Egress Queue Buffer Allocation	32
Buffer and Memory Allocation	33
Queues and WTD Thresholds	33
Shaped or Shared Mode	34
Packet Modification	34
Standard QoS Default Configuration	35

Default Egress Queue Configuration	35
Default Mapping Table Configuration	38
DSCP Maps	38
Default CoS-to-DSCP Map	39
Default IP-Precedence-to-DSCP Map	39
Default DSCP-to-CoS Map	40
How to Configure QoS	40
Enabling QoS Globally	40
Enabling VLAN-Based QoS on Physical Ports	42
Configuring Classification Using Port Trust States	43
Configuring the Trust State on Ports Within the QoS Domain	44
Configuring the CoS Value for an Interface	46
Configuring a Trusted Boundary to Ensure Port Security	48
Enabling DSCP Transparency Mode	50
DSCP Transparency Mode	51
Configuring the DSCP Trust State on a Port Bordering Another QoS Domain	52
Configuring a QoS Policy	54
Classifying Traffic by Using ACLs	54
Creating an IP Standard ACL for IPv4 Traffic	54
Creating an IP Extended ACL for IPv4 Traffic	56
Creating an IPv6 ACL for IPv6 Traffic	58
Creating a Layer 2 MAC ACL for Non-IP Traffic	60
Classifying Traffic by Using Class Maps	62
Classifying Traffic by Using Class Maps and Filtering IPv6 Traffic	65
Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps	67
Classifying, Policing, and Marking Traffic on SVIs by Using Hierarchical Policy Maps	71
Classifying, Policing, and Marking Traffic by Using Aggregate Policers	79
Configuring DSCP Maps	82
Configuring the CoS-to-DSCP Map	82
Configuring the IP-Precedence-to-DSCP Map	83
Configuring the Policed-DSCP Map	84
Configuring the DSCP-to-CoS Map	86
Configuring the DSCP-to-DSCP-Mutation Map	87
Configuring Egress Queue Characteristics	89

Configuration Guidelines	89
Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue Set	90
Mapping DSCP or CoS Values to an Egress Queue and to a Threshold ID	93
Configuring SRR Shaped Weights on Egress Queues	95
Configuring SRR Shared Weights on Egress Queues	96
Configuring the Egress Expedite Queue	98
Limiting the Bandwidth on an Egress Interface	100
Monitoring Standard QoS	101
Configuration Examples for QoS	102
Example: Configuring Port to the DSCP-Trusted State and Modifying the DSCP-to-DSCP-Mutation Map	102

Preface

This book describes configuration information and examples for Quality of Service (QoS) on the switch.

- [Document Conventions, page ix](#)
- [Related Documentation, page xi](#)
- [Obtaining Documentation and Submitting a Service Request, page xi](#)

Document Conventions

This document uses the following conventions:

Convention	Description
^ or Ctrl	Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination ^D or Ctrl-D means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)
bold font	Commands and keywords and user-entered text appear in bold font .
<i>Italic font</i>	Document titles, new or emphasized terms, and arguments for which you supply values are in <i>italic font</i> .
Courier font	Terminal sessions and information the system displays appear in <code>courier font</code> .
Bold Courier font	Bold Courier font indicates text that the user must enter.
[x]	Elements in square brackets are optional.
...	An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.
	A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.

Convention	Description
[x y]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
{x y}	Required alternative keywords are grouped in braces and separated by vertical bars.
[x {y z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.
<>	Nonprinting characters such as passwords are in angle brackets.
[]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

Reader Alert Conventions

This document may use the following conventions for reader alerts:

Note

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Tip

Means *the following information will help you solve a problem*.

Caution

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Timesaver

Means *the described action saves time*. You can save time by performing the action described in the paragraph.

**Warning****IMPORTANT SAFETY INSTRUCTIONS**

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

SAVE THESE INSTRUCTIONS

Related Documentation

**Note**

Before installing or upgrading the switch, refer to the release notes.

- Catalyst 2960-XR Switch, located at http://www.cisco.com/go/cat2960xr_docs.

http://www.cisco.com/en/US/products/hw/modules/ps5455/tsd_products_support_series_home.html

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/c/en/us/td/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

Using the Command-Line Interface

- [Information About Using the Command-Line Interface, page 1](#)
- [How to Use the CLI to Configure Features, page 6](#)

Information About Using the Command-Line Interface

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, a SSH, or by using the browser.

When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.

Table 1: Command Mode Summary

Mode	Access Method	Prompt	Exit Method	About This Mode
User EXEC	Begin a session using Telnet, SSH, or console.	Switch>	Enter logout or quit .	Use this mode to <ul style="list-style-type: none"> • Change terminal settings. • Perform basic tests. • Display system information.
Privileged EXEC	While in user EXEC mode, enter the enable command.	Switch#	Enter disable to exit.	Use this mode to verify commands that you have entered. Use a password to protect access to this mode.
Global configuration	While in privileged EXEC mode, enter the configure command.	Switch(config)#	To exit to privileged EXEC mode, enter exit or end , or press Ctrl-Z .	Use this mode to configure parameters that apply to the entire switch.
VLAN configuration	While in global configuration mode, enter the vlan <i>vlan-id</i> command.	Switch(config-vlan)#	To exit to global configuration mode, enter the exit command. To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.
Interface configuration	While in global configuration mode, enter the interface command (with a specific interface).	Switch(config-if)#		Use this mode to configure parameters for the Ethernet ports.

Mode	Access Method	Prompt	Exit Method	About This Mode
			To exit to global configuration mode, enter exit . To return to privileged EXEC mode, press Ctrl-Z or enter end .	
Line configuration	While in global configuration mode, specify a line with the line vty or line console command.	Switch(config-line)#	To exit to global configuration mode, enter exit . To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure parameters for the terminal line.

Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the **show configuration** privileged EXEC command in an abbreviated form:

```
Switch# show conf
```

No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.

Table 2: Common CLI Error Messages

Error Message	Meaning	How to Get Help
<code>% Ambiguous command: "show con"</code>	You did not enter enough characters for your switch to recognize the command.	Reenter the command followed by a question mark (?) without any space between the command and the question mark. The possible keywords that you can enter with the command appear.
<code>% Incomplete command.</code>	You did not enter all of the keywords or values required by this command.	Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.
<code>% Invalid input detected at '^' marker.</code>	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all of the commands that are available in this command mode. The possible keywords that you can enter with the command appear.

Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

Note Only CLI or HTTP changes are logged.

Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

SUMMARY STEPS

1. **help**
2. *abbreviated-command-entry ?*
3. *abbreviated-command-entry <Tab>*
4. **?**
5. *command ?*
6. *command keyword ?*

DETAILED STEPS

	Command or Action	Purpose
Step 1	help Example: Switch# help	Obtains a brief description of the help system in any command mode.
Step 2	<i>abbreviated-command-entry ?</i> Example: Switch# di? dir disable disconnect	Obtains a list of commands that begin with a particular character string.
Step 3	<i>abbreviated-command-entry <Tab></i> Example: Switch# sh conf<tab> Switch# show configuration	Completes a partial command name.
Step 4	? Example: Switch> ?	Lists all commands available for a particular command mode.
Step 5	<i>command ?</i> Example: Switch> show ?	Lists the associated keywords for a command.
Step 6	<i>command keyword ?</i> Example: Switch(config)# cdp holdtime ? <10-255> Length of time (in sec) that receiver must keep this packet	Lists the associated arguments for a keyword.

How to Use the CLI to Configure Features

Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

SUMMARY STEPS

1. `terminal history [size number-of-lines]`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>terminal history [size number-of-lines]</code> Example: Switch# <code>terminal history size 200</code>	Changes the number of command lines that the switch records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.

Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

SUMMARY STEPS

1. **Ctrl-P** or use the **up arrow** key
2. **Ctrl-N** or use the **down arrow** key
3. `show history`

DETAILED STEPS

	Command or Action	Purpose
Step 1	Ctrl-P or use the up arrow key	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
Step 2	Ctrl-N or use the down arrow key	Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.
Step 3	show history Example: Switch# show history	Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the terminal history global configuration command and the history line configuration command.

Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

SUMMARY STEPS

1. **terminal no history**

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal no history Example: Switch# terminal no history	Disables the feature during the current terminal session in privileged EXEC mode.

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenable it.

SUMMARY STEPS

1. **terminal editing**
2. **terminal no editing**

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal editing Example: Switch# <code>terminal editing</code>	Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.
Step 2	terminal no editing Example: Switch# <code>terminal no editing</code>	Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.

Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

Table 3: Editing Commands

Editing Commands	Description
Ctrl-B or use the left arrow key	Moves the cursor back one character.
Ctrl-F or use the right arrow key	Moves the cursor forward one character.
Ctrl-A	Moves the cursor to the beginning of the command line.
Ctrl-E	Moves the cursor to the end of the command line.
Esc B	Moves the cursor back one word.
Esc F	Moves the cursor forward one word.
Ctrl-T	Transposes the character to the left of the cursor with the character located at the cursor.
Delete or Backspace key	Erases the character to the left of the cursor.
Ctrl-D	Deletes the character at the cursor.

Ctrl-K	Deletes all characters from the cursor to the end of the command line.
Ctrl-U or Ctrl-X	Deletes all characters from the cursor to the beginning of the command line.
Ctrl-W	Deletes the word to the left of the cursor.
Esc D	Deletes from the cursor to the end of the word.
Esc C	Capitalizes at the cursor.
Esc L	Changes the word at the cursor to lowercase.
Esc U	Capitalizes letters from the cursor to the end of the word.
Ctrl-V or Esc Q	Designates a particular keystroke as an executable command, perhaps as a shortcut.
Return key	Scrolls down a line or screen on displays that are longer than the terminal screen can display. Note The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including show command output. You can use the Return and Space bar keystrokes whenever you see the More prompt.
Space bar	Scrolls down one screen.
Ctrl-L or Ctrl-R	Redisplays the current command line if the switch suddenly sends a message to your screen.

Editing Command Lines That Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

SUMMARY STEPS

1. **access-list**
2. **Ctrl-A**
3. **Return key**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>access-list</p> <p>Example:</p> <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 Switch(config)# \$ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.25 Switch(config)# \$t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Switch(config)# \$15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</pre>	<p>Displays the global configuration command entry that extends beyond one line.</p> <p>When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.</p>
Step 2	<p>Ctrl-A</p> <p>Example:</p> <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.2\$</pre>	<p>Checks the complete syntax.</p> <p>The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right.</p>
Step 3	<p>Return key</p>	<p>Execute the commands.</p> <p>The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the terminal width privileged EXEC command to set the width of your terminal.</p> <p>Use line wrapping with the command history feature to recall and modify previous complex command entries.</p>

Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

SUMMARY STEPS

1. **{show | more} command | {begin | include | exclude} regular-expression**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>{show more} <i>command</i> {begin include exclude} <i>regular-expression</i></p> <p>Example: Switch# show interfaces include protocol Vlan1 is up, line protocol is up Vlan10 is up, line protocol is down GigabitEthernet1/0/1 is up, line protocol is down GigabitEthernet1/0/2 is up, line protocol is up</p>	<p>Searches and filters the output.</p> <p>Expressions are case sensitive. For example, if you enter exclude output, the lines that contain output are not displayed, but the lines that contain output appear.</p>

Accessing the CLI on a Switch Stack

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the stack master. You cannot manage stack members on an individual switch basis. You can connect to the stack master through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the stack master. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

**Note**

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

- The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
- The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

Configuring QoS

- [Finding Feature Information, page 13](#)
- [Prerequisites for QoS, page 13](#)
- [Restrictions for QoS, page 16](#)
- [Information About QoS, page 16](#)
- [How to Configure QoS, page 40](#)
- [Monitoring Standard QoS, page 101](#)
- [Configuration Examples for QoS, page 102](#)
- [Where to Go Next, page 112](#)
- [Additional References, page 112](#)
- [Feature History and Information for QoS, page 113](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for QoS

Before configuring standard QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. For example, is the traffic on your network bursty? Do you need to reserve bandwidth for voice and video streams?

- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.

You can configure QoS on physical ports and on switch virtual interfaces (SVIs). Other than to apply policy maps, you configure the QoS settings, such as classification, queuing, and scheduling, the same way on physical ports and SVIs. When configuring QoS on a physical port, you apply a nonhierarchical policy map. When configuring QoS on an SVI, you apply a nonhierarchical or a hierarchical policy map.

QoS ACL Guidelines

Follow these guidelines when configuring QoS with access control lists (ACLs):

- It is not possible to match IP fragments against configured IP extended ACLs to enforce QoS. IP fragments are sent as best-effort. IP fragments are denoted by fields in the IP header.
- Only one ACL per class map and only one **match** class-map configuration command per class map are supported. The ACL can have multiple ACEs, which match fields against the contents of the packet.
- A trust statement in a policy map requires multiple hardware entries per ACL line. If an input service policy map contains a trust statement in an ACL, the access list might be too large to fit into the available QoS hardware memory, and an error can occur when you apply the policy map to a port. Whenever possible, you should minimize the number of lines in a QoS ACL.

