devices send PIM router-query messages to find which device will be the designated router (DR) for each LAN segment (subnet). The DR is responsible for sending IGMP host-query messages to all hosts on the directly connected LAN.

With PIM DM operation, the DR has meaning only if IGMPv1 is in use. IGMPv1 does not have an IGMP querier election process, so the elected DR functions as the IGMP querier. With PIM-SM operation, the DR is the device that is directly connected to the multicast source. It sends PIM register messages to notify the RP that multicast traffic from a source needs to be forwarded down the shared tree. In this case, the DR is the device with the highest IP address.

This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>infinity group-list 16</code></td>
<td>Note: Because of device hardware limitations, 0 kbps is the only valid entry even though the range is 0 to 4294967.</td>
</tr>
<tr>
<td></td>
<td>• Specify <code>infinity</code> if you want all sources for the specified group to use the shared tree, never switching to the source tree.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>group-list access-list-number</code>, specify the access list created in Step 2. If the value is 0 or if the group list is not used, the threshold applies to all groups.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>

#### Command or Action

<table>
<thead>
<tr>
<th>Step 1</th>
<th>enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

Enables privileged EXEC mode.

- Enter your password if prompted.

<table>
<thead>
<tr>
<th>Step 2</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
</tbody>
</table>

Enters global configuration mode.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>interface interface-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
</tr>
</tbody>
</table>

Specifies the interface to be configured, and enters interface configuration mode.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>ip pim query-interval seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-if)# ip pim query-interval 45</td>
</tr>
</tbody>
</table>

Configures the frequency at which the device sends PIM router-query messages.

The default is 30 seconds. The range is 1 to 65535.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# end</td>
</tr>
</tbody>

Verifying PIM Operations

Verifying IP Multicast Operation in a PIM-SM or a PIM-SSM Network

Perform the following optional tasks to verify IP multicast operation in a PIM-SM or a PIM-SSM network. The steps in these tasks help to locate a faulty hop when sources and receivers are not operating as expected.

If packets are not reaching their expected destinations, you might want consider disabling IP multicast fast switching, which would place the router in process switching mode. If packets begin reaching their proper destinations after IP multicast fast switching has been disabled, then the issue most likely was related to IP multicast fast switching.

Verifying IP Multicast on the First Hop Router

Enter these commands on the first hop router to verify IP multicast operations on the first hop router:

SUMMARY STEPS

1. enable
2. show ip mroute [group-address]
3. show ip mroute active [kb/s]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 enable     | Enables privileged EXEC mode.  
| Example: Device> enable |  
| Step 2 show ip mroute [group-address] | Confirms that the F flag has been set for mroutes on the first hop router.  
| Example: Device# show ip mroute 239.1.2.3  
(*, 239.1.2.3), 00:18:10/stopped, RP 172.16.0.1, flags: SPF  
Incoming interface: Serial1/0, RPF nbr 172.31.200.2  
Outgoing interface list: Null  
(10.0.0.1, 239.1.2.3), 00:18:10/00:03:22, flags: FT  
Incoming interface: GigabitEthernet0/0/0, RPF nbr 0.0.0.0 | |
Verifying IP Multicast on Routers Along the SPT

Enter these commands on routers along the SPT to verify IP multicast operations on routers along the SPT in a PIM-SM or PIM-SSM network:

**SUMMARY STEPS**

1. enable
2. show ip mroute [group-address]
3. show ip mroute active

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> show ip mroute [group-address]</td>
<td>Confirms the RPF neighbor towards the source for a particular group or groups.</td>
</tr>
<tr>
<td>Example: Device# show ip mroute 239.1.2.3 (*, 239.1.2.3), 00:17:56/00:03:02, RP 172.16.0.1, flags: S</td>
<td></td>
</tr>
<tr>
<td>Incoming interface: Null, RPF nbr 0.0.0.0</td>
<td></td>
</tr>
<tr>
<td>Outgoing interface list:</td>
<td></td>
</tr>
</tbody>
</table>
Verifying IP Multicast Operation on the Last Hop Router

Enter these commands on the last hop router to verify IP multicast operations on the last hop router:

**SUMMARY STEPS**

1. enable
2. show ip igmp groups
3. show ip pim rp mapping
4. show ip mroute
5. show ip interface [type number]
6. show ip pim interface count
7. show ip mroute count
8. show ip mroute active [kb/s]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
Verifying IP Multicast Operation on the Last Hop Router

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**show ip igmp groups**

**Example:**

```
Device# show ip igmp groups
IGMP Connected Group Membership
Group Address  Interface        Uptime
Expires  Last Reporter
239.1.2.3     GigabitEthernet1/0/0  00:05:14
   00:02:14  10.1.0.6
224.0.1.39    GigabitEthernet0/0/0 00:09:11
   00:02:08  172.31.100.1
```

Verifies IGMP memberships on the last hop router. This information will confirm the multicast groups with receivers that are directly connected to the last hop router and that are learned through IGMP.

**Step 3**

**show ip pim rp mapping**

**Example:**

```
Device# show ip pim rp mapping
PIM Group-to-RP Mappings
Group(s) 224.0.0.0/4
   RP 172.16.0.1 (?), v2v1
      Info source: 172.16.0.1 (?), elected via Auto-RP
      Uptime: 00:09:11, expires: 00:02:47
```

Confirms that the group-to-RP mappings are being populated correctly on the last hop router.

**Note**

Ignore this step if you are verifying a last hop router in a PIM-SSM network. The `show ip pim rp mapping` command does not work with routers in a PIM-SSM network because PIM-SSM does not use RPs. In addition, if configured correctly, PIM-SSM groups do not appear in the output of the `show ip pim rp mapping` command.

**Step 4**

**show ip mroute**

**Example:**

```
Device# show ip mroute
(*, 239.1.2.3), 00:05:14/00:03:04, RP 172.16.0.1, flags: SJC
   Incoming interface: GigabitEthernet0/0/0, RPF nbr 172.31.100.1
   Outgoing interface list:
      GigabitEthernet1/0, Forward/Sparse-Dense, 00:05:15/00:00:00
(10.0.0.1, 239.1.2.3), 00:02:49/00:03:29, flags: T
   Incoming interface: GigabitEthernet0/0/0, RPF nbr 172.31.100.1
   Outgoing interface list:
      GigabitEthernet1/0, Forward/Sparse-Dense, 00:02:49/00:03:04
(*, 224.0.1.39), 00:10:05/stopped, RP 0.0.0.0, flags: DC
   Incoming interface: Null, RPF nbr 0.0.0.0
   Outgoing interface list:
      GigabitEthernet1/0, Forward/Sparse-Dense, 00:05:15/00:00:00
      GigabitEthernet0/0, Forward/Sparse-Dense, 00:10:05/00:00:00
(172.16.0.1, 224.0.1.39), 00:02:00/00:01:33, flags:
```

Verifies that the mroute table is being populated properly on the last hop router.
Verifying IP Multicast Operation on the Last Hop Router

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTX Incoming interface: GigabitEthernet0/0/0, RPF nbr 172.31.100.1</td>
<td>Verifies that multicast fast switching is enabled for optimal performance on the outgoing interface on the last hop router.</td>
</tr>
</tbody>
</table>

**Step 5**

**show ip interface [type number]**

**Example:**

```
Device# show ip interface GigabitEthernet 0/0/0
GigabitEthernet0/0 is up, line protocol is up
Internet address is 172.31.100.2/24
Broadcast address is 255.255.255.255
Address determined by setup command
MTU is 1500 bytes
Helper address is not set
Directed broadcast forwarding is disabled
Multicast reserved groups joined: 224.0.0.1
  224.0.0.2 224.0.0.13
  224.0.0.5 224.0.0.6
Outgoing access list is not set
Inbound access list is not set
Proxy ARP is enabled
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachables are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is disabled
IP Fast switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
```

**Note**
Using the no ip mroute-cache interface command enables IP multicast fast-switching. When IP multicast fast switching is disabled, packets are forwarded through the process-switched path.

**Step 6**

**show ip pim interface count**

**Example:**

```
Device# show ip pim interface count
State: * - Fast Switched, D - Distributed Fast Switched
  H - Hardware Switching Enabled
Address Interface FS Mpackets In/Out
172.31.100.2 GigabitEthernet0/0/0 * 4122/0
```

Confirms that multicast traffic is being forwarded on the last hop router.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.1.0.1 GigabitEthernet1/0/0 * 0/3193</td>
<td><strong>Purpose</strong> confirms that multicast traffic is being forwarded on the last hop router.</td>
</tr>
</tbody>
</table>

#### Step 7

**show ip mroute count**

**Example:**

```
Device# show ip mroute count
IP Multicast Statistics
6 routes using 4008 bytes of memory
3 groups, 1.00 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts: Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group: 239.1.2.3, Source count: 1, Packets forwarded: 3165, Packets received: 3165
  RP-tree: Forwarding: 0/0/0, Other: 0/0/0
  Source: 10.0.0.1/32, Forwarding: 3165/20/28/4, Other: 0/0/0
Group: 224.0.1.39, Source count: 1, Packets forwarded: 21, Packets received: 120
  Source: 172.16.0.1/32, Forwarding: 21/1/48/0, Other: 120/0/99
Group: 224.0.1.40, Source count: 1, Packets forwarded: 10, Packets received: 10
  Source: 172.16.0.1/32, Forwarding: 10/1/48/0, Other: 10/0/0
```

#### Step 8

**show ip mroute active [kb/s]**

**Example:**

```
Device# show ip mroute active
Active IP Multicast Sources - sending >= 4 kbps
Group: 239.1.2.3, (?)
  Source: 10.0.0.1 (?)
  Rate: 20 pps/4 kbps(1sec), 4 kbps(last 50 secs), 4 kbps(life avg)
```

**Displays information about active multicast sources sending traffic to groups on the last hop router.** The output of this command provides information about the multicast packet rate for active sources.

**Note** By default, the output of the **show ip mroute** command with the **active** keyword displays information about active sources sending traffic to groups at a rate greater than or equal to 4 kb/s. To display information about active sources sending low-rate traffic to groups (that is, traffic less than 4 kb/s), specify a value of 1 for the **kb/s** argument. Specifying a value of 1 for this argument displays information about active sources sending traffic to groups at a rate equal to or greater than 1 kb/s, which effectively displays information about all possible active source traffic.

### Using PIM-Enabled Routers to Test IP Multicast Reachability

If all the PIM-enabled routers and access servers that you administer are members of a multicast group, pinging that group causes all routers to respond, which can be a useful administrative and debugging tool.

To use PIM-enabled routers to test IP multicast reachability, perform the following tasks:
### Configuring Routers to Respond to Multicast Pings

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `ip igmp join-group group-address`
5. Repeat Step 3 and Step 4 for each interface on the router participating in the multicast network.
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
`enable`  
*Example:*  
Device> enable | Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2**  
`configure terminal`  
*Example:*  
Device# configure terminal | Enters global configuration mode. |
| **Step 3**  
`interface type number`  
*Example:*  
Device(config)# interface gigabitethernet 1/0/0 | Enters interface configuration mode.  
For the *type* and *number* arguments, specify an interface that is directly connected to hosts or is facing hosts. |
| **Step 4**  
`ip igmp join-group group-address`  
*Example:*  
Device(config-if)# ip igmp join-group 225.2.2.2 | (Optional) Configures an interface on the router to join the specified group.  
For the purpose of this task, configure the same group address for the *group-address* argument on all interfaces on the router participating in the multicast network.  
*Note* With this method, the router accepts the multicast packets in addition to forwarding them. Accepting the multicast packets prevents the router from fast switching. |
| **Step 5**  
Repeat Step 3 and Step 4 for each interface on the router participating in the multicast network. | -- |
| **Step 6**  
`end`  
*Example:*  
Device(config-if)# end | Ends the current configuration session and returns to privileged EXEC mode. |
Pinging Routers Configured to Respond to Multicast Pings

on a router to initiate a ping test to the routers configured to respond to multicast pings. This task is used to
test IP multicast reachability in a network.

SUMMARY STEPS

1. enable
2. ping group-address

Monitoring and Troubleshooting PIM

Monitoring PIM Information

Use the privileged EXEC commands in the following table to monitor your PIM configurations.

Table 22: PIM Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip pim interface</td>
<td>Displays information about interfaces configured for Protocol Independent Multicast (PIM).</td>
</tr>
<tr>
<td>show ip pim neighbor</td>
<td>Displays the PIM neighbor information.</td>
</tr>
<tr>
<td>show ip pim rp [group-name</td>
<td>group-address]</td>
</tr>
</tbody>
</table>
Monitoring the RP Mapping and BSR Information

Use the privileged EXEC mode in the following table to verify the consistency of group-to-RP mappings:

### Table 23: RP Mapping Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip pim rp [ hostname or IP address</td>
<td>Displays all available RP mappings and metrics. This tells you how the device learns of the RP (through the BSR or the Auto-RP mechanism).</td>
</tr>
<tr>
<td>mapping [ hostname or IP address</td>
<td>• (Optional) For the hostname, specify the IP name of the group about which to display RPs.</td>
</tr>
<tr>
<td>elected</td>
<td>• (Optional) For the IP address, specify the IP address of the group about which to display RPs.</td>
</tr>
<tr>
<td>in-use ]</td>
<td>• (Optional) Use the mapping keyword to display all group-to-RP mappings of which the Cisco device is aware (either configured or learned from Auto-RP).</td>
</tr>
<tr>
<td>metric [ hostname or IP address ]</td>
<td>• (Optional) Use the metric keyword to display the RP RPF metric.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</thead>
<tbody>
<tr>
<td>show ip pim rp-hash group</td>
<td>Displays the RP that was selected for the specified group. That is, on a PIMv2 router or multilayer device, confirms that the same RP is the one that a PIMv1 system chooses. For group, enter the group address for which to display RP information.</td>
</tr>
</tbody>
</table>

Use the privileged EXEC commands in the following table to monitor BSR information:

### Table 24: BSR Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip pim bsr</td>
<td>Displays information about the elected BSR.</td>
</tr>
</tbody>
</table>

**Troubleshooting PIMv1 and PIMv2 Interoperability Problems**

When debugging interoperability problems between PIMv1 and PIMv2, check these in the order shown:

1. Verify RP mapping with the `show ip pim rp-hash` privileged EXEC command, making sure that all systems agree on the same RP for the same group.

2. Verify interoperability between different versions of DRs and RPs. Make sure that the RPs are interacting with the DRs properly (by responding with register-stops and forwarding decapsulated data packets from registers).
Configuration Examples for PIM

Example: Enabling PIM Stub Routing

In this example, IP multicast routing is enabled, Switch A PIM uplink port 25 is configured as a routed uplink port with spare-dense-mode enabled. PIM stub routing is enabled on the VLAN 100 interfaces and on Gigabit Ethernet port 20.

```
Device(config)#  ip multicast-routing distributed
Device(config)#  interface GigabitEthernet3/0/25
Device(config-if)#  no switchport
Device(config-if)#  ip address 3.1.1.2 255.255.255.0
Device(config-if)#  ip pim sparse-dense-mode
Device(config-if)#  exit
Device(config)#  interface vlan100
Device(config-if)#  ip pim passive
Device(config-if)#  exit
Device(config)#  interface GigabitEthernet3/0/20
Device(config-if)#  ip pim passive
Device(config-if)#  exit
Device(config)#  interface vlan100
Device(config-if)#  ip address 100.1.1.1 255.255.255.0
Device(config-if)#  ip pim passive
Device(config-if)#  exit
Device(config)#  interface GigabitEthernet3/0/20
Device(config-if)#  no switchport
Device(config-if)#  ip address 10.1.1.1 255.255.255.0
Device(config-if)#  ip pim passive
Device(config-if)#  end
```

Example: Verifying PIM Stub Routing

To verify that PIM stub is enabled for each interface, use the `show ip pim interface` privileged EXEC command:

```
Device#  show ip pim interface
Address  Interface  Ver/ Nbr  Query DR DR
Mode Count Intvl Prior
3.1.1.2  GigabitEthernet3/0/25  v2/SD 1 30 1 3.1.1.2
100.1.1.1 Vlan100  v2/P 0 30 1 100.1.1.1
10.1.1.1 GigabitEthernet3/0/20  v2/P 0 30 1 10.1.1.1
```

Example: Manually Assigning an RP to Multicast Groups

This example shows how to configure the address of the RP to 147.106.6.22 for multicast group 225.2.2.2 only:

```
Device(config)#  access-list 1 permit 225.2.2.2 0.0.0.0
Device(config)#  ip pim rp-address 147.106.6.22 1
```
Example: Configuring Auto-RP

This example shows how to send RP announcements out all PIM-enabled interfaces for a maximum of 31 hops. The IP address of port 1 is the RP. Access list 5 describes the group for which this device serves as RP:

```
Device(config)# ip pim send-rp-announce gigabitethernet1/0/1 scope 31 group-list 5
Device(config)# access-list 5 permit 224.0.0.0 15.255.255.255
```

Example: Defining the IP Multicast Boundary to Deny Auto-RP Information

This example shows a portion of an IP multicast boundary configuration that denies Auto-RP information:

```
Device(config)# access-list 1 deny 224.0.1.39
Device(config)# access-list 1 deny 224.0.1.40
Device(config)# access-list 1 permit all
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip multicast boundary 1
```

Example: Filtering Incoming RP Announcement Messages

This example shows a sample configuration on an Auto-RP mapping agent that is used to prevent candidate RP announcements from being accepted from unauthorized candidate RPs:

```
Device(config)# ip pim rp-announce-filter rp-list 10 group-list 20
Device(config)# access-list 10 permit host 172.16.5.1
Device(config)# access-list 10 permit host 172.16.2.1
Device(config)# access-list 20 deny 239.0.0.0 0.0.255.255
Device(config)# access-list 20 permit 224.0.0.0 15.255.255.255
```

The mapping agent accepts candidate RP announcements from only two devices, 172.16.5.1 and 172.16.2.1. The mapping agent accepts candidate RP announcements from these two devices only for multicast groups that fall in the group range of 224.0.0.0 to 239.255.255.255. The mapping agent does not accept candidate RP announcements from any other devices in the network. Furthermore, the mapping agent does not accept candidate RP announcements from 172.16.5.1 or 172.16.2.1 if the announcements are for any groups in the 239.0.0.0 through 239.255.255.255 range. This range is the administratively scoped address range.

Example: Preventing Join Messages to False RPs

If all interfaces are in sparse mode, use a default-configured RP to support the two well-known groups 224.0.1.39 and 224.0.1.40. Auto-RP uses these two well-known groups to collect and distribute RP-mapping information. When this is the case and the `ip pim accept-rp auto-rp` command is configured, another `ip pim accept-rp` command accepting the RP must be configured as follows:

```
Device(config)# ip pim accept-rp 172.10.20.1 1
Device(config)# access-list 1 permit 224.0.1.39
Device(config)# access-list 1 permit 224.0.1.40
```
Example: Configuring Candidate BSRs

This example shows how to configure a candidate BSR, which uses the IP address 172.21.24.18 on a port as the advertised BSR address, uses 30 bits as the hash-mask-length, and has a priority of 10.

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip address 172.21.24.18 255.255.255.0
Device(config-if)# ip pim sparse-mode
Device(config-if)# ip pim bsr-candidate gigabitethernet1/0/2 30 10
```

Example: Configuring Candidate RPs

This example shows how to configure the device to advertise itself as a candidate RP to the BSR in its PIM domain. Standard access list number 4 specifies the group prefix associated with the RP that has the address identified by a port. That RP is responsible for the groups with the prefix 239.

```
Device(config)# ip pim rp-candidate gigabitethernet1/0/2 group-list 4
Device(config)# access-list 4 permit 239.0.0.0 0.255.255.255
```

CHAPTER 13

IPv6 Protocol Independent Multicast

- Protocol Independent Multicast, on page 207

Protocol Independent Multicast

Protocol Independent Multicast (PIM) is used between switches so that they can track which multicast packets to forward to each other and to their directly connected LANs. PIM works independently of the unicast routing protocol to perform send or receive multicast route updates like other protocols. Regardless of which unicast routing protocols are being used in the LAN to populate the unicast routing table, Cisco IOS PIM uses the existing unicast table content to perform the Reverse Path Forwarding (RPF) check instead of building and maintaining its own separate routing table.

You can configure IPv6 multicast to use either PIM-SM or PIM-SSM operation, or you can use both PIM-SM and PIM-SSM together in your network.

PIM-Sparse Mode

IPv6 multicast provides support for intradomain multicast routing using PIM-SM. PIM-SM uses unicast routing to provide reverse-path information for multicast tree building, but it is not dependent on any particular unicast routing protocol.

PIM-SM is used in a multicast network when relatively few switches are involved in each multicast and these switches do not forward multicast packets for a group, unless there is an explicit request for the traffic. PIM-SM distributes information about active sources by forwarding data packets on the shared tree. PIM-SM initially uses shared trees, which requires the use of an RP.

Requests are accomplished via PIM joins, which are sent hop by hop toward the root node of the tree. The root node of a tree in PIM-SM is the RP in the case of a shared tree or the first-hop switch that is directly connected to the multicast source in the case of a shortest path tree (SPT). The RP keeps track of multicast groups and the hosts that send multicast packets are registered with the RP by that host's first-hop switch.

As a PIM join travels up the tree, switches along the path set up multicast forwarding state so that the requested multicast traffic will be forwarded back down the tree. When multicast traffic is no longer needed, a switch sends a PIM prune up the tree toward the root node to prune (or remove) the unnecessary traffic. As this PIM prune travels hop by hop up the tree, each switch updates its forwarding state appropriately. Ultimately, the forwarding state associated with a multicast group or source is removed.

A multicast data sender sends data destined for a multicast group. The designated switch (DR) of the sender takes those data packets, unicast-encapsulates them, and sends them directly to the RP. The RP receives these
encapsulated data packets, de-encapsulates them, and forwards them onto the shared tree. The packets then follow the (*, G) multicast tree state in the switches on the RP tree, being replicated wherever the RP tree branches, and eventually reaching all the receivers for that multicast group. The process of encapsulating data packets to the RP is called registering, and the encapsulation packets are called PIM register packets.

IPv6 BSR: Configure RP Mapping

PIM switches in a domain must be able to map each multicast group to the correct RP address. The BSR protocol for PIM-SM provides a dynamic, adaptive mechanism to distribute group-to-RP mapping information rapidly throughout a domain. With the IPv6 BSR feature, if an RP becomes unreachable, it will be detected and the mapping tables will be modified so that the unreachable RP is no longer used, and the new tables will be rapidly distributed throughout the domain.

Every PIM-SM multicast group needs to be associated with the IP or IPv6 address of an RP. When a new multicast sender starts sending, its local DR will encapsulate these data packets in a PIM register message and send them to the RP for that multicast group. When a new multicast receiver joins, its local DR will send a PIM join message to the RP for that multicast group. When any PIM switch sends a (*, G) join message, the PIM switch needs to know which is the next switch toward the RP so that G (Group) can send a message to that switch. Also, when a PIM switch is forwarding data packets using (*, G) state, the PIM switch needs to know which is the correct incoming interface for packets destined for G, because it needs to reject any packets that arrive on other interfaces.

A small set of switches from a domain are configured as candidate bootstrap switches (C-BSRs) and a single BSR is selected for that domain. A set of switches within a domain are also configured as candidate RPs (C-RPs); typically, these switches are the same switches that are configured as C-BSRs. Candidate RPs periodically unicast candidate-RP-advertisement (C-RP-Adv) messages to the BSR of that domain, advertising their willingness to be an RP. A C-RP-Adv message includes the address of the advertising C-RP, and an optional list of group addresses and mask length fields, indicating the group prefixes for which the candidacy is advertised. The BSR then includes a set of these C-RPs, along with their corresponding group prefixes, in bootstrap messages (BSMs) it periodically originates. BSMs are distributed hop-by-hop throughout the domain.

Bidirectional BSR support allows bidirectional RPs to be advertised in C-RP messages and bidirectional ranges in the BSM. All switches in a system must be able to use the bidirectional range in the BSM; otherwise, the bidirectional RP feature will not function.

PIM-Source Specific Multicast

PIM-SSM is the routing protocol that supports the implementation of SSM and is derived from PIM-SM. However, unlike PIM-SM where data from all multicast sources are sent when there is a PIM join, the SSM feature forwards datagram traffic to receivers from only those multicast sources that the receivers have explicitly joined, thus optimizing bandwidth utilization and denying unwanted Internet broadcast traffic. Further, instead of the use of RP and shared trees, SSM uses information found on source addresses for a multicast group. This information is provided by receivers through the source addresses relayed to the last-hop switches by MLD membership reports, resulting in shortest-path trees directly to the sources.

In SSM, delivery of datagrams is based on (S, G) channels. Traffic for one (S, G) channel consists of datagrams with an IPv6 unicast source address S and the multicast group address G as the IPv6 destination address. Systems will receive this traffic by becoming members of the (S, G) channel. Signaling is not required, but receivers must subscribe or unsubscribe to (S, G) channels to receive or not receive traffic from specific sources.
MLD version 2 is required for SSM to operate. MLD allows the host to provide source information. Before SSM can run with MLD, SSM must be supported in the Cisco IOS IPv6 switch, the host where the application is running, and the application itself.

**Routable Address Hello Option**

When an IPv6 interior gateway protocol is used to build the unicast routing table, the procedure to detect the upstream switch address assumes the address of a PIM neighbor is always same as the address of the next-hop switch, as long as they refer to the same switch. However, it may not be the case when a switch has multiple addresses on a link.

Two typical situations can lead to this situation for IPv6. The first situation can occur when the unicast routing table is not built by an IPv6 interior gateway protocol such as multicast BGP. The second situation occurs when the address of an RP shares a subnet prefix with downstream switches (note that the RP switch address has to be domain-wide and therefore cannot be a link-local address).

The routable address hello option allows the PIM protocol to avoid such situations by adding a PIM hello message option that includes all the addresses on the interface on which the PIM hello message is advertised. When a PIM switch finds an upstream switch for some address, the result of RPF calculation is compared with the addresses in this option, in addition to the PIM neighbor's address itself. Because this option includes all the possible addresses of a PIM switch on that link, it always includes the RPF calculation result if it refers to the PIM switch supporting this option.

Because of size restrictions on PIM messages and the requirement that a routable address hello option fits within a single PIM hello message, a limit of 16 addresses can be configured on the interface.

**PIM IPv6 Stub Routing**

The PIM stub routing feature reduces resource usage by moving routed traffic closer to the end user.

In a network using PIM stub routing, the only allowable route for IPv6 traffic to the user is through a switch that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IPv6 multicast routing and configure only the switch as a PIM stub router. The switch does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the switch. The switch uplink port cannot be used with SVIs.

You must also configure EIGRP stub routing when configuring PIM stub routing on the switch.

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM assert and designated router election mechanisms are not supported on the PIM passive interfaces. Only the non-redundant access router topology is supported by the PIM stub feature. By using a non-redundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

In the figure shown below, Switch A routed uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source.

CHAPTER 14

Configuring MLD Snooping

This module contains details of configuring MLD snooping

- Finding Feature Information, on page 213
- Information About Configuring IPv6 MLD Snooping, on page 213
- How to Configure IPv6 MLD Snooping, on page 217
- Displaying MLD Snooping Information, on page 225
- Configuration Examples for Configuring MLD Snooping, on page 226

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IPv6 MLD Snooping

You can use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP Version 6 (IPv6) multicast data to clients and routers in a switched network on the switch. Unless otherwise noted, the term switch refers to a standalone switch and to a switch stack.

Note

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release or the Cisco IOS documentation referenced in the procedures.
**Understanding MLD Snooping**

In IP Version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on the links that are directly attached to the routers and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD Version 1 (MLDv1) is equivalent to IGMPv2, and MLD Version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol Version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

---

**Note**

The switch does not support MLDv2 enhanced snooping, which sets up IPv6 source and destination multicast address-based forwarding.

MLD snooping can be enabled or disabled globally or per VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

**MLD Messages**

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQS).
- Multicast Listener Reports are the equivalent of IGMPv2 reports
- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPv2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.
**MLD Queries**

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast group address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

---

**Note**

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 2960, 2960-S, 2960-C, 2960-X or 2960-CX switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

**Multicast Client Aging Robustness**

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

**Multicast Router Discovery**

Like IGMP snooping, MLD snooping performs multicast router discovery, with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If there are multiple routers on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).
- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.
- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether or not MLD snooping is enabled on the switch.
After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).

MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address is entered in the VLAN MLD database. Then all IPv6 multicast traffic to the group within the VLAN is forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (which would be the case when there are multiple clients for a group on the same port) and a Done message is received on a port, an MASQ is generated on that port. The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the `ipv6 mld snooping last-listener-query count` global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If there are no reports sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the `ipv6 mld snooping last-listener-query-interval` global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the `ipv6 mld snooping tcn query solicit` global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the `ipv6 mld snooping tcn flood query count` global configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This is same as done in IGMP snooping.
MLD Snooping in Switch Stacks

The MLD IPv6 group address databases are maintained on all switches in the stack, regardless of which switch learns of an IPv6 multicast group. Report suppression and proxy reporting are done stack-wide. During the maximum response time, only one received report for a group is forwarded to the multicast routers, regardless of which switch the report arrives on.

The election of a new stack master does not affect the learning or bridging of IPv6 multicast data; bridging of IPv6 multicast data does not stop during a stack master re-election. When a new switch is added to the stack, it synchronizes the learned IPv6 multicast information from the stack master. Until the synchronization is complete, data ingress on the newly added switch is treated as unknown multicast data.

How to Configure IPv6 MLD Snooping

Default MLD Snooping Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLD snooping (Global)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>MLD snooping (per VLAN)</td>
<td>Enabled. MLD snooping must be globally enabled for VLAN MLD snooping to take place.</td>
</tr>
<tr>
<td>IPv6 Multicast addresses</td>
<td>None configured.</td>
</tr>
<tr>
<td>IPv6 Multicast router ports</td>
<td>None configured.</td>
</tr>
<tr>
<td>MLD snooping Immediate Leave</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| MLD snooping robustness variable | Global: 2; Per VLAN: 0.  
Note: The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count. |
| Last listener query count      | Global: 2; Per VLAN: 0.  
Note: The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count. |
| Last listener query interval   | Global: 1000 (1 second); VLAN: 0.  
Note: The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global interval. |
| TCN query solicit              | Disabled.                                            |
| TCN query count                | 2.                                                   |
MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the `ipv6 mld snooping` global configuration command for the configuration to take effect.

- When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch.

- The maximum number of address entries allowed for the switch or switch stack is 1000.

Enabling or Disabling MLD Snooping on the Switch

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. That is, MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis or for a range of VLANs, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

To globally enable MLD snooping on the switch, perform this procedure:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ipv6 mld snooping</td>
<td>Enables MLD snooping on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Enabling or Disabling MLD Snooping on a VLAN

To enable MLD snooping on a VLAN, perform this procedure:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv6 mld snooping</td>
<td>Enables MLD snooping on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ipv6 mld snooping</td>
<td></td>
</tr>
</tbody>
</table>

---

**IPv6**

### Enabling or Disabling MLD Snooping on a VLAN

To enable MLD snooping on a VLAN, perform this procedure:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> reload</td>
<td>Reload the operating system.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# reload</td>
<td></td>
</tr>
</tbody>
</table>
Configuring a Static Multicast Group

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

To add a Layer 2 port as a member of a multicast group, perform this procedure:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures a multicast group with a Layer 2 port as a member of a multicast group:</td>
</tr>
<tr>
<td><code>ipv6 mld snooping vlan vlan-id static ipv6_multicast_address interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ipv6 mld snooping vlan 1 static 3333.0000.1111 interface gigabitethernet 0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Multicast Router Port

**Note**
Static connections to multicast routers are supported only on switch ports.

To add a multicast router port to a VLAN, perform this procedure:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
| Step 3 | ipv6 mld snooping vlan vlan-id mrouter interface interface-id | Specifies the multicast router VLAN ID, and specify the interface to the multicast router.  
- The VLAN ID range is 1 to 1001 and 1006 to 4094.  
- The interface can be a physical interface or a port channel. The port-channel range is 1 to 48. |
| Example: | Device(config)# ipv6 mld snooping vlan 1 mrouter interface gigabitethernet 0/2 | |
| Step 4 | end | Returns to privileged EXEC mode. |
| Example: | | |

---

**Device(config)# end**

**Step 5**
Use one of the following:
- show ipv6 mld snooping address
- show ipv6 mld snooping address vlan vlan-id

**Example:**

Device# show ipv6 mld snooping address  
or  
Device# show ipv6 mld snooping vlan 1

Verifies the static member port and the IPv6 address.
### Enabling MLD Immediate Leave

To enable MLDv1 immediate leave, perform this procedure:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ipv6 mld snooping vlan {vlan-id} immediate-leave</td>
<td>Enables MLD Immediate Leave on the VLAN interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ipv6 mld snooping vlan 1 immediate-leave</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show ipv6 mld snooping vlan {vlan-id}</td>
<td>Verifies that Immediate Leave is enabled on the VLAN interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show ipv6 mld snooping vlan 1</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring MLD Snooping Queries

To configure MLD snooping query characteristics for the switch or for a VLAN, perform this procedure:
### Configuring MLD Snooping Queries

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | *enable*  
Example: Device> *enable* | Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2** | *configure terminal*  
Example: Device# *configure terminal* | Enters global configuration mode. |
| **Step 3** | *ipv6 mld snooping robustness-variable* value  
Example: Device(config)# *ipv6 mld snooping robustness-variable 3* | (Optional) Sets the number of queries that are sent before switch will deletes a listener (port) that does not respond to a general query. The range is 1 to 3; the default is 2. |
| **Step 4** | *ipv6 mld snooping vlan* vlan-id *robustness-variable* value  
Example: Device(config)# *ipv6 mld snooping vlan 1 robustness-variable 3* | (Optional) Sets the robustness variable on a VLAN basis, which determines the number of general queries that MLD snooping sends before aging out a multicast address when there is no MLD report response. The range is 1 to 3; the default is 0. When set to 0, the number used is the global robustness variable value. |
| **Step 5** | *ipv6 mld snooping last-listener-query-count* count  
Example: Device(config)# *ipv6 mld snooping last-listener-query-count 7* | (Optional) Sets the number of MASQs that the switch sends before aging out an MLD client. The range is 1 to 7; the default is 2. The queries are sent 1 second apart. |
| **Step 6** | *ipv6 mld snooping vlan* vlan-id *last-listener-query-count* count  
Example: Device(config)# *ipv6 mld snooping vlan 1 last-listener-query-count 7* | (Optional) Sets the last-listener query count on a VLAN basis. This value overrides the value configured globally. The range is 1 to 7; the default is 0. When set to 0, the global count value is used. Queries are sent 1 second apart. |
| **Step 7** | *ipv6 mld snooping last-listener-query-interval* interval  
Example: Device(config)# *ipv6 mld snooping last-listener-query-interval 2000* | (Optional) Sets the maximum response time that the switch waits after sending out a MASQ before deleting a port from the multicast group. The range is 100 to 32,768 thousands of a second. The default is 1000 (1 second). |
| **Step 8** | *ipv6 mld snooping vlan* vlan-id *last-listener-query-interval* interval  
Example: | (Optional) Sets the last-listener query interval on a VLAN basis. This value overrides the value configured globally. The range is 0 to 32,768 thousands of a second. The default is 0. When set to 0, the global last-listener query interval is used. |
### Disabling MLD Listener Message Suppression

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

To disable MLD listener message suppression, perform this procedure:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>

Device# show ipv6 mld snooping

---

### Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display IPv6 group address multicast entries for a VLAN configured for MLD snooping.

Table 26: Commands for Displaying MLD Snooping Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| show ipv6 mld snooping [ vlan vlan-id ] | Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN.  
(Optional) Enter vlan vlan-id to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |
| show ipv6 mld snooping mrouter [ vlan vlan-id ] | Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces.  
(Optional) Enters vlan vlan-id to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |
| show ipv6 mld snooping querier [ vlan vlan-id ] | Displays information about the IPv6 address and incoming port for the most-recently received MLD query messages in the VLAN.  
(Optional) Enters vlan vlan-id to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |
### Configuration Examples for Configuring MLD Snooping

#### Configuring a Static Multicast Group: Example

This example shows how to statically configure an IPv6 multicast group:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 2 static 3333.0000.1111 interface gigabitethernet1/0/1
Device(config)# end
```

#### Configuring a Multicast Router Port: Example

This example shows how to add a multicast router port to VLAN 200:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet 0/2
Device(config)# exit
```

#### Enabling MLD Immediate Leave: Example

This example shows how to enable MLD Immediate Leave on VLAN 130:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 130 immediate-leave
Device(config)# exit
```
Configuring MLD Snooping Queries: Example

This example shows how to set the MLD snooping global robustness variable to 3:

```
Device# configure terminal
Device(config)# ipv6 mld snooping robustness-variable 3
Device(config)# exit
```

This example shows how to set the MLD snooping last-listener query count for a VLAN to 3:

```
Device# configure terminal
Device(config)# ipv6 mld snooping vlan 200 last-listener-query-count 3
Device(config)# exit
```

This example shows how to set the MLD snooping last-listener query interval (maximum response time) to 2000 (2 seconds):

```
Device# configure terminal
Device(config)# ipv6 mld snooping last-listener-query-interval 2000
Device(config)# exit
```
CHAPTER 15

Configuring IPv6 Unicast Routing

• Finding Feature Information, on page 229
• Information About Configuring IPv6 Host Functions, on page 229
• Configuration Examples for IPv6 Unicast Routing, on page 240

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IPv6 Host Functions

This chapter describes how to configure IPv6 host functions on the Catalyst 2960, 2960-S, and 2960-C.

Note

To use IPv6 Host Functions, the switch must be running the LAN Base image.

For information about configuring IPv6 Multicast Listener Discovery (MLD) snooping, see Configuring MLD Snooping.

To enable dual stack environments (supporting both IPv4 and IPv6) on a Catalyst 2960 switch, you must configure the switch to use the a dual IPv4 and IPv6 switch database management (SDM) template. See the "Dual IPv4 and IPv6 Protocol Stacks" section. This template is not required on Catalyst 2960-S switches.

Note

For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS documentation referenced in the procedures.
Understanding IPv6

IPv4 users can move to IPv6 and receive services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For information about how Cisco Systems implements IPv6, go to:

For information about IPv6 and other features in this chapter

- See the Cisco IOS IPv6 Configuration Library.
- Use the Search field on Cisco.com to locate the Cisco IOS software documentation. For example, if you want information about static routes, you can enter Implementing Static Routes for IPv6 in the search field to learn about static routes.

IPv6 Addresses

The switch supports only IPv6 unicast addresses. It does not support site-local unicast addresses, or anycast addresses.

The IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons in the format: n:n:n:n:n:n:n:n. This is an example of an IPv6 address:
2031:0000:130F:0000:0000:09C0:080F:130B

For easier implementation, leading zeros in each field are optional. This is the same address without leading zeros:
2031:0:130F:0:0:9C0:80F:130B

You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only once in each address:
2031:0:130F::0:9C0:80F:130B

In the "Implementing Addressing and Basic Connectivity" chapter, these sections apply to the Catalyst 2960, 2960-S, 2960-C, 2960-X, 2960-CX and 3560-CX switches:

- IPv6 Address Formats
- IPv6 Address Type: Multicast
- IPv6 Address Output Display
- Simplified IPv6 Packet Header

Supported IPv6 Unicast Routing Features

These sections describe the IPv6 protocol features supported by the switch:
128-Bit Wide Unicast Addresses

The switch supports aggregatable global unicast addresses and link-local unicast addresses. It does not support site-local unicast addresses.

- Aggregatable global unicast addresses are IPv6 addresses from the aggregatable global unicast prefix. The address structure enables strict aggregation of routing prefixes and limits the number of routing table entries in the global routing table. These addresses are used on links that are aggregated through organizations and eventually to the Internet service provider.

These addresses are defined by a global routing prefix, a subnet ID, and an interface ID. Current global unicast address allocation uses the range of addresses that start with binary value 001 (2000::/3). Addresses with a prefix of 2000::/3(001) through E000::/3(111) must have 64-bit interface identifiers in the extended unique identifier (EUI)-64 format.

- Link local unicast addresses can be automatically configured on any interface by using the link-local prefix FE80::/10(1111111010) and the interface identifier in the modified EUI format. Link-local addresses are used in the neighbor discovery protocol (NDP) and the stateless autoconfiguration process. Nodes on a local link use link-local addresses and do not require globally unique addresses to communicate. IPv6 routers do not forward packets with link-local source or destination addresses to other links.

For more information, see the section about IPv6 unicast addresses in the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.

DNS for IPv6

IPv6 supports Domain Name System (DNS) record types in the DNS name-to-address and address-to-name lookup processes. The DNS AAAA resource record types support IPv6 addresses and are equivalent to an A address record in IPv4. The switch supports DNS resolution for IPv4 and IPv6.

ICMPv6

The Internet Control Message Protocol (ICMP) in IPv6 generates error messages, such as ICMP destination unreachable messages, to report errors during processing and other diagnostic functions. In IPv6, ICMP packets are also used in the neighbor discovery protocol and path MTU discovery.

Neighbor Discovery

The switch supports NDP for IPv6, a protocol running on top of ICMPv6, and static neighbor entries for IPv6 stations that do not support NDP. The IPv6 neighbor discovery process uses ICMP messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), to verify the reachability of the neighbor, and to keep track of neighboring routers.

The switch supports ICMPv6 redirect for routes with mask lengths less than 64 bits. ICMP redirect is not supported for host routes or for summarized routes with mask lengths greater than 64 bits.

Neighbor discovery throttling ensures that the switch CPU is not unnecessarily burdened while it is in the process of obtaining the next hop forwarding information to route an IPv6 packet. The switch drops any additional IPv6 packets whose next hop is the same neighbor that the switch is actively trying to resolve. This drop avoids further load on the CPU.

IPv6 Stateless Autoconfiguration and Duplicate Address Detection

The switch uses stateless autoconfiguration to manage link, subnet, and site addressing changes, such as management of host and mobile IP addresses. A host autonomously configures its own link-local address, and booting nodes send router solicitations to request router advertisements for configuring interfaces.
For more information about autoconfiguration and duplicate address detection, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

**IPv6 Applications**

The switch has IPv6 support for these applications:

- Ping, traceroute, and Telnet
- Secure Shell (SSH) over an IPv6 transport
- HTTP server access over IPv6 transport
- DNS resolver for AAAA over IPv4 transport
- Cisco Discovery Protocol (CDP) support for IPv6 addresses

For more information about managing these applications, see the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

**Dual IPv4 and IPv6 Protocol Stacks**

On a Catalyst 2960-X switch, you must use the dual IPv4 and IPv6 template to allocate ternary content addressable memory (TCAM) usage to both IPv4 and IPv6 protocols.

This figure shows a router forwarding both IPv4 and IPv6 traffic through the same interface, based on the IP packet and destination addresses.

*Figure 13: Dual IPv4 and IPv6 Support on an Interface*

Use the dual IPv4 and IPv6 switch database management (SDM) template to enable IPv6 routing dual stack environments (supporting both IPv4 and IPv6). For more information about the dual IPv4 and IPv6 SDM template, see *Configuring SDM Templates*.

The dual IPv4 and IPv6 templates allow the switch to be used in dual stack environments.

- If you try to configure IPv6 without first selecting a dual IPv4 and IPv6 template, a warning message appears.
- In IPv4-only environments, the switch routes IPv4 packets and applies IPv4 QoS and ACLs in hardware. IPv6 packets are not supported.
- In dual IPv4 and IPv6 environments, the switch applies IPv4 QoS and ACLs in hardware.
- IPv6 QoS and ACLs are not supported.
- If you do not plan to use IPv6, do not use the dual stack template because this template results in less hardware memory capacity for each resource.
For more information about IPv4 and IPv6 protocol stacks, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter of *Cisco IOS IPv6 Configuration Library* on Cisco.com.

**SNMP and Syslog Over IPv6**

To support both IPv4 and IPv6, IPv6 network management requires both IPv6 and IPv4 transports. Syslog over IPv6 supports address data types for these transports.

Simple Network Management Protocol (SNMP) and syslog over IPv6 provide these features:

- Support for both IPv4 and IPv6
- IPv6 transport for SNMP and to modify the SNMP agent to support traps for an IPv6 host
- SNMP- and syslog-related MIBs to support IPv6 addressing
- Configuration of IPv6 hosts as trap receivers

For support over IPv6, SNMP modifies the existing IP transport mapping to simultaneously support IPv4 and IPv6. These SNMP actions support IPv6 transport management:

- Opens User Datagram Protocol (UDP) SNMP socket with default settings
- Provides a new transport mechanism called `SR_IPV6_TRANSPORT`
- Sends SNMP notifications over IPv6 transport
- Supports SNMP-named access lists for IPv6 transport
- Supports SNMP proxy forwarding using IPv6 transport
- Verifies SNMP Manager feature works with IPv6 transport

For information on SNMP over IPv6, including configuration procedures, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

For information about syslog over IPv6, including configuration procedures, see the “Implementing IPv6 Addressing and Basic Connectivity” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

**HTTP(S) Over IPv6**

The HTTP client sends requests to both IPv4 and IPv6 HTTP servers, which respond to requests from both IPv4 and IPv6 HTTP clients. URLs with literal IPv6 addresses must be specified in hexadecimal using 16-bit values between colons.

The accept socket call chooses an IPv4 or IPv6 address family. The accept socket is either an IPv4 or IPv6 socket. The listening socket continues to listen for both IPv4 and IPv6 signals that indicate a connection. The IPv6 listening socket is bound to an IPv6 wildcard address.

The underlying TCP/IP stack supports a dual-stack environment. HTTP relies on the TCP/IP stack and the sockets for processing network-layer interactions.

Basic network connectivity (ping) must exist between the client and the server hosts before HTTP connections can be made.

For more information, see the “Managing Cisco IOS Applications over IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.
IPv6 and Switch Stacks

The switch supports IPv6 forwarding across the stack and IPv6 host functionality on the stack master. The stack master runs IPv6 host functionality and IPv6 applications.

While the new stack master is being elected and is resetting, the switch stack does not forward IPv6 packets. The stack MAC address changes, which also changes the IPv6 address. When you specify the stack IPv6 address with an extended unique identifier (EUI) by using the `ipv6 address` interface configuration command, the address is based on the interface MAC address. See the "Configuring IPv6 Addressing and Enabling IPv6 Host" section.

If you configure the persistent MAC address feature on the stack and the stack master changes, the stack MAC address does not change for approximately 4 minutes. For more information, see the "Enabling Persistent MAC Address" section in "Managing Switch Stacks."

Default IPv6 Configuration

Table 27: Default IPv6 Configuration

</tr>
</tbody>
</table>

Configuring IPv6 Addressing and Enabling IPv6 Routing

This section describes how to assign IPv6 addresses to individual Layer 3 interfaces and to globally forward IPv6 traffic on the switch.

Before configuring IPv6 on the switch, consider these guidelines:

- Be sure to select a dual IPv4 and IPv6 SDM template.
- In the `ipv6 address` interface configuration command, you must enter the `ipv6-address` and `ipv6-prefix` variables with the address specified in hexadecimal using 16-bit values between colons. The `prefix-length` variable (preceded by a slash `/`) is a decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address).

To forward IPv6 traffic on an interface, you must configure a global IPv6 address on that interface. Configuring an IPv6 address on an interface automatically configures a link-local address and activates IPv6 for the interface. The configured interface automatically joins these required multicast groups for that link:

- solicited-node multicast group FF02::0:0:0:0:1::ff00::/104 for each unicast address assigned to the interface (this address is used in the neighbor discovery process.)
- all-nodes link-local multicast group FF02::1
- all-routers link-local multicast group FF02::2

For more information about configuring IPv6 routing, see the “Implementing Addressing and Basic Connectivity for IPv6” chapter in the Cisco IOS IPv6 Configuration Library on Cisco.com.
Beginning in privileged EXEC mode, follow these steps to assign an IPv6 address to a Layer 3 interface and enable IPv6 forwarding:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
| **Step 2** | `sdm prefer dual-ipv4-and-ipv6 {default}` | Selects an SDM template that supports IPv4 and IPv6.  
  * default—Sets the switch to the default template to balance system resources. |
| | **Example:** `Device(config)# sdm prefer dual-ipv4-and-ipv6 default` | |
| **Step 3** | `end` | Returns to privileged EXEC mode. |
| | **Example:** `Device(config)# end` | |
| **Step 4** | `reload` | Reloads the operating system. |
| | **Example:** `Device# reload` | |
| **Step 5** | `configure terminal` | Enters global configuration mode after the switch reloads. |
| | **Example:** `Device# configure terminal` | |
| **Step 6** | `interface interface-id` | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| | **Example:** `Device(config)# interface gigabitethernet 1/0/1` | |
| **Step 7** | Use one of the following:  
  - `ipv6 address ipv6-prefix/prefix-length eui-64`  
  - `ipv6 address ipv6-address/prefix-length`  
  - `ipv6 address ipv6-address link-local`  
  - `ipv6 enable`  
  **Example:** |  
  - Specifies a global IPv6 address with an extended unique identifier (EUI) in the low-order 64 bits of the IPv6 address. Specify only the network prefix; the last 64 bits are automatically computed from the switch MAC address. This enables IPv6 processing on the interface.  
  - Manually configures an IPv6 address on the interface. |
### Configuring IPv6 ICMP Rate Limiting

ICMP rate limiting is enabled by default with a default interval between error messages of 100 milliseconds and a bucket size (maximum number of tokens to be stored in a bucket) of 10.

To change the ICMP rate-limiting parameters, perform this procedure:

#### Procedure

</tbody>
</table>

### Configuring Static Routing for IPv6

For more information about configuring static IPv6 routing, see the “Implementing Static Routes for IPv6” chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

To configure static IPv6 routing, perform this procedure:

**Before you begin**

You must enable routing by using the `ip routing` global configuration command, enable the forwarding of IPv6 packets by using the `ipv6 unicast-routing` global configuration command, and enable IPv6 on at least one Layer 3 interface by configuring an IPv6 address on the interface.
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures a static IPv6 route.</td>
</tr>
<tr>
<td>`ipv6 route ipv6-prefix/prefix length [ipv6-address</td>
<td>interface-id [ipv6-address]] [administrative distance]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ipv6 route 2001:0DB8::/32 gigabitethernet2/0/1 130</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note**
You must specify an `interface-id` when using a link-local address as the next hop (the link-local next hop must also be an adjacent router).

- `ipv6-prefix`—The IPv6 network that is the destination of the static route. It can also be a hostname when static host routes are configured.
- `/prefix length`—The length of the IPv6 prefix. A decimal value that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.
- `ipv6-address`—The IPv6 address of the next hop that can be used to reach the specified network. The IPv6 address of the next hop need not be directly connected; recursion is done to find the IPv6 address of the directly connected next hop. The address must be in the form documented in RFC 2373, specified in hexadecimal using 16-bit values between colons.
- `interface-id`—Specifies direct static routes from point-to-point and broadcast interfaces. With point-to-point interfaces, there is no need to specify the IPv6 address of the next hop. With broadcast interfaces, you should always specify the IPv6 address of the next hop, or ensure that the specified prefix is assigned to the link, specifying a link-local address as the next hop. You can optionally specify the IPv6 address of the next hop to which packets are sent.
- `administrative distance`—(Optional) An administrative distance. The range is 1 to 254; the default value is 1, which gives static routes precedence over any other type of route except connected routes. To configure a

### Configuration Examples for IPv6 Unicast Routing

#### Configuring IPv6 Addressing and Enabling IPv6 Routing: Example

This example shows how to enable IPv6 with both a link-local address and a global address based on the IPv6 prefix `2001:0DB8:c18:1::/64`. The EUI-64 interface ID is used in the low-order 64 bits of both addresses. Output from the `show ipv6 interface` EXEC command is included to show how the interface ID (20B:46FF:FE2F:D940) is appended to the link-local prefix FE80::/64 of the interface.

```
Device(config)# ipv6 unicast-routing
Device(config)# interface gigabitethernet0/11
Device(config-if)# ipv6 address 2001:0DB8:c18:1::/64 eui 64
Device(config-if)# end
Device# show ipv6 interface gigabitethernet0/11
GigabitEthernet0/11 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
Global unicast address(es):
2001:0DB8:c18:1:20B:46FF:FE2F:D940, subnet is 2001:0DB8:c18:1::/64 [EUI]
Joined group address(es):
FF02::1
FF02::2
FF02::1:FF2F:D940
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 milliseconds
ND advertised retransmit interval is 0 milliseconds
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
Hosts use stateless autoconfig for addresses.
```
**Configuring IPv6 ICMP Rate Limiting: Example**

This example shows how to configure an IPv6 ICMP error message interval of 50 milliseconds and a bucket size of 20 tokens.

```
Device(config)#ipv6 icmp error-interval 50 20
```

**Configuring Static Routing for IPv6: Example**

This example shows how to configure a floating static route to an interface with an administrative distance of 130:

```
Device(config)#ipv6 route 2001:0DB8::/32 gigabitethernet 1/0/1 130
```

**Displaying IPv6: Example**

This is an example of the output from the `show ipv6 interface` privileged EXEC command:

```
Device# show ipv6 interface
Vlan1 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::20B:46FF:FE2F:D940
  Global unicast address(es):
    3FFE:000:0:1:20B:46FF:FE2F:D940, subnet is 3FFE:000:0:1::/64 [EUI]
  Joined group address(es):
    FF02::1
    FF02::2
    FF02::1:FF2F:D940
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
<output truncated>
```

• Configuration Examples for IPv6 ACL, on page 251

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IPv6 ACLs

You can filter IP version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic.

Note

To use IPv6, you must configure the dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch. You select the template by entering the sdm prefer {default | dual-ipv4-and-ipv6} global configuration command.

Understanding IPv6 ACLs

A switch image supports two types of IPv6 ACLs:
• IPv6 router ACLs - Supported on inbound or outbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. Applied to only IPv6 packets that are routed.

• IPv6 port ACLs - Supported on inbound traffic on Layer 2 interfaces only. Applied to all IPv6 packets entering the interface.

**Note**
If you configure unsupported IPv6 ACLs, an error message appears and the configuration does not take affect.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface.

As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs:

• When an input router ACL and input port ACL exist in an SVI, packets received on ports to which a port ACL is applied are filtered by the port ACL. Routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

• When an output router ACL and input port ACL exist in an SVI, packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv6 packets are filtered by the router ACL. Other packets are not filtered.

**Note**
If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.

### Supported ACL Features

IPv6 ACLs on the switch have these characteristics:

• Fragmented frames (the fragments keyword as in IPv4) are supported.

• The same statistics supported in IPv4 are supported for IPv6 ACLs.

• If the switch runs out of TCAM space, packets associated with the ACL label are forwarded to the CPU, and the ACLs are applied in software.

• Routed or bridged packets with hop-by-hop options have IPv6 ACLs applied in software.

• Logging is supported for router ACLs, but not for port ACLs.

### IPv6 ACL Limitations

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

• IPv6 source and destination addresses-ACL matching is supported only on prefixes from /0 to /64 and host addresses (/128) that are in the extended universal identifier (EUI)-64 format. The switch supports only these host addresses with no loss of information:
- aggregatable global unicast addresses
- link local addresses

• The switch does not support matching on these keywords: `flowlabel`, `routing header`, and `undetermined-transport`.

• The switch does not support reflexive ACLs (the `reflect` keyword).

• This release supports only port ACLs and router ACLs for IPv6; it does not support VLAN ACLs (VLAN maps).

• The switch does not apply MAC-based ACLs on IPv6 frames.

• You cannot apply IPv6 port ACLs to Layer 2 EtherChannels.

• The switch does not support output port ACLs.

• Output router ACLs and input port ACLs for IPv6 are supported only on . Switches support only control plane (incoming) IPv6 ACLs.

• When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.

• If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

## Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

**Before you begin**

Before configuring IPv6 ACLs, you must select one of the dual IPv4 and IPv6 SDM templates.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Create an IPv6 ACL, and enter IPv6 access list configuration mode.</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Configure the IPv6 ACL to block (deny) or pass (permit) traffic.</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.</td>
<td></td>
</tr>
</tbody>
</table>
Default IPv6 ACL Configuration

There are no IPv6 ACLs configured or applied.

Interaction with Other Features and Switches

• If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

• If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.

• You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

• You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.

• If the hardware memory is full, for any additional configured ACLs, packets are dropped to the CPU, and the ACLs are applied in software. When the hardware is full a message is printed to the console indicating the ACL has been unloaded and the packets will be dropped on the interface.

Note

Only packets of the same type as the ACL that could not be added (ipv4, ipv6, MAC) will be dropped on the interface.

Creating IPv6 ACL

Follow these steps to create an IPv6 ACL:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
**IPv6**

Creating IPv6 ACL

---

### Command or Action

**Step 3**

```markdown
ipv6access-listaccess-list-name
```

**Example:**

```
ipv6 access-list access-list-name
```

**Purpose**

Define an IPv6 access list name, and enter IPv6 access-list configuration mode.

---

### Command or Action

**Step 4**

```markdown
{deny|permit} protocol
```

**Example:**

```
{deny | permit} protocol
{source-ipv6-prefix/prefix-length | any | host source-ipv6-address}
{operator [port-number]}{destination-ipv6-prefix/prefix-length
| any | host destination-ipv6-address}
{operator [port-number]}{dscp value}
{fragments | log | log-input | routing | sequence value}
{time-range name}
```

**Purpose**

Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions:

- For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, stcp, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.

- The source-ipv6-prefix/prefix-length or destination-ipv6-prefix/prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

- Enter any as an abbreviation for the IPv6 prefix ::/0.

- For host source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.

- (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range.

- (Optional) The port-number is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.

- (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

- (Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is ipv6.
Creating IPv6 ACL

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Enter log to cause an logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs.</td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter routing to specify that IPv6 packets be routed.</td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295</td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

{deny|permit} tcp

Example:

{deny | permit} tcp
{source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address} 
[operator [port-number]]|destination-ipv6-prefix/prefix-length 
| any | hostdestination-ipv6-address} 
[operator [port-number]][ack] [dscp value][established] [fin] 
[log][log-input] [neq {port | protocol}] [psh] 
[range{port | protocol}] [rst][routing] [sequence value] 
[syn] [time-range name][urg]

(Optional) Define a TCP access list and the access conditions.

Enter tcp for Transmission Control Protocol. The parameters are the same as those described in Step 3, with these additional optional parameters:

- ack—Acknowledgment bit set.
- established—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.
- fin—Finished bit set; no more data from sender.
- neq {port | protocol}—Matches only packets that are not on a given port number.
- psh—Push function bit set.
- range {port | protocol}—Matches only packets in the port number range.
- rst—Reset bit set.
- syn—Synchronize bit set.
- urg—Urgent pointer bit set.

**Step 6**

{deny|permit} udp

Example:

{deny | permit} udp
{source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address} 
[operator [port-number]]|destination-ipv6-prefix/prefix-length 
| any | hostdestination-ipv6-address} 
[operator [port-number]][dscp value] 
[log][log-input]

(Optional) Define a UDP access list and the access conditions.

Enter udp for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the operator [port] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.
<table>
<thead>
<tr>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>(neq (port</td>
</tr>
</tbody>
</table>

**Purpose**

(Optional) Define an ICMP access list and the access conditions.

Enter `icmp` for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 3a, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:

- **icmp-type**—Enter to filter by ICMP message type, a number from 0 to 255.
- **icmp-code**—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.
- **icmp-message**—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the `?` key or see command reference for this release.

**Step 7**

{deny|permit} icmp

**Example:**

```
{deny | permit} icmp
{source-ipv6-prefix/prefix-length | any | hostsource-ipv6-address}
{operator [port-number]}
{destination-ipv6-prefix/prefix-length | any | hostdestination-ipv6-address}
{operator [port-number]}[icmp-type [icmp-code]
|icmp-message] [dscpvalue] [log] [log-input]
{routing} [sequence value][time-range name]
```

**Step 8**

end

**Example:**

```
Device(config)# end
```

**Step 9**

show ipv6 access-list

**Example:**

```
show ipv6 access-list
```

**Step 10**

show running-config

**Example:**

```
Device# show running-config
```

**Step 11**

copy running-config startup-config

**Example:**

```
Device# copy running-config startup-config
```
Applying an IPv6 ACL to an Interface

This section describes how to apply IPv6 ACLs to network interfaces. You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface_id</td>
<td>Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# interface interface-id</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> no switchport</td>
<td>If applying a router ACL, change the interface from Layer 2 mode (the default) to Layer 3 mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# no switchport</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ipv6 address ipv6_address</td>
<td>Configure an IPv6 address on a Layer 3 interface (for router ACLs). This command is not required on Layer 2 interfaces or if the interface has already been configured with an explicit IPv6 address.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# ipv6 address ipv6-address</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ipv6 traffic-filter access-list-name</td>
<td>Apply the access list to incoming or outgoing traffic on the interface. The <em>out</em> keyword is not supported for Layer 2 interfaces (port ACLs).</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# ipv6 traffic-filter access-list-name {in</td>
<td>out}</td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> show running-config</td>
<td>Verify the access list configuration.</td>
</tr>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong> copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Displaying IPv6 ACLs**

To display IPv6 ACLs, perform this procedure:
### Configuration Examples for IPv6 ACL

#### Example: Creating an IPv6 ACL

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny -all condition is at the end of each IPv6 access list.

**Note**

Logging is supported only on Layer 3 interfaces.

```bash
Device(config)# ipv6 access-list CISCO
Device(config-ipv6-acl)# deny tcp any any gt 5000
Device (config-ipv6-acl)# deny udp any any lt 5000 log
Device(config-ipv6-acl)# permit icmp any any
Device(config-ipv6-acl)# permit any any
```

#### Example: Applying IPv6 ACLs

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface.

---

### Procedure

<table>
<thead>

<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# show ipv6 access-list [access-list-name]</code></td>
<td></td>
</tr>
</tbody>
</table>
Example: Displaying IPv6 ACLs

This is an example of the output from the `show access-lists` privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Device # show access-lists
Extended IP access list hello
10 permit ip any any
IPv6 access list ipv6
permit ipv6 any any sequence 10
```

This is an example of the output from the `show ipv6 access-lists` privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Device# show ipv6 access-list
IPv6 access list inbound
permit tcp any any eq bgp (8 matches) sequence 10
permit tcp any any eq telnet (15 matches) sequence 20
permit udp any any sequence 30

IPv6 access list outbound
deny udp any any sequence 10
deny tcp any any eq telnet sequence 20
```

CHAPTER 17

Configuring Spanning Tree Protocol

This chapter describes how to configure the Spanning Tree Protocol (STP) on port-based VLANs on the Catalyst devices. The device can use either the per-VLAN spanning-tree plus (PVST+) protocol based on the IEEE 802.1D standard and Cisco proprietary extensions, or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol based on the IEEE 802.1w standard. A switch stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID.

- Finding Feature Information, on page 255
- Restrictions for STP, on page 255
- Information About Spanning Tree Protocol, on page 256
- How to Configure Spanning-Tree Features, on page 268
- Monitoring Spanning-Tree Status, on page 280
- Feature Information for STP, on page 281

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for STP

- An attempt to configure a device as the root device fails if the value necessary to be the root device is less than 1.

- If your network consists of devices that support and do not support the extended system ID, it is unlikely that the device with the extended system ID support will become the root device. The extended system ID increases the device priority value every time the VLAN number is greater than the priority of the connected devices running older software.

- The root device for each spanning-tree instance should be a backbone or distribution device. Do not configure an access device as the spanning-tree primary root.
Information About Spanning Tree Protocol

Spanning Tree Protocol

Spanning Tree Protocol (STP) is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Devices might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one device of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- **Root**—A forwarding port elected for the spanning-tree topology
- **Designated**—A forwarding port elected for every switched LAN segment
- **Alternate**—A blocked port providing an alternate path to the root bridge in the spanning tree
- **Backup**—A blocked port in a loopback configuration

The device that has all of its ports as the designated role or as the backup role is the root device. The device that has at least one of its ports in the designated role is called the designated device.

Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Devices send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The devices do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending device and its ports, including device and MAC addresses, device priority, port priority, and path cost. Spanning tree uses this information to elect the root device and root port for the switched network and the root port and designated port for each switched segment.

When two ports on a device are part of a loop, the spanning-tree and path cost settings control which port is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of a port in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.

---

**Note**

By default, the device sends keepalive messages (to ensure the connection is up) only on interfaces that do not have small form-factor pluggable (SFP) modules. You can change the default for an interface by entering the `[no] keepalive` interface configuration command with no keywords.
Spanning-Tree Topology and BPDUs

The stable, active spanning-tree topology of a switched network is controlled by these elements:

• The unique bridge ID (device priority and MAC address) associated with each VLAN on each device. In a device stack, all devices use the same bridge ID for a given spanning-tree instance.

• The spanning-tree path cost to the root device.

• The port identifier (port priority and MAC address) associated with each Layer 2 interface.

When the devices in a network are powered up, each functions as the root device. Each device sends a configuration BPDU through all of its ports. The BPDUs communicate and compute the spanning-tree topology. Each configuration BPDU contains this information:

• The unique bridge ID of the device that the sending device identifies as the root device

• The spanning-tree path cost to the root

• The bridge ID of the sending device

• Message age

• The identifier of the sending interface

• Values for the hello, forward delay, and max-age protocol timers

When a device receives a configuration BPDU that contains superior information (lower bridge ID, lower path cost, and so forth), it stores the information for that port. If this BPDU is received on the root port of the device, the device also forwards it with an updated message to all attached LANs for which it is the designated device.

If a device receives a configuration BPDU that contains inferior information to that currently stored for that port, it discards the BPDU. If the device is a designated device for the LAN from which the inferior BPDU was received, it sends that LAN a BPDU containing the up-to-date information stored for that port. In this way, inferior information is discarded, and superior information is propagated on the network.

A BPDU exchange results in these actions:

• One device in the network is elected as the root device (the logical center of the spanning-tree topology in a switched network). See the figure following the bullets.

For each VLAN, the device with the highest device priority (the lowest numerical priority value) is elected as the root device. If all devices are configured with the default priority (32768), the device with the lowest MAC address in the VLAN becomes the root device. The device priority value occupies the most significant bits of the bridge ID, as shown in the following figure.

• A root port is selected for each device (except the root device). This port provides the best path (lowest cost) when the device forwards packets to the root device.

• Only one outgoing port on the stack root device is selected as the root port. The remaining devices in the stack become its designated devices (Device 2 and Device 3) as shown in the following figure.

• The shortest distance to the root device is calculated for each device based on the path cost.

• A designated device for each LAN segment is selected. The designated device incurs the lowest path cost when forwarding packets from that LAN to the root device. The port through which the designated device is attached to the LAN is called the designated port.
Figure 14: Spanning-Tree Port States in a Device Stack

One stack member is elected as the stack root device. The stack root device contains the outgoing root port (Device 1).

All paths that are not needed to reach the root device from anywhere in the switched network are placed in the spanning-tree blocking mode.

Bridge ID, Device Priority, and Extended System ID

The IEEE 802.1D standard requires that each device has an unique bridge identifier (bridge ID), which controls the selection of the root device. Because each VLAN is considered as a different logical bridge with PVST+ and Rapid PVST+, the same device must have a different bridge ID for each configured VLAN. Each VLAN on the device has a unique 8-byte bridge ID. The 2 most-significant bytes are used for the device priority, and the remaining 6 bytes are derived from the device MAC address.

The device supports the IEEE 802.1t spanning-tree extensions, and some of the bits previously used for the device priority are now used as the VLAN identifier. The result is that fewer MAC addresses are reserved for the device, and a larger range of VLAN IDs can be supported, all while maintaining the uniqueness of the bridge ID.
The 2 bytes previously used for the device priority are reallocated into a 4-bit priority value and a 12-bit extended system ID value equal to the VLAN ID.

Spanning tree uses the extended system ID, the device priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN. Because the device stack appears as a single device to the rest of the network, all devices in the stack use the same bridge ID for a given spanning tree. If the stack master fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the new stack master.

Support for the extended system ID affects how you manually configure the root device, the secondary root device, and the device priority of a VLAN. For example, when you change the device priority value, you change the probability that the device will be elected as the root device. Configuring a higher value decreases the probability; a lower value increases the probability.

If any root device for the specified VLAN has a device priority lower than 24576, the device sets its own priority for the specified VLAN to 4096 less than the lowest device priority. 4096 is the value of the least-significant bit of a 4-bit device priority value as shown in the table.

Port Priority Versus Path Cost

If a loop occurs, spanning tree uses port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

The spanning-tree path cost default value is derived from the media speed of an interface. If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

If your device is a member of a device stack, you must assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last instead of adjusting its port priority. For details, see Related Topics.

Spanning-Tree Interface States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When an interface transitions directly from nonparticipation in the spanning-tree topology to the forwarding state, it can create temporary data loops. Interfaces must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for forwarded frames that have used the old topology.

Each Layer 2 interface on a device using spanning tree exists in one of these states:

- **Blocking**—The interface does not participate in frame forwarding.
- **Listening**—The first transitional state after the blocking state when the spanning tree decides that the interface should participate in frame forwarding.
- **Learning**—The interface prepares to participate in frame forwarding.
- **Forwarding**—The interface forwards frames.
- **Disabled**—The interface is not participating in spanning tree because of a shutdown port, no link on the port, or no spanning-tree instance running on the port.

An interface moves through these states:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

*Figure 15: Spanning-Tree Interface States*
When you power up the device, spanning tree is enabled by default, and every interface in the device, VLAN, or network goes through the blocking state and the transitory states of listening and learning. Spanning tree stabilizes each interface at the forwarding or blocking state.

When the spanning-tree algorithm places a Layer 2 interface in the forwarding state, this process occurs:

1. The interface is in the listening state while spanning tree waits for protocol information to move the interface to the blocking state.
2. While spanning tree waits for the forward-delay timer to expire, it moves the interface to the learning state and resets the forward-delay timer.
3. In the learning state, the interface continues to block frame forwarding as the device learns end-station location information for the forwarding database.
4. When the forward-delay timer expires, spanning tree moves the interface to the forwarding state, where both learning and frame forwarding are enabled.

### Blocking State

A Layer 2 interface in the blocking state does not participate in frame forwarding. After initialization, a BPDU is sent to each device interface. A device initially functions as the root until it exchanges BPDUs with other devices. This exchange establishes which device in the network is the root or root device. If there is only one device in the network, no exchange occurs, the forward-delay timer expires, and the interface moves to the listening state. An interface always enters the blocking state after device initialization.

An interface in the blocking state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

### Listening State

The listening state is the first state a Layer 2 interface enters after the blocking state. The interface enters this state when the spanning tree decides that the interface should participate in frame forwarding.

An interface in the listening state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

### Learning State

A Layer 2 interface in the learning state prepares to participate in frame forwarding. The interface enters the learning state from the listening state.

An interface in the learning state performs these functions:

- Discards frames received on the interface
Forwarding State

A Layer 2 interface in the forwarding state forwards frames. The interface enters the forwarding state from the learning state.

An interface in the forwarding state performs these functions:
- Receives and forwards frames received on the interface
- Forwards frames switched from another interface
- Learns addresses
- Receives BPDUs

Disabled State

A Layer 2 interface in the disabled state does not participate in frame forwarding or in the spanning tree. An interface in the disabled state is nonoperational.

A disabled interface performs these functions:
- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Does not receive BPDUs

How a Device or Port Becomes the Root Device or Root Port

If all devices in a network are enabled with default spanning-tree settings, the device with the lowest MAC address becomes the root device.

Figure 16: Spanning-Tree Topology

Device A is elected as the root device because the device priority of all the devices is set to the default (32768) and Device A has the lowest MAC address. However, because of traffic patterns, number of forwarding interfaces, or link types, Device A might not be the ideal root device. By increasing the priority (lowering the
numerical value) of the ideal device so that it becomes the root device, you force a spanning-tree recalculation
to form a new topology with the ideal device as the root.

When the spanning-tree topology is calculated based on default parameters, the path between source and
destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links
to an interface that has a higher number than the root port can cause a root-port change. The goal is to make
the fastest link the root port.

For example, assume that one port on Device B is a Gigabit Ethernet link and that another port on Device B
(a 10/100 link) is the root port. Network traffic might be more efficient over the Gigabit Ethernet link. By
changing the spanning-tree port priority on the Gigabit Ethernet port to a higher priority (lower numerical
value) than the root port, the Gigabit Ethernet port becomes the new root port.

**Spanning Tree and Redundant Connectivity**

*Figure 17: Spanning Tree and Redundant Connectivity*

You can create a redundant backbone with spanning tree by connecting two device interfaces to another device
or to two different devices. Spanning tree automatically disables one interface but enables it if the other one
fails. If one link is high-speed and the other is low-speed, the low-speed link is always disabled. If the speeds
are the same, the port priority and port ID are added together, and spanning tree disables the link with the
highest value.

You can also create redundant links between devices by using EtherChannel groups.
Spanning-Tree Address Management

IEEE 802.1D specifies 17 multicast addresses, ranging from 0x00180C2000000 to 0x0180C2000010, to be used by different bridge protocols. These addresses are static addresses that cannot be removed.

Regardless of the spanning-tree state, each device in the stack receives but does not forward packets destined for addresses between 0x0180C2000000 and 0x0180C20000F.

If spanning tree is enabled, the CPU on the device or on each device in the stack receives packets destined for 0x0180C2000000 and 0x0180C2000010. If spanning tree is disabled, the device or each device in the stack forwards those packets as unknown multicast addresses.

Accelerated Aging to Retain Connectivity

The default for aging dynamic addresses is 5 minutes, the default setting of the `mac address-table aging-time` global configuration command. However, a spanning-tree reconfiguration can cause many station locations to change. Because these stations could be unreachable for 5 minutes or more during a reconfiguration, the address-aging time is accelerated so that station addresses can be dropped from the address table and then relearned. The accelerated aging is the same as the forward-delay parameter value (`spanning-tree vlan vlan-id forward-time seconds` global configuration command) when the spanning tree reconfigures.

Because each VLAN is a separate spanning-tree instance, the device accelerates aging on a per-VLAN basis. A spanning-tree reconfiguration on one VLAN can cause the dynamic addresses learned on that VLAN to be subject to accelerated aging. Dynamic addresses on other VLANs can be unaffected and remain subject to the aging interval entered for the device.

Spanning-Tree Modes and Protocols

The device supports these spanning-tree modes and protocols:

- **PVST+**—This spanning-tree mode is based on the IEEE 802.1D standard and Cisco proprietary extensions. The PVST+ runs on each VLAN on the device up to the maximum supported, ensuring that each has a loop-free path through the network.

  The PVST+ provides Layer 2 load-balancing for the VLAN on which it runs. You can create different logical topologies by using the VLANs on your network to ensure that all of your links are used but that no one link is oversubscribed. Each instance of PVST+ on a VLAN has a single root device. This root device propagates the spanning-tree information associated with that VLAN to all other devices in the network. Because each device has the same information about the network, this process ensures that the network topology is maintained.

- **Rapid PVST+**—This spanning-tree mode is the same as PVST+ except that it uses a rapid convergence based on the IEEE 802.1w standard. Beginning from 15.2(4)E release, the STP default mode is Rapid PVST+. To provide rapid convergence, the Rapid PVST+ immediately deletes dynamically learned MAC address entries on a per-port basis upon receiving a topology change. By contrast, PVST+ uses a short aging time for dynamically learned MAC address entries.

  Rapid PVST+ uses the same configuration as PVST+ (except where noted), and the device needs only minimal extra configuration. The benefit of Rapid PVST+ is that you can migrate a large PVST+ install base to Rapid PVST+ without having to learn the complexities of the Multiple Spanning Tree Protocol.
(MSTP) configuration and without having to re provision your network. In Rapid PVST+ mode, each VLAN runs its own spanning-tree instance up to the maximum supported.

- MSTP—This spanning-tree mode is based on the IEEE 802.1s standard. You can map multiple VLANs to the same spanning-tree instance, which reduces the number of spanning-tree instances required to support a large number of VLANs. The MSTP runs on top of the RSTP (based on IEEE 802.1w), which provides for rapid convergence of the spanning tree by eliminating the forward delay and by quickly transitioning root ports and designated ports to the forwarding state. In a device stack, the cross-stack rapid transition (CSRT) feature performs the same function as RSTP. You cannot run MSTP without RSTP or CSRT.

Related Topics
Changing the Spanning-Tree Mode, on page 268

Supported Spanning-Tree Instances

In PVST+ or Rapid PVST+ mode, the device or device stack supports up to 128 spanning-tree instances.

In MSTP mode, the device or device stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

Spanning-Tree Interoperability and Backward Compatibility

In a mixed MSTP and PVST+ network, the common spanning-tree (CST) root must be inside the MST backbone, and a PVST+ device cannot connect to multiple MST regions.

When a network contains devices running Rapid PVST+ and devices running PVST+, we recommend that the Rapid PVST+ devices and PVST+ devices be configured for different spanning-tree instances. In the Rapid PVST+ spanning-tree instances, the root device must be a Rapid PVST+ device. In the PVST+ instances, the root device must be a PVST+ device. The PVST+ devices should be at the edge of the network.

All stack members run the same version of spanning tree (all PVST+, all Rapid PVST+, or all MSTP).

STP and IEEE 802.1Q Trunks

The IEEE 802.1Q standard for VLAN trunks imposes some limitations on the spanning-tree strategy for a network. The standard requires only one spanning-tree instance for all VLANs allowed on the trunks. However, in a network of Cisco devices connected through IEEE 802.1Q trunks, the devices maintain one spanning-tree instance for each VLAN allowed on the trunks. When you connect a Cisco device to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco device uses PVST+ to provide spanning-tree interoperability. If Rapid PVST+ is enabled, the device uses it instead of PVST+. The device combines the spanning-tree instance of the IEEE 802.1Q VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q device.

However, all PVST+ or Rapid PVST+ information is maintained by Cisco devices separated by a cloud of non-Cisco IEEE 802.1Q devices. The non-Cisco IEEE 802.1Q cloud separating the Cisco devices is treated as a single trunk link between the devices.

Rapid PVST+ is automatically enabled on IEEE 802.1Q trunks, and no user configuration is required. The external spanning-tree behavior on access ports and Inter-Switch Link (ISL) trunk ports is not affected by PVST+.

VLAN-Bridge Spanning Tree

Cisco VLAN-bridge spanning tree is used with the fallback bridging feature (bridge groups), which forwards non-IP protocols such as DECnet between two or more VLAN bridge domains or routed ports. The VLAN-bridge spanning tree allows the bridge groups to form a spanning tree on top of the individual VLAN spanning trees to prevent loops from forming if there are multiple connections among VLANs. It also prevents the individual spanning trees from the VLANs being bridged from collapsing into a single spanning tree.

To support VLAN-bridge spanning tree, some of the spanning-tree timers are increased. To use the fallback bridging feature, you must have the IP services feature set enabled on your device.

Spanning Tree and Device Stacks

When the device stack is operating in PVST+ or Rapid PVST+ mode:

- A device stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the stack master.

- When a new device joins the stack, it sets its bridge ID to the stack master bridge ID. If the newly added device has the lowest ID and if the root path cost is the same among all stack members, the newly added device becomes the stack root.

- When a stack member leaves the stack, spanning-tree reconvergence occurs within the stack (and possibly outside the stack). The remaining stack member with the lowest stack port ID becomes the stack root.

- If the stack master fails or leaves the stack, the stack members elect a new stack master, and all stack members change their bridge IDs of the spanning trees to the new master bridge ID.

- If a device stack is the spanning-tree root and the stack master fails or leaves the stack, the stack members elect a new stack master, and a spanning-tree reconvergence occurs.

- If the device stack is the spanning-tree root and the stack master fails or leaves the stack, the standby switch becomes the new active switch, bridge IDs remain the same, and a spanning-tree reconvergence might occur.
• If a neighboring device external to the device stack fails or is powered down, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of losing a device in the active topology.

• If a new device external to the device stack is added to the network, normal spanning-tree processing occurs. Spanning-tree reconvergence might occur as a result of adding a device in the network.

How to Configure Spanning-Tree Features

Changing the Spanning-Tree Mode

The switch supports three spanning-tree modes: per-VLAN spanning tree plus (PVST+), Rapid PVST+, or multiple spanning tree protocol (MSTP). By default, the device runs the Rapid PVST+ protocol.

If you want to enable a mode that is different from the default mode, this procedure is required.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `spanning-tree mode {pvst | mst | rapid-pvst}`
4. `interface interface-id`
5. `spanning-tree link-type point-to-point`
6. `end`
7. `clear spanning-tree detected-protocols`

**DETAILED STEPS**

<table>
<thead>

- [Spanning-Tree Modes and Protocols](#), on page 264

### Disabling Spanning Tree

Spanning tree is enabled by default on VLAN 1 and on all newly created VLANs up to the spanning-tree limit. Disable spanning tree only if you are sure there are no loops in the network topology.

⚠️ **Caution**

When spanning tree is disabled and loops are present in the topology, excessive traffic and indefinite packet duplication can drastically reduce network performance. This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no spanning-tree vlan vlan-id`
4. `end`

### DETAILLED STEPS

<td></td>
</tr>
</tbody>
</table>
### Configuring the Root Device

To configure a device as the root for the specified VLAN, use the `spanning-tree vlan vlan-id root` global configuration command to modify the device priority from the default value (32768) to a significantly lower value. When you enter this command, the software checks the device priority of the root devices for each VLAN. Because of the extended system ID support, the device sets its own priority for the specified VLAN to 24576 if this value will cause this device to become the root for the specified VLAN.

Use the `diameter` keyword to specify the Layer 2 network diameter (that is, the maximum number of device hops between any two end stations in the Layer 2 network). When you specify the network diameter, the device automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

This procedure is optional.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `spanning-tree vlan vlan-id root primary [diameter net-diameter]`
4. `end`

#### DETAILED STEPS

</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config)# end</strong></td>
<td></td>
</tr>
</tbody>
</table>

### What to do next

After configuring the device as the root device, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the `spanning-tree vlan vlan-id hello-time`, `spanning-tree vlan vlan-id forward-time`, and `spanning-tree vlan vlan-id max-age` global configuration commands.

**Related Topics**

- Accelerated Aging to Retain Connectivity, on page 264
- Restrictions for STP, on page 255

### Configuring a Secondary Root Device

When you configure a device as the secondary root, the device priority is modified from the default value (32768) to 28672. With this priority, the device is likely to become the root device for the specified VLAN if the primary root device fails. This is assuming that the other network devices use the default device priority of 32768, and therefore, are unlikely to become the root device.
You can execute this command on more than one device to configure multiple backup root devices. Use the same network diameter and hello-time values that you used when you configured the primary root device with the `spanning-tree vlan vlan-id root primary` global configuration command.

This procedure is optional.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `spanning-tree vlan vlan-id root secondary [diameter net-diameter]`
4. `end`

**DETAILED STEPS**

<table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for MSTP

• For two or more devices to be in the same multiple spanning tree (MST) region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.

• For two or more stacked switches to be in the same MST region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.

• For load-balancing across redundant paths in the network to work, all VLAN-to-instance mapping assignments must match; otherwise, all traffic flows on a single link. You can achieve load-balancing across a device stack by manually configuring the path cost.

• For load-balancing between a per-VLAN spanning tree plus (PVST+) and an MST cloud or between a rapid-PVST+ and an MST cloud to work, all MST boundary ports must be forwarding. MST boundary ports are forwarding when the internal spanning tree (IST) master of the MST cloud is the root of the common spanning tree (CST). If the MST cloud consists of multiple MST regions, one of the MST
regions must contain the CST root, and all of the other MST regions must have a better path to the root contained within the MST cloud than a path through the PVST+ or rapid-PVST+ cloud. You might have to manually configure the devices in the clouds.

Related Topics
- Specifying the MST Region Configuration and Enabling MSTP, on page 303
- MSTP Configuration Guidelines, on page 285
- Multiple Spanning-Tree Regions, on page 287

Restrictions for MSTP

- The device stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.
- PVST+, Rapid PVST+, and MSTP are supported, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run Rapid PVST+, or all VLANs run MSTP.)
- All stack members must run the same version of spanning tree (all PVST+, Rapid PVST+, or MSTP).
- VLAN Trunking Protocol (VTP) propagation of the MST configuration is not supported. However, you can manually configure the MST configuration (region name, revision number, and VLAN-to-instance mapping) on each device within the MST region by using the command-line interface (CLI) or through the Simple Network Management Protocol (SNMP) support.
- Partitioning the network into a large number of regions is not recommended. However, if this situation is unavoidable, we recommend that you partition the switched LAN into smaller LANs interconnected by routers or non-Layer 2 devices.
- A region can have one member or multiple members with the same MST configuration; each member must be capable of processing rapid spanning tree protocol (RSTP) Bridge Protocol Data Units (BPDUs). There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.
- After configuring a device as the root device, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the spanning-tree mst hello-time, spanning-tree mst forward-time, and the spanning-tree mst max-age global configuration commands.

Information About MSTP

MSTP Configuration

MSTP, which uses RSTP for rapid convergence, enables multiple VLANs to be grouped into and mapped to the same spanning-tree instance, reducing the number of spanning-tree instances needed to support a large number of VLANs. The MSTP provides for multiple forwarding paths for data traffic, enables load balancing, and reduces the number of spanning-tree instances required to support a large number of VLANs. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

Note

The multiple spanning-tree (MST) implementation is based on the IEEE 802.1s standard.

The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. This deployment provides the highly available network required in a service-provider environment.

When the device is in the MST mode, the RSTP, which is based on IEEE 802.1w, is automatically enabled. The RSTP provides rapid convergence of the spanning tree through explicit handshaking that eliminates the IEEE 802.1D forwarding delay and quickly transitions root ports and designated ports to the forwarding state.

Both MSTP and RSTP improve the spanning-tree operation and maintain backward compatibility with equipment that is based on the (original) IEEE 802.1D spanning tree, with existing Cisco-proprietary Multiple Instance STP (MISTP), and with existing Cisco PVST+ and rapid per-VLAN spanning-tree plus (Rapid PVST+).

A device stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same device ID.

MSTP Configuration Guidelines

- When you enable MST by using the `spanning-tree mode mst` global configuration command, RSTP is automatically enabled.

- For configuration guidelines about UplinkFast, BackboneFast, and cross-stack UplinkFast, see the relevant sections in the Related Topics section.

- When the device is in MST mode, it uses the long path-cost calculation method (32 bits) to compute the path cost values. With the long path-cost calculation method, the following path cost values are supported:

<table>
<thead>
<tr>
<th>Speed</th>
<th>Path Cost Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Mb/s</td>
<td>2,000,000</td>
</tr>
<tr>
<td>100 Mb/s</td>
<td>200,000</td>
</tr>
<tr>
<td>1 Gb/s</td>
<td>20,000</td>
</tr>
</tbody>
</table>
### Root Switch

The device maintains a spanning-tree instance for the group of VLANs mapped to it. A device ID, consisting of the device priority and the device MAC address, is associated with each instance. For a group of VLANs, the device with the lowest device ID becomes the root device.

When you configure a device as the root, you modify the device priority from the default value (32768) to a significantly lower value so that the device becomes the root device for the specified spanning-tree instance. When you enter this command, the device checks the device priorities of the root devices. Because of the extended system ID support, the device sets its own priority for the specified instance to 24576 if this value will cause this device to become the root for the specified spanning-tree instance.

If any root device for the specified instance has a device priority lower than 24576, the device sets its own priority to 4096 less than the lowest device priority. (4096 is the value of the least-significant bit of a 4-bit device priority value. For more information, select "Bridge ID, Device Priority, and Extended System ID" link in Related Topics.

If your network consists of devices that support and do not support the extended system ID, it is unlikely that the device with the extended system ID support will become the root device. The extended system ID increases the device priority value every time the VLAN number is greater than the priority of the connected switches running older software.

The root device for each spanning-tree instance should be a backbone or distribution device. Do not configure an access device as the spanning-tree primary root.

Use the `diameter` keyword, which is available only for MST instance 0, to specify the Layer 2 network diameter (that is, the maximum number of device hops between any two end stations in the Layer 2 network). When you specify the network diameter, the device automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

Multiple Spanning-Tree Regions

For switches to participate in multiple spanning-tree (MST) instances, you must consistently configure the switches with the same MST configuration information. A collection of interconnected switches that have the same MST configuration comprises an MST region.

The MST configuration controls to which MST region each device belongs. The configuration includes the name of the region, the revision number, and the MST VLAN-to-instance assignment map. You configure the device for a region by specifying the MST region configuration on it. You can map VLANs to an MST instance, specify the region name, and set the revision number. For instructions and an example, select the "Specifying the MST Region Configuration and Enabling MSTP" link in Related Topics.

A region can have one or multiple members with the same MST configuration. Each member must be capable of processing RSTP bridge protocol data units (BPDUs). There is no limit to the number of MST regions in a network, but each region can support up to 65 spanning-tree instances. Instances can be identified by any number in the range from 0 to 4094. You can assign a VLAN to only one spanning-tree instance at a time.

IST, CIST, and CST

Unlike PVST+ and Rapid PVST+ in which all the spanning-tree instances are independent, the MSTP establishes and maintains two types of spanning trees:

- An internal spanning tree (IST), which is the spanning tree that runs in an MST region.

Within each MST region, the MSTP maintains multiple spanning-tree instances. Instance 0 is a special instance for a region, known as the internal spanning tree (IST). All other MST instances are numbered from 1 to 4094.

The IST is the only spanning-tree instance that sends and receives BPDUs. All of the other spanning-tree instance information is contained in M-records, which are encapsulated within MSTP BPDUs. Because the MSTP BPU carries information for all instances, the number of BPDUs that need to be processed to support multiple spanning-tree instances is significantly reduced.

All MST instances within the same region share the same protocol timers, but each MST instance has its own topology parameters, such as root device ID, root path cost, and so forth. By default, all VLANs are assigned to the IST.

An MST instance is local to the region; for example, MST instance 1 in region A is independent of MST instance 1 in region B, even if regions A and B are interconnected.

- A common and internal spanning tree (CIST), which is a collection of the ISTs in each MST region, and the common spanning tree (CST) that interconnects the MST regions and single spanning trees.
The spanning tree computed in a region appears as a subtree in the CST that encompasses the entire switched domain. The CIST is formed by the spanning-tree algorithm running among switches that support the IEEE 802.1w, IEEE 802.1s, and IEEE 802.1D standards. The CIST inside an MST region is the same as the CST outside a region.

**Operations Within an MST Region**

The IST connects all the MSTP switches in a region. When the IST converges, the root of the IST becomes the CIST regional root (called the *IST master* before the implementation of the IEEE 802.1s standard). It is the device within the region with the lowest device ID and path cost to the CIST root. The CIST regional root is also the CIST root if there is only one region in the network. If the CIST root is outside the region, one of the MSTP switches at the boundary of the region is selected as the CIST regional root.

When an MSTP device initializes, it sends BPDUs claiming itself as the root of the CIST and the CIST regional root, with both of the path costs to the CIST root and to the CIST regional root set to zero. The device also initializes all of its MST instances and claims to be the root for all of them. If the device receives superior MST root information (lower device ID, lower path cost, and so forth) than currently stored for the port, it relinquishes its claim as the CIST regional root.

During initialization, a region might have many subregions, each with its own CIST regional root. As switches receive superior IST information, they leave their old subregions and join the new subregion that contains the true CIST regional root. All subregions shrink except for the one that contains the true CIST regional root.

For correct operation, all switches in the MST region must agree on the same CIST regional root. Therefore, any two switches in the region only synchronize their port roles for an MST instance if they converge to a common CIST regional root.

- Illustration of MST Regions, on page 289

**Operations Between MST Regions**

If there are multiple regions or legacy IEEE 802.1D devices within the network, MSTP establishes and maintains the CST, which includes all MST regions and all legacy STP devices in the network. The MST instances combine with the IST at the boundary of the region to become the CST.

The IST connects all the MSTP devices in the region and appears as a subtree in the CIST that encompasses the entire switched domain. The root of the subtree is the CIST regional root. The MST region appears as a virtual device to adjacent STP devices and MST regions.

Only the CST instance sends and receives BPDUs, and MST instances add their spanning-tree information into the BPDUs to interact with neighboring devices and compute the final spanning-tree topology. Because of this, the spanning-tree parameters related to BPU transmission (for example, hello time, forward time, max-age, and max-hops) are configured only on the CST instance but affect all MST instances. Parameters related to the spanning-tree topology (for example, device priority, port VLAN cost, and port VLAN priority) can be configured on both the CST instance and the MST instance.

MSTP devices use Version 3 RSTP BPDUs or IEEE 802.1D STP BPDU s to communicate with legacy IEEE 802.1D devices. MSTP devices use MSTP BPDU s to communicate with MSTP devices.

IEEE 802.1s Terminology

Some MST naming conventions used in Cisco’s prestandard implementation have been changed to identify some internal or regional parameters. These parameters are significant only within an MST region, as opposed to external parameters that are relevant to the whole network. Because the CIST is the only spanning-tree instance that spans the whole network, only the CIST parameters require the external rather than the internal or regional qualifiers.

- The CIST root is the root device for the unique instance that spans the whole network, the CIST.
- The CIST external root path cost is the cost to the CIST root. This cost is left unchanged within an MST region. Remember that an MST region looks like a single device for the CIST. The CIST external root path cost is the root path cost calculated between the virtual devices and devices that do not belong to any region.
- The CIST regional root was called the IST master in the prestandard implementation. If the CIST root is in the region, the CIST regional root is the CIST root. Otherwise, the CIST regional root is the closest device to the CIST root in the region. The CIST regional root acts as a root device for the IST.
- The CIST internal root path cost is the cost to the CIST regional root in a region. This cost is only relevant to the IST, instance 0.

Illustration of MST Regions

This figure displays three MST regions and a legacy IEEE 802.1D device (D). The CIST regional root for region 1 (A) is also the CIST root. The CIST regional root for region 2 (B) and the CIST regional root for region 3 (C) are the roots for their respective subtrees within the CIST. The RSTP runs in all regions.
Hop Count

The IST and MST instances do not use the message-age and maximum-age information in the configuration BPDU to compute the spanning-tree topology. Instead, they use the path cost to the root and a hop-count mechanism similar to the IP time-to-live (TTL) mechanism.

By using the spanning-tree mst max-hops global configuration command, you can configure the maximum hops inside the region and apply it to the IST and all MST instances in that region. The hop count achieves the same result as the message-age information (triggers a reconfiguration). The root device of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the maximum value. When a device receives this BPDU, it decrements the received remaining hop count by one and propagates this value as the remaining hop count in the BPDU it generates. When the count reaches zero, the device discards the BPDU and ages the information held for the port.

The message-age and maximum-age information in the RSTP portion of the BPDU remain the same throughout the region, and the same values are propagated by the region designated ports at the boundary.
**Boundary Ports**

In the Cisco prestandard implementation, a boundary port connects an MST region to a single spanning-tree region running RSTP, to a single spanning-tree region running PVST+ or rapid PVST+, or to another MST region with a different MST configuration. A boundary port also connects to a LAN, the designated device of which is either a single spanning-tree device or a device with a different MST configuration.

There is no definition of a boundary port in the IEEE 802.1s standard. The IEEE 802.1Q-2002 standard identifies two kinds of messages that a port can receive:

- internal (coming from the same region)
- external (coming from another region)

When a message is internal, the CIST part is received by the CIST, and each MST instance receives its respective M-record.

When a message is external, it is received only by the CIST. If the CIST role is root or alternate, or if the external BPDU is a topology change, it could have an impact on the MST instances.

An MST region includes both devices and LANs. A segment belongs to the region of its designated port. Therefore, a port in a different region than the designated port for a segment is a boundary port. This definition allows two ports internal to a region to share a segment with a port belonging to a different region, creating the possibility of a port receiving both internal and external messages.

The primary change from the Cisco prestandard implementation is that a designated port is not defined as boundary, unless it is running in an STP-compatible mode.

---

**Note**

If there is a legacy STP device on the segment, messages are always considered external.

The other change from the Cisco prestandard implementation is that the CIST regional root device ID field is now inserted where an RSTP or legacy IEEE 802.1Q device has the sender device ID. The whole region performs like a single virtual device by sending a consistent sender device ID to neighboring devices. In this example, device C would receive a BPDU with the same consistent sender device ID of root, whether or not A or B is designated for the segment.

**IEEE 802.1s Implementation**

The Cisco implementation of the IEEE MST standard includes features required to meet the standard, as well as some of the desirable prestandard functionality that is not yet incorporated into the published standard.

**Port Role Naming Change**

The boundary role is no longer in the final MST standard, but this boundary concept is maintained in Cisco’s implementation. However, an MST instance port at a boundary of the region might not follow the state of the corresponding CIST port. Two boundary roles currently exist:

- The boundary port is the root port of the CIST regional root—When the CIST instance port is proposed and is in sync, it can send back an agreement and move to the forwarding state only after all the corresponding MSTI ports are in sync (and thus forwarding). The MSTI ports now have a special master role.
• The boundary port is not the root port of the CIST regional root—The MSTI ports follow the state and role of the CIST port. The standard provides less information, and it might be difficult to understand why an MSTI port can be alternately blocking when it receives no BPDUs (MRecords). In this case, although the boundary role no longer exists, the `show` commands identify a port as boundary in the `type` column of the output.

Interoperation Between Legacy and Standard Devices

Because automatic detection of prestandard devices can fail, you can use an interface configuration command to identify prestandard ports. A region cannot be formed between a standard and a prestandard device, but they can interoperate by using the CIST. Only the capability of load-balancing over different instances is lost in that particular case. The CLI displays different flags depending on the port configuration when a port receives prestandard BPDUs. A syslog message also appears the first time a device receives a prestandard BPDU on a port that has not been configured for prestandard BPDU transmission.

**Figure 19: Standard and Prestandard Device Interoperation**

Assume that A is a standard device and B a prestandard device, both configured to be in the same region. A is the root device for the CIST, and B has a root port (BX) on segment X and an alternate port (BY) on segment Y. If segment Y flaps, and the port on BY becomes the alternate before sending out a single prestandard BPDU, AY cannot detect that a prestandard device is connected to Y and continues to send standard BPDUs. The port BY is fixed in a boundary, and no load balancing is possible between A and B. The same problem exists on segment X, but B might transmit topology.

![Diagram of standard and prestandard device interoperation](image)

**Note**

We recommend that you minimize the interaction between standard and prestandard MST implementations.

Detecting Unidirectional Link Failure

This feature is not yet present in the IEEE MST standard, but it is included in this Cisco IOS release. The software checks the consistency of the port role and state in the received BPDUs to detect unidirectional link failures that could cause bridging loops.

When a designated port detects a conflict, it keeps its role, but reverts to the discarding state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.
This figure illustrates a unidirectional link failure that typically creates a bridging loop. Device A is the root device, and its BPDUs are lost on the link leading to device B. RSTP and MST BPDU s include the role and state of the sending port. With this information, device A can detect that device B does not react to the superior BPDU s it sends and that device B is the designated, not root device. As a result, device A blocks (or keeps blocking) its port, which prevents the bridging loop.

**MSTP and Device Stacks**

A device stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID for a given spanning tree. The bridge ID is derived from the MAC address of the stack master.

The stack master is the stack root when the stack is the root of the network and no root selection has been made within the stack.

If the device stack is the spanning-tree root and the stack master fails or leaves the stack, the standby switch becomes the new active switch, bridge IDs remain the same, and a spanning-tree reconvergence might occur.

If a device that does not support MSTP is added to a device stack that does support MSTP or the reverse, the device is put into a version-mismatch state. If possible, the device is automatically upgraded or downgraded to the same version of software that is running on the device stack.

When a new device joins the stack, it sets its device ID to the device ID. If the newly added device has the lowest ID and if the root path cost is the same among all stack members, the newly added device becomes the stack root. A topology change occurs if the newly added device contains a better root port for the device stack or a better designated port for the LAN connected to the stack. The newly added device causes a topology change in the network if another device connected to the newly added device changes its root port or designated ports.

When a stack member leaves the stack, spanning-tree reconvergence occurs within the stack (and possibly outside the stack). The remaining stack member with the lowest stack port ID becomes the stack root.

If the stack master fails or leaves the stack, the stack members elect a new stack master, and all stack members change their device IDs of the spanning trees to the new master device ID.

**Interoperability with IEEE 802.1D STP**

A device running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D devices. If this device receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDU s on that port. An MSTP device also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MSTP BPDU (Version 3) associated with a different region, or an RSTP BPDU (Version 2).

However, the device does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDU s because it cannot detect whether the legacy device has been removed from the link unless the legacy device is the designated device. A device might also continue to assign a boundary role to a port when the
device to which this device is connected has joined the region. To restart the protocol migration process (force the renegotiation with neighboring devices), use the `clear spanning-tree detected-protocols` privileged EXEC command.

If all the legacy devices on the link are RSTP devices, they can process MSTP BPDUs as if they are RSTP BPDUs. Therefore, MSTP devices send either a Version 0 configuration and TCN BPDUs or Version 3 MSTP BPDUs on a boundary port. A boundary port connects to a LAN, the designated device of which is either a single spanning-tree device or a device with a different MST configuration.

**RSTP Overview**

The RSTP takes advantage of point-to-point wiring and provides rapid convergence of the spanning tree. Reconfiguration of the spanning tree can occur in less than 1 second (in contrast to 50 seconds with the default settings in the IEEE 802.1D spanning tree).

**Port Roles and the Active Topology**

The RSTP provides rapid convergence of the spanning tree by assigning port roles and by learning the active topology. The RSTP builds upon the IEEE 802.1D STP to select the device with the highest device priority (lowest numerical priority value) as the root device. The RSTP then assigns one of these port roles to individual ports:

- **Root port**—Provides the best path (lowest cost) when the device forwards packets to the root device.
- **Designated port**—Connects to the designated device, which incurs the lowest path cost when forwarding packets from that LAN to the root device. The port through which the designated device is attached to the LAN is called the designated port.
- **Alternate port**—Offers an alternate path toward the root device to that provided by the current root port.
- **Backup port**—Acts as a backup for the path provided by a designated port toward the leaves of the spanning tree. A backup port can exist only when two ports are connected in a loopback by a point-to-point link or when a device has two or more connections to a shared LAN segment.
- **Disabled port**—Has no role within the operation of the spanning tree.

A port with the root or a designated port role is included in the active topology. A port with the alternate or backup port role is excluded from the active topology.

In a stable topology with consistent port roles throughout the network, the RSTP ensures that every root port and designated port immediately transition to the forwarding state while all alternate and backup ports are always in the discarding state (equivalent to blocking in IEEE 802.1D). The port state controls the operation of the forwarding and learning processes.

### Rapid Convergence

The RSTP provides for rapid recovery of connectivity following the failure of a device, a device port, or a LAN. It provides rapid convergence for edge ports, new root ports, and ports connected through point-to-point links as follows:

- **Edge ports**—If you configure a port as an edge port on an RSTP device by using the `spanning-tree portfast` interface configuration command, the edge port immediately transitions to the forwarding state. An edge port is the same as a Port Fast-enabled port, and you should enable it only on ports that connect to a single end station.

- **Root ports**—If the RSTP selects a new root port, it blocks the old root port and immediately transitions the new root port to the forwarding state.

- **Point-to-point links**—If you connect a port to another port through a point-to-point link and the local port becomes a designated port, it negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

![Figure 21: Proposal and Agreement Handshaking for Rapid Convergence](image)

Device A is connected to Device B through a point-to-point link, and all of the ports are in the blocking state. Assume that the priority of Device A is a smaller numerical value than the priority of Device B. Device A sends a proposal message (a configuration BPDU with the proposal flag set) to Device B, proposing itself as the designated device.

After receiving the proposal message, Device B selects as its new root port the port from which the proposal message was received, forces all nonedge ports to the blocking state, and sends an agreement message (a BPDU with the agreement flag set) through its new root port.

After receiving Device B’s agreement message, Device A also immediately transitions its designated port to the forwarding state. No loops in the network are formed because Device B blocked all of its nonedge ports and because there is a point-to-point link between Devices A and B.

When Device C is connected to Device B, a similar set of handshaking messages are exchanged. Device C selects the port connected to Device B as its root port, and both ends immediately transition to the forwarding state. With each iteration of this handshaking process, one more device joins the active topology. As the network converges, this proposal-agreement handshaking progresses from the root toward the leaves of the spanning tree.

In a device stack, the cross-stack rapid transition (CSRT) feature ensures that a stack member receives acknowledgments from all stack members during the proposal-agreement handshaking before moving the port to the forwarding state. CSRT is automatically enabled when the device is in MST mode.

The device learns the link type from the port duplex mode: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. You can override

the default setting that is controlled by the duplex setting by using the spanning-tree link-type interface configuration command.

Synchronization of Port Roles

When the device receives a proposal message on one of its ports and that port is selected as the new root port, the RSTP forces all other ports to synchronize with the new root information.

The device is synchronized with superior root information received on the root port if all other ports are synchronized. An individual port on the device is synchronized if

- That port is in the blocking state.
- It is an edge port (a port configured to be at the edge of the network).

If a designated port is in the forwarding state and is not configured as an edge port, it transitions to the blocking state when the RSTP forces it to synchronize with new root information. In general, when the RSTP forces a port to synchronize with root information and the port does not satisfy any of the above conditions, its port state is set to blocking.

Figure 22: Sequence of Events During Rapid Convergence

After ensuring that all of the ports are synchronized, the device sends an agreement message to the designated device corresponding to its root port. When the devices connected by a point-to-point link are in agreement
about their port roles, the RSTP immediately transitions the port states to forwarding.

Bridge Protocol Data Unit Format and Processing

The RSTP BPDU format is the same as the IEEE 802.1D BPDU format except that the protocol version is set to 2. A new 1-byte Version 1 Length field is set to zero, which means that no version 1 protocol information is present.

The sending device sets the proposal flag in the RSTP BPDU to propose itself as the designated device on that LAN. The port role in the proposal message is always set to the designated port.
The sending device sets the agreement flag in the RSTP BPDU to accept the previous proposal. The port role in the agreement message is always set to the root port.

The RSTP does not have a separate topology change notification (TCN) BPDU. It uses the topology change (TC) flag to show the topology changes. However, for interoperability with IEEE 802.1D devices, the RSTP device processes and generates TCN BPDUs.

The learning and forwarding flags are set according to the state of the sending port.

**Processing Superior BPDU Information**

If a port receives superior root information (lower device ID, lower path cost, and so forth) than currently stored for the port, the RSTP triggers a reconfiguration. If the port is proposed and is selected as the new root port, RSTP forces all the other ports to synchronize.

If the BPDU received is an RSTP BPDU with the proposal flag set, the device sends an agreement message after all of the other ports are synchronized. If the BPDU is an IEEE 802.1D BPDU, the device does not set the proposal flag and starts the forward-delay timer for the port. The new root port requires twice the forward-delay time to transition to the forwarding state.

If the superior information received on the port causes the port to become a backup or alternate port, RSTP sets the port to the blocking state but does not send the agreement message. The designated port continues sending BPDUs with the proposal flag set until the forward-delay timer expires, at which time the port transitions to the forwarding state.

**Processing Inferior BPDU Information**

If a designated port receives an inferior BPDU (such as a higher device ID or a higher path cost than currently stored for the port) with a designated port role, it immediately replies with its own information.

**Topology Changes**

This section describes the differences between the RSTP and the IEEE 802.1D in handling spanning-tree topology changes.

- **Detection**—Unlike IEEE 802.1D in which any transition between the blocking and the forwarding state causes a topology change, only transitions from the blocking to the forwarding state cause a topology change with RSTP (only an increase in connectivity is considered a topology change). State changes on an edge port do not cause a topology change. When an RSTP device detects a topology change, it deletes the learned information on all of its nonedge ports except on those from which it received the TC notification.

- **Notification**—Unlike IEEE 802.1D, which uses TCN BPDUs, the RSTP does not use them. However, for IEEE 802.1D interoperability, an RSTP device processes and generates TCN BPDUs.

- **Acknowledgement**—When an RSTP device receives a TCN message on a designated port from an IEEE 802.1D device, it replies with an IEEE 802.1D configuration BPDU with the TCA bit set. However, if the TC-while timer (the same as the topology-change timer in IEEE 802.1D) is active on a root port connected to an IEEE 802.1D device and a configuration BPDU with the TCA bit set is received, the TC-while timer is reset.

  This behavior is only required to support IEEE 802.1D devices. The RSTP BPDUs never have the TCA bit set.

- **Propagation**—When an RSTP device receives a TC message from another device through a designated or root port, it propagates the change to all of its nonedge, designated ports and to the root port (excluding
the port on which it is received). The device starts the TC-while timer for all such ports and flushes the information learned on them.

- Protocol migration—For backward compatibility with IEEE 802.1D devices, RSTP selectively sends IEEE 802.1D configuration BPDUs and TCN BPDUs on a per-port basis.

When a port is initialized, the migrate-delay timer is started (specifies the minimum time during which RSTP BPDUs are sent), and RSTP BPDUs are sent. While this timer is active, the device processes all BPDUs received on that port and ignores the protocol type.

If the device receives an IEEE 802.1D BPDU after the port migration-delay timer has expired, it assumes that it is connected to an IEEE 802.1D device and starts using only IEEE 802.1D BPDUs. However, if the RSTP device is using IEEE 802.1D BPDUs on a port and receives an RSTP BPDU after the timer has expired, it restarts the timer and starts using RSTP BPDUs on that port.

**Protocol Migration Process**

A device running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D devices. If this device receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP device also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or an RST BPDU (Version 2).

However, the device does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy device has been removed from the link unless the legacy device is the designated device. A device also might continue to assign a boundary role to a port when the device to which it is connected has joined the region.

### About MST-to-PVST+ Interoperability (PVST+ Simulation)

The PVST+ simulation feature enables seamless interoperability between MST and Rapid PVST+. You can enable or disable this per port, or globally. PVST+ simulation is enabled by default.

However, you may want to control the connection between MST and Rapid PVST+ to protect against accidentally connecting an MST-enabled port to a Rapid PVST+-enabled port. Because Rapid PVST+ is the default STP mode, you may encounter many Rapid PVST+-enabled connections.

Disabling this feature causes the switch to stop the MST region from interacting with PVST+ regions. The MST-enabled port moves to a PVST peer inconsistent (blocking) state once it detects it is connected to a Rapid PVST+-enabled port. This port remains in the inconsistent state until the port stops receiving Shared Spanning Tree Protocol (SSTP) BPDUs, and then the port resumes the normal STP transition process.

You can for instance, disable PVST+ simulation, to prevent an incorrectly configured switch from connecting to a network where the STP mode is not MSTP (the default mode is PVST+).

Observe these guidelines when you configure MST switches (in the same region) to interact with PVST+ switches:

- Configure the root for all VLANs inside the MST region as shown in this example:

  ```
  Switch# show spanning-tree mst interface gigabitethernet 1/1
  GigabitEthernet1/1 of MST00 is root forwarding
  Edge port: no (trunk) port guard : none (default)
  Link type: point-to-point (auto) bpdu filter: disable (default)
  Boundary : boundary (PVST) bpdu guard : disable (default)
  Bpdus sent 10, received 310
  
  Instance Role Sts Cost Prio.Nbr Vlans mapped
  --------- ---- --- --------- -------- -------------------------------
  0 Root FWD 20000 128.1 1-2,4-2999,4000-4094
  3 Boun FWD 20000 128.1 3,3000-3999
  ```

### Related Topics

- Supported Spanning-Tree Instances, on page 265
- Specifying the MST Region Configuration and Enabling MSTP, on page 303
The ports that belong to the MST switch at the boundary simulate PVST+ and send PVST+ BPDUs for all the VLANs.

If you enable loop guard on the PVST+ switches, the ports might change to a loop-inconsistent state when the MST switches change their configuration. To correct the loop-inconsistent state, you must disable and re-enable loop guard on that PVST+ switch.

• Do not locate the root for some or all of the VLANs inside the PVST+ side of the MST switch because when the MST switch at the boundary receives PVST+ BPDUs for all or some of the VLANs on its designated ports, root guard sets the port to the blocking state.

• When you connect a PVST+ switch to two different MST regions, the topology change from the PVST+ switch does not pass beyond the first MST region. In such a case, the topology changes are propagated only in the instance to which the VLAN is mapped. The topology change stays local to the first MST region, and the Cisco Access Manager (CAM) entries in the other region are not flushed. To make the topology change visible throughout other MST regions, you can map that VLAN to IST or connect the PVST+ switch to the two regions through access links.

• When you disable the PVST+ simulation, note that the PVST+ peer inconsistency can also occur while the port is already in other states of inconsistency. For example, the root bridge for all STP instances must all be in either the MST region or the Rapid PVST+ side. If the root bridge for all STP instances are not on one side or the other, the software moves the port into a PVST+ simulation-inconsistent state.

**Note**

We recommend that you put the root bridge for all STP instances in the MST region.

### About Detecting Unidirectional Link Failure

The dispute mechanism that detects unidirectional link failures is included in the IEEE 802.1D-2004 RSTP and IEEE 802.1Q-2005 MSTP standard, and requires no user configuration.

The switch checks the consistency of the port role and state in the BPDUs it receives, to detect unidirectional link failures that could cause bridging loops. When a designated port detects a conflict, it keeps its role, but reverts to a discarding (blocking) state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.

For example, in the figure below, Switch A is the root bridge and Switch B is the designated port. BPDUs from Switch A are lost on the link leading to switch B.

**Figure 23: Detecting Unidirectional Link Failure**

Since Rapid PVST+ (802.1w) and MST BPDUs include the role and state of the sending port, Switch A detects (from the inferior BPDU), that switch B does not react to the superior BPDUs it sends, because switch B has the role of a designated port and not the root bridge. As a result, switch A blocks (or keeps blocking) its port, thus preventing the bridging loop.
Note these guidelines and limitations relating to the dispute mechanism:

- It works only on switches running RSTP or MST (the dispute mechanism requires reading the role and state of the port initiating BPDUs).

- It may result in loss of connectivity. For example, in the figure below, Bridge A cannot transmit on the port it elected as a root port. As a result of this situation, there is loss of connectivity (r1 and r2 are designated, a1 is root and a2 is alternate. There is only a one way connectivity between A and R).

*Figure 24: Loss of Connectivity*

- It may cause permanent bridging loops on shared segments. For example, in the figure below, suppose that bridge R has the best priority, and that port b1 cannot receive any traffic from the shared segment 1 and sends inferior designated information on segment 1. Both r1 and a1 can detect this inconsistency. However, with the current dispute mechanism, only r1 will revert to discarding while the root port a1 opens a permanent loop. However, this problem does not occur in Layer 2 switched networks that are connected by point-to-point links.

*Figure 25: Bridging Loops on Shared Segments*
How to Configure MSTP Features

Specifying the MST Region Configuration and Enabling MSTP

For two or more switches to be in the same MST region, they must have the same VLAN-to-instance mapping, the same configuration revision number, and the same name.

A region can have one member or multiple members with the same MST configuration; each member must be capable of processing RSTP BPDUs. There is no limit to the number of MST regions in a network, but each region can only support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.

SUMMARY STEPS

1. enable
2. configure terminal
3. spanning-tree mst configuration
4. instance instance-id vlan vlan-range
5. name name
6. revision version
7. show pending
8. exit
9. spanning-tree mode mst
10. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> spanning-tree mst configuration</td>
<td>Enters MST configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# spanning-tree mst configuration</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> instance instance-id vlan vlan-range</td>
<td>Maps VLANs to an MST instance.</td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

```plaintext
Device(config-mst)# instance 1 vlan 10-20
```

**Purpose**

- For *instance-id*, the range is 0 to 4094.
- For *vlan vlan-range*, the range is 1 to 4094.

When you map VLANs to an MST instance, the mapping is incremental, and the VLANs specified in the command are added to or removed from the VLANs that were previously mapped.

To specify a VLAN range, use a hyphen; for example, `instance 1 vlan 1-63` maps VLANs 1 through 63 to MST instance 1.

To specify a VLAN series, use a comma; for example, `instance 1 vlan 10,20,30` maps VLANs 10, 20, and 30 to MST instance 1.

---

**Step 5**

**name name**

**Example:**

```plaintext
Device(config-mst)# name region1
```

Specifies the configuration name. The `name` string has a maximum length of 32 characters and is case sensitive.

---

**Step 6**

**revision version**

**Example:**

```plaintext
Device(config-mst)# revision 1
```

Specifies the configuration revision number. The range is 0 to 65535.

---

**Step 7**

**show pending**

**Example:**

```plaintext
Device(config-mst)# show pending
```

Verifies your configuration by displaying the pending configuration.

---

**Step 8**

**exit**

**Example:**

```plaintext
Device(config-mst)# exit
```

Applies all changes, and returns to global configuration mode.

---

**Step 9**

**spanning-tree mode mst**

**Example:**

```plaintext
Device(config)# spanning-tree mode mst
```

Enables MSTP. RSTP is also enabled.

Changing spanning-tree modes can disrupt traffic because all spanning-tree instances are stopped for the previous mode and restarted in the new mode.

You cannot run both MSTP and PVST+ or both MSTP and Rapid PVST+ at the same time.

---

**Step 10**

**end**

**Example:**

```plaintext
Device(config)# end
```

Returns to privileged EXEC mode.
Configuring the Root Device

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

You must also know the specified MST instance ID. Step 2 in the example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. spanning-tree mst instance-id root primary
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring a Secondary Root Device

When you configure a device with the extended system ID support as the secondary root, the device priority is modified from the default value (32768) to 28672. The device is then likely to become the root device for the specified instance if the primary root device fails. This is assuming that the other network devices use the default device priority of 32768 and therefore are unlikely to become the root device.

You can execute this command on more than one device to configure multiple backup root devices. Use the same network diameter and hello-time values that you used when you configured the primary root device with the `spanning-tree mst instance-id root primary` global configuration command.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

---

**Configuring Port Priority**

If a loop occurs, the MSTP uses the port priority when selecting an interface to put into the forwarding state. You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.
If the device is a member of a device stack, you must use the `spanning-tree mst [instance-id] cost cost` interface configuration command instead of the `spanning-tree mst [instance-id] port-priority priority` interface configuration command to select a port to put in the forwarding state. Assign lower cost values to ports that you want selected first and higher cost values to ports that you want selected last. For more information, see the path costs topic listed under Related Topics.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. spanning-tree mst instance-id port-priority priority
5. end

**DETAILED STEPS**

</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Device(config-if)# spanning-tree mst 0 port-priority 64 | of instances separated by a comma. The range is 0 to 4094.  
• For `priority`, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority.  
The priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. |

### Summary Steps

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `spanning-tree mst instance-id cost cost`
5. `end`

### Example:

```
Device(config-if)# end
```

The `show spanning-tree mst interface interface-id` privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the `show running-config interface` privileged EXEC command to confirm the configuration.

**Related Topics**

- Specifying the MST Region Configuration and Enabling MSTP, on page 303

### Configuring Path Cost

The MSTP path cost default value is derived from the media speed of an interface. If a loop occurs, the MSTP uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
**Example:**

Device> enable |

- Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**

Device# configure terminal |

**Step 3** interface interface-id | Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports and port-channel logical interfaces. The port-channel range is 1 to 48. |
| **Example:**

Device(config)# interface gigabitethernet 1/0/1 |

**Step 4** spanning-tree mst instance-id cost cost | Configures the cost.  
If a loop occurs, the MSTP uses the path cost when selecting an interface to place into the forwarding state. A lower path cost represents higher-speed transmission.  
- For instance-id, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.  
- For cost, the range is 1 to 200000000; the default value is derived from the media speed of the interface. |
| **Example:**

Device(config-if)# spanning-tree mst 0 cost 17031970 |

**Step 5** end | Returns to privileged EXEC mode. |
| **Example:**

Device(config-if)# end |

The `show spanning-tree mst interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

# Configuring the Device Priority

Changing the priority of a device makes it more likely to be chosen as the root device whether it is a standalone device or a device in the stack.

Exercise care when using this command. For normal network configurations, we recommend that you use the `spanning-tree mst instance-id root primary` and the `spanning-tree mst instance-id root secondary` global configuration commands to specify a device as the root or secondary root device. You should modify the device priority only in circumstances where these commands do not work.

This procedure is optional.

## Before you begin

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

You must also know the specified MST instance ID used. This example uses 0 as the instance ID because that was the instance ID set up by the instructions listed under Related Topics.

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `spanning-tree mst instance-id priority priority`
4. `end`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>

<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

Configure the hello time for all MST instances. The hello time is the time interval between configuration messages generated and sent by the root device. These messages indicate that the device is alive.

**Example:**

**Step 3**

```plaintext
spanning-tree mst hello-time seconds
```

For `seconds`, the range is 1 to 10; the default is 3.

**Step 4**

```plaintext
end
```

Returns to privileged EXEC mode.

### Specifying the Link Type to Ensure Rapid Transitions

If you connect a port to another port through a point-to-point link and the local port becomes a designated port, the RSTP negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

By default, the link type is controlled from the duplex mode of the interface: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. If you have a half-duplex link physically connected point-to-point to a single port on a remote device running MSTP, you can override the default setting of the link type and enable rapid transitions to the forwarding state.

This procedure is optional.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

You must also know the specified MST instance ID and the interface used. This example uses 0 as the instance ID and GigabitEthernet1/0/1 as the interface because that was the instance ID and interface set up by the instructions listed under Related Topics.

### Purpose

Enters global configuration mode.

---

### Step 3

**Command or Action**

| Device(config)# interface gigabitethernet 1/0/1 |

### Purpose

Specifies an interface to configure, and enters interface configuration mode. Valid interfaces include physical ports, VLANs, and port-channel logical interfaces. The VLAN ID range is 1 to 4094. The port-channel range is 1 to 48.

---

### Step 4

**Command or Action**

| Device(config-if)# spanning-tree link-type point-to-point |

### Purpose

Specifies that the link type of a port is point-to-point.

---

### Step 5

**Command or Action**

| Device(config-if)# end |

### Purpose

Returns to privileged EXEC mode.

---

### Related Topics

- Specifying the MST Region Configuration and Enabling MSTP, on page 303

---

### Designating the Neighbor Type

A topology could contain both prestandard and IEEE 802.1s standard compliant devices. By default, ports can automatically detect prestandard devices, but they can still receive both standard and prestandard BPDUs. When there is a mismatch between a device and its neighbor, only the CIST runs on the interface.

You can choose to set a port to send only prestandard BPDUs. The prestandard flag appears in all the show commands, even if the port is in STP compatibility mode.

This procedure is optional.

---

### Before you begin

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.

**Restarting the Protocol Migration Process**

This procedure restarts the protocol migration process and forces renegotiation with neighboring devices. It reverts the device to MST mode. It is needed when the device no longer receives IEEE 802.1D BPDUs after it has been receiving them.

Follow these steps to restart the protocol migration process (force the renegotiation with neighboring devices) on the device.

**Before you begin**

A multiple spanning tree (MST) must be specified and enabled on the device. For instructions, see Related Topics.
If you want to use the interface version of the command, you must also know the MST interface used. This example uses GigabitEthernet1/0/1 as the interface because that was the interface set up by the instructions listed under Related Topics.

**SUMMARY STEPS**

1. **enable**
2. Enter one of the following commands:
   - `clear spanning-tree detected-protocols`
   - `clear spanning-tree detected-protocols interface interface-id`

**DETAILED STEPS**

**Configuring PVST+ Simulation**

PVST+ simulation is enabled by default. This means that all ports automatically interoperate with a connected device that is running in Rapid PVST+ mode. If you disabled the feature and want to re-configure it, refer to the following tasks.

To enable PVST+ simulation globally, perform this task:
Enabling PVST+ Simulation on a Port

To enable PVST+ simulation on a port, perform this task:

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. spanning-tree mst simulate pvst global
5. end
6. show spanning-tree summary

DETAILED STEPS

<table>

## Examples

### Examples: PVST+ Simulation

This example shows how to prevent the switch from automatically interoperating with a connecting switch that is running Rapid PVST+:

Switch# configure terminal
Switch(config)# no spanning-tree mst simulate pvst global
This example shows how to prevent a port from automatically interoperating with a connecting device that is running Rapid PVST+:

```
Switch(config)# interface 1/0/1
Switch(config-if)# spanning-tree mst simulate pvst disable
```

The following sample output shows the system message you receive when a SSTP BPDU is received on a port and PVST+ simulation is disabled:

```
Message
SPANTREE_PVST_PEER_BLOCK: PVST BPDU detected on port %s [port number].
Severity
Critical
Explanation
A PVST+ peer was detected on the specified interface on the switch. PVST+
simulation feature is disabled, as a result of which the interface was
moved to the spanning tree
Blocking state.
Action
Identify the PVST+ switch from the network which might be configured
incorrectly.
```

The following sample output shows the system message you receive when peer inconsistency on the interface is cleared:

```
Message
SPANTREE_PVST_PEER_UNBLOCK: Unblocking port %s [port number].
Severity
Critical
Explanation
The interface specified in the error message has been restored to normal
spanning tree state.
Action
None.
```

This example shows the spanning tree status when port 1/0/1 has been configured to disable PVST+ simulation and is currently in the peer type inconsistent state:

```
Switch# show spanning-tree
VLAN0010
  Spanning tree enabled protocol mstp
  Root ID Priority 32778
    Address 0002.172c.f400
  This bridge is the root
  Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
  Bridge ID Priority 32778 (priority 32768 sys-id-ext 10)
    Address 0002.172c.f400
    Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
```

This example shows the interface details when PVST+ simulation is globally enabled, or the default configuration:

Switch# show spanning-tree interface 1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is forwarding
  Port path cost 4, Port priority 128, Port Identifier 128.297.
  Designated root has priority 32769, address 0013.5f20.01c0
  Designated bridge has priority 32769, address 0013.5f20.01c0
  Designated port id is 128.297, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  Link type is point-to-point by default
  PVST Simulation is enabled by default
  BPDU: sent 132, received 1

This example shows the interface details when PVST+ simulation is globally disabled:

Switch# show spanning-tree interface 1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is forwarding
  Port path cost 4, Port priority 128, Port Identifier 128.297.
  Designated root has priority 32769, address 0013.5f20.01c0
  Designated bridge has priority 32769, address 0013.5f20.01c0
  Designated port id is 128.297, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  Link type is point-to-point by default
  PVST Simulation is disabled by default
  BPDU: sent 132, received 1

This example shows the interface details when PVST+ simulation is explicitly enabled on the port:

Switch# show spanning-tree interface 1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is forwarding
  Port path cost 4, Port priority 128, Port Identifier 128.297.
  Designated root has priority 32769, address 0013.5f20.01c0
  Designated bridge has priority 32769, address 0013.5f20.01c0
  Designated port id is 128.297, designated path cost 0
  Timers: message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  Link type is point-to-point by default
PVST Simulation is enabled
BPDU: sent 132, received 1
This example shows the interface details when the PVST+ simulation feature is disabled and a PVST Peer inconsistency has been detected on the port:

Switch# show spanning-tree interface1/0/1 detail
Port 269 (GigabitEthernet1/0/1) of VLAN0002 is broken (PVST Peer Inconsistent)
    Port path cost 4, Port priority 128, Port Identifier 128.297.
    Designated root has priority 32769, address 0013.5f20.01c0
    Designated bridge has priority 32769, address 0013.5f20.01c0
    Designated port id is 128.297, designated path cost 0
    Timers: message age 0, forward delay 0, hold 0
    Number of transitions to forwarding state: 1
    Link type is point-to-point by default
    PVST Simulation is disabled
    BPDU: sent 132, received 1

Examples: Detecting Unidirectional Link Failure

This example shows the spanning tree status when port 1/0/1 detail has been configured to disable PVST+ simulation and the port is currently in the peer type inconsistent state:

Switch# show spanning-tree
VLAN0010
    Spanning tree enabled protocol rstp

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Restriction for Optional Spanning-Tree Features**

- PortFast minimizes the time that interfaces must wait for spanning tree to converge, so it is effective only when used on interfaces connected to end stations. If you enable PortFast on an interface connecting to another switch, you risk creating a spanning-tree loop.

Related Topics
- **Enabling PortFast**, on page 341
- **PortFast**, on page 328
Information About Optional Spanning-Tree Features

PortFast

PortFast immediately brings an interface configured as an access or trunk port to the forwarding state from a blocking state, bypassing the listening and learning states.

*Figure 26: PortFast-Enabled Interfaces*

You can use PortFast on interfaces connected to a single workstation or server to allow those devices to immediately connect to the network, rather than waiting for the spanning tree to converge.

Interfaces connected to a single workstation or server should not receive bridge protocol data units (BPDUs). An interface with PortFast enabled goes through the normal cycle of spanning-tree status changes when the switch is restarted.

You can enable this feature by enabling it on either the interface or on all nontrunking ports.

**Related Topics**

- Enabling PortFast, on page 341
- Restriction for Optional Spanning-Tree Features, on page 327

BPDU Guard

The Bridge Protocol Data Unit (BPDU) guard feature can be globally enabled on the switch or can be enabled per port, but the feature operates with some differences.

When you enable BPDU guard at the global level on PortFast edge-enabled ports, spanning tree shuts down ports that are in a PortFast edge-operational state if any BPDU is received on them. In a valid configuration, PortFast edge-enabled ports do not receive BPDUs. Receiving a BPDU on a Port Fast edge-enabled port means an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the port in the error-disabled state. When this happens, the switch shuts down the entire port on which the violation occurred.

When you enable BPDU guard at the interface level on any port without also enabling the PortFast edge feature, and the port receives a BPDU, it is put in the error-disabled state.
The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

**Related Topics**

Enabling BPDU Guard, on page 342

### BPDU Filtering

The BPDU filtering feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

Enabling BPDU filtering on PortFast edge-enabled interfaces at the global level keeps those interfaces that are in a PortFast edge-operational state from sending or receiving BPDUs. The interfaces still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these interfaces do not receive BPDUs. If a BPDU is received on a PortFast edge-enabled interface, the interface loses its PortFast edge-operational status, and BPDU filtering is disabled.

Enabling BPDU filtering on an interface without also enabling the PortFast edge feature keeps the interface from sending or receiving BPDUs.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.</td>
</tr>
</tbody>
</table>

You can enable the BPDU filtering feature for the entire switch or for an interface.

**Related Topics**

Enabling BPDU Filtering, on page 344

### UplinkFast

*Figure 27: Switches in a Hierarchical Network*

Switches in hierarchical networks can be grouped into backbone switches, distribution switches, and access switches. This complex network has distribution switches and access switches that each have at least one...
redundant link that spanning tree blocks to prevent loops.

If a switch loses connectivity, it begins using the alternate paths as soon as the spanning tree selects a new root port. You can accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself by enabling UplinkFast. The root port transitions to the forwarding state immediately without going through the listening and learning states, as it would with the normal spanning-tree procedures.

When the spanning tree reconfigures the new root port, other interfaces flood the network with multicast packets, one for each address that was learned on the interface. You can limit these bursts of multicast traffic by reducing the max-update-rate parameter (the default for this parameter is 150 packets per second). However, if you enter zero, station-learning frames are not generated, so the spanning-tree topology converges more slowly after a loss of connectivity.

**Note**

UplinkFast is most useful in wiring-closet switches at the access or edge of the network. It is not appropriate for backbone devices. This feature might not be useful for other types of applications.

UplinkFast provides fast convergence after a direct link failure and achieves load-balancing between redundant Layer 2 links using uplink groups. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.
Figure 28: UplinkFast Example Before Direct Link Failure

This topology has no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in a blocking state.

Figure 29: UplinkFast Example After Direct Link Failure

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked interface on Switch C and transitions it to the forwarding state without going through the listening and learning states. This change takes approximately 1 to 5 seconds.

Cross-Stack UplinkFast

Cross-Stack UplinkFast (CSUF) provides a fast spanning-tree transition (fast convergence in less than 1 second under normal network conditions) across a switch stack. During the fast transition, an alternate redundant link on the switch stack is placed in the forwarding state without causing temporary spanning-tree loops or loss of connectivity to the backbone. With this feature, you can have a redundant and resilient network in some configurations. CSUF is automatically enabled when you enable the UplinkFast feature.

CSUF might not provide a fast transition all the time; in these cases, the normal spanning-tree transition occurs, completing in 30 to 40 seconds. For more information, see Related Topics.
How Cross-Stack UplinkFast Works

Cross-Stack UplinkFast (CSUF) ensures that one link in the stack is elected as the path to the root.

**Figure 30: Cross-Stack UplinkFast Topology**

The stack-root port on Switch 1 provides the path to the root of the spanning tree. The alternate stack-root ports on Switches 2 and 3 can provide an alternate path to the spanning-tree root if the current stack-root switch fails or if its link to the spanning-tree root fails.

Link 1, the root link, is in the spanning-tree forwarding state. Links 2 and 3 are alternate redundant links that are in the spanning-tree blocking state. If Switch 1 fails, if its stack-root port fails, or if Link 1 fails, CSUF selects either the alternate stack-root port on Switch 2 or Switch 3 and puts it into the forwarding state in less than 1 second.

When certain link loss or spanning-tree events occur (described in the following topic), the Fast Uplink Transition Protocol uses the neighbor list to send fast-transition requests to stack members.

The switch sending the fast-transition request needs to do a fast transition to the forwarding state of a port that it has chosen as the root port, and it must obtain an acknowledgment from each stack switch before performing the fast transition.
Each switch in the stack decides if the sending switch is a better choice than itself to be the stack root of this spanning-tree instance by comparing the root, cost, and bridge ID. If the sending switch is the best choice as the stack root, each switch in the stack returns an acknowledgment; otherwise, it sends a fast-transition request. The sending switch then has not received acknowledgments from all stack switches.

When acknowledgments are received from all stack switches, the Fast Uplink Transition Protocol on the sending switch immediately transitions its alternate stack-root port to the forwarding state. If acknowledgments from all stack switches are not obtained by the sending switch, the normal spanning-tree transitions (blocking, listening, learning, and forwarding) take place, and the spanning-tree topology converges at its normal rate (2 * forward-delay time + max-age time).

The Fast Uplink Transition Protocol is implemented on a per-VLAN basis and affects only one spanning-tree instance at a time.

**Related Topics**

- Enabling UplinkFast for Use with Redundant Links, on page 345
- Events That Cause Fast Convergence, on page 333

### Events That Cause Fast Convergence

Depending on the network event or failure, the CSUF fast convergence might or might not occur.

Fast convergence (less than 1 second under normal network conditions) occurs under these circumstances:

- The stack-root port link fails.
  
  If two switches in the stack have alternate paths to the root, only one of the switches performs the fast transition.

- The failed link, which connects the stack root to the spanning-tree root, recovers.

- A network reconfiguration causes a new stack-root switch to be selected.

- A network reconfiguration causes a new port on the current stack-root switch to be chosen as the stack-root port.

**Note**

The fast transition might not occur if multiple events occur simultaneously. For example, if a stack member is powered off, and at the same time, the link connecting the stack root to the spanning-tree root comes back up, the normal spanning-tree convergence occurs.

Normal spanning-tree convergence (30 to 40 seconds) occurs under these conditions:

- The stack-root switch is powered off, or the software failed.

- The stack-root switch, which was powered off or failed, is powered on.

- A new switch, which might become the stack root, is added to the stack.

BackboneFast

BackboneFast detects indirect failures in the core of the backbone. BackboneFast is a complementary technology to the UplinkFast feature, which responds to failures on links directly connected to access switches. BackboneFast optimizes the maximum-age timer, which controls the amount of time the switch stores protocol information received on an interface. When a switch receives an inferior BPDU from the designated port of another switch, the BPDU is a signal that the other switch might have lost its path to the root, and BackboneFast tries to find an alternate path to the root.

BackboneFast starts when a root port or blocked interface on a switch receives inferior BPDUs from its designated switch. An inferior BPDU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPDU, it means that a link to which the switch is not directly connected (an indirect link) has failed (that is, the designated switch has lost its connection to the root switch). Under spanning-tree rules, the switch ignores inferior BPDUs for the maximum aging time (default is 20 seconds).

The switch tries to find if it has an alternate path to the root switch. If the inferior BPDU arrives on a blocked interface, the root port and other blocked interfaces on the switch become alternate paths to the root switch. (Self-looped ports are not considered alternate paths to the root switch.) If the inferior BPDU arrives on the root port, all blocked interfaces become alternate paths to the root switch. If the inferior BPDU arrives on the root port and there are no blocked interfaces, the switch assumes that it has lost connectivity to the root switch, causes the maximum aging time on the root port to expire, and becomes the root switch according to normal spanning-tree rules.

If the switch has alternate paths to the root switch, it uses these alternate paths to send a root link query (RLQ) request. The switch sends the RLQ request on all alternate paths to learn if any stack member has an alternate root to the root switch and waits for an RLQ reply from other switches in the network and in the stack. The switch sends the RLQ request on all alternate paths and waits for an RLQ reply from other switches in the network.

When a stack member receives an RLQ reply from a nonstack member on a blocked interface and the reply is destined for another nonstacked switch, it forwards the reply packet, regardless of the spanning-tree interface state.

When a stack member receives an RLQ reply from a nonstack member and the response is destined for the stack, the stack member forwards the reply so that all the other stack members receive it.

If the switch discovers that it still has an alternate path to the root, it expires the maximum aging time on the interface that received the inferior BPDU. If all the alternate paths to the root switch indicate that the switch has lost connectivity to the root switch, the switch expires the maximum aging time on the interface that received the RLQ reply. If one or more alternate paths can still connect to the root switch, the switch makes all interfaces on which it received an inferior BPDU its designated ports and moves them from the blocking state (if they were in the blocking state), through the listening and learning states, and into the forwarding state.
Figure 31: BackboneFast Example Before Indirect Link Failure

This is an example topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that connects directly to Switch B is in the blocking state.

Figure 32: BackboneFast Example After Indirect Link Failure

If link L1 fails, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, it detects the failure, elects itself the root, and begins sending BPDU to Switch C, identifying itself as the root. When Switch C receives the inferior BPDU from Switch B, Switch C assumes that an indirect failure has occurred. At that point, BackboneFast allows the blocked interface on Switch C to move immediately to the listening state without waiting for the maximum aging time for the interface to expire. BackboneFast then transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A. The root-switch election takes approximately 30 seconds, twice the Forward Delay time if the default Forward Delay time of 15 seconds is set. BackboneFast reconfigures the topology to account for the failure of link L1.

Figure 33: Adding a Switch in a Shared-Medium Topology

If a new switch is introduced into a shared-medium topology, BackboneFast is not activated because the inferior BPDU did not come from the recognized designated switch (Switch B). The new switch begins sending inferior BPDU that indicate it is the root switch. However, the other switches ignore these inferior...
BPDUs, and the new switch learns that Switch B is the designated switch to Switch A, the root switch.

- Enabling BackboneFast, on page 348

**EtherChannel Guard**

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the switch interfaces are configured in an EtherChannel, but the interfaces on the other device are not. A misconfiguration can also occur if the channel parameters are not the same at both ends of the EtherChannel.

If the switch detects a misconfiguration on the other device, EtherChannel guard places the switch interfaces in the error-disabled state, and displays an error message.

**Related Topics**
- Enabling EtherChannel Guard, on page 349

**Root Guard**

**Figure 34: Root Guard in a Service-Provider Network**

The Layer 2 network of a service provider (SP) can include many connections to switches that are not owned by the SP. In such a topology, the spanning tree can reconfigure itself and select a customer switch as the root switch. You can avoid this situation by enabling root guard on SP switch interfaces that connect to switches in your customer’s network. If spanning-tree calculations cause an interface in the customer network to be selected as the root port, root guard then places the interface in the root-inconsistent (blocked) state to prevent the customer’s switch from becoming the root switch or being in the path to the root.
If a switch outside the SP network becomes the root switch, the interface is blocked (root-inconsistent state), and spanning tree selects a new root switch. The customer’s switch does not become the root switch and is not in the path to the root.

If the switch is operating in multiple spanning-tree (MST) mode, root guard forces the interface to be a designated port. If a boundary port is blocked in an internal spanning-tree (IST) instance because of root guard, the interface also is blocked in all MST instances. A boundary port is an interface that connects to a LAN, the designated switch of which is either an IEEE 802.1D switch or a switch with a different MST region configuration.

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. VLANs can be grouped and mapped to an MST instance.

**Caution**

Misuse of the root guard feature can cause a loss of connectivity.

**Related Topics**

*Enabling Root Guard*, on page 350

---

**Loop Guard**

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is enabled on the entire switched network. Loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in MST mode, BPDUs are not sent on nonboundary ports only if the interface is blocked by loop guard in all MST instances. On a boundary port, loop guard blocks the interface in all MST instances.
You can configure a spanning tree port as an edge port, a network port, or a normal port. A port can be in only one of these states at a given time. The default spanning tree port type is normal. You can configure the port type either globally or per interface.

Depending on the type of device to which the interface is connected, you can configure a spanning tree port as one of these port types:

- A PortFast edge port—is connected to a Layer 2 host. This can be either an access port or an edge trunk port (*portfast edge trunk*). This type of port interface immediately transitions to the forwarding state, bypassing the listening and learning states. Use PortFast edge on Layer 2 access ports connected to a single workstation or server to allow those devices to connect to the network immediately, rather than waiting for spanning tree to converge.

Even if the interface receives a bridge protocol data unit (BPDU), spanning tree does not place the port into the blocking state. Spanning tree sets the port’s operating state to non-portfast even if the configured state remains portfast edge and starts participating in the topology change.

---

**Note**

If you configure a port connected to a Layer 2 switch or bridge as an edge port, you might create a bridging loop.

---

- A PortFast network port—is connected only to a Layer 2 switch or bridge. Bridge Assurance is enabled only on PortFast network ports. For more information, refer to *Bridge Assurance*.

---

**Note**

If you configure a port that is connected to a Layer 2 host as a spanning tree network port, the port will automatically move into the blocking state.

---

- A PortFast normal port—is the default type of spanning tree port.

---

**Note**

Beginning with Cisco IOS Release 15.2(4)E, or IOS XE 3.8.0E, if you enter the *spanning-tree portfast* [trunk] command in the global or interface configuration mode, the system automatically saves it as *spanning-tree portfast edge* [trunk].

---

- [Enabling PortFast Port Types](#), on page 352

### Bridge Assurance

You can use Bridge Assurance to help prevent looping conditions that are caused by unidirectional links (one-way traffic on a link or port), or a malfunction in a neighboring switch. Here a malfunction refers to a switch that is not able to run STP any more, while still forwarding traffic (a brain dead switch).
BPDUs are sent out on all operational network ports, including alternate and backup ports, for each hello time period. Bridge Assurance monitors the receipt of BPDUs on point-to-point links on all network ports. When a port does not receive BPDUs within the allotted hello time period, the port is put into a blocked state (the same as a port inconsistent state, which stops forwarding of frames). When the port resumes receipt of BPDUs, the port resumes normal spanning tree operations.

Only Rapid PVST+ and MST spanning tree protocols support Bridge Assurance. PVST+ does not support Bridge Assurance.

The following example shows how Bridge Assurance protects your network from bridging loops.

The following figure shows a network with normal STP topology.

*Figure 35: Network with Normal STP Topology*

The following figure demonstrates a potential network problem when the device fails (brain dead) and Bridge Assurance is not enabled on the network.

*Figure 36: Network Loop Due to a Malfunctioning Switch*

The following figure shows the network with Bridge Assurance enabled, and the STP topology progressing normally with bidirectional BDPUs issuing from every STP network port.
The following figure shows how the potential network problem shown in figure *Network Loop Due to a Malfunctioning Switch* does not occur when you have Bridge Assurance enabled on your network.

**Figure 38: Network Problem Averted with Bridge Assurance Enabled**

The system generates syslog messages when a port is blocked and unblocked. The following sample output shows the log that is generated for each of these states:

**BRIDGE_ASSURANCE_BLOCK**

Sep 17 09:48:16.249 PDT: %SPANTREE-2-BRIDGE_ASSURANCE_BLOCK: Bridge Assurance blocking port GigabitEthernet1/0/1 on VLAN0001.

**BRIDGE_ASSURANCE_UNBLOCK**

Sep 17 09:48:58.426 PDT: %SPANTREE-2-BRIDGE_ASSURANCE_UNBLOCK: Bridge Assurance unblocking port GigabitEthernet1/0/1 on VLAN0001.

Follow these guidelines when enabling Bridge Assurance:

- It can only be enabled or disabled globally.
- It applies to all operational network ports, including alternate and backup ports.
- Only Rapid PVST+ and MST spanning tree protocols support Bridge Assurance. PVST+ does not support Bridge Assurance.
• For Bridge Assurance to work properly, it must be supported and configured on both ends of a point-to-point link. If the device on one side of the link has Bridge Assurance enabled and the device on the other side does not, the connecting port is blocked and in a Bridge Assurance inconsistent state. We recommend that you enable Bridge Assurance throughout your network.

• To enable Bridge Assurance on a port, BPDU filtering and BPDU Guard must be disabled.

• You can enable Bridge Assurance in conjunction with Loop Guard.

• You can enable Bridge Assurance in conjunction with Root Guard. The latter is designed to provide a way to enforce the root bridge placement in the network.

How to Configure Optional Spanning-Tree Features

Enabling PortFast

An interface with the PortFast feature enabled is moved directly to the spanning-tree forwarding state without waiting for the standard forward-time delay.

If you enable the voice VLAN feature, the PortFast feature is automatically enabled. When you disable voice VLAN, the PortFast feature is not automatically disabled.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

Caution

Use PortFast only when connecting a single end station to an access or trunk port. Enabling this feature on an interface connected to a switch or hub could prevent spanning tree from detecting and disabling loops in your network, which could cause broadcast storms and address-learning problems.

This procedure is optional.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. spanning-tree portfast [trunk]
5. end

DETAILED STEPS

<table>

<td></td>
</tr>
<tr>
<td>Note</td>
<td>To enable PortFast on trunk ports, you must use the spanning-tree portfast trunk interface configuration command. The spanning-tree portfast command will not work on trunk ports. Make sure that there are no loops in the network between the trunk port and the workstation or server before you enable PortFast on a trunk port. By default, PortFast is disabled on all interfaces.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

You can use the `spanning-tree portfast default` global configuration command to globally enable the PortFast feature on all nontrunking ports.

Related Topics

- PortFast, on page 328
- Restriction for Optional Spanning-Tree Features, on page 327

Enabling BPDU Guard

You can enable the BPDU guard feature if your switch is running PVST+, Rapid PVST+, or MSTP.
Configure PortFast edge only on ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

This procedure is optional.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. spanning-tree portfast edge
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>- Enter your password if prompted.</td>

<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> spanning-tree portfast edge</td>
<td>Enables the PortFast edge feature.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# spanning-tree portfast edge</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

What to do next
To prevent the port from shutting down, you can use the **errdisab** **detect** **caus** **bsp** **guard** **shutdown** **vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.
You also can use the `spanning-tree bpduguard enable` interface configuration command to enable BPDU guard on any port without also enabling the PortFast edge feature. When the port receives a BPDU, it is put it in the error-disabled state.

**Related Topics**

- BPDUGuard, on page 328

### Enabling BPDU Filtering

You can also use the `spanning-tree bpdufilter enable` interface configuration command to enable BPDU filtering on any interface without also enabling the PortFast edge feature. This command prevents the interface from sending or receiving BPDUs.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.</td>
</tr>
</tbody>

### Enabling UplinkFast for Use with Redundant Links

#### Note
When you enable UplinkFast, it affects all VLANs on the switch or switch stack. You cannot configure UplinkFast on an individual VLAN.

You can configure the UplinkFast or the Cross-Stack UplinkFast (CSUF) feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Follow these steps to enable UplinkFast and CSUF.

#### Before you begin
UplinkFast cannot be enabled on VLANs that have been configured with a switch priority. To enable UplinkFast on a VLAN with switch priority configured, first restore the switch priority on the VLAN to the default value using the `no spanning-tree vlan vlan-id priority` global configuration command.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. spanning-tree uplinkfast [max-update-rate pkts-per-second]
### Enabling UplinkFast for Use with Redundant Links

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> spanning-tree uplinkfast [max-update-rate pkts-per-second]</td>
<td>Enables UplinkFast.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>(Optional) For <code>pkts-per-second</code>, the range is 0 to 32000 packets per second; the default is 150.</td>
</tr>
<tr>
<td>Device(config)# <code>spanning-tree uplinkfast</code></td>
<td>If you set the rate to 0, station-learning frames are not generated, and the spanning-tree topology converges more slowly after a loss of connectivity.</td>
</tr>
<tr>
<td><code>max-update-rate 200</code></td>
<td>When you enter this command, CSUF also is enabled on all nonstack port interfaces.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>

When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduce the chance that a switch will become the root switch.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you enable the UplinkFast feature using these instructions, CSUF is automatically globally enabled on nonstack port interfaces.

**Related Topics**
- UplinkFast, on page 329

- Cross-Stack UplinkFast, on page 331
- Events That Cause Fast Convergence, on page 333
# Disabling UplinkFast

This procedure is optional. Follow these steps to disable UplinkFast and Cross-Stack UplinkFast (CSUF).

**Before you begin**

UplinkFast must be enabled.

### SUMMARY STEPS

1. enable
2. configure terminal
3. no spanning-tree uplinkfast
4. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> no spanning-tree uplinkfast</td>
<td>Disables UplinkFast and CSUF on the switch and all of its VLANs.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# no spanning-tree uplinkfast</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When you disable the UplinkFast feature using these instructions, CSUF is automatically globally disabled on nonstack port interfaces.
Enabling BackboneFast

You can enable BackboneFast to detect indirect link failures and to start the spanning-tree reconfiguration sooner.

You can configure the BackboneFast feature for Rapid PVST+ or for the MSTP, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

This procedure is optional. Follow these steps to enable BackboneFast on the switch.

**Before you begin**

If you use BackboneFast, you must enable it on all switches in the network. BackboneFast is not supported on Token Ring VLANs. This feature is supported for use with third-party switches.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. spanning-tree backbonefast
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

You can use the `show interfaces status err-disabled` privileged EXEC command to show which device ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the `show etherchannel summary` privileged EXEC command to verify the EtherChannel configuration.

After the configuration is corrected, enter the `shutdown` and **no shutdown** interface configuration commands on the port-channel interfaces that were misconfigured.
Enabling Root Guard

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. Do not enable the root guard on interfaces to be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and are prevented from reaching the forwarding state.

You cannot enable both root guard and loop guard at the same time.

You can enable this feature if your switch is running PVST+, Rapid PVST+, or MSTP.

This procedure is optional.

Follow these steps to enable root guard on the switch.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `spanning-tree guard root`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<td></td>
</tr>
<tr>
<td><code>Device(config)# interface gigabitethernet 1/0/2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables root guard on the interface.</td>
</tr>
</tbody>
</table>
Enabling Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network. Loop guard operates only on interfaces that are considered point-to-point by the spanning tree.

Note
You cannot enable both loop guard and root guard at the same time.
You can enable this feature if your device is running PVST+, Rapid PVST+, or MSTP.
This procedure is optional. Follow these steps to enable loop guard on the device.

SUMMARY STEPS

1. Enter one of the following commands:
   • show spanning-tree active
   • show spanning-tree mst
2. configure terminal
3. spanning-tree loopguard default
4. end

DETAILED STEPS

Configuring PortFast Edge on a Specified Interface

Interfaces configured as edge ports immediately transition to the forwarding state, without passing through the blocking or learning states, on linkup.

Because the purpose of this type of port is to minimize the time that access ports must wait for spanning tree to converge, it is most effective when used on access ports. If you enable PortFast edge on a port connecting to another switch, you risk creating a spanning tree loop.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id | port-channel port_channel_number
4. spanning-tree portfast edge [trunk]
5. end
6. `show running interface interface-id | port-channel port_channel_number`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | |
| Device# configure terminal | |

| **Step 3** interface interface-id | port-channel port_channel_number | Specifies an interface to configure. |
| **Example:** | |
| Device(config)# interface gigabitethernet 1/0/1 | port-channel port_channel_number | |

| **Step 4** spanning-tree portfast edge [trunk] | Enables edge behavior on a Layer 2 access port connected to an end workstation or server. |
| **Example:** | • (Optional) **trunk**—Enables edge behavior on a trunk port. Use this keyword if the link is a trunk. Use this command only on ports that are connected to end host devices that terminate VLANs and from which the port should never receive STP BPDUs. Such end host devices include workstations, servers, and ports on routers that are not configured to support bridging. |
| Device(config-if)# spanning-tree portfast trunk | • Use the **no** version of the command to disable PortFast edge. |

| **Step 5** end | Exits configuration mode. |
| **Example:** | |
| Device(config-if)# end | |

| **Step 6** show running interface interface-id | port-channel port_channel_number | Verifies the configuration. |
| **Example:** | |
| Device# show running interface gigabitethernet 1/0/1 | port-channel port_channel_number | |
Configuring a PortFast Network Port on a Specified Interface

Ports that are connected to Layer 2 switches and bridges can be configured as network ports.

**Note**

Bridge Assurance is enabled only on PortFast network ports. For more information, refer to *Bridge Assurance*.

To configure a port as a network port, perform this task.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id | port-channel port_channel_number`
4. `spanning-tree portfast network`
5. `end`
6. `show running interface interface-id | port-channel port_channel_number`

Examples

Examples: Configuring PortFast Edge on a Specified Interface

This example shows how to enable edge behavior on GigabitEthernet interface 1/0/1:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# spanning-tree portfast edge
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show running-config interface gigabitethernet1/0/1
Building configuration...
Current configuration:
!
interface GigabitEthernet1/0/1
  no ip address
  switchport
  switchport access vlan 200
  switchport mode access
  spanning-tree portfast edge
  end
```

This example shows how you can display that port GigabitEthernet 1/0/1 is currently in the edge state:

```
Switch# show spanning-tree vlan 200
VLAN0200
  Spanning tree enabled protocol rstp
  Root ID Priority 2
  Address 001b.2a68.5fc0
  Cost 3
  Port 125 (GigabitEthernet5/9)
  Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
  Bridge ID Priority 2 (priority 0 sys-id-ext 2)
  Address 7010.5c9c.5200
  Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
  Aging Time 0 sec
```
### Examples: Configuring a PortFast Network Port on a Specified Interface

This example shows how to configure GigabitEthernet interface 1/0/1 as a network port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# spanning-tree portfast network
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show running-config interface gigabitethernet1/0/1
Building configuration...  
Current configuration:
!
interface GigabitEthernet1/0/1
no ip address
switchport
switchport access vlan 200
switchport mode access
spanning-tree portfast network
end
```

This example shows the output for show spanning-tree vlan

```
Switch# show spanning-tree vlan
Sep 17 09:51:36.370 PDT: %SYS-5-CONFIG_I: Configured from console by console2

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Overview of Resilient Ethernet Protocol

Resilient Ethernet Protocol (REP) is a Cisco-proprietary protocol that provides an alternative to Spanning Tree Protocol (STP) to control network loops, handle link failures, and improve convergence time. REP controls a group of ports connected in a segment, ensures that the segment does not create any bridging loops, and responds to link failures within the segment. REP provides a basis for constructing more complex networks and supports VLAN load balancing.

A REP segment is a chain of ports connected to each other and configured with a segment ID. Each segment consists of standard (nonedge) segment ports and two user-configured edge ports. A device can have no more than two ports that belong to the same segment, and each segment port can have only one external neighbor. A segment can go through a shared medium, but on any link, only two ports can belong to the same segment. REP is supported only on Trunk Ethernet Flow Point (EFP) interfaces.

The following figure shows an example of a segment consisting of six ports spread across four switches. Ports E1 and E2 are configured as edge ports. When all the ports are operational (as in the segment on the left), a
single port is blocked, as shown by the diagonal line. When there is a failure in the network, the blocked port returns to the forwarding state to minimize network disruption.

*Figure 39: REP Open Segment*

The segment shown in the figure above is an open segment; there is no connectivity between the two edge ports. The REP segment cannot cause a bridging loop, and you can safely connect the segment edges to any network. All the hosts connected to devices inside the segment have two possible connections to the rest of the network through the edge ports, but only one connection is accessible at any time. If a failure occurs on any segment or on any port on a REP segment, REP unblocks all the ports to ensure that connectivity is available through the other gateway.

The segment shown in the following figure is a ring segment, with both the edge ports located on the same device. With this configuration, you can create a redundant connection between any two devices in the segment.

*Figure 40: REP Ring Segment*

REP segments have the following characteristics:

- If all the ports in a segment are operational, one port (referred to as the *alternate* port) is in the blocked state for each VLAN. If VLAN load balancing is configured, two ports in the segment control the blocked state of VLANs.

- If one or more ports in a segment is not operational, and cause a link failure, all the ports forward traffic on all the VLANs to ensure connectivity.

- In case of a link failure, alternate ports are unblocked as quickly as possible. When the failed link is up, a logically blocked port per VLAN is selected with minimal disruption to the network.

You can construct almost any type of network based on REP segments. REP also supports VLAN load balancing, which is controlled by the primary edge port (any port in the segment).
In access ring-topologies, the neighboring switch might not support REP as shown in the following figure. In this scenario, you can configure the non-REP-facing ports (E1 and E2) as edge no-neighbor ports. These ports inherit all the properties of edge ports, and you can configure them the same as any edge port, including configuring them to send STP or REP topology change notices to the aggregation switch. In this scenario, the STP topology change notice (TCN) that is sent is a multiple spanning-tree (MST) STP message.

**Figure 41: Edge No-Neighbor Ports**

REP has these limitations:

- You must configure each segment port; an incorrect configuration might cause forwarding loops in the networks.
- REP can manage only a single failed port within the segment; multiple port failures within the REP segment cause loss of network connectivity.
- You should configure REP only in networks with redundancy. Configuring REP in a network without redundancy causes loss of connectivity.

**Link Integrity**

REP does not use an end-to-end polling function between edge ports to verify link integrity. It implements local link failure detection. The REP Link Status Layer (LSL) detects its REP-aware neighbor and establishes connectivity within the segment. All the VLANs are blocked on an interface until the neighbor is detected. After the neighbor is identified, REP determines which neighbor port should become the alternate port and which ports should forward traffic.

Each port in a segment has a unique port ID. The port ID format is similar to that used by the spanning tree algorithm: a port number (unique on the bridge) associated to a MAC address (unique in the network). When a segment port is coming up, its LSL starts sending packets that include the segment ID and the port ID. The port is declared as operational after it performs a three-way handshake with a neighbor in the same segment.

A segment port does not become operational if:

- No neighbor has the same segment ID.
- More than one neighbor has the same segment ID.
- A neighbor does not acknowledge a local port as a peer.
Each port creates an adjacency with its immediate neighbor. After the neighbor adjacencies are created, the ports negotiate with each other to determine the blocked port for the segment, which will function as the alternate port. All the other ports become unblocked. By default, REP packets are sent to a bridge protocol data unit-class MAC address. The packets can also be sent to a Cisco multicast address, which is used only to send blocked port advertisement (BPA) messages when there is a failure in the segment. The packets are dropped by the devices not running REP.

**Fast Convergence**

REP runs on a physical link basis and not on a per-VLAN basis. Only one hello message is required for all the VLANs, and this reduces the load on the protocol. We recommend that you create VLANs consistently on all the switches in a given segment and configure the same allowed VLANs on the REP trunk ports. To avoid the delay introduced by relaying messages in software, REP also allows some packets to be flooded to a regular multicast address. These messages operate at the hardware flood layer (HFL) and are flooded to the entire network, not just the REP segment. Switches that do not belong to the segment treat them as data traffic. You can control flooding of these messages by configuring an administrative VLAN for the entire domain or for a particular segment.

**VLAN Load Balancing**

One edge port in the REP segment acts as the primary edge port; and another as the secondary edge port. It is the primary edge port that always participates in VLAN load balancing in the segment. REP VLAN balancing is achieved by blocking some VLANs at a configured alternate port and all the other VLANs at the primary edge port. When you configure VLAN load balancing, you can specify the alternate port in one of three ways:

- By entering the port ID of the interface. To identify the port ID of a port in the segment, enter the `show interface rep detail` interface configuration command for the port.

- By entering the `preferred` keyword to select the port that you previously configured as the preferred alternate port with the `rep segment segment-id preferred` interface configuration command.

- By entering the neighbor offset number of a port in the segment, which identifies the downstream neighbor port of an edge port. The neighbor offset number range is –256 to +256; a value of 0 is invalid. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers indicate the secondary edge port (offset number -1) and its downstream neighbors.

---

**Note**  
Configure offset numbers on the primary edge port by identifying a port’s downstream position from the primary (or secondary) edge port. Never enter an offset value of 1 because that is the offset number of the primary edge port.

The following figure shows neighbor offset numbers for a segment, where E1 is the primary edge port and E2 is the secondary edge port. The red numbers inside the ring are numbers offset from the primary edge port; the black numbers outside of the ring show the offset numbers from the secondary edge port. Note that you can identify all the ports (except the primary edge port) by either a positive offset number (downstream position from the primary edge port) or a negative offset number (downstream position from the secondary edge port). If E2 became the primary edge port, its offset number would then be 1 and E1 would be -1.
When the REP segment is complete, all the VLANs are blocked. When you configure VLAN load balancing, you must also configure triggers in one of two ways:

- Manually trigger VLAN load balancing at any time by entering the `reppreempt segment segment-id` privileged EXEC command on the switch that has the primary edge port.

- Configure a preempt delay time by entering the `reppreempt delay seconds` interface configuration command. After a link failure and recovery, VLAN load balancing begins after the configured preemption time period elapses. Note that the delay timer restarts if another port fails before the time has elapsed.

When VLAN load balancing is configured, it does not start working until triggered by either manual intervention or a link failure and recovery.

When VLAN load balancing is triggered, the primary edge port sends out a message to alert all the interfaces in the segment about the preemption. When the secondary port receives the message, the message is sent to the network to notify the alternate port to block the set of VLANs specified in the message and to notify the primary edge port to block the remaining VLANs.

You can also configure a particular port in the segment to block all the VLANs. Only the primary edge port initiates VLAN load balancing, which is not possible if the segment is not terminated by an edge port on each end. The primary edge port determines the local VLAN load-balancing configuration.

Reconfigure the primary edge port to reconfigure load balancing. When you change the load-balancing configuration, the primary edge port waits for the `reppreempt segment` command or for the configured preempt delay period after a port failure and recovery, before executing the new configuration. If you change an edge port to a regular segment port, the existing VLAN load-balancing status does not change. Configuring a new edge port might cause a new topology configuration.

**Spanning Tree Interaction**

REP does not interact with the STP or the Flex Link feature, but can coexist with both. A port that belongs to a segment is removed from spanning tree control, and STP BPDU s are not accepted or sent from segment ports. Therefore, STP cannot run on a segment.

To migrate from an STP ring configuration to an REP segment configuration, begin by configuring a single port in the ring as part of the segment and continue by configuring contiguous ports to minimize the number of segments. Since each segment always contains a blocked port, multiple segments means multiple blocked
ports and a potential loss of connectivity. After the segment is configured in both directions up to the location of the edge ports, configure the edge ports.

**REP Ports**

REP segments consist of Failed, Open, or Alternate ports:

- A port configured as a regular segment port starts as a failed port.
- After the neighbor adjacencies are determined, the port transitions to alternate port state, blocking all the VLANs on the interface. Blocked-port negotiations occur, and when the segment settles, one blocked port remains in the alternate role and all the other ports become open ports.
- When a failure occurs in a link, all the ports move to the Failed state. When the Alternate port receives the failure notification, it changes to the Open state, forwarding all the VLANs.

A regular segment port converted to an edge port, or an edge port converted to a regular segment port, does not always result in a topology change. If you convert an edge port into a regular segment port, VLAN load balancing is not implemented unless it has been configured. For VLAN load balancing, you must configure two edge ports in the segment.

A segment port that is reconfigured as a spanning tree port restarts according to the spanning tree configuration. By default, this is a designated blocking port. If PortFast is configured or if STP is disabled, the port goes into the forwarding state.

**How to Configure Resilient Ethernet Protocol**

A segment is a collection of ports connected to one another in a chain and configured with a segment ID. To configure REP segments, configure the REP administrative VLAN (or use the default VLAN 1) and then add the ports to the segment, using interface configuration mode. You should configure two edge ports in a segment, with one of them being the primary edge port and the other the secondary edge port by default. A segment should have only one primary edge port. If you configure two ports in a segment as primary edge ports, for example, ports on different switches, the REP selects one of them to serve as the segment's primary edge port. If required, you can configure the location to which segment topology change notices (STCNs) and VLAN load balancing are to be sent.

**Default REP Configuration**

REP is disabled on all the interfaces. When enabled, the interface is a regular segment port unless it is configured as an edge port.

When REP is enabled, the task of sending segment topology change notices (STCNs) is disabled, all the VLANs are blocked, and the administrative VLAN is VLAN 1.

When VLAN load balancing is enabled, the default is manual preemption with the delay timer disabled. If VLAN load balancing is not configured, the default after manual preemption is to block all the VLANs in the primary edge port.

**REP Configuration Guidelines**

Follow these guidelines when configuring REP:
• We recommend that you begin by configuring one port and then configure contiguous ports to minimize the number of segments and the number of blocked ports.

• If more than two ports in a segment fail when no external neighbors are configured, one port goes into a forwarding state for the data path to help maintain connectivity during configuration. In the `show rep interface` command output, the Port Role for this port is displayed as **Fail Logical Open**; the Port Role for the other failed port is displayed as **Fail No Ext Neighbor**. When the external neighbors for the failed ports are configured, the ports go through the alternate port transitions and eventually go to an open state, or remain as the alternate port, based on the alternate port selection mechanism.

• REP ports must be Layer 2 IEEE 802.1Q or Trunk ports.

• We recommend that you configure all the trunk ports in a segment with the same set of allowed VLANs.

• Be careful when configuring REP through a Telnet connection because REP blocks all the VLANs until another REP interface sends a message to unblock it. You might lose connectivity to the router if you enable REP in a Telnet session that accesses the router through the same interface.

• You cannot run REP and STP or REP and Flex Links on the same segment or interface.

• If you connect an STP network to an REP segment, be sure that the connection is at the segment edge. An STP connection that is not at the edge might cause a bridging loop because STP does not run on REP segments. All the STP BPDUs are dropped at REP interfaces.

• You must configure all the trunk ports in a segment with the same set of allowed VLANs. If this is not done, misconfiguration occurs.

• If REP is enabled on two ports on a switch, both the ports must be either regular segment ports or edge ports. REP ports follow these rules:
  
  • There is no limit to the number of REP ports on a switch. However, only two ports on a switch can belong to the same REP segment.
  
  • If only one port on a switch is configured in a segment, the port should be an edge port.
  
  • If two ports on a switch belong to the same segment, they must both be edge ports, regular segment ports, or one regular port and one edge no-neighbor port. An edge port and regular segment port on a switch cannot belong to the same segment.
  
  • If two ports on a switch belong to the same segment, and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.

• REP interfaces come up in a blocked state and remain in a blocked state until they are safe to be unblocked. You must, therefore, be aware of the status of REP interfaces to avoid sudden connection losses.

• REP sends all the LSL PDUs in the untagged frames to the native VLAN. The BPA message sent to a Cisco multicast address is sent to the administration VLAN, which is VLAN 1 by default.

• You can configure the duration for which a REP interface remains up without receiving a hello from a neighbor. Use the `rep lsl-age-timer` value interface configuration command to set the time from 120 ms to 10000 ms. The LSL hello timer is then set to the age-timer value divided by 3. In normal operation, three LSL hellos are sent before the age timer on the peer switch expires and checks for hello messages.

  • EtherChannel port channel interfaces do not support LSL age-timer values less than 1000 ms. If you try to configure a value less than 1000 ms on a port channel, you receive an error message and the command is rejected.
• REP ports cannot be configured as one of the following port types:
  • Switched Port Analyzer (SPAN) destination port
  • Tunnel port
  • Access port

• REP is supported on EtherChannels, but not on an individual port that belongs to an EtherChannel.
• There can be a maximum of 64 REP segments per switch.

### Configuring REP Administrative VLAN

To avoid the delay created by link-failure messages, and VLAN-blocking notifications during load balancing, REP floods packets to a regular multicast address at the hardware flood layer (HFL). These messages are flooded to the whole network, and not just the REP segment. You can control the flooding of these messages by configuring an administrative VLAN.

Follow these guidelines when configuring the REP administrative VLAN:

• If you do not configure an administrative VLAN, the default is VLAN 1.
• You can configure one admin VLAN on the switch for all segments.
• The administrative VLAN cannot be the RSPAN VLAN.

To configure the REP administrative VLAN, follow these steps, beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. configure terminal
2. rep admin vlan vlan-id
3. end
4. show interface [interface-id] rep detail
5. copy running-config startup config

**DETAILED STEPS**

### Configuring a REP Interface

To configure REP, enable REP on each segment interface and identify the segment ID. This task is mandatory, and must be done before other REP configurations. You must also configure a primary and secondary edge port on each segment. All the other steps are optional.

Follow these steps to enable and configure REP on an interface:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode trunk`
5. `rep segment segment-id [edge [no-neighbor] [primary]] [preferred]`
6. `rep stcn {interface interface-id | segment id-list | stp}`
7. `rep block port {id port-id | neighbor-offset | preferred} vlan {vlan-list | all}`
8. `rep preempt delay seconds`
9. `rep isl-age-timer value`
10. `end`
11. `show interface [interface-id] rep [detail]`
12. `copy running-config startup-config`

<td></td>
</tr>
<tr>
<td>Device# rep segment 1 edge no-neighbor primary</td>
<td></td>
</tr>
</tbody>
</table>

### Note
You must configure two edge ports, including one primary edge port, for each segment.

These optional keywords are available:

- (Optional) **edge**—Configures the port as an edge port. Each segment has only two edge ports. Entering the keyword **edge** without the keyword **primary** configures the port as the secondary edge port.

- (Optional) **primary**—Configures the port as the primary edge port, the port on which you can configure VLAN load balancing.

- (Optional) **no-neighbor**—Configures a port with no external REP neighbors as an edge port. The port inherits all the properties of an edge port, and you can configure the properties the same way you would for an edge port.

### Note
Although each segment can have only one primary edge port, if you configure edge ports on two different switches and enter the keyword **primary** on both the switches, the configuration is valid. However, REP selects only one of these ports as the segment primary edge port. You can identify the primary edge port for a segment by entering the **show rep topology** privileged EXEC command.

- (Optional) **preferred**—Indicates that the port is the preferred alternate port or the preferred port for VLAN load balancing.
### Purpose

Configuring a port as preferred does not guarantee that it becomes the alternate port; it merely gives the port a slight edge over equal contenders. The alternate port is usually a previously failed port.

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>rep stcn {interface interface-id</td>
<td>segment id-list</td>
</tr>
<tr>
<td>• interface interface-id</td>
<td>Designates a physical interface or port channel to receive STCNs.</td>
</tr>
<tr>
<td>• segment id-list</td>
<td>Identifies one or more segments to receive STCNs. The range is from 1 to 1024.</td>
</tr>
<tr>
<td>• stp</td>
<td>Sends STCNs to STP networks.</td>
</tr>
<tr>
<td>rep block port {id port-id</td>
<td>neighbor-offset</td>
</tr>
<tr>
<td>• id port-id</td>
<td>Identifies the alternate port by port ID. The port ID is automatically generated for each port in the segment. You can view interface port IDs by entering the show interface type number rep [detail] privileged EXEC command.</td>
</tr>
<tr>
<td>• neighbor_offset</td>
<td>Number to identify the alternate port as a downstream neighbor from an edge port. The range is from -256 to 256, with negative numbers indicating the downstream neighbor from the secondary edge port. A value of 0 is invalid. Enter -1 to identify the secondary edge port as the alternate port.</td>
</tr>
<tr>
<td>• preferred</td>
<td>Selects the regular segment port previously identified as the preferred alternate port for VLAN load balancing.</td>
</tr>
<tr>
<td>• vlan vlan-list</td>
<td>Blocks one VLAN or a range of VLANs.</td>
</tr>
</tbody>
</table>

### Step 6

**Example:**

```
Device# rep stcn segment 25-50
```

### Step 7

**Example:**

```
Device# rep block port id 0009001818D68700 vlan 1-100
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td>rep preempt delay <em>seconds</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# rep preempt delay 100</td>
</tr>
<tr>
<td></td>
<td>(Optional) Configures a preempt time delay.</td>
</tr>
<tr>
<td></td>
<td>• Use this command if you want VLAN load balancing to be automatically triggered after a link failure and recovery.</td>
</tr>
<tr>
<td></td>
<td>• The time delay range is between 15 to 300 seconds. The default is manual preemption with no time delay.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Enter this command only on the REP primary edge port.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>rep lsl-age-timer <em>value</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# rep lsl-age-timer 2000</td>
</tr>
<tr>
<td></td>
<td>(Optional) Configures a time (in milliseconds) for which the REP interface remains up without receiving a hello from a neighbor.</td>
</tr>
<tr>
<td></td>
<td>The range is from 120 to 10000 ms in 40-ms increments. The default is 5000 ms (5 seconds).</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • EtherChannel port channel interfaces do not support LSL age-timer values that are less than 1000 ms.</td>
</tr>
<tr>
<td></td>
<td>• Both the ports on the link should have the same LSL age configured in order to avoid link flaps.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# end</td>
</tr>
<tr>
<td></td>
<td>Exits global configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>show interface [interface-id] rep [detail]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# show interface gigabitethernet1/1 rep detail</td>
</tr>
<tr>
<td></td>
<td>(Optional) Displays the REP interface configuration.</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the router startup configuration file.</td>
</tr>
</tbody>
</table>
Setting Manual Preemption for VLAN Load Balancing

If you do not enter the `rep preempt delay seconds` interface configuration command on the primary edge port to configure a preemption time delay, the default is to manually trigger VLAN load balancing on the segment. Be sure that all the other segment configurations have been completed before manually preempting VLAN load balancing. When you enter the `rep preempt delay segment segment-id` command, a confirmation message is displayed before the command is executed because preemption might cause network disruption.

SUMMARY STEPS

1. enable
2. configure terminal
3. rep preempt segment segment-id
4. show rep topology segment segment-id
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</table>
Configuring SNMP Traps for REP

You can configure a router to send REP-specific traps to notify the Simple Network Management Protocol (SNMP) server of link-operational status changes and port role changes.

**SUMMARY STEPS**

1. `configure terminal`
2. `snmp mib rep trap-rate value`
3. `end`
4. `show running-config`
5. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `configure terminal` | Enters global configuration mode. |
| Example:
| Device# configure terminal | |
| **Step 2**
| `snmp mib rep trap-rate value` | Enables the switch to send REP traps, and sets the number of traps sent per second. |
| Example:
| Device(config)# snmp mib rep trap-rate 500 | • Enter the number of traps sent per second. The range is from 0 to 1000. The default is 0 (no limit is imposed; a trap is sent at every occurrence). |
| **Step 3**
| `end` | Returns to privileged EXEC mode. |
| Example:
| Device(config)# end | |
| **Step 4**
| `show running-config` | (Optional) Displays the running configuration, which can be used to verify the REP trap configuration. |
| Example:
| Device# show running-config | |
| **Step 5**
| `copy running-config startup-config` | (Optional) Saves your entries in the switch startup configuration file. |
| Example:
| Device# copy running-config startup-config | |

**Monitoring Resilient Ethernet Protocol Configuration**

You can display the rep interface and rep topology details using the commands in this topic.

- `show interface [interface-id] rep [detail]`
Displays REP configuration and status for an interface or for all the interfaces.

- (Optional) **detail**—Displays interface-specific REP information.

**Example:**

```
Device# show interfaces TenGigabitEthernet4/1 rep detail
```

TenGigabitEthernet4/1 REP enabled
Segment-id: 3 (Primary Edge)
PortID: 03010015FA66FF80
Preferred flag: No
Operational Link Status: TWO WAY
Current Key: 02040015FA66FF804050
Port Role: Open
Blocked VLAN: <empty>
Admin-vlan: 1
Preempt Delay Timer: disabled
Configured Load-balancing Block Port: none
Configured Load-balancing Block VLAN: none
STCN Propagate to: none
LSL PDU rx: 999, tx: 652
HFL PDU rx: 0, tx: 0
BPA TLV rx: 500, tx: 4
BPA (STCN, LSL) TLV rx: 0, tx: 0
BPA (STCN, HFL) TLV rx: 0, tx: 0
BPA-ELECTION TLV rx: 6, tx: 5
EPA-COMMAND TLV rx: 0, tx: 0
EPA-INFO TLV rx: 135, tx: 136

- **show rep topology** [**segment segment-id**] [**archive**] [**detail**]

Displays REP topology information for a segment or for all the segments, including the primary and secondary edge ports in the segment.

- (Optional) **archive**—Displays the last stable topology.

**Note**

An archive topology is not retained when the switch reloads.

- (Optional) **detail**—Displays detailed archived information.

**Example:**

```
Device# show rep topology
REP Segment 1
  BridgeName PortName Edge Role
  ---------------- --------- ---- ----
  10.64.106.63 Te5/4 Pri Open
  10.64.106.228 Te3/4 Open

  ---------------- --------- ---- ----
  10.64.106.63 Gi50/1 Pri Open
```
Configuration Examples for Resilient Ethernet Protocol

This section provides the following configuration examples:

Example: Configuring the REP Administrative VLAN

This example shows how to configure the administrative VLAN as VLAN 100, and verify the configuration by entering the `show interface rep detail` command on one of the REP interfaces:

```
Device# configure terminal
Device(config)# rep admin vlan 100
Device(config)# end
```

```
Device# show interface gigabitethernet1/1 rep detail
GigabitEthernet1/1 REP enabled
Segment-id: 2 (Edge)
PortID: 00010019E7144680
Preferred flag: No
Operational Link Status: TWO_WAY
Current Key: 0002001121A2D5800E4D
Port Role: Open
Blocked Vlan: <empty>
Admin-vlan: 100
Preempt Delay Timer: disabled
LSL Ageout Timer: 5000 ms
Configured Load-balancing Block Port: none
Configured Load-balancing Block VLAN: none
STCN Propagate to: none
LSL PDU rx: 3322, tx: 1722
HFL PDU rx: 32, tx: 5
BPA TLV rx: 16849, tx: 508
BPA (STCN, LSL) TLV rx: 0, tx: 0
BPA (STCN, HFL) TLV rx: 0, tx: 0
EPA-ELECTION TLV rx: 118, tx: 118
EPA-COMMAND TLV rx: 0, tx: 0
EPA-INFO TLV rx: 4214, tx: 4190
```

The following example shows how to create an administrative VLAN per segment. Here, VLAN 2 is configured as the administrative VLAN only for REP segment 2. All the remaining segments that are not configured have VLAN 1 as the administrative VLAN by default.

```
Device# configure terminal
Device(config)# rep admin vlan 2 segment 2
Device(config)# end
```

Example: Configuring a REP Interface

This example shows how to configure an interface as the primary edge port for segment 1, to send STCNs to segments 2 through 5, and to configure the alternate port as the port with port ID 0009001818D68700 to block
all the VLANs after a preemption delay of 60 seconds after a segment port failure and recovery. The interface is configured to remain up for 6000 ms without receiving a hello from a neighbor.

Switch# configure terminal
Switch (conf)# interface gigabitethernet1/1
Switch (conf-if)# rep segment 1 edge primary
Switch (conf-if)# rep stcn segment 2-5
Switch (conf-if)# rep block port 0009001818D68700 vlan all
Switch (conf-if)# rep preempt delay 60
Switch (conf-if)# rep lsl-age-timer 6000
Switch (conf-if)# end

This example shows how to configure the same configuration when the interface has no external REP neighbor:

Switch# configure terminal
Switch (conf)# interface gigabitethernet1/1
Switch (conf-if)# rep segment 1 edge no-neighbor primary
Switch (conf-if)# rep stcn segment 2-5
Switch (conf-if)# rep block port 0009001818D68700 vlan all
Switch (conf-if)# rep preempt delay 60
Switch (conf-if)# rep lsl-age-timer 6000
Switch (conf-if)# end

This example shows how to configure the VLAN blocking configuration shown in the Figure 5. The alternate port is the neighbor with neighbor offset number 4. After manual preemption, VLANs 100 to 200 are blocked at this port, and all the other VLANs are blocked at the primary edge port E1 (Gigabit Ethernet port 1/1).

*Figure 43: Example of VLAN Blocking*

Feature Information for Resilient Ethernet Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for EtherChannels

- All ports in an EtherChannel must be assigned to the same VLAN or they must be configured as trunk ports.

- When the ports in an EtherChannel are configured as trunk ports, all the ports must be configured with the same mode (either Inter-Switch Link [ISL] or IEEE 802.1Q).

- Port Aggregation Protocol (PAgP) can be enabled only in single-switch EtherChannel configurations; PAgP cannot be enabled on cross-stack EtherChannels.
Information About EtherChannels

EtherChannel Overview

EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. You can use the EtherChannel to increase the bandwidth between the wiring closets and the data center, and you can deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention.

An EtherChannel consists of individual Ethernet links bundled into a single logical link.

Figure 44: Typical EtherChannel Configuration

Each EtherChannel can consist of up to eight compatibly configured Ethernet ports.

The LAN Lite feature set supports up to six EtherChannels. The LAN Base feature set supports up to 24 EtherChannels.

EtherChannel Modes

You can configure an EtherChannel in one of these modes: Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or On. Configure both ends of the EtherChannel in the same mode:

- When you configure one end of an EtherChannel in either PAgP or LACP mode, the system negotiates with the other end of the channel to determine which ports should become active. If the remote port cannot negotiate an EtherChannel, the local port is put into an independent state and continues to carry data traffic as would any other single link. The port configuration does not change, but the port does not participate in the EtherChannel.

- When you configure an EtherChannel in the on mode, no negotiations take place. The switch forces all compatible ports to become active in the EtherChannel. The other end of the channel (on the other switch) must also be configured in the on mode; otherwise, packet loss can occur.
EtherChannel on Devices

You can create an EtherChannel on a device, on a single device in the stack, or on multiple devices in the stack (known as cross-stack EtherChannel).

**Figure 45: Single-Switch EtherChannel**

**Figure 46: Cross-Stack EtherChannel**

**EtherChannel Link Failover**

If a link within an EtherChannel fails, traffic previously carried over that failed link moves to the remaining links within the EtherChannel. If traps are enabled on the switch, a trap is sent for a failure that identifies the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one link in an EtherChannel are blocked from returning on any other link of the EtherChannel.
Channel Groups and Port-Channel Interfaces

An EtherChannel comprises a channel group and a port-channel interface. The channel group binds physical ports to the port-channel interface. Configuration changes applied to the port-channel interface apply to all the physical ports bound together in the channel group.

**Figure 47: Relationship of Physical Ports, Channel Group and Port-Channel Interface**

The **channel-group** command binds the physical port and the port-channel interface together. Each EtherChannel has a port-channel logical interface numbered from 1 to 24. This port-channel interface number corresponds to the one specified with the **channel-group** interface configuration command.

- With Layer 2 ports, use the **channel-group** interface configuration command to dynamically create the port-channel interface.

You also can use the **interface port-channel port-channel-number** global configuration command to manually create the port-channel interface, but then you must use the **channel-group channel-group-number** command to bind the logical interface to a physical port. The **channel-group-number** can be the same as the **port-channel-number**, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

Port Aggregation Protocol

The Port Aggregation Protocol (PAgP) is a Cisco-proprietary protocol that can be run only on Cisco devices and on those devices licensed by vendors to support PAgP. PAgP facilitates the automatic creation of EtherChannels by exchanging PAgP packets between Ethernet ports. PAgP cannot be enabled on cross-stack EtherChannels.

By using PAgP, the device or device stack learns the identity of partners capable of supporting PAgP and the capabilities of each port. It then dynamically groups similarly configured ports (on a single device in the stack) into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, PAgP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, PAgP adds the group to the spanning tree as a single device port.
PAgP Modes

PAgP modes specify whether a port can send PAgP packets, which start PAgP negotiations, or only respond to PAgP packets received.

Table 41: EtherChannel PAgP Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This setting minimizes the transmission of PAgP packets. This mode is not supported when the EtherChannel members are from different switches in the switch stack (cross-stack EtherChannel).</td>
</tr>
<tr>
<td>desirable</td>
<td>Places a port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This mode is not supported when the EtherChannel members are from different switches in the switch stack (cross-stack EtherChannel).</td>
</tr>
</tbody>
</table>

Switch ports exchange PAgP packets only with partner ports configured in the auto or desirable modes. Ports configured in the on mode do not exchange PAgP packets.

Both the auto and desirable modes enable ports to negotiate with partner ports to form an EtherChannel based on criteria such as port speed and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- A port in the desirable mode can form an EtherChannel with another port that is in the desirable or auto mode.
- A port in the auto mode can form an EtherChannel with another port in the desirable mode.

A port in the auto mode cannot form an EtherChannel with another port that is also in the auto mode because neither port starts PAgP negotiation.

Silent Mode

If your switch is connected to a partner that is PAgP-capable, you can configure the switch port for nonsilent operation by using the non-silent keyword. If you do not specify non-silent with the auto or desirable mode, silent mode is assumed.

Use the silent mode when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port connected to a silent partner prevents that switch port from ever becoming operational. However, the silent setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

PAgP Learn Method and Priority

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device is an aggregate-port learner if it learns addresses by aggregate (logical) ports. The learn method must be configured the same at both ends of the link.
When a device and its partner are both aggregate-port learners, they learn the address on the logical port-channel. The device sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.

PAgP cannot automatically detect when the partner device is a physical learner and when the local device is an aggregate-port learner. Therefore, you must manually set the learning method on the local device to learn addresses by physical ports. You also must set the load-distribution method to source-based distribution, so that any given source MAC address is always sent on the same physical port.