Applying QoS on Interfaces Guidelines

These are the guidelines for configuring QoS on physical ports and SVIs (Layer 3 VLAN interfaces):

- You can configure QoS on physical ports and SVIs. When configuring QoS on physical ports, you create and apply nonhierarchical policy maps. When configuring QoS on SVIs, you can create and apply nonhierarchical and hierarchical policy maps.
- Incoming traffic is classified, policed, and marked down (if configured) regardless of whether the traffic is bridged, routed, or sent to the CPU. It is possible for bridged frames to be dropped or to have their DSCP and CoS values modified.
- Follow these guidelines when configuring policy maps on physical ports or SVIs:
 - You cannot apply the same policy map to a physical port and to an SVI.
 - If VLAN-based QoS is configured on a physical port, the switch removes all the port-based policy maps on the port. The traffic on this physical port is now affected by the policy map attached to the SVI to which the physical port belongs.
 - In a hierarchical policy map attached to an SVI, you can only configure an individual policer at the interface level on a physical port to specify the bandwidth limits for the traffic on the port. The ingress port must be configured as a trunk or as a static-access port. You cannot configure policers at the VLAN level of the hierarchical policy map.
 - The switch does not support aggregate policers in hierarchical policy maps.
 - After the hierarchical policy map is attached to an SVI, the interface-level policy map cannot be modified or removed from the hierarchical policy map. A new interface-level policy map also cannot be added to the hierarchical policy map. If you want these changes to occur, the hierarchical

policy map must first be removed from the SVI. You also cannot add or remove a class map specified in the hierarchical policy map.

Policing Guidelines

- The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for system internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries.

For example, you could configure 32 policers on a Gigabit Ethernet port and 7 policers on a 10-Gigabit Ethernet port, or you could configure 64 policers on a Gigabit Ethernet port and 4 policers on a 10-Gigabit Ethernet port. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries.

You cannot reserve policers per port; there is no guarantee that a port will be assigned to any policer.
- Only one policer is applied to a packet on an ingress port. Only the average rate and committed burst parameters are configurable.
- You can create an aggregate policer that is shared by multiple traffic classes within the same nonhierarchical policy map. However, you cannot use the aggregate policer across different policy maps.
- On a port configured for QoS, all traffic received through the port is classified, policed, and marked according to the policy map attached to the port. On a trunk port configured for QoS, traffic in all VLANs received through the port is classified, policed, and marked according to the policy map attached to the port.
- If you have EtherChannel ports configured on your switch, you must configure QoS classification, policing, mapping, and queueing on the individual physical ports that comprise the EtherChannel. You must decide whether the QoS configuration should match on all ports in the EtherChannel.
- If you need to modify a policy map of an existing QoS policy, first remove the policy map from all interfaces, and then modify or copy the policy map. After you finish the modification, apply the modified policy map to the interfaces. If you do not first remove the policy map from all interfaces, high CPU usage can occur, which, in turn, can cause the console to pause for a very long time.

General QoS Guidelines

- Control traffic (such as spanning-tree bridge protocol data units [BPDUs] and routing update packets) received by the switch are subject to all ingress QoS processing.
- You are likely to lose data when you change queue settings; therefore, try to make changes when traffic is at a minimum.
- A switch that is running the IP services feature set supports QoS DSCP and IP precedence matching in policy-based routing (PBR) route maps with these limitations:
 - You cannot apply QoS DSCP mutation maps and PBR route maps to the same interface.
 - You cannot configure DSCP transparency and PBR DSCP route maps on the same switch.

Restrictions for QoS

The following are the restrictions for QoS:

- Ingress queueing and scheduling are not supported on the switch.
- The switch supports 4 default egress queues, with the option to enable an additional 4 egress queues for a total of 8. This option is only available on a standalone switch.
- We recommend that you do not enable 8 egress queues by using the **mls qos srr-queue output queues 8** command, when running the following features in your configuration:
 - Auto-QoS
 - Auto SmartPort
 - EnergyWise

Running these features with 8 egress queue enabled in a single configuration is not supported on the switch.

- The switch supports 3 templates: default, vlan, and IPv4. Both the default and vlan templates support IPv6. The IPv4 template does not support IPv6.
- You can configure only individual policers on an SVI.
- For the **class-map [match-all | match-any] class-map-name** global configuration command, because only one **match** command per class map is supported, the **match-all** and **match-any** keywords function the same.

Information About QoS

QoS Implementation

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use congestion-management and congestion-avoidance techniques to provide preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

The QoS implementation is based on the Differentiated Services (Diff-Serv) architecture, a standard from the Internet Engineering Task Force (IETF). This architecture specifies that each packet is classified upon entry into the network.

The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (ToS) field to carry the classification (*class*) information. Classification can also be carried in the Layer 2 frame.

The special bits in the Layer 2 frame or a Layer 3 packet are shown in the following figure:

Figure 1: QoS Classification Layers in Frames and Packets

Layer 2 Frame Prioritization Bits

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On ports configured as Layer 2 ISL trunks, all traffic is in ISL frames.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On ports configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

Other frame types cannot carry Layer 2 CoS values.

Layer 2 CoS values range from 0 for low priority to 7 for high priority.

Layer 3 Packet Prioritization Bits

Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.

IP precedence values range from 0 to 7. DSCP values range from 0 to 63.

End-to-End QoS Solution Using Classification

All switches and routers that access the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to occur closer to the edge of the network, so that the core switches and routers are not overloaded with this task.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the Diff-Serv architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple task or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control that you need over incoming and outgoing traffic.

QoS Basic Model

To implement QoS, the switch must distinguish packets or flows from one another (classify), assign a label to indicate the given quality of service as the packets move through the switch, make the packets comply with the configured resource usage limits (police and mark), and provide different treatment (queue and schedule) in all situations where resource contention exists. The switch also needs to ensure that traffic sent from it meets a specific traffic profile (shape).

Figure 2: QoS Basic Model

Actions at Ingress Port

Actions at the ingress port include classifying traffic, policing, marking, and scheduling:

- Classifying a distinct path for a packet by associating it with a QoS label. The switch maps the CoS or DSCP in the packet to a QoS label to distinguish one kind of traffic from another. The QoS label that is generated identifies all future QoS actions to be performed on this packet.
- Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.
- Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, marking down the QoS label in the packet, or dropping the packet).

**Note**

Queueing and scheduling are only supported at egress and not at ingress on the switch.

Actions at Egress Port

Actions at the egress port include queueing and scheduling:

- Queueing evaluates the QoS packet label and the corresponding DSCP or CoS value before selecting which of the four egress queues to use. Because congestion can occur when multiple ingress ports simultaneously send data to an egress port, WTD differentiates traffic classes and subjects the packets to different thresholds based on the QoS label. If the threshold is exceeded, the packet is dropped.
- Scheduling services the four egress queues based on their configured SRR shared or shaped weights. One of the queues (queue 1) can be the expedited queue, which is serviced until empty before the other queues are serviced.

Classification Overview

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled only if QoS is globally enabled on the switch. By default, QoS is globally disabled, so no classification occurs.

During classification, the switch performs a lookup and assigns a QoS label to the packet. The QoS label identifies all QoS actions to be performed on the packet and from which queue the packet is sent.

The QoS label is based on the DSCP or the CoS value in the packet and decides the queueing and scheduling actions to perform on the packet. The label is mapped according to the trust setting and the packet type as shown in [Classification Flowchart](#), on page 22.

You specify which fields in the frame or packet that you want to use to classify incoming traffic.

Non-IP Traffic Classification

The following table describes the non-IP traffic classification options for your QoS configuration.

Table 4: Non- IP Traffic Classifications

Non-IP Traffic Classification	Description
Trust the CoS value	Trust the CoS value in the incoming frame (configure the port to trust CoS), and then use the configurable CoS-to-DSCP map to generate a DSCP value for the packet. Layer 2 ISL frame headers carry the CoS value in the 3 least-significant bits of the 1-byte User field. Layer 2 802.1Q frame headers carry the CoS value in the 3 most-significant bits of the Tag Control Information field. CoS values range from 0 for low priority to 7 for high priority.
Trust the DSCP or trust IP precedence value	Trust the DSCP or trust IP precedence value in the incoming frame. These configurations are meaningless for non-IP traffic. If you configure a port with either of these options and non-IP traffic is received, the switch assigns a CoS value and generates an internal DSCP value from the CoS-to-DSCP map. The switch uses the internal DSCP value to generate a CoS value representing the priority of the traffic.
Perform classification based on configured Layer 2 MAC ACL	Perform the classification based on a configured Layer 2 MAC access control list (ACL), which can examine the MAC source address, the MAC destination address, and other fields. If no ACL is configured, the packet is assigned 0 as the DSCP and CoS values, which means best-effort traffic. Otherwise, the policy-map action specifies a DSCP or CoS value to assign to the incoming frame.

After classification, the packet is sent to the policing and marking stages.

IP Traffic Classification

The following table describes the IP traffic classification options for your QoS configuration.

Table 5: IP Traffic Classifications

IP Traffic Classification	Description
Trust the DSCP value	<p>Trust the DSCP value in the incoming packet (configure the port to trust DSCP), and assign the same DSCP value to the packet. The IETF defines the 6 most-significant bits of the 1-byte ToS field as the DSCP. The priority represented by a particular DSCP value is configurable. DSCP values range from 0 to 63.</p> <p>You can also classify IP traffic based on IPv6 DSCP.</p> <p>For ports that are on the boundary between two QoS administrative domains, you can modify the DSCP to another value by using the configurable DSCP-to-DSCP-mutation map.</p>
Trust the IP precedence value	<p>Trust the IP precedence value in the incoming packet (configure the port to trust IP precedence), and generate a DSCP value for the packet by using the configurable IP-precedence-to-DSCP map. The IP Version 4 specification defines the 3 most-significant bits of the 1-byte ToS field as the IP precedence. IP precedence values range from 0 for low priority to 7 for high priority.</p> <p>You can also classify IP traffic based on IPv6 precedence.</p>
Trust the CoS value	<p>Trust the CoS value (if present) in the incoming packet, and generate a DSCP value for the packet by using the CoS-to-DSCP map. If the CoS value is not present, use the default port CoS value.</p>
IP standard or an extended ACL	<p>Perform the classification based on a configured IP standard or an extended ACL, which examines various fields in the IP header. If no ACL is configured, the packet is assigned 0 as the DSCP and CoS values, which means best-effort traffic. Otherwise, the policy-map action specifies a DSCP or CoS value to assign to the incoming frame.</p>
Override configured CoS	<p>Override the configured CoS of incoming packets, and apply the default port CoS value to them. For IPv6 packets, the DSCP value is rewritten by using the CoS-to-DSCP map and by using the default CoS of the port. You can do this for both IPv4 and IPv6 traffic.</p>

After classification, the packet is sent to the policing and marking stages.

Classification Flowchart

Figure 3: Classification Flowchart

Access Control Lists

You can use IP standard, IP extended, or Layer 2 MAC ACLs to define a group of packets with the same characteristics (class). You can also classify IP traffic based on IPv6 ACLs.

In the QoS context, the permit and deny actions in the access control entries (ACEs) have different meanings from security ACLs:

- If a match with a permit action is encountered (first-match principle), the specified QoS-related action is taken.
- If a match with a deny action is encountered, the ACL being processed is skipped, and the next ACL is processed.
- If no match with a permit action is encountered and all the ACEs have been examined, no QoS processing occurs on the packet, and the switch offers best-effort service to the packet.
- If multiple ACLs are configured on a port, the lookup stops after the packet matches the first ACL with a permit action, and QoS processing begins.

Note When creating an access list, note that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

After a traffic class has been defined with the ACL, you can attach a policy to it. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate-limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the **access-list** global configuration command; you implement Layer 2 MAC ACLs to classify non-IP traffic by using the **mac access-list extended** global configuration command.

Classification Based on Class Maps and Policy Maps

A class map is a mechanism that you use to name a specific traffic flow (or class) and to isolate it from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it. The criteria can include matching the access group defined by the ACL or matching a specific list of DSCP or IP precedence values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you further classify it through the use of a policy map.

A policy map specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; or specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile. Before a policy map can be effective, you must attach it to a port.

You create a class map by using the **class-map** global configuration command or the **class** policy-map configuration command. You should use the **class-map** command when the map is shared among many ports.

When you enter the **class-map** command, the switch enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the **match** class-map configuration command.

You can configure a default class by using the **class class-default** policy-map configuration command. Unclassified traffic (traffic specified in the other traffic classes configured on the policy-map) is treated as default traffic.

You create and name a policy map by using the **policy-map** global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the **class**, **trust**, or **set** policy-map configuration and policy-map class configuration commands.

The policy map can contain the **police** and **police aggregate** policy-map class configuration commands, which define the policer, the bandwidth limitations of the traffic, and the action to take if the limits are exceeded.

To enable the policy map, you attach it to a port by using the **service-policy** interface configuration command.

You can apply a nonhierarchical policy map to a physical port or an SVI. However, a hierarchical policy map can only be applied to an SVI. A hierarchical policy map contains two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on the SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI. The interface-level actions are specified in the interface-level policy map.

Policing and Marking Overview

After a packet is classified and has a DSCP-based or CoS-based QoS label assigned to it, the policing and marking process can begin.

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are *out of profile* or *nonconforming*. Each policer decides on a packet-by-packet basis whether the packet is in or out of profile and specifies the actions on the packet. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or modifying (marking down) the assigned DSCP of the packet and allowing the packet to pass through. The configurable policed-DSCP map provides the packet with a new DSCP-based QoS label. Marked-down packets use the same queues as the original QoS label to prevent packets in a flow from getting out of order.

Note

All traffic, regardless of whether it is bridged or routed, is subjected to a policer, if one is configured. As a result, bridged packets might be dropped or might have their DSCP or CoS fields modified when they are policed and marked.

You can configure policing (either individual or aggregate policers) on a physical port or an SVI. When configuring policy maps on an SVI, you can create a hierarchical policy map and can define an individual policer only in the secondary interface-level policy map.

After you configure the policy map and policing actions, attach the policy to an ingress port or SVI by using the **service-policy** interface configuration command.

Related Topics

[Classifying, Policing, and Marking Traffic by Using Aggregate Policers, on page 79](#)

[Examples: Classifying, Policing, and Marking Traffic by Using Aggregate Policers, on page 108](#)

Physical Port Policing

In policy maps on physical ports, you can create the following types of policers:

- Individual—QoS applies the bandwidth limits specified in the policer separately to each matched traffic class. You configure this type of policer within a policy map by using the **police** policy-map class configuration command.
- Aggregate—QoS applies the bandwidth limits specified in an aggregate policer cumulatively to all matched traffic flows. You configure this type of policer by specifying the aggregate policer name within a policy map by using the **police aggregate** policy-map class configuration command. You specify the bandwidth limits of the policer by using the **mls qos aggregate-policer** global configuration command. In this way, the aggregate policer is shared by multiple classes of traffic within a policy map.

Note

You can configure only individual policers on an SVI.

Policing uses a token-bucket algorithm. As each frame is received by the switch, a token is added to the bucket. The bucket has a hole in it and leaks at a rate that you specify as the average traffic rate in bits per second. Each time a token is added to the bucket, the switch verifies that there is enough room in the bucket. If there is not enough room, the packet is marked as nonconforming, and the specified policer action is taken (dropped or marked down).

How quickly the bucket fills is a function of the bucket depth (burst-byte), the rate at which the tokens are removed (rate-bps), and the duration of the burst above the average rate. The size of the bucket imposes an upper limit on the burst length and limits the number of frames that can be transmitted back-to-back. If the burst is short, the bucket does not overflow, and no action is taken against the traffic flow. However, if a burst is long and at a higher rate, the bucket overflows, and the policing actions are taken against the frames in that burst.

You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the burst-byte option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command.

The following figure shows the policing and marking process when these types of policy maps are configured:

- A nonhierarchical policy map on a physical port.
- The interface level of a hierarchical policy map attached to an SVI. The physical ports are specified in this secondary policy map.

Figure 4: Policing and Marking Flowchart on Physical Ports

SVI Policing

Note

Before configuring a hierarchical policy map with individual policers on an SVI, you must enable VLAN-based QoS on the physical ports that belong to the SVI. Though a policy map is attached to the SVI, the individual policers only affect traffic on the physical ports specified in the secondary interface level of the hierarchical policy map.

A hierarchical policy map has two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on an SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI and are specified in the interface-level policy map.

When configuring policing on an SVI, you can create and configure a hierarchical policy map with these two levels:

- VLAN level—Create this primary level by configuring class maps and classes that specify the port trust state or set a new DSCP or IP precedence value in the packet. The VLAN-level policy map applies only to the VLAN in an SVI and does not support policers.
- Interface level—Create this secondary level by configuring class maps and classes that specify the individual policers on physical ports the belong to the SVI. The interface-level policy map only supports individual policers and does not support aggregate policers. You can configure different interface-level policy maps for each class defined in the VLAN-level policy map.

The following figure shows the policing and marking process when hierarchical policy maps on an SVI.

Figure 5: Policing and Marking Flowchart on SVIs

Mapping Tables Overview

During QoS processing, the switch represents the priority of all traffic (including non-IP traffic) with a QoS label based on the DSCP or CoS value from the classification stage.

The following table describes QoS processing and mapping tables.

Table 6: QoS Processing and Mapping Tables

QoS Processing Stage	Mapping Table Usage
Classification	<p>During the classification stage, QoS uses configurable mapping tables to derive a corresponding DSCP or CoS value from a received CoS, DSCP, or IP precedence value. These maps include the CoS-to-DSCP map and the IP-precedence-to-DSCP map.</p> <p>You configure these maps by using the mls qos map cos-dscp and the mls qos map ip-prec-dscp global configuration commands.</p> <p>On an ingress port configured in the DSCP-trusted state, if the DSCP values are different between the QoS domains, you can apply the configurable DSCP-to-DSCP-mutation map to the port that is on the boundary between the two QoS domains.</p> <p>You configure this map by using the mls qos map dscp-mutation global configuration command.</p>
Policing	<p>During policing stage, QoS can assign another DSCP value to an IP or a non-IP packet (if the packet is out of profile and the policer specifies a marked-down value). This configurable map is called the policed-DSCP map.</p> <p>You configure this map by using the mls qos map policed-dscp global configuration command.</p>
Pre-scheduling	<p>Before the traffic reaches the scheduling stage, QoS stores the packet in an egress queue according to the QoS label. The QoS label is based on the DSCP or the CoS value in the packet and selects the queue through the DSCP output queue threshold maps or through the CoS output queue threshold maps. In addition to an egress queue, the QoS label also identifies the WTD threshold value.</p> <p>You configure these maps by using the mls qos srr-queue { output } dscp-map and the mls qos srr-queue { output } cos-map global configuration commands.</p>

The CoS-to-DSCP, DSCP-to-CoS, and the IP-precedence-to-DSCP maps have default values that might or might not be appropriate for your network.

The default DSCP-to-DSCP-mutation map and the default policed-DSCP map are null maps; they map an incoming DSCP value to the same DSCP value. The DSCP-to-DSCP-mutation map is the only map you apply to a specific port. All other maps apply to the entire switch.

Related Topics

[Mapping DSCP or CoS Values to an Egress Queue and to a Threshold ID, on page 93](#)

[Examples: Configuring Egress Queue Characteristics, on page 111](#)

Queueing and Scheduling Overview

The switch has queues at specific points to help prevent congestion.

Figure 6: Egress Queue Location on Switch

Note

The switch supports 4 egress queues by default and there is an option to enable a total of 8 egress queues. The 8 egress queue configuration is only supported on a standalone switch.

Weighted Tail Drop

As a frame is enqueued to a particular queue, WTD uses the frame's assigned QoS label to subject it to different thresholds. If the threshold is exceeded for that QoS label (the space available in the destination queue is less than the size of the frame), the switch drops the frame.

Each queue has three threshold values. The QoS label determines which of the three threshold values is subjected to the frame. Of the three thresholds, two are configurable (explicit) and one is not (implicit).

The following figure shows an example of WTD operating on a queue whose size is 1000 frames. Three drop percentages are configured: 40 percent (400 frames), 60 percent (600 frames), and 100 percent (1000 frames).

These percentages indicate that up to 400 frames can be queued at the 40-percent threshold, up to 600 frames at the 60-percent threshold, and up to 1000 frames at the 100-percent threshold.

Figure 7: WTD and Queue Operation

In the example, CoS values 6 and 7 have a greater importance than the other CoS values, and they are assigned to the 100-percent drop threshold (queue-full state). CoS values 4 and 5 are assigned to the 60-percent threshold, and CoS values 0 to 3 are assigned to the 40-percent threshold.

Suppose the queue is already filled with 600 frames, and a new frame arrives. It contains CoS values 4 and 5 and is subjected to the 60-percent threshold. If this frame is added to the queue, the threshold will be exceeded, so the switch drops it.

SRR Shaping and Sharing

You can configure SRR on egress queues for sharing or for shaping.

In shaped mode, the egress queues are guaranteed a percentage of the bandwidth, and they are rate-limited to that amount. Shaped traffic does not use more than the allocated bandwidth even if the link is idle. Shaping provides a more even flow of traffic over time and reduces the peaks and valleys of bursty traffic. With shaping, the absolute value of each weight is used to compute the bandwidth available for the queues.

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue is empty and no longer requires a share of the link, the remaining queues can expand into the unused bandwidth and share it among them. With sharing, the ratio of the weights controls the frequency of dequeuing; the absolute values are meaningless. Shaping and sharing is configured per interface. Each interface can be uniquely configured.

Queueing and Scheduling on Egress Queues

The following figure shows queueing and scheduling flowcharts for egress ports on the switch.

Figure 8: Queueing and Scheduling Flowchart for Egress Ports on the Switch

Note

If the expedite queue is enabled, SRR services it until it is empty before servicing the other three queues.

[Limiting the Bandwidth on an Egress Interface, on page 100](#)

[Examples: Configuring Egress Queue Characteristics, on page 111](#)

Egress Expedite Queue

Each port supports four egress queues, one of which (queue 1) can be the egress expedite queue. These queues are assigned to a queue-set. All traffic exiting the switch flows through one of these four queues and is subjected to a threshold based on the QoS label assigned to the packet.

Note If the expedite queue is enabled, SRR services it until it is empty before servicing the other three queues.

Egress Queue Buffer Allocation

The following figure shows the egress queue buffer.

The buffer space is divided between the common pool and the reserved pool. The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to control whether to grant buffer space to a requesting queue. The switch detects whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Figure 9: Egress Queue Buffer Allocation

Buffer and Memory Allocation

You guarantee the availability of buffers, set drop thresholds, and configure the maximum memory allocation for a queue-set by using the **mls qos queue-set output *qset-id* threshold *queue-id* drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold** global configuration command. Each threshold value is a percentage of the queue's allocated memory, which you specify by using the **mls qos queue-set output *qset-id* buffers *allocation1* ... *allocation4*** global configuration command. The sum of all the allocated buffers represents the reserved pool, and the remaining buffers are part of the common pool.

Through buffer allocation, you can ensure that high-priority traffic is buffered. For example, if the buffer space is 400, you can allocate 70 percent of it to queue 1 and 10 percent to queues 2 through 4. Queue 1 then has 280 buffers allocated to it, and queues 2 through 4 each have 40 buffers allocated to them.

You can guarantee that the allocated buffers are reserved for a specific queue in a queue-set. For example, if there are 100 buffers for a queue, you can reserve 50 percent (50 buffers). The switch returns the remaining 50 buffers to the common pool. You also can enable a queue in the full condition to obtain more buffers than are reserved for it by setting a maximum threshold. The switch can allocate the needed buffers from the common pool if the common pool is not empty.

Note

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the **mls qos srr-queue output queues 8** global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds and buffers for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

Queues and WTD Thresholds

You can assign each packet that flows through the switch to a queue and to a threshold.

Specifically, you map DSCP or CoS values to an egress queue and map DSCP or CoS values to a threshold ID. You use the **mls qos srr-queue output dscp-map queue *queue-id* {*dscp1*...*dscp8* | threshold *threshold-id* *dscp1*...*dscp8*}** or the **mls qos srr-queue output cos-map queue *queue-id* {*cos1*...*cos8* | threshold *threshold-id* *cos1*...*cos8*}** global configuration command. You can display the DSCP output queue threshold map and the CoS output queue threshold map by using the **show mls qos maps** privileged EXEC command.

The queues use WTD to support distinct drop percentages for different traffic classes. Each queue has three drop thresholds: two configurable (*explicit*) WTD thresholds and one nonconfigurable (*implicit*) threshold preset to the queue-full state. You assign the two WTD threshold percentages for threshold ID 1 and ID 2. The drop threshold for threshold ID 3 is preset to the queue-full state, and you cannot modify it. You map a port to queue-set by using the **queue-set *qset-id*** interface configuration command. Modify the queue-set configuration to change the WTD threshold percentages.

Note

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the **mls qos srr-queue output queues 8** global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds and buffers for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

Shaped or Shared Mode

SRR services each queue-set in shared or shaped mode. You map a port to a queue-set by using the **queue-set *qset-id*** interface configuration command. You assign shared or shaped weights to the port by using the **srr-queue bandwidth share *weight1 weight2 weight3 weight4*** or the **srr-queue bandwidth shape *weight1 weight2 weight3 weight4*** interface configuration command.

The buffer allocation together with the SRR weight ratios control how much data can be buffered and sent before packets are dropped. The weight ratio is the ratio of the frequency in which the SRR scheduler sends packets from each queue.

All four queues participate in the SRR unless the expedite queue is enabled, in which case the first bandwidth weight is ignored and is not used in the ratio calculation. The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced. You enable the expedite queue by using the **priority-queue out** interface configuration command.