You also can configure a single port within the group for all transmissions and use other ports for hot-standby. The unused ports in the group can be swapped into operation in just a few seconds if the selected single port loses hardware-signal detection. You can configure which port is always selected for packet transmission by changing its priority with the `pagp port-priority` interface configuration command. The higher the priority, the more likely that the port will be selected.

The device supports address learning only on aggregate ports even though the `physical-port` keyword is provided in the CLI. The `pagp learn-method` command and the `pagp port-priority` command have no effect on the device hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner of the device is a physical learner, we recommend that you configure the device as a physical-port learner by using the `pagp learn-method physical-port` interface configuration command. Set the load-distribution method based on the source MAC address by using the `port-channel load-balance src-mac` global configuration command. The device then sends packets to the physical learner using the same port in the EtherChannel from which it learned the source address. Only use the `pagp learn-method` command in this situation.

### PAgP Interaction with Virtual Switches and Dual-Active Detection

A virtual switch can be two or more core switches connected by virtual switch links (VSLs) that carry control and data traffic between them. One of the switches is in active mode. The others are in standby mode. For redundancy, remote switches are connected to the virtual switch by remote satellite links (RSLs).

If the VSL between two switches fails, one switch does not know the status of the other. Both switches could change to the active mode, causing a dual-active situation in the network with duplicate configurations (including duplicate IP addresses and bridge identifiers). The network might go down.

To prevent a dual-active situation, the core switches send PAgP protocol data units (PDUs) through the RSLs to the remote switches. The PAgP PDUs identify the active switch, and the remote switches forward the PDUs to core switches so that the core switches are in sync. If the active switch fails or resets, the standby switch takes over as the active switch. If the VSL goes down, one core switch knows the status of the other and does not change its state.

### PAgP Interaction with Other Features

The Dynamic Trunking Protocol (DTP) and the Cisco Discovery Protocol (CDP) send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive PAgP protocol data units (PDUs) on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel.
PAgP sends and receives PAgP PDUs only from ports that are up and have PAgP enabled for the auto or desirable mode.

**Link Aggregation Control Protocol**

The LACP is defined in IEEE 802.3ad and enables Cisco devices to manage Ethernet channels between devices that conform to the IEEE 802.3ad protocol. LACP facilitates the automatic creation of EtherChannels by exchanging LACP packets between Ethernet ports.

By using LACP, the device or device stack learns the identity of partners capable of supporting LACP and the capabilities of each port. It then dynamically groups similarly configured ports into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, LACP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, LACP adds the group to the spanning tree as a single device port.

The independent mode behavior of ports in a port channel is changed. With CSCtn96950, by default, standalone mode is enabled. When no response is received from an LACP peer, ports in the port channel are moved to suspended state.

**LACP Modes**

LACP modes specify whether a port can send LACP packets or only receive LACP packets.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>Places a port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.</td>
</tr>
<tr>
<td>passive</td>
<td>Places a port into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation. This setting minimizes the transmission of LACP packets.</td>
</tr>
</tbody>
</table>

Both the active and passive LACP modes enable ports to negotiate with partner ports to an EtherChannel based on criteria such as port speed, and for Layer 2 EtherChannels, based on trunk state and VLAN numbers.

Ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A port in the active mode can form an EtherChannel with another port that is in the active or passive mode.
- A port in the passive mode cannot form an EtherChannel with another port that is also in the passive mode because neither port starts LACP negotiation.

**LACP Interaction with Other Features**

The DTP and the CDP send and receive packets over the physical ports in the EtherChannel. Trunk ports send and receive LACP PDUs on the lowest numbered VLAN.
In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel.

LACP sends and receives LACP PDUs only from ports that are up and have LACP enabled for the active or passive mode.

**EtherChannel On Mode**

EtherChannel *on* mode can be used to manually configure an EtherChannel. The *on* mode forces a port to join an EtherChannel without negotiations. The *on* mode can be useful if the remote device does not support PAgP or LACP. In the *on* mode, a usable EtherChannel exists only when the devices at both ends of the link are configured in the *on* mode.

Ports that are configured in the *on* mode in the same channel group must have compatible port characteristics, such as speed and duplex. Ports that are not compatible are suspended, even though they are configured in the *on* mode.

---

**Caution**

You should use care when using the *on* mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

---

**Load-Balancing and Forwarding Methods**

EtherChannel balances the traffic load across the links in a channel by reducing part of the binary pattern formed from the addresses in the frame to a numerical value that selects one of the links in the channel. You can specify one of several different load-balancing modes, including load distribution based on MAC addresses, IP addresses, source addresses, destination addresses, or both source and destination addresses. The selected mode applies to all EtherChannels configured on the device.

---

**Note**

Layer 3 Equal-cost multi path (ECMP) load balancing is based on source IP address, destination IP address, source port, destination port, and layer 4 protocol. Fragmented packets will be treated on two different links based on the algorithm calculated using these parameters. Any changes in one of these parameters will result in load balancing.

You configure the load-balancing and forwarding method by using the `port-channel load-balance` global configuration command.

**MAC Address Forwarding**

With source-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source-MAC address of the incoming packet. Therefore, to provide load-balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel.

With destination-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the destination host’s MAC address of the incoming packet. Therefore,
packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

With source-and-destination MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on both the source and destination MAC addresses. This forwarding method, a combination source-MAC and destination-MAC address forwarding methods of load distribution, can be used if it is not clear whether source-MAC or destination-MAC address forwarding is better suited on a particular device. With source-and-destination MAC-address forwarding, packets sent from host A to host B, host A to host C, and host C to host B could all use different ports in the channel.

**IP Address Forwarding**

With source-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the source-IP address of the incoming packet. To provide load balancing, packets from different IP addresses use different ports in the channel, and packets from the same IP address use the same port in the channel.

With destination-IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on the destination-IP address of the incoming packet. To provide load balancing, packets from the same IP source address sent to different IP destination addresses could be sent on different ports in the channel. Packets sent from different source IP addresses to the same destination IP address are always sent on the same port in the channel.

With source-and-destination IP address-based forwarding, packets are distributed across the ports in the EtherChannel based on both the source and destination IP addresses of the incoming packet. This forwarding method, a combination of source-IP and destination-IP address-based forwarding, can be used if it is not clear whether source-IP or destination-IP address-based forwarding is better suited on a particular device. In this method, packets sent from the IP address A to IP address B, from IP address A to IP address C, and from IP address C to IP address B could all use different ports in the channel.

**Load-Balancing Advantages**

Different load-balancing methods have different advantages, and the choice of a particular load-balancing method should be based on the position of the device in the network and the kind of traffic that needs to be load-distributed.

*Figure 48: Load Distribution and Forwarding Methods*

In the following figure, an EtherChannel of four workstations communicates with a router. Because the router is a single MAC-address device, source-based forwarding on the device EtherChannel ensures that the device uses all available bandwidth to the router. The router is configured for destination-based forwarding because
the large number of workstations ensures that the traffic is evenly distributed from the router EtherChannel.

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination-MAC address always chooses the same link in the channel. Using source addresses or IP addresses might result in better load-balancing.

**EtherChannel Load Deferral Overview**

In an Instant Access system, the EtherChannel Load Deferral feature allows ports to be bundled into port channels, but prevents the assignment of group mask values to these ports. This prevents the traffic from being forwarded to new instant access stack members and reduce data loss following a stateful switchover (SSO).

Cisco Catalyst Instant Access creates a single network touch point and a single point of configuration across distribution and access layer switches. Instant Access enables the merging of physical distribution and access layer switches into a single logical entity with a single point of configuration, management, and troubleshooting. The following illustration represents a sample network where an Instant Access system interacts with a switch (Catalyst 2960-X Series Switches) that is connected via a port channel to stacked clients (Member 1 and Member 2).

When the EtherChannel Load Deferral feature is configured and a new Instant Access client stack member comes up, ports of this newly-joined stack member is bundled into the port channel. In the transition period, the data path is not fully established on the distribution switch (Catalyst 6000 Series Switches), and traffic originating from the access layer switch (Catalyst 2960-X Series Switches) reaches the non-established ports and the traffic gets lost.

When load share deferral is enabled on a port channel, the assignment of a member port’s load share is delayed for a period that is configured globally by the `port-channel load-defer` command. During the deferral period, the load share of a deferred member port is set to 0. In this state, the deferred port is capable of receiving data and control traffic, and of sending control traffic, but the port is prevented from sending data traffic to the virtual switching system (VSS). Upon expiration of the global deferral timer, the deferred member port exits the deferral state and the port assumes its normal configured load share.
Load share deferral is applied only if at least one member port of the port channel is currently active with a nonzero load share. If a port enabled for load share deferral is the first member bringing up the EtherChannel, the deferral feature does not apply and the port will forward traffic immediately.

This feature is enabled on a per port-channel basis; however, the load deferral timer is configured globally and not per port-channel. As a result, when a new port is bundled, the timer starts only if it is not already running. If some other ports are already deferred then the new port will be deferred only for the remaining amount of time.

The load deferral is stopped as soon as a member in one of the deferred port channels is unbundled. As a result, all the ports that were deferred is assigned a group-mask in the event of an unbundling during the deferral period.

**Note**

When you try to enable this feature on a stack member switch, the following message is displayed:

*Load share deferral is supported only on stand-alone stack.*

---

**EtherChannel and Device Stacks**

If a stack member that has ports participating in an EtherChannel fails or leaves the stack, the active device removes the failed stack member device ports from the EtherChannel. The remaining ports of the EtherChannel, if any, continue to provide connectivity.

When a device is added to an existing stack, the new device receives the running configuration from the active device and updates itself with the EtherChannel-related stack configuration. The stack member also receives the operational information (the list of ports that are up and are members of a channel).

When two stacks merge that have EtherChannels configured between them, self-looped ports result. Spanning tree detects this condition and acts accordingly. Any PAgP or LACP configuration on a winning device stack is not affected, but the PAgP or LACP configuration on the losing device stack is lost after the stack reboots.

For a mixed stack containing one or more Catalyst 2960-S switches, we recommend that you configure no more than six EtherChannels on the stack.

**Device Stack and PAgP**

With PAgP, if the active device fails or leaves the stack, the standby device becomes the new active device. The new active device synchronizes the configuration of the stack members to that of the active device. The PAgP configuration is not affected after an active device change unless the EtherChannel has ports residing on the old active device.

**Switch Stacks and LACP**

With LACP, the system ID uses the stack MAC address from the active switch, and if the active switch changes, the LACP system ID can change. If the LACP system ID changes, the entire EtherChannel will flap, and there will be an STP reconvergence. Use the **stack-mac persistent timer** command to control whether or not the stack MAC address changes during a active switch failover.
Default EtherChannel Configuration

The default EtherChannel configuration is described in this table.

**Table 43: Default EtherChannel Configuration**

<table>

</tbody>
</table>
Layer 2 EtherChannel Configuration Guidelines

When configuring Layer 2 EtherChannels, follow these guidelines:

- Assign all ports in the EtherChannel to the same VLAN, or configure them as trunks. Ports with different native VLANs cannot form an EtherChannel.

- An EtherChannel supports the same allowed range of VLANs on all the ports in a trunking Layer 2 EtherChannel. If the allowed range of VLANs is not the same, the ports do not form an EtherChannel even when PAgP is set to the auto or desirable mode.

- Ports with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.

Auto-LAG

The auto-LAG feature provides the ability to auto create EtherChannels on ports connected to a switch. By default, auto-LAG is disabled globally and is enabled on all port interfaces. The auto-LAG applies to a switch only when it is enabled globally.

On enabling auto-LAG globally, the following scenarios are possible:

- All port interfaces participate in creation of auto EtherChannels provided the partner port interfaces have EtherChannel configured on them. For more information, see the “The supported auto-LAG configurations between the actor and partner devices” table below.

- Ports that are already part of manual EtherChannels cannot participate in creation of auto EtherChannels.
• When auto-LAG is disabled on a port interface that is already a part of an auto created EtherChannel, the port interface will unbundle from the auto EtherChannel.

The following table shows the supported auto-LAG configurations between the actor and partner devices:

<table>
<thead>
<tr>
<th>Actor/Partner</th>
<th>Active</th>
<th>Passive</th>
<th>Auto</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Passive</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>Auto</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

On disabling auto-LAG globally, all auto created Etherchannels become manual EtherChannels.

You cannot add any configurations in an existing auto created EtherChannel. To add, you should first convert it into a manual EtherChannel by executing the `port-channel <channel-number> persistent`.

**Note**

Auto-LAG uses the LACP protocol to create auto EtherChannel. Only one EtherChannel can be automatically created with the unique partner devices.

**Auto-LAG Configuration Guidelines**

Follow these guidelines when configuring the auto-LAG feature.

• When auto-LAG is enabled globally and on the port interface, and if you do not want the port interface to become a member of the auto EtherChannel, disable the auto-LAG on the port interface.

• A port interface will not bundle to an auto EtherChannel when it is already a member of a manual EtherChannel. To allow it to bundle with the auto EtherChannel, first unbundle the manual EtherChannel on the port interface.

• When auto-LAG is enabled and auto EtherChannel is created, you can create multiple EtherChannels manually with the same partner device. But by default, the port tries to create auto EtherChannel with the partner device.

• The auto-LAG is supported only on Layer 2 EtherChannel. It is not supported on Layer 3 interface and Layer 3 EtherChannel.

• The auto-LAG is supported on cross-stack EtherChannel.

**How to Configure EtherChannels**

After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical ports assigned to the port-channel interface, and configuration changes applied to the physical port affect only the port where you apply the configuration.
Configuring Layer 2 EtherChannels

You configure Layer 2 EtherChannels by assigning ports to a channel group with the `channel-group` interface configuration command. This command automatically creates the port-channel logical interface.

If you enabled PAgP on a port in the `auto` or `desirable` mode, you must reconfigure it for either the `on` mode or the LACP mode before adding this port to a cross-stack EtherChannel. PAgP does not support cross-stack EtherChannels.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `switchport mode {access | trunk}`
4. `switchport access vlan vlan-id`
5. `channel-group channel-group-number mode {auto [non-silent] | desirable [non-silent] | on} | { active | passive}`
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>

<tr>
<td></td>
<td>Example: Device(config)# interface gigabitethernet1/0/1</td>
<td>Valid interfaces are physical ports. For a PAgP EtherChannel, you can configure up to eight ports of the same type and speed for the same group. For a LACP EtherChannel, you can configure up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`switchport mode {access</td>
<td>trunk}`</td>
</tr>
<tr>
<td></td>
<td>Example: Device(config-if)# switchport mode access</td>
<td>If you configure the port as a static-access port, assign it to only one VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>switchport access vlan vlan-id</code></td>
<td>(Optional) If you configure the port as a static-access port, assign it to only one VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>Example: Device(config-if)# switchport access vlan 22</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

Assigns the port to a channel group, and specifies the PAgP or the LACP mode.

For `channel-group-number`, the range is 1 to 24.

For `mode`, select one of these keywords:

- **auto** — Enables PAgP only if a PAgP device is detected. It places the port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This keyword is not supported when EtherChannel members are from different devices in the device stack.

- **desirable** — Unconditionally enables PAgP. It places the port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets. This keyword is not supported when EtherChannel members are from different devices in the device stack.

- **on** — Forces the port to channel without PAgP or LACP. In the **on** mode, an EtherChannel exists only when a port group in the **on** mode is connected to another port group in the **on** mode.

- **non-silent** — (Optional) If your device is connected to a partner that is PAgP-capable, configures the device port for nonsilent operation when the port is in the **auto** or **desirable** mode. If you do not specify **non-silent**, silent is assumed. The silent setting is for connections to file servers or packet analyzers. This setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

- **active** — Enables LACP only if a LACP device is detected. It places the port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.

- **passive** — Enables LACP on the port and places it into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation.

### Command or Action

**Step 5**

- `channel-group channel-group-number mode {auto [non-silent] | desirable [non-silent] | on } | { active | passive}

  **Example:**

  `Device(config-if)# channel-group 5 mode auto`

### Step 6

- `end`

  **Example:**

  `Device(config-if)# end`

- Returns to privileged EXEC mode.
Configuring EtherChannel Load-Balancing

You can configure EtherChannel load-balancing by using source-based or destination-based forwarding methods.

This task is optional.

**SUMMARY STEPS**

1. configure terminal  
2. port-channel load-balance { dst-ip | dst-mac | src-dst-ip | src-dst-mac | src-ip | src-mac }  
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
</tbody>
</table>
### Command or Action

**Step 8**

**show platform pm group-masks**

**Example:**

Switch# show platform pm group-masks

**Purpose**

Display EtherChannel group masks information.

---

### Example

The following is sample output from the `show etherchannel channel-group port-channel` command. If the `channel-group` argument is not specified, the command displays information about all channel groups.

```
Switch# show etherchannel 1 port-channel

Port-channels in the group:
----------------------------
Port-channel: Po1
--------------
Age of the Port-channel = 0d:00h:37m:08s
Logical slot/port = 9/1 Number of ports = 0
GC = 0x00000000 HotStandBy port = null
Port state = Port-channel Ag-Not-Inuse
Protocol = -
Port security = Disabled
Load share deferral = Enabled defer period = 120 sec time left = 0 sec
```

The following is sample output from the `show platform pm group-masks` command. Deferred ports have the group mask of 0xFFFF, when the defer timer is running.

```
Switch# show platform pm group-masks

Etherchannel members and group masks table
Group #ports group frame-dist slot port mask interface index
---------------------------------------------------------------
 1   0   1 src-mac
 2   0   2 src-mac
 3   0   3 src-mac
 4   0   4 src-mac
 5   0   5 src-mac
 6   0   6 src-mac

    10 FFFF Gi1/0/10 6
    11 FFFF Gi1/0/11 7
```
Configuring the PAgP Learn Method and Priority

This task is optional.

**SUMMARY STEPS**

1. configure terminal  
2. interface interface-id  
3. pagp learn-method physical-port  
4. pagp port-priority priority  
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| **Example:**  
Device# configure terminal | |
| **Step 2** interface interface-id | Specifies the port for transmission, and enters interface configuration mode. |
| **Example:**  
Device(config)# interface gigabitethernet 1/0/2 | |
| **Step 3** pagp learn-method physical-port | Selects the PAgP learning method. |
| **Example:**  
Device(config-if)# pagp learn-method physical port | By default, **aggregation-port learning** is selected, which means the device sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives. |
| | Selects **physical-port** to connect with another device that is a physical learner. |
| | Make sure to configure the **port-channel load-balance** global configuration command to **src-mac**. |
| | The learning method must be configured the same at both ends of the link. |
| **Step 4** pagp port-priority priority | Assigns a priority so that the selected port is chosen for packet transmission. |
| **Example:**  
Device(config-if)# pagp port-priority 200 | For **priority**, the range is 0 to 255. The default is 128. The higher the priority, the more likely that the port will be used for PAgP transmission. |
### Configuring LACP Hot-Standby Ports

When enabled, LACP tries to configure the maximum number of LACP-compatible ports in a channel, up to a maximum of 16 ports. Only eight LACP links can be active at one time. The software places any additional links in a hot-standby mode. If one of the active links becomes inactive, a link that is in the hot-standby mode becomes active in its place.

If you configure more than eight links for an EtherChannel group, the software automatically decides which of the hot-standby ports to make active based on the LACP priority. To every link between systems that operate LACP, the software assigns a unique priority made up of these elements (in priority order):

- LACP system priority
- System ID (the device MAC address)
- LACP port priority
- Port number

In priority comparisons, numerically lower values have higher priority. The priority decides which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Determining which ports are active and which are hot standby is a two-step procedure. First the system with a numerically lower system priority and system ID is placed in charge of the decision. Next, that system decides which ports are active and which are hot standby, based on its values for port priority and port number. The port priority and port number values for the other system are not used.

You can change the default values of the LACP system priority and the LACP port priority to affect how the software selects active and standby links.

### Configuring the LACP System Priority

You can configure the system priority for all the EtherChannels that are enabled for LACP by using the `lacp system-priority` global configuration command. You cannot configure a system priority for each LACP-configured channel. By changing this value from the default, you can affect how the software selects active and standby links.

You can use the `show etherchannel summary` privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

Follow these steps to configure the LACP system priority. This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. configure terminal
3. lacp system-priority  priority
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> lacp system-priority  priority</td>
<td>Configures the LACP system priority.</td>
</tr>
<tr>
<td>Example: Device(config)# lacp system-priority 32000</td>
<td>The range is 1 to 65535. The default is 32768. The lower the value, the higher the system priority.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Configuring the LACP Port Priority

By default, all ports use the same port priority. If the local system has a lower value for the system priority and the system ID than the remote system, you can affect which of the hot-standby links become active first by changing the port priority of LACP EtherChannel ports to a lower value than the default. The hot-standby ports that have lower port numbers become active in the channel first. You can use the show etherchannel summary privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

**Note**

If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), all the ports that cannot be actively included in the EtherChannel are put in the hot-standby state and are used only if one of the channeled ports fails.

Follow these steps to configure the LACP port priority. This procedure is optional.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. lacp port-priority priority
5. end

DETAILED STEPS

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode.    |
| configure terminal|                                     |
| Example:          |                                     |
| Device# configure terminal |     |

| **Step 3**        | Specifies the port to be configured, and enters interface configuration mode. |
| interface interface-id|                                         |
| Example:          |                                     |
| Device(config)# interface gigabitethernet 1/0/2 |     |

| **Step 4**        | Configures the LACP port priority.    |
| lACP port-priority | priority                                      |
| Example:          |                                     |
| Device(config-if)# lACP port-priority 32000 |     |

| **Step 5**        | Returns to privileged EXEC mode.        |
| end               |                                     |
| Example:          |                                     |
| Device(config-if)# end |     |

**Configuring the LACP Port Channel Min-Links Feature**

You can specify the minimum number of active ports that must be in the link-up state and bundled in an EtherChannel for the port channel interface to transition to the link-up state. Using EtherChannel min-links, you can prevent low-bandwidth LACP EtherChannels from becoming active. Port channel min-links also cause LACP EtherChannels to become inactive if they have too few active member ports to supply the required minimum bandwidth.
To configure the minimum number of links that are required for a port channel, perform the following tasks.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface port-channel channel-number`
4. `port-channel min-links min-links-number`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

### Configuring LACP Fast Rate Timer

You can change the LACP timer rate to modify the duration of the LACP timeout. Use the `lacp rate` command to set the rate at which LACP control packets are received by an LACP-supported interface. You can change the timeout rate from the default rate (30 seconds) to the fast rate (1 second). This command is supported only on LACP-enabled interfaces.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface {fastethernet | gigabitethernet | tengigabitethernet} slot/port
4. lacp rate {normal | fast}
5. end
6. show lacp internal

Configuring Auto-LAG Globally

SUMMARY STEPS
1. enable
2. configure terminal
3. [no] port-channel auto
4. end
5. show etherchannel auto

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Example: | Device> enable |
| Step 2 | configure terminal | Enters global configuration mode. |
| Example: | Device# configure terminal |
| Step 3 | [no] port-channel auto | Enables the auto-LAG feature on a switch globally. Use the no form of this command to disable the auto-LAG feature on the switch globally.  
Note: By default, the auto-LAG feature is enabled on the port. |
| Example: | Device(config)# port-channel auto |
| Step 4 | end | Returns to privileged EXEC mode. |
| Example: | Device(config)# end |
| Step 5 | show etherchannel auto | Displays that EtherChannel is created automatically. |
| Example: | Device# show etherchannel auto |

Configuring Auto-LAG on a Port Interface

SUMMARY STEPS
1. enable
2. configure terminal
3. interface interface-id
4. `[no] channel-group auto
5. end
6. show etherchannel auto

### DETAILED STEPS

<table>
<thead>
<tr>

### What to do next

#### Configuring Persistence with Auto-LAG

You use the persistence command to convert the auto created EtherChannel into a manual one and allow you to add configuration on the existing EtherChannel.

### SUMMARY STEPS

1. `enable`
2. `port-channel channel-number persistent`
3. `show etherchannel summary`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>Example:</em></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Converts the auto created EtherChannel into a manual one and allows you to add configuration on the EtherChannel. |
| `port-channel channel-number persistent` | |
| *Example:*        | `Device# port-channel 1 persistent` |

| **Step 3**        | Displays the EtherChannel information. |
| `show etherchannel summary` | |
| *Example:*        | `Device# show etherchannel summary` |

### Monitoring EtherChannel, PAgP, and LACP Status

You can display EtherChannel, PAgP, and LACP status using the commands listed in this table.

**Table 45: Commands for Monitoring EtherChannel, PAgP, and LACP Status**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
Configuration Examples for Configuring EtherChannels

Configuring Layer 2 EtherChannels: Examples

This example shows how to configure an EtherChannel on a single device in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the PAgP mode desirable:

```
Device# configure terminal
Device(config)# interface range gigabitethernet2/0/1 -2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode desirable non-silent
Device(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single device in the stack. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the LACP mode active:

```
Device# configure terminal
Device(config)# interface range gigabitethernet2/0/1 -2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode active
Device(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel. It uses LACP passive mode and assigns two ports on stack member 1 and one port on stack member 2 as static-access ports in VLAN 10 to channel 5:

```
Device# configure terminal
Device(config)# interface range gigabitethernet2/0/4 -5
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode passive
Device(config-if-range)# exit
Device(config)# interface gigabitethernet3/0/3
Device(config-if)# switchport mode access
Device(config-if)# switchport access vlan 10
Device(config-if)# channel-group 5 mode passive
Device(config-if)# exit
```
PoE or LACP negotiation errors may occur if you configure two ports from switch to the access point (AP). This scenario can be avoided if the port channel configuration is on the switch side. For more details, see the following example:

```plaintext
interface Port-channel1
  switchport access vlan 20
  switchport mode access
  switchport nonegotiate
  spanning-tree portfast
  no port-channel standalone-disable  <--this one
```

**Note**

If the port reports LACP errors on port flap, you should include the following command as well: `no errdisable detect cause pagp-flap`

---

**Example: Configuring Port Channel Load Deferral**

Switch# configure terminal
Switch(config)# port-channel load-defer 60
Switch(config)# interface port-channel 10
Switch(config-if)# port-channel load-defer
Switch(config-if)# end

**Configuring Auto LAG: Examples**

This example shows how to configure Auto-LAG on a switch

```plaintext
device> enable
device# configure terminal
device (config)# port-channel auto
device (config-if)# end
device# show etherchannel auto
```

The following example shows the summary of EtherChannel that was created automatically.

```plaintext
device# show etherchannel auto
Flags: D - down  P - bundled in port-channel
       I - stand-alone  s - suspended
       H - Hot-standby  {LACP only}
       R - Layer3   S - Layer2
       U - in use  f - failed to allocate aggregator
       M - not in use, minimum links not met
       u - unsuitable for bundling
       w - waiting to be aggregated
       d - default port
       A - formed by Auto LAG

Number of channel-groups in use: 1
Number of aggregators: 1

Group  Port-channel  Protocol  Ports
-----------------------------------------------
1  Po1(SUA)  LACP  Gi1/0/45(P) Gi2/0/21(P) Gi3/0/21(P)
```

The following example shows the summary of auto EtherChannel after executing the `port-channel 1 persistent` command.
device# port-channel 1 persistent

device# show etherchannel summary
Switch# show etherchannel summary
Flags: D - down P - bundled in port-channel
I - stand-alone s - suspended
H - Hot-standby (LACP only)
R - Layer3 S - Layer2

Configuring LACP Port Channel Min-Links: Examples

This example shows how to configure LACP port-channel min-links:

device > enable
device# configure terminal
device(config)# interface port-channel 5
device(config-if)# port-channel min-links 3
device# show etherchannel 25 summary
device# end

When the minimum links requirement is not met in standalone switches, the port-channel is flagged and assigned SM/SN or RM/RN state.

device# show etherchannel 5 summary

Flags: D - down P - bundled in port-channel
I - stand-alone s - suspended
H - Hot-standby (LACP only)
R - Layer3 S - Layer2
U - in use N- not in use, no aggregation
f - failed to allocate aggregator
M - not in use, no aggregation due to minimum links not met
m- not in use, port not aggregated due to minimum links not met
u - unsuitable for bundling
w - waiting to be aggregated
d - default port
Number of channel-groups in use: 6
Number of aggregators: 6

<table>
<thead>
<tr>
<th>Group</th>
<th>Port-channel</th>
<th>Protocol</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Po25(RM)</td>
<td>LACP</td>

</tr>
</tbody>
</table>

Example: Configuring LACP Fast Rate Timer

This example shows you how to configure the LACP rate:
device> enable
device# configure terminal
device(config)# interface gigabitEthernet 2/1
device(config-if)# lacp rate fast
device(config-if)# exit
device(config)# end
device# show lacp internal
device# show lacp counters

The following is sample output from the `show lacp internal` command:

device# show lacp internal
Flags: S - Device is requesting Slow LACPDUs
F - Device is requesting Fast LACPDUs
A - Device is in Active mode P - Device is in Passive mode
Channel group 25
LACP port Admin Oper Port Port
Port Flags State Priority Key Key Number State
Te1/49 FA bndl 32768 0x19 0x19 0x32 0x3F
Te1/50 FA bndl 32768 0x19 0x19 0x33 0x3F
Te1/51 FA bndl 32768 0x19 0x19 0x34 0x3F
Te1/52 FA bndl 32768 0x19 0x19 0x35 0x3F

The following is sample output from the `show lacp counters` command:

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Link-State Tracking

- This feature is supported only on the LAN Base image.
- You can configure only two link-state groups per switch.
- An interface cannot be a member of more than one link-state group.
- An interface that is defined as an upstream interface in a link-state group cannot also be defined as a downstream interface in the link-state group.
- Do not enable link-state tracking on individual interfaces that will part of a downstream EtherChannel interface.

Understanding Link-State Tracking

Link-state tracking, also known as trunk failover, binds the link state of multiple interfaces. Link-state tracking can be with server NIC adapter teaming to provide redundancy in the network. When the server NIC adapters are configured in a primary or secondary relationship, and the link is lost on the primary interface, network connectivity is transparently changed to the secondary interface.

Note

An interface can be an aggregation of ports (an EtherChannel) or a single physical port in either access or trunk mode.

The configuration in this figure ensures that the network traffic flow is balanced.

*For links to switches and other network devices

* Server 1 and server 2 use switch A for primary links and switch B for secondary links.
- Server 3 and server 4 use switch B for primary links and switch A for secondary links.

- Link-state group 1 on switch A
  - Switch A provides primary links to server 1 and server 2 through link-state group 1. Port 1 is connected to server 1, and port 2 is connected to server 2. Port 1 and port 2 are the downstream interfaces in link-state group 1.
  - Port 5 and port 6 are connected to distribution switch 1 through link-state group 1. Port 5 and port 6 are the upstream interfaces in link-state group 1.

- Link-state group 2 on switch A
  - Switch A provides secondary links to server 3 and server 4 through link-state group 2. Port 3 is connected to server 3, and port 4 is connected to server 4. Port 3 and port 4 are the downstream interfaces in link-state group 2.
  - Port 7 and port 8 are connected to distribution switch 2 through link-state group 2. Port 7 and port 8 are the upstream interfaces in link-state group 2.

- Link-state group 2 on switch B
  - Switch B provides primary links to server 3 and server 4 through link-state group 2. Port 3 is connected to server 3, and port 4 is connected to server 4. Port 3 and port 4 are the downstream interfaces in link-state group 2.
  - Port 5 and port 6 are connected to distribution switch 2 through link-state group 2. Port 5 and port 6 are the upstream interfaces in link-state group 2.

- Link-state group 1 on switch B
  - Switch B provides secondary links to server 1 and server 2 through link-state group 1. Port 1 is connected to server 1, and port 2 is connected to server 2. Port 1 and port 2 are the downstream interfaces in link-state group 1.
  - Port 7 and port 8 are connected to distribution switch 1 through link-state group 1. Port 7 and port 8 are the upstream interfaces in link-state group 1.

In a link-state group, the upstream ports can become unavailable or lose connectivity because the distribution switch or router fails, the cables are disconnected, or the link is lost. These are the interactions between the downstream and upstream interfaces when link-state tracking is enabled:

- If any of the upstream interfaces are in the link-up state, the downstream interfaces can change to or remain in the link-up state.

- If all of the upstream interfaces become unavailable, link-state tracking automatically puts the downstream interfaces in the error-disabled state. Connectivity to and from the servers is automatically changed from the primary server interface to the secondary server interface. For example, in the previous figure, if the upstream link for port 6 is lost, the link states of downstream ports 1 and 2 do not change. However, if the link for upstream port 5 is also lost, the link state of the downstream ports changes to the link-down state. Connectivity to server 1 and server 2 is then changed from link-state group 1 to link-state group 2. The downstream ports 3 and 4 do not change state because they are in link-group 2.
• If the link-state group is configured, link-state tracking is disabled, and the upstream interfaces lose connectivity, the link states of the downstream interfaces remain unchanged. The server does not recognize that upstream connectivity has been lost and does not failover to the secondary interface.

You can recover a downstream interface link-down condition by removing the failed downstream port from the link-state group. To recover multiple downstream interfaces, disable the link-state group.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Flex Links and MAC Address-Table Move Update

- This feature is supported only on the LAN Base image.
- Flex Links are supported only on Layer 2 ports and port channels.
- You can configure up to 16 backup links.
- You can configure only one Flex Links backup link for any active link, and it must be a different interface from the active interface.
• An interface can belong to only one Flex Links pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Links pair.

• Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.

• A backup link does not have to be the same type (Gigabit Ethernet or port channel) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.

• STP is disabled on Flex Links ports. A Flex Links port does not participate in STP, even if the VLANs present on the port are configured for STP. When STP is not enabled, be sure that there are no loops in the configured topology.

### Information About Flex Links and MAC Address-Table Move Update

#### Flex Links

Flex Links are a pair of a Layer 2 interfaces (device ports or port channels) where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP). Users can disable STP and still retain basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the device. If the device is running STP, Flex Links are not necessary because STP already provides link-level redundancy or backup.

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the FlexLinks or backup link. On devices, the Flex Links can be on the same device or on another device in the stack. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link shuts down. At any given time, only one of the interfaces is in the linkup state and forwarding traffic. If the primary link shuts down, the standby link starts forwarding traffic. When the active link comes back up, it goes into standby mode and does not forward traffic. STP is disabled on Flex Links interfaces.

#### Flex Links Configuration

In the following figure, ports 1 and 2 on device A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 goes down, port 2 comes up and starts forwarding traffic to switch C. When port 1 comes back up, it goes into standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also configure a preemption function, specifying the preferred port for forwarding traffic. For example, you can configure the Flex Links pair with preemption mode. In the scenario shown, when port 1 comes back up and has more bandwidth than port 2, port 1 begins forwarding traffic after 60 seconds. Port 2 becomes the standby port. You do this by entering the `switchport backup interface preemption mode bandwidth` and `switchport backup interface preemption delay` interface configuration commands.
If a primary (forwarding) link goes down, a trap notifies the network management stations. If the standby link goes down, a trap notifies the users.

Flex Links are supported only on Layer 2 ports and port channels, not on VLANs or on Layer 3 ports.

**VLAN Flex Links Load Balancing and Support**

VLAN Flex Links load balancing allows users to configure a Flex Links pair so that both ports simultaneously forward the traffic for some mutually exclusive VLANs. For example, if Flex Links ports are configured for 1 to 100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the rest on the other port. If one of the ports fail, the other active port forwards all the traffic. When the failed port comes back up, it resumes forwarding traffic in the preferred VLANs. In addition to providing the redundancy, this Flex Links pair can be used for load balancing. Flex Links VLAN load balancing does not impose any restrictions on uplink devices.

**Multicast Fast Convergence with Flex Links Failover**

Multicast fast convergence reduces the multicast traffic convergence time after a Flex Links failure. Multicast fast convergence is implemented by a combination of learning the backup link as an mrouter port, generating IGMP reports, and leaking IGMP reports.

**Learning the Other Flex Links Port as the mrouter Port**

In a typical multicast network, there is a querier for each VLAN. A device deployed at the edge of a network has one of its Flex Links ports receiving queries. Flex Links ports are also always forwarding at any given time.

A port that receives queries is added as an mrouter port on the device. An mrouter port is part of all the multicast groups learned by the device. After a changeover, queries are received by the other Flex Links port.
The other Flex Links port is then learned as the mrouter port. After changeover, multicast traffic then flows through the other Flex Links port. To achieve faster convergence of traffic, both Flex Links ports are learned as mrouter ports whenever either Flex Links port is learned as the mrouter port. Both Flex Links ports are always part of multicast groups.

Although both Flex Links ports are part of the groups in normal operation mode, all traffic on the backup port is blocked. The normal multicast data flow is not affected by the addition of the backup port as an mrouter port. When the changeover happens, the backup port is unblocked, allowing the traffic to flow. In this case, the upstream multicast data flows as soon as the backup port is unblocked.

**Generating IGMP Reports**

When the backup link comes up after the changeover, the upstream new distribution device does not start forwarding multicast data, because the port on the upstream router, which is connected to the blocked Flex Links port, is not part of any multicast group. The reports for the multicast groups were not forwarded by the downstream device because the backup link is blocked. The data does not flow on this port, until it learns the multicast groups, which occurs only after it receives reports.

The reports are sent by hosts when a general query is received, and a general query is sent within 60 seconds in normal scenarios. When the backup link starts forwarding, to achieve faster convergence of multicast data, the downstream device immediately sends proxy reports for all the learned groups on this port without waiting for a general query.

**Leaking IGMP Reports**

To achieve multicast traffic convergence with minimal loss, a redundant data path must be set up before the Flex Links active link goes down. This can be achieved by leaking only IGMP report packets on the Flex Links backup link. These leaked IGMP report messages are processed by upstream distribution routers, so multicast data traffic gets forwarded to the backup interface. Because all incoming traffic on the backup interface is dropped at the ingress of the access device, no duplicate multicast traffic is received by the host. When the Flex Links active link fails, the access device starts accepting traffic from the backup link immediately. The only disadvantage of this scheme is that it consumes bandwidth on the link between the distribution devices and on the backup link between the distribution and access devices. This feature is disabled by default and can be configured by using the `switchport backup interface interface-id multicast fast-convergence` command.

When this feature has been enabled at changeover, the device does not generate the proxy reports on the backup port, which became the forwarding port.

**MAC Address-Table Move Update**

The MAC address-table move update feature allows the device to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

*Figure 52: MAC Address-Table Move Update Example*

In the following figure, switch A is an access switch, and ports 1 and 2 on switch A are connected to uplink devices B and D through a Flex Links pair. Port 1 is forwarding traffic, and port 2 is in the backup state. Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC has been...
learned on port 3 of device C. Traffic from the server to the PC is forwarded from port 3 to port 1.

If the MAC address-table move update feature is not configured and port 1 goes down, port 2 starts forwarding traffic. However, for a short time, device C keeps forwarding traffic from the server to the PC through port 3, and the PC does not get the traffic because port 1 is down. If device C removes the MAC address of the PC on port 3 and relearns it on port 4, traffic can then be forwarded from the server to the PC through port 2.

If the MAC address-table move update feature is configured and enabled on the devices, and port 1 goes down, port 2 starts forwarding traffic from the PC to the server. The device sends a MAC address-table move update packet from port 2. Device C gets this packet on port 4 and immediately learns the MAC address of the PC on port 4, which reduces the reconvergence time.

You can configure the access device, device A, to send MAC address-table move update messages. You can also configure the uplink devices B, C, and D to get and process the MAC address-table move update messages. When device C gets a MAC address-table move update message from device A, device C learns the MAC address of the PC on port 4. Device C updates the MAC address table, including the forwarding table entry for the PC.

Device A does not need to wait for the MAC address-table update. The device detects a failure on port 1 and immediately starts forwarding server traffic from port 2, the new forwarding port. This change occurs in less than 100 milliseconds (ms). The PC is directly connected to device A, and the connection status does not change. Device A does not need to update the PC entry in the MAC address table.
Flex Links VLAN Load Balancing Configuration Guidelines

- For Flex Links VLAN load balancing, you must choose the preferred VLANs on the backup interface.
- You cannot configure a preemption mechanism and VLAN load balancing for the same Flex Links pair.

MAC Address-Table Move Update Configuration Guidelines

- You can enable and configure this feature on the access device to send the MAC address-table move updates.
- You can enable and configure this feature on the uplink devices to get the MAC address-table move updates.

Default Flex Links and MAC Address-Table Move Update Configuration

- Flex Links is not configured, and there are no backup interfaces defined.
- The preemption mode is off.
- The preemption delay is 35 seconds.
- The MAC address-table move update feature is not configured on the device.

How to Configure Flex Links and the MAC Address-Table Move Update Feature

Configuring Flex Links

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport backup interface interface-id
4. end

<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** interface interface-id  | Specifies the interface, and enters interface configuration mode. The interface can be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 24. |
| Example:                           |                                                                         |
| Device#interface gigabitethernet1/0/1 |                                                                         |

| **Step 3**                          | Configures a physical Layer 2 interface (or port channel), as part of a Flex Links pair with the interface. The MAC address-table move update VLAN is the lowest VLAN ID on the interface. Configure a physical Layer 2 interface (or port channel) and specifies the VLAN ID on the interface, which is used for sending the MAC address-table move update. When one link is forwarding traffic, the other interface is in standby mode. |
| Use one of the following:           |                                                                         |
| - switchport backup interface interface-id |                                                                         |
| - switchport backup interface interface-id mmu | primary vlan vlan-id |                                                                         |
| Example:                           |                                                                         |
| Device(config-if)# switchport backup interface gigabitethernet0/2 mmu primary vlan 2 |                                                                         |

| **Step 4** end                      | Returns to global configuration mode.                                   |
| Example:                           |                                                                         |
| Device(config-if)# end             |                                                                         |

| **Step 5** mac address-table move update transmit | Enables the access device to send MAC address-table move updates to other devices in the network if the primary link goes down and the device starts forwarding traffic through the standby link. Enter command mac address-table move update on the device, for MMU packets to update MAC tables. When the primary link comes back up, the MAC tables need to reconverge and this command will transmit the MMU, that will establish the behavior. |
| Example:                                |                                                                         |
| Device(config)# mac address-table move update transmit |                                                                         |

| **Step 6** end                      | Returns to privileged EXEC mode.                                       |
| Example:                           |                                                                         |
| Device(config)# end                 |                                                                         |
### Configuring a Device to Obtain and Process MAC Address-Table Move Update Messages

### Configuration Examples for Flex Links

#### Configuring Flex Links: Examples

This example shows how to verify the configuration after you configure an interface with a backup interface:

```bash
Device# show interface switchport backup

Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet1/0/1 GigabitEthernet1/0/2 Active Up/Backup Standby
```

This example shows how to verify the configuration after you configure the preemption mode as forced for a backup interface pair:

```bash
Device# show interface switchport backup detail

Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet1/0/211 GigabitEthernet1/0/2 Active Up/Backup Standby
Interface Pair : Gi1/0/1, Gi1/0/2
Preemption Mode : forced
Preemption Delay : 50 seconds
Bandwidth : 100000 Kbit (Gi1/0/1), 100000 Kbit (Gi1/0/2)
Mac Address Move Update Vlan : auto
```

#### Configuring VLAN Load Balancing on Flex Links: Examples

In the following example, VLANs 1 to 50, 60, and 100 to 120 are configured on the device:

```bash
Device(config)# interface gigabitethernet 2/0/6
Device(config-if)# switchport backup interface gigabitethernet 2/0/8 prefer vlan 60,100-120
```

When both interfaces are up, Gi2/0/8 forwards traffic for VLANs 60 and 100 to 120 and Gi2/0/6 forwards traffic for VLANs 1 to 50.

```bash
Device# show interfaces switchport backup

Switch Backup Interface Pairs:
Active Interface Backup Interface State
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mac address-table move update</td>
<td>Displays the MAC address-table move update information on the device.</td>
</tr>
</tbody>
</table>
When a Flex Links interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Links pair. In this example, if interface Gi2/0/6 goes down, Gi2/0/8 carries all VLANs of the Flex Links pair.

When a Flex Links interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi2/0/6 comes up, VLANs preferred on this interface are blocked on the peer interface Gi2/0/8 and forwarded on Gi2/0/6.

Configuring the MAC Address-Table Move Update: Examples

This example shows how to verify the configuration after you configure an access device to send MAC address-table move updates:

Device# show mac address-table move update
Configuring Multicast Fast Convergence with Flex Links Failover: Examples

These are configuration examples for learning the other Flex Links port as the mrouter port when Flex Links is configured on GigabitEthernet1/0/11 and GigabitEthernet1/0/12, and output for the `show interfaces switchport backup` command:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface GigabitEthernet1/0/11
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# switchport backup interface GigabitEthernet1/0/12
Device(config-if)# exit
Device(config)# interface GigabitEthernet1/0/12
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# end
Device# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet1/0/11 GigabitEthernet1/0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : Off
Bandwidth : 100000 Kbit (Gi1/0/11), 100000 Kbit (Gi1/0/12)
Mac Address Move Update Vlan : auto
```

This output shows a querier for VLANs 1 and 401, with their queries reaching the device through GigabitEthernet1/0/11:

```
Device# show ip igmp snooping querier
Vlan  IP Address  IGMP Version  Port
----------------------------------------
 1    1.1.1.1    v2           Gi1/0/11
401  41.41.41.1  v2           Gi1/0/11
```
This example is output for the `show ip igmp snooping mrouter` command for VLANs 1 and 401:

```
Device# show ip igmp snooping mrouter
Vlan ports
----- -----
1    Gi1/0/11(dynamic), Gi1/0/12(dynamic)
401  Gi1/0/11(dynamic), Gi1/0/12(dynamic)
```

Similarly, both Flex Links ports are part of learned groups. In this example, GigabitEthernet2/0/11 is a receiver/host in VLAN 1, which is interested in two multicast groups:

```
Device# show ip igmp snooping groups
Vlan Group Type Version Port List
-----------------------------------------------
1 228.1.5.1 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
1 228.1.5.2 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
```

When a host responds to the general query, the device forwards this report on all the mrouter ports. In this example, when a host sends a report for the group 228.1.5.1, it is forwarded only on GigabitEthernet1/0/11, because the backup port GigabitEthernet1/0/12 is blocked. When the active link, GigabitEthernet1/0/11, goes down, the backup port, GigabitEthernet1/0/12, begins forwarding.

As soon as this port starts forwarding, the device sends proxy reports for the groups 228.1.5.1 and 228.1.5.2 on behalf of the host. The upstream router learns the groups and starts forwarding multicast data. This is the default behavior of Flex Links. This behavior changes when the user configures fast convergence using the `switchport backup interface gigabitEthernet 1/0/12 multicast fast-convergence` command. This example shows turning on this feature:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface gigabitEthernet 1/0/11
Device(config-if)# switchport backup interface gigabitEthernet 1/0/12 multicast fast-convergence
Device(config-if)# exit
Device# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface Backup Interface State
-----------------------------------------------
GigabitEthernet1/0/11 GigabitEthernet1/0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : On
Bandwidth : 100000 Kbit (Gi1/0/11), 100000 Kbit (Gi1/0/12)
Mac Address Move Update Vlan : auto
```

This output shows a querier for VLAN 1 and 401 with their queries reaching the device through GigabitEthernet1/0/11:

```
Device# show ip igmp snooping querier
Vlan IP Address IGMP Version Port
--------------------------------
1 1.1.1.1  v2 Gi1/0/11
```
This is output for the `show ip igmp snooping mrouter` command for VLAN 1 and 401:

```
Device# show ip igmp snooping mrouter
Vlan ports
---- ----- 
  1   Gi1/0/11(dynamic), Gi1/0/12(dynamic)
  401 Gi1/0/11(dynamic), Gi1/0/12(dynamic)
```

Similarly, both the Flex Links ports are a part of the learned groups. In this example, GigabitEthernet2/0/11 is a receiver/host in VLAN 1, which is interested in two multicast groups:

```
Device# show ip igmp snooping groups
Vlan Group Type Version Port List
-----------------------------------------------------------------------
  1  228.1.5.1 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
  1  228.1.5.2 igmp v2 Gi1/0/11, Gi1/0/12, Gi2/0/11
```

Whenever a host responds to the general query, the device forwards this report on all the mrouter ports. When you turn on this feature through the command-line port, and when a report is forwarded by the device on GigabitEthernet1/0/11, it is also leaked to the backup port GigabitEthernet1/0/12. The upstream router learns the groups and starts forwarding multicast data, which is dropped at the ingress because GigabitEthernet1/0/12 is blocked. When the active link, GigabitEthernet1/0/11, goes down, the backup port, GigabitEthernet1/0/12, begins forwarding. You do not need to send any proxy reports as the multicast data is already being forwarded by the upstream router. By leaking reports to the backup port, a redundant multicast path has been set up, and the time taken for the multicast traffic convergence is very minimal.

CHAPTER 24

Configuring UniDirectional Link Detection

• Finding Feature Information, on page 439
• Restrictions for Configuring UDLD, on page 439
• Information About UDLD, on page 440
• How to Configure UDLD, on page 442
• Monitoring and Maintaining UDLD, on page 445
• Additional References for UDLD, on page 445
• Feature Information for UDLD, on page 446

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring UDLD

The following are restrictions for configuring UniDirectional Link Detection (UDLD):

• A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another device.

• When configuring the mode (normal or aggressive), make sure that the same mode is configured on both sides of the link.

Caution

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.
Information About UDLD

UniDirectional Link Detection (UDLD) is a Layer 2 protocol that enables devices connected through fiber-optic or twisted-pair Ethernet cables to monitor the physical configuration of the cables and detect when a unidirectional link exists. All connected devices must support UDLD for the protocol to successfully identify and disable unidirectional links. When UDLD detects a unidirectional link, it disables the affected port and alerts you. Unidirectional links can cause a variety of problems, including spanning-tree topology loops.

Modes of Operation

UDLD two modes of operation: normal (the default) and aggressive. In normal mode, UDLD can detect unidirectional links due to misconnected ports on fiber-optic connections. In aggressive mode, UDLD can also detect unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and to misconnected ports on fiber-optic links.

In normal and aggressive modes, UDLD works with the Layer 1 mechanisms to learn the physical status of a link. At Layer 1, autonegotiation takes care of physical signaling and fault detection. UDLD performs tasks that autonegotiation cannot perform, such as detecting the identities of neighbors and shutting down misconnected ports. When you enable both autonegotiation and UDLD, the Layer 1 and Layer 2 detections work together to prevent physical and logical unidirectional connections and the malfunctioning of other protocols.

A unidirectional link occurs whenever traffic sent by a local device is received by its neighbor but traffic from the neighbor is not received by the local device.

Normal Mode

In normal mode, UDLD detects a unidirectional link when fiber strands in a fiber-optic port are misconnected and the Layer 1 mechanisms do not detect this misconnection. If the ports are connected correctly but the traffic is one way, UDLD does not detect the unidirectional link because the Layer 1 mechanism, which is supposed to detect this condition, does not do so. In this case, the logical link is considered undetermined, and UDLD does not disable the port.

When UDLD is in normal mode, if one of the fiber strands in a pair is disconnected, as long as autonegotiation is active, the link does not stay up because the Layer 1 mechanisms detects a physical problem with the link. In this case, UDLD does not take any action and the logical link is considered undetermined.

Related Topics
- Enabling UDLD Globally, on page 442
- Enabling UDLD on an Interface, on page 444

Aggressive Mode

In aggressive mode, UDLD detects a unidirectional link by using the previous detection methods. UDLD in aggressive mode can also detect a unidirectional link on a point-to-point link on which no failure between the two devices is allowed. It can also detect a unidirectional link when one of these problems exists:

- On fiber-optic or twisted-pair links, one of the ports cannot send or receive traffic.
- On fiber-optic or twisted-pair links, one of the ports is down while the other is up.
- One of the fiber strands in the cable is disconnected.
In these cases, UDLD disables the affected port.

In a point-to-point link, UDLD hello packets can be considered as a heart beat whose presence guarantees the health of the link. Conversely, the loss of the heart beat means that the link must be shut down if it is not possible to reestablish a bidirectional link.

If both fiber strands in a cable are working normally from a Layer 1 perspective, UDLD in aggressive mode detects whether those fiber strands are connected correctly and whether traffic is flowing bidirectionally between the correct neighbors. This check cannot be performed by autonegotiation because autonegotiation operates at Layer 1.

Methods to Detect Unidirectional Links

UDLD operates by using two methods:
- Neighbor database maintenance
- Event-driven detection and echoing

Related Topics
- Enabling UDLD Globally, on page 442
- Enabling UDLD on an Interface, on page 444

Neighbor Database Maintenance

UDLD learns about other UDLD-capable neighbors by periodically sending a hello packet (also called an advertisement or probe) on every active port to keep each device informed about its neighbors.

When the device receives a hello message, it caches the information until the age time (hold time or time-to-live) expires. If the device receives a new hello message before an older cache entry ages, the device replaces the older entry with the new one.

Whenever a port is disabled and UDLD is running, whenever UDLD is disabled on a port, or whenever the device is reset, UDLD clears all existing cache entries for the ports affected by the configuration change. UDLD sends at least one message to inform the neighbors to flush the part of their caches affected by the status change. The message is intended to keep the caches synchronized.

Event-Driven Detection and Echoing

UDLD relies on echoing as its detection operation. Whenever a UDLD device learns about a new neighbor or receives a resynchronization request from an out-of-sync neighbor, it restarts the detection window on its side of the connection and sends echo messages in reply. Because this behavior is the same on all UDLD neighbors, the sender of the echoes expects to receive an echo in reply.

If the detection window ends and no valid reply message is received, the link might shut down, depending on the UDLD mode. When UDLD is in normal mode, the link might be considered undetermined and might not be shut down. When UDLD is in aggressive mode, the link is considered unidirectional, and the port is disabled.

UDLD Reset Options

If an interface becomes disabled by UDLD, you can use one of the following options to reset UDLD:

- The `udld reset` interface configuration command.
- The `shutdown` interface configuration command followed by the `no shutdown` interface configuration command restarts the disabled port.
- The `no udld {aggressive | enable}` global configuration command followed by the `udld {aggressive | enable}` global configuration command reenables the disabled ports.
- The `no udld port` interface configuration command followed by the `udld port [aggressive]` interface configuration command reenables the disabled fiber-optic port.
- The `errdisable recovery cause udld` global configuration command enables the timer to automatically recover from the UDLD error-disabled state, and the `errdisable recovery interval interval` global configuration command specifies the time to recover from the UDLD error-disabled state.

**Purpose**

- **configure terminal**: Enters global configuration mode.
- **interface interface-id**: Specifies the port to be enabled for UDLD, and enters interface configuration mode.
- **udld port [aggressive]**: UDLD is disabled by default.
  - `udld port`: Enables UDLD in normal mode on the specified port.
  - `udld port aggressive`: (Optional) Enables UDLD in aggressive mode on the specified port.

**Note**

Use the `no udld port` interface configuration command to disable UDLD on a specified fiber-optic port.

- Clearing Packet Counters, on page 461
- Debugging PPPoE Intermediate Agent, on page 461
- Troubleshooting Tips, on page 462
- Feature Information for Configuring the PPPoE Intermediate Agent, on page 463

Restrictions for PPPoE Intermediate Agent

PPPoE Intermediate Agent is not supported on routed interfaces.

Information about PPPoE Intermediate Agent

PPPoE Intermediate Agent (PPPoE IA) is placed between a subscriber and BRAS to help the service provider BRAS distinguish between end hosts connected over Ethernet to an access switch. On the access switch, PPPoE IA enables Subscriber Line Identification by appropriately tagging Ethernet frames of different users. (The tag contains specific information such as which subscriber is connected to the switch and VLAN.) PPPoE IA acts as mini security firewall between host and BRAS by intercepting all PPPoE Active Discovery (PAD) messages on a per-port per-VLAN basis. It provides specific security feature such as verifying the intercepted PAD message from untrusted port, performing per-port PAD message rate limiting, inserting and removing VSA Tags into and from PAD messages, respectively.

DSL Forum TR-101 [1] offers a means by which the PPPoE Discovery packets are tagged at the service provider's access switch with subscriber line specific information. The mechanism specifies using VSA of the PPPoE Discovery packets to add the line specific information at the switch. Even though you can perform Subscriber Line Identification (SLI) in another way (recreating virtual paths and circuits using stacked VLAN tags), DSL Forum 2004-071 [4] recommends the PPPoE Intermediate Agent mechanism. It cites lower provisioning costs and simpler co-ordination between OSS systems in charge of access switch and BRAS. PPPoE Intermediate Agent helps the service provider, BRAS, distinguish between end hosts connected over Ethernet to an access switch.
How to Configure PPPoE IA

Enabling PPPoE IA on a Switch

Note
By default, PPPoE IA is disabled globally.

Follow these steps to enable or disable PPPoE IA globally on the switch:

SUMMARY STEPS

1. enable
2. configure terminal
3. pppoe intermediate-agent

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# config t</td>
<td></td>
</tr>
<tr>
<td>Step 3 pppoe intermediate-agent</td>
<td>Enables PPPoE IA globally on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# pppoe intermediate-agent</td>
<td></td>
</tr>
</tbody>
</table>

Configuring the Access Node Identifier for PPPoE IA on a Switch

Follow these steps to set the Access Node Identifier of the switch.

Note
By default, access-node-id is not set.

SUMMARY STEPS

1. enable
2. configure terminal
3. pppoe intermediate-agent format-type access-node-id string word
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>

<td></td>
</tr>
</tbody>
</table>

*access-node-identifier string word* – ASCII string literal value for the access-node-identifier.

### Configuring the Identifier String, Option, and Delimiter for PPPoE IA on a Switch

This functionality overrides the default automatic generation of circuit-id by the system.

The options available are sp, sv, pv and spv denoting slot:port, slot-vlan, port-vlan, and slot-port-vlan combinations, respectively. Valid delimiters are #, ., ;, /, space.

The no form of this command without WORD, options, and delimiters, reverts to the default automatic generation of circuit-id.

This command does not affect the circuit ID configured explicitly per-interface or per-interface per-VLAN with the *pppoe intermediate-agent format-type circuit-id*.

Follow these steps to set an identifier string word with option spv delimited by “:”

### SUMMARY STEPS

1. enable
2. configure terminal
3. **pppoe intermediate-agent format-type identifier-string string word** option {sp | sv | pv | spv} delimiter {, | . | ; | / | #}

### DETAILED STEPS

<table>
<thead>
<tr>

<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# config t</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the Generic Error Message for PPPoE IA on a Switch

Follow these steps to configure a generic message of `packet_length>1484`:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **pppoe intermediate-agent format-type generic-error-message string**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# config terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> pppoe intermediate-agent format-type generic-error-message string</td>
<td>Sets the generic error message.</td>
</tr>
<tr>
<td>Example: Device(config)# pppoe intermediate-agent format-type generic-error-message string packet_length&gt;1484</td>
<td></td>
</tr>
</tbody>
</table>

### Enabling PPPoE IA on an Interface

Follow these steps to enable PPPoE IA on FastEthernet 3/1:
Before you begin

Note

Enabling PPPoE IA on an interface does not ensure that incoming packets are tagged. For this to happen, PPPoE IA must be enabled globally, and at least one interface that connects the switch to PPPoE server has a trusted PPPoE IA setting. Refer to the following section for details.

This functionality enables the PPPoE IA feature on an interface. The `pppoe intermediate-agent` command has an effect only if the PPPoE IA feature was enabled globally with this command. (You need to enable globally to activate PPPoE IA static ACL and on an interface for PPPoE IA processing of PPPoE discovery packets received on that interface.)

This setting applies to all frames passing through this interface, regardless of the VLAN they belong to. By default the PPPoE IA feature is disabled on all interfaces. You need to run this command on every interface that requires this feature.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `pppoe intermediate-agent`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# config terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Enter interface configuration mode and the physical interface identification.</td>
</tr>
<tr>
<td>Example: Device(config)interface FastEthernet 3/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> pppoe intermediate-agent</td>
<td>Enables PPPoE IA on the interface.</td>
</tr>
<tr>
<td>Example: Device(config-if)pppoe intermediate-agent</td>
<td></td>
</tr>
</tbody>
</table>
Configuring the PPPoE IA Trust Setting on an Interface

Interfaces that connect the switch to PPPoE server are configured as trusted. Interfaces that connect the switch to users (PPPoE clients) are untrusted.

Follow these steps to set FastEthernet interface 3/2 as trusted:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `pppoe intermediate-agent trust`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><em>Example:</em> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><em>Example:</em> Device&gt; config terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Enter interface configuration mode and the physical interface identification.</td>
</tr>
<tr>
<td><em>Example:</em> Device(config)interface FastEthernet 3/2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> pppoe intermediate-agent trust</td>
<td>Sets the trust configuration of an interface.</td>
</tr>
<tr>
<td><em>Example:</em> Device(config-if)pppoe intermediate-agent trust</td>
<td></td>
</tr>
</tbody>
</table>

Configuring PPPoE Intermediate Agent Rate Limiting Setting on an Interface

The parameter for rate limiting is the number of packets per second. If the incoming packet rate exceeds this value, the port shuts down.

Follow these steps to set a rate limit on an interface:

**SUMMARY STEPS**

1. `enable`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| `configure terminal` | Enters the global configuration mode. |
| Example:          |         |
| Device# config terminal |

| **Step 3**        |         |
| `interface interface-id` | Enters interface configuration mode and the physical interface identification. |
| Example:          |         |
| Device(config)interface FastEthernet 3/1 |

| **Step 4**        |         |
| `pppoe intermediate-agent limit rate number` | Limits the rate of the PPPoE Discovery packets arriving on an interface. |
| Example:          |         |
| Device(config-if)pppoe intermediate-agent limit rate 30 |

## Configuring PPPoE IA Vendor-tag Stripping on an Interface

### Note

Generally, you would configure vendor-tag stripping on an interfaces connected to the PPPoE server. If you configure stripping, incoming packets are stripped of their VSAs (which carry subscriber and line identification information). For this to happen, the PPPoE Intermediate agent must be enabled to make the `pppoe intermediate-agent vendor-tag strip` command effective, and the interface must be set to trust. In isolation, the command has no effect.

### Note

BRAS automatically strips the vendor-specific tag off of the PPPoE discovery packets before sending them downstream to the access switch. To operate with older BRAS which does not possess this capability, use the `pppoe intermediate-agent vendor-tag strip` command on the interface connecting the access switch to BRAS.

Follow these steps to enable vendor-tag stripping:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. pppoe intermediate-agent vendor-tag strip

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# config terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
<td>Enters interface configuration mode and the physical interface identification.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)interface FastEthernet 3/2</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>pppoe intermediate-agent vendor-tag strip</td>
<td>Enables vendor-tag stripping on PPPoE Discovery packets from PPPoE Server (or BRAS).</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)pppoe intermediate-agent vendor-tag strip</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring PPPoE Intermediate Agent Circuit-ID and Remote-ID on an Interface**

The `[no] pppoe intermediate-agent format-type circuit-id` command sets the circuit ID on an interface and overrides the automatic generation of circuit ID by the switch. Without this command, one default tag (for example, Ethernet x/y:z on the PPPoE to which the user is connected) inserted by an intermediate-agent.

The `[no] pppoe intermediate-agent format-type remote-id` command sets the remote ID on an interface.

This functionality causes tagging of PADI, PADR, and PADT packets (belonging to PPPoE Discovery stage) received on this physical interface with circuit ID or remote ID. This happens regardless s of their VLAN if PPPoE IA is not enabled for that VLAN.

You should use remote ID instead of circuit ID for subscriber line identification. You should configure this setting on every interface where you enabled PPPoE IA because it is not set by default. The default value for remote-id is the switch MAC address (for all physical interfaces).

Follow these steps to configure the circuit ID as root and the remote ID as granite:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. pppoe intermediate-agent format-type {circuit-id | remote-id} stringstring
**Enabling PPPoE IA for a Specific VLAN on an Interface**

**Note**

The `pppoe intermediate-agent` command in the vlan-range mode is not dependent on the same command in interface mode. The `pppoe intermediate-agent` command will take effect independently of the command in the interface mode. To make this happen, PPPoE IA must be enabled globally and at least one interface is connected to the PPPoE server.

Follow these steps to enable PPPoE IA on a specific VLAN:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. vlan-range {vlan-id |vlan-list|vlan-range}
5. pppoe intermediate-agent

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

</table>

### Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface

#### Note

The circuit-id and remote-id configurations in vlan-range mode are affected only if PPPoE IA is enabled globally and in vlan-range mode.

#### Note

The vlan-range mode commands configure PPPoE IA for either a specific VLAN, multiple VLANs, or VLAN range, depending on what you specify in the syntax.

In this section you set the circuit ID and remote ID for a specific VLAN on an interface. The command overrides the circuit ID and remote ID specified for this physical interface and the switch uses the WORD value to tag packets received on this VLAN. This parameter is unset by default.

The default value of remote-id is the switch MAC address (for all VLANs). You would set this parameter to encode subscriber-specific information.

Follow these steps to set the circuit-id and the remote-id:

**SUMMARY STEPS**

1. `interface interface-id`
2. `vlan-range vlan-range`
3. `pppoe intermediate-agent`
4. `pppoe intermediate-agent format-type {circuit-id | remote-id} stringstring`
## DETAILED STEPS

## Configuration Examples for PPPoE IA

### Example: Enabling PPPoE Intermediate Agent on a Switch

This example shows how to enable or disable PPPoE IA globally on the switch:

```plaintext
Device> enable
Device# configure terminal
Device(config)# pppoe intermediate-agent
```

### Example: Configuring the Access Node Identifier for PPPoE IA on a Switch

This example shows how to set an access node identifier of abcd:

```plaintext
Device> enable
Device# configure terminal
Device(config)# pppoe intermediate-agent format-type access-node-id string abcd
```

### Example: Configuring the Identifier String, Option, and Delimiter for PPPoE IA on a Switch

This example shows how to set an identifier string word with option spv delimited by “:”:

```plaintext
Device> enable
Device# configure terminal
```
Example: Configuring the Generic Error Message for PPPoE IA on a Switch

This example shows how to configure a generic message of packet_length>1484:

Device> enable
Device# configure terminal
Device(config)#pppoe intermediate-agent format-type generic-error-message string packet_length>1484

Example: Enabling PPPoE IA on an Interface

This example shows how to enable PPPoE IA on FastEthernet 3/1:

Device> enable
Device# configure terminal
Device(config) interface FastEthernet 3/1
Device(config-if)pppoe intermediate-agent

Example: Configuring the PPPoE Intermediate Agent Trust Setting on an Interface

The following example shows how to set FastEthernet interface 3/2 as trusted:

Device> enable
Device# configure terminal
Device(config) interface FastEthernet 3/2
Device(config-if)pppoe intermediate-agent trust

Example: Configuring PPPoE Intermediate Agent Rate Limiting Setting on an Interface

This example shows how to set a rate limit of 30 at FastEthernet 3/1:

Device> enable
Device# configure terminal
Device(config) interface FastEthernet 3/1
Device(config-if)pppoe intermediate-agent limit rate 30

Example: Configuring PPPoE IA Vendor-tag Stripping on an Interface

The following example shows how to enable stripping on FastEthernet 3/2:

Device> enable
Device# configure terminal
Device(config) interface FastEthernet 3/2
Device(config-if)pppoe intermediate-agent vendor-tag strip
Example: Configuring PPPoE IA Circuit-ID and Remote-ID on an Interface

The following example shows how to configure the circuit ID as root and the remote ID as granite:

Device> enable
Device# configure terminal
Device(config) interface FastEthernet 3/1
Device(config-if)pppoe intermediate-agent format-type circuit-id string root
Device(config-if)pppoe intermediate-agent format-type remote-id string granite

Example: Enabling PPPoE IA for a Specific VLAN on an Interface

The following example shows how to enable PPPOE IA on a specific VLAN:

Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5
Switch(config-if-vlan-range)# pppoe intermediate-agent

The following examples show how to enable PPPoE IA on a comma-separated VLAN list

Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5,6
Switch(config-if-vlan-range)# pppoe intermediate-agent

The following example shows how to enable PPPoE IA on a VLAN-range such as “x-y.”

Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5-9
Switch(config-if-vlan-range)# pppoe intermediate-agent

Example: Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface

The following example shows how to set the circuit-id to aaa and the remote-id as ccc on interface g3/7:

Switch(config)# int g3/7
Switch(config-if)# vlan-range 5
Switch(config-if)# pppoe intermediate-agent
Switch(config-if-vlan-range)# pppoe intermediate-agent format-type circuit-id string aaa
Switch(config-if-vlan-range)# pppoe intermediate-agent format-type remote-id string ccc

Displaying Configuration Parameters

The show pppoe intermediate-agent [ info | statistics][interface{interface}] command displays the various configuration parameters, statistics, and counters stored for PPPoE.

The info keyword appears if the PPPoE Intermediate Agent is enabled globally on an interface or on a VLAN (in an interface). It also informs you about the access node ID and generic error message of the switch, as well as the identifier string options, delimiter values configured globally, global circuit id and remote id configuration by using the following command:

Switch(config)# pppoe intermediate-agent format-type ?
access-node-id Access Node Identifier
circuit-id Circuit Id
The `info` keyword also displays the circuit ID, remote ID, trust and rate limit configurations, and vendor tag strip setting for all interfaces and for all VLANs pertaining to those interfaces. If any of these parameters are not set, they are not displayed.

The `statistics` option displays the number of PADI/PADR/PADT packets received, and the time the last packet was received on all interfaces and on all VLANs pertaining to those interfaces.

If `interface` is specified, information or statistics applicable only to that physical interface and pertaining VLANs is displayed.

Although PPoE IA is supported on PVLANs, be aware that no PVLAN association (primary and secondary VLAN mapping) information is displayed.

The PPoE IA show commands such as `show ppoe intermediate-agent info`, `show ppoe intermediate-agent info interface g3/7`, or `show ppoe intermediate-agent statistics` do not provide information about private VLAN association (primary and secondary VLAN mapping).

However, they do provide information about VLANs regardless of private or normal VLANs, as the following example illustrate:

```
Switch# show ppoe intermediate-agent info
   PPPOE Intermediate-Agent is enabled
PPPOE Intermediate-Agent trust/rate is configured on the following Interfaces:

  Interface IA Trusted Vsa Strip Rate limit (pps)
  ----------------------- -------- ------- --------- ----------------
  GigabitEthernet3/4 no yes yes unlimited PPPOE

PPPOE Intermediate-Agent is configured on following VLANs:
- 2-3

Switch# show ppoe intermediate-agent info interface g3/7
   Interface IA Trusted Vsa Strip Rate limit (pps)
  ----------------------- -------- ------- --------- ----------------
  GigabitEthernet3/7 yes no no unlimited oE Intermediate-Agent

PPPOE Intermediate-Agent is configured on following VLANs:
- 3

Switch# show ppoe intermediate-agent statistics
PPPOE IA Per-Port Statistics

Interface : GigabitEthernet3/7 Packets received
  All = 0
  PADI = 0 PADO = 0
  PADR = 0 PADS = 0
  PADT = 0
Packets dropped:
  Rate-limit exceeded = 0
  Server responses from untrusted ports = 0
  Client requests towards untrusted ports = 0
  Malformed PPoE Discovery packets = 0
```
The following statistics will be displayed when PPPoE IA feature is enabled on every VLAN interface and the PAD packet counters have a non-zero value.

```
switch# sh run int gi2/0/1
Building configuration...
Current configuration : 135 bytes
!
interface GigabitEthernet2/0/1
switchport mode trunk
pppoe intermediate-agent
vlan-range 200-201
pppoe intermediate-agent
end
```

```
Switch# show pppoe intermediate-agent statistics interface gi2/0/3
Interface: GigabitEthernet2/0/3
Packets received
All = 0
PADI = 0 PADO = 0
PADR = 0 PADS = 0
PADT = 0
Packets dropped:
Rate-limit exceeded = 0

Malformed PPPoE Discovery packets = 0
```

```
Switch# show pppoe intermediate-agent statistics interface gi2/0/3
Interface: GigabitEthernet2/0/1
Packets received
All = 50
PADI = 20 PADO = 0
PADR = 20 PADS = 0
PADT = 10
Packets dropped: Rate-limit exceeded = 0
Server responses from untrusted ports = 0
Client requests towards untrusted ports = 0
Malformed PPPoE Discovery packets = 0
Vlan 200: Packets received PADI = 2 PADO = 0 PADR = 2 PADS = 0 PADT = 1
Vlan 201: Packets received PADI = 2 PADO = 0 PADR = 2 PADS = 0 PADT = 1
```

### Clearing Packet Counters

This section illustrates how to clear packet counters on all interfaces (per-port and per-port-per-VLAN).

The following example illustrates how to do this:

```
Switch# clear pppoe intermediate-agent statistics
```

Issuing of the above command clears the counters for all PPPoE discovery packets (PADI, PADO, PADR, PADS, PADT) received on DUT.

### Debugging PPPoE Intermediate Agent

The **debug pppoe intermediate-agent [packet | event | all]** command enables you to display useful PPPoE information that assists in debugging. This command is disabled by default.

The **packet** option of the command displays the contents of a packet received in the software: source and destination MAC address of Ethernet frame, code, version and type of PPPoE Discovery packet and a list of TAGs present.
The `event` option of the command echoes important messages (interface state change to errdisable due to PPPoE discovery packets entering at a rate exceeding the configured limit). It is the only event shown by the `debug pppoe intermediate-agent event` command.

The `all` option enables both package and event options.

The following example illustrates how to enter the debug command with the packet option:

```
Switch# debug pppoe intermediate-agent packet
PPPOE IA Packet debugging is on
*Sep 2 06:12:56.133: PPPOE_IA: Process new PPPoE packet, Message type: PADI, input interface: 
Gi3/7, vlan : 2 MAC da: ffff.ffff.ffff, MAC sa: aabb.cc00.0000
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface
(GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface
(GigabitEthernet3/8)
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADO, input interface: 
Gi3/4, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface
(GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADO, input interface: 
Gi3/8, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: aabb.cc80.0000
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface
(GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADR, input interface: 
Gi3/7, vlan : 2 MAC da: 001d.e64c.6512, MAC sa: aabb.cc00.0000
*Sep 2 06:12:56.145: PPPOE_IA: received new PPPOE packet from input interface
(GigabitEthernet3/4)
*Sep 2 06:12:56.145: PPPOE_IA: Process new PPPoE packet, Message type: PAD, input interface: 
Gi3/4, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
```

The following example illustrates how to enter the debug command with the event option:

```
Switch# debug radius
*Jul 30 19:00:10.254: %PPPOE_IA-4-PPPOE_IA_ERRDISABLE_WARNING: PPPOE IA received 5 PPPoE packets on interface Gi3/7
*Jul 30 19:00:10.254: %PPPOE_IA-4-PPPOE_IA_RATE_LIMIT_EXCEEDED: The interface Gi3/7 is receiving more than the threshold set
*Jul 30 19:00:10.394: %PM-4-ERR_DISABLE: detected on Gi3/7, putting Gi3/7 in err-disable stat
```

### Troubleshooting Tips

When the `radius-server attribute 31 remote-id` global configuration command is entered in the PPPoE Agent Remote-ID Tag and DSL Line Characteristics feature configuration on the BRAS, the `debug radius` privileged EXEC command can be used to generate a report that includes information about the incoming access interface, where discovery frames are received, and about the session being established in PPPoE extended NAS-Port format (format d)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Flexible NetFlow

• Flexible NetFlow is supported on the Catalyst 2960-X Switch and the Catalyst 2960-XR Switch with a Cisco ONE for Access license. Catalyst 2960-XR is not stackable with the Catalyst 2960-X platform.

• One of the following must be enabled on your device and on any interfaces on which you want to enable Flexible NetFlow: Cisco Express Forwarding or distributed Cisco Express Forwarding.

• The targets for attaching a NetFlow monitor are the following:

  • Port—Monitor attachment is only supported on physical interfaces and not on logical interfaces, such as EtherChannels. The physical interface could be a routed port or a switched port.

  • VLAN—Monitor attachment is supported on VLAN interfaces only (SVI) and not on a Layer 2 VLAN.
You are familiar with the Flexible NetFlow key fields as they are defined in the following commands:

- **match datalink**—Datalink (layer2) fields
- **match ipv4**—IPv4 fields
- **match ipv6**—IPv6 fields
- **match transport**—Transport layer fields

You are familiar with the Flexible NetFlow non key fields as they are defined in the following commands:

- **collect counter**—Counter fields
- **collect flow**—Flow identifying fields
- **collect interface**—Interface fields
- **collect timestamp**—Timestamp fields
- **collect transport**—Transport layer fields

### Restrictions for Flexible NetFlow

The following restrictions apply to Flexible NetFlow and Flexible NetFlow Lite:

#### General Restrictions:

- InterSwitch Link (ISL) is not supported.
- Policy-based NetFlow is not supported.
- Cisco TrustSec monitoring is not supported.
- Access control lists (ACL)-based NetFlow is not supported.
- Only NetFlow Version 9 is supported for Flexible NetFlow exporter using the `export-protocol` command option.
- NetFlow Version 5 is not supported.

#### Flow Record Restrictions:

- When a flow monitor has configured the **collect interface output** command as the collect field in the flow record, the field will return a value of **NULL** when a flow gets created for any of the following addresses:
  - L2 broadcast and multicast
  - L3 broadcast and multicast
  - L2 unknown destination.

When a flow monitor has the collect interface output configured as the collect field in the flow record, the output interface is detected based on the destination IP address on the device. For the different flow monitors, you must configure the following commands:
• IPv4 flow monitor--Configure the `match ip destination address` command.
• IPv6 flow monitor--Configure the `match ipv6 destination address` command.
• Datalink flow monitor--Configure the `match datalink mac output` command.

• Predefined flow records are not supported.

Monitor Restrictions:
• Monitor attachment is only supported in the ingress direction.
• One monitor per interface is supported, although multiple exporters per interface are supported.
• Only permanent and normal cache is supported for the monitor; immediate cache is not supported.
• Changing any monitor parameter will not be supported when it is applied on any of the interfaces or VLANs.
• When both the port and VLANs have monitors attached, then VLAN monitor will overwrite the port monitor for traffic coming on the port.
• Flow monitor type and traffic type (type means IPv4, IPv6, and data link) should be same for the flows to be created.
• You cannot attach an IP and a port-based monitor to an interface. A 48-port device supports a maximum of 48 monitors (IP or port-based) and for 256 SVIs, you can configure up to 256 monitors (IP or port-based).
• When running the `show flow monitor flow_name cache` command, the device displays cache information from an earlier switch software version (Catalyst 2960-S) with all fields entered as zero. Ignore these fields, as they are inapplicable to the switch.

Sampler Restrictions:
• For both port and VLANs, a total of only 4 samplers (random or deterministic) are supported on the device.  
  
• The sampling minimum rate for both modes is 1 out of 32 flows, and the sampling maximum rate for both modes is 1 out of 1022 flows.

• Use the `ip flow monitor monitor_name sampler sampler_name input` command to associate a sample with a monitor while attaching it to an interface.

• When you attach a monitor using a deterministic sampler, every attachment with the same sampler uses one new free sampler from the switch (hardware) out of the 4 available samplers. You are not allowed to attach a monitor with any sampler, beyond 4 attachments.  

  When you attach a monitor using a random sampler, only the first attachment uses a new sampler from the switch (hardware). The remainder of all of the attachments using the same sampler, share the same sampler.

  Because of this behavior, when using a deterministic sampler, you can always make sure that the correct number of flows are sampled by comparing the sampling rate and what the device sends. If the same random sampler is used with multiple interfaces, flows from any interface can always be sampled, and flows from other interfaces can always be skipped.

Stacking Restrictions:
Each device in a stack (hardware) can support the creation of a maximum of 16,000 flows at any time. But as the flows are periodically pushed to the software cache, the software cache can hold a much larger amount of flows (1048 Kb flows). From the hardware flow cache, every 20 seconds (termed as poll timer), 200 flows (termed as poll entries) are pushed to software.

- Use the `remote command all show platform hulc-fnf poll` command to report on the current NetFlow polling parameters of each switch.
- Use the `show platform hulc-fnf poll` command to report on the current NetFlow polling parameters of the master switch.
- Network flows and statistics are collected at the line rate.

### Information About Flexible Netflow

#### Flexible NetFlow Overview

Flexible NetFlow uses flows to provide statistics for accounting, network monitoring, and network planning. A flow is a unidirectional stream of packets that arrives on a source interface and has the same values for the keys. A key is an identified value for a field within the packet. You create a flow using a flow record to define the unique keys for your flow.

The device supports the Flexible NetFlow feature that enables enhanced network anomalies and security detection. Flexible NetFlow allows you to define an optimal flow record for a particular application by selecting the keys from a large collection of predefined fields.

All key values must match for the packet to count in a given flow. A flow might gather other fields of interest, depending on the export record version that you configure. Flows are stored in the Flexible NetFlow cache.

You can export the data that Flexible NetFlow gathers for your flow by using an exporter and export this data to a remote system such as a Flexible NetFlow collector. The Flexible NetFlow collector can use an IPv4 address.

You define the size of the data that you want to collect for a flow using a monitor. The monitor combines the flow record and exporter with the Flexible NetFlow cache information.

#### Original NetFlow and Benefits of Flexible NetFlow

Flexible NetFlow allows the flow to be user defined. The benefits of Flexible NetFlow include:

- High-capacity flow recognition, including scalability and aggregation of flow information.
- Enhanced flow infrastructure for security monitoring and dDoS detection and identification.
- New information from packets to adapt flow information to a particular service or operation in the network. The flow information available will be customizable by Flexible NetFlow users.
- A comprehensive IP accounting feature that can be used to replace many accounting features, such as IP accounting, Border Gateway Protocol (BGP) Policy Accounting, and persistent caches.
Flexible NetFlow allows you to understand network behavior with more efficiency, with specific flow information tailored for various services used in the network. The following are some example applications for a Flexible NetFlow feature:

- Flexible NetFlow enhances Cisco NetFlow as a security monitoring tool. For instance, new flow keys can be defined for packet length or MAC address, allowing users to search for a specific type of attack in the network.

- Flexible NetFlow allows you to quickly identify how much application traffic is being sent between hosts by specifically tracking TCP or UDP applications by the class of service (CoS) in the packets.

- The accounting of traffic entering a Multiprotocol Label Switching (MPLS) or IP core network and its destination for each next hop per class of service. This capability allows the building of an edge-to-edge traffic matrix.

The figure below is an example of how Flexible NetFlow might be deployed in a network.

**Figure 53: Typical Deployment for Flexible NetFlow**

---

**Flexible NetFlow Components**

Flexible NetFlow consists of components that can be used together in several variations to perform traffic analysis and data export. The user-defined flow records and the component structure of Flexible NetFlow facilitates the creation of various configurations for traffic analysis and data export on a networking device with a minimum number of configuration commands. Each flow monitor can have a unique combination of flow record, flow exporter, and cache type. If you change a parameter such as the destination IP address for a flow exporter, it is automatically changed for all the flow monitors that use the flow exporter. The same flow monitor can be used in conjunction with different flow samplers to sample the same type of network traffic at different rates on different interfaces. The following sections provide more information on Flexible NetFlow components:

**Flow Records**

In Flexible NetFlow a combination of key and nonkey fields is called a record. Flexible NetFlow records are assigned to Flexible NetFlow flow monitors to define the cache that is used for storing flow data.

A flow record defines the keys that Flexible NetFlow uses to identify packets in the flow, as well as other fields of interest that Flexible NetFlow gathers for the flow. You can define a flow record with any combination
of keys and fields of interest. The device supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 64-bit packet or byte counters. The device enables the following match fields as the defaults when you create a flow record:

- match datalink—Layer 2 attributes
- match ipv4—IPv4 attributes
- match ipv6—IPv6 attributes
- match transport—Transport layer fields
- match wireless—Wireless fields

**User-Defined Records**

Flexible NetFlow enables you to define your own records for a Flexible NetFlow flow monitor cache by specifying the key and nonkey fields to customize the data collection to your specific requirements. When you define your own records for a Flexible NetFlow flow monitor cache, they are referred to as *user-defined records*. The values in nonkey fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a nonkey field does not create a new flow. In most cases the values for nonkey fields are taken from only the first packet in the flow. Flexible NetFlow enables you to capture counter values such as the number of bytes and packets in a flow as nonkey fields.

Flexible NetFlow adds a new Version 9 export format field type for the header and packet section types. Flexible NetFlow will communicate to the NetFlow collector the configured section sizes in the corresponding Version 9 export template fields. The payload sections will have a corresponding length field that can be used to collect the actual size of the collected section.

**Flow Exporters**

Flow exporters export the data in the flow monitor cache to a remote system, such as a server running NetFlow collector, for analysis and storage. Flow exporters are created as separate entities in the configuration. Flow exporters are assigned to flow monitors to provide data export capability for the flow monitors. You can create several flow exporters and assign them to one or more flow monitors to provide several export destinations. You can create one flow exporter and apply it to several flow monitors.

**NetFlow Data Export Format Version 9**

The basic output of NetFlow is a flow record. Several different formats for flow records have evolved as NetFlow has matured. The most recent evolution of the NetFlow export format is known as Version 9. The distinguishing feature of the NetFlow Version 9 export format is that it is template-based. Templates provide an extensible design to the record format, a feature that should allow future enhancements to NetFlow services without requiring concurrent changes to the basic flow-record format. Using templates provides several key benefits:

- Third-party business partners who produce applications that provide collector or display services for NetFlow do not have to recompile their applications each time a new NetFlow feature is added. Instead, they should be able to use an external data file that documents the known template formats.
- New features can be added to NetFlow quickly without breaking current implementations.
- NetFlow is “future-proofed” against new or developing protocols because the Version 9 format can be adapted to provide support for them.
The Version 9 export format consists of a packet header followed by one or more template flow or data flow sets. A template flow set provides a description of the fields that will be present in future data flow sets. These data flow sets may occur later within the same export packet or in subsequent export packets. Template flow and data flow sets can be intermingled within a single export packet, as illustrated in the figure below.

**Figure 54: Version 9 Export Packet**

NetFlow Version 9 will periodically export the template data so the NetFlow collector will understand what data is to be sent and also export the data flow set for the template. The key advantage to Flexible NetFlow is that the user configures a flow record, which is effectively converted to a Version 9 template and then forwarded to the collector. The figure below is a detailed example of the NetFlow Version 9 export format, including the header, template flow, and data flow sets.

**Figure 55: Detailed Example of the NetFlow Version 9 Export Format**

**Flow Monitors**

Flow monitors are the Flexible NetFlow component that is applied to interfaces to perform network traffic monitoring.
Flow data is collected from the network traffic and added to the flow monitor cache during the monitoring process based on the key and nonkey fields in the flow record.

Flexible NetFlow can be used to perform different types of analysis on the same traffic. In the figure below, packet 1 is analyzed using a record designed for standard traffic analysis on the input interface and a record designed for security analysis on the output interface.

*Figure 56: Example of Using Two Flow Monitors to Analyze the Same Traffic*

```

The figure below shows a more complex example of how you can apply different types of flow monitors with custom records.

*Figure 57: Complex Example of Using Multiple Types of Flow Monitors with Custom Records*
Normal

The default cache type is “normal”. In this mode, the entries in the cache are aged out according to the timeout active and timeout inactive settings. When a cache entry is aged out, it is removed from the cache and exported via any exporters configured.

Flow Samplers

Flow samplers are created as separate components in a router’s configuration. Flow samplers are used to reduce the load on the device that is running Flexible NetFlow by limiting the number of packets that are selected for analysis.

Samplers use random sampling techniques (modes); that is, a randomly selected sampling position is used each time a sample is taken.

Flow sampling exchanges monitoring accuracy for router performance. When you apply a sampler to a flow monitor, the overhead load on the router of running the flow monitor is reduced because the number of packets that the flow monitor must analyze is reduced. The reduction in the number of packets that are analyzed by the flow monitor causes a corresponding reduction in the accuracy of the information stored in the flow monitor’s cache.

Samplers are combined with flow monitors when they are applied to an interface with the `ip flow monitor` command.

Supported Flexible NetFlow Fields

The following tables provide a consolidated list of supported fields in Flexible NetFlow (FNF) for various traffic types and traffic direction.

<table>
<thead>
<tr>
<th>Field</th>
<th>Layer 2 In</th>
<th>Layer 2 Out</th>
<th>IPv4 In</th>
<th>IPv4 Out</th>
<th>IPv6 In</th>
<th>IPv6 Out</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key or Collect Fields</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Interface input</td>
<td>Yes</td>
<td>—</td>
<td>Yes</td>
<td>—</td>
<td>Yes</td>
<td>—</td>
<td>If you apply a flow monitor in the input direction:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Use the <code>match</code> keyword and use the input interface as a key field.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Use the <code>collect</code> keyword and use the output interface as a collect field. This field will be present in the exported records but with a value of 0.</td>
</tr>
</tbody>
</table>

Note: If the packet has a VLAN field, then that length is not accounted for.
If you apply a flow monitor in the output direction:

- Use the `match` keyword and use the output interface as a key field.
- Use the `collect` keyword and use the input interface as a collect field. This field will be present in the exported records but with a value of 0.

### Default Settings

The following table lists the Flexible NetFlow default settings for the device.

**Table 49: Default Flexible NetFlow Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow active timeout</td>
<td>1800 seconds</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The default value for this setting may be too high for your specific Flexible NetFlow configuration. You may want to consider changing it to a lower value of 180 or 300 seconds.</td>
</tr>
<tr>
<td>Flow timeout inactive</td>
<td>Enabled, 30 seconds</td>
</tr>
<tr>
<td>Flow update timeout</td>
<td>1800 seconds</td>
</tr>
<tr>
<td>Default cache size</td>
<td>16640 bits</td>
</tr>
</tbody>
</table>
In Cisco IOS Release 15.2(5)E1, Flexible NetFlow polling was changed from 200 entries every 20 seconds to 2000 entries every 5 seconds. Based on this change, the current flow count will reflect the actual hardware flow count, and continuously active flows will experience active timeout. All flows will be exported as per the configured timeout values.

How to Configure Flexible Netflow

To configure Flexible Netflow, follow these general steps:

1. Create a flow record by specifying keys and non-key fields to the flow.
2. Create an optional flow exporter by specifying the protocol and transport destination port, destination, and other parameters.
3. Create a flow monitor based on the flow record and flow exporter.
4. Create an optional sampler.
5. Apply the flow monitor to a Layer 2 port, Layer 3 port, or VLAN.

Creating a Flow Record

Perform this task to configure a customized flow record.

Customized flow records are used to analyze traffic data for a specific purpose. A customized flow record must have at least one `match` criterion for use as the key field and typically has at least one `collect` criterion for use as a nonkey field.

There are hundreds of possible permutations of customized flow records. This task shows the steps that are used to create one of the possible permutations. Modify the steps in this task as appropriate to create a customized flow record for your requirements.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `flow record record-name`
4. `description description`
5. `match {ip | ipv6} {destination | source} address`
6. Repeat Step 5 as required to configure additional key fields for the record.
7. `• collect counter {bytes [exported | long] | flows [exported] | packets} [ exported | long]`
   `• or`
   `collect timestamp sysuptime {first | last}`
8. Repeat the above step as required to configure additional nonkey fields for the record.
9. `end`
10. `show flow record record-name`
11. `show running-config flow record record-name`
# DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> flow record record-name</td>
<td>Creates a flow record and enters Flexible NetFlow flow record configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# flow record FLOW-RECORD-1</td>
<td>• This command also allows you to modify an existing flow record.</td>
</tr>
<tr>
<td><strong>Step 4</strong> description description</td>
<td>(Optional) Creates a description for the flow record.</td>
</tr>
<tr>
<td>Example: Device(config-flow-record)# description Used for basic traffic analysis</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> match {ip</td>
<td>ipv6} {destination</td>
</tr>
<tr>
<td>Example: Device(config-flow-record)# match ipv4 destination address</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> Repeat Step 5 as required to configure additional key fields for the record.</td>
<td>—</td>
</tr>
<tr>
<td><strong>Step 7</strong> • collect counter {bytes [exported</td>
<td>long]</td>
</tr>
<tr>
<td>or collect timestamp sysuptime {first</td>
<td>last}</td>
</tr>
<tr>
<td>Example: Device(config-flow-record)# collect counter bytes</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> Repeat the above step as required to configure additional nonkey fields for the record.</td>
<td>—</td>
</tr>
<tr>
<td><strong>Step 9</strong> end</td>
<td>Exits Flexible NetFlow flow record configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<tbody>
<tr>
<td>Device(config-flow-record)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Step 10

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show flow record record-name</td>
<td>(Optional) Displays the current status of the specified flow record.</td>
</tr>
</tbody>
</table>

**Example:**

Device# show flow record FLOW_RECORD-1

### Step 11

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show running-config flow record record-name</td>
<td>(Optional) Displays the configuration of the specified flow record.</td>
</tr>
</tbody>
</table>

**Example:**

Device# show running-config flow record FLOW_RECORD-1

---

**Creating a Flow Exporter**

You can create a flow export to define the export parameters for a flow.