You can combine the commands described in this section to prioritize traffic by placing packets with particular DSCPs or CoSs into certain queues, by allocating a large queue size or by servicing the queue more frequently, and by adjusting queue thresholds so that packets with lower priorities are dropped.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Note

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the **mls qos srr-queue output queues 8** global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds, buffers, bandwidth share weights, and bandwidth shape weights for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

Packet Modification

A packet is classified, policed, and queued to provide QoS. The following packet modifications can occur during the process to provide QoS:

- For IP and non-IP packets, classification involves assigning a QoS label to a packet based on the DSCP or CoS of the received packet. However, the packet is not modified at this stage; only an indication of the assigned DSCP or CoS value is carried along. The reason for this is that QoS classification and forwarding look-ups occur in parallel, and it is possible that the packet is forwarded with its original DSCP to the CPU where it is again processed through software.
- During policing, IP and non-IP packets can have another DSCP assigned to them (if they are out of profile and the policer specifies a markdown DSCP). Once again, the DSCP in the packet is not modified, but an indication of the marked-down value is carried along. For IP packets, the packet modification occurs at a later stage; for non-IP packets the DSCP is converted to CoS and used for queuing and scheduling decisions.
- Depending on the QoS label assigned to a frame and the mutation chosen, the DSCP and CoS values of the frame are rewritten. If you do not configure a table map and if you configure the port to trust the DSCP of the incoming frame, the DSCP value in the frame is not changed, but the CoS is rewritten

according to the DSCP-to-CoS map. If you configure the port to trust the CoS of the incoming frame and it is an IP packet, the CoS value in the frame is not changed, but the DSCP might be changed according to the CoS-to-DSCP map.

The input mutation causes the DSCP to be rewritten depending on the new value of DSCP chosen. The set action in a policy map also causes the DSCP to be rewritten.

Standard QoS Default Configuration

Standard QoS is disabled by default.

There is no concept of trusted or untrusted ports because the packets are not modified. The CoS, DSCP, and IP precedence values in the packet are not changed.

Traffic is switched in pass-through mode. The packets are switched without any rewrites and classified as best effort without any policing.

When QoS is enabled using the **mls qos** global configuration command and all other QoS settings are at their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted.

Default Egress Queue Configuration

The following tables describe the default egress queue configurations.

Note

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the **mls qos srr-queue output queues 8** global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds and buffers for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

The following table shows the default egress queue configuration for each queue-set when QoS is enabled. All ports are mapped to queue-set 1. The port bandwidth limit is set to 100 percent and rate unlimited. Note that for the SRR shaped weights (absolute) feature, a shaped weight of zero indicates that the queue is operating in shared mode. Note that for the SRR shared weights feature, one quarter of the bandwidth is allocated to each queue.

Table 7: Default Egress Queue Configuration

Feature	Queue 1	Queue 2	Queue 3	Queue 4
Buffer allocation	25 percent	25 percent	25 percent	25 percent
WTD drop threshold 1	100 percent	200 percent	100 percent	100 percent
WTD drop threshold 2	100 percent	200 percent	100 percent	100 percent
Reserved threshold	50 percent	50 percent	50 percent	50 percent

Feature	Queue 1	Queue 2	Queue 3	Queue 4
Maximum threshold	400 percent	400 percent	400 percent	400 percent
SRR shaped weights (absolute)	25	0	0	0
SRR shared weights	25	25	25	25

The following table shows the default CoS output queue threshold map when QoS is enabled.

Table 8: Default CoS Output Queue Threshold Map

CoS Value	Queue ID–Threshold ID
0, 1	2–1
2, 3	3–1
4	4–1
5	1–1
6, 7	4–1

The following table shows the default DSCP output queue threshold map when QoS is enabled.

Table 9: Default DSCP Output Queue Threshold Map

DSCP Value	Queue ID–Threshold ID
0–15	2–1
16–31	3–1
32–39	4–1
40–47	1–1
48–63	4–1

The following table displays the default egress queue configuration when the 8 egress queue configuration is enabled using the **mls qos srr-queue output queues 8** command.

Table 10: Default 8 Egress Queue Configuration

Feature	Queue 1	Queue 2	Queue 3	Queue 4	Queue 5	Queue 6	Queue 7	Queue 8
Buffer allocation	10	30	10	10	10	10	10	10
WTD drop threshold 1	100	1600	100	100	100	100	100	100
WTD drop threshold 2	100	2000	100	100	100	100	100	100
Reserved threshold	100	100	100	100	100	100	100	100
Maximum threshold	400	2400	400	400	400	400	400	400
SRR shaped weights	25	0	0	0	0	0	0	0
SRR shared weights	25	25	25	25	25	25	25	25

The following table displays the default CoS output queue threshold map when QoS is enabled and the 8 egress queue configuration is enabled using the **mls qos srr-queue output queues 8** command.

Table 11: Default CoS Output 8 Queue Threshold Map

CoS	Egress Queue	Threshold ID	4 Egress Queue Mapping
0	2	1	2
1	3	1	2
2	4	1	3
3	5	1	3
4	6	1	4
5	1	1	1

CoS	Egress Queue	Threshold ID	4 Egress Queue Mapping
6	7	1	4
7	8	1	4

The following table displays the default DSCP output queue threshold map when QoS is enabled and the 8 egress queue configuration is enabled using the `mls qos srr-queue output queues 8` command.

Table 12: Default DSCP Output 8 Queue Threshold Map

DSCP	Egress Queue	Threshold ID	4 Egress Queue Mapping
0-7	2	1	2
8-15	3	1	2
16-23	4	1	3
24-31	5	1	3
32-39	6	1	4
40-47	1	1	1
48-55	7	1	4
56-63	8	1	4

Default Mapping Table Configuration

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value (no markdown).

32–39	4
40–47	5
48–55	6
56–63	7

How to Configure QoS

Enabling QoS Globally

By default, QoS is disabled on the switch.

The following procedure to enable QoS globally is required.

SUMMARY STEPS

1. `configure terminal`
2. `mls qos`
3. `end`
4. `show mls qos`
5. `copy running-config startup-config`

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# <code>configure terminal</code>	Enters global configuration mode.
Step 2	mls qos Example: Switch(config)# <code>mls qos</code>	Enables QoS globally. QoS operates with the default settings described in the related topic sections below. Note To disable QoS, use the no mls qos global configuration command.
Step 3	end Example: Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 4	show mls qos Example: Switch# <code>show mls qos</code>	Verifies the QoS configuration.
Step 5	copy running-config startup-config Example: Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

[Standard QoS Default Configuration, on page 35](#)

Enabling VLAN-Based QoS on Physical Ports

By default, VLAN-based QoS is disabled on all physical switch ports. The switch applies QoS, including class maps and policy maps, only on a physical-port basis. You can enable VLAN-based QoS on a switch port.

The following procedure is required on physical ports that are specified in the interface level of a hierarchical policy map on a Switch Virtual Interface (SVI).

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **mls qos vlan-based**
4. **end**
5. **show mls qos interface *interface-id***
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Switch(config)# interface gigabitethernet 1/0/1	Specifies the physical port, and enter interface configuration mode.
Step 3	mls qos vlan-based Example: Switch(config-if)# mls qos vlan-based	Enables VLAN-based QoS on the port. Note Use the no mls qos vlan-based interface configuration command to disable VLAN-based QoS on the physical port.
Step 4	end Example: Switch(config-if)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 5	show mls qos interface <i>interface-id</i> Example: <pre>Switch# show mls qos interface gigabitethernet 1/0/1</pre>	Verifies if VLAN-based QoS is enabled on the physical port.
Step 6	copy running-config startup-config Example: <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring Classification Using Port Trust States

These sections describe how to classify incoming traffic by using port trust states.

Note

Depending on your network configuration, you must perform one or more of these tasks in this module or one or more of the tasks in the [Configuring a QoS Policy](#).

Configuring the Trust State on Ports Within the QoS Domain

Packets entering a QoS domain are classified at the edge of the QoS domain. When the packets are classified at the edge, the switch port within the QoS domain can be configured to one of the trusted states because there is no need to classify the packets at every switch within the QoS domain.

Figure 10: Port Trusted States on Ports Within the QoS Domain

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **mls qos trust [*cos* | *dscp* | *ip-precedence*]**
4. **end**
5. **show mls qos interface**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 2	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config)# interface gigabitethernet 1/0/2</pre>	Specifies the port to be trusted, and enters interface configuration mode. Valid interfaces are physical ports.
Step 3	<p>mls qos trust [cos dscp ip-precedence]</p> <p>Example:</p> <pre>Switch(config-if)# mls qos trust cos</pre>	<p>Configures the port trust state.</p> <p>By default, the port is not trusted. If no keyword is specified, the default is dscp.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> • cos—Classifies an ingress packet by using the packet CoS value. For an untagged packet, the port default CoS value is used. The default port CoS value is 0. • dscp—Classifies an ingress packet by using the packet DSCP value. For a non-IP packet, the packet CoS value is used if the packet is tagged; for an untagged packet, the default port CoS is used. Internally, the switch maps the CoS value to a DSCP value by using the CoS-to-DSCP map. • ip-precedence—Classifies an ingress packet by using the packet IP-precedence value. For a non-IP packet, the packet CoS value is used if the packet is tagged; for an untagged packet, the default port CoS is used. Internally, the switch maps the CoS value to a DSCP value by using the CoS-to-DSCP map. <p>To return a port to its untrusted state, use the no mls qos trust interface configuration command.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 5	show mls qos interface Example: Switch# <code>show mls qos interface</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Related Topics

[Example: Configuring Port to the DSCP-Trusted State and Modifying the DSCP-to-DSCP-Mutation Map, on page 102](#)

Configuring the CoS Value for an Interface

QoS assigns the CoS value specified with the **mls qos cos** interface configuration command to untagged frames received on trusted and untrusted ports.

Beginning in privileged EXEC mode, follow these steps to define the default CoS value of a port or to assign the default CoS to all incoming packets on the port.

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **mls qos cos {*default-cos* | *override*}**
4. **end**
5. **show mls qos interface**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# <code>configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
Step 2	interface <i>interface-id</i> Example: <pre>Switch(config)# interface gigabitethernet 1/1/1</pre>	Specifies the port to be configured, and enters interface configuration mode. Valid interfaces include physical ports.
Step 3	mls qos cos { <i>default-cos</i> override } Example: <pre>Switch(config-if)# mls qos override</pre>	Configures the default CoS value for the port. <ul style="list-style-type: none"> For <i>default-cos</i>, specify a default CoS value to be assigned to a port. If the packet is untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7. The default is 0. Use the override keyword to override the previously configured trust state of the incoming packet and to apply the default port CoS value to the port on all incoming packets. By default, CoS override is disabled. Use the override keyword when all incoming packets on specified ports deserve higher or lower priority than packets entering from other ports. Even if a port was previously set to trust DSCP, CoS, or IP precedence, this command overrides the previously configured trust state, and all the incoming CoS values are assigned the default CoS value configured with this command. If an incoming packet is tagged, the CoS value of the packet is modified with the default CoS of the port at the ingress port. <p>Note To return to the default setting, use the no mls qos cos {<i>default-cos</i> override} interface configuration command.</p>
Step 4	end Example: <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 5	show mls qos interface Example: <pre>Switch# show mls qos interface</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring a Trusted Boundary to Ensure Port Security

In a typical network, you connect a Cisco IP Phone to a switch port and cascade devices that generate data packets from the back of the telephone. The Cisco IP Phone guarantees the voice quality through a shared data link by marking the CoS level of the voice packets as high priority (CoS = 5) and by marking the data packets as low priority (CoS = 0). Traffic sent from the telephone to the switch is typically marked with a tag that uses the 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which is the priority of the packet.

For most Cisco IP Phone configurations, the traffic sent from the telephone to the switch should be trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the **mls qos trust cos** interface configuration command, you configure the switch port to which the telephone is connected to trust the CoS labels of all traffic received on that port. Use the **mls qos trust dscp** interface configuration command to configure a routed port to which the telephone is connected to trust the DSCP labels of all traffic received on that port.

With the trusted setting, you also can use the trusted boundary feature to prevent misuse of a high-priority queue if a user bypasses the telephone and connects the PC directly to the switch. Without trusted boundary, the CoS labels generated by the PC are trusted by the switch (because of the trusted CoS setting). By contrast, trusted boundary uses CDP to detect the presence of a Cisco IP Phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port. If the telephone is not detected, the trusted boundary feature disables the trusted setting on the switch port and prevents misuse of a high-priority queue. Note that the trusted boundary feature is not effective if the PC and Cisco IP Phone are connected to a hub that is connected to the switch.

In some situations, you can prevent a PC connected to the Cisco IP Phone from taking advantage of a high-priority data queue. You can use the **switchport priority extend cos** interface configuration command to configure the telephone through the switch CLI to override the priority of the traffic received from the PC.