---

**Note**

Each flow exporter supports only one destination. If you want to export the data to multiple destinations, you must configure multiple flow exporters and assign them to the flow monitor.

You can export to a destination using IPv4 address.

---

**SUMMARY STEPS**

1. configure terminal
2. flow exporter name
3. description string
4. destination {ipv4-address} [ vrf vrf-name ]
5. dscp value
6. source { source type }
7. transport udp number
8. ttl seconds
9. export-protocol { netflow-v9 }
10. end
11. show flow exporter [ name record-name ]
12. copy running-config startup-config

---

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```text
Device(config-flow-record)# configure terminal
```

Device# show running-config flow record FLOW_RECORD-1

---

**Creating a Flow Exporter**

You can create a flow export to define the export parameters for a flow.

---

**Note**

Each flow exporter supports only one destination. If you want to export the data to multiple destinations, you must configure multiple flow exporters and assign them to the flow monitor.

You can export to a destination using IPv4 address.

---

**SUMMARY STEPS**

1. configure terminal
2. flow exporter name
3. description string
4. destination {ipv4-address} [ vrf vrf-name ]
5. dscp value
6. source { source type }
7. transport udp number
8. ttl seconds
9. export-protocol { netflow-v9 }
10. end
11. show flow exporter [ name record-name ]
12. copy running-config startup-config

---

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```text
Device(config-flow-record)# configure terminal
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**  
**flow exporter name**  
**Example:**  
Device(config)# `flow exporter ExportTest`  
Creates a flow exporter and enters flow exporter configuration mode.

**Step 3**  
**description string**  
**Example:**  
Device(config-flow-exporter)# `description ExportV9`  
(Optional) Describes this flow record as a maximum 63-character string.

**Step 4**  
**destination {ipv4-address} [vrf vrf-name]**  
**Example:**  
Device(config-flow-exporter)# `destination 192.0.2.1 (IPv4 destination)`  
Sets the IPv4 destination address or hostname for this exporter.

**Step 5**  
**dscp value**  
**Example:**  
Device(config-flow-exporter)# `dscp 0`  
(Optional) Specifies the differentiated services codepoint value. The range is from 0 to 63. The default is 0.

**Step 6**  
**source {source type}**  
**Example:**  
Device(config-flow-exporter)# `source gigabitEthernet1/0/1`  
(Optional) Specifies the interface to use to reach the NetFlow collector at the configured destination. The following interfaces can be configured as source: \  

**Step 7**  
**transport udp number**  
**Example:**  
Device(config-flow-exporter)# `transport udp 200`  
(Optional) Specifies the UDP port to use to reach the NetFlow collector. The range is from 1 to 65536.

**Step 8**  
**ttl seconds**  
**Example:**  
Device(config-flow-exporter)# `ttl 210`  
(Optional) Configures the time-to-live (TTL) value for datagrams sent by the exporter. The range is from 1 to 255 seconds. The default is 255.
### Creating a Flow Monitor

Perform this required task to create a customized flow monitor.

Each flow monitor has a separate cache assigned to it. Each flow monitor requires a record to define the contents and layout of its cache entries. These record formats can be a user-defined format. An advanced user can create a customized format using the `flow record` command.

#### Before you begin

If you want to use a customized record, you must create the customized record before you can perform this task. If you want to add a flow exporter to the flow monitor for data export, you must create the exporter before you can complete this task.

**Note** You must use the `no ip flow monitor` command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the `record` command on the flow monitor.
SUMMARY STEPS

1. enable
2. configure terminal
3. flow monitor monitor-name
4. description description
5. record {record-name}
6. cache {entries number | timeout {active | inactive | update} seconds | { normal }}
7. Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.
8. exporter exporter-name
9. end
10. show flow monitor [(name] monitor-name [cache [format {csv | record | table}]]]
11. show running-config flow monitor monitor-name
12. copy running-config startup-config

DETAILED STEPS

<table>

<td>---------</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.</td>
</tr>
</tbody>
</table>
| **Step 8** | exporter exporter-name  
Example: Device(config-flow-monitor)# exporter EXPORTER-1  |
| **Step 9** | end  
Example: Device(config-flow-monitor)# end  |
| **Step 10** | show flow monitor [[name] monitor-name [cache [format {csv | record | table} ]] ]  
Example: Device# show flow monitor FLOW-MONITOR-2 cache  |
| **Step 11** | show running-config flow monitor monitor-name  
Example: Device# show running-config flow monitor FLOW_MONITOR-1  |
| **Step 12** | copy running-config startup-config  
Example: Device# copy running-config startup-config  |

**Note**  
Although visible in the command line help, the entries keyword and inactive and update timeouts are not supported.
Creating a Sampler

You can create a sampler to define the NetFlow sampling rate for a flow.

**SUMMARY STEPS**

1. configure terminal
2. sampler name
3. description string
4. mode \{deterministic \{m - n\} | random \{m - n\}\}
5. end
6. show sampler \[name\]
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>sampler name</td>
<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Device(config)# sampler SampleTest</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>

<td><strong>Example:</strong></td>
</tr>
<tr>
<td>Device(config-flow-sampler)# description samples</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>mode {deterministic {m - n}</td>
<td>random {m - n}}</td>
</tr>
<tr>
<td>Device(config-flow-sampler)# mode random 1 out-of 1022</td>
<td>You can configure either a random or deterministic sampler to an interface. Select (m) packets out of an (n) packet window. The window size to select packets from ranges from 32 to 1022.</td>
</tr>
<tr>
<td>Note the following when configuring a sampler to an interface:</td>
<td></td>
</tr>
<tr>
<td>• When you attach a monitor using deterministic sampler (for example, s1), every attachment with same sampler s1 uses one new free sampler from the device (hardware) out of 4 available samplers. Therefore, beyond 4 attachments, you are not allowed to attach a monitor with any sampler.</td>
<td></td>
</tr>
</tbody>
</table>
Applying a Flow to an Interface

You can apply a flow monitor and an optional sampler to an interface.

SUMMARY STEPS

1. configure terminal
2. interface type
3. (ip flow monitor | ipv6 flow monitor) name [ sampler name ] [ input | output ]
4. end
5. show flow interface [ interface-type number ]
6. copy running-config startup-config
## DETAILED STEPS

</tbody>
</table>
### Configuring Layer 2 NetFlow

You can define Layer 2 keys in Flexible NetFlow records that you can use to capture flows in Layer 2 interfaces.

**SUMMARY STEPS**

1. `configure terminal`
2. `flow record name`
3. `match datalink {ethertype | mac {destination {address input} | source {address input}}}`
4. `match {ipv4 {destination | protocol | source | tos} | ipv6 {destination | flow-label | protocol | source | traffic-class} | transport {destination-port | source-port}}`
5. `end`
6. `show flow record [name]`
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>flow record name</td>
<td>Enters flow record configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# flow record L2_record \nDevice(config-flow-record)#</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>match datalink {ethertype</td>
<td>mac {destination {address input}</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-flow-record)# match datalink mac source address input \nDevice(config-flow-record)# match datalink mac destination address input</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>match {ipv4 {destination</td>
<td>protocol</td>
</tr>
</tbody>
</table>

**Note** When a datalink flow monitor is assigned to an interface or VLAN record, it only creates flows for non-IPv4 or non-IPv6 traffic.
Monitoring Flexible NetFlow

The commands in the following table can be used to monitor Flexible NetFlow.

Table 50: Flexible NetFlow Monitoring Commands

<table>
<thead>
<tr>

<tr>
<td><code>show wlan wlan-name</code></td>
<td>Displays the WLAN configured on the device.</td>
</tr>
</tbody>
</table>

### Configuration Examples for Flexible NetFlow

**Example: Configuring a Flow**

This example shows how to create a flow and apply it to an interface:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Device(config)# flow export export1
Device(config-flow-exporter)# destination 10.0.101.254
Device(config-flow-exporter)# transport udp 2055
Device(config-flow-exporter)# exit
Device(config)# flow record record1
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# match ipv4 protocol
Device(config-flow-record)# match transport source-port
Device(config-flow-record)# match transport destination-port

Device(config-flow-record)# collect counter byte long
Device(config-flow-record)# collect counter packet long
Device(config-flow-record)# collect timestamp absolute first
Device(config-flow-record)# collect timestamp absolute last
Device(config-flow-record)# exit
Device(config)# flow monitor monitor1
Device(config-flow-monitor)# record record1
Device(config-flow-monitor)# exporter export1
Device(config-flow-monitor)# exit
Device(config)# interface tenGigabitEthernet 1/0/1
Device(config-if)# ip flow monitor monitor1 input
Device(config-if)# end
```

Feature Information for Flexible NetFlow

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for OpenFlow

The Prerequisites for OpenFlow are as follows:

- A Cisco device and its corresponding operating system that supports the installation of OpenFlow.

  Refer to the corresponding release notes for information about which operating system release supports the features and necessary infrastructure.

  Note: Release notes for Cisco Catalyst 2960X/XR Series Switches

- A controller installed on a connected server.
Table 52: Controller Support

</tr>
<tr>
<td>OpenFlow 1.3</td>
<td>Ixia, Cisco Open SDN Controller, or OpenDaylight</td>
</tr>
</tbody>
</table>

Restrictions for OpenFlow

The Restrictions for OpenFlow are as listed below:

- OpenFlow supports only a subset of OpenFlow 1.3 functions. For more information, see the Cisco OpenFlow Feature Support section.
- You cannot configure more than one OpenFlow logical switch. The logical switch ID has a value of 1.
- OpenFlow hybrid model (ships-in-the-night) is supported. VLANs configured for OpenFlow logical switch ports should not overlap with regular device interfaces.
- The OpenFlow logical switch ports must not be configured in a mode other than trunk port.
- You cannot configure a bridge domain, Virtual LANs, virtual routing and forwarding (VRF) or port-channel interfaces on an OpenFlow logical switch. You can only configure physical interfaces.
- You cannot make additional configurations to an interface configured as a port of OpenFlow Logical Switch without removing the configuration as a port of OpenFlow Logical Switch.
- In stack scenarios, consisting of master / member switches, whenever the master switch goes down, all current configuration will exist in newly elected master switch. However, the flows have to program again from the controller.
- MIBs and XMLs are not supported.
- Cisco Catalyst 2960X/XR switch supports 1000 L2 flows with EtherType, 200 L2 flows without EtherType, and 500 L3 flows.
- A maximum of 48 ports can be assigned for Openflow operation.
- In general, the maximum sustained flow programming rate from the controller should not exceed 50 (added or deleted) flows per second. For flows that have more than 1 match criteria (more than input port + 1 match), the sustained controller programming rate should not exceed 40 flows per second.
- The maximum burst flow programming rate from the controller should not exceed 1000 flows, spaced by 30-second time intervals. A minimum of 30-second time interval should be maintained between addition or deletion of flows.
- The rate of PACKET_IN messages sent to the controller should be rate-limited to 300 packets per second, using configuration.
Information About Open Flow

Overview of OpenFlow

OpenFlow is a standard communications interface defined between the control and forwarding plane for direct access to and manipulation of the forwarding plane of network devices such as switches and routers from multiple vendors.

OpenFlow Switch Specification Version 1.0.1 (Wire Protocol 0x01), referred to as OpenFlow 1.0, and OpenFlow Switch Specification Version 1.3.0 (Wire Protocol 0x04), referred to as OpenFlow 1.3, are based on the concept of an Ethernet switch with an internal flow table and standardized interface to allow traffic flows on a device to be added or removed. OpenFlow 1.3 defines the communication channel between OpenFlow and controllers.

A generic OpenFlow controller will interact with an specialized OpenFlow agent that translates the OpenFlow configuration into IOS configurations and configures the data plane.

Support of OpenFlow on catalyst 2960X/XR is limited to only software forwarding (due to ASIC limitations). The software forwarding of flows will happen at the OpenFlow agent with support of 12 tuples matches consisting of single table with both L2 and L3 fields together. The match criteria can be match on all 12 tuple fields or any of the 12 tuple fields.

The corresponding actions to the matching criteria can be:

- Push / Pop of Vlan
- Output the packet to port
- Drop the packet
- Set/Decrement IP TTL value
- Modify of L2/L3/L4 fields of Ethernet frame

The Physical ports can be configured as OpenFlow ports or as normal port. The flows in the flow table will be installed based on the priority of the flow.

Note

Priority 0 flows are not supported.

Cisco supports a subset of OpenFlow 1.0 and OpenFlow 1.3 functions. A controller can be Extensible Network Controller (XNC) 1.0, or any controller compliant with OpenFlow 1.3.

OpenFlow Controller Operation

OpenFlow controller (referred to as controller) controls the switch and inserts flows with a subset of OpenFlow 1.3 and 1.0 match and action criteria through OpenFlow logical switch.
# Cisco OpenFlow Feature Support

The following is a subset of OpenFlow 1.3 and OpenFlow 1.0 functions that are supported by OpenFlow.

### Table 53: Cisco OpenFlow Feature Support

<table>
<thead>
<tr>
<th>Feature</th>
<th>Notes</th>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Connection to controllers</th>
<th>You can connect up to eight controllers. Connection to the controller through a management interface or a switched virtual interface (SVI) is supported. Connection via TCP and TLS is supported.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
<td>Notes</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Multiple actions                | If multiple actions are associated with a flow, they are processed in the order specified. The output action should be the last action in the action list. Any action after the output action is not supported, and can cause the flow to fail and return an error to the controller. Flows defined on the controller must follow these guidelines:  
  • The flow can have only one output action.  
  • Some action combinations which are not supported may be rejected at flow programming time.  
  • The flow should not have an output-to-controller action in combination with other rewrite actions. |
| Supported OpenFlow counters     | Per Table—Active entries, packet lookups, and packet matches.  
  Per Flow—Received Packets, Received bytes, Duration (seconds), Duration (milliseconds).  
  Per Port—Received or transmitted packets, and bytes.  
  Per Controller—Flow addition, modification, deletion, error messages, echo requests or replies, barrier requests or replies, connection attempts, successful connections, packet in or packet out. |
| Default forwarding rule         | All packets that cannot be matched to programmed flows are dropped by default. You can configure sending unmatched packets to the controller. You can modify the default action taken on unmatched packets either using the default-miss command or by the controller. |
| Idle timeout                    | A minimum Idle timeout of 14 seconds is supported for 700 flows and 48 ports.  
  The statistics collection interval influences the minimum idle timeout. When the interval is set to 7 seconds, the timeout is a minimum of 14 seconds. 700 flows are supported with the 14-second idle timeout.  
  When using an idle timeout of less than 25 seconds, the number of L3 flows should be limited to 700. |
# Supported Match and Actions and Pipelines

To configure OpenFlow logical switch and the IP address of a controller, perform this task:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `feature openflow`
4. `openflow`
5. `switch logical-switch-id pipeline logical-id`
6. `controller [ipv4 ip-address ] [ port tcp-port ] [ vrf vrf-name ] [ security { none | tls } ]`
7. `of-port interface interface-name`
8. `default-miss action-for-unmatched-flows`
9. `protocol-version {1.1 | 1.3 | negotiate}`
10. `shutdown`
11. `datapath-id datapath-id`
12. `tls trust-point local local-trust-point remote remote-trust-point`
13. `probe-interval probe-interval`
14. `rate-limit packet_in controller-packet-rate burst maximum-packets-to-controller`
15. `max-backoff backoff-timer`
16. `logging flow-mod`
17. `statistics collection-interval interval`
18. `end`
19. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device&gt; enable</code>&lt;br&gt;Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;<code>Device# configure terminal</code>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>feature openflow&lt;br&gt;Example: &lt;br&gt;Device(config)# feature openflow</td>
</tr>
<tr>
<td>Enables Open Flow Agent support on the switch.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>openflow&lt;br&gt;Example: &lt;br&gt;Device(config)# openflow</td>
</tr>
<tr>
<td>Enables Open Flow Agent support on the switch.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>switch logical-switch-id pipeline logical-id&lt;br&gt;Example: &lt;br&gt;Device(config-ofa-switch)# switch 1 pipeline 1</td>
</tr>
<tr>
<td>Specifies an ID for a logical switch that is used for OpenFlow switching and enters logical switch configuration mode.&lt;br&gt;The only logical switch ID supported is 1.&lt;br&gt;Configures a pipeline.&lt;br&gt;This step is mandatory for a logical switch configuration. The only pipeline ID supported is 1.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>controller [ipv4 ip-address] [port tcp-port] [vrf vrf-name] [security {none</td>
</tr>
<tr>
<td>Specifies the IPv4 address, port number used by the controller to connect to the logical switch Repeat this step if you need to configure additional controllers. You can configure up to eight controllers. If TLS is used in this step, configure TLS trustpoints in the next step. If unspecified, by default, Controllers use TCP port 6633. A connection to a controller is initiated by the logical switch.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>of-port interface interface-name&lt;br&gt;Example: &lt;br&gt;Device(config-ofa-switch)# of-port interface GigabitEthernet1/0/23&lt;br&gt;Device(config-ofa-switch)# of-port interface TenGigabitEthernet1/1/2</td>
</tr>
<tr>
<td>Adds interfaces to the logical switch configuration. Observe these guidelines:&lt;br&gt;• Do not abbreviate the interface type. Ensure that the interface type is spelled out completely and is as shown in the examples.&lt;br&gt;• If the keyword is abbreviated, the interface is not configured.&lt;br&gt;• The interface must be designated for the OpenFlow logical switch only. Repeat this step to configure additional interfaces.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>default-miss action-for-unmatched-flows&lt;br&gt;Example:</td>
</tr>
<tr>
<td>Configures the action to be taken for packets that do not match any of the flow defined. The supported options are:&lt;br&gt;• forward the packets using the normal routing tables</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| `default-miss` continue-controller | • forward the packets to the controller  
• drop the packets  
The default option is to forward the packets using the normal routing tables. |
| **Step 9** protocol-version \{1.1 | 1.3 | negotiate\} | Configures the protocol version. Supported values are:  
• 1.0—Configures device to connect to 1.0 controllers only.  
• 1.3—Configures device to connect to 1.3 controllers only..  
• negotiate—Negotiates the protocol version with the controller. Device uses 1.3 for negotiation.  
The default value is 1.0. |
| **Step 10** shutdown | Disables a logical switch, bringing down the tcp/ip connection and removing flows from the dataplane. |
| **Step 11** datapath-id *datapath-id* | Configures a unique datapath ID for the switch.  
This step is mandatory for a logical switch configuration.  
Enter a 64-bit hexadecimal value. |
| **Step 12** tls trust-point local *local-trust-point* remote *remote-trust-point* | (Optional) Specifies the local and remote TLS trustpoints to be used for the controller connection. |
| **Step 13** probe-interval *probe-interval* | (Optional) Configures the interval (in seconds) at which the controller is probed.  
After the configured interval of time passes, if the switch has not received any messages from the controller, the switch sends an echo request (echo_request) to the controller. It should normally receive an echo reply (echo_reply). If no message is seen for the duration of another probe interval, the switch presumes that the controller is down and disconnects the controller connection. The switch tries to reconnect periodically.  
The default value is 5 seconds; the range is from 5 to 65535 seconds. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 14</strong></td>
<td><strong>rate-limit packet_in controllet-packet-rate burst maximum-packets-to-controller</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ofa-switch)# rate-limit packet_in 300 burst 50</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Configures the maximum packet rate sent to the controller and the maximum packets burst sent to the controller in a second. The default value is zero, that is, an indefinite packet rate and packet burst is permitted. This rate limit is for OpenFlow. It is not related to the rate limit of the device (data plane) configured by COPP.</td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td><strong>max-backoff backoff-timer</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ofa-switch)# max-backoff 8</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Configures the duration (in seconds) for which the device must wait before attempting to initiate a connection with the controller. The device initially tries to initiate connection frequently, as the number of unsuccessful attempts increases, the device tries less frequently, that is, the waiting period between attempts also increases. The backoff timer configures the maximum period that the device waits in-between each retry. The default value is 8 seconds; the range is from 1 to 65535 seconds.</td>
</tr>
<tr>
<td><strong>Step 16</strong></td>
<td><strong>logging flow-mod</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ofa-switch)# logging flow-mod</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Enables logging of flow changes, including addition, deletion, and modification of flows. Logging of flow changes is a CPU intensive activity and should not be enabled for a large number of flows. Logging of flow changes is disabled by default. Flow changes are logged in syslog and can be viewed using the show logging command.</td>
</tr>
<tr>
<td><strong>Step 17</strong></td>
<td><strong>statistics collection-interval interval</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-ofa-switch)# statistics collection-interval 7</td>
</tr>
</tbody>
</table>
| **Purpose:** | Configures the statistics collection interval (in seconds) for all configured flows of OpenFlow. Observe these guidelines:

- The default interval value is 7 seconds.
- The minimum interval is 7 seconds; the maximum is 82 seconds.
- You can also specify a value of 0, this disables statistics collection.
- Flows with an idle timeout value less than 2 * interval are rejected. Configured interval value is displayed in the output of the show openflow switch 1 command. |
| **Step 18** | **end** |
| **Example:** | | Returns to privileged EXEC mode. |
Monitoring OpenFlow

You can monitor OpenFlow parameters using the following commands:

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show openflow switch switch-id</code></td>
<td>Displays information related to OpenFlow on the logical switch.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id controllers [ stats ]</code></td>
<td>Displays information related to the connection status between an OpenFlow logical switch and connected Controllers.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id ports</code></td>
<td>Displays the mapping between physical device interfaces and ports of OpenFlow logical switch.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id flows</code></td>
<td>Displays flows defined for the device by controllers.</td>
</tr>
<tr>
<td><code>show openflow switch switch-id stats</code></td>
<td>Displays send and receive statistics for each port defined for an OpenFlow logical switch.</td>
</tr>
<tr>
<td>`show running-config</td>
<td>section openflow`</td>
</tr>
<tr>
<td><code>show openflow hardware capabilities</code></td>
<td>Displays OpenFlow hardware configurations.</td>
</tr>
</tbody>
</table>

Configuration Examples for OpenFlow

PART VII

QoS

• Configuring QoS, on page 519
• Configuring Auto-QoS, on page 613
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for QoS

Before configuring standard QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. For example, is the traffic on your network bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.
QoS ACL Guidelines

Follow these guidelines when configuring QoS with access control lists (ACLs):

- It is not possible to match IP fragments against configured IP extended ACLs to enforce QoS. IP fragments are sent as best-effort. IP fragments are denoted by fields in the IP header.

- Only one ACL per class map and only one `match` class-map configuration command per class map are supported. The ACL can have multiple ACEs, which match fields against the contents of the packet.

- A trust statement in a policy map requires multiple hardware entries per ACL line. If an input service policy map contains a trust statement in an ACL, the access list might be too large to fit into the available QoS hardware memory, and an error can occur when you apply the policy map to a port. Whenever possible, you should minimize the number of lines is a QoS ACL.

Policing Guidelines

Note

To use policing, the switch must be running the LAN Base image.

- The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for system internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries.

You cannot reserve policers per port; there is no guarantee that a port will be assigned to any policer.

- Only one policer is applied to a packet on an ingress port. Only the average rate and committed burst parameters are configurable.

- On a port configured for QoS, all traffic received through the port is classified, policed, and marked according to the policy map attached to the port. On a trunk port configured for QoS, traffic in all VLANs received through the port is classified, policed, and marked according to the policy map attached to the port.

- If you have EtherChannel ports configured on your switch, you must configure QoS classification, policing, mapping, and queueing on the individual physical ports that comprise the EtherChannel. You must decide whether the QoS configuration should match on all ports in the EtherChannel.

- If you need to modify a policy map of an existing QoS policy, first remove the policy map from all interfaces, and then modify or copy the policy map. After you finish the modification, apply the modified policy map to the interfaces. If you do not first remove the policy map from all interfaces, high CPU usage can occur, which, in turn, can cause the console to pause for a very long time.

General QoS Guidelines

These are the general QoS guidelines:

- You configure QoS only on physical ports; there is no support for it at the VLAN level.

- Control traffic (such as spanning-tree bridge protocol data units [BPDUs] and routing update packets) received by the switch are subject to all ingress QoS processing.
• You are likely to lose data when you change queue settings; therefore, try to make changes when traffic is at a minimum.

• The switch supports homogeneous stacking and mixed stacking. Mixed stacking is supported only with the Catalyst 2960-S switches. A homogenous stack can have up to eight stack members, while a mixed stack can have up to four stack members. All switches in a switch stack must be running the LAN Base image.

Restrictions for QoS

The following are the restrictions for QoS:

• To use these features, the switch must be running the LAN Base image: stacking, DSCP, auto-QoS, trusted boundary, policing, marking, mapping tables, and weighted tail drop.

• Ingress queueing is not supported.

• The switch supports 4 default egress queues, with the option to enable an additional 4 egress queues for a total of 8. This option is only available on a standalone switch running the LAN Base image.

• We recommend that you do not enable 8 egress queues by using the `mls qos srr-queue output queues 8` command, when running the following features in your configuration:
  - Auto-QoS
  - Auto SmartPort
  - EnergyWise

Running these features with 8 egress queue enabled in a single configuration is not supported on the switch.

• You can configure QoS only on physical ports. VLAN-based QoS is not supported. You configure the QoS settings, such as classification, queueing, and scheduling, and apply the policy map to a port. When configuring QoS on a physical port, you apply a nonhierarchical policy map to a port.

• If the switch is running the LAN Lite image you can:
  - Configure ACLs, but you cannot attach them to physical interfaces. You can attach them to VLAN interfaces to filter traffic to the CPU.
  - Enable only cos trust at interface level.
  - Enable SRR shaping and sharing at interface level.
  - Enable Priority queueing at interface level.
  - Enable or disable `mls qos rewrite ip dscp`.

• The switch must be running the LAN Base image to use the following QoS features:
  - Policy maps
  - Policing and marking
  - Mapping tables
Information About QoS

QoS Implementation

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use congestion-management and congestion-avoidance techniques to provide preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

The QoS implementation is based on the Differentiated Services (Diff-Serv) architecture, a standard from the Internet Engineering Task Force (IETF). This architecture specifies that each packet is classified upon entry into the network.

The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (ToS) field to carry the classification (class) information. Classification can also be carried in the Layer 2 frame.
Figure 58: QoS Classification Layers in Frames and Packets

The special bits in the Layer 2 frame or a Layer 3 packet are shown in the following figure:

### Layer 2 Frame Prioritization Bits

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On ports configured as Layer 2 ISL trunks, all traffic is in ISL frames.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On ports configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

Other frame types cannot carry Layer 2 CoS values.

Layer 2 CoS values range from 0 for low priority to 7 for high priority.

### Layer 3 Packet Prioritization Bits

Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.

IP precedence values range from 0 to 7. DSCP values range from 0 to 63.
End-to-End QoS Solution Using Classification

All switches and routers that access the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to occur closer to the edge of the network, so that the core switches and routers are not overloaded with this task.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the Diff-Serv architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple task or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control that you need over incoming and outgoing traffic.

QoS Basic Model

To implement QoS, the switch must distinguish packets or flows from one another (classify), assign a label to indicate the given quality of service as the packets move through the switch, make the packets comply with the configured resource usage limits (police and mark), and provide different treatment (queue and schedule) in all situations where resource contention exists. The switch also needs to ensure that traffic sent from it meets a specific traffic profile (shape).

Figure 59: QoS Basic Wired Model

Actions at Ingress Port

Actions at the ingress port include classifying traffic, policing, marking, and scheduling:

- Classifying a distinct path for a packet by associating it with a QoS label. The switch maps the CoS or DSCP in the packet to a QoS label to distinguish one kind of traffic from another. The QoS label that is generated identifies all future QoS actions to be performed on this packet.

- Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.
Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, marking down the QoS label in the packet, or dropping the packet).

Queueing and scheduling are only supported at egress and not at ingress on the switch.

**Actions at Egress Port**

Actions at the egress port include queueing and scheduling:

- Queueing evaluates the QoS packet label and the corresponding DSCP or CoS value before selecting which of the four egress queues to use. Because congestion can occur when multiple ingress ports simultaneously send data to an egress port, WTD differentiates traffic classes and subjects the packets to different thresholds based on the QoS label. If the threshold is exceeded, the packet is dropped.

- Scheduling services the four egress queues based on their configured SRR shared or shaped weights. One of the queues (queue 1) can be the expedited queue, which is serviced until empty before the other queues are serviced.

**Classification Overview**

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled only if QoS is globally enabled on the switch. By default, QoS is globally disabled, so no classification occurs.

During classification, the switch performs a lookup and assigns a QoS label to the packet. The QoS label identifies all QoS actions to be performed on the packet and from which queue the packet is sent.

The QoS label is based on the DSCP or the CoS value in the packet and decides the queuing and scheduling actions to perform on the packet. The label is mapped according to the trust setting and the packet type as shown in the Classification Flowchart.

You specify which fields in the frame or packet that you want to use to classify incoming traffic.

**Non-IP Traffic Classification**

The following table describes the non-IP traffic classification options for your QoS configuration.

<table>
<thead>
<tr>
<th>Non-IP Traffic Classification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trust the CoS value</td>
<td>Trust the CoS value in the incoming frame (configure the port to trust CoS), and then use the configurable CoS-to-DSCP map to generate a DSCP value for the packet. Layer 2 ISL frame headers carry the CoS value in the 3 least-significant bits of the 1-byte User field. Layer 2 802.1Q frame headers carry the CoS value in the 3 most-significant bits of the Tag Control Information field. CoS values range from 0 for low priority to 7 for high priority.</td>
</tr>
</tbody>
</table>
Non-IP Traffic Classification | Description
---|---
Trust the DSCP or trust IP precedence value | Trust the DSCP or trust IP precedence value in the incoming frame. These configurations are meaningless for non-IP traffic. If you configure a port with either of these options and non-IP traffic is received, the switch assigns a CoS value and generates an internal DSCP value from the CoS-to-DSCP map. The switch uses the internal DSCP value to generate a CoS value representing the priority of the traffic.

Perform classification based on configured Layer 2 MAC ACL | Perform the classification based on a configured Layer 2 MAC access control list (ACL), which can examine the MAC source address, the MAC destination address, and other fields. If no ACL is configured, the packet is assigned 0 as the DSCP and CoS values, which means best-effort traffic. Otherwise, the policy-map action specifies a DSCP or CoS value to assign to the incoming frame.

After classification, the packet is sent to the policing and marking stages.

IP Traffic Classification

The following table describes the IP traffic classification options for your QoS configuration.

**Table 56: IP Traffic Classifications**

<table>
<thead>
<tr>
<th>IP Traffic Classification</th>
<th>Description</th>
</tr>
</thead>
</table>
| Trust the DSCP value | Trust the DSCP value in the incoming packet (configure the port to trust DSCP), and assign the same DSCP value to the packet. The IETF defines the 6 most-significant bits of the 1-byte ToS field as the DSCP. The priority represented by a particular DSCP value is configurable. DSCP values range from 0 to 63.

You can also classify IP traffic based on IPv6 DSCP.

For ports that are on the boundary between two QoS administrative domains, you can modify the DSCP to another value by using the configurable DSCP-to-DSCP-mutation map. |

| Trust the IP precedence value | Trust the IP precedence value in the incoming packet (configure the port to trust IP precedence), and generate a DSCP value for the packet by using the configurable IP-precedence-to-DSCP map. The IP Version 4 specification defines the 3 most-significant bits of the 1-byte ToS field as the IP precedence. IP precedence values range from 0 for low priority to 7 for high priority.

You can also classify IP traffic based on IPv6 precedence. |

| Trust the CoS value | Trust the CoS value (if present) in the incoming packet, and generate a DSCP value for the packet by using the CoS-to-DSCP map. If the CoS value is not present, use the default port CoS value. |
### IP Traffic Classification

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP standard or an extended ACL</td>
<td>Perform the classification based on a configured IP standard or an extended ACL, which examines various fields in the IP header. If no ACL is configured, the packet is assigned 0 as the DSCP and CoS values, which means best-effort traffic. Otherwise, the policy-map action specifies a DSCP or CoS value to assign to the incoming frame.</td>
</tr>
<tr>
<td>Override configured CoS</td>
<td>Override the configured CoS of incoming packets, and apply the default port CoS value to them. For IPv6 packets, the DSCP value is rewritten by using the CoS-to-DSCP map and by using the default CoS of the port. You can do this for both IPv4 and IPv6 traffic.</td>
</tr>
</tbody>
</table>

After classification, the packet is sent to the policing and marking stages.
Access Control Lists

You can use IP standard, IP extended, or Layer 2 MAC ACLs to define a group of packets with the same characteristics (class). You can also classify IP traffic based on IPv6 ACLs.

In the QoS context, the permit and deny actions in the access control entries (ACEs) have different meanings from security ACLs:
• If a match with a permit action is encountered (first-match principle), the specified QoS-related action is taken.

• If a match with a deny action is encountered, the ACL being processed is skipped, and the next ACL is processed.

**Note**
Deny action is supported in Cisco IOS Release 3.7.4E and later releases.

• If no match with a permit action is encountered and all the ACEs have been examined, no QoS processing occurs on the packet, and the offers best-effort service to the packet.

• If multiple ACLs are configured on a port, the lookup stops after the packet matches the first ACL with a permit action, and QoS processing begins.

**Note**
When creating an access list, note that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

After a traffic class has been defined with the ACL, you can attach a policy to it. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate-limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the `access-list` global configuration command; you implement Layer 2 MAC ACLs to classify non-IP traffic by using the `mac access-list extended` global configuration command.

### Classification Based on Class Maps and Policy Maps

To use policy maps, the switch must be running the LAN Base image.

A class map is a mechanism that you use to name a specific traffic flow (or class) and to isolate it from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it. The criteria can include matching the access group defined by the ACL or matching a specific list of DSCP or IP precedence values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you further classify it through the use of a policy map.

A policy map specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; or specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile. Before a policy map can be effective, you must attach it to a port.

You create a class map by using the `class-map` global configuration command or the `class` policy-map configuration command. You should use the `class-map` command when the map is shared among many ports. When you enter the `class-map` command, the switch enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the `match` class-map configuration command.

You can configure a default class by using the `class class-default` policy-map configuration command. Unclassified traffic (traffic specified in the other traffic classes configured on the policy-map) is treated as default traffic.
You create and name a policy map by using the `policy-map` global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the `class`, `trust`, or `set` policy-map configuration and policy-map class configuration commands.

The policy map can contain the `police` and `police aggregate` policy-map class configuration commands, which define the policer, the bandwidth limitations of the traffic, and the action to take if the limits are exceeded.

To enable the policy map, you attach it to a port by using the `service-policy` interface configuration command.

**Policing and Marking Overview**

After a packet is classified and has a DSCP-based or CoS-based QoS label assigned to it, the policing and marking process can begin.

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are out of profile or nonconforming. Each policer decides on a packet-by-packet basis whether the packet is in or out of profile and specifies the actions on the packet. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or modifying (marking down) the assigned DSCP of the packet and allowing the packet to pass through. The configurable policed-DSCP map provides the packet with a new DSCP-based QoS label. Marked-down packets use the same queues as the original QoS label to prevent packets in a flow from getting out of order.

---

**Note**

All traffic, regardless of whether it is bridged or routed, is subjected to a policer, if one is configured. As a result, bridged packets might be dropped or might have their DSCP or CoS fields modified when they are policed and marked.

You can configure policing on a physical port. After you configure the policy map and policing actions, attach the policy to a port by using the `service-policy` interface configuration command.

**Physical Port Policing**

In policy maps on physical ports, you can create the following types of policers:

- Individual—QoS applies the bandwidth limits specified in the policer separately to each matched traffic class. You configure this type of policer within a policy map by using the `police` policy-map class configuration command.

- Aggregate—QoS applies the bandwidth limits specified in an aggregate policer cumulatively to all matched traffic flows. You configure this type of policer by specifying the aggregate policer name within a policy map by using the `police aggregate` policy-map class configuration command. You specify the bandwidth limits of the policer by using the `mls qos aggregate-policer` global configuration command. In this way, the aggregate policer is shared by multiple classes of traffic within a policy map.

Policing uses a token-bucket algorithm. As each frame is received by the switch, a token is added to the bucket. The bucket has a hole in it and leaks at a rate that you specify as the average traffic rate in bits per second. Each time a token is added to the bucket, the switch verifies that there is enough room in the bucket. If there is not enough room, the packet is marked as nonconforming, and the specified policer action is taken (dropped or marked down).

How quickly the bucket fills is a function of the bucket depth (burst-byte), the rate at which the tokens are removed (rate-bps), and the duration of the burst above the average rate. The size of the bucket imposes an upper limit on the burst length and limits the number of frames that can be transmitted back-to-back. If the
burst is short, the bucket does not overflow, and no action is taken against the traffic flow. However, if a burst is long and at a higher rate, the bucket overflows, and the policing actions are taken against the frames in that burst.

You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the burst-byte option of the `policing` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the rate-bps option of the `policing` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command.

*Figure 61: Policing and Marking Flowchart on Physical Ports*

---

**Mapping Tables Overview**

During QoS processing, the switch represents the priority of all traffic (including non-IP traffic) with a QoS label based on the DSCP or CoS value from the classification stage.
The following table describes QoS processing and mapping tables.

**Table 57: QoS Processing and Mapping Tables**

<table>
<thead>
<tr>
<th>QoS Processing Stage</th>
<th>Mapping Table Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>During the classification stage, QoS uses configurable mapping tables to derive a corresponding DSCP or CoS value from a received CoS, DSCP, or IP precedence value. These maps include the CoS-to-DSCP map and the IP-precedence-to-DSCP map. You configure these maps by using the <code>mls qos map cos-dscp</code> and the <code>mls qos map ip-prec-dscp</code> global configuration commands. On an ingress port configured in the DSCP-trusted state, if the DSCP values are different between the QoS domains, you can apply the configurable DSCP-to-DSCP-mutation map to the port that is on the boundary between the two QoS domains. You configure this map by using the <code>mls qos map dscp-mutation</code> global configuration command.</td>
</tr>
<tr>
<td>Policing</td>
<td>During policing stage, QoS can assign another DSCP value to an IP or a non-IP packet (if the packet is out of profile and the policer specifies a marked-down value). This configurable map is called the policed-DSCP map. You configure this map by using the <code>mls qos map policed-dscp</code> global configuration command.</td>
</tr>
<tr>
<td>Pre-scheduling</td>
<td>Before the traffic reaches the scheduling stage, QoS stores the packet in an egress queue according to the QoS label. The QoS label is based on the DSCP or the CoS value in the packet and selects the queue through the DSCP output queue threshold maps or through the CoS output queue threshold maps. In addition to an egress queue, the QOS label also identifies the WTD threshold value. You configure these maps by using the <code>mls qos srr-queue { output } dscp-map</code> and the <code>mls qos srr-queue { output } cos-map</code> global configuration commands.</td>
</tr>
</tbody>
</table>

The CoS-to-DSCP, DSCP-to-CoS, and the IP-precedence-to-DSCP maps have default values that might or might not be appropriate for your network.

The default DSCP-to-DSCP-mutation map and the default policed-DSCP map are null maps; they map an incoming DSCP value to the same DSCP value. The DSCP-to-DSCP-mutation map is the only map you apply to a specific port. All other maps apply to the entire switch.

**Queueing and Scheduling Overview**

The switch has queues at specific points to help prevent congestion.
The switch supports 4 egress queues by default and there is an option to enable a total of 8 egress queues. The 8 egress queue configuration is only supported on a standalone switch.

### Weighted Tail Drop

Egress queues use an enhanced version of the tail-drop congestion-avoidance mechanism called weighted tail drop (WTD). WTD is implemented on queues to manage the queue lengths and to provide drop precedences for different traffic classifications.

As a frame is enqueued to a particular queue, WTD uses the frame’s assigned QoS label to subject it to different thresholds. If the threshold is exceeded for that QoS label (the space available in the destination queue is less than the size of the frame), the switch drops the frame.

Each queue has three threshold values. The QoS label determines which of the three threshold values is subjected to the frame. Of the three thresholds, two are configurable (explicit) and one is not (implicit).

#### Figure 63: WTD and Queue Operation

The following figure shows an example of WTD operating on a queue whose size is 1000 frames. Three drop percentages are configured: 40 percent (400 frames), 60 percent (600 frames), and 100 percent (1000 frames). These percentages indicate that up to 400 frames can be queued at the 40-percent threshold, up to 600 frames at the 60-percent threshold, and up to 1000 frames at the 100-percent threshold.

In the example, CoS values 6 and 7 have a greater importance than the other CoS values, and they are assigned to the 100-percent drop threshold (queue-full state). CoS values 4 and 5 are assigned to the 60-percent threshold, and CoS values 0 to 3 are assigned to the 40-percent threshold.
Suppose the queue is already filled with 600 frames, and a new frame arrives. It contains CoS values 4 and 5 and is subjected to the 60-percent threshold. If this frame is added to the queue, the threshold will be exceeded, so the switch drops it.

**SRR Shaping and Sharing**

Egress queues are serviced by shaped round robin (SRR), which controls the rate at which packets are sent. On the egress queues, SRR sends packets to the egress port.

You can configure SRR on egress queues for sharing or for shaping.

In shaped mode, the egress queues are guaranteed a percentage of the bandwidth, and they are rate-limited to that amount. Shaped traffic does not use more than the allocated bandwidth even if the link is idle. Shaping provides a more even flow of traffic over time and reduces the peaks and valleys of bursty traffic. With shaping, the absolute value of each weight is used to compute the bandwidth available for the queues.

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue is empty and no longer requires a share of the link, the remaining queues can expand into the unused bandwidth and share it among them. With sharing, the ratio of the weights controls the frequency of dequeuing; the absolute values are meaningless. Shaping and sharing is configured per interface. Each interface can be uniquely configured.

**Queueing and Scheduling on Ingress Queues**

The following figure shows queueing and scheduling flowcharts for ingress ports on Catalyst 3750-E and 3750-X switches.
The following figure shows queueing and scheduling flowcharts for ingress ports on Catalyst 3560-E and 3560-X switches.

### Note
SRR services the priority queue for its configured share before servicing the other queue.

**Configurable Ingress Queue Types**

The switch supports two configurable ingress queue types, which are serviced by SRR in shared mode only.

**Note**
The switch also uses two nonconfigurable queues for traffic that are essential for proper network and stack operation.
The following table describes the two configurable ingress queues.

**Table 58: Configurable Ingress Queue Types**

<table>
<thead>
<tr>
<th>Queue Type</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>User traffic that is considered to be normal priority. You can configure three different thresholds to differentiate among the flows. Use the following global configuration commands:</td>
</tr>
</tbody>
</table>
|            | • mls qos srr-queue input threshold  
|            | • mls qos srr-queue input dscp-map  
|            | • mls qos srr-queue input cos-map  |
| Expedite   | High-priority user traffic such as differentiated services (DF) expedited forwarding or voice traffic. You can configure the bandwidth required for this traffic as a percentage of the total traffic or total stack traffic on the switches by using the mls qos srr-queue input priority-queue global configuration command. The expedite queue has guaranteed bandwidth. |

You assign each packet that flows through the switch to a queue and to a threshold. Specifically, you map DSCP or CoS values to an ingress queue and map DSCP or CoS values to a threshold ID. You use the mls qos srr-queue input dscp-map queue queue-id \{dscp1...dscp8 | threshold threshold-id dscp1...dscp8\} or the mls qos srr-queue input cos-map queue queue-id \{cos1...cos8 | threshold threshold-id cos1...cos8\} global configuration command. You can display the DSCP input queue threshold map and the CoS input queue threshold map by using the show mls qos maps privileged EXEC command.

**WTD Thresholds**

The queues use WTD to support distinct drop percentages for different traffic classes. Each queue has three drop thresholds: two configurable (explicit) WTD thresholds and one nonconfigurable (implicit) threshold preset to the queue-full state.

You assign the two explicit WTD threshold percentages for threshold ID 1 and ID 2 to the ingress queues by using the mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2 global configuration command. Each threshold value is a percentage of the total number of allocated buffers for the queue. The drop threshold for threshold ID 3 is preset to the queue-full state, and you cannot modify it.

**Buffer and Bandwidth Allocation**

You define the ratio (allocate the amount of space) with which to divide the ingress buffers between the two queues (normal and expedite) by using the mls qos srr-queue input buffers percentage1 percentage2 global configuration command. The buffer allocation together with the bandwidth allocation control how much data can be buffered and sent before packets are dropped. You allocate bandwidth as a percentage by using the mls qos srr-queue input bandwidth weight1 weight2 global configuration command. The ratio of the weights is the ratio of the frequency in which the SRR scheduler sends packets from each queue.
Priority Queueing

You can configure one ingress queue as the priority queue by using the command `mls qos srr-queue input priority-queue queue-id bandwidth weight global` configuration command. The priority queue should be used for traffic (such as voice) that requires guaranteed delivery because this queue is guaranteed part of the bandwidth regardless of the load on the stack or internal ring.

SRR services the priority queue for its configured weight as specified by the `bandwidth` keyword in the `mls qos srr-queue input priority-queue queue-id bandwidth weight global` configuration command. Then, SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the `mls qos srr-queue input bandwidth weight1 weight2` global configuration command.

You can combine the above commands to prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues, by allocating a large queue size or by servicing the queue more frequently, and by adjusting queue thresholds so that packets with lower priorities are dropped.

Queueing and Scheduling on Egress Queues

The following figure shows queueing and scheduling flowcharts for egress ports on the switch.
Each port supports four egress queues, one of which (queue 1) can be the egress expedite queue. These queues are assigned to a queue-set. All traffic exiting the switch flows through one of these four queues and is subjected to a threshold based on the QoS label assigned to the packet.
If the expedite queue is enabled, SRR services it until it is empty before servicing the other three queues.

### Egress Queue Buffer Allocation

The following figure shows the egress queue buffer.

**Figure 67: Egress Queue Buffer Allocation**

The buffer space is divided between the common pool and the reserved pool. The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to control whether to grant buffer space to a requesting queue. The switch detects whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

### Buffer and Memory Allocation

You guarantee the availability of buffers, set drop thresholds, and configure the maximum memory allocation for a queue-set by using the **mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold** global configuration command. Each threshold value is a percentage of the queue’s allocated memory, which you specify by using the **mls qos queue-set output qset-id buffers allocation1 ... allocation4** global configuration command. The sum of all the allocated buffers represents the reserved pool, and the remaining buffers are part of the common pool.

Through buffer allocation, you can ensure that high-priority traffic is buffered. For example, if the buffer space is 400, you can allocate 70 percent of it to queue 1 and 10 percent to queues 2 through 4. Queue 1 then has 280 buffers allocated to it, and queues 2 through 4 each have 40 buffers allocated to them.

You can guarantee that the allocated buffers are reserved for a specific queue in a queue-set. For example, if there are 100 buffers for a queue, you can reserve 50 percent (50 buffers). The switch returns the remaining 50 buffers to the common pool. You also can enable a queue in the full condition to obtain more buffers than are reserved for it by setting a maximum threshold. The switch can allocate the needed buffers from the common pool if the common pool is not empty.
Queues and WTD Thresholds

You can assign each packet that flows through the switch to a queue and to a threshold. Specifically, you map DSCP or CoS values to an egress queue and map DSCP or CoS values to a threshold ID. You use the `mls qos srr-queue output dscp-map queue queue-id {dscp1...dscp8 | threshold threshold-id dscp1...dscp8}` or the `mls qos srr-queue output cos-map queue queue-id {cos1...cos8 | threshold threshold-id cos1...cos8}` global configuration command. You can display the DSCP output queue threshold map and the CoS output queue threshold map by using the `show mls qos maps` privileged EXEC command.

The queues use WTD to support distinct drop percentages for different traffic classes. Each queue has three drop thresholds: two configurable (explicit) WTD thresholds and one nonconfigurable (implicit) threshold preset to the queue-full state. You assign the two WTD threshold percentages for threshold ID 1 and ID 2. The drop threshold for threshold ID 3 is preset to the queue-full state, and you cannot modify it. You map a port to queue-set by using the `queue-set qset-id` interface configuration command. Modify the queue-set configuration to change the WTD threshold percentages.

Shaped or Shared Mode

SRR services each queue-set in shared or shaped mode. You map a port to a queue-set by using the `queue-set qset-id` interface configuration command.

You assign shared or shaped weights to the port by using the `srr-queue bandwidth share weight1 weight2 weight3 weight4` or the `srr-queue bandwidth shape weight1 weight2 weight3 weight4` interface configuration command.

The buffer allocation together with the SRR weight ratios control how much data can be buffered and sent before packets are dropped. The weight ratio is the ratio of the frequency in which the SRR scheduler sends packets from each queue.

All four queues participate in the SRR unless the expedite queue is enabled, in which case the first bandwidth weight is ignored and is not used in the ratio calculation. The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced. You enable the expedite queue by using the `priority-queue out` interface configuration command.

You can combine the commands described in this section to prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues, by allocating a large queue size or by servicing the queue more frequently, and by adjusting queue thresholds so that packets with lower priorities are dropped.
The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos srr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds, buffers, bandwidth share weights, and bandwidth shape weights for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

**Packet Modification**

A packet is classified, policed, and queued to provide QoS. The following packet modifications can occur during the process to provide QoS:

- For IP and non-IP packets, classification involves assigning a QoS label to a packet based on the DSCP or CoS of the received packet. However, the packet is not modified at this stage; only an indication of the assigned DSCP or CoS value is carried along.

- During policing, IP and non-IP packets can have another DSCP assigned to them (if they are out of profile and the policer specifies a markdown DSCP). Once again, the DSCP in the packet is not modified, but an indication of the marked-down value is carried along. For IP packets, the packet modification occurs at a later stage; for non-IP packets the DSCP is converted to CoS and used for queueing and scheduling decisions.

- Depending on the QoS label assigned to a frame and the mutation chosen, the DSCP and CoS values of the frame are rewritten. If you do not configure a table map and if you configure the port to trust the DSCP of the incoming frame, the DSCP value in the frame is not changed, but the CoS is rewritten according to the DSCP-to-CoS map. If you configure the port to trust the CoS of the incoming frame and it is an IP packet, the CoS value in the frame is not changed, but the DSCP might be changed according to the CoS-to-DSCP map.

The input mutation causes the DSCP to be rewritten depending on the new value of DSCP chosen. The set action in a policy map also causes the DSCP to be rewritten.

**Standard QoS Default Configuration**

Standard QoS is disabled by default.

When QoS is disabled, there is no concept of trusted or untrusted ports because the packets are not modified. The CoS, DSCP, and IP precedence values in the packet are not changed.

Traffic is switched in pass-through mode. The packets are switched without any rewrites and classified as best effort without any policing.

When QoS is enabled using the `mls qos` global configuration command and all other QoS settings are at their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted.
Starting Cisco IOS Release 15.2(1)E, IPv6 QoS is supported on switches running the LAN base license with lanbase-routing template.

### Default Ingress Queue Configuration

The following tables describe the default ingress queue configurations.

The following table shows the default ingress queue configuration when QoS is enabled. For the bandwidth allocation feature, bandwidth is equally shared between the queues. SRR sends packets in shared mode only. Queue 2 is the priority queue. SRR services the priority queue for its configured share before servicing the other queue.

*Table 59: Default Ingress Queue Configuration*

Default Egress Queue Configuration

The following tables describe the default egress queue configurations.

**Note**
The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos srr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds and buffers for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

The following table shows the default egress queue configuration for each queue-set when QoS is enabled. All ports are mapped to queue-set 1. The port bandwidth limit is set to 100 percent and rate unlimited. Note that for the SRR shaped weights (absolute) feature, a shaped weight of zero indicates that the queue is operating in shared mode. Note that for the SRR shared weights feature, one quarter of the bandwidth is allocated to each queue.

**Default Mapping Table Configuration**

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value (no markdown).
DSCP Maps

Default CoS-to-DSCP Map

When DSCP transparency mode is disabled, the DSCP values are derived from CoS as per the following table. If these values are not appropriate for your network, you need to modify them.

**Note** The DSCP transparency mode is disabled by default. If it is enabled (no mls qos rewrite ip dscp interface configuration command), DSCP rewrite will not happen.

<table>
<thead>
<tr>

<td>56</td>
</tr>
</tbody>
</table>

Default IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic. The following table shows the default IP-precedence-to-DSCP map. If these values are not appropriate for your network, you need to modify them.

<table>
<thead>
<tr>
<th>IP Precedence Value</th>
<th>DSCP Value</th>

How to Configure QoS

Enabling QoS Globally

By default, QoS is disabled on the switch.

The following procedure to enable QoS globally is required.

SUMMARY STEPS

1. configure terminal
2. mls qos
3. end
4. show mls qos
5. copy running-config startup-config
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

### Enabling VLAN-Based QoS on Physical Ports

By default, VLAN-based QoS is disabled on all physical switch ports. You can enable VLAN-based QoS on a switch port.

### Summary Steps

1. configure terminal
2. interface `interface-id`
3. mls qos vlan-based
4. end
5. show mls qos interface `interface-id`
6. copy running-config startup-config
# DETAILED STEPS

### Configuring Classification Using Port Trust States

These sections describe how to classify incoming traffic by using port trust states.

**Note** Depending on your network configuration, you must perform one or more of these tasks in this module or one or more of the tasks in the Configuring a QoS Policy.
Configuring the Trust State on Ports Within the QoS Domain

Packets entering a QoS domain are classified at the edge of the QoS domain. When the packets are classified at the edge, the switch port within the QoS domain can be configured to one of the trusted states because there is no need to classify the packets at every switch within the QoS domain.

Figure 68: Port Trusted States on Ports Within the QoS Domain

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. mls qos trust [cos | dscp | ip-precedence]
4. end
5. show mls qos interface
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device# configure terminal</code></td>
<td>Specifies the port to be trusted, and enters interface configuration mode. Valid interfaces are physical ports.</td>
</tr>
</tbody>
</table>

#### Step 2

**interface interface-id**

**Example:**

```
Device(config)# interface gigabitethernet 1/0/2
```

#### Step 3

**mls qos trust [cos | dscp | ip-precedence]**

**Example:**

```
Device(config-if)# mls qos trust cos
```

The keywords have these meanings:

- **cos**—Classifies an ingress packet by using the packet CoS value. For an untagged packet, the port default CoS value is used. The default port CoS value is 0.

- **dscp**—Classifies an ingress packet by using the packet DSCP value. For a non-IP packet, the packet CoS value is used if the packet is tagged; for an untagged packet, the default port CoS is used. Internally, the switch maps the CoS value to a DSCP value by using the CoS-to-DSCP map.

- **ip-precedence**—Classifies an ingress packet by using the packet IP-precedence value. For a non-IP packet, the packet CoS value is used if the packet is tagged; for an untagged packet, the default port CoS is used. Internally, the switch maps the CoS value to a DSCP value by using the CoS-to-DSCP map.

To return a port to its untrusted state, use the `no mls qos trust` interface configuration command.

#### Step 4

**end**

**Example:**

```
Device(config-if)# end
```

Returns to privileged EXEC mode.

#### Step 5

**show mls qos interface**

**Example:**

```
Device# show mls qos interface
```

Verifies your entries.
Configuring the CoS Value for an Interface

QoS assigns the CoS value specified with the `mls qos cos` interface configuration command to untagged frames received on trusted and untrusted ports.

Beginning in privileged EXEC mode, follow these steps to define the default CoS value of a port or to assign the default CoS to all incoming packets on the port.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `mls qos cos {default-cos | override}`
4. `end`
5. `show mls qos interface`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>interface interface-id</code></td>
<td>Specifies the port to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Valid interfaces include physical ports.</td>
</tr>
<tr>
<td>Device(config)# <code>interface</code></td>
<td></td>
</tr>
<tr>
<td>gigabitethernet 1/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `mls qos cos {default-cos</td>
<td>override}`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# <code>mls qos</code></td>
<td></td>
</tr>
<tr>
<td>override</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# <code>mls qos</code></td>
<td></td>
</tr>
<tr>
<td>override</td>
<td></td>
</tr>
</tbody>
</table>

- For `default-cos`, specify a default CoS value to be assigned to a port. If the packet is untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7. The default is 0.
- Use the `override` keyword to override the previously configured trust state of the incoming packet and to
**Command or Action** | **Purpose**
--- | ---
apply the default port CoS value to the port on all incoming packets. By default, CoS override is disabled. Use the `override` keyword when all incoming packets on specified ports deserve higher or lower priority than packets entering from other ports. Even if a port was previously set to trust DSCP, CoS, or IP precedence, this command overrides the previously configured trust state, and all the incoming CoS values are assigned the default CoS value configured with this command. If an incoming packet is tagged, the CoS value of the packet is modified with the default CoS of the port at the ingress port.

**Note** To return to the default setting, use the `no mls qos cos {default-cos | override}` interface configuration command.

**Step 4**

_Example:_

```
Device(config-if)# end
```

Returns to privileged EXEC mode.

**Step 5**

_Example:_

```
Device# show mls qos interface
```

Verifies your entries.

**Step 6**

_Example:_

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Configuring a Trusted Boundary to Ensure Port Security

In a typical network, you connect a Cisco IP Phone to a port and cascade devices that generate data packets from the back of the telephone. The Cisco IP Phone guarantees the voice quality through a shared data link by marking the CoS level of the voice packets as high priority (CoS = 5) and by marking the data packets as low priority (CoS = 0). Traffic sent from the telephone to the is typically marked with a tag that uses the 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which is the priority of the packet.

For most Cisco IP Phone configurations, the traffic sent from the telephone to the should be trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the `mls qos trust cos` interface configuration command, you configure the port to which the telephone is connected to trust the CoS labels of all traffic received on that port. Use the `mls qos trust dscp` interface configuration command
to configure a routed port to which the telephone is connected to trust the DSCP labels of all traffic received on that port.

With the trusted setting, you also can use the trusted boundary feature to prevent misuse of a high-priority queue if a user bypasses the telephone and connects the PC directly to the port. Without trusted boundary, the CoS labels generated by the PC are trusted by the (because of the trusted CoS setting). By contrast, trusted boundary uses CDP to detect the presence of a Cisco IP Phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a port. If the telephone is not detected, the trusted boundary feature disables the trusted setting on the port and prevents misuse of a high-priority queue. Note that the trusted boundary feature is not effective if the PC and Cisco IP Phone are connected to a hub that is connected to the network.

In some situations, you can prevent a PC connected to the Cisco IP Phone from taking advantage of a high-priority data queue. You can use the `switchport priority extend cos` interface configuration command to configure the telephone through the CLI to override the priority of the traffic received from the PC.

**SUMMARY STEPS**

1. `configure terminal`
2. `cdp run`
3. `interface interface-id`
4. `cdp enable`
5. Use one of the following:
   - `mls qos trust cos`
   - `mls qos trust dscp`
6. `mls qos trust device cisco-phone`
7. `end`
8. `show mls qos interface`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>cdp run</code></td>
<td>Enables CDP globally. By default, CDP is enabled.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# cdp run</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>interface interface-id</code></td>
<td>Specifies the port connected to the Cisco IP Phone, and enters interface configuration mode. Valid interfaces include physical ports.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# interface</td>
<td></td>

<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>gigabitethernet 2/1/1</td>
<td>Enables CDP on the port. By default, CDP is enabled.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

`cdp enable`

**Example:**
```
Device(config-if)# cdp enable
```

**Step 5**

Use one of the following:
- `mls qos trust cos`
- `mls qos trust dscp`

**Example:**
```
Device(config-if)# mls qos trust cos
```

Configures the port to trust the CoS value in traffic received from the Cisco IP Phone.

**Step 6**

`mls qos trust device cisco-phone`

**Example:**
```
Device(config-if)# mls qos trust device cisco-phone
```

Specifies that the Cisco IP Phone is a trusted device.

You cannot enable both trusted boundary and auto-QoS (auto qos voip interface configuration command) at the same time; they are mutually exclusive.

**Note**

To disable the trusted boundary feature, use the `no mls qos trust device` interface configuration command.

**Step 7**

`end`

**Example:**
```
Device(config-if)# end
```

Returns to privileged EXEC mode.

**Step 8**

`show mls qos interface`

**Example:**
```
Device# show mls qos interface
```

Verifies your entries.

**Step 9**

`copy running-config startup-config`

**Example:**
```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

**Enabling DSCP Transparency Mode**

The switch supports the DSCP transparency feature. It affects only the DSCP field of a packet at egress. By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the
DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

If DSCP transparency is enabled by using the `no mls qos rewrite ip dscp` command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet, which the switch uses to generate a class of service (CoS) value that represents the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

**SUMMARY STEPS**

1. `configure terminal`
2. `mls qos`
3. `no mls qos rewrite ip dscp`
4. `end`
5. `show mls qos interface [interface-id]`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>mls qos</code></td>
<td>Enables QoS globally.</td>
</tr>
<tr>

<td>Device(config)# <code>end</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show mls qos interface [interface-id]</code></td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>
### DSCP Transparency Mode

To configure the switch to modify the DSCP value based on the trust setting or on an ACL by disabling DSCP transparency, use the `mls qos rewrite ip dscp` global configuration command.

If you disable QoS by using the `no mls qos` global configuration command, the CoS and DSCP values are not changed (the default QoS setting).

If you enter the `no mls qos rewrite ip dscp` global configuration command to enable DSCP transparency and then enter the `mls qos trust [cos | dscp]` interface configuration command, DSCP transparency is still enabled.

**Note**
For Catalyst 2960-L switches, DSCP transparency is enabled by default.

### Configuring the DSCP Trust State on a Port Bordering Another QoS Domain

If you are administering two separate QoS domains between which you want to implement QoS features for IP traffic, you can configure the ports bordering the domains to a DSCP-trusted state. The receiving port accepts the DSCP-trusted value and avoids the classification stage of QoS. If the two domains use different DSCP values, you can configure the DSCP-to-DSCP-mutation map to translate a set of DSCP values to match the definition in the other domain.

*Figure 69: DSCP-Trusted State on a Port Bordering Another QoS Domain*
Beginning in privileged EXEC mode, follow these steps to configure the DSCP-trusted state on a port and modify the DSCP-to-DSCP-mutation map. To ensure a consistent mapping strategy across both QoS domains, you must perform this procedure on the ports in both domains.

**SUMMARY STEPS**

1. `configure terminal`
2. `mls qos map dscp-mutation dscp-mutation-name in-dscp to out-dscp`
3. `interface interface-id`
4. `mls qos trust dscp`
5. `mls qos dscp-mutation dscp-mutation-name`
6. `end`
7. `show mls qos maps dscp-mutation`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>mls qos map dscp-mutation dscp-mutation-name in-dscp to out-dscp</code></td>
<td>Modifies the DSCP-to-DSCP-mutation map. The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# mls qos map dscp-mutation gigabitethernet1/0/2-mutation 10 11 12 13 to 30</td>
<td>• For <code>dscp-mutation-name</code>, enter the mutation map name. You can create more than one map by specifying a new name. • For <code>in-dscp</code>, enter up to eight DSCP values separated by spaces. Then enter the <code>to</code> keyword. • For <code>out-dscp</code>, enter a single DSCP value. The DSCP range is 0 to 63.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>interface interface-id</code></td>
<td>Specifies the port to be trusted, and enter interface configuration mode. Valid interfaces include physical ports.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet1/0/2</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>mls qos trust dscp</code></td>
<td>Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a QoS Policy

Configuring a QoS policy typically requires the following tasks:

- Classifying traffic into classes
- Configuring policies applied to those traffic classes
- Attaching policies to ports

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config-if)# mls qos trust dscp</code></td>
<td>To return a port to its non-trusted state, use the <strong>no mls qos trust</strong> interface configuration command.</td>
</tr>
</tbody>
</table>

#### Step 5

**mls qos dscp-mutation** `dscp-mutation-name`

**Example:**

```
Device(config-if)# mls qos dscp-mutation gigabitethernet1/0/2-mutation
```

Applies the map to the specified ingress DSCP-trusted port.

For `dscp-mutation-name`, specify the mutation map name created in Step 2.

You can configure multiple DSCP-to-DSCP-mutation maps on an ingress port.

**Note**

To return to the default DSCP-to-DSCP-mutation map values, use the **no mls qos map dscp-mutation** `dscp-mutation-name` global configuration command.

#### Step 6

**end**

**Example:**

```
Device(config-if)# end
```

Returns to privileged EXEC mode.

#### Step 7

**show mls qos maps dscp-mutation**

**Example:**

```
Device# show mls qos maps dscp-mutation
```

Verifies your entries.

#### Step 8

**copy running-config startup-config**

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

**Note**

To return a port to its non-trusted state, use the **no mls qos trust interface** configuration command. To return to the default DSCP-to-DSCP-mutation map values, use the **no mls qos map dscp-mutation** `dscp-mutation-name` global configuration command.
These sections describe how to classify, police, and mark traffic. Depending on your network configuration, you must perform one or more of the modules in this section.

Classifying Traffic by Using ACLs

You can classify IP traffic by using IPv4 standard ACLs, IPv4 extended ACLs, or IPv6 ACLs.

You can classify non-IP traffic by using Layer 2 MAC ACLs.

Creating an IP Standard ACL for IPv4 Traffic

Before you begin

Before you perform this task, determine which access lists you will be using for your QoS configuration.

SUMMARY STEPS

1. configure terminal
2. access-list access-list-number {deny | permit} source [source-wildcard]
3. end
4. show access-lists
5. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Creates an IP standard ACL, repeating the command as many times as necessary. |
| access-list access-list-number {deny | permit} source [source-wildcard] | |
| **Example:** |         |
| Device(config)# access-list 1 permit 192.2.255.0 1.1.1.255 | |

- For `access-list-number`, enter the access list number. The range is 1 to 99 and 1300 to 1999.
- Use the `permit` keyword to permit a certain type of traffic if the conditions are matched. Use the `deny` keyword to deny a certain type of traffic if conditions are matched.
- For `source`, enter the network or host from which the packet is being sent. You can use the `any` keyword as an abbreviation for 0.0.0.0 255.255.255.255.
- (Optional) For `source-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.
### Creating an IP Extended ACL for IPv4 Traffic

#### Before you begin
Before you perform this task, determine which access lists you will be using for your QoS configuration.

#### SUMMARY STEPS
1. `configure terminal`
2. `access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard`
3. `end`
4. `show access-lists`
5. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>show access-lists</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>

<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# copy-running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

| Device# configure terminal |

### Purpose

Creates an IP extended ACL, repeating the command as many times as necessary.

- **access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard**

  **Example:**

  ```
  Device(config)# access-list 100 permit ip any any dscp 32
  ```

  - For **access-list-number**, enter the access list number. The range is 100 to 199 and 2000 to 2699.
  - Use the **permit** keyword to permit a certain type of traffic if the conditions are matched. Use the **deny** keyword to deny a certain type of traffic if conditions are matched.
  - For **protocol**, enter the name or number of an IP protocol. Use the question mark (?) to see a list of available protocol keywords.
  - For **source**, enter the network or host from which the packet is being sent. You specify this by using dotted decimal notation, by using the **any** keyword as an abbreviation for source 0.0.0.0 source-wildcard 255.255.255.255, or by using the **host** keyword for source 0.0.0.0.
  - For **source-wildcard**, enter the wildcard bits by placing ones in the bit positions that you want to ignore. You specify the wildcard by using dotted decimal notation, by using the **any** keyword as an abbreviation for source 0.0.0.0 source-wildcard 255.255.255.255, or by using the **host** keyword for source 0.0.0.0.
  - For **destination**, enter the network or host to which the packet is being sent. You have the same options for specifying the destination and destination-wildcard as those described by source and source-wildcard.

When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

**Note**

To delete an access list, use the **no access-list access-list-number** global configuration command.

**Step 3**

| end |

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 4** show access-lists  
Example:  
Device# show access-lists | Verifies your entries. |
| **Step 5** copy running-config startup-config  
Example:  
Device# copy-running-config startup-config | (Optional) Saves your entries in the configuration file. |

### Creating an IPv6 ACL for IPv6 Traffic

**Before you begin**  
Before you perform this task, determine which access lists you will be using for your QoS configuration.

### SUMMARY STEPS

1. configure terminal
2. ipv6 access-list access-list-name
3. {deny | permit} protocol {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]
4. end
5. show ipv6 access-list
6. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 2** ipv6 access-list access-list-name  
Example:  
Device(config)# ipv6 access-list ipv6_Name_ACL | Creates an IPv6 ACL and enters IPv6 access-list configuration mode.  
Accesses list names cannot contain a space or quotation mark or begin with a numeric.  
**Note** To delete an access list, use the **no ipv6 access-list access-list-number** global configuration command. |
<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Enters</strong> <em>deny</em> or <em>permit</em> <strong>to specify whether to deny or permit the packet if conditions are matched. These are the conditions:</strong></td>
</tr>
<tr>
<td>{deny \</td>
<td>permit}  protocol {source-ipv6-prefix/prefix-length} {any \</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config-ipv6-acl)#</strong> permit ip host 10::1 host 11::2 host</td>
</tr>
</tbody>
</table>

*The source-ipv6-prefix/prefix-length or destination-ipv6-prefix/ prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).*

*Enter any as an abbreviation for the IPv6 prefix ::0. *

*For host source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons. *

*(Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are *lt* (less than), *gt* (greater than), *eq* (equal), *neq* (not equal), and *range*. *

If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/ prefix-length argument, it must match the destination port. *

*(Optional) The port-number is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP. *

*(Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63. *

*(Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is IPv6. *

*(Optional) Enter log to cause a logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs.*
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Enter <code>routing</code> to specify that IPv6 packets be routed.</td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter <code>sequence</code> value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.</td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter <code>time-range</code> name to specify the time range that applies to the deny or permit statement.</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 4

**Example:**

```plaintext
Device(config-ipv6-acl)# end
```

Returns to privileged EXEC mode.

#### Step 5

**Example:**

```plaintext
Device# show ipv6 access-list
```

Verifies the access list configuration.

#### Step 6

**Example:**

```plaintext
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Creating a Layer 2 MAC ACL for Non-IP Traffic

**Before you begin**

Before you perform this task, determine that Layer 2 MAC access lists are required for your QoS configuration.

**SUMMARY STEPS**

1. `configure terminal`
2. `mac access-list extended name`
3. `{permit | deny} [host src-MAC-addr mask | any | host dst-MAC-addr | dst-MAC-addr mask] [type mask]`
4. `end`
5. `show access-lists [access-list-number | access-list-name]`
6. `copy running-config startup-config`
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> &lt;br&gt;configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> &lt;br&gt;mac access-list extended name</td>
<td>Creates a Layer 2 MAC ACL by specifying the name of the list.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>After entering this command, the mode changes to extended MAC ACL configuration.</td>
</tr>
<tr>
<td>Device(config)# mac access-list extended maclist1</td>
<td>Note: To delete an access list, use the no mac access-list extended access-list-name global configuration command.</td>
</tr>
<tr>
<td><strong>Step 3</strong> &lt;br&gt;{permit</td>
<td>deny} {host src-MAC-addr mask</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-ext-macl) # permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0 0.0.0 0002.0000.0002 0.0.0 0.0.0 xns-idp</td>
<td>• For src-MAC-addr, enter the MAC address of the host from which the packet is being sent. You specify this by using the hexadecimal format (H.H.H), by using the any keyword as an abbreviation for source 0.0.0, source-wildcard fff.fff.ffe, or by using the host keyword for source 0.0.0.</td>
</tr>
<tr>
<td></td>
<td>• For mask, enter the wildcard bits by placing ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>• For dst-MAC-addr, enter the MAC address of the host to which the packet is being sent. You specify this by using the hexadecimal format (H.H.H), by using the any keyword as an abbreviation for source 0.0.0, source-wildcard fff.fff.ffe, or by using the host keyword for source 0.0.0.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For type mask, specify the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet. For type, the range is from 0 to 65535, typically specified in hexadecimal. For mask, enter the don’t care bits applied to the Ethertype before testing for a match.</td>
</tr>
</tbody>
</table>

When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>

</table>

### Classifying Traffic by Using Class Maps

You use the `class-map` global configuration command to name and to isolate a specific traffic flow (or class) from all other traffic. The class map defines the criteria to use to match against a specific traffic flow to further classify it. Match statements can include criteria such as an ACL, IP precedence values, or DSCP values. The match criterion is defined with one match statement entered within the class-map configuration mode.

**Note**

You can also create class maps during policy map creation by using the `class` policy-map configuration command.

### SUMMARY STEPS

1. `configure terminal`
2. Use one of the following:
   - `access-list access-list-number {deny | permit} source [source-wildcard]`
   - `access-list access-list-number {deny | permit} protocol source [source-wildcard] destination [destination-wildcard]`
   - `ipv6 access-list access-list-name {deny | permit} protocol {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address] [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]`
   - `mac access-list extended name {permit | deny} {host src-MAC-addr mask | any | host dst-MAC-addr | dst-MAC-addr mask} [type mask]`
3. `class-map [match-all | match-any] class-map-name`
4. `match {access-group acl-index-or-name | ip dscp dscp-list | ip precedence ip-precedence-list}`
5. `end`
### Classifying Traffic by Using Class Maps

#### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal&lt;br&gt;Example:&lt;br&gt;Device# configure terminal</td>
</tr>

### QoS

### Classifying Traffic by Using Class Maps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
</tbody>
</table>

**match [access-group acl-index-or-name | ip dscp dscp-list | ip precedence ip-precedence-list]**

**Example:**
```
Device(config-cmap)# match ip dscp 10 11 12
```

Defines the match criterion to classify traffic.

By default, no match criterion is defined.

Only one match criterion per class map is supported, and only one ACL per class map is supported.

- For `access-group acl-index-or-name`, specify the number or name of the ACL created in Step 2.
- To filter IPv6 traffic with the `match access-group` command, create an IPv6 ACL, as described in Step 2.
- For `ip dscp dscp-list`, enter a list of up to eight IP DSCP values to match against incoming packets. Separate each value with a space. The range is 0 to 63.
- For `ip precedence ip-precedence-list`, enter a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7.

**Note** To remove a match criterion, use the `no match {access-group acl-index-or-name | ip dscp | ip precedence}` class-map configuration command.

| **Step 5** |

**end**

**Example:**
```
Device(config-cmap)# end
```

Returns to privileged EXEC mode.

| **Step 6** |

**show class-map**

**Example:**
```
Device# show class-map
```

Verifies your entries.

| **Step 7** |

**copy running-config startup-config**

**Example:**
```
Device# copy-running-config startup-config
```

(Optional) Saves your entries in the configuration file.
Classifying Traffic by Using Class Maps and Filtering IPv6 Traffic

To apply the primary match criteria to only IPv4 traffic, use the `match protocol` command with the `ip` keyword. To apply the primary match criteria to only IPv6 traffic, use the `match protocol` command with the `ipv6` keyword.

**SUMMARY STEPS**

1. `configure terminal`
2. `class-map {match-all} class-map-name`
3. `match protocol [ip | ipv6]`
4. `match {ip dscp dscp-list | ip precedence ip-precedence-list}`
5. `end`
6. `show class-map`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** class-map {match-all} class-map-name | Creates a class map, and enters class-map configuration mode. |
| Example: | |
| Device(config)# class-map cm-1 | |

**By default, no class maps are defined.**

When you use the `match protocol` command, only the `match-all` keyword is supported.

- For `class-map-name`, specify the name of the class map.

If neither the `match-all` or `match-any` keyword is specified, the default is `match-all`.

**Note** To delete an existing class map, use the `no class-map {match-all | match-any} class-map-name` global configuration command.

| **Step 3** match protocol [ip | ipv6] | (Optional) Specifies the IP protocol to which the class map applies: |
| Example: | |
| Device(config-cmap)# match protocol ip | |

- Use the argument `ip` to specify IPv4 traffic and `ipv6` to specify IPv6 traffic.

- When you use the `match protocol` command, only the `match-all` keyword is supported for the class-map command.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> match {ip dscp dscp-list</td>
<td>ip precedence ip-precedence-list}</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-cmap)# match ip dscp 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-cmap)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show class-map</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show class-map</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# copy-running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps

You can configure a policy map on a physical port that specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; and specifying the traffic bandwidth limitations for each matched traffic class (policer) and the action to take when the traffic is out of profile (marking).

A policy map also has these characteristics:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A policy map can contain a predefined default traffic class explicitly placed at the end of the map.
- A separate policy-map class can exist for each type of traffic received through a port.

Follow these guidelines when configuring policy maps on physical ports:
• You can attach only one policy map per ingress port.

• If you configure the IP-precedence-to-DSCP map by using the `mls qos map ip-prec-dscp dscp1...dscp8` global configuration command, the settings only affect packets on ingress interfaces that are configured to trust the IP precedence value. In a policy map, if you set the packet IP precedence value to a new value by using the `set ip precedence new-precedence` policy-map class configuration command, the egress DSCP value is not affected by the IP-precedence-to-DSCP map. If you want the egress DSCP value to be different than the ingress value, use the `set dscp new-dscp` policy-map class configuration command.

• If you enter or have used the `set ip dscp` command, the changes this command to `set dscp` in its configuration.

• You can use the `set ip precedence` or the `set precedence` policy-map class configuration command to change the packet IP precedence value. This setting appears as set ip precedence in the configuration.

• A policy-map and a port trust state can both run on a physical interface. The policy-map is applied before the port trust state.

• When you configure a default traffic class by using the `class class-default` policy-map configuration command, unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as the default traffic class (class-default).

### SUMMARY STEPS

1. `configure terminal`
2. `class-map [match-all | match-any] class-map-name`
3. `policy-map policy-map-name`
4. `class [class-map-name | class-default]`
5. `trust [cos | dscp | ip-precedence]`
6. `set {dscp new-dscp | ip precedence new-precedence}`
7. `police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]`
8. `exit`
9. `exit`
10. `interface interface-id`
11. `service-policy input policy-map-name`
12. `end`
13. `show policy-map [policy-map-name [class class-map-name]]`
14. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>`class-map [match-all</td>
<td>match-any] class-map-name`</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| **Device(config)# class-map ipclass1** | By default, no class maps are defined.  
  - (Optional) Use the **match-all** keyword to perform a logical-AND of all matching statements under this class map. All match criteria in the class map must be matched.  
  - (Optional) Use the **match-any** keyword to perform a logical-OR of all matching statements under this class map. One or more match criteria must be matched.  
  - For **class-map-name**, specify the name of the class map.  
  If neither the **match-all** or **match-any** keyword is specified, the default is **match-all**. |

**Step 3**

**policy-map policy-map-name**  
**Example:**  
**Device(config-cmap)# policy-map flowit**  
**Note**  
To delete an existing policy map, use the **no policy-map policy-map-name** global configuration command.

**Step 4**

**class [class-map-name | class-default]**  
**Example:**  
**Device(config-pmap)# class ipclass1**  
**Note**  
To delete an existing class map, use the **no class class-map-name** policy-map configuration command.

**Step 5**

**trust [cos | dscp | ip-precedence]**  
**Example:**  
**Configure the trust state, which QoS uses to generate a CoS-based or DSCP-based QoS label.**
This command is mutually exclusive with the set command within the same policy map. If you enter the trust command, go to Step 6.

By default, the port is not trusted. If no keyword is specified when the command is entered, the default is dscp.

The keywords have these meanings:

- **cos**—QoS derives the DSCP value by using the received or default port CoS value and the CoS-to-DSCP map.

- **dscp**—QoS derives the DSCP value by using the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS derives the DSCP value by using the received CoS value; for non-IP packets that are untagged, QoS derives the DSCP value by using the default port CoS value. In either case, the DSCP value is derived from the CoS-to-DSCP map.

- **ip-precedence**—QoS derives the DSCP value by using the IP precedence value from the ingress packet and the IP-precedence-to-DSCP map. For non-IP packets that are tagged, QoS derives the DSCP value by using the received CoS value; for non-IP packets that are untagged, QoS derives the DSCP value by using the default port CoS value. In either case, the DSCP value is derived from the CoS-to-DSCP map.

Note To return to the untrusted state, use the no trust policy-map configuration command.

### Step 6

**set** `{dscp new-dscp | ip precedence new-precedence}`

**Example:**

Device(config-pmap-c)# set dscp 45

Classifies IP traffic by setting a new value in the packet.

- For **dscp new-dscp**, enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63.

- For **ip precedence new-precedence**, enter a new IP-precedence value to be assigned to the classified traffic. The range is 0 to 7.

Note To remove an assigned DSCP or IP precedence value, use the no set `{dscp new-dscp | ip precedence new-precedence}` policy-map configuration command.

### Step 7

**police** `rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]`

**Example:**

Device(config-pmap-c)# police 100000

Defines a policer for the classified traffic.

By default, no policer is defined.

- For **rate-bps**, specify average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 80000 drop       | • For burst-byte, specify the normal burst size in bytes. The range is 8000 to 1000000.  
|                  | • (Optional) Specifies the action to take when the rates are exceeded. Use the **exceed-action drop** keywords to drop the packet. Use the **exceed-action policed-dscp-transmit** keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet.  |
|                  | **Note** To remove an existing policer, use the **no police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]** policy-map configuration command. |

**Step 8**

_**exit**_

**Example:**

Device(config-pmap-c)# exit

Returns to policy map configuration mode.

**Step 9**

_**exit**_

**Example:**

Device(config-pmap)# exit

Returns to global configuration mode.

**Step 10**

_**interface interface-id**_

**Example:**

Device(config)# interface gigabitethernet 2/0/1

Specifies the port to attach to the policy map, and enters interface configuration mode.  
Valid interfaces include physical ports.

**Step 11**

_**service-policy input policy-map-name**_

**Example:**

Device(config-if)# service-policy input flowit

Specifies the policy-map name, and applies it to an ingress port.  
Only one policy map per ingress port is supported.  
**Note** To remove the policy map and port association, use the **no service-policy input policy-map-name** interface configuration command.

**Step 12**

_**end**_

**Example:**

Device(config-if)# end

Returns to privileged EXEC mode.
### Command or Action | Purpose
--- | ---
**Step 13** | **show policy-map**
Example:
Device# show policy-map
**Step 14** | **copy running-config startup-config**
Example:
Device# copy-running-config startup-config

### Classifying, Policing, and Marking Traffic by Using Aggregate Policers

By using an aggregate policer, you can create a policer that is shared by multiple traffic classes within the same policy map. However, you cannot use the aggregate policer across different policy maps or ports.

You can configure aggregate policers only in nonhierarchical policy maps on physical ports.

### SUMMARY STEPS

1. configure terminal
2. mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action {drop | policed-dscp-transmit}
3. class-map [match-all | match-any] class-map-name
4. policy-map policy-map-name
5. class [class-map-name | class-default]
6. police aggregate aggregate-policer-name
7. exit
8. interface interface-id
9. service-policy input policy-map-name
10. end
11. show mls qos aggregate-policer [aggregate-policer-name]
12. copy running-config startup-config

### DETAILED STEPS

### Command or Action | Purpose
--- | ---
**Step 1** | **configure terminal**
Example:
Device# configure terminal

- Enters global configuration mode.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>`mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action {drop</td>
<td>policed-dscp-transmit}`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# mls qos aggregate-policer transmit1 48000 8000 exceed-action policed-dscp-transmit</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`class-map [match-all</td>
<td>match-any] class-map-name`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# class-map ipclass1</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>policy-map policy-map-name</code></td>
<td>Creates a policy map by entering the policy map name, and enters policy-map configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-cmap)# policy-map aggflow1</code></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>`class [class-map-name</td>
<td>class-default]`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-cmap-p)# class ipclass1</code></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>police aggregate aggregate-policer-name</code></td>
<td>Applies an aggregate policer to multiple classes in the same policy map.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(configure-cmap-p)# police aggregate transmit1</code></td>
<td></td>
</tr>
</tbody>
</table>

For aggregate-policer-name, enter the name specified in Step 2.

To remove the specified aggregate policer from a policy map, use the `no police aggregate aggregate-policer-name` policy map configuration command. To delete an aggregate policer and its parameters, use the `no mls qos aggregate-policer aggregate-policer-name` global configuration command.
### Command or Action

<table>
<thead>
<tr>
<th>Step 7</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(configure-cmap-p)# exit</td>
</tr>

<th>Step 8</th>
<th>interface interface-id</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# interface gigabitethernet 2/0/1</td>
</tr>
</tbody>
</table>

### Purpose

- Specifies the port to attach to the policy map, and enters interface configuration mode.
- Valid interfaces include physical ports.

<table>
<thead>
<tr>
<th>Step 9</th>
<th>service-policy input policy-map-name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-if)# service-policy input aggflow1</td>
</tr>
</tbody>
</table>

### Purpose

- Specifies the policy-map name, and applies it to an ingress port.
- Only one policy map per ingress port is supported.

<table>
<thead>
<tr>
<th>Step 10</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(configure-if)# end</td>
</tr>
</tbody>
</table>

### Purpose

- Returns to privileged EXEC mode.

<table>
<thead>
<tr>
<th>Step 11</th>
<th>show mls qos aggregate-policer [aggregate-policer-name]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# show mls qos aggregate-policer transmit1</td>
</tr>
</tbody>
</table>

### Purpose

- Verifies your entries.

<table>
<thead>
<tr>
<th>Step 12</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# copy-running-config startup-config</td>
</tr>
</tbody>
</table>

### Purpose

- (Optional) Saves your entries in the configuration file.

---

## Configuring DSCP Maps

### Configuring the CoS-to-DSCP Map

You use the CoS-to-DSCP map to map CoS values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Beginning in privileged EXEC mode, follow these steps to modify the CoS-to-DSCP map. This procedure is optional.
SUMMARY STEPS

1. configure terminal
2. mls qos map cos-dscp dscp1...dscp8
3. end
4. show mls qos maps cos-dscp
5. copy running-config startup-config

Configuring the IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.
Beginning in privileged EXEC mode, follow these steps to modify the IP-precedence-to-DSCP map. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. mls qos map ip-prec-dscp dscp1...dscp8
3. end
4. show mls qos maps ip-prec-dscp
5. copy running-config startup-config

**DETAILED STEPS**

## Configuring the Policed-DSCP Map

You use the policed-DSCP map to mark down a DSCP value to a new value as the result of a policing and marking action.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value. Beginning in privileged EXEC mode, follow these steps to modify the policed-DSCP map. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `mls qos map policed-dscp dscp-list to mark-down-dscp`
3. `end`
4. `show mls qos maps policed-dscp`
5. `copy running-config startup-config`

### Configuring the DSCP-to-CoS Map

You use the DSCP-to-CoS map to generate a CoS value, which is used to select one of the four egress queues. Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-CoS map. This procedure is optional.

#### SUMMARY STEPS

1. `configure terminal`
2. `mls qos map dscp-cos dscp-list to cos`
3. `end`
4. `show mls qos maps dscp-to-cos`
5. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>mls qos map dscp-cos dscp-list to cos</code></td>
<td>Modifies the DSCP-to-CoS map.</td>
</tr>
</tbody>
</table>
| Example: | `Device(config)# mls qos map dscp-cos 0 8 16 24 32 40 48 50 to 0` | - For `dscp-list`, enter up to eight DSCP values separated by spaces. Then enter the `to` keyword.  
- For `cos`, enter the CoS value to which the DSCP values correspond.  
The DSCP range is 0 to 63; the CoS range is 0 to 7. |
| Note | To return to the default map, use the `no mls qos dscp-cos` global configuration command. | |
| Step 3 | `end` | Returns to privileged EXEC mode. |
| Example: | `Device(config)# end` | |
Configuring the DSCP-to-DSCP-Mutation Map

If two QoS domains have different DSCP definitions, use the DSCP-to-DSCP-mutation map to translate one set of DSCP values to match the definition of another domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a QoS administrative domain.

With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS applies the new value to the packet. The sends the packet out the port with the new DSCP value.

You can configure multiple DSCP-to-DSCP-mutation maps on an ingress port. The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-DSCP-mutation map. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. mls qos map dscp-mutation dscp-mutation-name in-dscp to out-dscp
3. interface interface-id
4. mls qos trust dscp
5. mls qos dscp-mutation dscp-mutation-name
6. end
7. show mls qos maps dscp-mutation
8. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>

<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 2** mls qos map dscp-mutation dscp-mutation-name in-dscp to out-dscp  
Example:  
Device(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 0 | Modifies the DSCP-to-DSCP-mutation map.  
- For `dscp-mutation-name`, enter the mutation map name. You can create more than one map by specifying a new name.  
- For `in-dscp`, enter up to eight DSCP values separated by spaces. Then enter the `to` keyword.  
- For `out-dscp`, enter a single DSCP value.  
The DSCP range is 0 to 63.  
**Note** To return to the default map, use the `no mls qos dscp-mutation dscp-mutation-name` global configuration command. |
| **Step 3** interface interface-id  
Example:  
Device(config)# interface gigabitethernet1/0/1 | Specifies the port to which to attach the map, and enters interface configuration mode.  
Valid interfaces include physical ports. |
| **Step 4** mls qos trust dscp  
Example:  
Device(config-if)# mls qos trust dscp | Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted. |
| **Step 5** mls qos dscp-mutation dscp-mutation-name  
Example:  
Device(config-if)# mls qos dscp-mutation mutation1 | Applies the map to the specified ingress DSCP-trusted port.  
For `dscp-mutation-name`, enter the mutation map name specified in Step 2. |
| **Step 6** end  
Example:  
Device(config-if)# end | Returns to privileged EXEC mode. |
| **Step 7** show mls qos maps dscp-mutation  
Example:  
Device# show mls qos maps dscp-mutation | Verifies your entries. |
| **Step 8** copy running-config startup-config  
Example: | (Optional) Saves your entries in the configuration file. |
Configuring Ingress Queue Characteristics

Depending on the complexity of your network and your QoS solution, you might need to perform all of the tasks in the next modules. You need to make decisions about these characteristics:

- Which packets are assigned (by DSCP or CoS value) to each queue?
- What drop percentage thresholds apply to each queue, and which CoS or DSCP values map to each threshold?
- How much of the available buffer space is allocated between the queues?
- How much of the available bandwidth is allocated between the queues?
- Is there traffic (such as voice) that should be given high priority?

Configuration Guidelines

Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:

- If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.
- If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.
- If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services this queue in shared mode.

Mapping DSCP or CoS Values to an Ingress Queue and Setting WTD Thresholds

You can prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues and adjusting the queue thresholds so that packets with lower priorities are dropped.

Beginning in privileged EXEC mode, follow these steps to map DSCP or CoS values to an ingress queue and to set WTD thresholds. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. Use one of the following:
   
   - `mls qos srr-queue input dscp-map queue queue-id threshold threshold-id dscp1...dscp8`
   - `mls qos srr-queue input cos-map queue queue-id threshold threshold-id cos1...cos8`
3. `mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2`
4. `end`
5. `show mls qos maps`
6. `copy running-config startup-config`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Use one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>mls qos srr-queue input dscp-map queue queue-id threshold threshold-id dscp1...dscp8</code></td>
<td></td>
</tr>
<tr>
<td>• <code>mls qos srr-queue input cos-map queue queue-id threshold threshold-id cos1...cos8</code></td>
<td></td>
</tr>
<tr>
<td>Example: <code>Device(config)# mls qos srr-queue input dscp-map queue 1 threshold 2 20 21 22 23 24 25 26</code></td>
<td></td>
</tr>
</tbody>
</table>

Maps DSCP or CoS values to an ingress queue and to a threshold ID.

- By default, DSCP values 0–39 and 48–63 are mapped to queue 1 and threshold 1. DSCP values 40–47 are mapped to queue 2 and threshold 1.
- By default, CoS values 0–4, 6, and 7 are mapped to queue 1 and threshold 1. CoS value 5 is mapped to queue 2 and threshold 1.

  - For `queue-id`, the range is 1 to 2.
  - For `threshold-id`, the range is 1 to 3. The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
  - For `dscp1...dscp8`, enter up to eight values, and separate each value with a space. The range is 0 to 63.
  - For `cos1...cos8`, enter up to eight values, and separate each value with a space. The range is 0 to 7.

<table>
<thead>
<tr>
<th>Step 3</th>
<th><code>mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: <code>Device(config)# mls qos srr-queue input threshold 1 50 70</code></td>
<td></td>
</tr>
</tbody>
</table>

Assigns the two WTD threshold percentages for (threshold 1 and 2) to an ingress queue. The default, both thresholds are set to 100 percent.

  - For `queue-id`, the range is 1 to 2.
  - For `threshold-percentage1 threshold-percentage2`, the range is 1 to 100. Separate each value with a space.

Each threshold value is a percentage of the total number of queue descriptors allocated for the queue.

<table>
<thead>
<tr>
<th>Step 4</th>
<th><code>end</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: <code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

Returns to privileged EXEC mode.

<table>
<thead>
<tr>
<th>Step 5</th>
<th><code>show mls qos maps</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td>The DSCP input queue threshold map appears as a matrix. The d1 column specifies the most-significant digit of the</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Device# show mls qos maps</td>
<td>DSCP number; the d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID; for example, queue 2 and threshold 1 (02-01). The CoS input queue threshold map shows the CoS value in the top row and the corresponding queue ID and threshold ID in the second row; for example, queue 2 and threshold 2 (2-2).</td>
</tr>
</tbody>
</table>

**Step 6**

- **copy running-config startup-config**

  **Example:**

  Device# copy running-config startup-config

  (Optional) Saves your entries in the configuration file.