SUMMARY STEPS

1. **configure terminal**
2. **cdp run**
3. **interface *interface-id***
4. **cdp enable**
5. Use one of the following:
 - **mls qos trust cos**
 - **mls qos trust dscp**
6. **mls qos trust device cisco-phone**
7. **end**
8. **show mls qos interface**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	cdp run Example: Switch(config)# cdp run	Enables CDP globally. By default, CDP is enabled.
Step 3	interface interface-id Example: Switch(config)# interface gigabitethernet 2/1/1	Specifies the port connected to the Cisco IP Phone, and enters interface configuration mode. Valid interfaces include physical ports.
Step 4	cdp enable Example: Switch(config-if)# cdp enable	Enables CDP on the port. By default, CDP is enabled.
Step 5	Use one of the following: <ul style="list-style-type: none"> • mls qos trust cos • mls qos trust dscp Example: Switch(config-if)# mls qos trust cos	Configures the switch port to trust the CoS value in traffic received from the Cisco IP Phone. or Configures the routed port to trust the DSCP value in traffic received from the Cisco IP Phone. By default, the port is not trusted.
Step 6	mls qos trust device cisco-phone Example: Switch(config-if)# mls qos trust device cisco-phone	Specifies that the Cisco IP Phone is a trusted device. You cannot enable both trusted boundary and auto-QoS (auto qos voip interface configuration command) at the same time; they are mutually exclusive. Note To disable the trusted boundary feature, use the no mls qos trust device interface configuration command.
Step 7	end Example: Switch(config-if)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 8	show mls qos interface Example: Switch# <code>show mls qos interface</code>	Verifies your entries.
Step 9	copy running-config startup-config Example: Switch# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Related Topics

[Example: Configuring Port to the DSCP-Trusted State and Modifying the DSCP-to-DSCP-Mutation Map, on page 102](#)

Enabling DSCP Transparency Mode

The switch supports the DSCP transparency feature. It affects only the DSCP field of a packet at egress. By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

If DSCP transparency is enabled by using the **no mls qos rewrite ip dscp** command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

Note

Enabling DSCP transparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet, which the switch uses to generate a class of service (CoS) value that represents the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos**
3. **no mls qos rewrite ip dscp**
4. **end**
5. **show mls qos interface** [*interface-id*]
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	mls qos Example: Switch(config)# mls qos	Enables QoS globally.
Step 3	no mls qos rewrite ip dscp Example: Switch(config)# no mls qos rewrite ip dscp	Enables DSCP transparency. The switch is configured to not modify the DSCP field of the IP packet.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show mls qos interface [<i>interface-id</i>] Example: Switch# show mls qos interface gigabitethernet 2/1/1	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

DSCP Transparency Mode

To configure the switch to modify the DSCP value based on the trust setting or on an ACL by disabling DSCP transparency, use the **mls qos rewrite ip dscp** global configuration command.

If you disable QoS by using the **no mls qos** global configuration command, the CoS and DSCP values are not changed (the default QoS setting).

If you enter the **no mls qos rewrite ip dscp** global configuration command to enable DSCP transparency and then enter the **mls qos trust [cos | dscp]** interface configuration command, DSCP transparency is still enabled.

Configuring the DSCP Trust State on a Port Bordering Another QoS Domain

If you are administering two separate QoS domains between which you want to implement QoS features for IP traffic, you can configure the switch ports bordering the domains to a DSCP-trusted state. The receiving port accepts the DSCP-trusted value and avoids the classification stage of QoS. If the two domains use different DSCP values, you can configure the DSCP-to-DSCP-mutation map to translate a set of DSCP values to match the definition in the other domain.

Figure 11: DSCP-Trusted State on a Port Bordering Another QoS Domain

Beginning in privileged EXEC mode, follow these steps to configure the DSCP-trusted state on a port and modify the DSCP-to-DSCP-mutation map. To ensure a consistent mapping strategy across both QoS domains, you must perform this procedure on the ports in both domains.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos map dscp-mutation *dscp-mutation-name* in-dscp to out-dscp**
3. **interface *interface-id***
4. **mls qos trust dscp**
5. **mls qos dscp-mutation *dscp-mutation-name***
6. **end**
7. **show mls qos maps dscp-mutation**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
Step 2	<p>mls qos map dscp-mutation <i>dscp-mutation-name in-dscp to out-dscp</i></p> <p>Example:</p> <pre>Switch(config)# mls qos map dscp-mutation gigabitethernet1/0/2-mutation 10 11 12 13 to 30</pre>	<p>Modifies the DSCP-to-DSCP-mutation map.</p> <p>The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.</p> <ul style="list-style-type: none"> • For <i>dscp-mutation-name</i>, enter the mutation map name. You can create more than one map by specifying a new name. • For <i>in-dscp</i>, enter up to eight DSCP values separated by spaces. Then enter the to keyword. • For <i>out-dscp</i>, enter a single DSCP value. <p>The DSCP range is 0 to 63.</p>
Step 3	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config)# interface gigabitethernet1/0/2</pre>	<p>Specifies the port to be trusted, and enter interface configuration mode.</p> <p>Valid interfaces include physical ports.</p>
Step 4	<p>mls qos trust dscp</p> <p>Example:</p> <pre>Switch(config-if)# mls qos trust dscp</pre>	<p>Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted.</p> <p>Note To return a port to its non-trusted state, use the no mls qos trust interface configuration command.</p>
Step 5	<p>mls qos dscp-mutation <i>dscp-mutation-name</i></p> <p>Example:</p> <pre>Switch(config-if)# mls qos dscp-mutation gigabitethernet1/0/2-mutation</pre>	<p>Applies the map to the specified ingress DSCP-trusted port.</p> <p>For <i>dscp-mutation-name</i>, specify the mutation map name created in Step 2.</p> <p>You can configure multiple DSCP-to-DSCP-mutation maps on an ingress port.</p> <p>Note To return to the default DSCP-to-DSCP-mutation map values, use the no mls qos map dscp-mutation <i>dscp-mutation-name</i> global configuration command.</p>
Step 6	<p>end</p> <p>Example:</p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 7	show mls qos maps dscp-mutation Example: Switch# show mls qos maps dscp-mutation	Verifies your entries.
Step 8	copy running-config startup-config Example: Switch# copy-running-config startup-config	(Optional) Saves your entries in the configuration file. Note To return a port to its non-trusted state, use the no mls qos trust interface configuration command. To return to the default DSCP-to-DSCP-mutation map values, use the no mls qos map dscp-mutation dscp-mutation-name global configuration command.

Configuring a QoS Policy

Configuring a QoS policy typically requires the following tasks:

- Classifying traffic into classes
- Configuring policies applied to those traffic classes
- Attaching policies to ports

These sections describe how to classify, police, and mark traffic. Depending on your network configuration, you must perform one or more of the modules in this section.

Classifying Traffic by Using ACLs

You can classify IP traffic by using IPv4 standard ACLs, IPv4 extended ACLs, or IPv6 ACLs.

You can classify non-IP traffic by using Layer 2 MAC ACLs.

Creating an IP Standard ACL for IPv4 Traffic

Before You Begin

Before you perform this task, determine which access lists you will be using for your QoS configuration.

SUMMARY STEPS

1. **configure terminal**
2. **access-list** *access-list-number* {**deny** | **permit**} *source* [*source-wildcard*]
3. **end**
4. **show access-lists**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	access-list <i>access-list-number</i> { deny permit } <i>source</i> [<i>source-wildcard</i>] Example: Switch(config)# access-list 1 permit 192.2.255.0 1.1.1.255	Creates an IP standard ACL, repeating the command as many times as necessary. <ul style="list-style-type: none"> • For <i>access-list-number</i>, enter the access list number. The range is 1 to 99 and 1300 to 1999. • Use the permit keyword to permit a certain type of traffic if the conditions are matched. Use the deny keyword to deny a certain type of traffic if conditions are matched. • For <i>source</i>, enter the network or host from which the packet is being sent. You can use the any keyword as an abbreviation for 0.0.0.0 255.255.255.255. • (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. <p>When you create an access list, remember that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.</p> <p>Note To delete an access list, use the no access-list <i>access-list-number</i> global configuration command.</p>
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 4	show access-lists Example: Switch# show access-lists	Verifies your entries.
Step 5	copy running-config startup-config Example: Switch# copy-running-config startup-config	(Optional) Saves your entries in the configuration file.

Creating an IP Extended ACL for IPv4 Traffic

Before You Begin

Before you perform this task, determine which access lists you will be using for your QoS configuration.

SUMMARY STEPS

1. **configure terminal**
2. **access-list** *access-list-number* {deny | permit} *protocol source source-wildcard destination destination-wildcard*
3. **end**
4. **show access-lists**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	access-list <i>access-list-number</i> {deny permit} <i>protocol source</i>	Creates an IP extended ACL, repeating the command as many times as necessary.

	Command or Action	Purpose
	<p><i>source-wildcard destination destination-wildcard</i></p> <p>Example:</p> <pre>Switch(config)# access-list 100 permit ip any any dscp 32</pre>	<ul style="list-style-type: none"> For <i>access-list-number</i>, enter the access list number. The range is 100 to 199 and 2000 to 2699. Use the permit keyword to permit a certain type of traffic if the conditions are matched. Use the deny keyword to deny a certain type of traffic if conditions are matched. For <i>protocol</i>, enter the name or number of an IP protocol. Use the question mark (?) to see a list of available protocol keywords. For <i>source</i>, enter the network or host from which the packet is being sent. You specify this by using dotted decimal notation, by using the any keyword as an abbreviation for <i>source 0.0.0.0 source-wildcard 255.255.255.255</i>, or by using the host keyword for <i>source 0.0.0.0</i>. For <i>source-wildcard</i>, enter the wildcard bits by placing ones in the bit positions that you want to ignore. You specify the wildcard by using dotted decimal notation, by using the any keyword as an abbreviation for <i>source 0.0.0.0 source-wildcard 255.255.255.255</i>, or by using the host keyword for <i>source 0.0.0.0</i>. For <i>destination</i>, enter the network or host to which the packet is being sent. You have the same options for specifying the <i>destination and destination-wildcard</i> as those described by <i>source</i> and <i>source-wildcard</i>. <p>When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.</p> <p>Note To delete an access list, use the no access-list access-list-number global configuration command.</p>
Step 3	<p>end</p> <p>Example:</p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	<p>show access-lists</p> <p>Example:</p> <pre>Switch# show access-lists</pre>	Verifies your entries.
Step 5	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Creating an IPv6 ACL for IPv6 Traffic

Before You Begin

Before you perform this task, determine which access lists you will be using for your QoS configuration.

SUMMARY STEPS

1. **configure terminal**
2. **ipv6 access-list** *access-list-name*
3. **{deny | permit} protocol** {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/ prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**routing**] [**sequence** *value*] [**time-range** *name*]
4. **end**
5. **show ipv6 access-list**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	ipv6 access-list <i>access-list-name</i> Example: Switch(config)# ipv6 access-list <i>ipv6_Name_ACL</i>	Creates an IPv6 ACL and enters IPv6 access-list configuration mode. Accesses list names cannot contain a space or quotation mark or begin with a numeric. Note To delete an access list, use the no ipv6 access-list <i>access-list-number</i> global configuration command.
Step 3	{deny permit} protocol {source-ipv6-prefix/prefix-length any host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/ prefix-length any host destination-ipv6-address} [operator [port-number]] [dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]	Enters deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions: For <i>protocol</i> , enter the name or number of an Internet protocol: ahp , esp , icmp , ipv6 , pcp , stcp , tcp , or udp , or an integer in the range 0 to 255 representing an IPv6 protocol number. <ul style="list-style-type: none"> • The <i>source-ipv6-prefix/prefix-length</i> or <i>destination-ipv6-prefix/ prefix-length</i> is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

	Command or Action	Purpose
	<p>Example:</p> <pre>Switch(config-ipv6-acl)# permit ip host 10::1 host 11::2 host</pre>	<ul style="list-style-type: none"> • Enter any as an abbreviation for the IPv6 prefix <code>::/0</code>. • For host <i>source-ipv6-address</i> or <i>destination-ipv6-address</i>, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons. • (Optional) For <i>operator</i>, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range. If the operator follows the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port. If the operator follows the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port. • (Optional) The <i>port-number</i> is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP. • (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63. • (Optional) Enter fragments to check noninitial fragments. This keyword is visible only if the protocol is IPv6. • (Optional) Enter log to cause a logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs. • (Optional) Enter routing to specify that IPv6 packets be routed. • (Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295. • (Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.
Step 4	<p>end</p> <p>Example:</p> <pre>Switch(config-ipv6-acl)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show ipv6 access-list</p> <p>Example:</p> <pre>Switch# show ipv6 access-list</pre>	Verifies the access list configuration.

	Command or Action	Purpose
Step 6	copy running-config startup-config Example: Switch# <code>copy-running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Creating a Layer 2 MAC ACL for Non-IP Traffic

Before You Begin

Before you perform this task, determine that Layer 2 MAC access lists are required for your QoS configuration.

SUMMARY STEPS

1. **configure terminal**
2. **mac access-list extended** *name*
3. **{permit | deny} {host** *src-MAC-addr mask* **| any | host** *dst-MAC-addr* **|** *dst-MAC-addr mask* **} [type mask]**
4. **end**
5. **show access-lists** [*access-list-number* | *access-list-name*]
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# <code>configure terminal</code>	Enters global configuration mode.
Step 2	mac access-list extended <i>name</i> Example: Switch(config)# <code>mac access-list extended maclist1</code>	Creates a Layer 2 MAC ACL by specifying the name of the list. After entering this command, the mode changes to extended MAC ACL configuration. Note To delete an access list, use the no mac access-list extended <i>access-list-name</i> global configuration command.