  To return to the default CoS input queue threshold map or the default DSCP input queue threshold map, use the **no mls qos srr-queue input cos-map** or the **no mls qos srr-queue input dscp-map** global configuration command. To return to the default WTD threshold percentages, use the **no mls qos srr-queue input threshold queue-id** global configuration command.

---

## Allocating Buffer Space Between the Ingress Queues

You define the ratio (allocate the amount of space) with which to divide the ingress buffers between the two queues. The buffer and the bandwidth allocation control how much data can be buffered before packets are dropped.

Beginning in privileged EXEC mode, follow these steps to allocate the buffers between the ingress queues. This procedure is optional.

### SUMMARY STEPS

1. configure terminal
2. mls qos srr-queue input buffers percentage1 percentage2
3. end
4. Use one of the following:
   - show mls qos interface buffer
   - show mls qos input-queue
5. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<p>| Step 2                           | Allocates the buffers between the ingress queues                                        |
| mls qos srr-queue input buffers  | percentage1 percentage2                                                                  |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>By default 90 percent of the buffers are allocated to queue 1, and 10 percent of the buffers are allocated to queue 2.</td>
</tr>
<tr>
<td></td>
<td>For percentage1 percentage2, the range is 0 to 100. Separate each value with a space.</td>
</tr>
<tr>
<td></td>
<td>You should allocate the buffers so that the queues can handle any incoming bursty traffic.</td>
</tr>
</tbody>
</table>

**Step 3**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 4**

Use one of the following:

* show mls qos interface buffer
* show mls qos input-queue

**Example:**

```
Device# show mls qos interface buffer
```

or

```
Device# show mls qos input-queue
```

Verifies your entries.

**Step 5**

**Example:**

```
Device# copy-running-config startup-config
```

(Optional) Saves your entries in the configuration file.

To return to the default setting, use the `no mls qos srr-queue input buffers` global configuration command.

---

**Allocating Bandwidth Between the Ingress Queues**

You need to specify how much of the available bandwidth is allocated between the ingress queues. The ratio of the weights is the ratio of the frequency in which the SRR scheduler sends packets from each queue. The bandwidth and the buffer allocation control how much data can be buffered before packets are dropped. On ingress queues, SRR operates only in shared mode.

**Note**

SRR bandwidth limit works in both mls qos enabled and disabled states.

Beginning in privileged EXEC mode, follow these steps to allocate bandwidth between the ingress queues. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `mls qos srr-queue input bandwidth weight1 weight2`
3. `end`
4. Use one of the following:
   - `show mls qos interface queueing`
   - `show mls qos input-queue`
5. `copy running-config startup-config`

### Configuring Egress Queue Characteristics

Depending on the complexity of your network and your QoS solution, you might need to perform all of the tasks in the following modules. You need to make decisions about these characteristics:

- Which packets are mapped by DSCP or CoS value to each queue and threshold ID?
- What drop percentage thresholds apply to the queue-set (four egress queues per port), and how much reserved and maximum memory is needed for the traffic type?
- How much of the fixed buffer space is allocated to the queue-set?
- Does the bandwidth of the port need to be rate limited?
- How often should the egress queues be serviced and which technique (shaped, shared, or both) should be used?

### Configuration Guidelines

Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:

- If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.
- If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.
- If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services this queue in shared mode.

### Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue-Set

You can guarantee the availability of buffers, set WTD thresholds, and configure the maximum allocation for a queue-set by using the `mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold` global configuration command.

Each threshold value is a percentage of the queue’s allocated buffers, which you specify by using the `mls qos queue-set output qset-id buffers allocation1 ... allocation4` global configuration command. The queues use WTD to support distinct drop percentages for different traffic classes.
The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the `mls qos srr-queue output queues 8` global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds, buffers, bandwidth share weights, and bandwidth shape weights for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to configure the memory allocation and to drop thresholds for a queue-set. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `mls qos srr-queue output queues 8`
3. `mls qos queue-set output qset-id buffers allocation1 ... allocation8`
4. `mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold`
5. `interface interface-id`
6. `queue-set qset-id`
7. `end`
8. `show mls qos interface [interface-id] buffers`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | (Optional) The switch supports 4 egress queues by default, although you can enable a total of 8 egress queues. Use the optional `mls qos srr-queue output queues 8` command to enable the additional 4 egress queues. Once 8 queue support is enabled, you can then proceed to configure the additional 4 queues. Any existing egress queue configuration commands are then modified to support the additional queue parameters. |
| `mls qos srr-queue output queues 8` | |
| Example: | |
| `Device(config)# mls qos srr-queue output queues 8` | |

**Note** The option to enable 8 queues is only available on a standalone switch.
### Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue-Set

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>Allocates buffers to a queue set.</td>
</tr>
<tr>
<td>mls qos queue-set output qset-id buffers allocation1 ... allocation8</td>
<td>By default, all allocation values are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of the buffer space. When eight egress queues are configured, then by default 30 percent of the total buffer space is allocated to queue 2 and 10 percent (each) to queues 1, 3, 4, 5, 6, 7, and 8.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# mls qos queue-set output 2 buffers 40 20 20 20 10 10 10 10</td>
<td>If you enabled 8 egress queues as described in Step 2 above, then the following applies:</td>
</tr>
<tr>
<td></td>
<td>• For qset-id, enter the ID of the queue set. The range is 1 to 2. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port.</td>
</tr>
<tr>
<td></td>
<td>• For allocation1 ... allocation8, specify eight percentages, one for each queue in the queue set. For allocation1, allocation3, and allocation4 to allocation8, the range is 0 to 99. For allocation2, the range is 1 to 100 (including the CPU buffer).</td>
</tr>
<tr>
<td></td>
<td>Allocate buffers according to the importance of the traffic; for example, give a large percentage of the buffer to the queue with the highest-priority traffic.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>To return to the default setting, use the no mls qos queue-set output qset-id buffers global configuration command.</td>
</tr>
</tbody>
</table>

| **Step 4** | Configures the WTD thresholds, guarantee the availability of buffers, and configure the maximum memory allocation for the queue-set (four egress queues per port). |
| mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold | By default, the WTD thresholds for queues 1, 3, and 4 are set to 100 percent. The thresholds for queue 2 are set to 200 percent. The reserved thresholds for queues 1, 2, 3, and 4 are set to 50 percent. The maximum thresholds for all queues are set to 400 percent by default. |
| **Example:** | If you enabled 8 egress queues as described in Step 2 above, then the following applies: |
| Device(config)# mls qos queue-set output 2 threshold 2 40 60 100 200 | • For qset-id, enter the ID of the queue-set specified in Step 2. The range is 1 to 2. |
| | • For queue-id, enter the specific queue in the queue set on which the command is performed. The queue-id range is 1-4 by default and 1-8 when 8 queues are enabled. |
| | • For drop-threshold1 drop-threshold2, specify the two WTD thresholds expressed as a percentage of the |
### Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue-Set

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>queue's allocated memory.</strong> The range is 1 to 3200 percent.</td>
<td>• For <em>reserved-threshold</em>, enter the amount of memory to be guaranteed (reserved) for the queue expressed as a percentage of the allocated memory. The range is 1 to 100 percent.</td>
</tr>
<tr>
<td>• For <em>maximum-threshold</em>, enable a queue in the full condition to obtain more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped if the common pool is not empty. The range is 1 to 3200 percent.</td>
<td><strong>Note</strong> To return to the default WTD threshold percentages, use the <strong>no mls qos queue-set output qset-id threshold [queue-id]</strong> global configuration command.</td>
</tr>
</tbody>
</table>

#### Step 5

**interface interface-id**

**Example:**

Device(config)# interface gigabitethernet1/0/1

This specifies the port of the outbound traffic, and enters interface configuration mode.

#### Step 6

**queue-set qset-id**

**Example:**

Device(config-id)# queue-set 2

This maps the port to a queue-set.

For *qset-id*, enter the ID of the queue-set specified in Step 2. The range is 1 to 2. The default is 1.

#### Step 7

**end**

**Example:**

Device(config-id)# end

This returns to privileged EXEC mode.

#### Step 8

**show mls qos interface [interface-id] buffers**

**Example:**

Device# show mls qos interface buffers

This verifies your entries.

#### Step 9

**copy running-config startup-config**

**Example:**

Device# copy-running-config startup-config

(Optional) Saves your entries in the configuration file.

To return to the default setting, use the **no mls qos queue-set output qset-id buffers** global configuration command. To return to the default WTD threshold percentages, use the **no mls qos queue-set output qset-id threshold [queue-id]** global configuration command.
Mapping DSCP or CoS Values to an Egress Queue and to a Threshold ID

You can prioritize traffic by placing packets with particular DSCPs or costs of service into certain queues and adjusting the queue thresholds so that packets with lower priorities are dropped.

Note
The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to map DSCP or CoS values to an egress queue and to a threshold ID. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. Use one of the following:
   - mls qos srr-queue output dscp-map queue queue-id threshold threshold-id dscp1...dscp8
   - mls qos srr-queue output cos-map queue queue-id threshold threshold-id cos1...cos8
3. mls qos srr-queue output cos-map queue queue-id threshold threshold-id cos1...cos8
4. end
5. show mls qos maps
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 | Maps DSCP or CoS values to an egress queue and to a threshold ID. |
| Use one of the following: | |
| • mls qos srr-queue output dscp-map queue queue-id threshold threshold-id dscp1...dscp8 | |
| • mls qos srr-queue output cos-map queue queue-id threshold threshold-id cos1...cos8 | |
| Example: | |
| Device(config)# mls qos srr-queue output dscp-map queue 1 threshold 2 10 11 | |

By default, DSCP values 0–15 are mapped to queue 2 and threshold 1. DSCP values 16–31 are mapped to queue 3 and threshold 1. DSCP values 32–39 and 48–63 are mapped to queue 4 and threshold 1. DSCP values 40–47 are mapped to queue 1 and threshold 1.

By default, CoS values 0 and 1 are mapped to queue 2 and threshold 1. CoS values 2 and 3 are mapped to queue 3 and threshold 1. CoS values 4, 6, and 7 are mapped to queue 4 and threshold 1. CoS value 5 is mapped to queue 1 and threshold 1.

• For queue-id, the range is 1 to 4.
### Purpose

If you enabled 8 egress queues using the `mls qos srr-queue output queues 8` global configuration command, then the `queue-id` range would be from 1 to 8.

- For `threshold-id`, the range is 1 to 3. The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
- For `dscp1...dscp8`, enter up to eight values, and separate each value with a space. The range is 0 to 63.
- For `cos1...cos8`, enter up to eight values, and separate each value with a space. The range is 0 to 7.

**Note**

To return to the default DSCP output queue threshold map or the default CoS output queue threshold map, use the `no mls qos srr-queue output dscp-map` or the `no mls qos srr-queue output cos-map` global configuration command.

### Command or Action | Purpose
--- | ---
| **Step 3** `mls qos srr-queue output cos-map queue queue-id threshold threshold-id cos1...cos8` | Maps CoS values to an egress queue and to a threshold ID. By default, CoS values 0 and 1 are mapped to queue 2 and threshold 1. CoS values 2 and 3 are mapped to queue 3 and threshold 1. CoS values 4, 6, and 7 are mapped to queue 4 and threshold 1. CoS value 5 is mapped to queue 1 and threshold 1.
- For `queue-id`, the range is 1 to 4.
- For `threshold-id`, the range is 1 to 3. The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
- For `cos1...cos8`, enter up to eight values, and separate each value with a space. The range is 0 to 7.

**Note** To return to the default CoS output queue threshold map, use the `no mls qos srr-queue output cos-map` global configuration command.
| **Step 4** `end` | Returns to privileged EXEC mode.
| **Step 5** `show mls qos maps` | Verifies your entries.
The DSCP output queue threshold map appears as a matrix. The d1 column specifies the most-significant digit of the...
### Configuring SRR Shaped Weights on Egress Queues

You can specify how much of the available bandwidth is allocated to each queue. The ratio of the weights is the ratio of frequency in which the SRR scheduler sends packets from each queue.

You can configure the egress queues for shaped or shared weights, or both. Use shaping to smooth bursty traffic or to provide a smoother output over time.

Beginning in privileged EXEC mode, follow these steps to assign the shaped weights and to enable bandwidth shaping on the four egress queues mapped to a port. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `srr-queue bandwidth shape weight1 weight2 weight3 weight4`
4. `end`
5. `show mls qos interface interface-id queueing`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 `interface interface-id`        | Specifies the port of the outbound traffic, and enters interface configuration mode. |
| Example:                               |                                                   |
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# interface gigabitethernet2/0/1</code></td>
<td>Assigns SRR weights to the egress queues. By default, weight1 is set to 25; weight2, weight3, and weight4 are set to 0, and these queues are in shared mode.</td>
</tr>
</tbody>
</table>
| **Step 3** `srr-queue bandwidth shape` **weight1 weight2 weight3 weight4**  
**Example:**  
`Device(config-if)# srr-queue bandwidth shape 8 0 0 0` | For weight1 weight2 weight3 weight4, enter the weights to control the percentage of the port that is shaped. The inverse ratio (1/weight) controls the shaping bandwidth for this queue. Separate each value with a space. The range is 0 to 65535.  
If you configure a weight of 0, the corresponding queue operates in shared mode. The weight specified with the `srr-queue bandwidth shape` command is ignored, and the weights specified with the `srr-queue bandwidth share` interface configuration command for a queue come into effect. When configuring queues in the same queue-set for both shaping and sharing, make sure that you configure the lowest number queue for shaping.  
The shaped mode overrides the shared mode.  
To return to the default setting, use the `no srr-queue bandwidth shape` interface configuration command.  
**Note** If you enabled 8 egress queues using the `mls qos srr-queue output queues 8` global configuration command, then you would be able to assign SRR weights to a total of 8 queues. |
| **Step 4** `end`  
**Example:**  
`Device(config-if)# end` | Returns to privileged EXEC mode. |
| **Step 5** `show mls qos interface interface-id queuing`  
**Example:**  
`Device# show mls qos interface interface-id queuing` | Verifies your entries. |
| **Step 6** `copy running-config startup-config`  
**Example:**  
`Device# copy running-config startup-config` | (Optional) Saves your entries in the configuration file.  
To return to the default setting, use the `no srr-queue bandwidth shape` interface configuration command. |
Configuring SRR Shared Weights on Egress Queues

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue empties and does not require a share of the link, the remaining queues can expand into the unused bandwidth and share it among them. With sharing, the ratio of the weights controls the frequency of dequeuing; the absolute values are meaningless.

**Note**
The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. srr-queue bandwidth share weight1 weight2 weight3 weight4
4. end
5. show mls qos interface interface-id queueing
6. copy running-config startup-config

### Purpose

**Command or Action**

- **Step 4**
  - end
  - Example:
    ```
    Device(config-id)# end
    ```
  - Purpose: Returns to privileged EXEC mode.

- **Step 5**
  - show mls qos interface interface-id queueing
  - Example:
    ```
    Device# show mls qos interface interface_id queuing
    ```
  - Purpose: Verifies your entries.

- **Step 6**
  - copy running-config startup-config
  - Example:
    ```
    Device# copy-running-config startup-config
    ```
  - Purpose: (Optional) Saves your entries in the configuration file. To return to the default setting, use the **no srr-queue bandwidth share** interface configuration command.

---

### Note

If you enabled 8 egress queues using the **mls qos srr-queue output queues 8** global configuration command, then you would be able to assign SRR weights to a total of 8 queues.

<td>Displays global QoS configuration information.</td>
</tr>
<tr>
<td><code>show mls qos aggregate-policer [aggregate-policer-name]</code></td>
<td>Displays the aggregate policer configuration.</td>
</tr>
<tr>
<td>`show mls qos interface [interface-id] [buffers</td>
<td>policers</td>
</tr>
<tr>
<td><code>show mls qos queue-set [qset-id]</code></td>
<td>Displays QoS settings for the egress queues.</td>
</tr>
</tbody>
</table>
Command | Description
---|---
`show policy-map [policy-map-name [class class-map-name]]` | Displays QoS policy maps, which define classification criteria for incoming traffic. Do not use the `show policy-map interface` privileged EXEC command to display classification information for incoming traffic. The `control-plane` and `interface` keywords are not supported, and the statistics shown in the display should be ignored.

`show running-config | include rewrite` | Displays the DSCP transparency setting.

### Configuration Examples for QoS

#### Example: Configuring Port to the DSCP- Trusted State and Modifying the DSCP-to-DSCP-Mutation Map

This example shows how to configure a port to the DSCP-trusted state and to modify the DSCP-to-DSCP-mutation map (named `g1/0/2-mutation`) so that incoming DSCP values 10 to 13 are mapped to DSCP 30:

```
Device(config)# mls qos map dscp-mutation gigabitethernet1/0/2-mutation 10 11 12 13 to 30
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# mls qos trust dscp
Device(config-if)# mls qos dscp-mutation gigabitethernet1/0/2-mutation
Device(config-if)# end
```

#### Examples: Classifying Traffic by Using ACLs

This example shows how to allow access for only those hosts on the three specified networks. The wildcard bits apply to the host portions of the network addresses. Any host with a source address that does not match the access list statements is rejected.

```
Device(config)# access-list 1 permit 192.5.255.0 0.0.0.255
Device(config)# access-list 1 permit 128.88.0.0 0.0.255.255
Device(config)# access-list 1 permit 36.0.0.0 0.0.0.255
! (Note: all other access implicitly denied)
```

This example shows how to create an ACL that permits IP traffic from any source to any destination that has the DSCP value set to 32:

```
Device(config)# access-list 100 permit ip any any dscp 32
```

This example shows how to create an ACL that permits IP traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:
Examples: Classifying Traffic by Using Class Maps

This example shows how to create an ACL that permits PIM traffic from any source to a destination group address of 224.0.0.2 with a DSCP set to 32:

Device(config)# access-list 102 permit pim any 224.0.0.2 dscp 32

This example shows how to create an ACL that permits IPv6 traffic from any source to any destination that has the DSCP value set to 32:

Device(config)# ipv6 access-list 100 permit ip any any dscp 32

This example shows how to create an ACL that permits IPv6 traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:

Device(config)# ipv6 access-list ipv6_Name_ACL permit ip host 10::1 host 10.1.1.2 precedence 5

This example shows how to create a Layer 2 MAC ACL with two permit statements. The first statement allows traffic from the host with MAC address 0001.0000.0001 to the host with MAC address 0002.0000.0001. The second statement allows only Ethertype XNS-IDP traffic from the host with MAC address 0001.0000.0002 to the host with MAC address 0002.0000.0002.

Device(config)# mac access-list extended maclist1
Device(config-ext-macl)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Device(config-ext-macl)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
! (Note: all other access implicitly denied)

Examples: Classifying Traffic by Using Class Maps

This example shows how to configure the class map called class1. The class1 has one match criterion, which is access list 103. It permits traffic from any host to any destination that matches a DSCP value of 10.

Device(config)# access-list 103 permit ip any any dscp 10
Device(config)# class-map class1
Device(config-cmap)# match access-group 103
Device(config-cmap)# end
Device#

This example shows how to create a class map called class2, which matches incoming traffic with DSCP values of 10, 11, and 12.

Device(config)# class-map class2
Device(config-cmap)# match ip dscp 10 11 12
Device(config-cmap)# end
Device#

This example shows how to create a class map called class3, which matches incoming traffic with IP-precedence values of 5, 6, and 7:
Device(config)# class-map class3
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# end
Device#

This example shows how to configure a class map to match IP DSCP and IPv6:

Device(config)# Class-map cm-1
Device(config-cmap)# match ip dscp 10
Device(config-cmap)# match protocol ipv6
Device(config-cmap)# exit
Device(config)# Class-map cm-2
Device(config-cmap)# match ip dscp 20
Device(config-cmap)# match protocol ip
Device(config-cmap)# exit
Device(config)# Policy-map pml
Device(config-pmap)# class cm-1
Device(config-pmap-c)# set dscp 4
Device(config-pmap-c)# exit
Device(config-pmap)# class cm-2
Device(config-pmap-c)# set dscp 6
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# interface G1/0/1
Device(config-if)# service-policy input pml

This example shows how to configure a class map that applies to both IPv4 and IPv6 traffic:

Device(config)# ip access-list 101 permit ip any any
Device(config)# ipv6 access-list ipv6-any permit ip any any
Device(config)# Class-map cm-1
Device(config-cmap)# match access-group 101
Device(config-cmap)# exit
Device(config)# Class-map cm-2
Device(config-cmap)# match access-group name ipv6-any
Device(config-cmap)# exit
Device(config)# Policy-map pml
Device(config-pmap)# class cm-1
Device(config-pmap-c)# set dscp 4
Device(config-pmap-c)# exit
Device(config-pmap)# class cm-2
Device(config-pmap-c)# set dscp 6
Device(config-pmap-c)# exit

Device(config-if)# switch mode access
Device(config-if)# service-policy input pml

Examples: Classifying, Policing, and Marking Traffic on Physical Ports Using Policy Maps

This example shows how to create a policy map and attach it to an ingress port. In the configuration, the IP standard ACL permits traffic from network 10.1.0.0. For traffic matching this classification, the DSCP value...
in the incoming packet is trusted. If the matched traffic exceeds an average traffic rate of 48000 b/s and a
normal burst size of 8000 bytes, its DSCP is marked down (based on the policed-DSCP map) and sent:

```plaintext
Device(config)# access-list 1 permit 10.1.0.0 0.0.255.255
Device(config)# class-map ipclass1
Device(config-cmap)# match access-group 1
Device(config-cmap)# exit
Device(config)# policy-map flow1t
Device(config-pmap)# class ipclass1
Device(config-pmap-c)# trust dscp
Device(config-pmap-c)# police 1000000 8000 exceed-action policed-dscp-transmit
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# service-policy input flow1t
```

This example shows how to create a Layer 2 MAC ACL with two permit statements and attach it to an ingress
port. The first permit statement allows traffic from the host with MAC address 0001.0000.0001 destined for
the host with MAC address 0002.0000.0001. The second permit statement allows only Ethertype XNS-IDP
traffic from the host with MAC address 0001.0000.0002 destined for the host with MAC address
0002.0000.0002.

```plaintext
Device(config)# mac access-list extended maclist1
Device(config-ext-mac)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Device(config-ext-mac)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
Device(config-ext-mac)# exit
Device(config)# mac access-list extended maclist2
Device(config-ext-mac)# permit 0001.0000.0003 0.0.0 0002.0000.0003 0.0.0
Device(config-ext-mac)# permit 0001.0000.0004 0.0.0 0002.0000.0004 0.0.0 aarp
Device(config-ext-mac)# exit
Device(config)# class-map macclass1
Device(config-cmap)# match access-group maclist1
Device(config-cmap)# exit
Device(config)# policy-map macpolicy1
Device(config-pmap)# class macclass1
Device(config-pmap-c)# set dscp 63
Device(config-pmap-c)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# mls qos trust cos
Device(config-if)# service-policy input macpolicy1
```

This example shows how to create a class map that applies to both IPv4 and IPv6 traffic with the default class
applied to unclassified traffic:

```plaintext
Device(config)# ip access-list 101 permit ip any any
Device(config)# ipv6 access-list ipv6-any permit ip any any
Device(config)# class-map cm-1
Device(config-cmap)# match access-group 101
Device(config-cmap)# exit
Device(config)# class-map cm-2
Device(config-cmap)# match access-group name ipv6-any
Device(config-cmap)# exit
Device(config)# policy-map pml
```
Examples: Classifying, Policing, and Marking Traffic by Using Aggregate Policers

This example shows how to create an aggregate policer and attach it to multiple classes within a policy map. In the configuration, the IP ACLs permit traffic from network 10.1.0.0 and from host 11.3.1.1. For traffic coming from network 10.1.0.0, the DSCP in the incoming packets is trusted. For traffic coming from host 11.3.1.1, the DSCP in the packet is changed to 56. The traffic rate from the 10.1.0.0 network and from host 11.3.1.1 is policed. If the traffic exceeds an average rate of 48000 b/s and a normal burst size of 8000 bytes, its DSCP is marked down (based on the policed-DSCP map) and sent. The policy map is attached to an ingress port.

Device(config)# access-list 1 permit 10.1.0.0 0.0.255.255
Device(config)# access-list 2 permit 11.3.1.1
Device(config)# mls qos aggregate-police transmit1 48000 8000 exceed-action policed-dscp-transmit
Device(config)# class-map ipclass1
Device(config-cmap)# match access-group 1
Device(config-cmap)# exit
Device(config)# class-map ipclass2
Device(config-cmap)# match access-group 2
Device(config-cmap)# exit
Device(config)# policy-map aggflow1
Device(config-pmap)# class ipclass1
Device(config-pmap-c)# trust dscp
Device(config-pmap-c)# police aggregate transmit1
Device(config-pmap-c)# exit
Device(config-pmap)# class ipclass2
Device(config-pmap-c)# set dscp 56
Device(config-pmap-c)# police aggregate transmit1
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# service-policy input aggflow1
Device(config-if)# exit
Examples: Configuring DSCP Maps

This example shows how to modify and display the CoS-to-DSCP map:

```plaintext
Device(config)# mls qos map cos-dscp 10 15 20 25 30 35 40 45
Device(config)# end
Device# show mls qos maps cos-dscp

Cos-dscp map:
  cos: 0 1 2 3 4 5 6 7
  ---------------------------------
  dscp: 10 15 20 25 30 35 40 45
```

This example shows how to modify and display the IP-precedence-to-DSCP map:

```plaintext
Device(config)# mls qos map ip-prec-dscp 10 15 20 25 30 35 40 45
Device(config)# end
Device# show mls qos maps ip-prec-dscp

IpPrecedence-dscp map:
  ipprec: 0 1 2 3 4 5 6 7
  ---------------------------------
  dscp: 10 15 20 25 30 35 40 45
```

This example shows how to map DSCP 50 to 57 to a marked-down DSCP value of 0:

```plaintext
Device(config)# mls qos map policed-dscp 50 51 52 53 54 55 56 57 to 0
Device(config)# end
Device# show mls qos maps policed-dscp

Policed-dscp map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
  ---------------------------------------
  0 : 00 01 02 03 04 05 06 07 08 09
  1 : 10 11 12 13 14 15 16 17 18 19
  2 : 20 21 22 23 24 25 26 27 28 29
  3 : 30 31 32 33 34 35 36 37 38 39
  4 : 40 41 42 43 44 45 46 47 48 49
  5 : 00 00 00 00 00 00 00 58 59
  6 : 60 61 62 63
```

Note: In this policed-DSCP map, the marked-down DSCP values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the marked-down value. For example, an original DSCP value of 53 corresponds to a marked-down DSCP value of 0.

This example shows how to map DSCP values 0, 8, 16, 24, 32, 40, 48, and 50 to CoS value 0 and to display the map:

```plaintext
Device(config)# mls qos map dscp-cos 0 8 16 24 32 40 48 50 to 0
Device(config)# end
Device# show mls qos maps dscp-cos

Dscp-cos map:
  d1 : d2 0 1 2 3 4 5 6 7 8 9
```
In the above DSCP-to-CoS map, the CoS values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the DSCP; the d2 row specifies the least-significant digit of the DSCP. The intersection of the d1 and d2 values provides the CoS value. For example, in the DSCP-to-CoS map, a DSCP value of 08 corresponds to a CoS value of 0.

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remains as specified in the null map):

```plaintext
Device(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 0
Device(config)# mls qos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Device(config)# mls qos map dscp-mutation mutation1 20 21 22 to 20
Device(config)# mls qos map dscp-mutation mutation1 30 31 32 33 34 to 30
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# mls qos trust dscp
Device(config-if)# mls qos dscp-mutation mutation1
Device(config-if)# end
Device# show mls qos maps dscp-mutation mutation1
Dscp-dscp mutation map:
  mutation1:
    d1  d2 0 1 2 3 4 5 6 7 8 9
  0 : 00 00 00 00 00 00 00 00 10 10
  1 : 01 01 01 01 01 01 01 02 02 02
  2 : 02 02 02 02 00 03 03 03 03 03
  3 : 03 03 00 04 04 04 04 04 04 04
  4 : 00 05 05 05 05 05 05 05 00 06
  5 : 00 06 06 06 06 06 07 07 07 07
  6 : 07 07 07 07
```

In the above DSCP-to-DSCP-mutation map, the mutated values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the mutated value. For example, a DSCP value of 12 corresponds to a mutated value of 10.

Examples: Configuring Ingress Queue Characteristics

This example shows how to map DSCP values 0 to 6 to ingress queue 1 and to threshold 1 with a drop threshold of 50 percent. It maps DSCP values 20 to 26 to ingress queue 1 and to threshold 2 with a drop threshold of 70 percent:

```plaintext
Device(config)# mls qos srr-queue input dscp-map queue 1 threshold 1 0 1 2 3 4 5 6
```
In this example, the DSCP values (0 to 6) are assigned the WTD threshold of 50 percent and will be dropped sooner than the DSCP values (20 to 26) assigned to the WTD threshold of 70 percent.

This example shows how to allocate 60 percent of the buffer space to ingress queue 1 and 40 percent of the buffer space to ingress queue 2:

Device(config)# mls qos srr-queue input buffers 60 40

This example shows how to assign the ingress bandwidth to the queues. Priority queueing is disabled, and the shared bandwidth ratio allocated to queue 1 is 25/(25+75) and to queue 2 is 75/(25+75):

Device(config)# mls qos srr-queue input priority-queue 2 bandwidth 0
Device(config)# mls qos srr-queue input bandwidth 25 75

This example shows how to assign the ingress bandwidths to the queues. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratios allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Device(config)# mls qos srr-queue input priority-queue 1 bandwidth 10
Device(config)# mls qos srr-queue input bandwidth 4 4

Examples: Configuring Egress Queue Characteristics

This example shows how to map DSCP values 10 and 11 to egress queue 1 and to threshold 2:

Device(config)# mls qos srr-queue output dscp-map queue 1 threshold 2 10 11

This example shows how to configure bandwidth shaping on queue 1. Because the weight ratios for queues 2, 3, and 4 are set to 0, these queues operate in shared mode. The bandwidth weight for queue 1 is 1/8, which is 12.5 percent:

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# srr-queue bandwidth shape 8 0 0 0

This example shows how to configure the weight ratio of the SRR scheduler running on an egress port. Four queues are used, and the bandwidth ratio allocated for each queue in shared mode is 1/(1+2+3+4), 2/(1+2+3+4), 3/(1+2+3+4), and 4/(1+2+3+4), which is 10 percent, 20 percent, 30 percent, and 40 percent for queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth of queue 1, twice the bandwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# srr-queue bandwidth share 1 2 3 4
This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.

```plaintext
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# srr-queue bandwidth shape 25 0 0 0
Device(config-if)# srr-queue bandwidth share 30 20 25 25
Device(config-if)# priority-queue out
Device(config-if)# end
```

This example shows how to limit the bandwidth on a port to 80 percent:

```plaintext
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# srr-queue bandwidth limit 80
```

When you configure this command to 80 percent, the port is idle 20 percent of the time. The line rate drops to 80 percent of the connected speed, which is 800 Mb/s. These values are not exact because the hardware adjusts the line rate in increments of six.

**Where to Go Next**

Review the auto-QoS documentation to see if you can use these automated capabilities for your QoS configuration.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Auto-QoS

Before configuring standard QoS or auto-QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. Is the traffic bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.
Restrictions for Auto-QoS

The following are restrictions for automatic QoS (auto-QoS):

- Auto-QoS (and enhanced auto-QoS) is not supported on switches running the LAN Lite image.

Information about Configuring Auto-QoS

Auto-QoS Overview

You can use the auto-QoS feature to simplify the deployment of QoS features. Auto-QoS determines the network design and enables QoS configurations so that the switch can prioritize different traffic flows. It uses the egress queues instead of using the default (disabled) QoS behavior. The switch offers best-effort service to each packet, regardless of the packet contents or size, and sends it from a single queue.

When you enable auto-QoS, it automatically classifies traffic based on the traffic type and ingress packet label. The switch uses the classification results to choose the appropriate egress queue.

You can use auto-QoS commands to identify ports connected to the following Cisco devices:

- Cisco IP Phones
- Devices running the Cisco SoftPhone application
- Cisco TelePresence
- Cisco IP Camera
- Cisco digital media player

You also use the auto-QoS commands to identify ports that receive trusted traffic through an uplink. Auto-QoS then performs these functions:

- Detects the presence or absence of auto-QoS devices through conditional trusted interfaces.
- Configures QoS classification
- Configures egress queues

Auto-QoS Compact Overview

When you enter an auto-QoS command, the switch displays all the generated commands as if the commands were entered from the CLI. You can use the auto-QoS compact feature to hide the auto-QoS generated commands from the running configuration. This would make it easier to comprehend the running-configuration and also help to increase efficient usage of memory.

Generated Auto-QoS Configuration

By default, auto-QoS is disabled on all ports. Packets are not modified—the CoS, DSCP and IP precedence values in the packet are not changed.
When you enable the auto-QoS feature on the first port of the interface:

- Ingress packet label is used to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

- QoS is globally enabled (*mls qos* global configuration command), and other global configuration commands are automatically generated. (See *Examples: Global Auto-QoS Configuration*, on page 623).

- Switch enables the trusted boundary feature and uses the Cisco Discovery Protocol (CDP) to detect the presence of a supported device.

- Policing is used to determine whether a packet is in or out of profile and specifies the action on the packet.

**VoIP Device Specifics**

The following activities occur when you issue these auto-QoS commands on a port:

- When you enter the `auto qos voip cisco-phone` command on a port at the network edge connected to a Cisco IP Phone, the switch enables the trusted boundary feature. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. When there is no Cisco IP Phone, the ingress classification is set to not trust the QoS label in the packet. The policing is applied to the traffic matching the policy-map classification before the switch enables the trust boundary feature.

- When you enter the `auto qos voip cisco-softphone` interface configuration command on a port at the network edge that is connected to a device running the Cisco SoftPhone, the switch uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0.

- When you enter the `auto qos voip trust` interface configuration command on a port connected to the network interior, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices).

- When you enable auto-QoS by using the `auto qos voip cisco-phone`, the `auto qos voip cisco-softphone`, or the `auto qos voip trust` interface configuration command, the switch automatically generates a QoS configuration based on the traffic type and ingress packet label and applies the commands listed in Examples: Global Auto-QoS Configuration, on page 623 to the port.

**Enhanced Auto-QoS for Video, Trust, and Classification**

Auto-QoS is enhanced to support video. Automatic configurations are generated that classify and trust traffic from Cisco TelePresence systems and Cisco IP cameras.

**Auto-QoS Configuration Migration**

Auto-QoS configuration migration from legacy auto-QoS to enhanced auto-QoS occurs when:

- A switch is booted with a 12.2(55)SE image and QoS is not enabled.

  Any video or voice trust configuration on the interface automatically generates enhanced auto-QoS commands.

- A switch is enabled with QoS, these guidelines take effect:
  - If you configure the interface for conditional trust on a voice device, only the legacy auto-QoS VoIP configuration is generated.
• If you configure the interface for conditional trust on a video device, the enhanced auto-QoS configuration is generated.

• If you configure the interface with classification or conditional trust based on the new interface auto-QoS commands, enhanced auto-QoS configuration is generated.

• Auto-QoS migration happens after a new device is connected when the `auto qos srnd4` global configuration command is enabled.

---

**Note**

If an interface previously configured with legacy auto-QoS migrates to enhanced auto-QoS, voice commands and configuration are updated to match the new global QoS commands.

Auto-QoS configuration migration from enhanced auto-QoS to legacy auto-QoS can occur only when you disable all existing auto-QoS configurations from the interface.

---

**Auto-QoS Configuration Guidelines**

Before configuring auto-QoS, you should be aware of this information:

• After auto-QoS is enabled, do not modify a policy map that includes `AutoQoS` in its name. If you need to modify the policy map, make a copy of it, and change the copied policy map. To use this new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map to the interface.

• To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. If necessary, you can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed.

• You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

• By default, the CDP is enabled on all ports. For auto-QoS to function properly, do not disable CDP.

---

**Auto-QoS VoIP Considerations**

Before configuring auto-QoS for VoIP, you should be aware of this information:

• Auto-QoS configures the switch for VoIP with Cisco IP Phones on nonrouted and routed ports. Auto-QoS also configures the switch for VoIP with devices running the Cisco SoftPhone application.

---

**Note**

When a device running Cisco SoftPhone is connected to a nonrouted or routed port, the switch supports only one Cisco SoftPhone application per port.

---

• When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

• This release supports only Cisco IP SoftPhone Version 1.3(3) or later.

• Connected devices must use Cisco Call Manager Version 4 or later.
Auto-QoS Enhanced Considerations

Auto-QoS is enhanced to support video. Automatic configurations are generated that classify and trust traffic from Cisco TelePresence systems and Cisco IP cameras.

Before configuring auto-QoS enhanced, you should be aware of this information:

- The `auto qos srnd4` global configuration command is generated as a result of enhanced auto-QoS configuration.

Effects of Auto-QoS on Running Configuration

When auto-QoS is enabled, the `auto qos` interface configuration commands and the generated global configuration are added to the running configuration.

The switch applies the auto-QoS-generated commands as if the commands were entered from the CLI. An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions may occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands are not applied, the previous running configuration is restored.

Effects of Auto-Qos Compact on Running Configuration

If auto-QoS compact is enabled:

- Only the auto-QoS commands entered from the CLI are displayed in running-config.
- The generated global and interface configurations are hidden.
- When you save the configuration, only the auto-qos commands you have entered are saved (and not the hidden configuration).
- When you reload the switch, the system detects and re-executes the saved auto-QoS commands and the AutoQoS SRND4.0 compliant config-set is generated.

Note

Do not make changes to the auto-QoS-generated commands when auto-QoS compact is enabled, because user-modifications are overridden when the switch reloads.

When auto-qos global compact is enabled:

- `show derived-config` command can be used to view hidden AQC derived commands.
- AQC commands will not be stored to memory. They will be regenerated every time the switch is reloaded.
- When compaction is enabled, auto-qos generated commands should not be modified.
- If the interface is configured with auto-QoS and if AQC needs to be disabled, auto-qos should be disabled at interface level first.
How to Configure Auto-QoS

Configuring Auto-QoS

Enabling Auto-QoS

For optimum QoS performance, enable auto-QoS on all the devices in your network.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. Use one of the following:
   - auto qos voip {cisco-phone | cisco-softphone | trust}
   - auto qos video {cts | ip-camera | media-player}
   - auto qos classify [police]
   - auto qos trust {cos | dscp}
4. exit
5. interface interface-id
6. auto qos trust
7. end
8. show auto qos interface interface-id

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the port that is connected to a video device or the uplink port that is connected to another trusted switch or router in the network interior, and enters interface configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 3/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables auto-QoS for VoIP.</td>
</tr>
<tr>
<td>Use one of the following:</td>
<td></td>
</tr>
<tr>
<td>• auto qos voip {cisco-phone</td>
<td>cisco-softphone</td>
</tr>
<tr>
<td>• auto qos video {cts</td>
<td>ip-camera</td>
</tr>
<tr>
<td>• auto qos classify [police]</td>
<td></td>
</tr>
<tr>
<td>• auto qos trust {cos</td>
<td>dscp}</td>
</tr>
<tr>
<td>cisco-phone—If the port is connected to a Cisco IP Phone, the QoS labels of incoming packets are trusted only when the telephone is detected.</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

Device(config-if)# `auto qos trust dscp`

### Purpose

- **cisco-softphone**—The port is connected to a device running the Cisco SoftPhone feature.
- **trust**—The uplink port is connected to a trusted switch or router, and the VoIP traffic classification in the ingress packet is trusted.

Enables auto-QoS for a video device.

- **cts**—A port connected to a Cisco Telepresence system.
- **ip-camera**—A port connected to a Cisco video surveillance camera.
- **media-player**—A port connected to a CDP-capable Cisco digital media player.

QoS labels of incoming packets are trusted only when the system is detected.

Enables auto-QoS for classification.

- **police**—Policing is set up by defining the QoS policy maps and applying them to ports (port-based QoS).

Enables auto-QoS for trusted interfaces.

- **cos**—Class of service.
- **dscp**—Differentiated Services Code Point.
- `<cr>`—Trust interface.

**Note**

To view a list of commands that are automatically generated by issuing one of the auto-QoS commands listed here, you need to be in debug mode. Refer to the *Catalyst 2960-X Switch QoS Command Reference Guide, Cisco IOS Release 15.0(2)EX* for examples of how to run the appropriate debug command to view a list of these commands.

### Step 4

**exit**

**Example:**

Device(config-if)# `exit`

Returns to global configuration mode.

### Step 5

**interface** `interface-id`

**Example:**

Device(config)# `interface`

Specifies the switch port identified as connected to a trusted switch or router, and enters interface configuration mode.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>gigabitethernet 2/0/1</td>
<td>Enables auto-QoS on the port, and specifies that the port is connected to a trusted router or switch.</td>
</tr>
</tbody>
</table>

### Step 6

**auto qos trust**

*Example:*

```
Device(config-if)# auto qos trust
```

### Step 7

**end**

*Example:*

```
Device(config-if)# end
```

### Step 8

**show auto qos interface interface-id**

*Example:*

```
Device# show auto qos interface gigabitethernet 2/0/1
```

---

**Enabling Auto-Qos Compact**

To enable auto-Qos compact, enter this command:

#### SUMMARY STEPS

1. `configure terminal`
2. `auto qos global compact`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><code>auto qos global compact</code></td>
<td>Enables auto-Qos compact and generates (hidden) the global configurations for auto-QoS.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# auto qos global compact</code></td>
<td></td>
</tr>
</tbody>
</table>

You can then enter the auto-QoS command you want to configure in the interface configuration mode and the interface commands that the system generates are also hidden.

To display the auto-QoS configuration that has been applied, use these the privileged EXEC commands:
### What to do next

To disable auto-QoS compact, remove auto-Qos instances from all interfaces by entering the `no` form of the corresponding auto-QoS commands and then enter the `no auto qos global compact` global configuration command.

### Troubleshooting Auto-QoS

To troubleshoot auto-QoS, use the `debug auto qos` privileged EXEC command. For more information, see the `debug auto qos` command in the command reference for this release.

To disable auto-QoS on a port, use the `no` form of the `auto qos` command interface configuration command, such as `no auto qos voip`. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the `no auto qos voip` command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

### Monitoring Auto-QoS

#### Table 75: Commands for Monitoring Auto-QoS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show auto qos [interface [interface-type]]</code></td>
<td>Displays the initial auto-QoS configuration. You can compare the <code>show auto qos</code> and the <code>show running-config</code> command output to identify the user-defined QoS settings.</td>
</tr>
<tr>
<td>`show mls qos [ aggregate policer</td>
<td>interface</td>
</tr>
<tr>
<td><code>show mls qos aggregate policer policer_name</code></td>
<td>Displays information about the QoS aggregate policer configuration that might be affected by auto-QoS.</td>
</tr>
<tr>
<td>`show mls qos interface [interface-type</td>
<td>buffers</td>
</tr>
</tbody>
</table>
### Configuration Examples for Auto-Qos

#### Examples: Global Auto-QoS Configuration

The following table describes the automatically generated commands for auto-QoS and enhanced auto-QoS by the switch.

| Description | Automatically Generated Command (voip) | Enhanced Automatically Generated Command (Video|Trust|Classify) |
|-------------|---------------------------------------|------------------|
| The switch automatically enables standard QoS and configures the CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value). | Device(config)# mls qos cos-dscp 0 8 16 26 32 46 48 56 | Device(config)# mls qos cos-dscp 0 8 16 24 32 46 48 56 |
| Description | Automatically Generated Command | Enhanced Automatically Generated Command (Video|Trust|Classify) |
|-------------|--------------------------------|-------------------|
| The switch automatically maps CoS values to an egress queue and to a threshold ID. | Device(config)# no mls qos srr-queue output cos-map Device(config)# mls qos srr-queue output cos-map queue 1 threshold 3 5 Device(config)# mls qos srr-queue output cos-map queue 2 threshold 3 3 6 7 Device(config)# mls qos srr-queue output cos-map queue 3 threshold 3 2 4 Device(config)# mls qos srr-queue output cos-map queue 4 threshold 2 1 | Device(config)# no mls qos srr-queue output cos-map Device(config)# mls qos srr-queue output cos-map queue 1 threshold 3 4 5 Device(config)# mls qos srr-queue output cos-map queue 2 threshold 3 6 7 Device(config)# mls qos srr-queue output cos-map queue 2 threshold 1 2 Device(config)# mls qos srr-queue output cos-map queue 2 threshold 2 3 Device(config)# mls qos srr-queue output cos-map queue 3 threshold 3 0 Device(config)# mls qos srr-queue output cos-map queue 4 threshold 3 0 Device(config)# mls qos srr-queue output cos-map queue 4 threshold 3 1 |
| Description | Automatically Generated Command (voip) | Enhanced Automatically Generated Command (Video|Trust|Classify) |
|-------------|---------------------------------------|-----------------|
| The switch automatically maps DSCP values to an egress queue and to a threshold ID. | Device(config)# no mls qos srr-queue output dscp-map Device(config)# mls qos srr-queue output dscp-map queue 1 threshold 3 40 41 42 43 44 45 46 47 | Device(config)# no mls qos srr-queue output dscp-map Device(config)# mls qos srr-queue output dscp-map queue 1 threshold 3 32 33 40 41 42 43 44 45 46 47 |
| | Device(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 24 25 26 27 28 29 30 31 | Device(config)# mls qos srr-queue output dscp-map queue 2 threshold 1 16 17 18 19 20 21 22 23 |
| | Device(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 48 49 50 51 52 53 54 55 | Device(config)# mls qos srr-queue output dscp-map queue 2 threshold 1 26 27 28 29 30 31 34 35 36 37 38 39 |
| | Device(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 56 57 58 59 60 61 62 63 | Device(config)# mls qos srr-queue output dscp-map queue 2 threshold 2 24 |
| | Device(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 16 17 18 19 20 21 22 23 | Device(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 56 |
| | Device(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 32 33 34 35 36 37 38 39 | Device(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 57 58 59 60 61 62 63 |
| | Device(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 | |
| | Device(config)# mls qos srr-queue output dscp-map queue 4 threshold 2 9 10 11 12 13 14 15 | Device(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 9 11 13 15 |
| | Device(config)# mls qos srr-queue output dscp-map queue 4 threshold 3 0 1 2 3 4 5 6 7 | Device(config)# mls qos srr-queue output dscp-map queue 4 threshold 2 10 12 14 |
The switch automatically configures the egress queue buffer sizes. It configures the bandwidth and the SRR mode (shaped or shared) on the egress queues mapped to the port.

| Description | Automatically Generated Command (voip) | Enhanced Automatically Generated Command (Video|Trust|Classify) |
|-------------|----------------------------------------|---------------------------------|
|             | Device(config)# mls qos queue-set output 1 threshold 1 138 138 92 138 | Device(config)# mls qos queue-set output 1 threshold 2 100 100 50 200 |
|             | Device(config)# mls qos queue-set output 1 threshold 2 138 138 92 400 | Device(config)# mls qos queue-set output 1 threshold 2 125 125 100 400 |
|             | Device(config)# mls qos queue-set output 1 threshold 3 36 77 100 318 | Device(config)# mls qos queue-set output 1 threshold 3 100 100 100 400 |

</tr>
</tbody>
</table>
Examples: Auto-QoS Generated Configuration for VoIP Devices

If you entered the `auto qos voip cisco-phone` command, the switch automatically enables the trusted boundary feature, which uses the CDP to detect the presence or absence of a Cisco IP Phone.

```
Device(config-if)# mls qos trust device cisco-phone
```

If you entered the `auto qos voip cisco-softphone` command, the switch automatically creates class maps and policy maps.

```
Device(config)# mls qos map policed-dscp 24 26 46 to 0
Device(config)# class-map match-all AutoQoS-VoIP-RTP-Trust
Device(config-cmap)# match ip dscp ef
Device(config)# class-map match-all AutoQoS-VoIP-Control-Trust
Device(config-cmap)# match ip dscp cs3 af31
Device(config)# policy-map AutoQoS-Police-SoftPhone
Device(config-pmap)# class AutoQoS-VoIP-RTP-Trust
Device(config-pmap-c)# set dscp ef
Device(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
Device(config)# class AutoQoS-VoIP-Control-Trust
Device(config-pmap-c)# set dscp cs3
Device(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
```

After creating the class maps and policy maps, the switch automatically applies the policy map called `AutoQoS-Police-SoftPhone` to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.

```
Device(config-if)# service-policy input AutoQoS-Police-SoftPhone
```

If you entered the `auto qos voip cisco-phone` command, the switch automatically creates class maps and policy maps.

```
Device(config-if)# mls qos trust device cisco-phone
```

If you entered the `auto qos voip cisco-softphone` command, the switch automatically creates class maps and policy maps.

```
Device(config)# mls qos map policed-dscp 24 26 46 to 0
Device(config)# class-map match-all AutoQoS-VoIP-RTP-Trust
Device(config-cmap)# match ip dscp ef
Device(config)# class-map match-all AutoQoS-VoIP-Control-Trust
Device(config-cmap)# match ip dscp cs3 af31
Device(config)# policy-map AutoQoS-Police-CiscoPhone
Device(config-pmap)# class AutoQoS-VoIP-RTP-Trust
Device(config-pmap-c)# set dscp ef
Device(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
Device(config-pmap-c)# class AutoQoS-VoIP-Control-Trust
Device(config-pmap-c)# set dscp cs3
Device(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
```

After creating the class maps and policy maps, the switch automatically applies the policy map called `AutoQoS-Police-CiscoPhone` to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.
Examples: Auto-QoS Generated Configuration For Enhanced Video, Trust, and Classify Devices

If you entered the following enhanced auto-QoS commands, the switch configures a CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value):

- auto qos video cts
- auto qos video ip-camera
- auto qos video media-player
- auto qos trust
- auto qos trust cos
- auto qos trust dscp

The following command is initiated after entering one of the above auto-QoS commands:

```
Device(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
```

**Note**

No class maps and policy maps are configured.

If you entered the `auto qos classify` command, the switch automatically creates class maps and policy maps (as shown below).

```
Device(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Device(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Device(config)# class-map match-all AUTOQOS_MULTIENHANCED_CONF_CLASS
Device(config-cmap)# match access-group name AUTOQOS-ACL-MULTIENHANCED-CONF
Device(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Device(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Device(config)# class-map match-all AUTOQOS_TRANSACTION_CLASS
Device(config-cmap)# match access-group name AUTOQOS-ACL-TRANSACTIONAL-DATA
Device(config)# class-map match-all AUTOQOS_SIGNALING_CLASS
Device(config-cmap)# match access-group name AUTOQOS-ACL-SIGNALING
Device(config)# class-map match-all AUTOQOS_BULK_DATA_CLASS
Device(config-cmap)# match access-group name AUTOQOS-ACL-BULK-DATA
Device(config)# policy-map AUTOQOS-SRND4-CLASSIFY-POLICY
Device(config-pmap)# class AUTOQOS_MULTIENHANCED_CONF_CLASS
Device(config-pmap-c)# set dscp af11
Device(config-pmap-c)# class AUTOQOS_BULK_DATA_CLASS
Device(config-pmap-c)# set dscp af21
Device(config-pmap-c)# class AUTOQOS_TRANSACTION_CLASS
Device(config-pmap-c)# set dscp cs1
Device(config-pmap-c)# class AUTOQOS_SCAVANGER_CLASS
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Device(config-pmap)# class AUTOQOS_SIGNALING_CLASS
Device(config-pmap-c)# set dscp cs3
Device(config-pmap)# class AUTOQOS_DEFAULT_CLASS
Device(config-pmap-c)# set dscp default
;
Device(config-if)# service-policy input AUTOQOS-SRND4-CLASSIFY-POLICY

If you entered the auto qos classify police command, the switch automatically creates class maps and policy maps (as shown below).

Device(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Device(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56

auto qos global compact

The following is an example of the `auto qos global compact` command.

```
Device# configure terminal
Device(config)# auto qos global compact
Device(config)# interface GigabitEthernet1/2
Device(config-if)# auto qos voip cisco-phone

Device# show auto-qos
GigabitEthernet1/2
auto qos voip cisco-phone

Device# show running-config interface GigabitEthernet 1/0/2
interface GigabitEthernet1/0/2
auto qos voip cisco-phone
end
```

Where to Go Next for Auto-QoS

Review the QoS documentation if you require any specific QoS changes to your auto-QoS configuration.

PART VIII

Network Management

• Configuring Cisco IOS Configuration Engine, on page 637
• Configuring the Cisco Discovery Protocol, on page 657
• Configuring Simple Network Management Protocol, on page 669
• Configuring SPAN and RSPAN, on page 693
Prerequisites for Configuring the Configuration Engine

- Obtain the name of the configuration engine instance to which you are connecting.
- Because the CNS uses both the event bus and the configuration server to provide configurations to devices, you must define both ConfigID and Device ID for each configured device.
- All devices configured with the `cns config partial` global configuration command must access the event bus. The DeviceID, as originated on the device, must match the DeviceID of the corresponding device definition in the Cisco Configuration Engine. You must know the hostname of the event bus to which you are connecting.

Restrictions for Configuring the Configuration Engine

- Within the scope of a single instance of the configuration server, no two configured devices can share the same value for ConfigID.
- Within the scope of a single instance of the event bus, no two configured devices can share the same value for DeviceID.
Information About Configuring the Configuration Engine

Cisco Configuration Engine Software

The Cisco Configuration Engine is network management utility software that acts as a configuration service for automating the deployment and management of network devices and services. Each Cisco Configuration Engine manages a group of Cisco devices (devices and routers) and the services that they deliver, storing their configurations and delivering them as needed. The Cisco Configuration Engine automates initial configurations and configuration updates by generating device-specific configuration changes, sending them to the device, executing the configuration change, and logging the results.

The Cisco Configuration Engine supports standalone and server modes and has these Cisco Networking Services (CNS) components:

- Configuration service:
  - Web server
  - File manager
  - Namespace mapping server

- Event service (event gateway)
- Data service directory (data models and schema)

---

**Note**

Support for Cisco Configuration Engine will be deprecated in future releases. Use the configuration described in *Cisco Plug and Play Feature Guide*.

In standalone mode, the Cisco Configuration Engine supports an embedded directory service. In this mode, no external directory or other data store is required. In server mode, the Cisco Configuration Engine supports the use of a user-defined external directory.
Configuration Service

The Configuration Service is the core component of the Cisco Configuration Engine. It consists of a Configuration Server that works with Cisco IOS CNS agents on the device. The Configuration Service delivers device and service configurations to the device for initial configuration and mass reconfiguration by logical groups. Devices receive their initial configuration from the Configuration Service when they start up on the network for the first time.

The Configuration Service uses the CNS Event Service to send and receive configuration change events and to send success and failure notifications.

The Configuration Server is a web server that uses configuration templates and the device-specific configuration information stored in the embedded (standalone mode) or remote (server mode) directory.

Configuration templates are text files containing static configuration information in the form of CLI commands. In the templates, variables are specified by using Lightweight Directory Access Protocol (LDAP) URLs that reference the device-specific configuration information stored in a directory.

The Cisco IOS agent can perform a syntax check on received configuration files and publish events to show the success or failure of the syntax check. The configuration agent can either apply configurations immediately or delay the application until receipt of a synchronization event from the configuration server.

Event Service

The Cisco Configuration Engine uses the Event Service for receipt and generation of configuration events. The Event Service consists of an event agent and an event gateway. The event agent is on the device and facilitates the communication between the device and the event gateway on the Cisco Configuration Engine.

The Event Service is a highly capable publish-and-subscribe communication method. The Event Service uses subject-based addressing to send messages to their destinations. Subject-based addressing conventions define a simple, uniform namespace for messages and their destinations.
NameSpace Mapper

The Cisco Configuration Engine includes the NameSpace Mapper (NSM) that provides a lookup service for managing logical groups of devices based on application, device or group ID, and event.

Cisco IOS devices recognize only event subject-names that match those configured in Cisco IOS software; for example, cisco.cns.config.load. You can use the namespace mapping service to designate events by using any desired naming convention. When you have populated your data store with your subject names, NSM changes your event subject-name strings to those known by Cisco IOS.

For a subscriber, when given a unique device ID and event, the namespace mapping service returns a set of events to which to subscribe. Similarly, for a publisher, when given a unique group ID, device ID, and event, the mapping service returns a set of events on which to publish.

Cisco Networking Services IDs and Device Hostnames

The Cisco Configuration Engine assumes that a unique identifier is associated with each configured device. This unique identifier can take on multiple synonyms, where each synonym is unique within a particular namespace. The event service uses namespace content for subject-based addressing of messages.

The Cisco Configuration Engine intersects two namespaces, one for the event bus and the other for the configuration server. Within the scope of the configuration server namespace, the term ConfigID is the unique identifier for a device. Within the scope of the event bus namespace, the term DeviceID is the CNS unique identifier for a device.

ConfigID

Each configured device has a unique ConfigID, which serves as the key into the Cisco Configuration Engine directory for the corresponding set of device CLI attributes. The ConfigID defined on the device must match the ConfigID for the corresponding device definition on the Cisco Configuration Engine.

The ConfigID is fixed at startup time and cannot be changed until the device restarts, even if the device hostname is reconfigured.

DeviceID

Each configured device participating on the event bus has a unique DeviceID, which is analogous to the device source address so that the device can be targeted as a specific destination on the bus.

The origin of the DeviceID is defined by the Cisco IOS hostname of the device. However, the DeviceID variable and its usage reside within the event gateway adjacent to the device.

The logical Cisco IOS termination point on the event bus is embedded in the event gateway, which in turn functions as a proxy on behalf of the device. The event gateway represents the device and its corresponding DeviceID to the event bus.

The device declares its hostname to the event gateway immediately after the successful connection to the event gateway. The event gateway couples the DeviceID value to the Cisco IOS hostname each time this connection is established. The event gateway retains this DeviceID value for the duration of its connection to the device.
Hostname and DeviceID

The DeviceID is fixed at the time of the connection to the event gateway and does not change even when the device hostname is reconfigured.

When changing the device hostname on the device, the only way to refresh the DeviceID is to break the connection between the device and the event gateway. For instructions on refreshing DeviceIDs, see "Related Topics."

When the connection is reestablished, the device sends its modified hostname to the event gateway. The event gateway redefines the DeviceID to the new value.

Caution

When using the Cisco Configuration Engine user interface, you must first set the DeviceID field to the hostname value that the device acquires after, not before, and you must reinitialize the configuration for your Cisco IOS CNS agent. Otherwise, subsequent partial configuration command operations may malfunction.

Hostname, DeviceID, and ConfigID

In standalone mode, when a hostname value is set for a device, the configuration server uses the hostname as the DeviceID when an event is sent on hostname. If the hostname has not been set, the event is sent on the cn=<value> of the device.

In server mode, the hostname is not used. In this mode, the unique DeviceID attribute is always used for sending an event on the bus. If this attribute is not set, you cannot update the device.

These and other associated attributes (tag value pairs) are set when you run Setup on the Cisco Configuration Engine.

Cisco IOS CNS Agents

The CNS event agent feature allows the device to publish and subscribe to events on the event bus and works with the Cisco IOS CNS agent. These agents, embedded in the device Cisco IOS software, allow the device to be connected and automatically configured.

Initial Configuration

When the device first comes up, it attempts to get an IP address by broadcasting a Dynamic Host Configuration Protocol (DHCP) request on the network. Assuming there is no DHCP server on the subnet, the distribution device acts as a DHCP relay agent and forwards the request to the DHCP server. Upon receiving the request, the DHCP server assigns an IP address to the new device and includes the Trivial File Transfer Protocol (TFTP) server Internet Protocol (IP) address, the path to the bootstrap configuration file, and the default gateway IP address in a unicast reply to the DHCP relay agent. The DHCP relay agent forwards the reply to the device.

The device automatically configures the assigned IP address on interface VLAN 1 (the default) and downloads the bootstrap configuration file from the TFTP server. Upon successful download of the bootstrap configuration file, the device loads the file in its running configuration.

The Cisco IOS CNS agents initiate communication with the Configuration Engine by using the appropriate ConfigID and EventID. The Configuration Engine maps the Config ID to a template and downloads the full configuration file to the device.
The following figure shows a sample network configuration for retrieving the initial bootstrap configuration file by using DHCP-based autoconfiguration.

![Figure 71: Initial Configuration](image)

### Incremental (Partial) Configuration

After the network is running, new services can be added by using the Cisco IOS CNS agent. Incremental (partial) configurations can be sent to the device. The actual configuration can be sent as an event payload by way of the event gateway (push operation) or as a signal event that triggers the device to initiate a pull operation.

The device can check the syntax of the configuration before applying it. If the syntax is correct, the device applies the incremental configuration and publishes an event that signals success to the configuration server. If the device does not apply the incremental configuration, it publishes an event showing an error status. When the device has applied the incremental configuration, it can write it to nonvolatile random-access memory (NVRAM) or wait until signaled to do so.

### Synchronized Configuration

When the device receives a configuration, it can defer application of the configuration upon receipt of a write-signal event. The write-signal event tells the device not to save the updated configuration into its NVRAM. The device uses the updated configuration as its running configuration. This ensures that the device configuration is synchronized with other network activities before saving the configuration in NVRAM for use at the next reboot.

### Automated CNS Configuration

To enable automated CNS configuration of the device, you must first complete the prerequisites listed in this topic. When you complete them, power on the device. At the `setup` prompt, do nothing; the device begins the initial configuration. When the full configuration file is loaded on your device, you do not need to do anything else.

For more information on what happens during initial configuration, see "Related Topics."

**Table 78: Prerequisites for Enabling Automatic Configuration**

</tr>
</tbody>
</table>
How to Configure the Configuration Engine

Enabling the CNS Event Agent

You must enable the CNS event agent on the device before you enable the CNS configuration agent.

Follow these steps to enable the CNS event agent on the device.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `cns event {hostname | ip-address} [port-number] [keepalive seconds retry-count] [failover-time seconds] [reconnect-time time] [backup]`
4. `end`
5. `show running-config`

---

### Table: Device Configuration

<table>
<thead>
<tr>
<th>Device</th>
<th>Required Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution device</td>
<td>• IP helper address&lt;br&gt;• Enable DHCP relay agent&lt;br&gt;• IP routing (if used as default gateway)</td>
</tr>
<tr>
<td>DHCP server</td>
<td>• IP address assignment&lt;br&gt;• TFTP server IP address&lt;br&gt;• Path to bootstrap configuration file on the TFTP server&lt;br&gt;• Default gateway IP address</td>
</tr>
<tr>
<td>TFTP server</td>
<td>• A bootstrap configuration file that includes the CNS configuration commands that enable the device to communicate with the Configuration Engine&lt;br&gt;• The device configured to use either the device MAC address or the serial number (instead of the default hostname) to generate the ConfigID and EventID&lt;br&gt;• The CNS event agent configured to push the configuration file to the device</td>
</tr>
<tr>
<td>CNS Configuration Engine</td>
<td>One or more templates for each type of device, with the ConfigID of the device mapped to the template.</td>
</tr>
</tbody>
</table>

---

2 A DHCP Relay is needed only when the DHCP Server is on a different subnet from the client.
6. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| | Example: | |
| | Device> enable | |
| Step 2 | configure terminal | Enters global configuration mode. |
| | Example: | |
| | Device# configure terminal | |
| Step 3 | cns event \{hostname | ip-address\} [port-number] [keepalive seconds retry-count] [failover-time seconds] [reconnect-time time] | Enables the event agent, and enters the gateway parameters.  
- For \{hostname | ip-address\}, enter either the hostname or the IP address of the event gateway.  
  - (Optional) For port number, enter the port number for the event gateway. The default port number is 11011.  
  - (Optional) For keepalive seconds, enter how often the device sends keepalive messages. For retry-count, enter the number of unanswered keepalive messages that the device sends before the connection is terminated. The default for each is 0.  
  - (Optional) For failover-time seconds, enter how long the device waits for the primary gateway route after the route to the backup gateway is established.  
  - (Optional) For reconnect-time time, enter the maximum time interval that the device waits before trying to reconnect to the event gateway.  
  - (Optional) Enter backup to show that this is the backup gateway. (If omitted, this is the primary gateway.)  

| | Example: | |
| | Device(config)# cns event 10.180.1.27 keepalive 120 10 | |
| Step 4 | end | Returns to privileged EXEC mode. |
| | Example: | |
| | Device(config)# end | |

**Note** Though visible in the command-line help string, the `encrypt` and the `clock-timeout time` keywords are not supported.
Enabling the Cisco IOS CNS Agent

Follow these steps to enable the Cisco IOS CNS agent on the device.

**Before you begin**
You must enable the CNS event agent on the device before you enable this agent.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. cns config initial {hostname | ip-address} [port-number]
4. cns config partial {hostname | ip-address} [port-number]
5. end
6. show running-config
7. copy running-config startup-config
8. Start the Cisco IOS CNS agent on the device.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

To verify information about the event agent, use the `show cns event connections` command in privileged EXEC mode.

To disable the CNS event agent, use the `no cns event { ip-address | hostname }` global configuration command.
Enabling the Cisco IOS CNS Agent

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 3**        | Enables the Cisco IOS CNS agent, and enters the configuration server parameters. |
| `cns config initial {hostname | ip-address} [port-number]` | |
| **Example:** | |
| `Device(config)# cns config initial 10.180.1.27 10` | Enables the Cisco IOS CNS agent and initiates an initial configuration on the device. |

| **Step 4**        | Enables the Cisco IOS CNS agent, and enters the configuration server parameters. |
| `cns config partial {hostname | ip-address} [port-number]` | |
| **Example:** | |
| `Device(config)# cns config partial 10.180.1.27 10` | Enables the Cisco IOS CNS agent and initiates a partial configuration on the device. |

| **Step 5**        | Returns to privileged EXEC mode. |
| `end` | |
| **Example:** | |
| `Device(config)# end` | |

| **Step 6**        | Verifies your entries. |
| `show running-config` | |
| **Example:** | |
| `Device# show running-config` | |

| **Step 7**        | (Optional) Saves your entries in the configuration file. |
| `copy running-config startup-config` | |
| **Example:** | |
| `Device# copy running-config startup-config` | |

| **Step 8**        | Start the Cisco IOS CNS agent on the device. |
What to do next
You can now use the Cisco Configuration Engine to remotely send incremental configurations to the device.

Enabling an Initial Configuration for Cisco IOS CNS Agent

Follow these steps to enable the CNS configuration agent and initiate an initial configuration on the device.

SUMMARY STEPS

1. enable
2. configure terminal
3. cns template connect name
4. cli config-text
5. Repeat Steps 3 to 4 to configure another CNS connect template.
6. exit
7. cns connect name [retries number] [retry-interval seconds] [sleep seconds] [timeout seconds]
8. discover {controller controller-type | dlci [subinterface subinterface-number] | interface [interface-type] | line line-type}
9. template name [... name]
10. Repeat Steps 8 to 9 to specify more interface parameters and CNS connect templates in the CNS connect profile.
11. exit
12. hostname name
13. ip route network-number
14. cns id interface num {dns-reverse | ipaddress | mac-address} [event] [image]
15. cns id {hardware-serial | hostname | string string | udi} [event] [image]
16. cns config initial {hostname | ip-address} [port-number] [event] [no-persist] [page page] [source ip-address] [syntax-check]
17. end
18. show running-config
19. copy running-config startup-config

<tr>
<th>Step 6</th>
<th><code>exit</code></th>
<th>Returns to global configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# exit</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th><code>cns connect name [retries number] [retry-interval seconds] [sleep seconds] [timeout seconds]</code></th>
<th>Enters CNS connect configuration mode, specifies the name of the CNS connect profile, and defines the profile parameters. The device uses the CNS connect profile to connect to the Configuration Engine.</th>
</tr>
</thead>
</table>
| Example: | `Device(config)# cns connect dhcp` | • Enter the `name` of the CNS connect profile.  
• (Optional) For `retries number`, enter the number of connection retries. The range is 1 to 30. The default is 3.  
• (Optional) For `retry-interval seconds`, enter the interval between successive connection attempts to the Configuration Engine. The range is 1 to 40 seconds. The default is 10 seconds.  
• (Optional) For `sleep seconds`, enter the amount of time before which the first connection attempt occurs. The range is 0 to 250 seconds. The default is 0.  
• (Optional) For `timeout seconds`, enter the amount of time after which the connection attempts end. The range is 10 to 2000 seconds. The default is 120. |

| Step 8 | `discover {controller controller-type | dcli [subinterface subinterface-number] | interface [interface-type] | line line-type}` | Specifies the interface parameters in the CNS connect profile. |
|--------|-------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Example: | `Device(config-cns-conn)# discover interface gigabitethernet` | • For `controller controller-type`, enter the controller type.  
• For `dcli`, enter the active data-link connection identifiers (DLCIs). |
### Command or Action | Purpose
--- | ---
(Optional) For `subinterface subinterface-number`, specify the point-to-point subinterface number that is used to search for active DLCIs.  
• For `interface [interface-type]`, enter the type of interface.  
• For `line line-type`, enter the line type.

**Step 9**  
**template name [... name]**  
**Example:**  
Device(config-cns-conn)# `template template-dhcp`  
Specifies the list of CNS connect templates in the CNS connect profile to be applied to the device configuration. You can specify more than one template.

**Step 10**  
Repeat Steps 8 to 9 to specify more interface parameters and CNS connect templates in the CNS connect profile.

**Step 11**  
**exit**  
**Example:**  
Device(config-cns-conn)# `exit`  
Returns to global configuration mode.

**Step 12**  
**hostname name**  
**Example:**  
Device(config)# `hostname device1`  
Enters the hostname for the device.

**Step 13**  
**ip route network-number**  
**Example:**  
RemoteDevice(config)# `ip route 172.28.129.22 255.255.255.255 11.11.11.1`  
(Optional) Establishes a static route to the Configuration Engine whose IP address is `network-number`.

**Step 14**  
**cns id interface num [dns-reverse | ipaddress | mac-address] [event] [image]**  
**Example:**  
RemoteDevice(config)# `cns id GigabitEthernet0/1 ipaddress`  
((Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the `cns id {hardware-serial | hostname | string string | udi} [event] [image]` command.  
• For `interface num`, enter the type of interface. For example, ethernet, group-async, loopback, or virtual-template. This setting specifies from which interface the IP or MAC address should be retrieved to define the unique ID.  
• For `{dns-reverse | ipaddress | mac-address}`, enter `dns-reverse` to retrieve the hostname and assign it as the unique ID, enter `ipaddress` to use the IP address, or enter `mac-address` to use the MAC address as the unique ID.  

### Enabling an Initial Configuration for Cisco IOS CNS Agent

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| cns id \{hardware-serial | hostname | string string | udi\} \[event\] \[image\] | - (Optional) Enter `event` to set the ID to be the event-id value used to identify the device.  
- (Optional) Enter `image` to set the ID to be the image-id value used to identify the device.  

**Note** If both the `event` and `image` keywords are omitted, the image-id value is used to identify the device. |

**Step 15**

**Example:**

```
RemoteDevice(config)# cns id hostname
```

**Step 16**

**Example:**

```
RemoteDevice(config)# cns config initial 10.1.1.1 no-persist
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| cns config initial \{hostname | ip-address\} \[port-number\] \[event\] \[no-persist\] \[page page\] \[source ip-address\] \[syntax-check\] | Enables the Cisco IOS agent, and initiates an initial configuration.  
- For \{hostname | ip-address\}, enter the hostname or the IP address of the configuration server.  
- (Optional) For port-number, enter the port number of the configuration server. The default port number is 80.  
- (Optional) Enable `event` for configuration success, failure, or warning messages when the configuration is finished.  
- (Optional) Enable no-persist to suppress the automatic writing to NVRAM of the configuration pulled as a result of entering the cns config initial global configuration command. If the no-persist keyword is not entered, using the cns config initial command causes the resultant configuration to be automatically written to NVRAM.  
- (Optional) For page page, enter the web page of the initial configuration. The default is /Config/config/asp.  
- (Optional) Enter source ip-address to use for source IP address. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) Enable syntax-check to check the syntax when this parameter is entered.</td>
<td></td>
</tr>
<tr>
<td>Note Though visible in the command-line help string, the encrypt, status url, and inventory keywords are not supported.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 17**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 18**

**Example:**

```
Device# show running-config
```

Verifies your entries.

**Step 19**

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

**What to do next**

To verify information about the configuration agent, use the `show cns config connections` command in privileged EXEC mode.

To disable the CNS Cisco IOS agent, use the `no cns config initial { ip-address | hostname }` global configuration command.

---

**Refreshing DeviceIDs**

Follow these steps to refresh a DeviceID when changing the hostname on the device.

**SUMMARY STEPS**

1. enable
2. show cns config connections
3. Make sure that the CNS event agent is properly connected to the event gateway.
4. show cns event connections
5. Record from the output of Step 4 the information for the currently connected connection listed below. You will be using the IP address and port number in subsequent steps of these instructions.
6. configure terminal
7. no cns event ip-address port-number
8. cns event ip-address port-number
9. **end**
10. Make sure that you have reestablished the connection between the device and the event connection by examining the output from `show cns event connections`.
11. `show running-config`
12. `copy running-config startup-config`

## Enabling a Partial Configuration for Cisco IOS CNS Agent

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device&gt; enable</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

**Device# configure terminal**

*Example:*

```
Device# configure terminal
```

**Step 3**

**cns config partial {ip-address | hostname} [port-number] [source ip-address]**

*Example:*

```
Device(config)# cns config partial 172.28.129.22 2013
```

*Purpose:*

Enables the configuration agent, and initiates a partial configuration.

- For `{ip-address | hostname}`, enter the IP address or the hostname of the configuration server.
- (Optional) For `port-number`, enter the port number of the configuration server. The default port number is 80.
- (Optional) Enter `source ip-address` to use for the source IP address.

*Note:* Though visible in the command-line help string, the `encrypt` keyword is not supported.

**Step 4**

**end**

*Example:*

```
Device(config)# end
```

*Purpose:*

Returns to privileged EXEC mode.

**Step 5**

**show running-config**

*Example:*

```
Device# show running-config
```

*Purpose:*

Verifies your entries.

**Step 6**

**copy running-config startup-config**

*Example:*

```
Device# copy running-config startup-config
```

*Purpose:*

(Optional) Saves your entries in the configuration file.

### What to do next

To verify information about the configuration agent, use either the `show cns config stats` or the `show cns config outstanding` command in privileged EXEC mode.

To disable the Cisco IOS agent, use the `no cns config partial {ip-address | hostname}` global configuration command. To cancel a partial configuration, use the `cns config cancel` global configuration command.
Monitoring CNS Configurations

Table 79: CNS show Commands

<table>
<thead>
<tr>
<th>Command</th>

Configuring the Cisco Discovery Protocol

Cisco Discovery Protocol is a Layer 2, media-independent, and network-independent protocol that runs on Cisco devices and enables networking applications to learn about directly connected devices nearby. This protocol facilitates the management of Cisco devices by discovering these devices, determining how they are configured, and allowing systems using different network-layer protocols to learn about each other.

This module describes Cisco Discovery Protocol Version 2 and how it functions with SNMP.

- Information About CDP, on page 657
- How to Configure CDP, on page 658
- Monitoring and Maintaining Cisco Discovery Protocol, on page 665
- Additional References, on page 666
- Feature History and Information for Cisco Discovery Protocol, on page 667

Information About CDP

Cisco Discovery Protocol Overview

Cisco Discovery Protocol is a device discovery protocol that runs over Layer 2 (the data-link layer) on all Cisco-manufactured devices (routers, bridges, access servers, controllers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With Cisco Discovery Protocol, network management applications can learn the device type and the SNMP agent address of neighboring devices running lower-layer, transparent protocols. This feature enables applications to send SNMP queries to neighboring devices.

Cisco Discovery Protocol runs on all media that support Subnetwork Access Protocol (SNAP). Because Cisco Discovery Protocol runs over the data-link layer only, two systems that support different network-layer protocols can learn about each other.

Each Cisco Discovery Protocol-configured device sends periodic messages to a multicast address, advertising at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or holdtime information, which is the length of time a receiving device holds Cisco Discovery Protocol information before discarding it. Each device also listens to the messages sent by other devices to learn about neighboring devices.

On the device, Cisco Discovery Protocol enables Network Assistant to display a graphical view of the network. The device uses Cisco Discovery Protocol to find cluster candidates and maintain information about cluster members and other devices up to three cluster-enabled devices away from the command device by default.
- Cisco Discovery Protocol identifies connected endpoints that communicate directly with the device.
- To prevent duplicate reports of neighboring devices, only one wired device reports the location information.
- The wired device and the endpoints both send and receive location information.

**CDP and Stacks**

A device stack appears as a single device in the network. Therefore, CDP discovers the device stack, not the individual stack members. The device stack sends CDP messages to neighboring network devices when there are changes to the device stack membership, such as stack members being added or removed.

**Default Cisco Discovery Protocol Configuration**

This table shows the default Cisco Discovery Protocol configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Discovery Protocol global state</td>
<td>Enabled</td>
</tr>
<tr>
<td>Cisco Discovery Protocol interface state</td>
<td>Enabled</td>
</tr>
<tr>
<td>Cisco Discovery Protocol timer (packet update frequency)</td>
<td>60 seconds</td>
</tr>
<tr>
<td>Cisco Discovery Protocol holdtime (before discarding)</td>
<td>180 seconds</td>
</tr>
<tr>
<td>Cisco Discovery Protocol Version-2 advertisements</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**How to Configure CDP**

**Configuring Cisco Discovery Protocol Characteristics**

You can configure these Cisco Discovery Protocol characteristics:

- Frequency of Cisco Discovery Protocol updates
- Amount of time to hold the information before discarding it
- Whether or not to send Version 2 advertisements

**Note**

Steps 3 through 5 are all optional and can be performed in any order.

Follow these steps to configure the Cisco Discovery Protocol characteristics.

**SUMMARY STEPS**

1. enable
2. configure terminal
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</tbody>
</table>
Disabling Cisco Discovery Protocol

Cisco Discovery Protocol is enabled by default.

Note

Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

What to do next

Use the no form of the Cisco Discovery Protocol commands to return to the default settings.

SUMMARY STEPS

1. enable
2. configure terminal
3. no cdp run
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</tbody>
</table>
### Enabling Cisco Discovery Protocol

Cisco Discovery Protocol is enabled by default.

**Note**

Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

Follow these steps to enable Cisco Discovery Protocol when it has been disabled.

**Before you begin**

Cisco Discovery Protocol must be disabled, or it cannot be enabled.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `cdp run`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**Step 4**

```
Device(config)# no cdp run
```

*Purpose*

Returns to privileged EXEC mode.

**Step 5**

```
Device(config)# end
```

*Example:*

```
Device(config)# end
```

Verifies your entries.

**Step 6**

```
Device# show running-config
```

*Example:*

```
Device# show running-config
```

(Optional) Saves your entries in the configuration file.

**What to do next**

You must reenable Cisco Discovery Protocol to use it.
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  **Example:**  
  Device> **enable**  
  • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode.  
  **Example:**  
  Device# **configure terminal** |
| **Step 3** cdp run | Enables Cisco Discovery Protocol if it has been disabled.  
  **Example:**  
  Device(config)# **cdp run** |
| **Step 4** end | Returns to privileged EXEC mode.  
  **Example:**  
  Device(config)# **end** |
| **Step 5** show running-config | Verifies your entries.  
  **Example:**  
  Device# **show running-config** |
| **Step 6** copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
  **Example:**  
  Device# **copy running-config startup-config** |

### What to do next

Use the `show run all` command to show that Cisco Discovery Protocol has been enabled. If you enter only `show run`, the enabling of Cisco Discovery Protocol may not be displayed.

### Disabling Cisco Discovery Protocol on an Interface

Cisco Discovery Protocol is enabled by default on all supported interfaces to send and to receive Cisco Discovery Protocol information.
Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

Cisco Discovery Protocol bypass is not supported and may cause a port go into err-disabled state.

Follow these steps to disable Cisco Discovery Protocol on a port.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `no cdp enable`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>

<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> no cdp enable</td>
<td>Disables Cisco Discovery Protocol on the interface specified in Step 3.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# no cdp enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Enabling Cisco Discovery Protocol on an Interface

Cisco Discovery Protocol is enabled by default on all supported interfaces to send and to receive Cisco Discovery Protocol information.

**Note**

Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

**Note**

Cisco Discovery Protocol bypass is not supported and may cause a port go into err-disabled state.

Follow these steps to enable Cisco Discovery Protocol on a port on which it has been disabled.

**Before you begin**

Cisco Discovery Protocol must be disabled on the port that you are trying to Cisco Discovery Protocol enable on, or it cannot be enabled.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. cdp enable
5. end
6. show running-config
7. copy running-config startup-config

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# end</td>
<td></td>

Prerequisites for SNMP

Supported SNMP Versions

This software release supports the following SNMP versions:

- SNMPv1—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- SNMPv2C replaces the Party-based Administrative and Security Framework of SNMPv2Classic with the community-string-based Administrative Framework of SNMPv2C while retaining the bulk retrieval and improved error handling of SNMPv2Classic. It has these features:
  - SNMPv2C—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.
- SNMPv3—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
  - Message integrity—Ensures that a packet was not tampered with in transit.
  - Authentication—Determines that the message is from a valid source.
• Encryption—Mixes the contents of a package to prevent it from being read by an unauthorized source.

**Note**

To select encryption, enter the **priv** keyword.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent’s MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval function and more detailed error message reporting to management stations. The bulk retrieval function retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security method is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

The following table identifies characteristics and compares different combinations of security models and levels:

**Table 81: SNMP Security Models and Levels**

Version Restrictions

• SNMPv1 does not support informs.

Information About SNMP

SNMP Overview

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a management information...
base (MIB). The SNMP manager can be part of a network management system (NMS) such as Cisco Prime Infrastructure. The agent and MIB reside on the device. To configure SNMP on the device, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager’s requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a TCP connection, loss of connection to a neighbor, or other significant events.

### SNMP Manager Functions

The SNMP manager uses information in the MIB to perform the operations described in the following table:

**Table 82: SNMP Operations**

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieves a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieves a value from a variable within a table.</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.</td>
</tr>
<tr>
<td>get-response</td>
<td>Replies to a get-request, get-next-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>set-request</td>
<td>Stores a value in a specific variable.</td>
</tr>
<tr>
<td>trap</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.</td>
</tr>
</tbody>
</table>

With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.

The get-bulk command only works with SNMPv2 or later.

### SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.
- Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.
SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the device, the community string definitions on the NMS must match at least one of the three community string definitions on the device.

A community string can have one of the following attributes:

- Read-only (RO)—Gives all objects in the MIB except the community strings read access to authorized management stations, but does not allow write access.

- Read-write (RW)—Gives all objects in the MIB read and write access to authorized management stations, but does not allow access to the community strings.

- When a cluster is created, the command device manages the exchange of messages among member devices and the SNMP application. The Network Assistant software appends the member device number (@esN, where N is the device number) to the first configured RW and RO community strings on the command device and propagates them to the member devices.

SNMP MIB Variables Access

An example of an NMS is the Cisco Prime Infrastructure network management software. Cisco Prime Infrastructure software uses the device MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in the figure, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in get-request, get-next-request, and set-request format.

Figure 72: SNMP Network

SNMP Notifications

SNMP allows the device to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps or informs, or both. Use the snmp-server host command to specify whether to send SNMP notifications as traps or informs.

Note

SNMPv1 does not support informs.
Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be resent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the device and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be resent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the device is a concern and notification is not required, use traps.

**SNMP ifIndex MIB Object Values**

In an NMS, the IF-MIB generates and assigns an interface index (ifIndex) object value that is a unique number greater than zero to identify a physical or a logical interface. When the device reboots or the device software is upgraded, the device uses this same value for the interface. For example, if the device assigns a port 2 an ifIndex value of 10003, this value is the same after the device reboots.

The device uses one of the values in the following table to assign an ifIndex value to an interface:

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>ifIndex Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVI (^5)</td>
<td>1–4999</td>
</tr>
<tr>
<td>EtherChannel</td>
<td>5001–5048</td>
</tr>
<tr>
<td>Tunnel</td>
<td>5078–5142</td>
</tr>
<tr>
<td>Physical (such as Gigabit Ethernet or SFP (^6)-module interfaces) based on type and port numbers</td>
<td>10000–14500</td>
</tr>
<tr>
<td>Null</td>
<td>14501</td>
</tr>
<tr>
<td>Loopback and Tunnel</td>
<td>24567+</td>
</tr>
</tbody>
</table>

\(^5\) SVI = switch virtual interface  
\(^6\) SFP = small form-factor pluggable

**Default SNMP Configuration**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP agent</td>
<td>Disabled(^2).</td>
</tr>
<tr>
<td>SNMP trap receiver</td>
<td>None configured.</td>
</tr>
<tr>
<td>SNMP traps</td>
<td>None enabled except the trap for TCP connections (tty).</td>
</tr>
<tr>
<td>SNMP version</td>
<td>If no version keyword is present, the default is Version 1.</td>
</tr>
</tbody>
</table>
If no keyword is entered, the default is the noauth (noAuthNoPriv) security level.

SNMP notification type: If no type is specified, all notifications are sent.

This is the default when the device starts and the startup configuration does not have any snmp-server global configuration commands.

### SNMP Configuration Guidelines

If the device starts and the device startup configuration has at least one snmp-server global configuration command, the SNMP agent is enabled.

An SNMP group is a table that maps SNMP users to SNMP views. An SNMP user is a member of an SNMP group. An SNMP host is the recipient of an SNMP trap operation. An SNMP engine ID is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The snmp-server host global configuration command auto-generates a notify view for the user and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group.

- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.

- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the snmp-server engineID global configuration command with the remote option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.

- When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.

- If a local user is not associated with a remote host, the device does not send informs for the auth (authNoPriv) and the priv (authPriv) authentication levels.

- Changing the value of the SNMP engine ID has significant results. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the snmp-server user username global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.
# How to Configure SNMP

## Disabling the SNMP Agent

The `no snmp-server` global configuration command disables all running versions (Version 1, Version 2C, and Version 3) of the SNMP agent on the device. You reenable all versions of the SNMP agent by the first `snmp-server` global configuration command that you enter. There is no Cisco IOS command specifically designated for enabling SNMP.

Follow these steps to disable the SNMP agent.

### Before you begin

The SNMP Agent must be enabled before it can be disabled. The SNMP agent is enabled by the first `snmp-server` global configuration command entered on the device.

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no snmp-server`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Community Strings

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the device. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community

Follow these steps to configure a community string on the device.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server community string [view view-name] [ro | rw] [access-list-number]`
4. `access-list access-list-number {deny | permit} source [source-wildcard]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device# show running-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><code>Device# configure terminal</code></td>
</tr>
<tr>
<td>3</td>
<td>`snmp-server community string [view view-name] [ro</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# snmp-server community comaccess ro 4</code></td>
</tr>
<tr>
<td>4</td>
<td>`access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# access-list 4 deny any</code></td>
</tr>
</tbody>
</table>

**Note**

The `@` symbol is used for delimiting the context information. Avoid using the `@` symbol as part of the SNMP community string when configuring this command.

- For `string`, specify a string that acts like a password and permits access to the SNMP protocol. You can configure one or more community strings of any length.
- (Optional) For `view`, specify the view record accessible to the community.
- (Optional) Specify either read-only (`ro`) if you want authorized management stations to retrieve MIB objects, or specify read-write (`rw`) if you want authorized management stations to retrieve and modify MIB objects. By default, the community string permits read-only access to all objects.
- (Optional) For `access-list-number`, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.

- For `deny`, specify the conditions of the access list.
- The `deny` keyword denies access if the conditions are matched. The `permit` keyword permits access if the conditions are matched.
- For `source`, enter the IP address of the SNMP managers that are permitted to use the community string to gain access to the agent.
- (Optional) For `source-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.

Recall that the access list is always terminated by an implicit deny statement for everything.
Purpose:

Command or Action | Purpose
--- | ---
Step 5 | end
Example: Device(config)# end
Returns to privileged EXEC mode.

Step 6 | show running-config
Example: Device# show running-config
Verifies your entries.

Step 7 | copy running-config startup-config
Example: Device# copy running-config startup-config
(Optional) Saves your entries in the configuration file.

What to do next
To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).

To remove a specific community string, use the no snmp-server community string global configuration command.

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the device. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the device. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Follow these steps to configure SNMP groups and users on the device.

SUMMARY STEPS

1. enable
2. configure terminal
3. snmp-server engineID {local engineid-string | remote ip-address [udp-port port-number] engineid-string}
4. snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv} } [read readview] [write writeview] [notify notifyview] [access access-list]
5. snmp-server user username group-name {remote host [udp-port port] } {v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password] } [priv {des | 3des | aes {128 | 192 | 256} } priv-password]

- **v1**: is the least secure of the possible security models.
- **v2c**: is the second least secure model. It allows transmission of informs and integers twice the normal width.
- **v3**: is the most secure, requires you to select one of the following authentication levels:
  - **auth**: Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>noauth</strong>—Enables the noAuthNoPriv security level. This is the default if no keyword is specified.</td>
</tr>
<tr>
<td><strong>priv</strong>—Enables Data Encryption Standard (DES) packet encryption (also called privacy).</td>
</tr>
</tbody>
</table>

(Optional) Enter `read readview` with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.

(Optional) Enter `write writeview` with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.

(Optional) Enter `notify notifyview` with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.

(Optional) Enter `access access-list` with a string (not to exceed 64 characters) that is the name of the access list.

---

**Step 5**

```
smtp-server user username group-name {remote host [udp-port port]} {v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password] } [priv {des | 3des | aes {128 | 192 | 256}} priv-password]
```

Adds a new user for an SNMP group.

The `username` is the name of the user on the host that connects to the agent.

The `group-name` is the name of the group to which the user is associated.

Enter `remote` to specify a remote SNMP entity to which the user belongs and the hostname or IP address of that entity with the optional UDP port number. The default is 162.

Enter the SNMP version number (v1, v2c, or v3). If you enter v3, you have these additional options:

- **encrypted** specifies that the password appears in encrypted format. This keyword is available only when the v3 keyword is specified.

- **auth** is an authentication level setting session that can be either the HMAC-MD5-96 (md5) or the HMAC-SHA-96 (sha) authentication level and requires a password string `auth-password` (not to exceed 64 characters).

If you enter v3 you can also configure a private (priv) encryption algorithm and password string `priv-password` using the following keywords (not to exceed 64 characters):  
- **priv** specifies the User-based Security Model (USM).
- **des** specifies the use of the 56-bit DES algorithm.
- **3des** specifies the use of the 168-bit DES algorithm.
Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the device generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Devices running this Cisco IOS release can have an unlimited number of trap managers.

Many commands use the word traps in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword traps refers to traps, informs, or both. Use the snmp-server host global configuration command to specify whether to send SNMP notifications as traps or informs.

You can use the snmp-server host global configuration command for a specific host to receive the notification types listed in the following table. You can enable any or all of these traps and configure a trap manager to receive them.

Table 84: Device Notification Types

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridge</td>
<td>Generates STP bridge MIB traps.</td>
</tr>
<tr>
<td>cluster</td>
<td>Generates a trap when the cluster configuration changes.</td>
</tr>
<tr>
<td>config</td>
<td>Generates a trap for SNMP configuration changes.</td>
</tr>
<tr>
<td>copy-config</td>
<td>Generates a trap for SNMP copy configuration changes.</td>
</tr>
<tr>
<td>Notification Type Keyword</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>cpu threshold</td>
<td>Allow CPU-related traps.</td>
</tr>
<tr>
<td>entity</td>
<td>Generates a trap for SNMP entity changes.</td>
</tr>
<tr>
<td>envmon</td>
<td>Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, status, supply, temperature.</td>
</tr>
<tr>
<td>errdisable</td>
<td>Generates a trap for a port VLAN errdisabled. You can also set a maximum trap rate per minute. The range is from 0 to 10000; the default is 0, which means there is no rate limit.</td>
</tr>
<tr>
<td>flash</td>
<td>Generates SNMP FLASH notifications. In a device stack, you can optionally enable notification for flash insertion or removal, which would cause a trap to be issued whenever a device in the stack is removed or inserted (physical removal, power cycle, or reload).</td>
</tr>
<tr>
<td>fru-ctrl</td>
<td>Generates entity field-replaceable unit (FRU) control traps. In the device stack, this trap refers to the insertion or removal of a device in the stack.</td>
</tr>
<tr>
<td>hsrp</td>
<td>Generates a trap for Hot Standby Router Protocol (HSRP) changes.</td>
</tr>
<tr>
<td>ipmulticast</td>
<td>Generates a trap for IP multicast routing changes.</td>
</tr>
<tr>
<td>mac-notification</td>
<td>Generates a trap for MAC address notifications.</td>
</tr>
<tr>
<td>msdp</td>
<td>Generates a trap for Multicast Source Discovery Protocol (MSDP) changes.</td>
</tr>
<tr>
<td>ospf</td>
<td>Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes.</td>
</tr>
<tr>
<td>pim</td>
<td>Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.</td>
</tr>
</tbody>
</table>
| port-security            | Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit.  
|                          | **Note** When you configure a trap by using the notification type **port-security**, configure the port security trap first, and then configure the port security trap rate:  
|                          | 1. `snmp-server enable traps port-security`  
|                          | 2. `snmp-server enable traps port-security trap-rate rate` |
| rtr                      | Generates a trap for the SNMP Response Time Reporter (RTR). |
| snmp                     | Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down. |
### Notification Type Keyword | Description
---|---
storm-control | Generates a trap for SNMP storm-control. You can also set a maximum trap rate per minute. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence).

stpx | Generates SNMP STP Extended MIB traps.
syslog | Generates SNMP syslog traps.
tty | Generates a trap for TCP connections. This trap is enabled by default.
vlan-membership | Generates a trap for SNMP VLAN membership changes.
vlancreate | Generates SNMP VLAN created traps.
vlandelete | Generates SNMP VLAN deleted traps.
vtp | Generates a trap for VLAN Trunking Protocol (VTP) changes.