	Command or Action	Purpose
Step 3	<p>{permit deny} {host <i>src-MAC-addr mask</i> any host <i>dst-MAC-addr</i> <i>dst-MAC-addr mask</i>} [<i>type mask</i>]</p> <p>Example:</p> <pre>Switch(config-ext-macl) # permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0</pre> <pre>Switch(config-ext-macl) # permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp</pre>	<p>Specifies the type of traffic to permit or deny if the conditions are matched, entering the command as many times as necessary.</p> <ul style="list-style-type: none"> For <i>src-MAC-addr</i>, enter the MAC address of the host from which the packet is being sent. You specify this by using the hexadecimal format (H.H.H), by using the any keyword as an abbreviation for <i>source</i> 0.0.0, <i>source-wildcard</i> ffff.ffff.ffff, or by using the host keyword for <i>source</i> 0.0.0. For <i>mask</i>, enter the wildcard bits by placing ones in the bit positions that you want to ignore. For <i>dst-MAC-addr</i>, enter the MAC address of the host to which the packet is being sent. You specify this by using the hexadecimal format (H.H.H), by using the any keyword as an abbreviation for <i>source</i> 0.0.0, <i>source-wildcard</i> ffff.ffff.ffff, or by using the host keyword for <i>source</i> 0.0.0. (Optional) For <i>type mask</i>, specify the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet. For <i>type</i>, the range is from 0 to 65535, typically specified in hexadecimal. For <i>mask</i>, enter the <i>don't care</i> bits applied to the Ethertype before testing for a match. <p>When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Switch(config-ext-macl) # end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show access-lists [<i>access-list-number</i> <i>access-list-name</i>]</p> <p>Example:</p> <pre>Switch# show access-lists</pre>	Verifies your entries.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Classifying Traffic by Using Class Maps

You use the **class-map** global configuration command to name and to isolate a specific traffic flow (or class) from all other traffic. The class map defines the criteria to use to match against a specific traffic flow to further classify it. Match statements can include criteria such as an ACL, IP precedence values, or DSCP values. The match criterion is defined with one match statement entered within the class-map configuration mode.

**Note**

You can also create class maps during policy map creation by using the **class** policy-map configuration command.

SUMMARY STEPS

1. **configure terminal**
2. Use one of the following:
 - **access-list** *access-list-number* {deny | permit} *source* [*source-wildcard*]
 - **access-list** *access-list-number* {deny | permit} *protocol* *source* [*source-wildcard*] *destination* [*destination-wildcard*]
 - **ipv6 access-list** *access-list-name* {deny | permit} *protocol* {*source-ipv6-prefix/prefix-length* | any | host *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/ prefix-length* | any | host *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**routing**] [**sequence** *value*] [**time-range** *name*]
 - **mac access-list extended** *name* {permit | deny} {host *src-MAC-addr mask* | any | host *dst-MAC-addr* | *dst-MAC-addr mask*} [*type mask*]
3. **class-map** [**match-all** | **match-any**] *class-map-name*
4. **match** {**access-group** *acl-index-or-name* | **ip dscp** *dscp-list* | **ip precedence** *ip-precedence-list*}
5. **end**
6. **show class-map**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
Step 2	<p>Use one of the following:</p> <ul style="list-style-type: none"> • access-list <i>access-list-number</i> {deny permit} <i>source</i> [<i>source-wildcard</i>] • access-list <i>access-list-number</i> {deny permit} <i>protocol</i> <i>source</i> [<i>source-wildcard</i>] <i>destination</i> [<i>destination-wildcard</i>] • ipv6 access-list <i>access-list-name</i> {deny permit} <i>protocol</i> {<i>source-ipv6-prefix/prefix-length</i> any host <i>source-ipv6-address</i>} [<i>operator</i> [<i>port-number</i>]] {<i>destination-ipv6-prefix/prefix-length</i> any host <i>destination-ipv6-address</i>} [<i>operator</i> [<i>port-number</i>]] [dscp <i>value</i>] [fragments] [log] [log-input] [routing] [sequence <i>value</i>] [time-range <i>name</i>] • mac access-list extended <i>name</i> {permit deny} {host <i>src-MAC-addr mask</i> any host <i>dst-MAC-addr</i> <i>dst-MAC-addr mask</i>} [<i>type mask</i>] <p>Example:</p> <pre>Switch(config)# access-list 103 permit ip any dscp 10</pre>	<p>Creates an IP standard or extended ACL, an IPv6 ACL for IP traffic, or a Layer 2 MAC ACL for non-IP traffic, repeating the command as many times as necessary.</p> <p>When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.</p>
Step 3	<p>class-map [match-all match-any] <i>class-map-name</i></p> <p>Example:</p> <pre>Switch(config)# class-map class1</pre>	<p>Creates a class map, and enters class-map configuration mode.</p> <p>By default, no class maps are defined.</p> <ul style="list-style-type: none"> • (Optional) Use the match-all keyword to perform a logical-AND of all matching statements under this class map. All match criteria in the class map must be matched. • (Optional) Use the match-any keyword to perform a logical-OR of all matching statements under this class map. One or more match criteria must be matched. • For <i>class-map-name</i>, specify the name of the class map.

	Command or Action	Purpose
		<p>If neither the match-all or match-any keyword is specified, the default is match-all.</p> <p>Note To delete an existing class map, use the no class-map [match-all match-any] class-map-name global configuration command.</p>
Step 4	<p>match {access-group <i>acl-index-or-name</i> ip dscp <i>dscp-list</i> ip precedence <i>ip-precedence-list</i>}</p> <p>Example:</p> <pre>Switch(config-cmap)# match ip dscp 10 11 12</pre>	<p>Defines the match criterion to classify traffic.</p> <p>By default, no match criterion is defined.</p> <p>Only one match criterion per class map is supported, and only one ACL per class map is supported.</p> <ul style="list-style-type: none"> • For access-group <i>acl-index-or-name</i>, specify the number or name of the ACL created in Step 2. • To filter IPv6 traffic with the match access-group command, create an IPv6 ACL, as described in Step 2. • For ip dscp <i>dscp-list</i>, enter a list of up to eight IP DSCP values to match against incoming packets. Separate each value with a space. The range is 0 to 63. • For ip precedence <i>ip-precedence-list</i>, enter a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. <p>Note To remove a match criterion, use the no match {access-group <i>acl-index-or-name</i> ip dscp ip precedence} class-map configuration command.</p>
Step 5	<p>end</p> <p>Example:</p> <pre>Switch(config-cmap)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 6	<p>show class-map</p> <p>Example:</p> <pre>Switch# show class-map</pre>	<p>Verifies your entries.</p>
Step 7	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

Classifying Traffic by Using Class Maps and Filtering IPv6 Traffic**Note**

IPv6 QoS is not supported on switches running the LAN base feature set.

To apply the primary match criteria to only IPv4 traffic, use the **match protocol** command with the **ip** keyword. To apply the primary match criteria to only IPv6 traffic, use the **match protocol** command with the **ipv6** keyword.

SUMMARY STEPS

1. **configure terminal**
2. **class-map {match-all} class-map-name**
3. **match protocol [ip | ipv6]**
4. **match {ip dscp dscp-list | ip precedence ip-precedence-list}**
5. **end**
6. **show class-map**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	class-map {match-all} class-map-name Example: Switch(config)# class-map cm-1	Creates a class map, and enters class-map configuration mode. By default, no class maps are defined. When you use the match protocol command, only the match-all keyword is supported. <ul style="list-style-type: none"> • For <i>class-map-name</i>, specify the name of the class map. If neither the match-all or match-any keyword is specified, the default is match-all . Note To delete an existing class map, use the no class-map [match-all match-any] class-map-name global configuration command.
Step 3	match protocol [ip ipv6]	(Optional) Specifies the IP protocol to which the class map applies:

	Command or Action	Purpose
	<p>Example:</p> <pre>Switch(config-cmap) # match protocol ip</pre>	<ul style="list-style-type: none"> Use the argument <i>ip</i> to specify IPv4 traffic and <i>ipv6</i> to specify IPv6 traffic. When you use the match protocol command, only the match-all keyword is supported for the class-map command. <p>Note You can also match the following protocols: ARP, CDP, and HTTP.</p>
Step 4	<p>match {ip dscp <i>dscp-list</i> ip precedence <i>ip-precedence-list</i>}</p> <p>Example:</p> <pre>Switch(config-cmap) # match ip dscp 10</pre>	<p>Defines the match criterion to classify traffic.</p> <p>By default, no match criterion is defined.</p> <ul style="list-style-type: none"> For ip dscp <i>dscp-list</i>, enter a list of up to eight IP DSCP values to match against incoming packets. Separate each value with a space. The range is 0 to 63. For ip precedence <i>ip-precedence-list</i>, enter a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. <p>Note To remove a match criterion, use the no match {access-group <i>acl-index-or-name</i> ip dscp ip precedence} class-map configuration command.</p>
Step 5	<p>end</p> <p>Example:</p> <pre>Switch(config-cmap) # end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 6	<p>show class-map</p> <p>Example:</p> <pre>Switch# show class-map</pre>	<p>Verifies your entries.</p>
Step 7	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps

You can configure a policy map on a physical port that specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; and specifying the traffic bandwidth limitations for each matched traffic class (policer) and the action to take when the traffic is out of profile (marking).

A policy map also has these characteristics:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A policy map can contain a predefined default traffic class explicitly placed at the end of the map.
- A separate policy-map class can exist for each type of traffic received through a port.

Follow these guidelines when configuring policy maps on physical ports:

- You can attach only one policy map per ingress port.
- If you configure the IP-precedence-to-DSCP map by using the **mls qos map ip-prec-dscp** *dscp1...dscp8* global configuration command, the settings only affect packets on ingress interfaces that are configured to trust the IP precedence value. In a policy map, if you set the packet IP precedence value to a new value by using the **set ip precedence** *new-precedence* policy-map class configuration command, the egress DSCP value is not affected by the IP-precedence-to-DSCP map. If you want the egress DSCP value to be different than the ingress value, use the **set dscp new-dscp** policy-map class configuration command.
- If you enter or have used the **set ip dscp** command, the switch changes this command to **set dscp** in its configuration.
- You can use the **set ip precedence** or the **set precedence** policy-map class configuration command to change the packet IP precedence value. This setting appears as **set ip precedence** in the switch configuration.
- You can configure a separate second-level policy map for each class defined for the port. The second-level policy map specifies the police action to take for each traffic class.
- A policy-map and a port trust state can both run on a physical interface. The policy-map is applied before the port trust state.
- When you configure a default traffic class by using the **class class-default** policy-map configuration command, unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as the default traffic class (class-default).

SUMMARY STEPS

1. **configure terminal**
2. **class-map** [**match-all** | **match-any**] *class-map-name*
3. **policy-map** *policy-map-name*
4. **class** [*class-map-name* | **class-default**]
5. **trust** [**cos** | **dscp** | **ip-precedence**]
6. **set** {**dscp** *new-dscp* | **ip precedence** *new-precedence*}
7. **police** *rate-bps burst-byte* [**exceed-action** {**drop** | **policed-dscp-transmit**}]
8. **exit**
9. **exit**
10. **interface** *interface-id*
11. **service-policy input** *policy-map-name*
12. **end**
13. **show policy-map** [*policy-map-name* [**class** *class-map-name*]]
14. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	class-map [match-all match-any] <i>class-map-name</i> Example: Switch(config)# class-map ipclass1	Creates a class map, and enters class-map configuration mode. By default, no class maps are defined. <ul style="list-style-type: none"> • (Optional) Use the match-all keyword to perform a logical-AND of all matching statements under this class map. All match criteria in the class map must be matched. • (Optional) Use the match-any keyword to perform a logical-OR of all matching statements under this class map. One or more match criteria must be matched. • For <i>class-map-name</i>, specify the name of the class map. If neither the match-all or match-any keyword is specified, the default is match-all .
Step 3	policy-map <i>policy-map-name</i> Example: Switch(config-cmap)# policy-map	Creates a policy map by entering the policy map name, and enters policy-map configuration mode. By default, no policy maps are defined.

	Command or Action	Purpose
	<code>flowit</code>	<p>The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.</p> <p>Note To delete an existing policy map, use the no policy-map <i>policy-map-name</i> global configuration command.</p>
Step 4	<p>class [<i>class-map-name</i> class-default]</p> <p>Example:</p> <pre>Switch(config-pmap) # class ipclass1</pre>	<p>Defines a traffic classification, and enters policy-map class configuration mode.</p> <p>By default, no policy map class-maps are defined.</p> <p>If a traffic class has already been defined by using the class-map global configuration command, specify its name for <i>class-map-name</i> in this command.</p> <p>A class-default traffic class is pre-defined and can be added to any policy. It is always placed at the end of a policy map. With an implied match any included in the class-default class, all packets that have not already matched the other traffic classes will match class-default.</p> <p>Note To delete an existing class map, use the no class <i>class-map-name</i> policy-map configuration command.</p>
Step 5	<p>trust [cos dscp ip-precedence]</p> <p>Example:</p> <pre>Switch(config-pmap-c) # trust dscp</pre>	<p>Configures the trust state, which QoS uses to generate a CoS-based or DSCP-based QoS label.</p> <p>This command is mutually exclusive with the set command within the same policy map. If you enter the trust command, go to Step 6.</p> <p>By default, the port is not trusted. If no keyword is specified when the command is entered, the default is dscp.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> • cos—QoS derives the DSCP value by using the received or default port CoS value and the CoS-to-DSCP map. • dscp—QoS derives the DSCP value by using the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS derives the DSCP value by using the received CoS value; for non-IP packets that are untagged, QoS derives the DSCP value by using the default port CoS value. In either case, the DSCP value is derived from the CoS-to-DSCP map. • ip-precedence—QoS derives the DSCP value by using the IP precedence value from the ingress packet and the IP-precedence-to-DSCP map. For non-IP packets that are tagged, QoS derives the DSCP value by using the received CoS value; for non-IP packets that are untagged, QoS derives the DSCP value by using the default port CoS value. In either case, the DSCP value is derived from the CoS-to-DSCP map. <p>Note To return to the untrusted state, use the no trust policy-map configuration command</p>
Step 6	<p>set {dscp <i>new-dscp</i> ip precedence <i>new-precedence</i>}</p>	<p>Classifies IP traffic by setting a new value in the packet.</p> <ul style="list-style-type: none"> • For dscp <i>new-dscp</i>, enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63.