Follow these steps to configure the device to send traps or informs to a host.

### SUMMARY STEPS
1. enable
2. configure terminal
3. snmp-server engineID remote ip-address engineid-string
4. snmp-server user username group-name { remote host [ udp-port port ] } {v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password]}
5. snmp-server group group-name {v1 | v2c | v3 [auth | noauth | priv]} [read readview] [write writeview] [notify notifyview] [access access-list]
6. snmp-server host host-addr [informs | traps] [version {1 | 2c | 3 [auth | noauth | priv]}] community-string [notification-type]
7. snmp-server enable traps notification-types
8. snmp-server trap-source interface-id
9. snmp-server queue-length length
10. snmp-server trap-timeout seconds
11. end
12. show running-config
13. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Step 2**

**Command or Action**: configure terminal

**Example:**

```
Device# configure terminal
```

**Purpose**: Enters global configuration mode.

**Step 3**

**Command or Action**: `configure terminal`

**Example:**

```
Device(config)# configure terminal
```

**Purpose**: Specifies the engine ID for the remote host.

### Note

**Step 4**

**Command or Action**: `snmp-server engineID remote ip-address engineid-string`

**Example:**

```
Device(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b
```

**Purpose**: Configures an SNMP user to be associated with the remote host created in Step 3.

**Note**: You cannot configure a remote user for an address without first configuring the engine ID for the remote host. Otherwise, you receive an error message, and the command is not executed.

**Step 5**

**Command or Action**: `snmp-server group group-name { v1 | v2c | v3 { auth | noauth | priv } } [ read readview ] [ write writeview ] [ notify notifyview ] [ access access-list ]`

**Example:**

```
Device(config)# snmp-server group public v2c
```

**Purpose**: Configures an SNMP group.

### Note

**Step 6**

**Command or Action**: `snmp-server host host-addr [ informs | traps ] [ version { 1 | 2c | 3 { auth | noauth | priv } } ] community-string [ notification-type ]`

**Example:**

```
Device(config)# snmp-server host 203.0.113.1 comaccess snmp
```

**Purpose**: Specifies the recipient of an SNMP trap operation.

For `host-addr`, specify the name or Internet address of the host (the targeted recipient).

(Optional) Specify `traps` (the default) to send SNMP traps to the host.

(Optional) Specify `informs` to send SNMP informs to the host.

(Optional) Specify the SNMP `version` (1, 2c, or 3). SNMPv1 does not support informs.

(Optional) For Version 3, select authentication level `auth`, `noauth`, or `priv`.

**Note**: The `priv` keyword is available only when the cryptographic software image is installed.

For `community-string`, when `version 1` or `version 2c` is specified, enter the password-like community string sent with the notification operation. When `version 3` is specified, enter the SNMPv3 username.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>The <code>@</code> symbol is used for delimiting the context information. Avoid using the <code>@</code> symbol as part of the SNMP community string when configuring this command.</td>
<td></td>
</tr>
<tr>
<td>(Optional) For <code>notification-type</code>, use the keywords listed in the table above. If no type is specified, all notifications are sent.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 7**

**snmp-server enable traps** `notification-types`

**Example:**

```
Device(config)# snmp-server enable traps snmp
```

Enables the device to send traps or informs and specifies the type of notifications to be sent. For a list of notification types, see the table above, or enter `snmp-server enable traps ?`.

To enable multiple types of traps, you must enter a separate `snmp-server enable traps` command for each trap type.

**Note**

When you configure a trap by using the `notification-type` `port-security`, configure the port security trap first, and then configure the port security trap rate:

1. `snmp-server enable traps port-security`
2. `snmp-server enable traps port-security trap-rate rate`

**Step 8**

**snmp-server trap-source** `interface-id`

**Example:**

```
Device(config)# snmp-server trap-source gigabitethernet 1/0/1
```

(Optional) Specifies the source interface, which provides the IP address for the trap message. This command also sets the source IP address for informs.

**Step 9**

**snmp-server queue-length** `length`

**Example:**

```
Device(config)# snmp-server queue-length 20
```

(Optional) Establishes the message queue length for each trap host. The range is 1 to 5000; the default is 10.

**Step 10**

**snmp-server trap-timeout** `seconds`

**Example:**

```
Device(config)# snmp-server trap-timeout 60
```

(Optional) Defines how often to resend trap messages. The range is 1 to 1000; the default is 30 seconds.

**Step 11**

**end**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 12**

**show running-config**

**Example:**

```
Device# show running-config
```

Verifies your entries.
## Setting the Agent Contact and Location Information

Follow these steps to set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file.

### SUMMARY STEPS

1. enable
2. configure terminal
3. snmp-server contact *text*
4. snmp-server location *text*
5. end
6. show running-config
7. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device# enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**                         |                                        |
| configure terminal                 | Enters global configuration mode.      |
| Example:                           |                                        |
| Device# configure terminal         |                                        |
### Limiting TFTP Servers Used Through SNMP

Follow these steps to limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server tftp-server-list access-list-number`
4. `access-list access-list-number { deny | permit } source [source-wildcard]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>snmp-server contact text</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# snmp-server contact Dial System Operator at beeper 21555</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>snmp-server location text</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# snmp-server location Building 3/Room 222</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>show running-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# show running-config</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>copy running-config startup-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Sets the system contact string.

Sets the system location string.

Returns to privileged EXEC mode.

Verifies your entries.

(Optional) Saves your entries in the configuration file.
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
Example:  
Device> enable  
- Enter your password if prompted. |
| **Step 2** | configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
| **Step 3** | snmp-server tftp-server-list access-list-number | Limits the TFTP servers used for configuration file copies through SNMP to the servers in the access list.  
Example:  
Device(config)# snmp-server tftp-server-list 44  
For access-list-number, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999. |
| **Step 4** | access-list access-list-number {deny | permit} source [source-wildcard] | Creates a standard access list, repeating the command as many times as necessary.  
Example:  
Device(config)# access-list 44 permit 10.1.1.2  
The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.  
For source, enter the IP address of the TFTP servers that can access the device.  
(Optional) For source-wildcard, enter the wildcard bits, in dotted decimal notation, to be applied to the source. Place ones in the bit positions that you want to ignore.  
The access list is always terminated by an implicit deny statement for everything. |
| **Step 5** | end | Returns to privileged EXEC mode.  
Example:  
Device(config)# end |
| **Step 6** | show running-config | Verifies your entries.  
Example:  
Device# show running-config |

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Step 7  
**copy running-config startup-config**

**Example:**

Device# copy running-config startup-config

---

**Monitoring SNMP Status**

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the `show snmp` privileged EXEC command. You also can use the other privileged EXEC commands listed in the table to display SNMP information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show snmp</code></td>
<td>Displays SNMP statistics.</td>
</tr>
<tr>
<td><code>show snmp group</code></td>
<td>Displays information on each SNMP group on the network.</td>
</tr>
<tr>
<td><code>show snmp pending</code></td>
<td>Displays information on pending SNMP requests.</td>
</tr>
<tr>
<td><code>show snmp sessions</code></td>
<td>Displays information on the current SNMP sessions.</td>
</tr>
<tr>
<td><code>show snmp user</code></td>
<td>Displays information on each SNMP user name in the SNMP users table.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>You must use this command to display SNMPv3 configuration information for <code>auth</code></td>
</tr>
</tbody>
</table>

**SNMP Examples**

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string `public`. This configuration does not cause the device to send any traps.

Device(config)# snmp-server community public

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string `public`. The device also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33.
using SNMPv1 and to the host 192.180.1.27 using SNMPv2c. The community string public is sent with the traps.

```
Device(config)# snmp-server community public
Device(config)# snmp-server enable traps vtp
Device(config)# snmp-server host 192.180.1.27 version 2c public
Device(config)# snmp-server host 192.180.1.33 public
```

This example shows how to allow read-only access for all objects to members of access list 4 that use the comaccess community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2c to the host cisco.com using the community string public.

```
Device(config)# snmp-server community comaccess ro 4
Device(config)# snmp-server enable traps snmp authentication
Device(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host cisco.com. The community string is restricted. The first line enables the device to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous snmp-server host commands for the host cisco.com.

```
Device(config)# snmp-server enable traps entity
Device(config)# snmp-server host cisco.com restricted entity
```

This example shows how to enable the device to send all traps to the host myhost.cisco.com using the community string public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send auth (authNoPriv) authentication-level informs when the user enters global configuration mode:

```
Device(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b
Device(config)# snmp-server group authgroup v3 auth
Device(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
Device(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Device(config)# snmp-server enable traps
Device(config)# snmp-server inform retries 0
```

Configuring SPAN and RSPAN

- Prerequisites for SPAN and RSPAN, on page 693
- Restrictions for SPAN and RSPAN, on page 693
- Information About SPAN and RSPAN, on page 695
- How to Configure SPAN and RSPAN, on page 704
- Monitoring SPAN and RSPAN Operations, on page 721
- SPAN and RSPAN Configuration Examples, on page 721
- Additional References, on page 723
- Feature History and Information for SPAN and RSPAN, on page 724

Prerequisites for SPAN and RSPAN

SPAN

- You can limit SPAN traffic to specific VLANs by using the `filter vlan` keyword. If a trunk port is being monitored, only traffic on the VLANs specified with this keyword is monitored. By default, all VLANs are monitored on a trunk port.

RSPAN

- We recommend that you configure an RSPAN VLAN before you configure an RSPAN source or a destination session.

Restrictions for SPAN and RSPAN

SPAN

The restrictions for SPAN are as follows:

- On each device, you can configure 66 sessions. A maximum of 7 source sessions can be configured and the remaining sessions can be configured as RSPAN destinations sessions. A source session is either a local SPAN session or an RSPAN source session.

- For SPAN sources, you can monitor traffic for a single port or VLAN or a series or range of ports or VLANs for each session. You cannot mix source ports and source VLANs within a single SPAN session.
- The destination port cannot be a source port; a source port cannot be a destination port.

- You cannot have two SPAN sessions using the same destination port.

- When you configure a device port as a SPAN destination port, it is no longer a normal device port; only monitored traffic passes through the SPAN destination port.

- Entering SPAN configuration commands does not remove previously configured SPAN parameters. You must enter the `no monitor session {session_number | all | local | remote}` global configuration command to delete configured SPAN parameters.

- For local SPAN, outgoing packets through the SPAN destination port carry the original encapsulation headers—untagged, ISL, or IEEE 802.1Q—if the `encapsulation replicate` keywords are specified. If the keywords are not specified, the packets are sent in native form.

- You can configure a disabled port to be a source or destination port, but the SPAN function does not start until the destination port and at least one source port or source VLAN are enabled.

- You cannot mix source VLANs and filter VLANs within a single SPAN session.

Traffic monitoring in a SPAN session has the following restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.

- Wireshark does not capture egress packets when egress span is active.

- The device supports up to four local SPAN or RSPAN source sessions. However if this switch is stacked with Catalyst 2960-S switches, you are limited to 2 local SPAN or RSPAN source sessions.

- You can run both a local SPAN and an RSPAN source session in the same device or device stack. The device or device stack supports a total of 66 source and RSPAN destination sessions.

- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.

- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per device stack.

- SPAN sessions do not interfere with the normal operation of the device. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.

- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.

- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.

- The device does not support a combination of local SPAN and RSPAN in a single session.
  - An RSPAN source session cannot have a local destination port.
  - An RSPAN destination session cannot have a local source port.
  - An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same device or device stack.
RSPAN

The restrictions for RSPAN are as follows:

- RSPAN does not support BPDU packet monitoring or other Layer 2 device protocols.
- The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that the VLAN remote-span feature is supported in all the participating devices.
- RSPAN VLANs are included as sources for port-based RSPAN sessions when source trunk ports have active RSPAN VLANs. RSPAN VLANs can also be sources in SPAN sessions. However, since the device does not monitor spanned traffic, it does not support egress spanning of packets on any RSPAN VLAN identified as the destination of an RSPAN source session on the device.
- CDP packets are not forwarded in RSPAN configured VLAN due to limitation in hardware. The workaround is to disable CDP on all the interfaces carrying RSPAN VLAN on the devices connected to the switch.
- If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN IDs that are lower than 1005.
- To use RSPAN, the switch must be running the LAN Base image.

Information About SPAN and RSPAN

SPAN and RSPAN

You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the device or on another device that has been connected to a network analyzer or other monitoring or security device. SPAN copies (or mirrors) traffic received or sent (or both) on source ports or source VLANs to a destination port for analysis. SPAN does not affect the switching of network traffic on the source ports or VLANs. You must dedicate the destination port for SPAN use. Except for traffic that is required for the SPAN or RSPAN session, destination ports do not receive or forward traffic.

Only traffic that enters or leaves source ports or traffic that enters or leaves source VLANs can be monitored by using SPAN; traffic routed to a source VLAN cannot be monitored. For example, if incoming traffic is being monitored, traffic that gets routed from another VLAN to the source VLAN cannot be monitored; however, traffic that is received on the source VLAN and routed to another VLAN can be monitored.

You can use the SPAN or RSPAN destination port to inject traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.

Local SPAN

Local SPAN supports a SPAN session entirely within one device; all source ports or source VLANs and destination ports are in the same device or device stack. Local SPAN copies traffic from one or more source ports in any VLAN or from one or more VLANs to a destination port for analysis.
Remote SPAN

Remote SPAN supports source ports, source VLANs, and destination ports on different devices (or different device stacks), enabling remote monitoring of multiple devices across your network.

The figure below shows source ports on Device A and Device B. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating devices.
The RSPAN traffic from the source ports or VLANs is copied into the RSPAN VLAN and forwarded over trunk ports carrying the RSPAN VLAN to a destination session monitoring the RSPAN VLAN. Each RSPAN source device must have either ports or VLANs as RSPAN sources. The destination is always a physical port, as shown on Device C in the figure.

### SPAN and RSPAN Concepts and Terminology

#### SPAN Sessions

SPAN sessions (local or remote) allow you to monitor traffic on one or more ports, or one or more VLANs, and send the monitored traffic to one or more destination ports.

A local SPAN session is an association of a destination port with source ports or source VLANs, all on a single network device. Local SPAN does not have separate source and destination sessions. Local SPAN sessions gather a set of ingress and egress packets specified by the user and form them into a stream of SPAN data, which is directed to the destination port.

RSPAN consists of at least one RSPAN source session, an RSPAN VLAN, and at least one RSPAN destination session. You separately configure RSPAN source sessions and RSPAN destination sessions on different network devices. To configure an RSPAN source session on a device, you associate a set of source ports or source VLANs with an RSPAN VLAN. The output of this session is the stream of SPAN packets that are sent to the RSPAN VLAN. To configure an RSPAN destination session on another device, you associate the destination port with the RSPAN VLAN. The destination session collects all RSPAN VLAN traffic and sends it out the RSPAN destination port.

An RSPAN source session is very similar to a local SPAN session, except for where the packet stream is directed. In an RSPAN source session, SPAN packets are relabeled with the RSPAN VLAN ID and directed over normal trunk ports to the destination device.
An RSPAN destination session takes all packets received on the RSPAN VLAN, strips off the VLAN tagging, and presents them on the destination port. The session presents a copy of all RSPAN VLAN packets (except Layer 2 control packets) to the user for analysis.

More than one source session and more than one destination session can be active in the same RSPAN VLAN. Intermediate devices also can separate the RSPAN source and destination sessions. These devices are unable to run RSPAN, but they must respond to the requirements of the RSPAN VLAN.

Traffic monitoring in a SPAN session has these restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.
- You can run both a local SPAN and an RSPAN source session in the same device or device stack. The device or device stack supports a total of 66 source and RSPAN destination sessions.
- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.
- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per device stack.
- SPAN sessions do not interfere with the normal operation of the device. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.
- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Therefore monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.
- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.
- The device does not support a combination of local SPAN and RSPAN in a single session.
- An RSPAN source session cannot have a local destination port.
- An RSPAN destination session cannot have a local source port.
- An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same device or device stack.

Monitored Traffic

SPAN sessions can monitor these traffic types:

- Receive (Rx) SPAN—Receive (or ingress) SPAN monitors as much as possible all of the packets received by the source interface or VLAN before any modification or processing is performed by the device. A copy of each packet received by the source is sent to the destination port for that SPAN session.

  Packets that are modified because of routing or Quality of Service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied before modification.

  Features that can cause a packet to be dropped during receive processing have no effect on ingress SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input Access Control Lists (ACLs), ingress QoS policing, VLAN ACLs, and egress QoS policing.
• Transmit (Tx) SPAN—Transmit (or egress) SPAN monitors as much as possible all of the packets sent by the source interface after all modification and processing is performed by the device. A copy of each packet sent by the source is sent to the destination port for that SPAN session. The copy is provided after the packet is modified.

Packets that are modified because of routing (for example, with modified time-to-live (TTL), MAC address, or QoS values) are duplicated (with the modifications) at the destination port.

Features that can cause a packet to be dropped during transmit processing also affect the duplicated copy for SPAN. These features include IP standard and extended output ACLs and egress QoS policing.

• Both—In a SPAN session, you can also monitor a port or VLAN for both received and sent packets. This is the default.

The default configuration for local SPAN session ports is to send all packets untagged. SPAN also does not normally monitor bridge protocol data unit (BPDU) packets and Layer 2 protocols, such as Cisco Discovery Protocol (CDP), VLAN Trunk Protocol (VTP), Dynamic Trunking Protocol (DTP), Spanning Tree Protocol (STP), and Port Aggregation Protocol (PAgP). However, when you enter the encapsulation replicate keywords when configuring a destination port, these changes occur:

• Packets are sent on the destination port with the same encapsulation (untagged or IEEE 802.1Q) that they had on the source port.

• Packets of all types, including BPDU and Layer 2 protocol packets, are monitored.

Therefore, a local SPAN session with encapsulation replicate enabled can have a mixture of untagged and IEEE 802.1Q tagged packets appear on the destination port.

Device congestion can cause packets to be dropped at ingress source ports, egress source ports, or SPAN destination ports. In general, these characteristics are independent of one another. For example:

• A packet might be forwarded normally but dropped from monitoring due to an oversubscribed SPAN destination port.

• An ingress packet might be dropped from normal forwarding, but still appear on the SPAN destination port.

• An egress packet dropped because of device congestion is also dropped from egress SPAN.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the Rx monitor on port A and Tx monitor on port B. If a packet enters the device through port A and is switched to port B, both incoming and outgoing packets are sent to the destination port. Both packets are the same unless a Layer 3 rewrite occurs, in which case the packets are different because of the packet modification.

Source Ports

A source port (also called a monitored port) is a switched or routed port that you monitor for network traffic analysis.

In a local SPAN session or RSPAN source session, you can monitor source ports or VLANs for traffic in one or both directions.

The device supports any number of source ports (up to the maximum number of available ports on the device) and any number of source VLANs (up to the maximum number of VLANs supported).
However, the device supports a maximum of four sessions (two sessions if device is in a stack with Catalyst 2960-S switches) (local or RSPAN) with source ports or VLANs. You cannot mix ports and VLANs in a single session.

A source port has these characteristics:

- It can be monitored in multiple SPAN sessions.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor.
- It can be any port type (for example, EtherChannel, Gigabit Ethernet, and so forth).
- For EtherChannel sources, you can monitor traffic for the entire EtherChannel or individually on a physical port as it participates in the port channel.
- It can be an access port, trunk port, routed port, or voice VLAN port.
- It cannot be a destination port.
- Source ports can be in the same or different VLANs.
- You can monitor multiple source ports in a single session.

### Source VLANs

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs. The SPAN or RSPAN source interface in VSPAN is a VLAN ID, and traffic is monitored on all the ports for that VLAN.

VSPAN has these characteristics:

- All active ports in the source VLAN are included as source ports and can be monitored in either or both directions.
- On a given port, only traffic on the monitored VLAN is sent to the destination port.
- If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
- If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
- You cannot use filter VLANs in the same session with VLAN sources.
- You can monitor only Ethernet VLANs.

### VLAN Filtering

When you monitor a trunk port as a source port, by default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering.

- VLAN filtering applies only to trunk ports or to voice VLAN ports.
- VLAN filtering applies only to port-based sessions and is not allowed in sessions with VLAN sources.
- When a VLAN filter list is specified, only those VLANs in the list are monitored on trunk ports or on voice VLAN access ports.
- SPAN traffic coming from other port types is not affected by VLAN filtering; that is, all VLANs are allowed on other ports.
VLAN filtering affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic.

**Destination Port**

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer.

A destination port has these characteristics:

- For a local SPAN session, the destination port must reside on the same device or device stack as the source port. For an RSPAN session, it is located on the device containing the RSPAN destination session. There is no destination port on a device or device stack running only an RSPAN source session.

- When a port is configured as a SPAN destination port, the configuration overwrites the original port configuration. When the SPAN destination configuration is removed, the port reverts to its previous configuration. If a configuration change is made to the port while it is acting as a SPAN destination port, the change does not take effect until the SPAN destination configuration had been removed.

- When QoS is configured on the SPAN destination port, QoS takes effect immediately.

  **Note** When QoS is configured on the SPAN destination port, QoS takes effect immediately.

- If the port was in an EtherChannel group, it is removed from the group while it is a destination port. If it was a routed port, it is no longer a routed port.

- It can be any Ethernet physical port.

- It cannot be a secure port.

- It cannot be a source port.

- It can participate in only one SPAN session at a time (a destination port in one SPAN session cannot be a destination port for a second SPAN session).

- When it is active, incoming traffic is disabled. The port does not transmit any traffic except that required for the SPAN session. Incoming traffic is never learned or forwarded on a destination port.

- If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

- It does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).

- A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.

- The maximum number of destination ports in a device or device stack is 64.

Local SPAN and RSPAN destination ports function differently with VLAN tagging and encapsulation:

- For local SPAN, if the `encapsulation replicate` keywords are specified for the destination port, these packets appear with the original encapsulation (untagged, ISL, or IEEE 802.1Q). If these keywords are not specified, packets appear in the untagged format. Therefore, the output of a local SPAN session with `encapsulation replicate` enabled can contain a mixture of untagged, ISL, or IEEE 802.1Q-tagged packets.
For RSPAN, the original VLAN ID is lost because it is overwritten by the RSPAN VLAN identification. Therefore, all packets appear on the destination port as untagged.

RSPAN VLAN

The RSPAN VLAN carries SPAN traffic between RSPAN source and destination sessions. RSPAN VLAN has these special characteristics:

• All traffic in the RSPAN VLAN is always flooded.
• No MAC address learning occurs on the RSPAN VLAN.
• RSPAN VLAN traffic only flows on trunk ports.
• RSPAN VLANs must be configured in VLAN configuration mode by using the `remote-span` VLAN configuration mode command.
• STP can run on RSPAN VLAN trunks but not on SPAN destination ports.
• An RSPAN VLAN cannot be a private-VLAN primary or secondary VLAN.

For VLANs 1 to 1005 that are visible to VLAN Trunking Protocol (VTP), the VLAN ID and its associated RSPAN characteristic are propagated by VTP. If you assign an RSPAN VLAN ID in the extended VLAN range (1006 to 4094), you must manually configure all intermediate devices.

It is normal to have multiple RSPAN VLANs in a network at the same time with each RSPAN VLAN defining a network-wide RSPAN session. That is, multiple RSPAN source sessions anywhere in the network can contribute packets to the RSPAN session. It is also possible to have multiple RSPAN destination sessions throughout the network, monitoring the same RSPAN VLAN and presenting traffic to the user. The RSPAN VLAN ID separates the sessions.

SPAN and RSPAN Interaction with Other Features

SPAN interacts with these features:

• Routing—SPAN does not monitor routed traffic. VSPAN only monitors traffic that enters or exits the device, not traffic that is routed between VLANs. For example, if a VLAN is being Rx-monitored and the device routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and not received on the SPAN destination port.
• STP—A destination port does not participate in STP while its SPAN or RSPAN session is active. The destination port can participate in STP after the SPAN or RSPAN session is disabled. On a source port, SPAN does not affect the STP status. STP can be active on trunk ports carrying an RSPAN VLAN.
• CDP—A SPAN destination port does not participate in CDP while the SPAN session is active. After the SPAN session is disabled, the port again participates in CDP.
• VTP—You can use VTP to prune an RSPAN VLAN between devices.
• VLAN and trunking—You can modify VLAN membership or trunk settings for source or destination ports at any time. However, changes in VLAN membership or trunk settings for a destination port do not take effect until you remove the SPAN destination configuration. Changes in VLAN membership or trunk settings for a source port immediately take effect, and the respective SPAN sessions automatically adjust accordingly.
• EtherChannel—You can configure an EtherChannel group as a source port a SPAN destination port. When a group is configured as a SPAN source, the entire group is monitored.
If a physical port is added to a monitored EtherChannel group, the new port is added to the SPAN source port list. If a port is removed from a monitored EtherChannel group, it is automatically removed from the source port list.

A physical port that belongs to an EtherChannel group can be configured as a SPAN source port and still be a part of the EtherChannel. In this case, data from the physical port is monitored as it participates in the EtherChannel. However, if a physical port that belongs to an EtherChannel group is configured as a SPAN destination, it is removed from the group. After the port is removed from the SPAN session, it rejoins the EtherChannel group. Ports removed from an EtherChannel group remain members of the group, but they are in the inactive or suspended state.

If a physical port that belongs to an EtherChannel group is a destination port and the EtherChannel group is a source, the port is removed from the EtherChannel group and from the list of monitored ports.

- Multicast traffic can be monitored. For egress and ingress port monitoring, only a single unedited packet is sent to the SPAN destination port. It does not reflect the number of times the multicast packet is sent.
- A private-VLAN port cannot be a SPAN destination port.
- A secure port cannot be a SPAN destination port.

For SPAN sessions, do not enable port security on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable port security on any ports with monitored egress.

- An IEEE 802.1x port can be a SPAN source port. You can enable IEEE 802.1x on a port that is a SPAN destination port; however, IEEE 802.1x is disabled until the port is removed as a SPAN destination.

For SPAN sessions, do not enable IEEE 802.1x on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable IEEE 802.1x on any ports that are egress monitored.

**SPAN and RSPAN and Device Stacks**

Because the stack of devices represents one logical device, local SPAN source ports and destination ports can be in different devices in the stack. Therefore, the addition or deletion of devices in the stack can affect a local SPAN session, as well as an RSPAN source or destination session. An active session can become inactive when a device is removed from the stack or an inactive session can become active when a device is added to the stack.

**Default SPAN and RSPAN Configuration**

Table 86: Default SPAN and RSPAN Configuration

### Configuration Guidelines

#### SPAN Configuration Guidelines

- To remove a source or destination port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command or the `no monitor session session_number destination interface interface-id` global configuration command. For destination interfaces, the `encapsulation` options are ignored with the `no` form of the command.

- To monitor all VLANs on the trunk port, use the `no monitor session session_number filter` global configuration command.

#### RSPAN Configuration Guidelines

- All the SPAN configuration guidelines apply to RSPAN.

- As RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.

- You can apply an output ACL to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source devices.

- For RSPAN configuration, you can distribute the source ports and the destination ports across multiple devices in your network.

- Access ports (including voice VLAN ports) on the RSPAN VLAN are put in the inactive state.

- You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:
  - The same RSPAN VLAN is used for an RSPAN session in all the devices.
  - All participating devices support RSPAN.

### How to Configure SPAN and RSPAN

#### Creating a Local SPAN Session

Follow these steps to create a SPAN session and specify the source (monitored) ports or VLANs and the destination (monitoring) ports.
## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source {interface interface-id | vlan vlan-id} [ , | -] [both | rx | tx]`
5. `monitor session session_number destination {interface interface-id [, | -] [encapsulation replicate]}`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | **enable**        | Enables privileged EXEC mode.  
  **Example:**  
  `Device> enable`  
  • Enter your password if prompted. |
| 2    | **configure terminal** | Enters global configuration mode.  
  **Example:**  
  `Device# configure terminal` |
| 3    | **no monitor session {session_number | all | local | remote}** | Removes any existing SPAN configuration for the session.  
  **Example:**  
  `Device(config)# no monitor session all`  
  • For `session_number`, the range is 1 to 4.  
  • `all`—Removes all SPAN sessions.  
  • `local`—Removes all local sessions.  
  • `remote`—Removes all remote SPAN sessions. |
| 4    | **monitor session session_number source {interface interface-id | vlan vlan-id} [ , | -] [both | rx | tx]** | Specifies the SPAN session and the source port (monitored port).  
  **Example:**  
  `Device(config)# monitor session 1 source interface gigabitethernet1/0/1`  
  • For `session_number`, the range is 1 to 4.  
  • For `interface-id`, specify the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (`port-channel port-channel-number`). Valid port-channel numbers are 1 to 6.  
  • For `vlan-id`, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN). |
Creating a Local SPAN Session

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor session session_number destination {interface interface-id [,</td>
<td>-] [encapsulation replicate]}</td>
</tr>
<tr>
<td>Device(config)# monitor session 1 destination interface gigabitethernet1/0/2 encapsulation replicate</td>
<td>For local SPAN, you must use the same session number for the source and destination interfaces.</td>
</tr>
<tr>
<td>(Optional)</td>
<td>For session_number, specify the session number entered in step 4.</td>
</tr>
<tr>
<td>(Optional)</td>
<td>For interface-id, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.</td>
</tr>
<tr>
<td>(Optional) [,</td>
<td>-]</td>
</tr>
<tr>
<td>(Optional) encapsulation replicate</td>
<td>Specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).</td>
</tr>
</tbody>
</table>

Note

- A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session.

- (Optional) [, | -] Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.

- (Optional) both | rx | tx—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic.
  - both—Monitors both received and sent traffic.
  - rx—Monitors received traffic.
  - tx—Monitors sent traffic.

Note

- You can use the monitor session session_number source command multiple times to configure multiple source ports.
### Creating a Local SPAN Session and Configuring Incoming Traffic

Follow these steps to create a SPAN session, to specify the source ports or VLANs and the destination ports, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source {interface interface-id | vlan vlan-id} [ , | - ] [ both | rx | tx ]`
5. `monitor session session_number destination {interface interface-id [ , | - ] [ encapsulation replicate[ingress {dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id}] ]}
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td></td>
</tr>
</tbody>
</table>

You can use `monitor session session_number destination` command multiple times to configure multiple destination ports.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

configure terminal

Example:

Device# configure terminal

Removes any existing SPAN configuration for the session.

- For *session_number*, the range is 1 to 4.
- **all**—Removes all SPAN sessions.
- **local**—Removes all local sessions.
- **remote**—Removes all remote SPAN sessions.

**Step 3**

no monitor session {session_number | all | local | remote}

Example:

Device(config)# no monitor session all

Specifies the SPAN session and the source port (monitored port).

**Step 4**

monitor session session_number source {interface interface-id | vlan vlan-id} [ , | - ] [ both | rx | tx]

Example:

Device(config)# monitor session 2 source gigabitethernet0/1 rx

**Step 5**

monitor session session_number destination {interface interface-id[ , | - ] [ encapsulation replicate ingress {dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id} ] }

Example:

Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation replicate ingress dot1q vlan 6

- For *session_number*, specify the session number entered in Step 4.
- For *interface-id*, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.
- (Optional) [ , | - ]—Specifies a series or range of interfaces. Enter a space before and after the comma or hyphen.
- (Optional) *encapsulation replicate*—Specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
- **ingress**—Enables forwarding of incoming traffic on the destination port and to specify the encapsulation type.
  - *dot1q vlan vlan-id*—Accepts incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
### Specifying VLANs to Filter

Follow these steps to limit SPAN source traffic to specific VLANs.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source interface interface-id`
5. `monitor session session_number filter vlan vlan-id [, -]`
6. `monitor session session_number destination {interface interface-id [, -] [encapsulation replicate]}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>

<tr>
<td>monitor session session_number destination {interface interface-id [, -] [encapsulation replicate]}</td>
<td>Specifies the SPAN session and the destination port (monitoring port).</td>
</tr>
<tr>
<td>Example:</td>
<td>Specifies the SPAN session and the destination port (monitoring port).</td>
</tr>
<tr>
<td>Device(config)# monitor session 2 destination interface gigabitethernet1/0/1</td>
<td>Specifies the SPAN session and the destination port (monitoring port).</td>
</tr>
</tbody>
</table>
### Configuring a VLAN as an RSPAN VLAN

Follow these steps to create a new VLAN, then configure it to be the RSPAN VLAN for the RSPAN session.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vlan vlan-id`
4. `remote-span`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td></td>

**What to do next**

You must create the RSPAN VLAN in all devices that will participate in RSPAN. If the RSPAN VLAN-ID is in the normal range (lower than 1005) and VTP is enabled in the network, you can create the RSPAN VLAN in one device, and VTP propagates it to the other devices in the VTP domain. For extended-range VLANs (greater than 1005), you must configure RSPAN VLAN on both source and destination devices and any intermediate devices.

Use VTP pruning to get an efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

To remove the remote SPAN characteristic from a VLAN and convert it back to a normal VLAN, use the `no remote-span` VLAN configuration command.
To remove a source port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command. To remove the RSPAN VLAN from the session, use the `no monitor session session_number destination remote vlan vlan-id`.

Creating an RSPAN Source Session

Follow these steps to create and start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source {interface interface-id | vlan vlan-id} [, -] [both | rx | tx]`
5. `monitor session session_number destination remote vlan vlan-id`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
### Command or Action

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 tx
```

### Purpose

- Enter a source port or source VLAN for the RSPAN session:
  - For *interface-id*, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (*port-channel port-channel-number*). Valid port-channel numbers are 1 to 48.
  - For *vlan-id*, specifies the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).

A single session can include multiple sources (ports or VLANs), defined in a series of commands, but you cannot combine source ports and source VLANs in one session.

- (Optional) 
  - Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.
  - (Optional) **both** | **rx** | **tx**—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic.
    - **both**—Monitors both received and sent traffic.
    - **rx**—Monitors received traffic.
    - **tx**—Monitors sent traffic.

### Step 5

**monitor session session_number destination remote vlan vlan-id**

**Example:**

```
Device(config)# monitor session 1 destination remote vlan 100
```

Specifies the RSPAN session, the destination RSPAN VLAN, and the destination-port group.

- For *session_number*, enter the number defined in Step 4.
- For *vlan-id*, specify the source RSPAN VLAN to monitor.

### Step 6

**end**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

### Step 7

**show running-config**

**Example:**

Verifies your entries.
### Specifying VLANs to Filter

Follow these steps to configure the RSPAN source session to limit RSPAN source traffic to specific VLANs.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source interface interface-id`
5. `monitor session session_number filter vlan vlan-id [, -]`
6. `monitor session session_number destination remote vlan vlan-id`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 4 | `monitor session session_number source interface interface-id` | Specifies the characteristics of the source port (monitored port) and SPAN session.  
- For `session_number`, the range is 1 to 66.  
- For `interface-id`, specify the source port to monitor. The interface specified must already be configured as a trunk port. |
| Example: | Device(config)# `monitor session 2 source interface gigabitethernet1/0/2 rx` |
| Step 5 | `monitor session session_number filter vlan vlan-id [, -]` | Limits the SPAN source traffic to specific VLANs.  
- For `session_number`, enter the session number specified in step 4.  
- For `vlan-id`, the range is 1 to 4094.  
- (Optional) `,` or `-` Use a comma (,) to specify a series of VLANs or use a hyphen (-) to specify a range of VLANs. Enter a space before and after the comma; enter a space before and after the hyphen. |
| Example: | Device(config)# `monitor session 2 filter vlan 1 - 5 , 9` |
| Step 6 | `monitor session session_number destination remote vlan vlan-id` | Specifies the RSPAN session and the destination remote VLAN (RSPAN VLAN).  
- For `session_number`, enter the session number specified in Step 4.  
- For `vlan-id`, specify the RSPAN VLAN to carry the monitored traffic to the destination port. |
| Example: | Device(config)# `monitor session 2 destination remote vlan 902` |
| Step 7 | `end` | Returns to privileged EXEC mode. |
| Example: | Device(config)# `end` |
| Step 8 | `show running-config` | Verifies your entries. |
| Example: | Device# `show running-config` |
| Step 9 | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
| Example: | Device# `copy running-config startup-config` |
Creating an RSPAN Destination Session

You configure an RSPAN destination session on a different device or device stack; that is, not the device or device stack on which the source session was configured.

Follow these steps to define the RSPAN VLAN on that device, to create an RSPAN destination session, and to specify the source RSPAN VLAN and the destination port.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vlan vlan-id`
4. `remote-span`
5. `exit`
6. `no monitor session {session_number | all | local | remote}`
7. `monitor session session_number source remote vlan vlan-id`
8. `monitor session session_number destination interface interface-id`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

Creating an RSPAN Destination Session and Configuring Incoming Traffic

Follow these steps to create an RSPAN destination session, to specify the source RSPAN VLAN and the destination port, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source remote vlan vlan-id`
5. `monitor session session_number destination {interface interface-id [, | -] [ingress {dot1q vlan vlan-id} | untagged vlan vlan-id | vlan vlan-id]}`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>

### Creating an RSPAN Destination Session and Configuring Incoming Traffic

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
</tbody>
</table>
| `monitor session session_number source remote vlan vlan-id` | Specifies the RSPAN session and the source RSPAN VLAN.  
- For `session_number`, the range is 1 to 66.  
- For `vlan-id`, specify the source RSPAN VLAN to monitor. |
| **Example:** | Device(config)# `monitor session 2 source remote vlan 901` |
| **Step 5** | Specifies the SPAN session, the destination port, the packet encapsulation, and the incoming VLAN and encapsulation. |
| `monitor session session_number destination {interface interface-id [, | - ] [ingress {dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id}]}}` |  
- For `session_number`, enter the number defined in Step 5.  
In an RSPAN destination session, you must use the same session number for the source RSPAN VLAN and the destination port.  
- For `interface-id`, specify the destination interface. The destination interface must be a physical interface.  
- Though visible in the command-line help string, **encapsulation replicate** is not supported for RSPAN. The original VLAN ID is overwritten by the RSPAN VLAN ID, and all packets appear on the destination port as untagged.  
| **Example:** | Device(config)# `monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6` |
| **Step 6** | Returns to privileged EXEC mode. |
| `end` |  |
| **Example:** | Device(config)# `end` |
| **Step 7** | Verifies your entries. |
| `show running-config` |  |
| **Example:** |  |
Purpose Command or Action Purpose

Device# show running-config

Step 8 copy running-config startup-config (Optional) Saves your entries in the configuration file.

Example:

Device# copy running-config startup-config

Monitoring SPAN and RSPAN Operations

The following table describes the command used to display SPAN and RSPAN operations configuration and results to monitor operations:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show monitor</td>
<td>Displays the current SPAN, RSPAN, FSPAN, or FRSPAN configuration.</td>
</tr>
</tbody>
</table>

SPAN and RSPAN Configuration Examples

Example: Configuring Local SPAN

This example shows how to set up SPAN session 1 for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is deleted, and then bidirectional traffic is mirrored from source Gigabit Ethernet port 1 to destination Gigabit Ethernet port 2, retaining the encapsulation method.

Device> enable
Device# configure terminal
Device(config)# no monitor session 1
Device(config)# monitor session 1 source interface gigabitethernet1/0/1
Device(config)# monitor session 1 destination interface gigabitethernet1/0/2
Device(config)# encapsulation replicate
Device(config)# end

This example shows how to remove port 1 as a SPAN source for SPAN session 1:

Device> enable
Device# configure terminal
Device(config)# no monitor session 1 source interface gigabitethernet1/0/1
Device(config)# end

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:
Device> enable
Device# configure terminal
Device(config)# no monitor session 1 source interface gigabitethernet1/0/1 rx

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination Gigabit Ethernet port 2. The configuration is then modified to also monitor all traffic on all ports belonging to VLAN 10.

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source vlan 1 - 3 rx
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2
Device(config)# monitor session 2 source vlan 10
Device(config)# end

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on Gigabit Ethernet source port 1, and send it to destination Gigabit Ethernet port 2 with the same egress encapsulation type as the source port, and to enable ingress forwarding with VLAN 6 as the default ingress VLAN:

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source gigabitethernet0/1 rx
Device(config)# monitor session 2 destination interface gigabitethernet0/2 encapsulation replicate ingress vlan 6
Device(config)# end

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor traffic received on Gigabit Ethernet trunk port 2, and send traffic for only VLANs 1 through 5 and VLAN 9 to destination Gigabit Ethernet port 1:

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Device(config)# monitor session 2 filter vlan 1 - 5, 9
Device(config)# monitor session 2 destination interface gigabitethernet1/0/1
Device(config)# end

Examples: Creating an RSPAN VLAN

This example shows how to create the RSPAN VLAN 901:

Device> enable
Device# configure terminal
Device(config)# vlan 901
Device(config-vlan)# remote span
Device(config-vlan)# end

This example shows how to remove any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination as RSPAN VLAN 901:
Device> enable
Device# configure terminal
Device(config)# no monitor session 1
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 tx
Device(config)# monitor session 1 source interface gigabitethernet1/0/2 rx
Device(config)# monitor session 1 source interface port-channel 2
Device(config)# monitor session 1 destination remote vlan 901
Device(config)# end

This example shows how to remove any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 2, and send traffic for only VLANs 1 through 5 and 9 to destination RSPAN VLAN 902:

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Device(config)# monitor session 2 filter vlan 1 - 5, 9
Device(config)# monitor session 2 destination remote vlan 902
Device(config)# end

This example shows how to configure VLAN 901 as the source remote VLAN and port 1 as the destination interface:

Device> enable
Device# configure terminal
Device(config)# monitor session 1 source remote vlan 901
Device(config)# monitor session 1 destination interface gigabitethernet2/0/1
Device(config)# end

This example shows how to configure VLAN 901 as the source remote VLAN in RSPAN session 2, to configure Gigabit Ethernet source port 2 as the destination interface, and to enable forwarding of incoming traffic on the interface with VLAN 6 as the default receiving VLAN:

Device> enable
Device# configure terminal
Device(config)# monitor session 2 source remote vlan 901
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6
Device(config)# end

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IP Unicast Routing

This module describes how to configure IP Version 4 (IPv4) unicast routing on the switch.

A switch stack operates and appears as a single router to the rest of the routers in the network.

**Note**

In addition to IPv4 traffic, you can also enable IP Version 6 (IPv6) unicast routing and configure interfaces to forward IPv6 traffic.
Information About IP Routing

In some network environments, VLANs are associated with individual networks or subnetworks. In an IP network, each subnetwork is mapped to an individual VLAN. Configuring VLANs helps control the size of the broadcast domain and keeps local traffic local. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

Figure 76: Routing Topology Example

This figure shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router has an interface in each VLAN.

When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

Types of Routing

Routers and Layer 3 switches can route packets in these ways:

- By using default routing
- By using preprogrammed static routes for the traffic
- By dynamically calculating routes by using a routing protocol

The switch supports static routes and default routes. It does not support routing protocols.

IP Routing and Switch Stacks

A switch stack appears to the network as a single switch, regardless of which switch in the stack is connected to a routing peer.

The active switch performs these functions:

- It generates, maintains, and distributes the distributed Cisco Express Forwarding (dCEF) database to all stack members. The routes are programmed on all switches in the stack bases on this database.
- The MAC address of the active switch is used as the router MAC address for the whole stack, and all outside devices use this address to send IP packets to the stack.
- All IP packets that require software forwarding or processing go through the CPU of the active switch.
Stack members perform these functions:

• They act as routing standby switches, ready to take over in case they are elected as the new active switch if the active switch fails.

• They program the routes into hardware.

If a active switch fails, the stack detects that the active switch is down and elects one of the stack members to be the new active switch. During this period, except for a momentary interruption, the hardware continues to forward packets with no active protocols.

Upon election, the new active switch performs these functions:

• It starts generating, receiving, and processing routing updates.

• It builds routing tables, generates the CEF database, and distributes it to stack members.

• It uses its MAC address as the router MAC address. To notify its network peers of the new MAC address, it periodically (every few seconds for 5 minutes) sends a gratuitous ARP reply with the new router MAC address.

**Note**

If you configure the persistent MAC address feature on the stack and the active switch changes, the stack MAC address does not change for the configured time period. If the previous active switch rejoins the stack as a member switch during that time period, the stack MAC address remains the MAC address of the previous active switch.

• It attempts to determine the reachability of every proxy ARP entry by sending an ARP request to the proxy ARP IP address and receiving an ARP reply. For each reachable proxy ARP IP address, it generates a gratuitous ARP reply with the new router MAC address. This process is repeated for 5 minutes after a new active switch election.

**Caution**

Partitioning of the switch stack into two or more stacks might lead to undesirable behavior in the network.

If the switch is reloaded, then all the ports on that switch go down and there is a loss of traffic for the interfaces involved in routing.

**Configuring IP Unicast Routing**

By default, IP routing is disabled on the device. For detailed IP routing configuration information, see the Cisco IOS IP Configuration Guide, Release 12.2 from the Cisco.com page under Documentation > Cisco IOS Software Releases > 12.2 Mainline > Configuration Guides.

In these procedures, the specified interface must be a device virtual interface (SVI)-a VLAN interface created by using the `interface vlan vlan_id` global configuration command and by default a Layer 3 interface. All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them. See the Assigning IP Addresses to SVIs section.
The device supports 16 static routes (including user-configured routes and the default route) and any directly connected routes and default routes for the management interface. You can use the "lanbase-default" SDM template to configure the static routes. The device can have an IP address assigned to each SVI. Before enabling routing, enter the `sdmprefer lanbase-routing` global configuration command and reload the device.

Procedures for configuring routing:

- To support VLAN interfaces, create and configure VLANs on the device or switch stack, and assign VLAN membership to Layer 2 interfaces. For more information, see chapter: Configuring VLANs.
- Configure Layer 3 interfaces (SVIs).
- Enable IP routing on the device.
- Assign IP addresses to the Layer 3 interfaces.
- Configure static routes.

### Enabling IP Unicast Routing

By default, the Device is in Layer 2 switching mode and IP routing is disabled. To use the Layer 3 capabilities of the Device, you must enable IP routing.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip routing</code></td>
<td>Enables IP routing.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# ip routing</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Assigning IP Addresses to SVIs

To configure IP routing, you need to assign IP addresses to Layer 3 network interfaces. This enables communication with the hosts of those interfaces that use IP. IP routing is disabled by default, and no IP addresses are assigned to SVIs.

An IP address identifies a location to which IP packets can be sent. Some IP addresses are reserved for special uses and cannot be used for host, subnet, or network addresses. RFC 1166, “Internet Numbers,” contains the official description of IP addresses.

An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

Follow these steps to assign an IP address and a network mask to an SVI:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface vlan vlan-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 VLAN to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
**Configuring Static Unicast Routes**

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Follow these steps to configure a static route:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---

If the interface is still in Layer 2 mode (the default), you must enter a `no switchport` interface configuration command before entering the `ip address` interface configuration command.
### Command or Action

**Example:**

Device> enable

**Step 2**

**configure terminal**

**Example:**

Device# configure terminal

**Step 3**

**ip route prefix mask {address | interface} [distance]**

**Example:**

Device(config)# ip route prefix mask gigabitethernet 1/0/4

**Step 4**

**end**

**Example:**

Device(config)# end

**Step 5**

**show ip route**

**Example:**

Device# show ip route

**Step 6**

**copy running-config startup-config**

**Example:**

Device# copy running-config startup-config

---

**What to do next**

Use the `no ip route prefix mask {address | interface}` global configuration command to remove a static route. The device retains static routes until you remove them.

---

**Monitoring and Maintaining the IP Network**

You can remove all contents of a particular cache, table, or database. You can also display specific statistics.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip route [address [mask] [longer-prefixes]]</code></td>
<td>Displays the current state of the routing table.</td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for First Hop Security in IPv6

- You have configured the necessary IPv6 enabled SDM template.
- You should be familiar with the IPv6 neighbor discovery feature.
Restrictions for First Hop Security in IPv6

- The following restrictions apply when applying FHS policies to EtherChannel interfaces (Port Channels):
  - A physical port with an FHS policy attached cannot join an EtherChannel group.
  - An FHS policy cannot be attached to a physical port when it is a member of an EtherChannel group.

- By default, a snooping policy has a security-level of guard. When such a snooping policy is configured on an access switch, external IPv6 Router Advertisement (RA) or Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server packets are blocked, even though the uplink port facing the router or DHCP server/relay is configured as a trusted port. To allow IPv6 RA or DHCPv6 server messages, do the following:
  - Apply an IPv6 RA-guard policy (for RA) or IPv6 DHCP-guard policy (for DHCP server messages) on the uplink port.
  - Configure a snooping policy with a lower security-level, for example glean or inspect. However; configuring a lower security level is not recommended with such a snooping policy, because benefits of First Hop security features are not effective.

Information about First Hop Security in IPv6

First Hop Security in IPv6 (FHS IPv6) is a set of IPv6 security features, the policies of which can be attached to a physical interface, an EtherChannel interface, or a VLAN. An IPv6 software policy database service stores and accesses these policies. When a policy is configured or modified, the attributes of the policy are stored or updated in the software policy database, then applied as was specified. The following IPv6 policies are currently supported:

- IPv6 FHS Binding Table Content—A database table of IPv6 neighbors connected to the switch is created from information sources such as Neighbor Discovery (ND) protocol snooping. This database, or binding, table is used by various IPv6 guard features (such as IPv6 ND Inspection) to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.

- IPv6 Neighbor Discovery Inspection—IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database and IPv6 neighbor discovery messages that do not conform are dropped. An ND message is considered trustworthy if its IPv6-to-Media Access Control (MAC) mapping is verifiable.

  This feature mitigates some of the inherent vulnerabilities of the ND mechanism, such as attacks on DAD, address resolution, router discovery, and the neighbor cache.

- IPv6 Router Advertisement Guard—The IPv6 Router Advertisement (RA) guard feature enables the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network switch platform. RAs are used by routers to announce themselves on the link. The RA Guard feature
analyzes the RAs and filters out bogus RAs sent by unauthorized routers. In host mode, all router advertisement and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. Once the Layer 2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

• IPv6 DHCP Guard—The IPv6 DHCP Guard feature blocks reply and advertisement messages that come from unauthorized DHCPv6 servers and relay agents. IPv6 DHCP guard can prevent forged messages from being entered in the binding table and block DHCPv6 server messages when they are received on ports that are not explicitly configured as facing a DHCPv6 server or DHCP relay. To use this feature, configure a policy and attach it to an interface or a VLAN. To debug DHCP guard packets, use the **debug ipv6 snooping dhcp-guard** privileged EXEC command.

• IPv6 Source Guard—Like IPv4 Source Guard, IPv6 Source Guard validates the source address or prefix to prevent source address spoofing.

A source guard programs the hardware to allow or deny traffic based on source or destination addresses. It deals exclusively with data packet traffic.

The IPv6 source guard feature provides the ability to use the IPv6 binding table to install PACLs to prevent a host from sending packets with an invalid IPv6 source address.

To debug source-guard packets, use the **debug ipv6 snooping source-guard** privileged EXEC command.

Note The IPv6 PACL feature is supported only in the ingress direction; it is not supported in the egress direction.

The following restrictions apply:

• An FHS policy cannot be attached to a physical port when it is a member of an EtherChannel group.

• When IPv6 source guard is enabled on a switch port, NDP or DHCP snooping must be enabled on the interface to which the switch port belongs. Otherwise, all data traffic from this port will be blocked.

• An IPv6 source guard policy cannot be attached to a VLAN. It is supported only at the interface level.

• When you configure IPv4 and IPv6 source guard together on an interface, it is recommended to use **ip verify source mac-check** instead of **ip verify source**. IPv4 connectivity on a given port might break due to two different filtering rules set — one for IPv4 (IP-filter) and the other for IPv6 (IP-MAC filter).

• You cannot use IPv6 Source Guard and Prefix Guard together. When you attach the policy to an interface, it should be "validate address" or "validate prefix" but not both.

• PVLAN and Source/Prefix Guard cannot be applied together.

For more information on IPv6 Source Guard, see the IPv6 Source Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.
• IPv6 Prefix Guard—The IPv6 prefix guard feature works within the IPv6 source guard feature, to enable the device to deny traffic originated from non-topologically correct addresses. IPv6 prefix guard is often used when IPv6 prefixes are delegated to devices (for example, home gateways) using DHCP prefix delegation. The feature discovers ranges of addresses assigned to the link and blocks any traffic sourced with an address outside this range.

For more information on IPv6 Prefix Guard, see the IPv6 Prefix Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

• IPv6 Destination Guard—The IPv6 destination guard feature works with IPv6 neighbor discovery to ensure that the device performs address resolution only for those addresses that are known to be active on the link. It relies on the address glean functionality to populate all destinations active on the link into the binding table and then blocks resolutions before they happen when the destination is not found in the binding table.

IPv6 Destination Guard is recommended only on Layer 3. It is not recommended on Layer 2.

For more information about IPv6 Destination Guard, see the IPv6 Destination Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

• IPv6 Neighbor Discovery Multicast Suppress—The IPv6 Neighbor Discovery multicast suppress feature is an IPv6 snooping feature that runs on a switch or a wireless controller and is used to reduce the amount of control traffic necessary for proper link operations.

• DHCPv6 Relay—Lightweight DHCPv6 Relay Agent—The DHCPv6 Relay—Lightweight DHCPv6 Relay Agent feature allows relay agent information to be inserted by an access node that performs a link-layer bridging (non-routing) function. Lightweight DHCPv6 Relay Agent (LDRA) functionality can be implemented in existing access nodes, such as DSL access multiplexers (DSLAMs) and Ethernet switches, that do not support IPv6 control or routing functions. LDRA is used to insert relay-agent options in DHCP version 6 (DHCPv6) message exchanges primarily to identify client-facing interfaces. LDRA functionality can be enabled on an interface and on a VLAN.

If an LDRA device is directly connected to a client, the interface must have the pool configuration to fetch the specific subnet or link information at the server side. In this case, if the LDRA device is present in different subnets or links, the server may not be able to fetch the correct subnet. You can now configure the pool name in the interface so as to choose the proper subnet or link for the client.

For more information about DHCPv6 Relay, See the DHCPv6 Relay—Lightweight DHCPv6 Relay Agent section of the IP Addressing: DHCP Configuration Guide, Cisco IOS Release 15.1SG.

How to Configure an IPv6 Snooping Policy

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Snooping Policy:
SUMMARY STEPS

1. configure terminal
2. ipv6 snooping policy policy-name
3. {{[default] | [device-role {node | switch}] | [limit address-count value] | [no] | [protocol {dhcp | ndp}] | [security-level {glean | guard | inspect}] | [tracking {disable [stale-lifetime [seconds | infinite] | enable [reachable-lifetime [seconds | infinite]}]} | [trusted-port]}}
4. end
5. show ipv6 snooping policy policy-name

DETAILED STEPS

<table>

How to Attach an IPv6 Snooping Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an interface or VLAN:

**SUMMARY STEPS**

1. configure terminal
2. interface Interface_type stack/module/port
3. switchport
4. ipv6 snooping [attach-policy policy_name \[vlan vlan_id | add vlan_ids | exceptvlan_ids | none | remove vlan_ids\]] | vlan vlan_id | add vlan_ids | exceptvlan_ids | none | remove vlan_ids | all\]
5. do show running-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

Attach an IPv6 Snooping policy to interfaces or VLANs.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Specifies an interface type and identifier; enters the interface configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

**interface** Interface_type stack/module/port

**Example:**

Device(config)# interface gigabitethernet 1/1/4

Enters the Switchport mode.

**Note**
To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the switchport interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration. The command prompt displays as (config-if)# in Switchport configuration mode.

**Step 3**

**switchport**

**Example:**

Device(config-if)# switchport

**Step 4**

ipv6 snooping [attach-policy policy_name [ vlan {vlan_id | add vlan_ids | except vlan_ids | none | remove vlan_ids} | vlan {vlan_id | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]]

**Example:**

Device(config-if)# ipv6 snooping

or

Device(config-if)# ipv6 snooping attach-policy example_policy

or

Device(config-if)# ipv6 snooping vlan 111,112

or

Device(config-if)# ipv6 snooping attach-policy example_policy vlan 111,112

Attaches a custom ipv6 snooping policy to the interface or the specified VLANs on the interface. To attach the default policy to the interface, use the ipv6 snooping command without the attach-policy keyword. To attach the default policy to VLANs on the interface, use the ipv6 snooping vlan command. The default policy is, security-level guard, device-role node, protocol ndp and dhcp.

**Step 5**

**do show running-config**

**Example:**

Device#(config-if)# do show running-config

Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.
How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an EtherChannel interface or VLAN:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | configure terminal  
*Example:* Device# configure terminal | Enters the global configuration mode. |
| Step 2 | interface range *Interface_name*  
*Example:* Device(config)# interface range Po11 | Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode. |
| Tip | Enter the `do show interfaces summary` command for quick reference to interface names and types. |
| Step 3 | ipv6 snooping [attach-policy *policy_name* [vlan *vlan_ids*  
| | add *vlan_ids* | except *vlan_ids* | none | remove *vlan_ids*  
| | all] | vlan [ *vlan_ids* | add *vlan_ids* | except *vlan_ids*  
| | none | remove *vlan_ids* | all] ]  
*Example:* Device(config-if-range)# ipv6 snooping attach-policy example_policy  
| or  
| Device(config-if-range)# ipv6 snooping attach-policy example_policy vlan 222,223,224  
| or  
| Device(config-if-range)#ipv6 snooping vlan 222,223,224 | Attaches the IPv6 Snooping policy to the interface or the specified VLANs on that interface. The default policy is attached if the `attach-policy` option is not used. |
| Step 4 | do show running-config  
interface *portchannel_interface_name*  
*Example:* Device#(config-if-range)# do show running-config int po11 | Confirms that the policy is attached to the specified interface without exiting the configuration mode. |

How to Configure the IPv6 Binding Table Content

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:
**SUMMARY STEPS**

1. `configure terminal`
2. `[no] ipv6 neighbor binding [vlan vlan-id | ipv6-address interface interface_type stack/module/port hw_address] [reachable-lifetimevalue [seconds | default | infinite] | [tracking { [default | disable]  [reachable-lifetimevalue [seconds | default | infinite] | [enable [reachable-lifetimevalue [seconds | default | infinite] | [retry-interval [seconds] default [reachable-lifetimevalue [seconds | default | infinite] ] ] ] } ] ]}
3. `[no] ipv6 neighbor binding max-entries number [mac-limit number | port-limit number [mac-limit number] | vlan-limit number [ [mac-limit number] | [port-limit number [mac-limit number] ] ] ]]
4. `ipv6 neighbor binding logging`
5. `exit`
6. `show ipv6 neighbor binding`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>
|      | Example:  
|      | Device# configure terminal  |  |
| 2.   | `[no] ipv6 neighbor binding [vlan vlan-id | ipv6-address interface interface_type stack/module/port hw_address] [reachable-lifetimevalue [seconds | default | infinite] | [tracking { [default | disable]  [reachable-lifetimevalue [seconds | default | infinite] | [enable [reachable-lifetimevalue [seconds | default | infinite] | [retry-interval [seconds] default [reachable-lifetimevalue [seconds | default | infinite] ] ] ] } ] ]}`  | Adds a static entry to the binding table database.  |
|      | Example:  
|      | Device(config)# ipv6 neighbor binding  |   |
| 3.   | `[no] ipv6 neighbor binding max-entries number [mac-limit number | port-limit number [mac-limit number] | vlan-limit number [ [mac-limit number] | [port-limit number [mac-limit number] ] ] ]`  | Specifies the maximum number of entries that are allowed to be inserted in the binding table cache.  |
|      | Example:  
|      | Device(config)# ipv6 neighbor binding max-entries 30000  |   |
| 4.   | `ipv6 neighbor binding logging`  | Enables the logging of binding table main events.  |
|      | Example:  
|      | Device(config)# ipv6 neighbor binding logging  |   |
| 5.   | `exit`  | Exits global configuration mode, and places the router in privileged EXEC mode.  |
|      | Example:  
|      | Device(config)# exit  |   |
How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no]ipv6 nd inspection policy policy-name`
3. `device-role {host | monitor | router | switch}`
4. `drop-unsecure`
5. `limit address-count value`
6. `sec-level minimum value`
7. `tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}]}`
8. `trusted-port`
9. `validate source-mac`
10. `[no] {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}`
11. `default {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}`
12. `do show ipv6 nd inspection policy policy_name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>[no]ipv6 nd inspection policy policy-name</code></td>
<td>Specifies the ND inspection policy name and enters ND Inspection Policy configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# ipv6 nd inspection policy example_policy</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`device-role {host</td>
<td>monitor</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-nd-inspection)# device-role switch</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>drop-unsecure</code></td>
<td>Drops messages with no or invalid options or an invalid signature.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The table is missing from the document, but the steps are detailed for configuration.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-nd-inspection)# drop-unsecure</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 5** limit address-count *value*  
  Example:  
  Device(config-nd-inspection)# limit address-count 1000 | Enter 1–10,000. |
| **Step 6** sec-level minimum *value*  
  Example:  
  Device(config-nd-inspection)# limit address-count 1000 | Specifies the minimum security level parameter value when Cryptographically Generated Address (CGA) options are used. |
| **Step 7** tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}] |  
  Example:  
  Device(config-nd-inspection)# tracking disable stale-lifetime infinite | Overrides the default tracking policy on a port. |
| **Step 8** trusted-port  
  Example:  
  Device(config-nd-inspection)# trusted-port | Configures a port to become a trusted port. |
| **Step 9** validate source-mac  
  Example:  
  Device(config-nd-inspection)# validate source-mac | Checks the source media access control (MAC) address against the link-layer address. |
| **Step 10** no {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}  
  Example:  
  Device(config-nd-inspection)# no validate source-mac | Remove the current configuration of a parameter with the no form of the command. |
| **Step 11** default {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}  
  Example:  
  Device(config-nd-inspection)# default limit address-count | Restores configuration to the default values. |
| **Step 12** do show ipv6 nd inspection policy *policy_name*  
  Example:  
  Device(config-nd-inspection)# do show ipv6 nd inspection policy example_policy |Verifies the ND Inspection Configuration without exiting ND inspection configuration mode. |
How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to an interface or VLANs on an interface:

**SUMMARY STEPS**

1. **configure terminal**
2. **interface** Interface_type stack/module/port
3. **ipv6 nd inspection** [attach-policy policy_name [ vlan vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all] ] [ vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] ]
4. **do show running-config**

**DETAILED STEPS**

How to Configure an IPv6 Router Advertisement Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 Router Advertisement policy:

SUMMARY STEPS

1. configure terminal
2. [no]ipv6 nd raguard policy policy-name
3. [no]device-role {host | monitor | router | switch}
4. [no]hop-limit {maximum | minimum} value
5. [no]managed-config-flag {off | on}
6. [no]match {ipv6 access-list list | ra prefix-list list}
7. [no]other-config-flag {on | off}
8. [no]router-preference maximum {high | medium | low}
9. [no]trusted-port
10. default {device-role | hop-limit {maximum | minimum} | managed-config-flag | match {ipv6 access-list | ra prefix-list | other-config-flag | router-preference maximum | trusted-port}
11. do show ipv6 nd raguard policy policy_name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>

<td>[no]device-role {host</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-nd-raguard)# device-role switch</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>[no]hop-limit {maximum</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-nd-raguard)# hop-limit maximum 33</td>
</tr>
</tbody>
</table>

(1–255) Range for Maximum and Minimum Hop Limit values.

Enables filtering of Router Advertisement messages by the Hop Limit value. A rogue RA message may have a low Hop Limit value (equivalent to the IPv4 Time to Live) that when accepted by the host, prevents the host from generating traffic to destinations beyond the rogue RA message generator. An RA message with an unspecified Hop Limit value is blocked.

If not configured, this filter is disabled. Configure minimum to block RA messages with Hop Limit values.
### How to Configure an IPv6 Router Advertisement Guard Policy

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **[no]**managed-config-flag {off | on} | Enables filtering of Router Advertisement messages by the Managed Address Configuration, or "M" flag field. A rogue RA message with an M field of 1 can cause a host to use a rogue DHCPv6 server. If not configured, this filter is disabled.  
**On**—Accepts and forwards RA messages with an M value of 1, blocks those with 0.  
**Off**—Accepts and forwards RA messages with an M value of 0, blocks those with 1. |
| **[no]**match {ipv6 access-list list | ra prefix-list list} | Matches a specified prefix list or access list. |
| **[no]**other-config-flag {on | off} | Enables filtering of Router Advertisement messages by the Other Configuration, or "O" flag field. A rogue RA message with an O field of 1 can cause a host to use a rogue DHCPv6 server. If not configured, this filter is disabled.  
**On**—Accepts and forwards RA messages with an O value of 1, blocks those with 0.  
**Off**—Accepts and forwards RA messages with an O value of 0, blocks those with 1. |
| **[no]**router-preference maximum {high | medium | low} | Enables filtering of Router Advertisement messages by the Router Preference flag. If not configured, this filter is disabled.  
- **high**—Accepts RA messages with the Router Preference set to high, medium, or low.  
- **medium**—Blocks RA messages with the Router Preference set to high.  
- **low**—Blocks RA messages with the Router Preference set to medium and high. |
| **[no]**trusted-port | When configured as a trusted port, all attached devices are trusted, and no further message verification is performed. |
| default {device-role | hop-limit {maximum | minimum} | managed-config-flag | match {ipv6 access-list | ra} | Restores a command to its default value. |
How to Attach an IPv6 Router Advertisement Guard Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Router Advertisement policy to an interface or to VLANs on the interface:

**SUMMARY STEPS**

1. `configure terminal`
2. `interface Interface_type stack/module/port`
3. `ipv6 nd raguard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | vlan [ {vlan_ids | add vlan_ids | exceptvlan_ids | none | remove vlan_ids | all} ]]
4. `do show running-config`

How to Configure an IPv6 DHCP Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 DHCP (DHCPv6) Guard policy:

**SUMMARY STEPS**

1. configure terminal
2. [no]ipv6 dhcp guard policy policy-name
3. [no]device-role {client | server}
4. [no]match server access-list ipv6-access-list-name
5. [no]match reply prefix-list ipv6-prefix-list-name
6. [no]preference { max limit | min limit }
7. [no]trusted-port
8. default {device-role | trusted-port}
9. do show ipv6 dhcp guard policy policy_name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> [no]ipv6 dhcp guard policy policy-name</td>
<td>Specifies the DHCPv6 Guard policy name and enters DHCPv6 Guard Policy configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

Device(config)# ipv6 dhcp guard policy example_policy

**Purpose**

(Optional) Filters out DHCPv6 replies and DHCPv6 advertisements on the port that are not from a device of the specified role. Default is *client*.

- **client**—Default value, specifies that the attached device is a client. Server messages are dropped on this port.
- **server**—Specifies that the attached device is a DHCPv6 server. Server messages are allowed on this port.

### Step 3

[no]device-role {client | server}

**Example:**

Device(config-dhcp-guard)# device-role server

### Step 4

[no] match server access-list ipv6-access-list-name

**Example:**

```bash
Device(config)# ipv6 access-list my_acls
Device(config-ipv6-acl)# permit host FE80::A8BB:CCFF:FE01:F700 any
```

; ; Assume a preconfigured IPv6 Access List as follows:

Step 4

**Example:**

```bash
Device(config)# ipv6 access-list my_acls
Device(config-ipv6-acl)# permit host FE80::A8BB:CCFF:FE01:F700 any
```

; ; configure DHCPv6 Guard to match approved access list.

Device(config-dhcp-guard)# match server access-list my_acls

### Step 5

[no] match reply prefix-list ipv6-prefix-list-name

**Example:**

```bash
Device(config)# ipv6 prefix-list my_prefix permit 2001:0DB8::/64 le 128
```

; ; Assume a preconfigured IPv6 prefix list as follows:

Step 5

**Example:**

```bash
Device(config)# ipv6 prefix-list my_prefix permit 2001:0DB8::/64 le 128
```

; ; Configure DHCPv6 Guard to match prefix

Device(config-dhcp-guard)# match reply prefix-list my_prefix

### Step 6

[no] preference { max limit | min limit }

**Example:**

Device(config-dhcp-guard)# preference max 250
Device(config-dhcp-guard)# preference min 150

Configure **max** and **min** when *device-role* is *server* to filter DHCPv6 server advertisements by the server preference value. The defaults permit all advertisements.

- **max limit**—(0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is less than the specified limit. Default is 255. If not specified, this check will be bypassed.

- **min limit**—(0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is greater than the specified limit. Default is 0. If not specified, this check will be bypassed.
### How to Attach an IPv6 DHCP Guard Policy to an Interface or a VLAN on an Interface

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

**SUMMARY STEPS**

1. `configure terminal`
2. `interface Interface_type stack/module/port`
3. `ipv6 dhcp guard [attach-policy policy_name [vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] ]`
4. `do show running-config interface Interface_type stack/module/port`

### How to Attach an IPv6 DHCP Guard Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 DHCP Guard policy on an EtherChannel interface or VLAN:

### SUMMARY STEPS

1. configure terminal
2. interface range Interface_name
3. ipv6 dhcp guard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]
### How to Configure IPv6 Source Guard

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | configure terminal  
Example: configure terminal | Enters the global configuration mode. |
| Step 2 | interface range Interface_name  
Example: interface Po11 | Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode. |
| Step 3 | ipv6 dhcp guard [attach-policy policy_name [ vlan vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all ]] vlan [ vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all ]]  
Example:  
Device(config-if-range)# ipv6 dhcp guard attach-policy example_policy  
or  
Device(config-if-range)# ipv6 dhcp guard attach-policy example_policy vlan 222,223,224  
or  
Device(config-if-range)# ipv6 dhcp guard vlan 222,223,224 | Attaches the DHCP Guard policy to the interface or the specified VLANs on that interface. The default policy is attached if the attach-policy option is not used. |
| Step 4 | do show running-config interfaceportchannel_interface_name  
Example: do show running-config int poll | Confirms that the policy is attached to the specified interface without exiting the configuration mode. |

---

### How to Configure IPv6 Source Guard

#### SUMMARY STEPS

1. enable
2. configure terminal

---
3. [no] ipv6 source-guard policy policy_name
4. [deny global-autoconf] [permit link-local] [default{ . . . }] [exit] [no{ . . . }]
5. end
6. show ipv6 source-guard policy policy_name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable  
Example: 
Device> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Step 2 | configure terminal  
Example: 
Device# configure terminal | Enters the global configuration mode. |
| Step 3 | [no] ipv6 source-guard policy policy_name  
Example: 
Device(config)# ipv6 source-guard policy example_policy | Specifies the IPv6 Source Guard policy name and enters IPv6 Source Guard policy configuration mode. |
| Step 4 | [deny global-autoconf] [permit link-local] [default{ . . . }] [exit] [no{ . . . }]  
Example: 
Device(config-sisf-sourceguard)# deny global-autoconf | (Optional) Defines the IPv6 Source Guard policy.  
• deny global-autoconf—Denies data traffic from auto-configured global addresses. This is useful when all global addresses on a link are DHCP-assigned and the administrator wants to block hosts with self-configured addresses to send traffic.  
• permit link-local—Allows all data traffic that is sourced by a link-local address.  
Note Trusted option under source guard policy is not supported. |
| Step 5 | end  
Example: 
Device(config-sisf-sourceguard)# end | Exits out of IPv6 Source Guard policy configuration mode. |
| Step 6 | show ipv6 source-guard policy policy_name  
Example: 
Device# show ipv6 source-guard policy example_policy | Shows the policy configuration and all the interfaces where the policy is applied. |

What to do next

Apply the IPv6 Source Guard policy to an interface.
How to Attach an IPv6 Source Guard Policy to an Interface

SUMMARY STEPS

**Configuration Examples for IPv6 First Hop Security**

**Examples: How to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface**

The following example shows how to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface:

```
Switch# configure terminal
Switch(config)# ipv6 source-guard policy POL
Switch(config-sisf-sourceguard)# validate address
Switch(config-sisf-sourceguard)# exit
Switch(config)# interface Po4
Switch(config)# ipv6 snooping
Switch(config-if)# ipv6 source-guard attach-policy POL
Switch(config-if)# exit
switch(config)#
```

**Examples: How to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface**

The following example shows how to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface:

```
Switch# configure terminal
Switch(config)# ipv6 source-guard policy POL
Switch (config-sisf-sourceguard)# no validate address
```
Switch((config-sisf-sourceguard)# validate prefix
Switch(config)# interface Po4
Switch(config-if)# ipv6 snooping
Switch(config-if)# ipv6 source-guard attach-policy POL

Routing Information Protocol

RIP is a commonly used routing protocol in small to medium TCP/IP networks. Routing Information Protocol (RIP) is a stable protocol that uses a distance-vector algorithm to calculate routes.

This module describes how to configure RIP.

• Prerequisites for RIP, on page 769
• Restrictions for RIP, on page 769
• Information About Routing Information Protocol, on page 769
• How to Configure Routing Information Protocol, on page 773
• Configuration Examples for Routing Information Protocol, on page 776
• Additional References for RIP, on page 777
• Feature Information for RIP, on page 777

Prerequisites for RIP

You must configure `ip routing` command before you configure RIP.

Restrictions for RIP

Routing Information Protocol (RIP) uses hop count as the metric to rate the value of different routes. The hop count is the number of devices that can be traversed in a route. A directly connected network has a metric of zero; an unreachable network has a metric of 16. This limited metric range makes RIP unsuitable for large networks.

Information About Routing Information Protocol

RIP Overview

The Routing Information Protocol (RIP) Version 1 uses broadcast UDP data packets, and RIPv2 uses multicast packets to exchange the routing information. Cisco software sends routing information updates every 30 seconds, which is termed advertising. If a device does not receive an update from another device for 180
seconds or more, the receiving device marks the routes served by the nonupdating device as unusable. If there is still no update after 240 seconds, the device removes all routing table entries for the nonupdating device.

A device that is running RIP can receive a default network via an update from another device that is running RIP, or the device can source the default network using RIP. In both cases, the default network is advertised through RIP to other RIP neighbors.

The Cisco implementation of RIP Version 2 (RIPv2) supports plain text and message digest algorithm 5 (MD5) authentication, route summarization, classless interdomain routing (CIDR), and variable-length subnet masks (VLSMs).

**RIP Routing Updates**

The Routing Information Protocol (RIP) sends routing-update messages at regular intervals and when the network topology changes. When a device receives a RIP routing update that includes changes to an entry, the device updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP devices maintain only the best route (the route with the lowest metric value) to a destination. After updating its routing table, the device immediately begins transmitting RIP routing updates to inform other network devices of the change. These updates are sent independently of the regularly scheduled updates that RIP devices send.

**Authentication in RIP**

The Cisco implementation of the Routing Information Protocol (RIP) Version 2 (RIPv2) supports authentication, key management, route summarization, classless interdomain routing (CIDR), and variable-length subnet masks (VLSMs).

By default, the software receives RIPv1 and RIPv2 packets, but sends only RIPv1 packets. You can configure the software to receive and send only RIPv1 packets. Alternatively, you can configure the software to receive and send only RIPv2 packets. To override the default behavior, you can configure the RIPv2 version that an interface sends. Similarly, you can also control how packets received from an interface are processed.

RIPv1 does not support authentication. If you are sending and receiving RIPv2 packets, you can enable RIP authentication on an interface.

The key chain determines the set of keys that can be used on the interface. Authentication, including default authentication, is performed on that interface only if a key chain is configured.

Cisco supports two modes of authentication on an interface on which RIP is enabled: plain-text authentication and message digest algorithm 5 (MD5) authentication. Plain-text authentication is the default authentication in every RIPv2 packet.

---

**Note**

Do not use plain text authentication in RIP packets for security purposes, because the unencrypted authentication key is sent in every RIPv2 packet. Use plain-text authentication when security is not an issue; for example, you can use plain-text authentication to ensure that misconfigured hosts do not participate in routing.
**RIP Routing Metric**

The Routing Information Protocol (RIP) uses a single routing metric to measure the distance between the source and the destination network. Each hop in a path from the source to the destination is assigned a hop-count value, which is typically 1. When a device receives a routing update that contains a new or changed destination network entry, the device adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop. If an interface network is not specified in the routing table, it will not be advertised in any RIP update.

**RIP Versions**

The original version of Routing Information Protocol (RIP), is known as RIP Version 1 (RIPv1). The specification of the RIP, defined in RFC 1058, uses classful routing. Periodic routing updates do not support variable length subnet masks (VLSM) because periodic routing updates do not contain subnet information. All subnets in a network class must be of the same size. Because RIP, as per RFC 1058, does not support VLSM, it is not possible to have subnets of varying sizes inside the same network class. This limitation makes RIP vulnerable to attacks.

To rectify the deficiencies of the original RIP specification, RIP Version 2 (RIPv2), as described in RFC 2453, was developed. RIPv2 has the ability to carry subnet information; thus, it supports Classless Inter-Domain Routing (CIDR).

**Exchange of Routing Information**

Routing Information Protocol (RIP) is normally a broadcast protocol, and for RIP routing updates to reach nonbroadcast networks, you must configure the Cisco software to permit this exchange of routing information. To control the set of interfaces with which you want to exchange routing updates, you can disable the sending of routing updates on specified interfaces by configuring the `passive-interface` router configuration command.

You can use an offset list to increase increasing incoming and outgoing metrics to routes learned via RIP. Optionally, you can limit the offset list with either an access list or an interface.

Routing protocols use several timers that determine variables such as the frequency of routing updates, the length of time before a route becomes invalid, and other parameters. You can adjust these timers to tune routing protocol performance to better suit your internetwork needs. You can make the following timer adjustments:

- The rate (time, in seconds, between updates) at which routing updates are sent
- The interval of time, in seconds, after which a route is declared invalid
- The interval, in seconds, during which routing information about better paths is suppressed
- The amount of time, in seconds, that must pass before a route is removed from the routing table
- The amount of time for which routing updates will be postponed

You can adjust the IP routing support in the Cisco software to enable faster convergence of various IP routing algorithms, and hence, cause quicker fallback to redundant devices. The total effect is to minimize disruptions to end users of the network in situations where quick recovery is essential.

In addition, an address family can have timers that explicitly apply to that address family (or Virtual Routing and Forwarding [VRF]) instance. The `timers-basic` command must be specified for an address family or the
system defaults for the `timers-basic` command are used regardless of the timer that is configured for RIP routing. The VRF does not inherit the timer values from the base RIP configuration. The VRF will always use the system default timers unless the timers are explicitly changed using the `timers-basic` command.

**Neighbor Router Authentication**

You can prevent your router from receiving fraudulent route updates by configuring neighbor router authentication. When configured, neighbor authentication occurs whenever routing updates are exchanged between neighbor routers. This authentication ensures that a router receives reliable routing information from a trusted source.

Without neighbor authentication, unauthorized or deliberately malicious routing updates could compromise the security of your network traffic. A security compromise could occur if an unfriendly party diverts or analyzes your network traffic. For example, an unauthorized router could send a fictitious routing update to convince your router to send traffic to an incorrect destination. This diverted traffic could be analyzed to learn confidential information about your organization or merely used to disrupt your organization's ability to effectively communicate using the network. Neighbor authentication prevents any such fraudulent route updates from being received by your router.

When neighbor authentication has been configured on a router, the router authenticates the source of each routing update packet that it receives. This is accomplished by the exchange of an authenticating key (sometimes referred to as a password) that is known to both the sending and the receiving router.

There are two types of neighbor authentication used: plain text authentication and Message Digest Algorithm Version 5 (MD5) authentication. Both forms work in the same way, with the exception that MD5 sends a "message digest" instead of the authenticating key itself. The message digest is created using the key and a message, but the key itself is not sent, preventing it from being read while it is being transmitted. Plain text authentication sends the authenticating key itself over the wire.

---

**Note**

Note that plain text authentication is not recommended for use as part of your security strategy. Its primary use is to avoid accidental changes to the routing infrastructure. Using MD5 authentication, however, is a recommended security practice.

In plain text authentication, each participating neighbor router must share an authenticating key. This key is specified at each router during configuration. Multiple keys can be specified with some protocols; each key must then be identified by a key number.

In general, when a routing update is sent, the following authentication sequence occurs:

1. A router sends a routing update with a key and the corresponding key number to the neighbor router. In protocols that can have only one key, the key number is always zero. The receiving (neighbor) router checks the received key against the same key stored in its own memory.

2. If the two keys match, the receiving router accepts the routing update packet. If the two keys do not match, the routing update packet is rejected.

MD5 authentication works similarly to plain text authentication, except that the key is never sent over the wire. Instead, the router uses the MD5 algorithm to produce a "message digest" of the key (also called a "hash"). The message digest is then sent instead of the key itself. This ensures that nobody can eavesdrop on the line and learn keys during transmission.
Another form of neighbor router authentication is to configure key management using key chains. When you configure a key chain, you specify a series of keys with lifetimes, and the Cisco IOS software rotates through each of these keys. This decreases the likelihood that keys will be compromised.

How to Configure Routing Information Protocol

Enabling RIP and Configuring RIP Parameters

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router rip
4. network ip-address
5. neighbor ip-address
6. auto-summary
7. offset-list [access-list-number | access-list-name] {in | out} offset [interface-type interface-number]
8. timers basic update invalid holddown flush [sleeptime]
9. maximum-paths maximum
10. distance admin-distance [prefix prefix-length | prefix-mask ]
11. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> router rip</td>
<td>Enables a RIP routing process and enters router configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# router rip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> network ip-address</td>
<td>Associates a network with a RIP routing process.</td>
</tr>
<tr>
<td>Example: Device(config-router)# network 10.1.1.0</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Step 5**
`neighbor ip-address`  
**Example:**  
Device(config-router)# neighbor 10.1.1.2

**Purpose**
Defines a neighboring device with which to exchange routing information.

**Step 6**
`auto-summary`  
**Example:**  
Device(config-router)# auto-summary

**Purpose**
Restores the default behavior of automatic summarization of subnet routes into network-level routes.

**Step 7**
`offset-list [access-list-number | access-list-name] {in | out} offset [interface-type interface-number]`  
**Example:**  
Device(config-router)# offset-list 98 in 1 Ethernet 1/0

**Purpose**
(Optional) Applies an offset list to routing metrics.

**Step 8**
`timers basic update invalid holddown flush [sleeptime]`  
**Example:**  
Device(config-router)# timers basic 1 2 3 4

**Purpose**
(Optional) Adjusts routing protocol timers.

**Step 9**
`maximum-paths maximum`  
**Example:**  
Device(config-router)# maximum-paths 16

**Purpose**
Configures the maximum number of equal cost parallel routes that RIP will install into the routing table.

**Step 10**
`distance admin-distance [prefix prefix-length | prefix-mask]`  
**Example:**  
Device(config-router)# distance 85 192.168.10.0/24

**Purpose**
Defines the administrative distance assigned to routes discovered by RIP.

**Step 11**
`end`  
**Example:**  
Device(config-router)# end

**Purpose**
Exits router configuration mode and returns to privileged EXEC mode.

---

### Specifying a RIP Version and Enabling Authentication

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router rip`
4. `version {1 | 2}`
5. `exit`  
6. `interface type number`  
7. `ip rip send version [1] [2]`  
8. `ip rip receive version [1] [2]`  
9. `ip rip authentication key-chain name-of-chain`  
10. `ip rip authentication mode {text | md5}`  
11. `end`

### Feature Information for RIP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Open Shortest Path First (OSPF)

Information About OSPF

OSPF is an Interior Gateway Protocol (IGP) designed expressly for IP networks, supporting IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets. The Cisco implementation supports RFC 1253, OSPF management information base (MIB).

The Cisco implementation conforms to the OSPF Version 2 specifications with these key features:

- Definition of stub areas is supported.
- Routes learned through any IP routing protocol can be redistributed into another IP routing protocol. At the intradomain level, this means that OSPF can import routes learned through EIGRP and RIP. OSPF routes can also be exported into RIP.
- Plain text and MD5 authentication among neighboring routers within an area is supported.
- Configurable routing interface parameters include interface output cost, retransmission interval, interface transmit delay, router priority, router dead and hello intervals, and authentication key.
- Virtual links are supported.
- Not-so-stubby-areas (NSSAs) per RFC 1587 are supported.

OSPF typically requires coordination among many internal routers, area border routers (ABRs) connected to multiple areas, and autonomous system boundary routers (ASBRs). The minimum configuration would use all default parameter values, no authentication, and interfaces assigned to areas. If you customize your environment, you must ensure coordinated configuration of all routers.
OSPF for Routed Access

Note

OSPF is supported in. OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a combined total of 1000 dynamically learned routes. The image provides OSPF for routed access. However, these restrictions are not enforced in this release.

With the typical topology (hub and spoke) in a campus environment, where the wiring closets (spokes) are connected to the distribution switch (hub) that forwards all nonlocal traffic to the distribution layer, the wiring closet switch need not hold a complete routing table. A best practice design, where the distribution switch sends a default route to the wiring closet switch to reach interarea and external routes (OSPF stub or totally stub area configuration) should be used when OSPF for Routed Access is used in the wire. For more details, see the “High Availability Campus Network Design—Routed Access Layer using EIGRP or OSPF” document.

OSPF Area Parameters

You can optionally configure several OSPF area parameters. These parameters include authentication for password-based protection against unauthorized access to an area, stub areas, and not-so-stubby-areas (NSSAs). Stub areas are areas into which information on external routes is not sent. Instead, the area border router (ABR) generates a default external route into the stub area for destinations outside the autonomous system (AS). An NSSA does not flood all LSAs from the core into the area, but can import AS external routes within the area by redistribution.

Route summarization is the consolidation of advertised addresses into a single summary route to be advertised by other areas. If network numbers are contiguous, you can use the area range router configuration command to configure the ABR to advertise a summary route that covers all networks in the range.

Other OSPF Parameters

You can optionally configure other OSPF parameters in router configuration mode.

- Route summarization: When redistributing routes from other protocols. Each route is advertised individually in an external LSA. To help decrease the size of the OSPF link state database, you can use the summary-address router configuration command to advertise a single router for all the redistributed routes included in a specified network address and mask.

- Virtual links: In OSPF, all areas must be connected to a backbone area. You can establish a virtual link in case of a backbone-continuity break by configuring two Area Border Routers as endpoints of a virtual link. Configuration information includes the identity of the other virtual endpoint (the other ABR) and the nonbackbone link that the two routers have in common (the transit area). Virtual links cannot be configured through a stub area.

- Default route: When you specifically configure redistribution of routes into an OSPF routing domain, the route automatically becomes an autonomous system boundary router (ASBR). You can force the ASBR to generate a default route into the OSPF routing domain.

- Domain Name Server (DNS) names for use in all OSPF show privileged EXEC command displays makes it easier to identify a router than displaying it by router ID or neighbor ID.
• Default Metrics: OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The metric is calculated as \( \text{ref-bw} \) divided by bandwidth, where \( \text{ref} \) is 10 by default, and bandwidth (\( \text{bw} \)) is specified by the bandwidth interface configuration command. For multiple links with high bandwidth, you can specify a larger number to differentiate the cost on those links.

• Administrative distance is a rating of the trustworthiness of a routing information source, an integer between 0 and 255, with a higher value meaning a lower trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. OSPF uses three different administrative distances: routes within an area (interarea), routes to another area (interarea), and routes from another routing domain learned through redistribution (external). You can change any of the distance values.

• Passive interfaces: Because interfaces between two devices on an Ethernet represent only one network segment, to prevent OSPF from sending hello packets for the sending interface, you must configure the sending device to be a passive interface. Both devices can identify each other through the hello packet for the receiving interface.

• Route calculation timers: You can configure the delay time between when OSPF receives a topology change and when it starts the shortest path first (SPF) calculation and the hold time between two SPF calculations.

• Log neighbor changes: You can configure the router to send a syslog message when an OSPF neighbor state changes, providing a high-level view of changes in the router.