	Command or Action	Purpose
	<p>Example:</p> <pre>Switch(config-pmap-c) # set dscp 45</pre>	<ul style="list-style-type: none"> For ip precedence <i>new-precedence</i>, enter a new IP-precedence value to be assigned to the classified traffic. The range is 0 to 7. <p>Note To remove an assigned DSCP or IP precedence value, use the no set {dscp new-dscp ip precedence new-precedence} policy-map configuration command.</p>
Step 7	<p>police <i>rate-bps burst-byte</i> [exceed-action {drop policed-dscp-transmit}]</p> <p>Example:</p> <pre>Switch(config-pmap-c) # police 100000 80000 drop</pre>	<p>Defines a policer for the classified traffic.</p> <p>By default, no policer is defined.</p> <ul style="list-style-type: none"> For <i>rate-bps</i>, specify average traffic rate in bits per second (b/s). The range is 8000 to 10000000000. For <i>burst-byte</i>, specify the normal burst size in bytes. The range is 8000 to 1000000. (Optional) Specifies the action to take when the rates are exceeded. Use the exceed-action drop keywords to drop the packet. Use the exceed-action policed-dscp-transmit keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet. <p>Note To remove an existing policer, use the no police <i>rate-bps burst-byte</i> [exceed-action {drop policed-dscp-transmit}] policy-map configuration command.</p>
Step 8	<p>exit</p> <p>Example:</p> <pre>Switch(config-pmap-c) # exit</pre>	<p>Returns to policy map configuration mode.</p>
Step 9	<p>exit</p> <p>Example:</p> <pre>Switch(config-pmap) # exit</pre>	<p>Returns to global configuration mode.</p>
Step 10	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config) # interface gigabitethernet 2/0/1</pre>	<p>Specifies the port to attach to the policy map, and enters interface configuration mode.</p> <p>Valid interfaces include physical ports.</p>
Step 11	<p>service-policy input <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch(config-if) # service-policy</pre>	<p>Specifies the policy-map name, and applies it to an ingress port.</p> <p>Only one policy map per ingress port is supported.</p> <p>Note To remove the policy map and port association, use the no service-policy input <i>policy-map-name</i> interface configuration command.</p>

	Command or Action	Purpose
	<code>input flowit</code>	
Step 12	end Example: <code>Switch(config-if)# end</code>	Returns to privileged EXEC mode.
Step 13	show policy-map [<i>policy-map-name</i>] [<i>class class-map-name</i>] Example: <code>Switch# show policy-map</code>	Verifies your entries.
Step 14	copy running-config startup-config Example: <code>Switch# copy-running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Classifying, Policing, and Marking Traffic on SVIs by Using Hierarchical Policy Maps

You can configure hierarchical policy maps on SVIs, but not on other types of interfaces. Hierarchical policing combines the VLAN- and interface-level policy maps to create a single policy map.

You can configure hierarchical policy maps on SVIs, but not on other types of interfaces. Hierarchical policing combines the VLAN- and interface-level policy maps to create a single policy map.

On an SVI, the VLAN-level policy map specifies which traffic class to act on. Actions can include trusting the CoS, DSCP, or IP precedence values or setting a specific DSCP or IP precedence value in the traffic class. Use the interface-level policy map to specify the physical ports that are affected by individual policers.

You can configure hierarchical policy maps that filter IPv4 and IPv6 traffic.

Follow these guidelines when configuring hierarchical policy maps:

- Before configuring a hierarchical policy map, you must enable VLAN-based QoS on the physical ports that are to be specified at the interface level of the policy map.
- You can attach only one policy map per ingress port or SVI.
- A policy map can contain multiple class statements, each with different match criteria and actions.

- A separate policy-map class can exist for each type of traffic received on the SVI.
- In a switch stack, you cannot use the **match input-interface** class-map configuration command to specify interfaces across stack members in a policy-map class.
- A policy-map and a port trust state can both run on a physical interface. The policy-map is applied before the port trust state.
- If you configure the IP-precedence-to-DSCP map by using the **mls qos map ip-prec-dscp dscp1...dscp8** global configuration command, the settings only affect packets on ingress interfaces that are configured to trust the IP precedence value. In a policy map, if you set the packet IP precedence value to a new value by using the **set ip precedence new-precedence** policy-map class configuration command, the egress DSCP value is not affected by the IP-precedence-to-DSCP map. If you want the egress DSCP value to be different than the ingress value, use the **set dscp new-dscp** policy-map class configuration command.
- If you enter or have used the **set ip dscp** command, the switch changes this command to **set dscp** in its configuration. If you enter the **set ip dscp** command, this setting appears as **set dscp** in the switch configuration.
- You can use the **set ip precedence** or the **set precedence** policy-map class configuration command to change the packet IP precedence value. This setting appears as **set ip precedence** in the switch configuration.
- If VLAN-based QoS is enabled, the hierarchical policy map supersedes the previously configured port-based policy map.
- The hierarchical policy map is attached to the SVI and affects all traffic in the VLAN. The actions specified in the VLAN-level policy map affect the traffic belonging to the SVI. The police action on the port-level policy map affects the ingress traffic on the affected physical interfaces.
- When configuring a hierarchical policy map on trunk ports, the VLAN ranges must not overlap. If the ranges overlap, the actions specified in the policy map affect the incoming and outgoing traffic on the overlapped VLANs.
- Aggregate policers are not supported in hierarchical policy maps.
- When VLAN-based QoS is enabled, the switch supports VLAN-based features, such as the VLAN map.
- You can configure a hierarchical policy map only on the primary VLAN of a private VLAN.
- When you enable VLAN-based QoS and configure a hierarchical policy map in a switch stack, these automatic actions occur when the stack configuration changes:
 - When a new stack master is selected, the stack master reenables and reconfigures these features on all applicable interfaces on the stack master.
 - When a stack member is added, the stack master reenables and reconfigures these features on all applicable ports on the stack member.
 - When you merge switch stacks, the new stack master reenables and reconfigures these features on the switches in the new stack.
 - When the switch stack divides into two or more switch stacks, the stack master in each switch stack re-enables and reconfigures these features on all applicable interfaces on the stack members, including the stack master.

- When you configure a default traffic class by using the **class class-default** policy-map configuration command, unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic class (**class-default**).

SUMMARY STEPS

1. **configure terminal**
2. **class-map** [**match-all** | **match-any**] *class-map-name*
3. **match** {**access-group** *acl-index-or-name* | **ip dscp** *dscp-list* | **ip precedence** *ip-precedence-list*}
4. **match protocol** [*ip* | *ipv6*]
5. **exit**
6. **exit**
7. **class-map** [**match-all** | **match-any**] *class-map-name*
8. **match input-interface** *interface-id-list*
9. **exit**
10. **exit**
11. **policy-map** *policy-map-name*
12. **class-map** *class-map-name*
13. **police** *rate-bps burst-byte* [**exceed-action** {**drop** | **policed-dscp-transmit**}]
14. **exit**
15. **exit**
16. **policy-map** *policy-map-name*
17. **class** [*class-map-name* | **class-default**]
18. **trust** [**cos** | **dscp** | **ip-precedence**]
19. **set** {**dscp** *new-dscp* | **ip precedence** *new-precedence*}
20. **service-policy** *policy-map-name*
21. **exit**
22. **exit**
23. **interface** *interface-id*
24. **service-policy input** *policy-map-name*
25. **end**
26. **show policy-map** [*policy-map-name* [**class** *class-map-name*]] or **show mls qos vlan-based**
27. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	class-map [match-all match-any] <i>class-map-name</i> Example: Switch(config)# class-map cm-1	<p>Creates a VLAN-level class map, and enters class-map configuration mode.</p> <p>By default, no class maps are defined.</p> <ul style="list-style-type: none"> • (Optional) Use the match-all keyword to perform a logical-AND of all matching statements under this class map. All match criteria in the class map must be matched. • (Optional) Use the match-any keyword to perform a logical-OR of all matching statements under this class map. One or more match criteria must be matched. • For <i>class-map-name</i>, specify the name of the class map. <p>If neither the match-all or match-any keyword is specified, the default is match-all.</p> <p>Because only one match command per class map is supported, the match-all and match-any keywords function the same.</p>
Step 3	match {access-group <i>acl-index-or-name</i> ip dscp <i>dscp-list</i> ip precedence <i>ip-precedence-list</i> Example: Switch(config-cmap)# match ip dscp 10	<p>Defines the match criterion to classify traffic.</p> <p>By default, no match criterion is defined.</p> <p>Only one match criterion per class map is supported, and only one ACL per class map is supported.</p> <ul style="list-style-type: none"> • For access-group <i>acl-index-or-name</i>, specify the number or name of the ACL. • For ip dscp <i>dscp-list</i>, enter a list of up to eight IP DSCP values to match against incoming packets. Separate each value with a space. The range is 0 to 63. • For ip precedence <i>ip-precedence-list</i>, enter a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7.
Step 4	match protocol [<i>ip</i> <i>ipv6</i>] Example: Switch(config-cmap)# match protocol ipv6	<p>(Optional) Specifies the IP protocol to which the class map applies.</p> <ul style="list-style-type: none"> • Use the argument <i>ip</i> to specify IPv4 traffic, and <i>ipv6</i> to specify IPv6 traffic. • When you use the match protocol command, only the match-all keyword is supported for the first level class map.

	Command or Action	Purpose
		You can use the match protocol command with the match ip dscp or match precedence commands, but not with the match access-group command.
Step 5	exit Example: <pre>Switch(config-cmap) # exit</pre>	Returns to class-map configuration mode.
Step 6	exit Example: <pre>Switch(config) # exit</pre>	Returns to global configuration mode.
Step 7	class-map [match-all match-any] <i>class-map-name</i> Example: <pre>Switch(config) # class-map match-all cm-2</pre>	<p>Creates an interface-level class map, and enters class-map configuration mode. By default, no class maps are defined.</p> <ul style="list-style-type: none"> • (Optional) Use the match-all keyword to perform a logical-AND of all matching statements under this class map. All match criteria in the class map must be matched. • (Optional) Use the match-any keyword to perform a logical-OR of all matching statements under this class map. One or more match criteria must be matched. • For <i>class-map-name</i>, specify the name of the class map. <p>If neither the match-all or match-any keyword is specified, the default is match-all.</p> <p>Because only one match command per class map is supported, the match-all and match-any keywords function the same.</p>
Step 8	match input-interface <i>interface-id-list</i> Example: <pre>Switch(config-cmap) # match input-interface gigabitethernet 3/0/1-3/0/2</pre>	<p>Specifies the physical ports on which the interface-level class map acts. You can specify up to six ports as follows:</p> <ul style="list-style-type: none"> • A single port (counts as one entry) • A list of ports separated by a space (each port counts as an entry) • A range of ports separated by a hyphen (counts as two entries) <p>This command can only be used in the child-level policy map and must be the only match condition in the child-level policy map.</p>
Step 9	exit Example: <pre>Switch(config-cmap) # exit</pre>	Returns to class-map configuration mode.

	Command or Action	Purpose
Step 10	<p>exit</p> <p>Example:</p> <pre>Switch(config)# exit</pre>	Returns to global configuration mode.
Step 11	<p>policy-map <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch# policy-map port-plcmap</pre>	<p>Creates an interface-level policy map by entering the policy-map name, and enters policy-map configuration mode.</p> <p>By default, no policy maps are defined, and no policing is performed.</p> <p>To delete an existing policy map, use the no policy-map <i>policy-map-name</i> global configuration command. To delete an existing class map, use the no class <i>class-map-name</i> policy-map configuration command.</p> <p>To return to the untrusted state in a policy map, use the no trust policy-map configuration command. To remove an assigned DSCP or IP precedence value, use the no set {dscp <i>new-dscp</i> ip precedence <i>new-precedence</i>} policy-map configuration command.</p>
Step 12	<p>class-map <i>class-map-name</i></p> <p>Example:</p> <pre>Switch(config-pmap)# class cm-interface-1</pre>	<p>Defines an interface-level traffic classification, and enters policy-map configuration mode.</p> <p>By default, no policy-map class-maps are defined.</p> <p>If a traffic class has already been defined by using the class-map global configuration command, specify its name for <i>class-map-name</i> in this command.</p>
Step 13	<p>police <i>rate-bps burst-byte</i> [exceed-action {drop policed-dscp-transmit}]</p> <p>Example:</p> <pre>Switch(config-pmap-c)# police 900000 9000 exceed-action policed-dscp-transmit</pre>	<p>Defines an individual policer for the classified traffic.</p> <p>By default, no policer is defined.</p> <ul style="list-style-type: none"> For <i>rate-bps</i>, specify average traffic rate in bits per second (b/s). The range is 8000 to 10000000000. For <i>burst-byte</i>, specify the normal burst size in bytes. The range is 8000 to 1000000. (Optional) Specifies the action to take when the rates are exceeded. Use the exceed-action drop keywords to drop the packet. Use the exceed-action policed-dscp-transmit keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet. <p>To remove an existing policer in an interface-level policy map, use the no police <i>rate-bps burst-byte</i> [exceed-action {drop policed-dscp-transmit}] policy-map configuration command. To remove the hierarchical policy map and port associations, use the no service-policy input <i>policy-map-name</i> interface configuration command.</p>
Step 14	<p>exit</p> <p>Example:</p> <pre>Switch(config-pmap-c)# exit</pre>	Returns to policy-map configuration mode.