**LSA Group Pacing**

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, check-summing, and aging functions for more efficient router use. This feature is enabled by default with a 4-minute default pacing interval, and you will not usually need to modify this parameter. The optimum group pacing interval is inversely proportional to the number of LSAs the router is refreshing, check-summing, and aging. For example, if you have approximately 10,000 LSAs in the database, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

**Loopback Interfaces**

OSPF uses the highest IP address configured on the interfaces as its router ID. If this interface is down or removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces. If a loopback interface is configured with an IP address, OSPF uses this IP address as its router ID, even if other interfaces have higher IP addresses. Because loopback interfaces never fail, this provides greater stability. OSPF automatically prefers a loopback interface over other interfaces, and it chooses the highest IP address among all loopback interfaces.
# How to Configure OSPF

## Default OSPF Configuration

Table 90: Default OSPF Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface parameters</td>
<td>Cost:&lt;br&gt;Retransmit interval: 5 seconds.&lt;br&gt;Transmit delay: 1 second.&lt;br&gt;Priority: 1.&lt;br&gt;Hello interval: 10 seconds.&lt;br&gt;Dead interval: 4 times the hello interval.&lt;br&gt;No authentication.&lt;br&gt;No password specified.&lt;br&gt;MD5 authentication disabled.</td>
</tr>
<tr>
<td></td>
<td>Authentication type: 0 (no authentication).&lt;br&gt;Default cost: 1.&lt;br&gt;Range: Disabled.&lt;br&gt;Stub: No stub area defined.&lt;br&gt;NSSA: No NSSA area defined.</td>

## Configuring Basic OSPF Parameters

To enable OSPF, create an OSPF routing process, specify the range of IP addresses to associate with the routing process, and assign area IDs to be associated with that range.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>router ospf</code> process-id</td>
<td>Enables OSPF routing, and enter router configuration mode. The process ID is an internally used identification parameter that is locally assigned and can be any positive integer. Each OSPF routing process has a unique value.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>router ospf 15</code></td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a maximum number of 1000 dynamically learned routes.</td>
<td></td>
</tr>
</tbody>
</table>

### Feature Default Setting

<tr>
<td>Timers shortest path first (spf)</td>
<td><code>spf delay: 5 seconds.; spf-holdtime: 10 seconds.</code></td>
</tr>
</tbody>
</table>
### Configuring OSPF Interfaces

You can use the `ip ospf` interface configuration commands to modify interface-specific OSPF parameters. You are not required to modify any of these parameters, but some interface parameters (hello interval, dead interval, and authentication key) must be consistent across all routers in an attached network. If you modify these parameters, be sure all routers in the network have compatible values.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# interface interface-id</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

The `ip ospf` interface configuration commands are all optional.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# interface gigabitethernet 1/0/1</code></td>
<td>(Optional) Explicitly specifies the cost of sending a packet on the interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip ospf cost</code></td>
<td>(Optional) Specifies the number of seconds between link state advertisement transmissions. The range is 1 to 65535 seconds. The default is 5 seconds.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf 8</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>ip ospf retransmit-interval seconds</code></td>
<td>(Optional) Sets the estimated number of seconds to wait before sending a link state update packet. The range is 1 to 65535 seconds. The default is 1 second.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf transmit-interval 10</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>ip ospf transmit-delay seconds</code></td>
<td>(Optional) Sets priority to help find the OSPF designated router for a network. The range is from 0 to 255. The default is 1.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf transmit-delay 2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>ip ospf priority number</code></td>
<td>(Optional) Sets the number of seconds between hello packets sent on an OSPF interface. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf priority 5</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>ip ospf hello-interval seconds</code></td>
<td>(Optional) Sets the number of seconds after the last device hello packet was seen before its neighbors declare the OSPF router to be down. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 4 times the hello interval.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf hello-interval 12</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>ip ospf dead-interval seconds</code></td>
<td>(Optional) Assign a password to be used by neighboring OSPF routers. The password can be any string of keyboard-entered characters up to 8 bytes in length. All neighboring routers on the same network must have the same password to exchange OSPF information.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf dead-interval 8</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> <code>ip ospf authentication-key key</code></td>
<td>(Optional) Enables MDS authentication.</td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf authentication-key password</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> <code>ip ospf message digest-key keyid md5 key</code></td>
<td></td>
</tr>
<tr>
<td>Example: <code>Device(config-if)# ip ospf message digest-key 16 md5 yourlpas</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> <code>ip ospf database-filter all out</code></td>
<td>(Optional) Block flooding of OSPF LSA packets to the interface. By default, OSPF floods new LSAs over all</td>
</tr>
</tbody>
</table>
### Configuring OSPF Area Parameters

#### Before you begin

- The OSPF area router configuration commands are all optional.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

#### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-if)# ip ospf database-filter all out</td>
<td>interfaces in the same area, except the interface on which the LSA arrives.</td>
</tr>
</tbody>
</table>

**Step 12**

- `end`  
  - Example:  
    ```bash  
    Device(config)# end  
    ```

**Step 13**

- `show ip ospf interface [interface-name]`  
  - Example:  
    ```bash  
    Device# show ip ospf interface  
    ```

**Step 14**

- `show ip ospf neighbor detail`  
  - Example:  
    ```bash  
    Device# show ip ospf neighbor detail  
    ```

**Step 15**

- `copy running-config startup-config`  
  - Example:  
    ```bash  
    Device# copy running-config startup-config  
    ```

**Example:**

**Step 12**

```
Device(config-if)# ip ospf database-filter all out
```

**Step 12**

- `end`  
  - Example:  
    ```bash  
    Device(config)# end  
    ```

**Step 13**

- `show ip ospf interface [interface-name]`  
  - Example:  
    ```bash  
    Device# show ip ospf interface  
    ```

**Step 14**

- `show ip ospf neighbor detail`  
  - Example:  
    ```bash  
    Device# show ip ospf neighbor detail  
    ```

**Step 15**

- `copy running-config startup-config`  
  - Example:  
    ```bash  
    Device# copy running-config startup-config  
    ```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Enables OSPF routing, and enter router configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> router ospf process-id</td>
<td>(Optional) Allow password-based protection against unauthorized access to the identified area. The identifier can be either a decimal value or an IP address.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# router ospf 109</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> area area-id authentication</td>
<td>(Optional) Enables MD5 authentication on the area.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-router)# area 1 authentication</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> area area-id authentication message-digest</td>
<td>(Optional) Define an area as a stub area. The no-summary keyword prevents an ABR from sending summary link advertisements into the stub area.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-router)# area 1 authentication message-digest</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> area area-id stub [no-summary]</td>
<td>(Optional) Defines an area as a not-so-stubby-area. Every router within the same area must agree that the area is NSSA. Select one of these keywords:</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-router)# area 1 stub</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> area area-id nssa [no-redistribution] [default-information originate] [no-summary]</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-router)# area 1 nssa default-information-originate</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> area area-id range address mask</td>
<td>(Optional) Specifies an address range for which a single route is advertised. Use this command only with area border routers.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-router)# area 1 range 255.240.0.0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

#### Command or Action

**Step 9**  
*show ip ospf [process-id]*  
*Example:*  
Device# show ip ospf

**Step 10**  
*show ip ospf [process-id [area-id]] database*  
*Example:*  
Device# show ip ospf database

**Step 11**  
*copy running-config startup-config*  
*Example:*  
Device# copy running-config startup-config

### Configuring Other OSPF Parameters

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> router ospf process-id</td>
<td>Enables OSPF routing, and enter router config</td>
</tr>
<tr>
<td>Example:</td>
<td>mode.</td>
</tr>
<tr>
<td>Device(config)# router ospf 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> summary-address address mask</td>
<td>(Optional) Specifies an address and IP</td>
</tr>
<tr>
<td>Example:</td>
<td>subnet mask for redistributed routes so that</td>
</tr>
<tr>
<td>Device(config)# summary-address 10.1.1.1 255.255.255.0</td>
<td>only one summary route is advertised.</td>
</tr>
<tr>
<td><strong>Step 4</strong> area area-id virtual-link router-id [hello-interval seconds] [retransmit-interval seconds] [trans] [[authentication-key key]</td>
<td>(Optional) Establishes a virtual link and set</td>
</tr>
<tr>
<td>Example:</td>
<td>its parameters.</td>
</tr>
<tr>
<td>Device(config)# area 2 virtual-link 192.168.255.1 hello-interval 5</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 5**       | default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]  
**Example:**  
Device(config)# default-information originate metric 100 metric-type 1  
(Optional) Forces the ASBR to generate a default route into the OSPF routing domain. Parameters are all optional. |
| **Step 6**       | ip ospf name-lookup  
**Example:**  
Device(config)# ip ospf name-lookup  
(Optional) Configures DNS name lookup. The default is disabled. |
| **Step 7**       | ip auto-cost reference-bandwidth ref-bw  
**Example:**  
Device(config)# ip auto-cost reference-bandwidth 5  
(Optional) Specifies an address range for which a single route will be advertised. Use this command only with area border routers. |
| **Step 8**       | distance ospf {{[inter-area dist1] [inter-area dist2] [external dist3]}}  
**Example:**  
Device(config)# distance ospf inter-area 150  
(Optional) Changes the OSPF distance values. The default distance for each type of route is 110. The range is 1 to 255. |
| **Step 9**       | passive-interface type number  
**Example:**  
Device(config)# passive-interface gigabitethernet 1/0/6  
(Optional) Suppresses the sending of hello packets through the specified interface. |
| **Step 10**      | timers throttle spf spf-delay spf-holdtime spf-wait  
**Example:**  
Device(config)# timers throttle spf 200 100 100  
(Optional) Configures route calculation timers.  
- *spf-delay*—Delay between receiving a change to SPF calculation. The range is from 1 to 600000 milliseconds.  
- *spf-holdtime*—Delay between first and second SPF calculation. The range is from 1 to 600000 in milliseconds.  
- *spf-wait*—Maximum wait time in milliseconds for SPF calculations. The range is from 1 to 600000 in milliseconds. |
| **Step 11**      | ospf log-adj-changes  
**Example:**  
Device(config)# ospf log-adj-changes  
(Optional) Sends syslog message when a neighbor state changes. |
**Changing LSA Group Pacing**

Configuration Examples for OSPF

Example: Configuring Basic OSPF Parameters

This example shows how to configure an OSPF routing process and assign it a process number of 109:

Device(config)# router ospf 109
Device(config-router)# network 131.108.0.0 255.255.255.0 area 24
IPv6 Open Shortest Path First version 3

IPv6 Routing: OSPFv3

Open Shortest Path First version 3 (OSPFv3) is an IPv4 and IPv6 link-state routing protocol that supports IPv6 and IPv4 unicast address families (AFs).

Prerequisites for IPv6 Routing: OSPFv3

- Complete the OSPFv3 network strategy and planning for your IPv6 network. For example, you must decide whether multiple areas are required.
- Enable IPv6 unicast routing.
- Enable IPv6 on the interface.

Restrictions for IPv6 Routing: OSPFv3

When running a dual-stack IP network with OSPF version 2 for IPv4 and OSPFv3, be careful when changing the defaults for commands used to enable OSPFv3. Changing these defaults may affect your OSPFv3 network, possibly adversely.

Information About IPv6 Routing: OSPFv3

How OSPFv3 Works

OSPFv3 is a routing protocol for IPv4 and IPv6. It is a link-state protocol, as opposed to a distance-vector protocol. Think of a link as being an interface on a networking device. A link-state protocol makes its routing decisions based on the states of the links that connect source and destination machines. The state of a link is a description of that interface and its relationship to its neighboring networking devices. The interface information includes the IPv6 prefix of the interface, the network mask, the type of network it is connected to, the devices connected to that network, and so on. This information is propagated in various type of link-state advertisements (LSAs).
A device’s collection of LSA data is stored in a link-state database. The contents of the database, when subjected to the Dijkstra algorithm, result in the creation of the OSPF routing table. The difference between the database and the routing table is that the database contains a complete collection of raw data; the routing table contains a list of shortest paths to known destinations via specific device interface ports.

OSPFv3, which is described in RFC 5340, supports IPv6 and IPv4 unicast AFs.

**Comparison of OSPFv3 and OSPF Version 2**

Much of OSPF version 3 is the same as in OSPF version 2. OSPFv3, which is described in RFC 5340, expands on OSPF version 2 to provide support for IPv6 routing prefixes and the larger size of IPv6 addresses.

In OSPFv3, a routing process does not need to be explicitly created. Enabling OSPFv3 on an interface will cause a routing process, and its associated configuration, to be created.

In OSPFv3, each interface must be enabled using commands in interface configuration mode. This feature is different from OSPF version 2, in which interfaces are indirectly enabled using the device configuration mode.

When using a nonbroadcast multiaccess (NBMA) interface in OSPFv3, you must manually configure the device with the list of neighbors. Neighboring devices are identified by their device ID.

In IPv6, you can configure many address prefixes on an interface. In OSPFv3, all address prefixes on an interface are included by default. You cannot select some address prefixes to be imported into OSPFv3; either all address prefixes on an interface are imported, or no address prefixes on an interface are imported.

Unlike OSPF version 2, multiple instances of OSPFv3 can be run on a link.

OSPF automatically prefers a loopback interface over any other kind, and it chooses the highest IP address among all loopback interfaces. If no loopback interfaces are present, the highest IP address in the device is chosen. You cannot tell OSPF to use any particular interface.

**LSA Types for OSPFv3**

The following list describes LSA types, each of which has a different purpose:

- **Device LSAs (Type 1)**—Describes the link state and costs of a device’s links to the area. These LSAs are flooded within an area only. The LSA indicates if the device is an Area Border Router (ABR) or Autonomous System Boundary Router (ASBR), and if it is one end of a virtual link. Type 1 LSAs are also used to advertise stub networks. In OSPFv3, these LSAs have no address information and are network-protocol-independent. In OSPFv3, device interface information may be spread across multiple device LSAs. Receivers must concatenate all device LSAs originated by a given device when running the SPF calculation.

- **Network LSAs (Type 2)**—Describes the link-state and cost information for all devices attached to the network. This LSA is an aggregation of all the link-state and cost information in the network. Only a designated device tracks this information and can generate a network LSA. In OSPFv3, network LSAs have no address information and are network-protocol-independent.

- **Interarea-prefix LSAs for ABRs (Type 3)**—Advertises internal networks to devices in other areas (interarea routes). Type 3 LSAs may represent a single network or a set of networks summarized into one advertisement. Only ABRs generate summary LSAs. In OSPFv3, addresses for these LSAs are expressed as prefix, prefix length instead of address, mask. The default route is expressed as a prefix with length 0.

- **Interarea-device LSAs for ASBRs (Type 4)**—Advertises the location of an ASBR. Devices that are trying to reach an external network use these advertisements to determine the best path to the next hop. Type 4 LSAs are generated by ABRs on behalf of ASBRs.
• Autonomous system external LSAs (Type 5)—Redistributes routes from another autonomous system, usually from a different routing protocol into OSPFv3. In OSPFv3, addresses for these LSAs are expressed as prefix, prefix length instead of address, mask. The default route is expressed as a prefix with length 0.

• Link LSAs (Type 8)—Have local-link flooding scope and are never flooded beyond the link with which they are associated. Link LSAs provide the link-local address of the device to all other devices attached to the link, inform other devices attached to the link of a list of prefixes to associate with the link, and allow the device to assert a collection of Options bits to associate with the network LSA that will be originated for the link.

• Intra-Area-Prefix LSAs (Type 9)—A device can originate multiple intra-area-prefix LSAs for each device or transit network, each with a unique link-state ID. The link-state ID for each intra-area-prefix LSA describes its association to either the device LSA or the network LSA and contains prefixes for stub and transit networks.

An address prefix occurs in almost all newly defined LSAs. The prefix is represented by three fields: PrefixLength, PrefixOptions, and Address Prefix. In OSPFv3, addresses for these LSAs are expressed as prefix, prefix length instead of address, mask. The default route is expressed as a prefix with length 0. Type 3 and Type 9 LSAs carry all prefix (subnet) information that, in OSPFv2, is included in device LSAs and network LSAs. The Options field in certain LSAs (device LSAs, network LSAs, interarea-device LSAs, and link LSAs) has been expanded to 24 bits to provide support for OSPFv3.

In OSPFv3, the sole function of the link-state ID in interarea-prefix LSAs, interarea-device LSAs, and autonomous-system external LSAs is to identify individual pieces of the link-state database. All addresses or device IDs that are expressed by the link-state ID in OSPF version 2 are carried in the body of the LSA in OSPFv3.

The link-state ID in network LSAs and link LSAs is always the interface ID of the originating device on the link being described. For this reason, network LSAs and link LSAs are now the only LSAs whose size cannot be limited. A network LSA must list all devices connected to the link, and a link LSA must list all of the address prefixes of a device on the link.

**NBMA in OSPFv3**

On NBMA networks, the designated router (DR) or backup DR (BDR) performs the LSA flooding. On point-to-point networks, flooding simply goes out an interface directly to a neighbor.

Devices that share a common segment (Layer 2 link between two interfaces) become neighbors on that segment. OSPFv3 uses the Hello protocol, periodically sending hello packets out each interface. Devices become neighbors when they see themselves listed in the neighbor’s hello packet. After two devices become neighbors, they may proceed to exchange and synchronize their databases, which creates an adjacency. Not all neighboring devices have an adjacency.

On point-to-point and point-to-multipoint networks, the software floods routing updates to immediate neighbors. There is no DR or BDR; all routing information is flooded to each networking device.

On broadcast or NBMA segments only, OSPFv3 minimizes the amount of information being exchanged on a segment by choosing one device to be a DR and one device to be a BDR. Thus, the devices on the segment have a central point of contact for information exchange. Instead of each device exchanging routing updates with every other device on the segment, each device exchanges information with the DR and BDR. The DR and BDR relay the information to the other devices.

The software looks at the priority of the devices on the segment to determine which devices will be the DR and BDR. The device with the highest priority is elected the DR. If there is a tie, then the device with the
higher device ID takes precedence. After the DR is elected, the BDR is elected the same way. A device with a device priority set to zero is ineligible to become the DR or BDR.

When using NBMA in OSPFv3, you cannot automatically detect neighbors. On an NBMA interface, you must configure your neighbors manually using interface configuration mode.

**Load Balancing in OSPFv3**

When a device learns multiple routes to a specific network via multiple routing processes (or routing protocols), it installs the route with the lowest administrative distance in the routing table. Sometimes the device must select a route from among many learned via the same routing process with the same administrative distance. In this case, the device chooses the path with the lowest cost (or metric) to the destination. Each routing process calculates its cost differently and the costs may need to be manipulated in order to achieve load balancing.

OSPFv3 performs load balancing automatically in the following way. If OSPFv3 finds that it can reach a destination through more than one interface and each path has the same cost, it installs each path in the routing table. The only restriction on the number of paths to the same destination is controlled by the `maximum-paths` command. The default maximum paths is 32, and the range is from 1 to 32.

**Addresses Imported into OSPFv3**

When importing the set of addresses specified on an interface on which OSPFv3 is running into OSPFv3, you cannot select specific addresses to be imported. Either all addresses are imported, or no addresses are imported.

**OSPFv3 Customization**

You can customize OSPFv3 for your network, but you likely will not need to do so. The defaults for OSPFv3 are set to meet the requirements of most customers and features. If you must change the defaults, refer to the IPv6 command reference to find the appropriate syntax.

⚠️ **Caution**

Be careful when changing the defaults. Changing defaults will affect your OSPFv3 network, possibly adversely.

**OSPFv3 Cost Calculation**

Because cost components can change rapidly, it might be necessary to reduce the volume of changes to reduce network-wide churn. The recommended values for S2, S3, and S4 in the second table below are based on network simulations that may reduce the rate of network changes. The recommended value for S1 is 0 to eliminate this variable from the route cost calculation.

The overall link cost is computed using the formula shown in the figure below.
The table below defines the symbols used in the OSPFv3 cost calculation.

**Table 92: OSPFv3 Cost Calculation Definitions**

<table>
<thead>
<tr>
<th>Cost Component</th>
<th>Component Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OC</td>
<td>The default OSPFv3 cost. Calculated from reference bandwidth using reference_bw / (MDR*1000), where reference_bw=10^8.</td>
</tr>
<tr>
<td>A through D</td>
<td>Various radio-specific data-based formulas that produce results in the 0 through 64,000 range.</td>
</tr>
<tr>
<td>A</td>
<td>CDR- and MDR-related formula: ((2^{16} * (100 - (CDR * 100 / MDR))) / 100)</td>
</tr>
<tr>
<td>B</td>
<td>Resources related formula: (((100 - RESOURCES)^3 * 2^{16} / 10^6))</td>
</tr>
<tr>
<td>C</td>
<td>Latency as reported by the radio, already in the 0 through 64,000 range when reported (LATENCY).</td>
</tr>
<tr>
<td>D</td>
<td>RLF-related formula: (((100 - RLF) * 2^{16}) / 100)</td>
</tr>
<tr>
<td>S1 through S4</td>
<td>Scalar weighting factors input from the CLI. These scalars scale down the values as computed by A through D. The value of 0 disables and the value of 100 enables full 0 through 64,000 range for one component.</td>
</tr>
</tbody>
</table>

Because each network might have unique characteristics that require different settings to optimize actual network performance, these are recommended values intended as a starting point for optimizing an OSPFv3 network. The table below lists the recommended value settings for OSPFv3 cost metrics.
### Table 93: Recommended Value Settings for OSPFv3 Cost Metrics

<table>
<thead>
<tr>
<th>Setting</th>
<th>Metric Description</th>
<th>Default Value</th>
<th>Recommended Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>S1</td>
<td>ipv6 ospf dynamic weight throughout</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>S2</td>
<td>ipv6 ospf dynamic weight resources</td>
<td>100</td>
<td>29</td>
</tr>
<tr>
<td>S3</td>
<td>ipv6 ospf dynamic weight latency</td>
<td>100</td>
<td>29</td>
</tr>
<tr>
<td>S4</td>
<td>ipv6 ospf dynamic weight L2 factor</td>
<td>100</td>
<td>29</td>
</tr>
</tbody>
</table>

The default path costs were calculated using this formula, as noted in the following list. If these values do not suit your network, you can use your own method of calculating path costs.

- 56-kbps serial link—Default cost is 1785.
- 64-kbps serial link—Default cost is 1562.
- T1 (1.544-Mbps serial link)—Default cost is 64.
- E1 (2.048-Mbps serial link)—Default cost is 48.
- 4-Mbps Token Ring—Default cost is 25.
- Ethernet—Default cost is 10.
- 16-Mbps Token Ring—Default cost is 6.
- FDDI—Default cost is 1.
- X25—Default cost is 5208.
- Asynchronous—Default cost is 10,000.
- ATM—Default cost is 1.

### Force SPF in OSPFv3

When the `process` keyword is used with the `clear ipv6 ospf` command, the OSPFv3 database is cleared and repopulated, and then the SPF algorithm is performed. When the `force-spf` keyword is used with the `clear ipv6 ospf` command, the OSPFv3 database is not cleared before the SPF algorithm is performed.

### How to Configure Load Balancing in OSPFv3

#### Configuring the OSPFv3 Device Process

Once you have completed step 3 and entered OSPFv3 router configuration mode, you can perform any of the subsequent steps in this task as needed to configure OSPFv3 Device configuration.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospfv3 [process-id]`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

</tbody>
</table>

**Example:**

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
### Configuring NBMA Interfaces in OSPFv3

You can customize OSPFv3 in your network to use NBMA interfaces. OSPFv3 cannot automatically detect neighbors over NBMA interfaces. On an NBMA interface, you must configure your neighbors manually using interface configuration mode.

#### Before you begin

Before you configure NBMA interfaces, you must perform the following tasks:

- Configure your network to be an NBMA network
- Identify each neighbor

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-router)# default area 1</td>
<td>Suppresses the sending of syslog messages when the device receives LSA Type 6 multicast OSPFv3 packets, which are unsupported.</td>
</tr>
<tr>
<td><strong>Step 7</strong> ignore lsa mospf</td>
<td>Configures OSPFv3 interfaces with Simple Network Management Protocol (SNMP) MIB-II interface Index (ifIndex) identification numbers in IPv4 and IPv6.</td>
</tr>
</tbody>
</table>
| **Example:**
Device(config-router)# ignore lsa mospf | |
| **Step 8** interface-id snmp-if-index | Configures the device to send a syslog message when an OSPFv3 neighbor goes up or down. |
| **Example:**
Device(config-router)# interface-id snmp-if-index | |
| **Step 9** log-adjacency-changes [detail] | Suppresses sending routing updates on an interface when an IPv4 OSPFv3 process is used. |
| **Example:**
Device(config-router)# log-adjacency-changes | |
| **Step 10** passive-interface [default | interface-type interface-number] | |
| **Example:**
Device(config-router)# passive-interface default | |
| **Step 11** queue-depth hello | update | queue-size | unlimited |歌舞伎 |
| **Example:**
Device(config-router)# queue-depth update 1500 | |
| **Step 12** router-id router-id | Enter this command to use a fixed router ID. |
| **Example:**
Device(config-router)# router-id 10.1.1.1 | |
• You cannot automatically detect neighbors when using NBMA interfaces. You must manually configure your device to detect neighbors when using an NBMA interface.
• When the `ipv6 ospf neighbor` command is configured, the IPv6 address used must be the link-local address of the neighbor.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `ipv6 enable`
5. `ipv6 ospf neighbor ipv6-address [priority number] [poll-interval seconds] [cost number] [database-filter all out]`

**DETAILED STEPS**

<table>
<thead>

### Command or Action

- `ipv6-prefix` | `link-state-id` | `inter-area router`
- `destination-router-id` | `link-state-id` | `link`
- `interface interface-name` | `link-state-id` | `network`
- `link-state-id`
- `nssa-external` `ipv6-prefix` | `link-state-id`
- `prefix ref-lsa` `router`
- `network` | `link-state-id`
- `promiscuous` | `router`
- `link-state-id`
- `unknown` `area` | `as` | `link`
- `link-state-id`
- `adv-router router-id` | `self-originate`

### Purpose

**Example:**

Device# show ospfv3 database

**Step 4**

`show ospfv3 [process-id] [address-family] events`
- `generic` | `interface` | `lsa` | `neighbor` | `reverse` | `rib` | `spf`  

**Example:**

Device# show ospfv3 events

**Step 5**

`show ospfv3 [process-id] [area-id] [address-family] flood-list interface-type interface-number`

**Example:**

Device# show ospfv3 flood-list

**Step 6**

`show ospfv3 [process-id] [address-family] graceful-restart`

**Example:**

Device# show ospfv3 graceful-restart

**Step 7**

`show ospfv3 [process-id] [area-id] [address-family] interface [type number] [brief]`

**Example:**

Device# show ospfv3 interface

**Step 8**

`show ospfv3 [process-id] [area-id] [address-family] neighbor [interface-type interface-number] [neighbor-id] [detail]`

**Example:**

Device# show ospfv3 neighbor

**Step 9**

`show ospfv3 [process-id] [area-id] [address-family] request-list [neighbor] [interface] [interface-neighbor]`

**Example:**

Device# show ospfv3 request-list
<table>
<thead>
<tr>

## Configuration Examples for Load Balancing in OSPFv3

### Example: Configuring the OSPFv3 Device Process

```
Device# show ospfv3 database
OSPFv3 Device with ID (172.16.4.4) (Process ID 1)
Device Link States (Area 0)
ADV Device   Age   Seg#     Fragment ID   Link count   Bits
172.16.4.4   239   0x80000003 0      1            B
172.16.6.6   239   0x80000003 0      1            B
Inter Area Prefix Link States (Area 0)
```
Example: Configuring NBMA Interfaces

The following example shows how to configure an OSPFv3 neighboring device with the IPv6 address of FE80::A8BB:CCFF:FE00:C01.

```
ipv6 enable

ipv6 ospf neighbor FE80::A8BB:CCFF:FE00:C0
```

Example: Forcing SPF Configuration

The following example shows how to trigger SPF to redo the SPF and repopulate the routing tables:

```
clear ipv6 ospf force-spf
```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Feature Information for IPv6 Routing: OSPFv3

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Policy-Based Routing (PBR)

• Policy-Based Routing, on page 811

Policy-Based Routing

Information About Policy-Based Routing

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

• Identity of a particular end system
• Application
• Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

• Route map statement marked as permit is processed as follows:
  • A match command can match on length or multiple ACLs. A route map statement can contain multiple match commands. Logical or algorithm function is performed across all the match commands to reach a permit or deny decision.

For example:
match length A B
match ip address acl1 acl2
match ip address acl3
A packet is permitted if it is permitted by match length A B or acl1 or acl2 or acl3

• If the decision reached is permit, then the action specified by the set command is applied on the packet.
• If the decision reached is deny, then the PBR action (specified in the set command) is not applied. Instead the processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.

• For PBR, route-map statements marked as deny are not supported.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify match criteria based on an application, a protocol type, or an end station. The process proceeds through the route map until a match is found. If no match is found, normal destination-based routing occurs. There is an implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop router in the path.

Policy-Based Routing Using Object Tracking

You can configure policy-based routing (PBR) to use object tracking to verify the most viable next-hop IP address to which to forward packets, using an Internet Control Message Protocol (ICMP) ping as the verification method.

PBR with Object Tracking is most suitable for devices that have multiple Ethernet connections as the next hop. Normally, Ethernet interfaces connect to DSL modems or cable modems, and do not detect a failure upstream, in the ISP broadband network. The Ethernet interface remains up, and any form of static routing points to that interface. PBR with object tracking allows you to back up two Ethernet interfaces, determine the interface that is available by sending ICMP pings to verify reachability, and then route traffic to that interface.

To verify the next-hop IP address for the device, PBR informs the object-tracking process that it is interested in tracking a certain object. The tracking process, in turn, informs PBR when the state of the object changes.

Note

VRF is not supported with PBR using Object Tracking.

How to Configure PBR

• To use PBR, you must have the feature set enabled on the switch or stack master.
• Multicast traffic is not policy-routed. PBR applies to only to unicast traffic.
• You can enable PBR on a routed port or an SVI.
• The switch supports PBR based on match length.
• You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do so, the command is rejected. When a policy route map is applied to a physical interface, that interface cannot become a member of an EtherChannel.
• You can define a maximum of 128 IP policy route maps on the switch or switch stack.
• You can define a maximum of 512 access control entries (ACEs) for PBR on the switch or switch stack.
• When configuring match criteria in a route map, follow these guidelines:
  • Do not match ACLs that permit packets destined for a local address. PBR would forward these packets, which could cause ping or Telnet failure or route protocol flapping.
• VRF and PBR are mutually exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when VRF is enabled on an interface.
• The number of hardware entries used by PBR depends on the route map itself, the ACLs used, and the order of the ACLs and route-map entries.
• PBR based on TOS, DSCP and IP Precedence are not supported.
• Set interface, set default next-hop and set default interface are not supported.
• ip next-hop recursive and ip next-hop verify availability features are not available and the next-hop should be directly connected.
• Policy-maps with no set actions are supported. Matching packets are routed normally.
• Policy-maps with no match clauses are supported. Set actions are applied to all packets.

By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>

</tr>
<tr>
<td>Device(config)# route-map pbr-map permit</td>
<td></td>
</tr>
</tbody>
</table>

*map-tag — A meaningful name for the route map. The ip policy route-map interface configuration command uses this name to reference the route map. Multiple route-map statements with the same map tag define a single route map.

* (Optional) permit — If permit is specified and the match criteria are met for this route map, the route is policy routed as defined by the set actions.
<table>

Security Features Overview

The switch supports a LAN base image or a LAN lite image with a reduced feature set, depending on switch hardware. The security features are as follows:

• IPv6 First Hop Security—A suite of security features to be applied at the first hop switch to protect against vulnerabilities inherent in IPv6 networks. These include, Binding Integrity Guard (Binding Table), Router Advertisement Guard (RA Guard), DHCP Guard, IPv6 Neighbor Discovery Inspection (ND Guard), and IPv6 Source Guard.

This feature is not supported on LanLite images on Catalyst 2960-X Series Switches.

• Web Authentication—Allows a supplicant (client) that does not support IEEE 802.1x functionality to be authenticated using a web browser.

• Local Web Authentication Banner—A custom banner or an image file displayed at a web authentication login screen.

• IEEE 802.1x Authentication with ACLs and the RADIUS Filter-Id Attribute

• Password-protected access (read-only and read-write access) to management interfaces (device manager, Network Assistant, and the CLI) for protection against unauthorized configuration changes

• Multilevel security for a choice of security level, notification, and resulting actions

• Static MAC addressing for ensuring security

• Protected port option for restricting the forwarding of traffic to designated ports on the same switch

• Port security option for limiting and identifying MAC addresses of the stations allowed to access the port

• VLAN aware port security option to shut down the VLAN on the port when a violation occurs, instead of shutting down the entire port.

• Port security aging to set the aging time for secure addresses on a port.

• Protocol storm protection to control the rate of incoming protocol traffic to a switch by dropping packets that exceed a specified ingress rate.
• BPDU guard for shutting down a Port Fast-configured port when an invalid configuration occurs.

• Standard and extended IP access control lists (ACLs) for defining inbound security policies on Layer 2 interfaces (port ACLs).

• Extended MAC access control lists for defining security policies in the inbound direction on Layer 2 interfaces.

• Source and destination MAC-based ACLs for filtering non-IP traffic.

• DHCP snooping to filter untrusted DHCP messages between untrusted hosts and DHCP servers.

• IP source guard to restrict traffic on nonrouted interfaces by filtering traffic based on the DHCP snooping database and IP source bindings.

• Dynamic ARP inspection to prevent malicious attacks on the switch by not relaying invalid ARP requests and responses to other ports in the same VLAN.

This feature is not supported on LanLite images on Catalyst 2960-X Series Switches.

• IEEE 802.1x port-based authentication to prevent unauthorized devices (clients) from gaining access to the network. These 802.1x features are supported:
  • Support for single-host, multi-host, multi-auth, and multi-domain-auth modes.
  • Multidomain authentication (MDA) to allow both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), to independently authenticate on the same IEEE 802.1x-enabled switch port.
  • Dynamic voice virtual LAN (VLAN) for MDA to allow a dynamic voice VLAN on an MDA-enabled port.
  • VLAN assignment for restricting 802.1x-authenticated users to a specified VLAN.
  • Support for VLAN assignment on a port configured for multi-auth mode. The RADIUS server assigns a VLAN to the first host to authenticate on the port, and subsequent hosts use the same VLAN. Voice VLAN assignment is supported for one IP phone.
  • Port security for controlling access to 802.1x ports.
  • Voice VLAN to permit a Cisco IP Phone to access the voice VLAN regardless of the authorized or unauthorized state of the port.
  • IP phone detection enhancement to detect and recognize a Cisco IP phone.
  • Guest VLAN to provide limited services to non-802.1x-compliant users.
  • Restricted VLAN to provide limited services to users who are 802.1x compliant, but do not have the credentials to authenticate via the standard 802.1x processes.
  • 802.1x accounting to track network usage.
  • 802.1x with wake-on-LAN to allow dormant PCs to be powered on based on the receipt of a specific Ethernet frame.
  • 802.1x readiness check to determine the readiness of connected end hosts before configuring IEEE 802.1x on the switch.
  • Voice aware 802.1x security to apply traffic violation actions only on the VLAN on which a security violation occurs.
• MAC authentication bypass (MAB) to authorize clients based on the client MAC address.

• Network Admission Control (NAC) Layer 2 802.1x validation of the antivirus condition or posture of endpoint systems or clients before granting the devices network access.

  ![Note]

  NAC is not supported on LanLite images.

• Network Edge Access Topology (NEAT) with 802.1X switch supplicant, host authorization with CISP, and auto enablement to authenticate a switch outside a wiring closet as a supplicant to another switch.

  ![Note]

  NEAT is not supported on LanLite images.

• IEEE 802.1x with open access to allow a host to access the network before being authenticated.

  ![Note]

  This feature is not supported on LanLite images.

• IEEE 802.1x authentication with downloadable ACLs and redirect URLs to allow per-user ACL downloads from a Cisco Secure ACS server to an authenticated switch.

• Support for dynamic creation or attachment of an auth-default ACL on a port that has no configured static ACLs.

  ![Note]

  This feature is not supported on LanLite images.

• Flexible-authentication sequencing to configure the order of the authentication methods that a port tries when authenticating a new host.

• Multiple-user authentication to allow more than one host to authenticate on an 802.1x-enabled port.

• TACACS+, a proprietary feature for managing network security through a TACACS server for both IPv4 and IPv6.

• RADIUS for verifying the identity of, granting access to, and tracking the actions of remote users through authentication, authorization, and accounting (AAA) services for both IPv4 and IPv6.

• Enhancements to RADIUS, TACACS+, and SSH to function over IPv6.

• Secure Socket Layer (SSL) Version 3.0 support for the HTTP 1.1 server authentication, encryption, and message integrity and HTTP client authentication to allow secure HTTP communications (requires the cryptographic version of the software).

• IEEE 802.1x Authentication with ACLs and the RADIUS Filter-Id Attribute.

• Support for IP source guard on static hosts.
• RADIUS Change of Authorization (CoA) to change the attributes of a certain session after it is authenticated. When there is a change in policy for a user or user group in AAA, administrators can send the RADIUS CoA packets from the AAA server, such as Cisco Identity Services Engine, or Cisco Secure ACS to reinitialize authentication, and apply to the new policies.

• IEEE 802.1x User Distribution to allow deployments with multiple VLANs (for a group of users) to improve scalability of the network by load balancing users across different VLANs. Authorized users are assigned to the least populated VLAN in the group, assigned by RADIUS server.

**Note**  
This feature is not supported on LanLite images.

• Support for critical VLAN—multi-host/multi-auth enabled ports are placed in a critical VLAN in order to permit access to critical resources if AAA server becomes unreachable.

**Note**  
This feature is not supported on LanLite images.

• Support for Network Edge Access Topology (NEAT) to change the port host mode and to apply a standard port configuration on the authenticator switch port.

• VLAN-ID based MAC authentication to use the combined VLAN and MAC address information for user authentication to prevent network access from unauthorized VLANs.

• MAC move to allow hosts (including the hosts connected behind an IP phone) to move across ports within the same switch without any restrictions to enable mobility. With MAC move, the switch treats the reappearance of the same MAC address on another port in the same way as a completely new MAC address.

• Support for 3DES and AES with version 3 of the Simple Network Management Protocol (SNMPv3). This release adds support for the 168-bit Triple Data Encryption Standard (3DES) and the 128-bit, 192-bit, and 256-bit Advanced Encryption Standard (AES) encryption algorithms to SNMPv3.

• Support for Cisco TrustSec SXP protocol. This feature is not supported on LanLite images.
CHAPTER 41

Preventing Unauthorized Access

- Finding Feature Information, on page 825
- Preventing Unauthorized Access, on page 825

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Preventing Unauthorized Access

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.

- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

- If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.
• You can also enable the login enhancements feature, which logs both failed and unsuccessful login attempts. Login enhancements can also be configured to block future login attempts after a set number of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements documentation.
CHAPTER 42

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Controlling Switch Access with Passwords and Privileges

The following are the restrictions for controlling switch access with passwords and privileges:

- Disabling password recovery will not work if you have set the switch to boot up manually by using the boot manual global configuration command. This command produces the boot loader prompt (switch:) after the switch is power cycled.
Information About Passwords and Privilege Levels

Default Password and Privilege Level Configuration

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.</td>
</tr>
<tr>
<td>Line password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>

Additional Password Security

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the `enable password` or `enable secret` global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the `enable secret` command because it uses an improved encryption algorithm.

If you configure the `enable secret` command, it takes precedence over the `enable password` command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.
If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the `service password-recovery` global configuration command.

Terminal Line Telnet Configuration

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line.

Username and Password Pairs

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

Privilege Levels

Cisco devices use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privilege levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

Privilege Levels on Lines

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the `clear line` command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the `configure` command, you can assign it level 3 security and distribute that password to a more restricted group of users.

Command Privilege Levels

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the `show ip traffic` command to level 15, the `show` commands and `show ip` commands are automatically set to privilege level 15 unless you set them individually to different levels.
How to Control Switch Access with Passwords and Privilege Levels

Setting or Changing a Static Enable Password

The enable password controls access to the privileged EXEC mode. Follow these steps to set or change a static enable password:

SUMMARY STEPS

1. enable
2. configure terminal
3. enable password password
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> enable password password</td>
<td>Defines a new password or changes an existing password for access to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# enable password secret321</td>
<td>By default, no password is defined.</td>
</tr>
<tr>
<td>For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this:</td>
<td></td>
</tr>
<tr>
<td>1. Enter abc.</td>
<td></td>
</tr>
<tr>
<td>2. Enter Ctrl-v.</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
3. Enter `?123`.  
When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter `abc?123` at the password prompt.
---

**Step 4**

**end**  
**Example:**  
Device(config)# end

**Step 5**

**show running-config**  
**Example:**  
Device# show running-config

**Step 6**

**copy running-config startup-config**  
**Example:**  
Device# copy running-config startup-config

---

### Protecting Enable and Enable Secret Passwords with Encryption

Follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. Use one of the following:
   - `enable password [level level] {password encryption-type encrypted-password}`
   - `enable secret [level level] {password encryption-type encrypted-password}`
4. service password-encryption
5. end
6. show running-config
7. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:**                  | |
| Device# configure terminal    | |

| **Step 3** Use one of the following: | • Defines a new password or changes an existing password for access to privileged EXEC mode. |
| • enable password [level level] {password encryption-type encrypted-password} | • Defines a secret password, which is saved using a nonreversible encryption method. |
| • enable secret [level level] {password encryption-type encrypted-password} | • (Optional) For level, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges). |
| **Example:**                   | • For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined. |
| Device(config)# enable password example102 | • (Optional) For encryption-type, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password that you copy from another switch configuration. |
| or                            | Note If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method. |
| Device(config)# enable secret level 1 password secret123sample | |

| **Step 4** service password-encryption | (Optional) Encrypts the password when the password is defined or when the configuration is written. |
| **Example:**                           | Encryption prevents the password from being readable in the configuration file. |
| Device(config)# service password-encryption | |
### Disabling Password Recovery

Follow these steps to disable password recovery to protect the security of your switch:

**Before you begin**

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. system disable password recovery switch \{all\} \(<1-9>\)\}
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example: Device# show running-config</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 2**

`configure terminal`

**Example:**

Device# configure terminal

**Purpose**

Enters global configuration mode.

**Step 3**

`system disable password recovery switch {all | <1-9>}`

**Example:**

Device(config)# system disable password recovery switch all

**Purpose**

Disables password recovery.

- **all** - Sets the configuration on switches in stack.
- **<1-9>** - Sets the configuration on the Switch Number selected.

This setting is saved in an area of the flash memory that is accessible by the boot loader and the Cisco IOS image, but it is not part of the file system and is not accessible by any user.

**Step 4**

`end`

**Example:**

Device(config)# end

**Purpose**

Returns to privileged EXEC mode.

---

### What to do next

To remove `disable password recovery`, use the `no system disable password recovery switch all` global configuration command.

### Setting a Telnet Password for a Terminal Line

Beginning in user EXEC mode, follow these steps to set a Telnet password for the connected terminal line:

**Before you begin**

- Attach a PC or workstation with emulation software to the switch console port, or attach a PC to the Ethernet management port.
- The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. line vty 0 15
4. password *password*
5. end
6. show running-config
7. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>If a password is required for access to privileged EXEC mode, you will be prompted for it.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Enters privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Enters global configuration mode. |
| **Example:** | |
| configure terminal | Device# configure terminal |

| **Step 3** | Configures the number of Telnet sessions (lines), and enters line configuration mode. |
| **Example:** | There are 16 possible sessions on a command-capable Device. The 0 and 15 mean that you are configuring all 16 possible Telnet sessions. |
| line vty 0 15 | |
| Device(config)# line vty 0 15 |

| **Step 4** | Sets a Telnet password for the line or lines. |
| **Example:** | For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined. |
| password password | |
| Device(config-line)# password abcxyz543 |

| **Step 5** | Returns to privileged EXEC mode. |
| **Example:** | |
| end | |
| Device(config-line)# end |

| **Step 6** | Verifies your entries. |
| **Example:** | |
| show running-config | |
| Device# show running-config |

| **Step 7** | (Optional) Saves your entries in the configuration file. |
| **Example:** | |
| copy running-config startup-config | |
| Device# copy running-config startup-config |

### Configuring Username and Password Pairs
Follow these steps to configure username and password pairs:
### SUMMARY STEPS

1. enable
2. configure terminal
3. `username name [privilege level] {password encryption-type password}`
4. Use one of the following:
   - `line console 0`
   - `line vty 0 15`
5. login local
6. end
7. show running-config
8. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
| ```                                  
Device> enable                          ```                               |
| **Step 2** configure terminal                                                    | Enters global configuration mode.                                       |
| Example:                                                                         |                                                                         |
| ```                                  
Device# configure terminal             ```                               |
| **Step 3** `username name [privilege level] {password encryption-type password}` | Sets the username, privilege level, and password for each user.         |
| Example:                                                                         | • For `name`, specify the user ID as one word or the MAC address. Spaces and quotation marks are not allowed. |
| ```                                  
Device(config)# username adamsample privilege 1 password secret456                ```                               |
| • You can configure a maximum of 12000 clients each, for both username and MAC filter. |
| ```                                  
Device(config)# username 111111111111 mac attribute                              ```                               |
| • (Optional) For `level`, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access. |
| • For `encryption-type`, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow. |
| • For `password`, specify the password the user must enter to gain access to the Device. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the `username` command. |
### Purpose

- **Command or Action**: Use one of the following:
  - line console 0
  - line vty 0 15

- **Example**:
  - Device(config)# line console 0
  - or
  - Device(config)# line vty 15

- **Purpose**: Enters line configuration mode, and configures the console port (line 0) or the VTY lines (line 0 to 15).

- **Command or Action**: login local

- **Example**:
  - Device(config-line)# login local

- **Purpose**: Enables local password checking at login time. Authentication is based on the username specified in Step 3.

- **Command or Action**: end

- **Example**:
  - Device(config)# end

- **Purpose**: Returns to privileged EXEC mode.

- **Command or Action**: show running-config

- **Example**:
  - Device# show running-config

- **Purpose**: Verifies your entries.

- **Command or Action**: copy running-config startup-config

- **Example**:
  - Device# copy running-config startup-config

- **Purpose**: (Optional) Saves your entries in the configuration file.

---

### Setting the Privilege Level for a Command

Follow these steps to set the privilege level for a command:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. privilege mode level level command
4. enable password level level password
5. end
6. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**                                 | Enters global configuration mode.                                      |
| Example:                                   |                                                                         |
| Device# configure terminal                 |                                                                         |

| **Step 3**                                 | Sets the privilege level for a command.                                |
| Example:                                   | • For **mode**, enter **configure** for global configuration mode, **exec** for EXEC mode, **interface** for interface configuration mode, or **line** for line configuration mode. |
| Device(config)# privilege exec level 14 configure | • For **level**, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the **enable** password. |
|                                           | • For **command**, specify the command to which you want to restrict access. |

| **Step 4**                                 | Specifies the password to enable the privilege level.                  |
| Example:                                   | • For **level**, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. |
| Device(config)# enable password level 14 SecretPswd14 | • For **password**, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined. |

| **Step 5**                                 | Returns to privileged EXEC mode.                                       |
| Example:                                   |                                                                         |
| Device(config)# end                         |                                                                         |

| **Step 6**                                 | (Optional) Saves your entries in the configuration file.               |
| Example:                                   |                                                                         |
| Device# copy running-config startup-config |                                                                         |
Changing the Default Privilege Level for Lines

Follow these steps to change the default privilege level for the specified line:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. line vty line
4. privilege level level
5. end
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable         | Enables privileged EXEC mode.  
| Example: Device> enable   | • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal |
| **Step 3** line vty line  | Selects the virtual terminal line on which to restrict access. |
| Example: Device(config)# line vty 10 |
| **Step 4** privilege level level | Changes the default privilege level for the line.  
| Example: Device(config)# privilege level 15 |
| **Step 5** end            | Returns to privileged EXEC mode. |
| Example: Device(config)# end |
| **Step 6** copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: Device(config)# copy running-config startup-config |
What to do next

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

Logging into and Exiting a Privilege Level

Beginning in user EXEC mode, follow these steps to log into a specified privilege level and exit a specified privilege level.

**SUMMARY STEPS**

1. `enable level`
2. `disable level`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device# copy running-config startup-config</code></td>
<td>Logs in to a specified privilege level. Following the example, Level 15 is privileged EXEC mode. For <code>level</code>, the range is 0 to 15.</td>
</tr>
<tr>
<td><code>Device&gt; enable 15</code></td>
<td>Exits to a specified privilege level. Following the example, Level 1 is user EXEC mode. For <code>level</code>, the range is 0 to 15.</td>
</tr>
</tbody>
</table>

Monitoring Switch Access

**Table 97: Commands for Displaying DHCP Information**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show privilege</code></td>
<td>Displays the privilege level configuration.</td>
</tr>

</table>
Configuration Examples for Setting Passwords and Privilege Levels

Example: Setting or Changing a Static Enable Password

This example shows how to change the enable password to l1u2c3k4y5. The password is not encrypted and provides access to level 15 (traditional privileged EXEC mode access):

```
Device(config)# enable password l1u2c3k4y5
```

Example: Protecting Enable and Enable Secret Passwords with Encryption

This example shows how to configure the encrypted password $1$FaD0$Xyti5Rkls3LoyxzS8 for privilege level 2:

```
Device(config)# enable secret level 2 5 $1$FaD0$Xyti5Rkls3LoyxzS8
```

Example: Setting a Telnet Password for a Terminal Line

This example shows how to set the Telnet password to let45me67in89:

```
Device(config)# line vty 10
Device(config-line)# password let45me67in89
```

Example: Setting the Privilege Level for a Command

This example shows how to set the configure command to privilege level 14 and define SecretPswd14 as the password users must enter to use level 14 commands:

```
Device(config)# privilege exec level 14 configure
Device(config)# enable password level 14 SecretPswd14
```

CHAPTER 43

Configuring TACACS+

TACACS+ is a security application that provides centralized validation of users attempting to gain access to a router or network access server. TACACS+ provides detailed accounting information and flexible administrative control over authentication and authorization processes. TACACS+ is facilitated through authentication, authorization and accounting (AAA) and can be enabled only through AAA commands.

- Prerequisites for TACACS+, on page 843
- Restrictions for TACACS+, on page 844
- Information About TACACS+, on page 845
- How to Configure TACACS+, on page 869
- Configuration Examples for TACACS+, on page 880
- Additional References for TACACS+, on page 884
- Feature Information for TACACS+, on page 884

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for TACACS+

The following are the prerequisites for set up and configuration of switch access with TACACS+ (must be performed in the order presented):

1. Configure the switches with the TACACS+ server addresses.
2. Set an authentication key.
3. Configure the key from Step 2 on the TACACS+ servers.
4. Enable authentication, authorization, and accounting (AAA).
5. Create a login authentication method list.

6. Apply the list to the terminal lines.

7. Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:

- You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.

- We recommend a redundant connection between a switch stack and the TACACS+ server. This is to help ensure that the TACACS+ server remains accessible in case one of the connected stack members is removed from the switch stack.

- You need a system running the TACACS+ daemon software to use TACACS+ on your switch.

- To use TACACS+, it must be enabled.

- Authorization must be enabled on the switch to be used.

- Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

- To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the `aaa new-model` command.

- At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting.

- The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.

- Use the local database if authentication was not performed by using TACACS+.

---

**Restrictions for TACACS+**

TACACS+ can be enabled only through AAA commands.
Information About TACACS+

TACACS+ and Switch Access

This section describes TACACS+. TACACS+ provides detailed accounting information and flexible administrative control over the authentication and authorization processes. It is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

TACACS+ Overview

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—independently. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers.

Figure 78: Typical TACACS+ Network Configuration

TACACS+, administered through the AAA security services, can provide these services:

- Authentication—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.

The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name,
service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- Authorization—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- Accounting—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

**TACACS+ Operation**

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

   TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   - ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   - REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   - ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   - CONTINUE—The user is prompted for additional authentication information.

   After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
   - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
Method List

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

If a method list is configured under VTY lines, the corresponding method list must be added to AAA. The following example shows how to configure a method list under a VTY line:

```
Device# configure terminal
Device(config)# line vty 0 4
Device(config)# authorization commands 15 auth1
```

The following example shows how to configure a method list in AAA:

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authorization commands 15 auth1 group tacacs+
```

If no method list is configured under VTY lines, the default method list must be added to AAA. The following example shows a VTY configuration without a method list:

```
Device# configure terminal
Device(config)# line vty 0 4
```

The following example shows how to configure the default method list:

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authorization commands 15 default group tacacs+
```

TACACS AV Pairs

The network access server implements TACACS+ authorization and accounting functions by transmitting and receiving TACACS+ attribute-value (AV) pairs for each user session.

TACACS Authentication and Authorization AV Pairs

The following table lists and describes the supported TACACS+ authentication and authorization AV pairs and specifies the Cisco IOS release in which they are implemented.

<table>
<thead>
<tr>

</table>
### Attribute | Description | 11.0 | 11.1 | 11.2 | 11.3 | 12.0 | 12.1 | 12.2
--- | --- | --- | --- | --- | --- | --- | --- | ---
link-compression= | Defines whether to turn on or turn off "stac" compression over a PPP link. Used with service=ppp. Link compression is defined as a numeric value as follows:
- 0: None
- 1: Stac
- 2: Stac-Draft-9
- 3: MS-Stac | no | no | no | yes | yes | yes | yes
load-threshold=<n> | Sets the load threshold for the caller at which additional links are either added to or deleted from the multilink bundle. If the load goes above the specified value, additional links are added. If the load goes below the specified value, links are deleted. Used with service=ppp and protocol=multilink. The range for <n> is from 1 to 255. | no | no | no | yes | yes | yes | yes
map-class | Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out. Used with the service=outbound and protocol=ip. | no | no | no | no | no | yes | yes
max-links=<n> | Restricts the number of links that a user can have in a multilink bundle. Used with service=ppp and protocol=multilink. The range for <n> is from 1 to 255. | no | no | no | yes | yes | yes | yes
min-links | Sets the minimum number of links for MLP. Used with service=ppp and protocol=multilink, protocol=vpdn. | no | no | no | no | no | yes | yes
nas-password | Specifies the password for the network access server during the L2F tunnel authentication. Used with service=ppp and protocol=vpdn. | no | no | yes | yes | yes | yes | yes
nocallback-verify | Indicates that no callback verification is required. The only valid value for this parameter is 1 (for example, nocallback-verify=1). Used with service=arap, service=slip, service=ppp, service=shell. There is no authentication on callback. Not valid for ISDN. | no | yes | yes | yes | yes | yes | yes
noescape=x | Prevents user from using an escape character. Used with service=shell. Can be either true or false (for example, noescape=true). | yes | yes | yes | yes | yes | yes | yes
nohangup=x | Used with service=shell. Specifies the nohangup option, which means that after an EXEC shell is terminated, the user is presented with another login (username) prompt. Can be either true or false (for example, nohangup=false). | yes | yes | yes | yes | yes | yes | yes
old-prompts | Allows providers to make the prompts in TACACS+ appear identical to those of earlier systems (TACACS and Extended TACACS). This allows administrators to upgrade from TACACS or Extended TACACS to TACACS+ transparently to users. | yes | yes | yes | yes | yes | yes | yes

### Configuring AAA Server Group Selection Based on DNIS

Cisco software allows you to authenticate users to a particular AAA server group based on the Dialed Number Identification Service (DNIS) number of the session. Any phone line (a regular home phone or a commercial T1/PRI line) can be associated with several phone numbers. The DNIS number identifies the number that was called to reach you.

For example, suppose you want to share the same phone number with several customers, but you want to know which customer is calling before you pick up the phone. You can customize how you answer the phone because DNIS allows you to know which customer is calling when you answer.
Cisco devices with either ISDN or internal modems can receive the DNIS number. This functionality allows users to assign different TACACS+ server groups for different customers (that is, different TACACS+ servers for different DNIS numbers). Additionally, using server groups you can specify the same server group for AAA services or a separate server group for each AAA service.

Cisco IOS software provides the flexibility to implement authentication and accounting services in several ways:

- Globally--AAA services are defined using global configuration access list commands and applied in general to all interfaces on a specific network access server.

- Per interface--AAA services are defined using interface configuration commands and applied specifically to the interface being configured on a specific network access server.

- DNIS mapping--You can use DNIS to specify an AAA server to supply AAA services.

Because AAA configuration methods can be configured simultaneously, Cisco has established an order of precedence to determine which server or groups of servers provide AAA services. The order of precedence is as follows:

- Per DNIS--If you configure the network access server to use DNIS to identify which server group provides AAA services, then this method takes precedence over any additional AAA selection method.

- Per interface--If you configure the network access server per interface to use access lists to determine how a server provides AAA services, this method takes precedence over any global configuration AAA access lists.

- Globally--If you configure the network access server by using global AAA access lists to determine how the security server provides AAA services, this method has the lowest precedence.

Prior to configuring AAA Server Group Selection Based on DNIS, you must configure the remote security servers associated with each AAA server group. See Identifying the TACACS Server Host and Configuring AAA Server Groups for more information.

To configure the device to select a particular AAA server group based on the DNIS of the server group, configure DNIS mapping. To map a server group with a group name with DNIS number, use the following commands in global configuration mode:

**SUMMARY STEPS**

1. Device>enable
2. Device#configure terminal
3. Device (config)#aaa dnis map enable
4. Router(config)# aaa dnis map dnis-number authentication ppp group server-group-name
5. Router(config)# aaa dnis map dnis-number accounting network [none | start-stop | stop-only] group server-group-name
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** Device>enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Step 2** Device#configure terminal | Enters global configuration mode. |
| **Step 3** Device (config)#aaa dnis map enable | Enables DNIS mapping. |
| **Step 4** Router(config)# aaa dnis map dnis-number authentication ppp group server-group-name | Maps a DNIS number to a defined AAA server group; the servers in this server group are being used for authentication. |
| **Step 4** Router(config)# aaa dnis map dnis-number accounting network [none | start-stop | stop-only] group server-group-name | Maps a DNIS number to a defined AAA server group; the servers in this server group are being used for accounting. |

---

**TACACS+ Configuration Options**

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

**TACACS+ Login Authentication**

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**TACACS+ Authorization for Privileged EXEC Access and Network Services**

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

**TACACS+ Authentication**

After you have identified the TACACS+ daemon and defined an associated TACACS+ encryption key, you must define method lists for TACACS+ authentication. Because TACACS+ authentication is operated via AAA, you need to issue the **aaa authentication** command, specifying TACACS+ as the authentication method.
TACACS+ Authorization

AAA authorization enables you to set parameters that restrict a user’s access to the network. Authorization via TACACS+ may be applied to commands, network connections, and EXEC sessions. Because TACACS+ authorization is facilitated through AAA, you must issue the `aaa authorization` command, specifying TACACS+ as the authorization method.

TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

---

**Note**

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

Per VRF for TACACS Servers

The Per VRF for TACACS+ Servers feature allows per virtual routing and forwarding (VRF) AAA to be configured on TACACS+ servers. TACACS+ server access is required to configure this feature.

How to Configure TACACS+

Identifying the TACACS+ Server Host and Setting the Authentication Key

Follow these steps to identify the TACACS+ server host and set the authentication key:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `tacacs-server host hostname`
4. `aaa new-model`
5. `aaa group server tacacs+ group-name`
6. `server ip-address`
### Identifying the TACACS+ Server Host and Setting the Authentication Key

7. **end**
8. **show running-config**
9. **copy running-config startup-config**

### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
• Enter your password if prompted.  |
| | Example: Device> enable | |
| **Step 2** | configure terminal | Enters global configuration mode. |
| | Example: Device# configure terminal | |
| **Step 3** | tacacs-server host **hostname** | Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.  
For **hostname**, specify the name or IP address of the host. |
| | Example: Device(config)# tacacs-server host yourserver | |
| **Step 4** | aaa new-model | Enables AAA. |
| | Example: Device(config)# aaa new-model | |
| **Step 5** | aaa group server tacacs+ **group-name** | (Optional) Defines the AAA server-group with a group name.  
This command puts the Device in a server group subconfiguration mode. |
| | Example: Device(config)# aaa group server tacacs+ your_server_group | |
| **Step 6** | server **ip-address** | (Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.  
Each server in the group must be previously defined in Step 3. |
| | Example: Device(config)# server 10.1.2.3 | |
| **Step 7** | end | Returns to privileged EXEC mode. |
| | Example: Device(config)# end | |
### Configuring TACACS+ Login Authentication

Follow these steps to configure TACACS+ login authentication:

**Before you begin**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.

**Note**

To secure the HTTP access by using AAA methods, you must configure the with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the HTTP access by using AAA methods.

For more information about the `ip http authentication` command, see the *Cisco IOS Security Command Reference, Release 12.4*.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication login {default | list-name} method1 [method2...]
5. line [console | tty | vty] line-number [ending-line-number]
6. login authentication {default | list-name}
7. end
8. show running-config
9. copy running-config startup-config

#### DETAILED STEPS

<table>

## Configuring TACACS+ Login Authentication

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt;` enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt;` configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)&gt; aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Creates a login authentication method list.</td>
</tr>
<tr>
<td>aaa authentication login {default</td>
<td>list-name} method1 [method2...]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)&gt; aaa authentication login default tacacs+ local</td>
<td></td>
</tr>
</tbody>
</table>

Select one of these methods:

- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command.

- **group tacacs+**—Uses TACACS+ authentication. Before you can use this authentication method, you must configure the TACACS+ server.

- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the password password line configuration command.

- **local**—Use the local username database for authentication. You must enter username information in the database. Use the username password global configuration command.
### Command or Action

| Step | Command [console | tty | vty] line-number [ending-line-number] | Purpose |
|------|-------------------------------------------------|---------|
| 5    | line [console | tty | vty] line-number [ending-line-number] | **local-case**—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the **username name password** global configuration command.  
- **none**—Do not use any authentication for login.  
Enters line configuration mode, and configures the lines to which you want to apply the authentication list. |
| 6    | login authentication {default | list-name} | Applies the authentication list to a line or set of lines.  
- If you specify **default**, use the default list created with the **aaa authentication login** command.  
- For **list-name**, specify the list created with the **aaa authentication login** command. |
| 7    | end | Returns to privileged EXEC mode. |
| 8    | show running-config | Verifies your entries. |
| 9    | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

### Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

You can use the **aaa authorization** global configuration command with the **tacacs+** keyword to set parameters that restrict a user’s network access to privileged EXEC mode.
Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

SUMMARY STEPS

1. enable
2. configure terminal
3. aaa authorization network tacacs+
4. aaa authorization exec tacacs+
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa authorization network tacacs+</td>
<td>Configures the switch for user TACACS+ authorization for all network-related service requests.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# aaa authorization network tacacs+</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa authorization exec tacacs+</td>
<td>Configures the switch for user TACACS+ authorization if the user has privileged EXEC access.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# aaa authorization exec tacacs+</td>
<td>The exec keyword might return user profile information (such as autocmd information).</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>

### Starting TACACS+ Accounting

Follow these steps to start TACACS+ Accounting:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. aaa accounting network start-stop tacacs+
4. aaa accounting exec start-stop tacacs+
5. end
6. show running-config
7. copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable Example:</td>

<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa accounting network start-stop tacacs+ Example:</td>
<td>Enables TACACS+ accounting for all network-related service requests.</td>
</tr>
<tr>
<td>Device(config)# aaa accounting network start-stop</td>
<td></td>
</tr>
</tbody>
</table>
Establishing a Session with a Router if the AAA Server is Unreachable

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tacacs+</td>
<td>Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
</tbody>
</table>

**Step 4** aaa accounting exec start-stop tacacs+

Example:

```
Device(config)# aaa accounting exec start-stop tacacs+
```

**Step 5** end

Example:

```
Device(config)# end
```

**Step 6** show running-config

Example:

```
Device# show running-config
```

**Step 7** copy running-config startup-config

Example:

```
Device# copy running-config startup-config
```

What to do next

To establish a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

Establishing a Session with a Router if the AAA Server is Unreachable

To establishing a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.
Establishing a Session with a Router if the AAA Server is Unreachable

The `aaa accounting system guarantee-first` command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

Configuring Per VRF on a TACACS Server

The initial steps in this procedure are used to configure AAA and a server group, create a VRF routing table, and configure an interface. Steps 10 through 13 are used to configure the per VRF on a TACACS+ server feature:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip vrf vrf-name`
4. `rd route-distinguisher`
5. `exit`
6. `interface interface-name`
7. `ip vrf forwarding vrf-name`
8. `ip address ip-address mask [secondary]`
9. `exit`
10. `aaa group server tacacs+ group-name`
11. `server-private {ip-address | name} [nat] [single-connection] [port port-number] [timeout seconds] [key [0 | 7] string]`
12. `ip vrf forwarding vrf-name`
13. `ip tacacs source-interface subinterface-name`
14. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures a VRF table and enters VRF configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device(config)# ip vrf cisco</td>
<td>Creates routing and forwarding tables for a VRF instance.</td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>rd route-distinguisher</td>
<td>Exits VRF configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-vrf)# rd 100:1
```

**Step 5**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td>Configures an interface and enters interface configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-vrf)# exit
```

**Step 6**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-name</td>
<td>Configures a VRF for the interface.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config)# interface Loopback0
```

**Step 7**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip vrf forwarding vrf-name</td>
<td>Sets a primary or secondary IP address for an interface.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-if)# ip vrf forwarding cisco
```

**Step 8**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip address ip-address mask [secondary]</td>
<td>Exits interface configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-if)# ip address 10.0.0.2 255.0.0.0
```

**Step 9**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td>Configures the VRF reference of a AAA TACACS+ server group.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-if)# exit
```

**Step 10**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa group server tacacs+ group-name</td>
<td>Creates the IP address of the private TACACS+ server for the group server.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config)# aaa group server tacacs+ tacacs1
```

**Step 11**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>server-private {ip-address</td>
<td>name} [nat] [single-connection] [port port-number] [timeout seconds] [key [0</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-sg-tacacs+)# server-private 10.1.1.1 port 19 key cisco
```

**Step 12**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip vrf forwarding vrf-name</td>
<td>Groups different TACACS+ server hosts into distinct lists and distinct methods and enters server-group configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config)# ip vrf forwarding cisco
```
Verifying Per VRF for TACACS Servers

To verify the per VRF TACACS+ configuration, perform the following steps:

Note: The `debug` commands may be used in any order.

**SUMMARY STEPS**

1. `enable`
2. `debug tacacs authentication`
3. `debug tacacs authorization`
4. `debug tacacs accounting`
5. `debug tacacs packets`

### Configuration Examples for TACACS+

#### Example: TACACS Authorization

The following example shows how to configure TACACS+ as the security protocol for PPP authentication using the default method list; it also shows how to configure network authorization via TACACS+:

```console
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
aaa authorization network default group tacacs+
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.

- The **aaa authentication** command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword **default** means that PPP authentication is applied by default to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
The **aaa authorization** command configures network authorization via TACACS+. Unlike authentication lists, this authorization list always applies to all incoming network connections made to the network access server.

The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”

The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.

### Example: TACACS Accounting

The following example shows how to configure TACACS+ as the security protocol for PPP authentication using the default method list; it also shows how to configure accounting via TACACS+:

```
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
aaa accounting network default stop-only group tacacs+
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.
- The **aaa authentication** command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword **default** means that PPP authentication is applied by default to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.
- The **aaa accounting** command configures network accounting via TACACS+. In this example, accounting records describing the session that just terminated will be sent to the TACACS+ daemon whenever a network connection terminates.
- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”
- The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.

### Example: TACACS Authentication

The following example shows how to configure TACACS+ as the security protocol for PPP authentication:

```
aaa new-model
aaa authentication ppp test group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
```
interface serial 0
  ppp authentication chap pap test

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.

- The **aaa authentication** command defines a method list, “test,” to be used on serial interfaces running PPP. The keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.

- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”

- The **interface** command selects the line, and the **ppp authentication** command applies the test method list to this line.

The following example shows how to configure TACACS+ as the security protocol for PPP authentication, but instead of the “test” method list, the “default” method list is used.

```
aaa new-model
aaa authentication ppp default if-needed group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication chap default
```

The lines in the preceding sample configuration are defined as follows:

- The **aaa new-model** command enables the AAA security services.

- The **aaa authentication** command defines a method list, “default,” to be used on serial interfaces running PPP. The keyword **default** means that PPP authentication is applied by default to all interfaces. The **if-needed** keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword **group tacacs+** means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword **local** indicates that authentication will be attempted using the local database on the network access server.

- The **tacacs-server host** command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The **tacacs-server key** command defines the shared encryption key to be “goaway.”

- The **interface** command selects the line, and the **ppp authentication** command applies the default method list to this line.

The following example shows how to create the same authentication algorithm for PAP, but it calls the method list “MIS-access” instead of “default”:

```
aaa new-model
aaa authentication pap MIS-access if-needed group tacacs+ local
tacacs-server host 10.1.2.3
tacacs-server key goaway
interface serial 0
  ppp authentication pap MIS-access
```
The lines in the preceding sample configuration are defined as follows:

- The `aaa new-model` command enables the AAA security services.
- The `aaa authentication` command defines a method list, “MIS-access,” to be used on serial interfaces running PPP. The method list, “MIS-access,” means that PPP authentication is applied to all interfaces. The `if-needed` keyword means that if the user has already authenticated by going through the ASCII login procedure, then PPP authentication is not necessary and can be skipped. If authentication is needed, the keyword `group tacacs+` means that authentication will be done through TACACS+. If TACACS+ returns an ERROR of some sort during authentication, the keyword `local` indicates that authentication will be attempted using the local database on the network access server.
- The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.1.2.3. The `tacacs-server key` command defines the shared encryption key to be “goaway.”
- The `interface` command selects the line, and the `ppp authentication` command applies the default method list to this line.

The following example shows the configuration for a TACACS+ daemon with an IP address of 10.2.3.4 and an encryption key of “apple”:

```
aaa new-model
aaa authentication login default group tacacs+ local
tacacs-server host 10.2.3.4
tacacs-server key apple
```

The lines in the preceding sample configuration are defined as follows:

- The `aaa new-model` command enables the AAA security services.
- The `aaa authentication` command defines the default method list. Incoming ASCII logins on all interfaces (by default) will use TACACS+ for authentication. If no TACACS+ server responds, then the network access server will use the information contained in the local username database for authentication.
- The `tacacs-server host` command identifies the TACACS+ daemon as having an IP address of 10.2.3.4. The `tacacs-server key` command defines the shared encryption key to be “apple.”

**Example: Configuring Per VRF for TACACS Servers**

The following output example shows that the group server `tacacs1` is configured for per VRF AAA services:

```
aaa group server tacacs+ tacacs1
  server-private 10.1.1.1 port 19 key cisco
  ip vrf forwarding cisco
  ip tacacs source-interface Loopback0
  ip vrf cisco
  rd 100:1
  interface Loopback0
  ip address 10.0.0.2 255.0.0.0
  ip vrf forwarding cisco
```

**Example: Configuring Per VRF for TACACS Servers**

The following output example shows that the group server `tacacs1` is configured for per VRF AAA services:

CHAPTER 44

Configuring RADIUS

The RADIUS security system is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco devices and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

- Finding Feature Information, on page 887
- Prerequisites for Configuring RADIUS, on page 887
- Restrictions for Configuring RADIUS, on page 888
- Information about RADIUS, on page 888
- How to Configure RADIUS, on page 908
- Configuration Examples for RADIUS, on page 923
- Additional References for RADIUS, on page 926
- Feature Information for RADIUS, on page 927

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring RADIUS

This section lists the prerequisites for controlling Device access with RADIUS.

General:

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.

- RADIUS is facilitated through AAA and can be enabled only through AAA commands.

- Use the **aaa new-model** global configuration command to enable AAA.
• Use the `aaa authentication` global configuration command to define method lists for RADIUS authentication.

• Use `line` and `interface` commands to enable the defined method lists to be used.

• At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.

• You should have access to and should configure a RADIUS server before configuring RADIUS features on your Device.

• The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

• To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

For RADIUS operation:

• Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

### Restrictions for Configuring RADIUS

This topic covers restrictions for controlling Device access with RADIUS.

**General:**

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

• Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.

• Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.

• Networks using a variety of services. RADIUS generally binds a user to one service model.

### Information about RADIUS

#### RADIUS and Switch Access

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.
RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

• Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

• Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validates users and to grant access to network resources.

• Networks already using RADIUS. You can add a Cisco Device containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.

• Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, “Configuring IEEE 802.1x Port-Based Authentication.”

• Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

Figure 79: Transitioning from RADIUS to TACACS+ Services

RADIUS Operation

When a user attempts to log in and authenticate to a Device that is access controlled by a RADIUS server, these events occur:
1. The user is prompted to enter a username and password.

2. The username and encrypted password are sent over the network to the RADIUS server.

3. The user receives one of the following responses from the RADIUS server:
   - ACCEPT—The user is authenticated.
   - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   - CHALLENGE—A challenge requires additional data from the user.
   - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

### Default RADIUS Configuration

RADIUS and AAA are disabled by default. To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

### RADIUS Server Host

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS_DEAD message appears,
and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

### RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

### AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order in which they are configured.)

### AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.
RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

```
protocol : attribute sep value *
```

**Protocol** is a value of the Cisco protocol attribute for a particular type of authorization. **Attribute** and **value** are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and **sep** is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco’s “multiple named IP address pools” feature to be activated during IP authorization (during PPP’s Internet Protocol Control Protocol (IPCP) address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an “*”, the AV pair “ip:addr-pool=first” becomes optional. Note that any AV pair can be made optional:

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)
  - Vendor-Id
  - Vendor-Type
  - Vendor-Length
  - Vendor-Data
The figure below shows the packet format for a VSA encapsulated “behind” attribute 26.

Figure 80: VSA Encapsulated Behind Attribute 26

It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor’s definition of that attribute.

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).

**Table 102: Vendor-Specific Attributes Table Field Descriptions**

<table>

### Store and Forward Fax Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>3</td>
<td>Fax-Account-Id-Origin</td>
<td>Indicates the account ID origin as defined by the system administrator for the <code>mnoip aaa receive-id</code> or the <code>mnoip aaa send-id</code> commands.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>4</td>
<td>Fax-Msg-Id=</td>
<td>Indicates a unique fax message identification number assigned by Store and Forward Fax.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>5</td>
<td>Fax-Pages</td>
<td>Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>-----------------</td>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>6</td>
<td>Fax-Coverpage-Flag</td>
<td>Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>7</td>
<td>Fax-Modem-Time</td>
<td>Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>8</td>
<td>Fax-Connect-Speed</td>
<td>Indicates the modem speed at which this fax-mail was initially transmitted or received. Possible values are 1200, 4800, 9600, and 14400.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>9</td>
<td>Fax-Recipient-Count</td>
<td>Indicates the number of recipients for this fax transmission. Until e-mail servers support Session mode, the number should be 1.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>10</td>
<td>Fax-Process-Abort-Flag</td>
<td>Indicates that the fax session was aborted or successful. True means that the session was aborted; false means that the session was successful.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>11</td>
<td>Fax-Dsn-Address</td>
<td>Indicates the address to which DSNs will be sent.</td>
</tr>
<tr>
<td>Number</td>

<td>9</td>
<td>12</td>
<td>Fax-Dsn-Flag</td>
<td>Indicates whether or not DSN has been enabled. True indicates that DSN has been enabled; false means that DSN has not been enabled.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>13</td>
<td>Fax-Mdn-Address</td>
<td>Indicates the address to which MDNs will be sent.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>14</td>
<td>Fax-Mdn-Flag</td>
<td>Indicates whether or not message delivery notification (MDN) has been enabled. True indicates that MDN had been enabled; false means that MDN had not been enabled.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>15</td>
<td>Fax-Auth-Status</td>
<td>Indicates whether or not authentication for this fax session was successful. Possible values for this field are success, failed, bypassed, or unknown.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>16</td>
<td>Email-Server-Address</td>
<td>Indicates the IP address of the e-mail server handling the on-ramp fax-mail message.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>17</td>
<td>Email-Server-Ack-Flag</td>
<td>Indicates that the on-ramp gateway has received a positive acknowledgment from the e-mail server accepting the fax-mail message.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>18</td>
<td>Gateway-Id</td>
<td>Indicates the name of the gateway that processed the fax session. The name appears in the following format: hostname.domain-name.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>19</td>
<td>Call-Type</td>
<td>Describes the type of fax activity: fax receive or fax send.</td>
</tr>
<tr>
<td>Number</td>
<td>Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>--------------</td>
<td>-----------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>20</td>
<td>Port-Used</td>
<td>Indicates the slot/port number of the Cisco AS5300 used to either transmit or receive this fax-mail.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>21</td>
<td>Abort-Cause</td>
<td>If the fax session aborts, indicates the system component that signaled the abort. Examples of system components that could trigger an abort are FAP (Fax Application Process), TIFF (the TIFF reader or the TIFF writer), fax-mail client, fax-mail server, ESMTP client, or ESMTP server.</td>
</tr>
</tbody>
</table>

**H323 Attributes**

<table>
<thead>
<tr>
<th>Number</th>
<th>Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>23</td>
<td>Remote-Gateway-ID (h323-remote-address)</td>
<td>Indicates the IP address of the remote gateway.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>24</td>
<td>Connection-ID (h323-conf-id)</td>
<td>Identifies the conference ID.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>25</td>
<td>Setup-Time (h323-setup-time)</td>
<td>Indicates the setup time for this connection in Coordinated Universal Time (UTC) formerly known as Greenwich Mean Time (GMT) and Zulu time.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>26</td>
<td>Call-Origin (h323-call-origin)</td>
<td>Indicates the origin of the call relative to the gateway. Possible values are originating and terminating (answer).</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>27</td>
<td>Call-Type (h323-call-type)</td>
<td>Indicates call leg type. Possible values are telephony and VoIP.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>28</td>
<td>Connect-Time (h323-connect-time)</td>
<td>Indicates the connection time for this call leg in UTC.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------</td>
<td>----------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>29</td>
<td>Disconnect-Time (h323-disconnect-time)</td>
<td>Indicates the time this call leg was disconnected in UTC.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>30</td>
<td>Disconnect-Cause (h323-disconnect-cause)</td>
<td>Specifies the reason a connection was taken offline per Q.931 specification.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>31</td>
<td>Voice-Quality (h323-voice-quality)</td>
<td>Specifies the impairment factor (ICPIF) affecting voice quality for a call.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>33</td>
<td>Gateway-ID (h323-gw-id)</td>
<td>Indicates the name of the underlying gateway.</td>
</tr>
</tbody>
</table>

**Large Scale Dialout Attributes**

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>callback-dialstring</td>
<td>Defines a dialing string to be used for callback.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>data-service</td>
<td>No description available.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>dial-number</td>
<td>Defines the number to dial.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>force-56</td>
<td>Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>map-class</td>
<td>Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-auth</td>
<td>Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.</td>
</tr>
<tr>
<td>Number</td>
<td>Vendor-Specific Company Code</td>
<td>Sub-Type Number</td>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>------------------------------</td>
<td>-----------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-name</td>
<td>PPP name authentication. To apply for PAP, do not configure the <code>ppp pap send-name password</code> command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.</td>
</tr>
</tbody>
</table>

**Note** The `send-name` attribute has changed over time: Initially, it performed the functions now provided by both the `send-name` and `remote-name` attributes. Because the `remote-name` attribute has been added, the `send-name` attribute is restricted to its current behavior.
### Vendor-Specific RADIUS Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>send-secret</td>
<td>PPP password authentication. The vendor-specific attributes (VSAs) “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both “preauth:send-name” and “preauth:send-secret” will be used in the response packet.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>remote-name</td>
<td>Provides the name of the remote host for use in large-scale dial-out. Dialer checks that the large-scale dial-out remote name matches the authenticated name, to protect against accidental user RADIUS misconfiguration. (For example, dialing a valid phone number but connecting to the wrong device.)</td>
</tr>
</tbody>
</table>

**Miscellaneous Attributes**
## Vendor-Specific RADIUS Attributes

<table>
<thead>
<tr>
<th>Number</th>
<th>Vendor-Specific Company Code</th>
<th>Sub-Type Number</th>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>26</td>
<td>9</td>
<td>2</td>
<td>Cisco-NAS-Port</td>
<td>Specifies additional vendor specific attribute (VSA) information for NAS-Port accounting. To specify additional NAS-Port information in the form an Attribute-Value Pair (AVPair) string, use the <code>radius-server vsa send</code> global configuration command. <strong>Note</strong> This VSA is typically used in Accounting, but may also be used in Authentication (Access-Request) packets.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>min-links</td>
<td>Sets the minimum number of links for MLP.</td>
</tr>
<tr>
<td>26</td>
<td>9</td>
<td>1</td>
<td>proxyacl#&lt;n&gt;</td>
<td>Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces.</td>
</tr>
</tbody>
</table>
Carries the authentication information needed by the home agent to authenticate a mobile node during registration. The information is in the same syntax as the `ip mobile secure host <addr>` configuration command. Basically it contains the rest of the configuration command that follows that string, verbatim. It provides the Security Parameter Index (SPI), key, authentication algorithm, authentication mode, and replay protection timestamp range.

**RADIUS Disconnect-Cause Attribute Values**

Disconnect-cause attribute values specify the reason a connection was taken offline. The attribute values are sent in Accounting request packets. These values are sent at the end of a session, even if the session fails to be authenticated. If the session is not authenticated, the attribute can cause stop records to be generated without first generating start records.

The table below lists the cause codes, values, and descriptions for the Disconnect-Cause (195) attribute.

<table>
<thead>
<tr>
<th>Cause Code</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No-Reason</td>
<td>No reason is given for the disconnect.</td>
</tr>
<tr>
<td>1</td>
<td>No-Disconnect</td>
<td>The event was not disconnected.</td>
</tr>
<tr>
<td>2</td>
<td>Unknown</td>
<td>Reason unknown.</td>
</tr>
<tr>
<td>3</td>
<td>Call-Disconnect</td>
<td>The call has been disconnected.</td>
</tr>
<tr>
<td>4</td>
<td>CLID-Authentication-Failure</td>
<td>Failure to authenticate number of the calling-party.</td>
</tr>
</tbody>
</table>

Note: The Disconnect-Cause is incremented by 1000 when it is used in RADIUS AVPairs; for example, disc-cause 4 becomes 1004.
<table>
<thead>
<tr>
<th>Cause Code</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>No-Modem-Available</td>
<td>A modem is not available to connect the call.</td>
</tr>
<tr>
<td>10</td>
<td>No-Carrier</td>
<td>No carrier detected.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> Codes 10, 11, and 12 can be sent if there is a disconnection during initial modem connection.</td>

<td>Local-Hangup</td>
<td>Disconnected by local hangup.</td>
</tr>
<tr>
<td>185</td>
<td>Remote-Hangup</td>
<td>Disconnected by remote end hangup.</td>
</tr>
<tr>
<td>190</td>
<td>T1-Quiesced</td>
<td>Disconnected because T1 line was quiesced.</td>
</tr>
<tr>
<td>195</td>
<td>Call-Duration</td>
<td>Disconnected because the maximum duration of the call was exceeded.</td>
</tr>
<tr>
<td>600</td>
<td>VPN-User-Disconnect</td>
<td>Call disconnected by client (through PPP). Codes are set if the LNS receives a PPP terminate request from the client.</td>
</tr>
<tr>
<td>601</td>
<td>VPN-Carrier-Loss</td>
<td>Loss of carrier. This can be the result of a physical line going dead.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Code is sent when a client is unable to dial out using a dialer.</td>
</tr>
<tr>
<td>602</td>
<td>VPN-No-Resources</td>
<td>No resources available to handle the call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Code is sent when the client is unable to allocate memory (running low on memory).</td>
</tr>
<tr>
<td>603</td>
<td>VPN-Bad-Control-Packet</td>
<td>Bad L2TP or L2F control packets.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This code is sent when an invalid control packet, such as missing mandatory Attribute-Value pairs (AVP), from the peer is received. When using L2TP, the code will be sent after six retransmits; when using L2F, the number of retransmit is user configurable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> VPN-Tunnel-Shut will be sent if there are active sessions in the tunnel.</td>
</tr>
<tr>
<td>604</td>
<td>VPN-Admin-Disconnect</td>
<td>Administrative disconnect. This can be the result of a VPN soft shutdown, which is when a client reaches maximum session limit or exceeds maximum hopcount. Code is sent when a tunnel is brought down by issuing the <code>clear vpdn tunnel</code> command.</td>
</tr>
<tr>
<td>605</td>
<td>VPN-Tunnel-Shut</td>
<td>Tunnel teardown or tunnel setup has failed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Code is sent when there are active sessions in a tunnel and the tunnel goes down.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> This code is not sent when tunnel authentication fails.</td>
</tr>
<tr>
<td>606</td>
<td>VPN-Local-Disconnect</td>
<td>Call is disconnected by LNS PPP module.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Code is sent when the LNS sends a PPP terminate request to the client. It indicates a normal PPP disconnection initiated by the LNS.</td>
</tr>
<tr>
<td>607</td>
<td>VPN-Session-Limit</td>
<td>VPN soft shutdown is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Code is sent when a call has been refused due to any of the soft shutdown restrictions previously mentioned.</td>
</tr>
<tr>
<td>608</td>
<td>VPN-Call-Redirect</td>
<td>VPN call redirect is enabled.</td>
</tr>
</tbody>
</table>
RADIUS Progress Codes

The RADIUS Progress Codes feature adds additional progress codes to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates a connection state before a call is disconnected through progress codes.

Attribute 196 is sent in network, exec, and resource accounting “start” and “stop” records. This attribute can facilitate call failure debugging because each progress code identifies accounting information relevant to the connection state of a call. The attribute is activated by default; when an accounting “start” or “stop” accounting record is requested, authentication, authorization, and accounting (AAA) adds attribute 196 into the record as part of the standard attribute list. Attribute 196 is valuable because the progress codes, which are sent in accounting “start” and “stop” records, facilitate the debugging of call failures.

In accounting “start” records, attribute 196 does not have a value.

Table 105: Newly Supported Progress Codes for Attribute 196

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Modem allocation and negotiation is complete; the call is up.</td>
</tr>
<tr>
<td>30</td>
<td>The modem is up.</td>
</tr>
<tr>
<td>33</td>
<td>The modem is waiting for result codes.</td>
</tr>
<tr>
<td>41</td>
<td>The max TNT is establishing the TCP connection by setting up a TCP clear call.</td>
</tr>
<tr>
<td>60</td>
<td>Link control protocol (LCP) is the open state with PPP and IP Control Protocol (IPCP) negotiation; the LAN session is up.</td>
</tr>
<tr>
<td>65</td>
<td>PPP negotiation occurs and, initially, the LCP negotiation occurs; LCP is in the open state.</td>
</tr>
<tr>
<td>67</td>
<td>After PPP negotiation with LCP in the open state occurs, IPCP negotiation begins.</td>
</tr>
</tbody>
</table>

Note

Progress codes 33, 30, and 67 are generated and seen through debugs on the NAS; all other codes are generated and seen through debugs and the accounting record on the RADIUS server.

Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius server` global configuration commands.
Enhanced Test Command

The Enhanced Test Command feature allows a named user profile to be created with calling line ID (CLID) or dialed number identification service (DNIS) attribute values. The CLID or DNIS attribute values can be associated with the RADIUS record that is sent with the user profile so that the RADIUS server can access CLID or DNIS attribute information for all incoming calls.

How to Configure RADIUS

Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the Device, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`.

You can configure the Device to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the Device and the key string to be shared by both the server and the Device. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

Before you begin

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius server name**
4. **address {ipv4 | ipv6} ip address {auth-port port number | acct-port port number}**
5. **key string**
6. **retransmit value**
7. **timeout seconds**
8. **end**
9. **show running-config**
10. **copy running-config startup-config**

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong> Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> radius server name</td>
<td>Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>The device also supports RADIUS for IPv6.</td>
</tr>
<tr>
<td>Device(config)# radius server ISE</td>
<td>Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> address {ipv4</td>
<td>ipv6} ip address {auth-port</td>
</tr>
<tr>
<td>Example:</td>
<td>For auth-port port-number, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536.</td>
</tr>
<tr>
<td>Device(config-radius-server)# address ipv4 10.1.1.1 auth-port 1645 acct-port 1646</td>
<td>For acct-port port-number, specify the UDP destination port for authentication requests. The default is 1646.</td>
</tr>
<tr>
<td><strong>Step 5</strong> key string</td>
<td>(Optional) For key string, specify the authentication and encryption key used between the Device and the RADIUS daemon running on the RADIUS server.</td>
</tr>
<tr>
<td>Example:</td>
<td>The key is a text string that must match the encryption key used on the RADIUS server.</td>
</tr>
<tr>
<td>Device(config-radius-server)# key cisco123</td>
<td>Always configure the key as the last item in the radius server command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td><strong>Step 6</strong> retransmit value</td>
<td>(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting.</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting.</td>
</tr>
<tr>
<td>Device(config-radius-server)# retransmit 10</td>
<td>(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting.</td>
</tr>
<tr>
<td><strong>Step 7</strong> timeout seconds</td>
<td>(Optional) Specifies the time interval that the Device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting.</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) Specifies the time interval that the Device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting.</td>
</tr>
<tr>
<td>Device(config-radius-server)# timeout 60</td>
<td>(Optional) Specifies the time interval that the Device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting.</td>
</tr>
</tbody>
</table>
### Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

**SUMMARY STEPS**

1. `configure terminal`
2. `radius-server key string`
3. `radius-server retransmit retries`
4. `radius-server timeout seconds`
5. `radius-server deadtime minutes`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>radius-server key string</code></td>
<td>Specifies the shared secret text string used between the switch and all RADIUS servers.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>end</code></td>
</tr>
<tr>
<td><strong>Step 9</strong> <code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>show running-config</code></td>
</tr>
<tr>
<td><strong>Step 10</strong> <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

```
Device(config)# radius-server key your_server_key
Device(config)# key your_server_key
```

**Purpose**

The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.

**Step 3**

**radius-server retransmit retries**

**Example:**

```
Device(config)# radius-server retransmit 5
```

Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.

**Step 4**

**radius-server timeout seconds**

**Example:**

```
Device(config)# radius-server timeout 3
```

Specifies the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.

**Step 5**

**radius-server deadtime minutes**

**Example:**

```
Device(config)# radius-server deadtime 0
```

When a RADIUS server is not responding to authentication requests, this command specifies a time to stop the request on that server. This avoids the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.

**Step 6**

**end**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 7**

**show running-config**

**Example:**

```
Device# show running-config
```

Verifies your entries.

**Step 8**

**copy running-config startup-config**

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Configuring RADIUS Login Authentication

Follow these steps to configure RADIUS login authentication:
Before you begin

To secure the device for HTTP access by using AAA methods, you must configure the device with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the device for HTTP access by using AAA methods.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login {default | list-name} method1 [method2...]
5. `line [console | tty | vty] line-number [ending-line-number]
6. `login authentication {default | list-name}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td><code>aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Creates a login authentication method list.</td>
</tr>
<tr>
<td>`aaa authentication login {default</td>
<td>list-name} method1 [method2...]`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# aaa authentication login default local</code></td>
<td>To create a default list that is used when a named list is not specified in the <code>login authentication</code> command, use the <code>default</code> keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td>For <code>list-name</code>, specify a character string to name the list you are creating.</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>• For method...</strong>, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.</td>
<td></td>
</tr>
<tr>
<td>Select one of these methods:</td>
<td></td>
</tr>
<tr>
<td>• <strong>enable</strong>—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the <code>enable password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>group radius</strong>—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td>• <strong>line</strong>—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <code>password password</code> line configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>local</strong>—Use the local username database for authentication. You must enter username information in the database. Use the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>local-case</strong>—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>none</strong>—Do not use any authentication for login.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

**line [console | tty] line-number [ending-line-number]**

Example:

```
Device(config)# line 1 4
```

Enters line configuration mode, and configure the lines to which you want to apply the authentication list.

### Step 6

**login authentication {default | list-name}**

Example:

```
Device(config)# login authentication default
```

Applies the authentication list to a line or set of lines.

- If you specify `default`, use the default list created with the `aaa authentication login` command.

- For `list-name`, specify the list created with the `aaa authentication login` command.

### Step 7

**end**

Example:

```
Example:
```

Returns to privileged EXEC mode.
## Defining AAA Server Groups

You use the `server` group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional `auth-port` and `acct-port` keywords.

Follow these steps to define AAA server groups:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius server name`
4. `address {ipv4 | ipv6} {ip-address | hostname} auth-port port-number acct-port port-number`
5. `key string`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

</tbody>
</table>
Configuring RADIUS Authorization for User Privileged Access and Network Services

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user privileged access and network services:

---

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa authorization network radius
4. aaa authorization exec radius
5. end
6. show running-config
7. copy running-config startup-config

---

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| configure terminal | Enters global configuration mode. |
| Example:           |         |
| Device# configure terminal |         |

| **Step 3**        |         |
| aaa authorization network radius | Configures the device for user RADIUS authorization for all network-related service requests. |
| Example:           |         |
| Device(config)# aaa authorization network radius |         |

| **Step 4**        |         |
| aaa authorization exec radius | Configures the device for user RADIUS authorization if the user has privileged EXEC access. |
| Example:           |         |
| Device(config)# aaa authorization exec radius | The exec keyword might return user profile information (such as autocommand information). |
**Purpose**

**Command or Action**

**Step 5**
- `end`
  
  *Example:*
  
  `Device(config)# end`

**Step 6**
- `show running-config`
  
  *Example:*
  
  `Device# show running-config`

**Step 7**
- `copy running-config startup-config`
  
  *Example:*
  
  `Device# copy running-config startup-config`

---

**What to do next**

You can use the `aaa authorization` global configuration command with the `radius` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

---

**Starting RADIUS Accounting**

Follow these steps to start RADIUS accounting:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa accounting network start-stop radius`
4. `aaa accounting exec start-stop radius`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Verifying Attribute 196

No configuration is required to configure RADIUS Progress Codes. To verify attribute 196 in accounting “start” and “stop” records, perform the following steps.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; <strong>enable</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables RADIUS accounting for all network-related service requests.</td>
</tr>
<tr>
<td>aaa accounting network start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa accounting network start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>aaa accounting exec start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa accounting exec start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Verifying Attribute 196**

No configuration is required to configure RADIUS Progress Codes. To verify attribute 196 in accounting “start” and “stop” records, perform the following steps.
### Configuring the Device to Use Vendor-Specific RADIUS Attributes

Follow these steps to configure the device to use vendor-specific RADIUS attributes:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius-server vsa send [accounting | authentication]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** `debug aaa accounting`     | Displays information on accountable events as they occur. |
| Example:                               |                                                   |
| Device# debug aaa accounting           |                                                   |

| **Step 3** `show radius statistics`   | Displays the RADIUS statistics for accounting and authentication packets. |
| Example:                               |                                                   |
| Device# debug aaa authorization        |                                                   |
### Command or Action | Purpose
---|---
**Step 2** configure terminal
  
  **Example:**
  
  `Device# configure terminal`

  **Purpose:** Enters global configuration mode.

**Step 3** radius-server vsa send [accounting | authentication]

  **Example:**
  
  `Device(config)# radius-server vsa send accounting`

  **Purpose:** Enables the device to recognize and use VSAs as defined by RADIUS IETF attribute 26.
  - (Optional) Use the `accounting` keyword to limit the set of recognized vendor-specific attributes to only accounting attributes.
  - (Optional) Use the `authentication` keyword to limit the set of recognized vendor-specific attributes to only authentication attributes.
  
  If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used.

**Step 4** end

  **Example:**
  
  `Device(config)# end`

  **Purpose:** Returns to privileged EXEC mode.

**Step 5** show running-config

  **Example:**
  
  `Device# show running-config`

  **Purpose:** Verifies your entries.

**Step 6** copy running-config startup-config

  **Example:**
  
  `Device# copy running-config startup-config`

  **Purpose:** (Optional) Saves your entries in the configuration file.

---

### Configuring the Device for Vendor-Proprietary RADIUS Server Communication

Follow these steps to configure the device to use vendor-proprietary RADIUS server communication:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `radius-server host {hostname | ip-address} non-standard`
4. `radius-server key string`
5. end
6. show running-config
7. copy running-config startup-config

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Example: Device&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Example: Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>

### Configuring a User Profile and Associating it with the RADIUS Record

This section describes how to create a named user profile with CLID or DNIS attribute values and associate it with the RADIUS record.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa user profile profile-name`
4. `aaa attribute {dnis | clid}`
5. `exit`
6. `test aaa group {group-name | radius} username password new-code [profile profile-name]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
  * Enter your password if prompted.  
  Example:  
  `Device> enable`
| Step 2 | `configure terminal` | Enters global configuration mode.  
  Example:  
  `Device# configure terminal`
| Step 3 | `aaa user profile profile-name` | Creates a user profile.  
  Example:  
  `Device(config)# aaa user profile profilename1`
| Step 4 | `aaa attribute {dnis | clid}` | Adds DNIS or CLID attribute values to the user profile and enters AAA-user configuration mode.  
  Example:  
  `Device# configure terminal`
| Step 5 | `exit` | Exit Global Configuration mode. |
### Verifying the Enhanced Test Command Configuration

To verify the Enhanced Test Command configuration, use the following commands in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# debug radius</td>
<td>Displays information associated with RADIUS.</td>
</tr>
<tr>
<td>Device# more system:running-config</td>
<td>Displays the contents of the current running configuration file. (Note that the more system:running-config command has replaced the show running-config command.)</td>
</tr>
</tbody>
</table>

### Configuration Examples for RADIUS

#### Examples: Identifying the RADIUS Server Host

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```plaintext
Device(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Device(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
```

This example shows how to configure host1 as the RADIUS server and to use the default ports for both authentication and accounting:

```plaintext
Device(config)# radius-server host host1
```

#### Example: Using Two Different RADIUS Group Servers

In this example, the switch is configured to recognize two different RADIUS group servers (group1 and group2). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```plaintext
Device(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Device(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Device(config)# aaa new-model
```
Examples: AAA Server Groups

The following example shows how to create server group `radgroup1` with three different RADIUS server members, each using the default authentication port (1645) and accounting port (1646):

```
aaa group server radius radgroup1
  server 172.16.1.1
  server 172.17.1.2
  server 172.18.1.3
```

The following example shows how to create server group `radgroup2` with three RADIUS server members, each with the same IP address but with unique authentication and accounting ports:

```
aaa group server radius radgroup2
  server 172.16.1.1 auth-port 1000 acct-port 1001
  server 172.16.1.1 auth-port 2000 acct-port 2001
  server 172.16.1.1 auth-port 3000 acct-port 3001
```

Troubleshooting Tips for RADIUS Progress Codes

The following example is a sample debug output from the `debug ppp negotiation` command. This debug output is used to verify that accounting “stop” records have been generated and that attribute 196 (Ascend-Connect-Progress) has a value of 65.

```
Tue Aug 7 06:21:03 2001
NAS-IP-Address = 10.0.58.62
  NAS-Port = 20018
  Vendor-Specific = ""
  NAS-Port-Type = ISDN
  User-Name = "peer_16a"
  Called-Station-Id = "5213124"
  Calling-Station-Id = "5212175"
  Acct-Status-Type = Stop
  Acct-Authentic = RADIUS
  Service-Type = Framed-User
  Acct-Session-Id = "00000014"
  Framed-Protocol = PPP
  Framed-IP-Address = 172.16.0.2
  Acct-Input-Octets = 3180
  Acct-Output-Octets = 3186
  Acct-Input-Packets = 40
  Acct-Output-Packets = 40
  Ascend-Connect-Pr = 65
  Acct-Session-Time = 49
  Acct-Delay-Time = 0
  Timestamp = 997190463
  Request-Authenticator = Unverified
```
**Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes**

For example, this AV pair activates Cisco’s *multiple named ip address pools* feature during IP authorization (during PPP IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

This example shows how to specify an authorized VLAN in the RADIUS server database:

```
cisco-avpair= "tunnel-type(#64)=VLAN(13)"
cisco-avpair= "tunnel-medium-type(#65)=802 media(6)"
cisco-avpair= "tunnel-private-group-id(#81)=vlanid"
```

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any decnet-iv"
```

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"
```

**Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication**

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of `rad124` between the switch and the server:

```
Device(config)# radius-server host 172.20.30.15 nonstandard
Device(config)# radius-server key rad124
```

**Example: User Profile Associated With the test aaa group Command**

The following example shows how to configure the `dnis = dnisvalue` user profile “prfl1” and associate it with a `test aaa group` command. In this example, the `debug radius` command has been enabled and the output follows the configuration.

```
user profile prfl1
attribute dnis
```
aaa attribute dnis dnisvalue
no aaa attribute clid
! Attribute not found.
  aaa attribute clid clidvalue
no aaa attribute clid
exit
!
! Associate the dnis user profile with the test aaa group command.
test aaa group radius user1 pass new-code profile profl1
!
!
! debug radius output, which shows that the dnis value has been passed to the radius server.

RADIUS Server Load Balancing

The RADIUS Server Load Balancing feature distributes authentication, authorization, and accounting (AAA) authentication and accounting transactions across RADIUS servers in a server group. These servers can share the AAA transaction load and thereby respond faster to incoming requests.

This module describes the RADIUS Server Load Balancing feature.

- Finding Feature Information, on page 929
- Prerequisites for RADIUS Server Load Balancing, on page 929
- Restrictions for RADIUS Server Load Balancing, on page 930
- Information About RADIUS Server Load Balancing, on page 930
- How to Configure RADIUS Server Load Balancing, on page 932
- Configuration Examples for RADIUS Server Load Balancing, on page 936

- Feature Information for RADIUS Server Load Balancing, on page 943

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for RADIUS Server Load Balancing

- Authentication, authorization, and accounting (AAA) must be configured on the RADIUS server.
- AAA RADIUS server groups must be configured.
- RADIUS must be configured for functions such as authentication, accounting, or static route download.
Restrictions for RADIUS Server Load Balancing

- Incoming RADIUS requests, such as Packet of Disconnect (POD) requests, are not supported.
- Load balancing is not supported on proxy RADIUS servers and for private server groups.

Information About RADIUS Server Load Balancing

RADIUS Server Load Balancing Overview

Load balancing distributes batches of transactions to RADIUS servers within a server group. Load balancing assigns each batch of transactions to the server with the lowest number of outstanding transactions in its queue. The process of assigning a batch of transactions is as follows:

1. The first transaction is received for a new batch.
2. All server transaction queues are checked.
3. The server with the lowest number of outstanding transactions is identified.
4. The identified server is assigned the next batch of transactions.

The batch size is a user-configured parameter. Changes in the batch size may impact CPU load and network throughput. As batch size increases, CPU load decreases and network throughput increases. However, if a large batch size is used, all available server resources may not be fully utilized. As batch size decreases, CPU load increases and network throughput decreases.

There is no set number for large or small batch sizes. A batch with more than 50 transactions is considered large and a batch with fewer than 25 transactions is considered small.

If a server group contains ten or more servers, we recommend that you set a high batch size to reduce CPU load.

Transaction Load Balancing Across RADIUS Server Groups

You can configure load balancing either per-named RADIUS server group or for the global RADIUS server group. The load balancing server group must be referred to as “radius” in the authentication, authorization, and accounting (AAA) method lists. All public servers that are part of the RADIUS server group are then load balanced.

You can configure authentication and accounting to use the same RADIUS server or different servers. In some cases, the same server can be used for preauthentication, authentication, or accounting transactions for a session. The preferred server, which is an internal setting and is set as the default, informs AAA to use the same server for the start and stop record for a session regardless of the server cost. When using the preferred
server setting, ensure that the server that is used for the initial transaction (for example, authentication), the preferred server, is part of any other server group that is used for a subsequent transaction (for example, accounting).

The preferred server is not used if one of the following criteria is true:

- The `load-balance method least-outstanding ignore-preferred-server` command is used.
- The preferred server is dead.
- The preferred server is in quarantine.
- The want server flag has been set, overriding the preferred server setting.

The want server flag, an internal setting, is used when the same server must be used for all stages of a multistage transaction regardless of the server cost. If the want server is not available, the transaction fails.

You can use the `load-balance method least-outstanding ignore-preferred-server` command if you have either of the following configurations:

- Dedicated authentication server and a separate dedicated accounting server
- Network where you can track all call record statistics and call record details, including start and stop records and records that are stored on separate servers

If you have a configuration where authentication servers are a superset of accounting servers, the preferred server is not used.

### RADIUS Server Status and Automated Testing

The RADIUS Server Load Balancing feature considers the server status when assigning batches. Transaction batches are sent only to live servers. We recommend that you test the status of all RADIUS load-balanced servers, including low usage servers (for example, backup servers).

Transactions are not sent to a server that is marked dead. A server is marked dead until its timer expires, at which time it moves to quarantine state. A server is in quarantine until it is verified alive by the RADIUS automated tester functionality.

To determine if a server is alive and available to process transactions, the RADIUS automated tester sends a request periodically to the server for a test user ID. If the server returns an Access-Reject message, the server is alive; otherwise the server is either dead or quarantined.

A transaction sent to an unresponsive server is failed over to the next available server before the unresponsive server is marked dead. We recommend that you use the retry reorder mode for failed transactions.

When using the RADIUS automated tester, verify that the authentication, authorization, and accounting (AAA) servers are responding to the test packets that are sent by the network access server (NAS). If the servers are not configured correctly, packets may be dropped and the server erroneously marked dead.

---

**Caution**

We recommend that you use a test user that is not defined on the RADIUS server for the RADIUS server automated testing to protect against security issues that may arise if the test user is not correctly configured.
How to Configure RADIUS Server Load Balancing

Enabling Load Balancing for a Named RADIUS Server Group

SUMMARY STEPS

1. enable
2. configure terminal
3. radius-server host {hostname | ip-address} [test username name] [auth-port number] [ignore-auth-port] [acct-port number] [ignore-acct-port] [idle-time seconds]
4. aaa group server radius group-name
5. load-balance method least-outstanding [batch-size number] [ignore-preferred-server]
6. end

### Troubleshooting RADIUS Server Load Balancing

After configuring the RADIUS Server Load Balancing feature, you can monitor the idle timer, dead timer, and load balancing server selection or verify the server status by using a manual test command.

#### SUMMARY STEPS

1. Use the `debug aaa test` command to determine when an idle timer or dead timer has expired, when test packets are sent, the status of the server, or to verify the server state.
2. Use the `debug aaa sg-server selection` command to determine the server that is selected for load balancing.
3. Use the `test aaa group` command to manually verify the RADIUS load-balanced server status.

#### DETAILED STEPS

**Step 1**

Use the `debug aaa test` command to determine when an idle timer or dead timer has expired, when test packets are sent, the status of the server, or to verify the server state.

The idle timer is used to check the server status and is updated with or without any incoming requests. Monitoring the idle timer helps to determine if there are nonresponsive servers and to keep the RADIUS server status updated to efficiently utilize available resources. For instance, an updated idle timer would help ensure that incoming requests are sent to servers that are alive.

The dead timer is used either to determine that a server is dead or to update a dead server’s status appropriately.

Monitoring server selection helps to determine how often the server selection changes. Server selection is effective in analyzing if there are any bottlenecks, a large number of queued requests, or if only specific servers are processing incoming requests.

The following sample output from the `debug aaa test` command shows when the idle timer expired:

**Example:**

```
Device# debug aaa test

Jul 16 00:07:01: AAA/SG/TEST: Server (192.0.2.245:1700,1701) quarantined.
Jul 16 00:07:01: AAA/SG/TEST: Sending test request(s) to server (192.0.2.245:1700,1701)
Jul 16 00:07:01: AAA/SG/TEST: Sending 1 Access-Requests, 1 Accounting-Requests in current batch.
Jul 16 00:07:01: AAA/SG/TEST(Req#: 1): Sending test AAA Accounting-Request.
```

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# radius-server load-balance method least-outstanding</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> load-balance method least-outstanding [batch-size number] [ignore-preferred-server]</td>
<td>Enables least-outstanding load balancing for a global named server group.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-sg)# load-balance method least-outstanding batch-size 5</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Exits server group configuration mode and enters privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-sg)# end</td>
<td></td>
</tr>
</tbody>
</table>
Step 2

Use the `debug aaa sg-server selection` command to determine the server that is selected for load balancing.

The following sample output from the `debug aaa sg-server selection` command shows five access requests being sent to a server group with a batch size of three:

**Example:**

```
Device# debug aaa sg-server selection

 Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
 Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
 Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining least loaded server.
 Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Obtaining a new least loaded server.
 Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Server[0] load: 3
 Jul 16 03:15:05: AAA/SG/SERVER_SELECT: Selected Server[1] with load 0
```

Step 3

Use the `test aaa group` command to manually verify the RADIUS load-balanced server status.

The following sample output shows the response from a load-balanced RADIUS server that is alive when the username "test" does not match a user profile. The server is verified alive when it issues an Access-Reject response to an authentication, authorization, and accounting (AAA) packet generated using the `test aaa group` command.

**Example:**

```
Device# test aaa group SG1 test lab new-code

 00:06:07: RADIUS/ENCODE(00000000):Orig. component type = INVALID

Configuration Examples for RADIUS Server Load Balancing

Example: Enabling Load Balancing for a Named RADIUS Server Group

The following examples show load balancing enabled for a named RADIUS server group. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information.

The following sample output shows the relevant RADIUS configuration:

```
Device# show running-config

aaa group server radius server-group1
  server 192.0.2.238 auth-port 2095 acct-port 2096
  server 192.0.2.238 auth-port 2015 acct-port 2016
  load-balance method least-outstanding batch-size 5
!

aaa authentication ppp default group server-group1
aaa accounting network default start-stop group server-group1
```

The lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The `aaa group server radius` command shows the configuration of a server group with two member servers.
- The `load-balance` command enables load balancing for global RADIUS server groups with the batch size specified.
- The `aaa authentication ppp` command authenticates all PPP users using RADIUS.
- The `aaa accounting` command enables sending of all accounting requests to the AAA server when the client is authenticated and then disconnected using the `start-stop` keyword.

The show debug sample output below shows the selection of the preferred server and the processing of requests for the preceding configuration:

```
Device# show debug

```

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
The following sample output from the `show aaa servers` command shows the AAA server status for the named RADIUS server group configuration:

The sample output shows the status of two RADIUS servers. Both servers are alive, and no requests have been processed since the counters were cleared 0 minutes ago.

```
Device# show aaa servers

RADIUS: id 8, priority 1, host 192.0.2.238, auth-port 2095, acct-port 2096
  State: current UP, duration 3781s, previous duration 0s
  Dead: total time 0s, count 0
  Quarantined: No
  Authen: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Author: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Account: request 0, timeouts 0
    Response: unexpected 0, server error 0, incorrect 0, time 0ms
    Transaction: success 0, failure 0
  Elapsed time since counters last cleared: 0m

RADIUS: id 9, priority 2, host 192.0.2.238, auth-port 2015, acct-port 2016
  State: current UP, duration 3781s, previous duration 0s
  Dead: total time 0s, count 0
  Quarantined: No
```
Example: Enabling Load Balancing for a Global RADIUS Server Group

The following examples show how to enable load balancing for global RADIUS server groups. These examples are shown in three parts: the current configuration of the RADIUS command output, debug output, and authentication, authorization, and accounting (AAA) server status information. You can use delimiting characters to display relevant parts of the configuration.

The following example shows the relevant RADIUS configuration:

```bash
Device# show running-config | include radius

aaa authentication ppp default group radius
aaa accounting network default start-stop group radius
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 key cisco
radius-server load-balance method least-outstanding batch-size 5
```

Lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The `aaa authentication ppp` command authenticates all PPP users using RADIUS.
- The `aaa accounting` command enables the sending of all accounting requests to an AAA server when the client is authenticated and then disconnected through use of the `start-stop` keyword.
- The `radius-server host` command defines the IP address of the RADIUS server host with the authorization and accounting ports specified and the authentication and encryption keys identified.
- The `radius-server load-balance` command enables load balancing for global RADIUS server groups with the batch size specified.

The `show debug` sample output below shows the selection of the preferred server and the processing of requests for the configuration:

```bash
Device# show debug

General OS:
   AAA server group server selection debugging is on
#
<sending 10 pppoe requests>

*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT:Selected Server[0] with load 0
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000014):Server (192.0.2.238:2095,2096) now being
```
used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000015):Server (192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000016):Server (192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000017):Server (192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000018):Server (192.0.2.238:2095,2096) now being used as preferred server
*Feb 28 13:40:32.199:AAA/SG/SERVER_SELECT(00000019):Server (192.0.2.238:2095,2096) now being used as preferred server

The following sample output from the `show aaa servers` command shows the AAA server status for the global RADIUS server group configuration:

The sample output shows the status of two RADIUS servers. Both servers are up and successfully processed in the last 2 minutes:

- Five out of six authentication requests
- Five out of five accounting requests

```
Device# show aaa servers
RADIUS: id 4, priority 1, host 192.0.2.238, auth-port 2095, acct-port 2096
  State: current UP, duration 3175s, previous duration 0s
  Dead: total time 0s, count 0
  Quarantined: No
  Authen: request 6, timeouts 1
  Response: unexpected 1, server 0, incorrect 0, time 1841ms
  Transaction: success 5, failure 0
  Author: request 0, timeouts 0
  Response: unexpected 0, server 0, incorrect 0, time 0ms
  Transaction: success 0, failure 0
  Account: request 5, timeouts 0
  Response: unexpected 0, server 0, incorrect 0, time 3303ms
  Transaction: success 5, failure 0
  Elapsed time since counters last cleared: 2m
RADIUS: id 5, priority 2, host 192.0.2.238, auth-port 2015, acct-port 2016
```

Security

Example: Enabling Load Balancing for a Global RADIUS Server Group
Example: Monitoring Idle Timer

The following example shows idle timer and related server state for load balancing enabled for a named RADIUS server group. The current configuration of the RADIUS command output and debug command output are also displayed.

The following sample output shows the relevant RADIUS configuration:

```
Device# show running-config | include radius

aaa group server radius server-group1
radius-server host 192.0.2.238 auth-port 2095 acct-port 2096 test username junk1 idle-time
1 key cisco
radius-server host 192.0.2.238 auth-port 2015 acct-port 2016 test username junk1 idle-time 1 key cisco
radius-server load-balance method least-outstanding batch-size 5
```

The lines in the current configuration of the preceding RADIUS command output are defined as follows:

- The `aaa group server radius` command shows the configuration of a server group.
- The `radius-server host` command defines the IP address of the RADIUS server host with authorization and accounting ports specified and the authentication and encryption key identified.
- The `radius-server load-balance` command enables load balancing for the RADIUS server with the batch size specified.

The `show debug` sample output below shows test requests being sent to servers. The response to the test request sent to the server is received, the server is removed from quarantine as appropriate, the server is marked alive, and then the idle timer is reset.

```
Device# show debug

*Feb 28 13:52:20.835:AAA/SG/TEST:Sending test request(s) to server (192.0.2.238:2015,2016)
```
Example: Configuring the Preferred Server with the Same Authentication and Authorization Server

The following example shows an authentication server group and an authorization server group that use the same servers 209.165.200.225 and 209.165.200.226. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
aaa group server radius accounting-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
```

When a preferred server is selected for a session, all transactions for that session will continue to use the original preferred server. The servers 209.165.200.225 and 209.165.200.226 are load balanced based on sessions rather than transactions.

Example: Configuring the Preferred Server with Different Authentication and Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225 and 209.165.200.226 and an authorization server group that uses servers 209.165.201.1 and 209.165.201.2. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
aaa group server radius accounting-group
  server 209.165.201.1 key radkey3
  server 209.165.201.2 key radkey4
```

The authentication server group and the accounting server group do not share any common servers. A preferred server is never found for accounting transactions; therefore, authentication and accounting servers are load-balanced based on transactions. Start and stop records are sent to the same server for a session.

Example: Configuring the Preferred Server with Overlapping Authentication and Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1 and an accounting server group that uses servers 209.165.201.1 and 209.165.201.2. Both server groups have the preferred server flag enabled.

```
aaa group server radius authentication-group
  server 209.165.200.225 key radkey1
  server 209.165.200.226 key radkey2
  server 209.165.201.1 key radkey3
aaa group server radius accounting-group
  server 209.165.201.1 key radkey3
  server 209.165.201.2 key radkey4
```

If all servers have equal transaction processing capability, one-third of all authentication transactions are directed toward the server 209.165.201.1. Therefore, one-third of all accounting transactions are also directed...
toward the server 209.165.201.1. The remaining two-thirds of accounting transactions are load balanced equally between servers 209.165.201.1 and 209.165.201.2. The server 209.165.201.1 receives fewer authentication transactions because the server 209.165.201.1 has outstanding accounting transactions.

Example: Configuring the Preferred Server with Authentication Servers As a Subset of Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225 and 209.165.200.226 and an authorization server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1. Both server groups have the preferred server flag enabled.

aaa group server radius authentication-group
    server 209.165.200.225 key radkey1
    server 209.165.200.226 key radkey2
aaa group server radius accounting-group
    server 209.165.200.225 key radkey1
    server 209.165.200.226 key radkey2
    server 209.165.201.1 key radkey3

One-half of all authentication transactions are sent to the server 209.165.200.225 and the other half to the server 209.165.200.226. Servers 209.165.200.225 and 209.165.200.226 are preferred servers for authentication and accounting transaction. Therefore, there is an equal distribution of authentication and accounting transactions across servers 209.165.200.225 and 209.165.200.226. The server 209.165.201.1 is relatively unused.

Example: Configuring the Preferred Server with Authentication Servers As a Superset of Authorization Servers

The following example shows an authentication server group that uses servers 209.165.200.225, 209.165.200.226, and 209.165.201.1 and an authorization server group that uses servers 209.165.200.225 and 209.165.200.226. Both server groups have the preferred server flag enabled.

aaa group server radius authentication-group
    server 209.165.200.225 key radkey1
    server 209.165.200.226 key radkey2
    server 209.165.201.1 key radkey3
aaa group server radius accounting-group
    server 209.165.200.225 key radkey1
    server 209.165.200.226 key radkey2

Initially, one-third of authentication transactions are assigned to each server in the authorization server group. As accounting transactions are generated for more sessions, accounting transactions are sent to servers 209.165.200.225 and 209.165.200.226 because the preferred server flag is on. As servers 209.165.200.225 and 209.165.200.226 begin to process more transactions, authentication transactions will start to be sent to server 209.165.201.1. Transaction requests authenticated by server 209.165.201.1 do not have any preferred server setting and are split between servers 209.165.200.225 and 209.165.200.226, which negates the use of the preferred server flag. This configuration should be used cautiously.

Feature Information for RADIUS Server Load Balancing

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 46

RADIUS Change of Authorization Support

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated.

Identity-Based Networking Services supports RADIUS change of authorization (CoA) commands for session query, reauthentication, and termination, port bounce and port shutdown, and service template activation and deactivation.

- Finding Feature Information, on page 945
- Information About RADIUS Change-of-Authorization, on page 945
- How to Configure RADIUS Change-of-Authorization, on page 956
- Additional References for RADIUS Change-of-Authorization, on page 959
- Feature Information for RADIUS Change-of-Authorization Support, on page 960

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About RADIUS Change-of-Authorization

RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.
• Change-of-Authorization Requests
• CoA Request Response Code
• CoA Request Commands
• Session Reauthentication
• Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

The Catalyst supports these per-session CoA requests:

• Session reauthentication
• Session termination
• Session termination with port shutdown
• Session termination with port bounce

This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst. However, some basic configuration is required for the following attributes:

• Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.
• Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

• CoA acknowledgement (ACK) [CoA-ACK]
• CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.

The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.
### Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

### RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.
This table shows the IETF attributes are supported for this feature.

Security

RFC 5176 Compliance

Consolidated Platform Configuration Guide, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switch)
Preconditions

To use the CoA interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect- negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.
The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**Session Identification**

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
  - Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**CoA ACK Response Code**

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

**CoA NAK Response Code**

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use `show` commands to verify a successful CoA.

**Session Reauthentication**

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: `Cisco:Avpair=“subscriber:command=reauthenticate”` and one or more session identification attributes.
The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

**Session Reauthentication in a Switch Stack**

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.
- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack member.
- If the stack master fails before authentication completes, reauthentication is initiated after stack master switch-over based on the original command (which is subsequently removed).
- If the stack master fails before sending an ACK, the new stack master treats the re-transmitted command as a new command.

**Session Termination**

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

**CoA Activate Service Command**

The CoA activate service command can be used to activate a service template on a session. The AAA server sends the request in a standard CoA-Request message using the following VSAs:

Cisco:Avpair="subscriber:command=activate-service"
CoA Deactivate Service Command

The CoA deactivate service command can be used to deactivate a service template on a session. The AAA server sends the request in a standard CoA-Request message using the following VSAs:

Cisco:Avpair="subscriber:command=deactivate-service"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the Session Identification section below. If the device cannot locate a session, it returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the device locates a session, it initiates a deactivate template operation for the hosting port and a CoA-ACK is returned. If deactivating the template fails, a CoA-NAK message is returned with the Error-Code attribute set to the appropriate message.
If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

**Session Identification**

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**CoA Request: Disable Host Port**

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network access on the port, reenable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

```plaintext
Cisco: Avpair="subscriber:command=disable-host-port"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

---

**Note**

A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.
CoA Request: Bounce-Port

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

CoA Session Query Command

The CoA session query command requests service information about a subscriber session. The AAA server sends the request in a standard CoA-Request message containing the following VSA:

Cisco:Avpair="subscriber:command=session-query"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the Session Identification section below. If the device cannot locate a session, it returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the device locates a session, it performs a session query operation on the session and returns a CoA-ACK message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

Session Identification

For disconnect and CoA requests targeted at a particular session, the device locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31, which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-Ip6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-Ip6-Address
- Plain IP Address (IETF attribute #8)
If more than one session identification attribute is included in the message, all of the attributes must match the session or the device returns a Disconnect-NAK or CoA-NAK with the error code “Invalid Attribute Value.”

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**CoA Session Reauthenticate Command**

To initiate session authentication, the AAA server sends a standard CoA-Request message containing the following VSAs:

- `Cisco:Avpair="subscriber:command=reauthenticate"`
- `Cisco:Avpair="subscriber:reauthenticate-type=<last | rerun>"`

“reauthenticate-type” defines whether the CoA reauthentication request uses the authentication method that last succeeded on the session or whether the authentication process is completely rerun.

The following rules apply:

- “subscriber:command=reauthenticate” must be present to trigger a reauthentication.
- If “subscriber:reauthenticate-type” is not specified, the default behavior is to rerun the last successful authentication method for the session. If the method reauthenticates successfully, all old authorization data is replaced with the new reauthenticated authorization data.
- “subscriber:reauthenticate-type” is valid only when included with “subscriber:command=reauthenticate.” If it is included in another CoA command, the VSA will be silently ignored.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is resent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation is complete, the operation is restarted on the new active device.

**CoA Session Terminate Command**

A CoA Disconnect-Request command terminates a session without disabling the host port. This command causes reinitialization of the authenticator state machine for the specified host, but does not restrict the host’s access to the network. If the session cannot be located, the device returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the device terminates the session. After the session has been completely removed, the device returns a Disconnect-ACK.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port” VSA. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. When you want to restore network access on the port, reenable it using a non-RADIUS mechanism.

**Stacking Guidelines for Session Termination**

No special handling is required for CoA Disconnect-Request messages in a switch stack.
Stacking Guidelines for CoA-Request Bounce-Port

Because the `bounce-port` command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid `bounce-port` command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby stack master.

If the stack master fails before the port-bounce completes, a port-bounce is initiated after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

Stacking Guidelines for CoA-Request Disable-Port

Because the `disable-port` command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid `disable-port` command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby stack master.

If the stack master fails before the port-disable operation completes, the port is disabled after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

How to Configure RADIUS Change-of-Authorization

Configuring CoA on the Device

Follow these steps to configure CoA on a device. This procedure is required.

**SUMMARY STEPS**

1. `enable`
2. configure terminal
3. aaa new-model
4. aaa server radius dynamic-author
5. client \{ip-address | name\} [vrf vrfname] [server-key string]
6. server-key \{0 | 7\} string
7. port port-number
8. auth-type \{any | all | session-key\}
9. ignore session-key
10. ignore server-key
11. authentication command bounce-port ignore
12. authentication command disable-port ignore
13. end
14. show running-config
15. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>

<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Monitoring and Troubleshooting CoA Functionality**

The following Cisco IOS commands can be used to monitor and troubleshoot CoA functionality on the switch:

- debug radius
- debug aaa coa
- debug aaa pod
- debug aaa subsys
- debug cmdhd [detail | error | events]
- show aaa attributes protocol radius

CHAPTER 47

Configuring Kerberos

Kerberos is a secret-key network authentication protocol, developed at the Massachusetts Institute of Technology (MIT), that uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication. Kerberos was designed to authenticate requests for network resources. Kerberos, like other secret-key systems, is based on the concept of a trusted third party that performs secure verification of users and services. In the Kerberos protocol, this trusted third party is called the key distribution center (KDC).

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

- So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.
• A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

When you add or create entries for the hosts and users, follow these guidelines:
• The Kerberos principal name must be in all lowercase characters.
• The Kerberos instance name must be in all lowercase characters.
• The Kerberos realm name must be in all uppercase characters.

Information About Kerberos

Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

Note

In the Kerberos configuration examples, the trusted third party can be any switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the key distribution center (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

Note

A Kerberos server can be any switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called single logon. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

Kerberos supports these network services:
This table lists the common Kerberos-related terms and definitions.

Table 111: Kerberos Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.</td>
</tr>
<tr>
<td>Authorization</td>
<td>A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.</td>
</tr>
<tr>
<td>Credential</td>
<td>A general term that refers to authentication tickets, such as TGTs and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.</td>
</tr>
</tbody>
</table>
| Instance      | An authorization level label for Kerberos principals. Most Kerberos principals are of the form `user@REALM` (for example, `smith@EXAMPLE.COM`). A Kerberos principal with a Kerberos instance has the form `user/instance@REALM` (for example, `smith/admin@EXAMPLE.COM`). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so.  
**Note** The Kerberos principal and instance names must be in all lowercase characters.  
**Note** The Kerberos realm name must be in all uppercase characters. |
| KDC           | Key distribution center that consists of a Kerberos server and database program that is running on a network host.                           |
| Kerberized    | A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.                |
| Kerberos realm| A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service.  
**Note** The Kerberos realm name must be in all uppercase characters. |
<p>| Kerberos server| A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services. |</p>
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEYTAB\textsuperscript{10}</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB\textsuperscript{11}.</td>
</tr>
<tr>
<td>Principal</td>
<td>Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server.</td>
</tr>
<tr>
<td></td>
<td>Note: The Kerberos principal name must be in all lowercase characters.</td>
</tr>
<tr>
<td>Service</td>
<td>A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.</td>
</tr>
<tr>
<td>Service</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.</td>
</tr>
<tr>
<td>TGT</td>
<td>Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC.</td>
</tr>
</tbody>
</table>

### Kerberos Operation

A Kerberos server can be a switch that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

### Kerberos Operation

A Kerberos server can be a device that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a device as a Kerberos server, remote users must follow these steps:

### Authenticating to a Boundary Switch

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
   • If the decryption is successful, the user is authenticated to the switch.
   • If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.

### Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a key distribution center (KDC) and obtain a ticket granting ticket (TGT) from the KDC to access network services.

When a remote user authenticates to a boundary device, that user technically becomes part of the network; that is, the network is extended to include the remote user and the user’s machine or network. To gain access to network services, however, the remote user must obtain a TGT from the KDC. The following process describes how remote users authenticate to the KDC:

1. The remote user, at a workstation on a remote site, launches the KINIT program (part of the client software provided with the Kerberos protocol).
2. The KINIT program finds the identity of the user and requests a TGT from the KDC.
3. The KDC creates a TGT, which contains the identity of the user, the identity of the KDC, and the expiration time of the TGT.
4. Using the user’s password as a key, the KDC encrypts the TGT and sends the TGT to the workstation.
5. When the KINIT program receives the encrypted TGT, it prompts the user for a password (this is the password that is defined for the user in the KDC).
6. If the KINIT program can decrypt the TGT with the password the user enters, the user is authenticated to the KDC, and the KINIT program stores the TGT in the user’s credential cache.

At this point, the user has a TGT and can communicate securely with the KDC. In turn, the TGT allows the user to authenticate to other network services.

### Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a ticket granting ticket (TGT) must now authenticate to the network services in a Kerberos realm.
The following process describes how a remote user with a TGT authenticates to network services within a given Kerberos realm. Assume the user is on a remote workstation (Host A) and wants to log in to Host B.

1. The user on Host A initiates a Kerberized application (such as Telnet) to Host B.
2. The Kerberized application builds a service credential request and sends it to the KDC. The service credential request includes (among other things) the user’s identity and the identity of the desired network service. The TGT is used to encrypt the service credential request.
3. The KDC tries to decrypt the service credential request with the TGT it issued to the user on Host A. If the KDC can decrypt the packet, it is assured that the authenticated user on Host A sent the request.
4. The KDC notes the network service identity in the service credential request.
5. The KDC builds a service credential for the appropriate network service on Host B on behalf of the user on Host A. The service credential contains the client’s identity and the desired network service’s identity.
6. The KDC then encrypts the service credential twice. It first encrypts the credential with the SRVTAB that it shares with the network service identified in the credential. It then encrypts the resulting packet with the TGT of the user (who, in this case, is on Host A).
7. The KDC sends the twice-encrypted credential to Host A.
8. Host A attempts to decrypt the service credential with the user’s TGT. If Host A can decrypt the service credential, it is assured the credential came from the real KDC.
9. Host A sends the service credential to the desired network service. Note that the credential is still encrypted with the SRVTAB shared by the KDC and the network service.
10. The network service attempts to decrypt the service credential using its SRVTAB.
11. If the network service can decrypt the credential, it is assured the credential was in fact issued from the KDC. Note that the network service trusts anything it can decrypt from the KDC, even if it receives it indirectly from a user. This is because the user first authenticated with the KDC.

At this point, the user is authenticated to the network service on Host B. This process is repeated each time a user wants to access a network service in the Kerberos realm.

How to Configure Kerberos

To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

Configuring the KDC Using Kerberos Commands

After a host is configured to function as the KDC in the Kerberos realm, entries must be made to the KDC database (and to modify existing database information) for all principals in the realm. Principals can be network services on devices and hosts or principals can be users.
All Kerberos command examples are based on Kerberos 5 Beta 5 of the original MIT implementation. Later versions use a slightly different interface.

Adding Users to the KDC Database

Follow these steps to add users to the KDC and create privileged instances for those users:

**SUMMARY STEPS**

1. Use the `su` command to become root on the host running the KDC.
2. Use the `kdb5_edit` program to configure the commands in the next steps.
3. Use the `ank` (add new key) command in privileged EXEC mode to add a user to the KDC. This command prompts for a password that the user must enter to authenticate the router. For example:
4. Use the `ank` command to add a privileged instance of a user. For example:

**DETAILED STEPS**

**Step 1**
Use the `su` command to become root on the host running the KDC.

**Step 2**
Use the `kdb5_edit` program to configure the commands in the next steps.

*Note* The Kerberos realm name in the following steps must be in uppercase characters.

**Step 3**
Use the `ank` (add new key) command in privileged EXEC mode to add a user to the KDC. This command prompts for a password that the user must enter to authenticate the router. For example:

**Example:**

Device # `ank username@REALM`

**Step 4**
Use the `ank` command to add a privileged instance of a user. For example:

**Example:**

Device # `ank username/instance@REALM`

The following example adds the user `loki` to the Kerberos realm `COMPANY.COM`:

`ank loki@COMPANY.COM`

Privileged instances can be created to allow network administrators to connect to the router at the enable level so that a clear text password is not used to avoid compromising security and to enter enabled modes. See the Enabling Kerberos Instance Mapping, on page 972 for more information on mapping Kerberos instances to various Cisco IOS privilege levels.
Creating and Extracting a SRVTAB on the KDC

All devices authenticated through Kerberos must have a SRVTAB that contains the password or randomly generated key for the service principal key that was entered into the KDC database. A service principal key must be shared with the host running that service. To do this, the SRVTAB entry must be saved (extracted) to a file and copied to the device and all hosts in the Kerberos realm.

Follow these steps to make a SRVTAB entry and extract this SRVTAB to a file on the KDC in privileged EXEC mode:

**SUMMARY STEPS**

1. Use the `ark` (add random key) command to add a network service supported by a host or device to the KDC. For example:
   
   ```
   Example:
   ```
   ```
   Device# ark
   SERVICE/HOSTNAME@REALM
   ```

2. Use the `kdb5_edit` command `xst` to write an SRVTAB entry to a file. For example:
   
   ```
   Example:
   ```
   ```
   Device# xst
   device-name host
   ```

3. Use the `quit` command to exit the `kdb5_edit` program.

**DETAILED STEPS**

**Step 1**  
Use the `ark` (add random key) command to add a network service supported by a host or device to the KDC. For example:

```
Example:
```
```
Device# ark
SERVICE/HOSTNAME@REALM
``` 

**Step 2**  
Use the `kdb5_edit` command `xst` to write an SRVTAB entry to a file. For example:

```
Example:
```
```
Device# xst
device-name host
``` 

**Step 3**  
Use the `quit` command to exit the `kdb5_edit` program.

---

**Example**

The following example shows how to add a Kerberized authentication service for a device called `device1` to the Kerberos realm `COMPANY.COM`:

```
ark host/device1.company.com@COMPANY.COM
```

The following example shows how to write an entry for all network services on all Kerberized hosts that use this KDC for authentication to a file:

```
xst device1.company.com@COMPANY.COM host
```
Configuring the Device to Use the Kerberos Protocol

Defining a Kerberos Realm

For a device to authenticate a user defined in the Kerberos database, it must know the host name or IP address of the host running the KDC, the name of the Kerberos realm and, optionally, be able to map the host name or Domain Name System (DNS) domain to the Kerberos realm.

To configure the device to authenticate to a specified KDC in a specified Kerberos realm, use the following commands in global configuration mode. Note that DNS domain names must begin with a leading dot (\.):

**SUMMARY STEPS**

1. Device(config)# kerberos local-realm kerberos-realm
2. Device(config)# kerberos server kerberos-realm {hostname | ip-address} [port-number]
3. Device(config)# kerberos realm {dns-domain | host} kerberos-realm

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Device(config)# kerberos local-realm kerberos-realm</td>
</tr>
<tr>
<td></td>
<td>Defines the default realm for the device.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Device(config)# kerberos server kerberos-realm {hostname</td>
</tr>
<tr>
<td></td>
<td>Specifies to the device which KDC to use in a given Kerberos realm and, optionally, the port number that the KDC is monitoring. (The default is 88.)</td>
</tr>
<tr>
<td>Step 3</td>
<td>Device(config)# kerberos realm {dns-domain</td>
</tr>
<tr>
<td></td>
<td>(Optional) Maps a host name or DNS domain to a Kerberos realm.</td>
</tr>
</tbody>
</table>

**What to do next**

Because the machine running the KDC and all Kerberized hosts must interact within a 5-minute window or authentication fails, all Kerberized machines, and especially the KDC, should be running the Network Time Protocol (NTP).

Note

The kerberos local-realm, kerberos realm, and kerberos server commands are equivalent to the UNIX krb.conf file. The table below identifies mappings from the Cisco IOS configuration commands to a Kerberos 5 configuration file (krb5.conf).

**Table 112: Kerberos 5 Configuration File and Commands**

<table>
<thead>
<tr>
<th>krb5.conf File</th>
<th>Cisco IOS Configuration Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>[libdefaults]</td>
<td>(in configuration mode)</td>
</tr>
<tr>
<td>default.realm = DOMAIN.COM</td>
<td>kerberos local-realm</td>
</tr>
<tr>
<td></td>
<td>DOMAIN.COM</td>
</tr>
</tbody>
</table>
### Copying SRVTAB Files

To make it possible for remote users to authenticate to the device using Kerberos credentials, the device must share a secret key with the KDC. To do this, you must give the device a copy of the SRVTAB you extracted on the KDC.

The most secure method to copy an SRVTAB file to the hosts in your Kerberos realm is to copy it onto physical media and go to each host in turn and manually copy the files onto the system. To copy an SRVTAB file to the device, which does not have a physical media drive, it must be transferred over the network using TFTP.

To remotely copy an SRVTAB file to the device from the KDC, use the `kerberos srvtab remote` command in global configuration mode:

```
Device(config)# kerberos srvtab remote {hostname | ip-address} {filename}
```

When you copy the SRVTAB file from the device to the KDC, the `kerberos srvtab remote` command parses the information in this file and stores it in the running configuration of the device, in the `kerberos srvtab entry` format. To ensure that the SRVTAB is available (does not need to be acquired from the KDC) when you reboot the device, use the `write memory` configuration command to write your running configuration (which contains the parsed SRVTAB file) to NVRAM.

### Specifying Kerberos Authentication

See the Configuring Authentication feature module for more information on configuring authentication on the device `aaa authentication` command is used to specify Kerberos as the authentication method.

### Enabling Credentials Forwarding

With Kerberos configured thus far, a user authenticated to a Kerberized device has a TGT and can use it to authenticate to a host on the network. However, if the user tries to list credentials after authenticating to a host, the output will show no Kerberos credentials present.

You can optionally configure the device to forward users’ TGTs with them as they authenticate from the device to Kerberized remote hosts on the network when using Kerberized Telnet, rcp, rsh, and rlogin (with the appropriate flags).
To force all clients to forward users’ credentials as they connect to other hosts in the Kerberos realm, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# kerberos credentials forward</code></td>
<td>Forces all clients to forward user credentials upon successful Kerberos authentication.</td>
</tr>
</tbody>
</table>

With credentials forwarding enabled, users’ TGTs are automatically forwarded to the next host they authenticate to. In this way, users can connect to multiple hosts in the Kerberos realm without running the KINIT program each time to get a new TGT.

**Opening a Telnet Session to a Device**

To use Kerberos to authenticate users opening a Telnet session to the device from within the network, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Device(config)# aaa authentication login {default</td>
<td>list-name} krb5_telnet`</td>
</tr>
</tbody>
</table>

Although Telnet sessions to the device are authenticated, users must still enter a clear text password if they want to enter enable mode. The `kerberos instance map` command, discussed in a later section, allows them to authenticate to the device at a predefined privilege level.

**Establishing an Encrypted Kerberized Telnet Session**

Another way for users to open a secure Telnet session is to use Encrypted Kerberized Telnet. With Encrypted Kerberized Telnet, users are authenticated by their Kerberos credentials before a Telnet session is established. The Telnet session is encrypted using 56-bit Data Encryption Standard (DES) encryption with 64-bit Cipher Feedback (CFB). Because data sent or received is encrypted, not clear text, the integrity of the dialed device or access server can be more easily controlled.

**Note**

This feature is available only if you have the 56-bit encryption image. 56-bit DES encryption is subject to U.S. Government export control regulations.

To establish an encrypted Kerberized Telnet session from a device to a remote host, use either of the following commands in EXEC command mode:
When a user opens a Telnet session from a device to a remote host, the device and remote host negotiate to authenticate the user using Kerberos credentials. If this authentication is successful, the device and remote host then negotiate whether or not to use encryption. If this negotiation is successful, both inbound and outbound traffic is encrypted using 56-bit DES encryption with 64-bit CFB.

When a user dials in from a remote host to a device configured for Kerberos authentication, the host and device will attempt to negotiate whether or not to use encryption for the Telnet session. If this negotiation is successful, the device will encrypt all outbound data during the Telnet session.

If encryption is not successfully negotiated, the session will be terminated and the user will receive a message stating that the encrypted Telnet session was not successfully established.

### Enabling Mandatory Kerberos Authentication

As an added layer of security, you can optionally configure the device so that, after remote users authenticate to it, these users can authenticate to other services on the network only with Kerberized Telnet, rlogin, rsh, and rcp. If you do not make Kerberos authentication mandatory and Kerberos authentication fails, the application attempts to authenticate users using the default method of authentication for that network service; for example, Telnet and rlogin prompt for a password, and rsh attempts to authenticate using the local rhost file.

To make Kerberos authentication mandatory, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# kerberos clients mandatory</code></td>
<td>Sets Telnet, rlogin, rsh, and rcp to fail if they cannot negotiate the Kerberos protocol with the remote server.</td>
</tr>
</tbody>
</table>

### Enabling Kerberos Instance Mapping

You can create administrative instances of users in the KDC database. The `kerberos instance map` command allows you to map those instances to Cisco IOS privilege levels so that users can open secure Telnet sessions to the device at a predefined privilege level, obviating the need to enter a clear text password to enter enable mode.

To map a Kerberos instance to a Cisco IOS privilege level, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
**Command**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# kerberos instance map instance privilege-level</code></td>
<td>Maps a Kerberos instance to a Cisco IOS privilege level.</td>
</tr>
</tbody>
</table>

If there is a Kerberos instance for user *loki* in the KDC database (for example, *loki/admin*), user *loki* can now open a Telnet session to the device as *loki/admin* and authenticate automatically at privilege level 15, assuming instance “admin” is mapped to privilege level 15.

Cisco IOS commands can be set to various privilege levels using the `privilege level` command.

After you map a Kerberos instance to a Cisco IOS privilege level, you must configure the device to check for Kerberos instances each time a user logs in. To run authorization to determine if a user is allowed to run an EXEC shell based on a mapped Kerberos instance, use the `aaa authorization` command with the `krb5-instance` keyword. For more information, refer to the chapter “Configuring Authorization.”

### Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the following commands:

- `show running-config`
- `show kerberos creds`: Lists the credentials in a current user’s credentials cache.
- `clear kerberos creds`: Destroys all credentials in a current user’s credentials cache, including those forwarded.

### Configuration Examples for Kerberos

#### Example: Defining a Kerberos Realm

To define CISCO.COM as the default Kerberos realm, use the following command:

```
kerberos local-realm CISCO.COM
```

To tell the device that the CISCO.COM KDC is running on host 10.2.3.4 at port number 170, use the following Kerberos command:

```
kerberos server CISCO.COM 10.2.3.4 170
```

To map the DNS domain cisco.com to the Kerberos realm CISCO.COM, use the following command:

```
kerberos realm.cisco.com CISCO.COM
```

#### Example: Copying a SRVTAB File

To copy over the SRVTAB file on a host named host123.cisco.com for a device named device1.cisco.com, the command would look like this:

```
kerberos srvtab remote host123.cisco.com device1.cisco.com-new-srvtab
```
Example: Configuring Kerberos

This section provides a typical non-Kerberos device configuration and shows output for this configuration from the `write term` command, then builds on this configuration by adding optional Kerberos functionality. Output for each configuration is presented for comparison against the previous configuration.

This example shows how to use the `kdb5_edit` program to perform the following configuration tasks:

- Adding user `chet` to the Kerberos database
- Adding a privileged Kerberos instance of user `chet` (chet/admin) to the Kerberos database
- Adding a restricted instance of `chet` (chet/restricted) to the Kerberos database
- Adding workstation `chet-ss20.cisco.com`
- Adding device `chet-2500.cisco.com` to the Kerberos database
- Adding workstation `chet-ss20.cisco.com` to the Kerberos database
- Extracting SRVTABs for the device and workstations
- Listing the contents of the KDC database (with the `ldb` command)

**Note**

In this sample configuration, host `chet-ss20` is also the KDC:

```
chet-ss20# sbin/kdb5_edit
kdb5_edit: ank chet
Enter password:
Re-enter password for verification:
kdb5_edit: ank chet/admin
Enter password:
Re-enter password for verification:
kdb5_edit: ank chet/restricted
Enter password:
Re-enter password for verification:
kdb5_edit: ark host/chet-ss20.cisco.com
kdb5_edit: ark host/chet-2500.cisco.com
kdb5_edit: xst chet-ss20.cisco.com host
'host/chet-ss20.cisco.com@CISCO.COM' added to keytab 'WRFILE:chet-ss20.cisco.com-new-srvtab'
kdb5_edit: xst chet-2500.cisco.com host
'host/chet-2500.cisco.com@CISCO.COM' added to keytab 'WRFILE:chet-2500.cisco.com-new-srvtab'
kdb5_edit: 1db
entry: host/chet-2500.cisco.com@CISCO.COM
entry: chet/restricted@CISCO.COM
entry: chet@CISCO.COM
entry: K/M@CISCO.COM
entry: host/chet-ss20.cisco.com@CISCO.COM
entry: krbtgt/CISCO.COM@CISCO.COM
entry: chet/admin@CISCO.COM
kdb5_edit: q
chet-ss20#
```

The following example shows output from a `write term` command, which displays the configuration of device `chet-2500`. This is a typical configuration with no Kerberos authentication.

```
chet-2500# write term
```

The following example shows how to enable user authentication on the device via the Kerberos database. To enable user authentication via the Kerberos database, you would perform the following tasks:

- Entering configuration mode
- Defining the Kerberos local realm
- Identifying the machine hosting the KDC
- Enabling credentials forwarding
- Specifying Kerberos as the method of authentication for login
- Exiting configuration mode (CTL-Z)
- Writing the new configuration to the terminal

chet-2500# configure term
Enter configuration commands, one per line. End with CNTL/Z.
chet-2500(config)# kerberos local-realm CISCO.COM
chet-2500(config)# kerberos server CISCO.COM chet-ss20
Translating "chet-ss20"...domain server (192.168.0.0) [OK]

Example: Configuring Kerberos

With the device configured thus far, user chet can log in to the device with a username and password and automatically obtain a TGT, as illustrated in the next example. With possession of a credential, user chet successfully authenticates to host chet-ss20 without entering a username/password.

chet-ss20% telnet chet-2500
Trying 172.16.0.0 ...
Connected to chet-2500.cisco.com.
Escape character is '^]'.
User Access Verification
Username: chet
Password:
chet-2500> show kerberos creds
Default Principal: chet@CISCO.COM
Valid Starting Expires Service Principal
chet-2500% telnet chet-ss20
Trying chet-ss20.cisco.com (172.71.54.14)... Open
Kerberos: Successfully forwarded credentials
SunOS UNIX (chet-ss20) (pts/7)
Last login: Mon May 13 13:47:35 from chet-ss20.cisco.com
Sun Microsystems Inc. SunOS 5.4 Generic July 1994
unknown mode: new
chet-ss20%

The following example shows how to authenticate to the device using Kerberos credentials. To authenticate using Kerberos credentials, you would perform the following tasks:

- Entering configuration mode
- Remotely copying over the SRVTAB file from the KDC
- Setting authentication at login to use the Kerberos 5 Telnet authentication protocol when using Telnet to connect to the device
- Writing the configuration to the terminal

Note that the new configuration contains a `kerberos srvtab entry` line. This line is created by the `kerberos srvtab remotecommand`.

chet-2500# configure term
Enter configuration commands, one per line. End with CNTL/Z.
chet-2500(config)# kerberos srvtab remote earth chet/chet-2500.cisco.com-new-srvtab
Translating "earth"...domain server (192.168.0.0) [OK]
Loading chet/chet-2500.cisco.com-new-srvtab from 172.68.1.123 (via Ethernet0): !
[OK - 66/1000 bytes]
chet-2500(config)# aaa authentication login default krb5-telnet krb5
chet-2500(config)#

chet-2500> q
Connection closed by foreign host.
chet-ss20%

The following example shows how to map Kerberos instances to Cisco's privilege levels. To map Kerberos instances to privilege levels, you would perform the following tasks:

- Entering configuration mode
- Mapping the Kerberos instance admin to privilege level 15
- Mapping the Kerberos instance restricted to privilege level 3
- Specifying that the instance defined by the `kerberos instance map` command be used for AAA Authorization
- Writing the configuration to the terminal

chet-2500# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
chet-2500(config)# kerberos instance map admin 15
chet-2500(config)# kerberos instance map restricted 3
chet-2500(config)# aaa authorization exec default krb5-instance
chet-2500(config)#

CHAPTER 48

Configuring Accounting

The AAA Accounting feature allows the services that users are accessing and the amount of network resources that users are consuming to be tracked. When AAA Accounting is enabled, the network access server reports user activity to the TACACS+ or RADIUS security server (depending on which security method is implemented) in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, and auditing.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Accounting

The following tasks must be performed before configuring accounting using named method lists:

- Enable AAA on the network access server by using the `aaa new-model` command in global configuration mode.

- Define the characteristics of the RADIUS or TACACS+ security server if RADIUS or TACACS+ authorization is issued. For more information about configuring the Cisco network access server to...
communicate with the RADIUS security server, see the Configuring RADIUS module. For more information about configuring the Cisco network access server to communicate with the TACACS+ security server, see the Configuring TACACS+ module.

Restrictions for Configuring Accounting

• Accounting information can be sent simultaneously to a maximum of only four AAA servers.

• For Service Selection Gateway (SSG) systems, the **aaa accounting network broadcast** command broadcasts only **start-stop** accounting records. If interim accounting records are configured using the **ssg accounting interval** command, the interim accounting records are sent only to the configured default RADIUS server.

Information About Configuring Accounting

Named Method Lists for Accounting

Similar to authentication and authorization method lists, method lists for accounting define the way accounting is performed and the sequence in which these methods are performed.

Named accounting method lists allow particular security protocol to be designated and used on specific lines or interfaces for accounting services. The only exception is the default method list (which is named “default”). The default method list is automatically applied to all interfaces except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list is simply a named list describing the accounting methods to be queried (such as RADIUS or TACACS+), in sequence. Method lists allow one or more security protocols to be designated and used for accounting, thus ensuring a backup system for accounting in case the initial method fails. Cisco IOS software uses the first method listed to support accounting; if that method fails to respond, the Cisco IOS software selects the next accounting method listed in the method list. This process continues until there is successful communication with a listed accounting method, or all methods defined are exhausted.

**Note**

The Cisco IOS software attempts accounting with the next listed accounting method only when there is no response from the previous method. If accounting fails at any point in this cycle--meaning that the security server responds by denying the user access--the accounting process stops and no other accounting methods are attempted.

Accounting method lists are specific to the type of accounting being requested. AAA supports seven different types of accounting:

• **Network** --Provides information for all PPP, SLIP, or ARAP sessions, including packet and byte counts.

• **EXEC** --Provides information about user EXEC terminal sessions of the network access server.

• **Commands** --Provides information about the EXEC mode commands that a user issues. Command accounting generates accounting records for all EXEC mode commands, including global configuration commands, associated with a specific privilege level.
• **Connection** -- Provides information about all outbound connections made from the network access server, such as Telnet, local-area transport (LAT), TN3270, packet assembler/disassembler (PAD), and rlogin.

• **System** -- Provides information about system-level events.

• **Resource** -- Provides “start” and “stop” records for calls that have passed user authentication, and provides “stop” records for calls that fail to authenticate.

• **VRRS** -- Provides information about Virtual Router Redundancy Service (VRRS).

---

**Note**

System accounting does not use named accounting lists; only the default list for system accounting can be defined.

Once again, when a named method list is created, a particular list of accounting methods for the indicated accounting type are defined.

Accounting method lists must be applied to specific lines or interfaces before any of the defined methods are performed. The only exception is the default method list (which is named “default”). If the `aaa accounting` command for a particular accounting type is issued without specifying a named method list, the default method list is automatically applied to all interfaces or lines except those that have a named method list explicitly defined (a defined method list overrides the default method list). If no default method list is defined, then no accounting takes place.

This section includes the following subsections:

### Method Lists and Server Groups

A server group is a way to group existing LDAP, RADIUS, or TACACS+ server hosts for use in method lists. The figure below shows a typical AAA network configuration that includes four security servers: R1 and R2 are RADIUS servers, and T1 and T2 are TACACS+ servers. R1 and R2 make up the group of RADIUS servers. T1 and T2 make up the group of TACACS+ servers.

Using server groups, a subset of the configured server hosts can be specified and use them for a particular service. For example, server groups allows R1 and R2 to be defined as separate server groups, and T1 and T2 as separate server groups. This allows either R1 and T1 to be specified in the method list or R2 and T2 in the method list, which provides more flexibility in the way that RADIUS and TACACS+ resources are assigned.

Server groups also can include multiple host entries for the same server, as long as each entry has a unique identifier. The combination of an IP address and a UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. In other words, this unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authorization—the second host entry configured acts as fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order they are configured.)

### AAA Accounting Methods

The Cisco IOS software supports the following two methods for accounting:
• TACACS+—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

• RADIUS—The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

Note: With CSCuc32663, passwords and accounting logs are masked before being sent to the TACACS+ or RADIUS security servers. Use the `aaa accounting commands visible-keys` command to send unmasked information to the TACACS+ or RADIUS security servers.

### Accounting Record Types

For minimal accounting, use the `stop-only` keyword, which instructs the specified method (RADIUS or TACACS+) to send a stop record accounting notice at the end of the requested user process. For more accounting information, use the `start-stop` keyword to send a start accounting notice at the beginning of the requested event and a stop accounting notice at the end of the event. To stop all accounting activities on this line or interface, use the `none` keyword.

### AAA Accounting Methods

The Cisco IOS software supports the following two methods for accounting:

• TACACS+—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

• RADIUS—The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting AV pairs and is stored on the security server.

Note: With CSCuc32663, passwords and accounting logs are masked before being sent to the TACACS+ or RADIUS security servers. Use the `aaa accounting commands visible-keys` command to send unmasked information to the TACACS+ or RADIUS security servers.

### AAA Accounting Types

#### Network Accounting

Network accounting provides information for all PPP, SLIP, or ARAP sessions, including packet and byte counts.

The following example shows the information contained in a RADIUS network accounting record for a PPP user who comes in through an EXEC session:

```
Wed Jun 27 04:44:45 2001
```
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "0000000D"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:45:00 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000E"
Framed-IP-Address = "10.1.1.2"
Framed-Protocol = PPP
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:47:46 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "562"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Framed
Acct-Session-Id = "0000000E"
Framed-IP-Address = "10.1.1.2"
Framed-Protocol = PPP
Acct-Input-Octets = 3075
Acct-Output-Octets = 167
Acct-Input-Packets = 39
Acct-Output-Packets = 9
Acct-Session-Time = 171
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

Wed Jun 27 04:48:45 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 5
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "408"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "0000000D"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

The following example shows the information contained in a TACACS+ network accounting record for a PPP user who first started an EXEC session:
Network Accounting

The precise format of accounting packets records may vary depending on the security server daemon.

The following example shows the information contained in a RADIUS network accounting record for a PPP user who comes in through autoselect:

Wed Jun 27 04:30:52 2001 172.16.25.15 username1 tty4 4327528 start
task_id=28
service=shell
Wed Jun 27 04:30:52 2001 172.16.25.15 username1 tty4 4327528 stop
task_id=28
service=shell

Wed Jun 27 04:36:49 2001 172.16.25.15 username1 tty4 4327528 update
addr=10.1.1.1 service=ppp protocol=ip addr=10.1.1.1
bytes_in=2844 bytes_out=1682 paks_in=36 paks_out=24 elapsed_time=51

The following example shows the information contained in a TACACS+ network accounting record for a PPP user who comes in through autoselect:

Wed Jun 27 04:02:19 2001 172.16.25.15 username1 Async5 562/4327528 start
service=ppp
EXEC Accounting

EXEC accounting provides information about user EXEC terminal sessions (user shells) on the network access server, including username, date, start and stop times, the access server IP address, and (for dial-in users) the telephone number the call originated from.

The following example shows the information contained in a RADIUS EXEC accounting record for a dial-in user:

```
Wed Jun 27 04:26:23 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 1
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329483"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "00000006"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
```

The following example shows the information contained in a TACACS+ EXEC accounting record for a dial-in user:

```
NAS-IP-Address = "172.16.25.15"
NAS-Port = 1
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329483"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "00000006"
Acct-Session-Time = 62
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
```

The following example shows the information contained in a RADIUS EXEC accounting record for a Telnet user:

```
NAS-IP-Address = "172.16.25.15"
NAS-Port = 26
User-Name = "username1"
Caller-ID = "10.68.202.158"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
```
Service-Type = Exec-User
Acct-Session-Id = "00000010"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

NAS-IP-Address = "172.16.25.15"
NAS-Port = 26
User-Name = "username1"
Caller-ID = "10.68.202.158"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Exec-User
Acct-Session-Id = "00000010"
Acct-Session-Time = 14
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"

The following example shows the information contained in a TACACS+ EXEC accounting record for a Telnet user:

start task_id=41 service=shell
stop task_id=41 service=shell elapsed_time=9

Command Accounting

Command accounting provides information about the EXEC shell commands for a specified privilege level that are being executed on a network access server. Each command accounting record includes a list of the commands executed for that privilege level, as well as the date and time each command was executed, and the user who executed it.

The following example shows the information contained in a TACACS+ command accounting record for privilege level 1:

Wed Jun 27 03:46:47 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=3 service=shell priv-lvl=1 cmd=show version <cr>
Wed Jun 27 03:46:50 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=4 service=shell priv-lvl=1 cmd=show interfaces Ethernet 0 <cr>
Wed Jun 27 03:47:03 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=5 service=shell priv-lvl=1 cmd=show ip route <cr>

The following example shows the information contained in a TACACS+ command accounting record for privilege level 15:

Wed Jun 27 03:47:17 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=6 service=shell priv-lvl=15 cmd=configure terminal <cr>
Wed Jun 27 03:47:21 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=7 service=shell priv-lvl=15 cmd=interface Serial 0 <cr>
Wed Jun 27 03:47:29 2001 172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=8 service=shell priv-lvl=15 cmd=ip address 10.1.1.1 255.255.255.0 <cr>
The Cisco implementation of RADIUS does not support command accounting.

Connection Accounting

Connection accounting provides information about all outbound connections made from the network access server such as Telnet, LAT, TN3270, PAD, and rlogin.

The following example shows the information contained in a RADIUS connection accounting record for an outbound Telnet connection:

Wed Jun 27 04:28:00 2001
NAS-IP-Address = “172.16.25.15”
NAS-Port = 2
User-Name = “username1”
Client-Port-DNIS = “4327528”
Caller-ID = “5622329477”
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = “00000008”
Login-Service = Telnet
Login-IP-Host = “10.68.202.158”
Acct-Delay-Time = 0
User-Id = “username1”
NAS-Identifier = “172.16.25.15”

NAS-IP-Address = “172.16.25.15”
NAS-Port = 2
User-Name = “username1”
Client-Port-DNIS = “4327528”
Caller-ID = “5622329477”
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = “00000008”
Login-Service = Telnet
Login-IP-Host = “10.68.202.158”
Acct-Delay-Time = 0
Acct-Input-Octets = 10774
Acct-Output-Octets = 112
Acct-Input-Packets = 91
Acct-Output-Packets = 99
Acct-Session-Time = 39
User-Id = “username1”
NAS-Identifier = “172.16.25.15”

The following example shows the information contained in a TACACS+ connection accounting record for an outbound Telnet connection:

Wed Jun 27 03:47:43 2001
username1 tty3 5622329430/4327528
start task_id=10 service=connection protocol=telnet addr=10.68.202.158 cmd=telnet
username1-sun

Wed Jun 27 03:48:38 2001
username1 tty3 5622329430/4327528
stop task_id=10 service=connection protocol=telnet addr=10.68.202.158 cmd=telnet
username1-sun bytes_in=4467 bytes_out=96 paks_in=61 paks_out=72 elapsed_time=55
The following example shows the information contained in a RADIUS connection accounting record for an outbound rlogin connection:

```
NAS-IP-Address = "172.16.25.15"
NAS-Port = 2
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329477"
Acct-Status-Type = Start
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = "0000000A"
Login-Service = Rlogin
Login-IP-Host = "10.68.202.158"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
```

```
Wed Jun 27 04:30:09 2001
NAS-IP-Address = "172.16.25.15"
NAS-Port = 2
User-Name = "username1"
Client-Port-DNIS = "4327528"
Caller-ID = "5622329477"
Acct-Status-Type = Stop
Acct-Authentic = RADIUS
Service-Type = Login
Acct-Session-Id = "0000000A"
Login-Service = Rlogin
Login-IP-Host = "10.68.202.158"
Acct-Delay-Time = 0
User-Id = "username1"
NAS-Identifier = "172.16.25.15"
```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound rlogin connection:

```
Wed Jun 27 03:48:46 2001
172.16.25.15 username1 tty3 5622329430/4327528
start task_id=12 service=connection protocol=rlogin addr=10.68.202.158 cmd=rlogin
username1-sun /user username1
```

```
Wed Jun 27 03:51:37 2001
172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=12 service=connection protocol=rlogin addr=10.68.202.158 cmd=rlogin
username1-sun /user username1 bytes_in=659926 bytes_out=138 paks_in=2378 paks_out=1251 elapsed_time=171
```

The following example shows the information contained in a TACACS+ connection accounting record for an outbound LAT connection:

```
Wed Jun 27 03:53:06 2001
172.16.25.15 username1 tty3 5622329430/4327528
start task_id=18 service=connection protocol=lat addr=VAX cmd=lat
VAX
```

```
Wed Jun 27 03:54:15 2001
172.16.25.15 username1 tty3 5622329430/4327528
stop task_id=18 service=connection protocol=lat addr=VAX cmd=lat
VAX bytes_in=0 bytes_out=0 paks_in=0 paks_out=0 elapsed_time=6
```
System Accounting

System accounting provides information about all system-level events (for example, when the system reboots or when accounting is turned on or off).

The following accounting record shows a typical TACACS+ system accounting record server indicating that AAA Accounting has been turned off:

```
   service=system   event=sys_acct   reason=reconfigure
```

Note

The precise format of accounting packets records may vary depending on the TACACS+ daemon.

The following accounting record shows a TACACS+ system accounting record indicating that AAA Accounting has been turned on:

```
Wed Jun 27 03:55:22 2001   172.16.25.15   unknown unknown unknown stop  task_id=23
   service=system   event=sys_acct   reason=reconfigure
```

Additional tasks for measuring system resources are covered in the Cisco IOS software configuration guides. For example, IP accounting tasks are described in the Configuring IP Services chapter in the Cisco IOS Application Services Configuration Guide.

Resource Accounting

The Cisco implementation of AAA accounting provides “start” and “stop” record support for calls that have passed user authentication. The additional feature of generating “stop” records for calls that fail to authenticate as part of user authentication is also supported. Such records are necessary for users employing accounting records to manage and monitor their networks.

This section includes the following subsections:

AAA Resource Failure Stop Accounting

Before AAA resource failure stop accounting, there was no method of providing accounting records for calls that failed to reach the user authentication stage of a call setup sequence. Such records are necessary for users employing accounting records to manage and monitor their networks and their wholesale customers.

This functionality generates a “stop” accounting record for any calls that do not reach user authentication; “stop” records are generated from the moment of call setup. All calls that pass user authentication behave as they did before; that is, no additional accounting records are seen.

The figure below illustrates a call setup sequence with normal call flow (no disconnect) and without AAA resource failure stop accounting enabled.

*Figure 81: Modem Dial-In Call Setup Sequence With Normal Flow and Without Resource Failure Stop Accounting Enabled*
AAA Resource Accounting for Start-Stop Records

AAA resource accounting for start-stop records supports the ability to send a “start” record at each call setup, followed by a corresponding “stop” record at the call disconnect. This functionality can be used to manage and monitor wholesale customers from one source of data reporting, such as accounting records.

With this feature, a call setup and call disconnect “start-stop” accounting record tracks the progress of the resource connection to the device. A separate user authentication “start-stop” accounting record tracks the
user management progress. These two sets of accounting records are interlinked by using a unique session ID for the call.

The figure below illustrates a call setup sequence with AAA resource start-stop accounting enabled.

**Figure 85: Modem Dial-In Call Setup Sequence With Resource Start-Stop Accounting Enabled**

---

**VRRS Accounting**

Virtual Router Redundancy Service (VRRS) provides a multiclent information abstraction and management service between a First Hop Redundancy Protocol (FHRP) and a registered client. The VRRS multiclent service provides a consistent interface with FHRP protocols by abstracting over several FHRPs and providing an idealized view of their state. VRRS manages data updates, allowing interested clients to register in one place and receive updates for named FHRP groups or all registered FHRP groups.

Virtual Router Redundancy Protocol (VRRP) is an FHRP that acts as a server that pushes FHRP status information out to all registered VRRS clients. Clients obtain status on essential information provided by the FHRP, including current and previous redundancy states, active and inactive L3 and L2 addresses, and, in some cases, information about other redundant gateways in the network. Clients can use this information to provide stateless and stateful redundancy information to clients and protocols.

**VRRS Accounting Plug-in**

The VRRS Accounting plug-in provides a configurable AAA method list mechanism that provides updates to a RADIUS server when a VRRS group transitions its state. The VRRS accounting plug-in is an extension of existing AAA system accounting messages. The VRRS Accounting plug-in provides accounting-on and accounting-off messages and an additional Vendor-Specific Attribute (VSA) that sends the configured VRRS name in RADIUS accounting messages. The VRRS name is configured using the `vrrp name` command in interface configuration mode.

The following RADIUS attributes are included in VRRS accounting messages by default:

- Attribute 4, NAS-IP-Address
- Attribute 26, Cisco VSA Type 1, VRRS Name
- Attribute 40, Acct-Status-Type
- Attribute 41, Acct-Delay-Time
Accounting messages for a VRRS transitioning out of master state are sent after all PPoE accounting stop messages for sessions that are part of that VRRS.

**AAA Accounting Enhancements**

**AAA Broadcast Accounting**

AAA broadcast accounting allows accounting information to be sent to multiple AAA servers at the same time; that is, accounting information can be broadcast to one or more AAA servers simultaneously. This functionality allows service providers to send accounting information to their own private AAA servers and to the AAA servers of their end customers. It also provides redundant billing information for voice applications.

Broadcasting is allowed among groups of RADIUS or TACACS+ servers, and each server group can define its backup servers for failover independently of other groups.

Thus, service providers and their end customers can use different protocols (RADIUS or TACACS+) for the accounting server. Service providers and their end customers can also specify their backup servers independently. As for voice applications, redundant accounting information can be managed independently through a separate group with its own failover sequence.

**AAA Session MIB**

The AAA session MIB feature allows customers to monitor and terminate their authenticated client connections using Simple Network Management Protocol (SNMP). The data of the client is presented so that it correlates directly to the AAA Accounting information reported by either the RADIUS or the TACACS+ server. AAA session MIB provides the following information:

- Statistics for each AAA function (when used in conjunction with the `show radius statistics` command)
- Status of servers providing AAA functions
- Identities of external AAA servers
- Real-time information (such as idle times), providing additional criteria for use by SNMP networks for assessing whether or not to terminate an active call

This command is supported only on Cisco AS5300 and Cisco AS5800 universal access server platforms.

The table below shows the SNMP user-end data objects that can be used to monitor and terminate authenticated client connections with the AAA session MIB feature.

**Table 113: SNMP End-User Data Objects**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionId</td>
<td>The session identification used by the AAA Accounting protocol (same value as reported by RADIUS attribute 44 (Acct-Session-ID)).</td>
</tr>
<tr>
<td>UserId</td>
<td>The user login ID or zero-length string if a login is unavailable.</td>
</tr>
<tr>
<td>IpAddr</td>
<td>The IP address of the session or 0.0.0.0 if an IP address is not applicable or unavailable.</td>
</tr>
</tbody>
</table>
IdelTime  The elapsed time in seconds that the session has been idle.
Disconnect The session termination object used to disconnect the given client.
CallId  The entry index corresponding to this accounting session that the Call Tracker record stored.

The table below describes the AAA summary information provided by the AAA session MIB feature using SNMP on a per-system basis.

Table 114: SNMP AAA Session Summary

<table>
<thead>
<tr>
<th>ActiveTableEntries</th>
<th>Number of sessions currently active.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActiveTableHighWaterMark</td>
<td>Maximum number of sessions present at once since last system reinstall.</td>
</tr>
<tr>
<td>TotalSessions</td>
<td>Total number of sessions since last system reinstallatation.</td>
</tr>
<tr>
<td>DisconnectedSessions</td>
<td>Total number of sessions that have been disconnected using since last system reinstall.</td>
</tr>
</tbody>
</table>

**Accounting Attribute-Value Pairs**

The network access server monitors the accounting functions defined in either TACACS+ AV pairs or RADIUS attributes, depending on which security method is implemented.

**How to Configure Accounting**

**Configuring AAA Accounting Using Named Method Lists**

To configure AAA Accounting using named method lists, perform the following steps:

1. `enable`
2. `configure terminal`
3. `aaa accounting {system | network | exec | connection | commands level} {default | list-name} {start-stop | stop-only | none} [method1 [method2...]]`
4. Do one of the following:
   • `line [aux | console | tty | vty] line-number [ending-line-number]`
   • `interface interface-type interface-number`
5. Do one of the following:
   • `accounting {arap | commands level | connection | exec} {default | list-name}`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa accounting {system</td>
<td>network</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa accounting system default start-stop</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Do one of the following:</td>
<td>Enters the line configuration mode for the lines to which the accounting method list is applied.</td>
</tr>
<tr>
<td>• line [aux</td>
<td>console</td>
</tr>
<tr>
<td>• interface interface-type interface-number</td>
<td>Enters the interface configuration mode for the interfaces to which the accounting method list is applied.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# line aux line1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Do one of the following:</td>
<td>Applies the accounting method list to a line or set of lines.</td>
</tr>
<tr>
<td>• accounting {arap</td>
<td>commands level</td>
</tr>
<tr>
<td>• ppp accounting {default</td>
<td>list-name}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-line)# accounting arap default</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> Device(config-line)# end</td>
<td>(Optional) Exits line configuration mode and returns to global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-line)# end</td>
<td></td>
</tr>
</tbody>
</table>
Configuring RADIUS System Accounting

Perform this task to configure RADIUS system accounting on the global RADIUS server:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa new-model
4. radius-server accounting system host-config
5. aaa group server radius server-name
6. server-private \{host-name | ip-address\} key \{0 server-key | 7 server-key\} server-key
7. accounting system host-config
8. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  Example:  
  Device> enable  
  • Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode.  
  Example:  
  Device# configure terminal |
| **Step 3** aaa new-model | Enables AAA network security services.  
  Example:  
  Device(config)# aaa new-model |
| **Step 4** radius-server accounting system host-config | Enables the device to send a system accounting record for the addition and deletion of a RADIUS server.  
  Example:  
  Device(config)# radius-server accounting system host-config |
| **Step 5** aaa group server radius server-name | Adds the RADIUS server and enters server-group configuration mode.  
  Example:  
  Device(config)# aaa group server radius radgroup1  
  • The server-name argument specifies the RADIUS server group name. |
| **Step 6** server-private \{host-name | ip-address\} key \{0 server-key | 7 server-key\} server-key | Enters the hostname or IP address of the RADIUS server and hidden server key.  
  Example:  
  Device(config)# server-private radgroup1  
  • The server-name argument specifies the RADIUS server group name. |
Suppressing Generation of Accounting Records for Null Username Sessions

When AAA Accounting is activated, the Cisco IOS software issues accounting records for all users on the system, including users whose username string, because of protocol translation, is NULL. An example of this is users who come in on lines where the `aaa authentication login method-list none` command is applied. To prevent accounting records from being generated for sessions that do not have usernames associated with them, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# aaa accounting suppress null-username</code></td>
<td>Prevents accounting records from being generated for users whose username string is NULL.</td>
</tr>
</tbody>
</table>

Generating Interim Accounting Records

To enable periodic interim accounting records to be sent to the accounting server, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# aaa accounting update [newinfo] [periodic] number</code></td>
<td>Enables periodic interim accounting records to be sent to the accounting server.</td>
</tr>
</tbody>
</table>
When the `aaa accounting update` command is activated, the Cisco IOS software issues interim accounting records for all users on the system. If the keyword `newinfo` is used, interim accounting records are sent to the accounting server every time there is new accounting information to report. An example of this would be when IPCP completes IP address negotiation with the remote peer. The interim accounting record includes the negotiated IP address used by the remote peer.

When used with the keyword `periodic`, interim accounting records are sent periodically as defined by the `number` argument. The interim accounting record contains all of the accounting information recorded for that user up to the time the interim accounting record is sent.

Using the `aaa accounting update periodic` command can cause heavy congestion when many users are logged in to the network.

### Generating Accounting Records for Failed Login or Session

When AAA Accounting is activated, the Cisco IOS software does not generate accounting records for system users who fail login authentication, or who succeed in login authentication but fail PPP negotiation for some reason.

To specify that accounting stop records be generated for users who fail to authenticate at login or during session negotiation, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# aaa accounting send stop-record authentication failure</code></td>
<td>Generates “stop” records for users who fail to authenticate at login or during session negotiation using PPP.</td>
</tr>
<tr>
<td><code>Device(config)# aaa accounting send stop-record always</code></td>
<td>Sends authentication, authorization, and accounting (AAA) stop records regardless of whether a start record was sent earlier.</td>
</tr>
</tbody>
</table>

### Specifying Accounting NETWORK-Stop Records Before EXEC-Stop Records

For PPP users who start EXEC terminal sessions, you can specify the NETWORK records to be generated before EXEC-stop records. In cases such as billing customers for specific services, it can be desirable to keep network start and stop records together, essentially “nesting” them within the framework of the EXEC start and stop messages. For example, a user dialing in using PPP can create the following records: EXEC-start, NETWORK-start, EXEC-stop, NETWORK-stop. By nesting the accounting records, NETWORK-stop records follow NETWORK-start messages: EXEC-start, NETWORK-start, NETWORK-stop, EXEC-stop.

To nest accounting records for user sessions, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# aaa accounting nested</code></td>
<td>Nests network accounting records.</td>
</tr>
</tbody>
</table>
Configuring AAA Resource Failure Stop Accounting

To enable resource failure stop accounting, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting resource method-list stop-failure group</td>
<td>Generates a “stop” record for any calls that do not reach user authentication.</td>
</tr>
<tr>
<td>server-group</td>
<td>Note Before configuring this feature, the tasks described in the Prerequisites for Configuring Accounting, on page 985 section must be performed, and SNMP must be enabled on the network access server.</td>
</tr>
</tbody>
</table>

Configuring AAA Resource Accounting for Start-Stop Records

To enable full resource accounting for start-stop records, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting resource method-list start-stop group</td>
<td>Supports the ability to send a “start” record at each call setup. followed with a corresponding “stop” record at the call disconnect.</td>
</tr>
<tr>
<td>server-group</td>
<td>Note Before configuring this feature, the tasks described in the Prerequisites for Configuring Accounting, on page 985 section must be performed, and SNMP must be enabled on the network access server.</td>
</tr>
</tbody>
</table>

Configuring AAA Broadcast Accounting

To configure AAA broadcast accounting, use the `aaa accounting` command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# aaa accounting {system</td>
<td>network</td>
</tr>
</tbody>
</table>

Configuring Per-DNIS AAA Broadcast Accounting

To configure AAA broadcast accounting per DNIS, use the `aaa dnis map accounting network` command in global configuration mode:
Configuring AAA Session MIB

The following tasks must be performed before configuring the AAA session MIB feature:

- Configure SNMP.
- Configure AAA.
- Define the RADIUS or TACACS+ server characteristics.

**Note**
Overusing SNMP can affect the overall system performance; therefore, normal network management performance must be considered when this feature is used.

To configure AAA session MIB, use the following command in global configuration mode:

**SUMMARY STEPS**

1. Device (config)# aaa session-mib disconnect

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Device (config)# a</td>
<td>Monitors and terminates authenticated client connections using SNMP.</td>
</tr>
<tr>
<td>a session-mib disconnect</td>
<td>To terminate the call, the disconnect keyword must be used.</td>
</tr>
</tbody>
</table>

Configuring VRRS Accounting

Perform the following task to configure Virtual Router Redundancy Service (VRRS) to send AAA Accounting messages to the AAA server:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa accounting vrrs {default | list-name} start-stop method1 [method2...]
4. aaa attribute list list-name
5. **attribute type** *name value* [service *service*] [protocol *protocol*][mandatory][tag *tag-value*]

6. **exit**

7. **vrrs** vrrs-group-name

8. **accounting delay** seconds

9. **accounting method** {default | accounting-method-list}

10. **end**

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables AAA accounting for VRRS.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa accounting vrrs default start-stop</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Defines a AAA attribute list locally on a device, and enters attribute list configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa attribute list list1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Defines an attribute type that is to be added to an attribute list locally on a device.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-attr-list)# attribute type example 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Exits attribute list configuration mode and returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-attr-list)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Defines a VRRP group and configures parameters for the VRRS group, and enters VRRS configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# vrrs vrrs1</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td>accounting delay <em>seconds</em></td>
<td>(Optional) Specifies the delay time for sending accounting-off messages to the VRRS.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td></td>
</tr>
<tr>
<td>accounting method {default</td>
<td>accounting-method-list}</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td></td>
</tr>
<tr>
<td><em>end</em></td>
<td>Exits VRRS configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Establishing a Session with a Device if the AAA Server is Unreachable

To establish a console or telnet session with a device if the AAA server is unreachable, use the following command in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# no aaa accounting system guarantee-first</td>
<td>The <em>aaa accounting system guarantee-first</em> command guarantees system accounting as the first record, which is the default condition. In some situations, users may be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than three minutes. To resolve this problem, the <em>no aaa accounting system guarantee-first</em> command can be used.</td>
</tr>
</tbody>
</table>

#### Note

Entering the *no aaa accounting system guarantee-first* command is not the only condition by which the console or telnet session can be started. For example, if the privileged EXEC session is being authenticated by TACACS and the TACACS server is not reachable, then the session cannot start.

### Monitoring Accounting

No specific *show* command exists for either RADIUS or TACACS+ accounting. To obtain accounting records displaying information about users currently logged in, use the following command in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# <em>show accounting</em></td>
<td>Allows display of the active accountable events on the network and helps collect information in the event of a data loss on the accounting server.</td>
</tr>
</tbody>
</table>
Troubleshooting Accounting

To troubleshoot accounting information, use the following command in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# debug aaa accounting</td>
<td>Displays information on accountable events as they occur.</td>
</tr>
</tbody>
</table>

Configuration Examples for Accounting

Example Configuring Named Method List

The following example shows how to configure a Cisco AS5200 (enabled for AAA and communication with a RADIUS security server) in order for AAA services to be provided by the RADIUS server. If the RADIUS server fails to respond, then the local database is queried for authentication and authorization information, and accounting services are handled by a TACACS+ server.

```
aaa new-model
aaa authentication login admins local
aaa authentication ppp dialins group radius local
aaa authorization network blue1 group radius local
aaa accounting network red1 start-stop group radius group tacacs+
username root password ALongPassword
tacacs-server host 172.31.255.0
tacacs-server key goaway
radius-server host 172.16.2.7
radius-server key myRaDiUSpassWoRd
interface group-async 1
group-range 1 16
encapsulation ppp
ppp authentication chap dialins
ppp authorization blue1
ppp accounting red1
line 1 16
autoselect ppp
autoselect during-login
login authentication admins
modem dialin
```

The lines in this sample RADIUS AAA configuration are defined as follows:

- The **aaa new-model** command enables AAA network security services.
- The **aaa authentication login admins local** command defines a method list “admins”, for login authentication.
- The **aaa authentication ppp dialins group radius local** command defines the authentication method list “dialins”, which specifies that first RADIUS authentication and then (if the RADIUS server does not respond) local authentication is used on serial lines using PPP.
- The **aaa authorization network blue1 group radius local** command defines the network authorization method list named “blue1”, which specifies that RADIUS authorization is used on serial lines using PPP. If the RADIUS server fails to respond, then local network authorization is performed.
• The `aaa accounting network red1 start-stop group radius group tacacs+` command defines the network accounting method list named red1, which specifies that RADIUS accounting services (in this case, start and stop records for specific events) are used on serial lines using PPP. If the RADIUS server fails to respond, accounting services are handled by a TACACS+ server.

• The `username` command defines the username and password to be used for the PPP Password Authentication Protocol (PAP) caller identification.

• The `tacacs-server host` command defines the name of the TACACS+ server host.

• The `tacacs-server key` command defines the shared secret text string between the network access server and the TACACS+ server host.

• The `radius-server host` command defines the name of the RADIUS server host.

• The `radius-server key` command defines the shared secret text string between the network access server and the RADIUS server host.

• The `interface group-async` command selects and defines an asynchronous interface group.

• The `group-range` command defines the member asynchronous interfaces in the interface group.

• The `encapsulation ppp` command sets PPP as the encapsulation method used on the specified interfaces.

• The `ppp authentication chap dialins` command selects Challenge Handshake Authentication Protocol (CHAP) as the method of PPP authentication and applies the “dialins” method list to the specified interfaces.

• The `ppp authorization blue1` command applies the blue1 network authorization method list to the specified interfaces.

• The `ppp accounting red1` command applies the red1 network accounting method list to the specified interfaces.

• The `line` command switches the configuration mode from global configuration to line configuration and identifies the specific lines being configured.

• The `autoselect ppp` command configures the Cisco IOS software to allow a PPP session to start up automatically on these selected lines.

• The `autoselect during-login` command is used to display the username and password prompt without pressing the Return key. After the user logs in, the autoselect function (in this case, PPP) begins.

• The `login authentication admins` command applies the admins method list for login authentication.

• The `modem dialin` command configures modems attached to the selected lines to only accept incoming calls.

The `show accounting` command yields the following output for the preceding configuration:

```
Active Accounted actions on tty1, User username2 Priv 1
Task ID 5, Network Accounting record, 00:00:52 Elapsed
task_id=5 service=ppp protocol=ip address=10.0.0.98
```

The table below describes the fields contained in the preceding output.
Table 115: show accounting Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Accounted actions on</td>
<td>Terminal line or interface name user with which the user logged in.</td>
</tr>
<tr>
<td>User</td>
<td>User’s ID.</td>
</tr>
<tr>
<td>Priv</td>
<td>User’s privilege level.</td>
</tr>
<tr>
<td>Task ID</td>
<td>Unique identifier for each accounting session.</td>
</tr>
<tr>
<td>Accounting record</td>
<td>Type of accounting session.</td>
</tr>
<tr>
<td>Elapsed</td>
<td>Length of time (hh:mm:ss) for this session type.</td>
</tr>
<tr>
<td>attribute=value</td>
<td>AV pairs associated with this accounting session.</td>
</tr>
</tbody>
</table>

Example Configuring AAA Resource Accounting

The following example shows how to configure the resource failure stop accounting and resource accounting for start-stop records functions:

```plaintext
!Enable AAA on your network access server.
aaa new-model
!Enable authentication at login and list the AOC string name to use for login authentication.
aaa authentication login AOL group radius local
!Enable authentication for ppp and list the default method to use for PPP authentication.
aaa authentication ppp default group radius local
!Enable authorization for all exec sessions and list the AOL string name to use for authorization.
aaa authorization exec AOL group radius if-authenticated
!Enable authorization for all network-related service requests and list the default method to use for all network-related authorizations.
aaa authorization network default group radius if-authenticated
!Enable accounting for all exec sessions and list the default method to use for all start-stop accounting services.
aaa accounting exec default start-stop group radius
!Enable accounting for all network-related service requests and list the default method to use for all start-stop accounting services.
aaa accounting network default start-stop group radius
!Enable failure stop accounting.
aaa accounting resource default stop-failure group radius
!Enable resource accounting for start-stop records.
aaa accounting resource default start-stop group radius
```

Example Configuring AAA Broadcast Accounting

The following example shows how to turn on broadcast accounting using the global `aaa accounting` command:

```plaintext
aaa group server radius isp
   server 10.0.0.1
   server 10.0.0.2
aaa group server tacacs+ isp_customer
   server 172.0.0.1
aaa accounting network default start-stop broadcast group isp group isp_customer
```
Example Configuring Per-DNIS AAA Broadcast Accounting

The following example shows how to turn on per DNIS broadcast accounting using the global `aaa dnis map accounting network` command:

```
aaa group server radius isp
  server 10.0.0.1
  server 10.0.0.2
aaa group server tacacs+ isp_customer
  server 172.0.0.1
aaa dnis map enable
aaa dnis map 7777 accounting network start-stop broadcast group isp group isp_customer
radius-server host 10.0.0.1
radius-server host 10.0.0.2
radius-server key key1
tacacs-server host 172.0.0.1 key key2
tacacs-server host 172.0.0.1 key key2
```

The `broadcast` keyword causes “start” and “stop” accounting records for network connection calls having DNIS number 7777 to be sent simultaneously to server 10.0.0.1 in the group isp and to server 172.0.0.1 in the group isp_customer. If server 10.0.0.1 is unavailable, failover to server 10.0.0.2 occurs. If server 172.0.0.1 is unavailable, no failover occurs because backup servers are not configured for the group isp_customer.

Example AAA Session MIB

The following example shows how to set up the AAA session MIB feature to disconnect authenticated client connections for PPP users:

```
aaa new-model
aaa authentication ppp default group radius
aaa authorization network default group radius
aaa accounting network default start-stop group radius
aaa session-mib disconnect
```

Example Configuring VRRS Accounting

The following example shows how to configure VRRS to send AAA Accounting messages to the AAA server:

```
Router# configure terminal
Router(config)# aaa accounting vrrs vrrp-mlist-1 start-stop group radius
Router(config)# aaa attribute list vrrp-1-attr
Router(config-attr-list)# attribute type account-delay 10
Router(config-attr-list)# exit
Router(config)# vrrs vrrp-group-1
Router(config-vrrs)# accounting delay 10
```
Router(config-vrrs)# accounting method vrrp-mlist-1
Router(config-vrrs)# exit

Feature Information for Configuring Accounting

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Local Authentication and Authorization

- Finding Feature Information, on page 1015
- How to Configure Local Authentication and Authorization, on page 1015
- Monitoring Local Authentication and Authorization, on page 1018
- Additional References, on page 1018
- Feature Information for Local Authentication and Authorization, on page 1018

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the ip http authentication aaa global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:
SUMMARY STEPS

1. enable
2. configure terminal
3. aaa new-model
4. aaa authentication login default local
5. aaa authorization exec default local
6. aaa authorization network default local
7. username name [privilege level] {password encryption-type password}
8. end
9. show running-config
10. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td></td>
</tr>
<tr>
<td>aaa authentication login default local</td>
<td>Sets the login authentication to use the local username database. The default keyword applies the local user database authentication to all ports.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa authentication login default local</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td></td>
</tr>
<tr>
<td>aaa authorization exec default local</td>
<td>Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa authorization exec default local</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>aaa authorization network default local</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# aaa authorization network default local</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>username</strong> name [privilege level] {password encryption-type password}&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# username your_user_name privilege 1 password 7 secret567</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# end</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>show running-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# show running-config</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>copy running-config startup-config</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# copy running-config startup-config</td>
</tr>
</tbody>
</table>
Monitoring Local Authentication and Authorization

To display Local Authentication and Authorization configuration, use the `show running-config` privileged EXEC command.

<td>This feature was introduced.</td>
</tr>
</tbody>
</table>
MAC Authentication Bypass

The MAC Authentication Bypass feature is a MAC-address-based authentication mechanism that allows clients in a network to integrate with the Cisco Identity Based Networking Services (IBNS) and Network Admission Control (NAC) strategy using the client MAC address. The MAC Authentication Bypass feature is applicable to the following network environments:

- Network environments in which a supplicant code is not available for a given client platform.
- Network environments in which the end client configuration is not under administrative control, that is, the IEEE 802.1X requests are not supported on these networks.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring MAC Authentication Bypass

IEEE 802.1x—Port-Based Network Access Control

You should understand the concepts of port-based network access control and have an understanding of how to configure port-based network access control on your Cisco platform.
**RADIUS and ACLs**

You should understand the concepts of the RADIUS protocol and have an understanding of how to create and apply access control lists (ACLs). For more information, see the documentation for your Cisco platform and the *Securing User Services Configuration Guide Library*.

The device must have a RADIUS configuration and be connected to the Cisco secure access control server (ACS). For more information, see the *User Guide for Secure ACS Appliance 3.2*.

---

**Information About MAC Authentication Bypass**

**Overview of the Cisco IOS Auth Manager**

The capabilities of devices connecting to a given network can be different, thus requiring that the network support different authentication methods and authorization policies. The Cisco IOS Auth Manager handles network authentication requests and enforces authorization policies regardless of authentication method. The Auth Manager maintains operational data for all port-based network connection attempts, authentications, authorizations, and disconnections and, as such, serves as a session manager.

The possible states for Auth Manager sessions are as follows:

- **Idle**—In the idle state, the authentication session has been initialized, but no methods have yet been run. This is an intermediate state.
- **Running**—A method is currently running. This is an intermediate state.
- **Authc Success**—The authentication method has run successfully. This is an intermediate state.
- **Authc Failed**—The authentication method has failed. This is an intermediate state.
- **Authz Success**—All features have been successfully applied for this session. This is a terminal state.
- **Authz Failed**—At least one feature has failed to be applied for this session. This is a terminal state.
- **No methods**—There were no results for this session. This is a terminal state.

**Overview of the Configurable MAB Username and Password**

A MAC Authentication Bypass (MAB) operation involves authentication using RADIUS Access-Request packets with both the username and password attributes. By default, the username and the password values are the same and contain the MAC address. The Configurable MAB Username and Password feature enables you to configure both the username and the password attributes in the following scenarios:

- To enable MAB for an existing large database that uses formatted username attributes, the username format in the client MAC needs to be configured. Use the `mab request format attribute 1` command to configure the username format.

- Some databases do not accept authentication if the username and password values are the same. In such instances, the password needs to be configured to ensure that the password is different from the username. Use the `mab request format attribute 2` command to configure the password.

The Configurable MAB Username and Password feature allows interoperability between the Cisco IOS Authentication Manager and the existing MAC databases and RADIUS servers. The password is a global
password and hence is the same for all MAB authentications and interfaces. This password is also synchronized across all supervisor devices to achieve high availability.

If the password is not provided or configured, the password uses the same value as the username. The table below describes the formatting of the username and the password:

<table>
<thead>
<tr>
<th>MAC Address</th>