	Command or Action	Purpose
Step 15	<p>exit</p> <p>Example:</p> <pre>Switch(config-pmap) # exit</pre>	Returns to global configuration mode.
Step 16	<p>policy-map <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch(config) # policy-map vlan-plcmap</pre>	<p>Creates a VLAN-level policy map by entering the policy-map name, and enters policy-map configuration mode.</p> <p>By default, no policy maps are defined.</p> <p>The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.</p>
Step 17	<p>class [<i>class-map-name</i> class-default]</p> <p>Example:</p> <pre>Switch(config-pmap) # class cm-1</pre>	<p>Defines a VLAN-level traffic classification, and enters policy-map class configuration mode.</p> <p>By default, no policy-map class-maps are defined.</p> <p>If a traffic class has already been defined by using the class-map global configuration command, specify its name for class-map-name in this command.</p> <p>A class-default traffic class is pre-defined and can be added to any policy. It is always placed at the end of a policy map. With an implied match any included in the class-default class, all packets that have not already matched the other traffic classes will match class-default.</p>
Step 18	<p>trust [cos dscp ip-precedence]</p> <p>Example:</p> <pre>Switch(config-pmap-c) # trust dscp</pre>	<p>Configures the trust state, which QoS uses to generate a CoS-based or DSCP-based QoS label.</p> <p>This command is mutually exclusive with the set command within the same policy map. If you enter the trust command, omit Step 18.</p> <p>By default, the port is not trusted. If no keyword is specified when the command is entered, the default is dscp.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> • cos—QoS derives the DSCP value by using the received or default port CoS value and the CoS-to-DSCP map. • dscp—QoS derives the DSCP value by using the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS derives the DSCP value by using the received CoS value; for non-IP packets that are untagged, QoS derives the DSCP value by using the default port CoS value. In either case, the DSCP value is derived from the CoS-to-DSCP map. • ip-precedence—QoS derives the DSCP value by using the IP precedence value from the ingress packet and the IP-precedence-to-DSCP map. For non-IP packets that are tagged, QoS derives the DSCP value by using the received CoS value; for non-IP packets that are untagged, QoS derives the DSCP value by using the default port CoS value. In either case, the DSCP value is derived from the CoS-to-DSCP map.

	Command or Action	Purpose
Step 19	<p>set {dscp <i>new-dscp</i> ip precedence <i>new-precedence</i>}</p> <p>Example:</p> <pre>Switch(config-pmap-c) # set dscp 10</pre>	<p>Classifies IP traffic by setting a new value in the packet.</p> <ul style="list-style-type: none"> • For dscp <i>new-dscp</i>, enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63. • For ip precedence <i>new-precedence</i>, enter a new IP-precedence value to be assigned to the classified traffic. The range is 0 to 7.
Step 20	<p>service-policy <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch(config-pmap-c) # service-policy port-plcmap-1</pre>	<p>Specifies the interface-level policy-map name (from Step 10) and associate it with the VLAN-level policy map.</p> <p>If the VLAN-level policy map specifies more than one class, each class can have a different service-policy <i>policy-map-name</i> command.</p>
Step 21	<p>exit</p> <p>Example:</p> <pre>Switch(config-pmap-c) # exit</pre>	<p>Returns to policy-map configuration mode.</p>
Step 22	<p>exit</p> <p>Example:</p> <pre>Switch(config-pmap) # exit</pre>	<p>Returns to global configuration mode.</p>
Step 23	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config) # interface vlan 10</pre>	<p>Specifies the SVI to which to attach the hierarchical policy map, and enters interface configuration mode.</p>
Step 24	<p>service-policy input <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch(config-if) # service-policy input vlan-plcmap</pre>	<p>Specifies the VLAN-level policy-map name, and applies it to the SVI. Repeat the previous step and this command to apply the policy map to other SVIs.</p> <p>If the hierarchical VLAN-level policy map has more than one interface-level policy map, all class maps must be configured to the same VLAN-level policy map specified in the service-policy <i>policy-map-name</i> command.</p> <p>Note To remove the hierarchical policy map and port associations, use the no service-policy input <i>policy-map-name</i> interface configuration command.</p>
Step 25	<p>end</p> <p>Example:</p> <pre>Switch(config-if) # end</pre>	<p>Returns to privileged EXEC mode.</p>

	Command or Action	Purpose
Step 26	<p>show policy-map [<i>policy-map-name</i> [<i>class class-map-name</i>]] or show mls qos vlan-based</p> <p>Example:</p> <pre>Switch# show mls qos vlan-based</pre>	Verifies your entries.
Step 27	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Classifying, Policing, and Marking Traffic by Using Aggregate Policers

By using an aggregate policer, you can create a policer that is shared by multiple traffic classes within the same policy map. However, you cannot use the aggregate policer across different policy maps or ports.

You can configure aggregate policers only in nonhierarchical policy maps on physical ports.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos aggregate-policer** *aggregate-policer-name* *rate-bps* *burst-byte* **exceed-action** {**drop** | **policed-dscp-transmit**}
3. **class-map** [**match-all** | **match-any**] *class-map-name*
4. **policy-map** *policy-map-name*
5. **class** [*class-map-name* | **class-default**]
6. **police aggregate** *aggregate-policer-name*
7. **exit**
8. **interface** *interface-id*
9. **service-policy input** *policy-map-name*
10. **end**
11. **show mls qos aggregate-policer** [*aggregate-policer-name*]
12. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
Step 2	<p>mls qos aggregate-policer <i>aggregate-policer-name</i> <i>rate-bps</i> <i>burst-byte</i> exceed-action {drop policed-dscp-transmit}</p> <p>Example:</p> <pre>Switch(config)# mls qos aggregate-police transmit1 48000 8000 exceed-action policed-dscp-transmit</pre>	<p>Defines the policer parameters that can be applied to multiple traffic classes within the same policy map.</p> <p>By default, no aggregate policer is defined.</p> <ul style="list-style-type: none"> For <i>aggregate-policer-name</i>, specify the name of the aggregate policer. For <i>rate-bps</i>, specify average traffic rate in bits per second (b/s). The range is 8000 to 10000000000. For <i>burst-byte</i>, specify the normal burst size in bytes. The range is 8000 to 1000000. Specifies the action to take when the rates are exceeded. Use the exceed-action drop keywords to drop the packet. Use the exceed-action policed-dscp-transmit keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet.
Step 3	<p>class-map [match-all match-any] <i>class-map-name</i></p> <p>Example:</p> <pre>Switch(config)# class-map ipclass1</pre>	Creates a class map to classify traffic as necessary.
Step 4	<p>policy-map <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch(config-cmap)# policy-map aggflow1</pre>	Creates a policy map by entering the policy map name, and enters policy-map configuration mode.
Step 5	<p>class [<i>class-map-name</i> class-default]</p> <p>Example:</p> <pre>Switch(config-cmap-p)# class ipclass1</pre>	Defines a traffic classification, and enters policy-map class configuration mode.

	Command or Action	Purpose
Step 6	<p>police aggregate <i>aggregate-policer-name</i></p> <p>Example:</p> <pre>Switch(configure-cmap-p)# police aggregate transmit1</pre>	<p>Applies an aggregate policer to multiple classes in the same policy map.</p> <p>For <i>aggregate-policer-name</i>, enter the name specified in Step 2.</p> <p>To remove the specified aggregate policer from a policy map, use the no police aggregate <i>aggregate-policer-name</i> policy map configuration command. To delete an aggregate policer and its parameters, use the no mls qos aggregate-policer <i>aggregate-policer-name</i> global configuration command.</p>
Step 7	<p>exit</p> <p>Example:</p> <pre>Switch(configure-cmap-p)# exit</pre>	<p>Returns to global configuration mode.</p>
Step 8	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config)# interface gigabitethernet 2/0/1</pre>	<p>Specifies the port to attach to the policy map, and enters interface configuration mode.</p> <p>Valid interfaces include physical ports.</p>
Step 9	<p>service-policy input <i>policy-map-name</i></p> <p>Example:</p> <pre>Switch(config-if)# service-policy input aggflow1</pre>	<p>Specifies the policy-map name, and applies it to an ingress port.</p> <p>Only one policy map per ingress port is supported.</p>
Step 10	<p>end</p> <p>Example:</p> <pre>Switch(configure-if)# end</pre>	<p>Returns to privileged EXEC mode.</p>
Step 11	<p>show mls qos aggregate-policer [<i>aggregate-policer-name</i>]</p> <p>Example:</p> <pre>Switch# show mls qos aggregate-policer transmit1</pre>	<p>Verifies your entries.</p>
Step 12	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p>

Configuring DSCP Maps

Configuring the CoS-to-DSCP Map

You use the CoS-to-DSCP map to map CoS values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Beginning in privileged EXEC mode, follow these steps to modify the CoS-to-DSCP map. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos map cos-dscp *dscp1...dscp8***
3. **end**
4. **show mls qos maps cos-dscp**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	mls qos map cos-dscp <i>dscp1...dscp8</i> Example: Switch(config)# mls qos map cos-dscp 10 15 20 25 30 35 40 45	Modifies the CoS-to-DSCP map. For <i>dscp1...dscp8</i> , enter eight DSCP values that correspond to CoS values 0 to 7. Separate each DSCP value with a space. The DSCP range is 0 to 63. Note To return to the default map, use the no mls qos cos-dscp global configuration command.

	Command or Action	Purpose
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 4	show mls qos maps cos-dscp Example: Switch# show mls qos maps cos-dscp	Verifies your entries.
Step 5	copy running-config startup-config Example: Switch# copy-running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Beginning in privileged EXEC mode, follow these steps to modify the IP-precedence-to-DSCP map. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos map ip-prec-dscp *dscp1...dscp8***
3. **end**
4. **show mls qos maps ip-prec-dscp**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	mls qos map ip-prec-dscp dscp1...dscp8 Example: Switch(config)# mls qos map ip-prec-dscp 10 15 20 25 30 35 40 45	Modifies the IP-precedence-to-DSCP map. For <i>dscp1...dscp8</i> , enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space. The DSCP range is 0 to 63. Note To return to the default map, use the no mls qos ip-prec-dscp global configuration command.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 4	show mls qos maps ip-prec-dscp Example: Switch# show mls qos maps ip-prec-dscp	Verifies your entries.
Step 5	copy running-config startup-config Example: Switch# copy-running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the Policed-DSCP Map

You use the policed-DSCP map to mark down a DSCP value to a new value as the result of a policing and marking action.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

Beginning in privileged EXEC mode, follow these steps to modify the policed-DSCP map. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos map policed-dscp** *dscp-list* **to** *mark-down-dscp*
3. **end**
4. **show mls qos maps policed-dscp**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	mls qos map policed-dscp <i>dscp-list</i> to <i>mark-down-dscp</i> Example: Switch(config)# mls qos map policed-dscp 50 51 52 53 54 55 56 57 to 0	Modifies the policed-DSCP map. <ul style="list-style-type: none"> • For <i>dscp-list</i>, enter up to eight DSCP values separated by spaces. Then enter the to keyword. • For <i>mark-down-dscp</i>, enter the corresponding policed (marked down) DSCP value. <p>Note To return to the default map, use the no mls qos policed-dscp global configuration command.</p>
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 4	show mls qos maps policed-dscp Example: Switch(config)# show mls qos maps policed-dscp	Verifies your entries.
Step 5	copy running-config startup-config Example: Switch# copy-running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the DSCP-to-CoS Map

You use the DSCP-to-CoS map to generate a CoS value, which is used to select one of the four egress queues. Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-CoS map. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos map dscp-cos *dscp-list* to *cos***
3. **end**
4. **show mls qos maps dscp-to-cos**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
Step 2	mls qos map dscp-cos <i>dscp-list</i> to <i>cos</i> Example: <pre>Switch# mls qos map dscp-cos 0 8 16 24 32 40 48 50 to 0</pre>	Modifies the DSCP-to-CoS map. <ul style="list-style-type: none"> • For <i>dscp-list</i>, enter up to eight DSCP values separated by spaces. Then enter the to keyword. • For <i>cos</i>, enter the CoS value to which the DSCP values correspond. The DSCP range is 0 to 63; the CoS range is 0 to 7. Note To return to the default map, use the no mls qos dscp-cos global configuration command.
Step 3	end Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 4	show mls qos maps dscp-to-cos Example: <pre>Switch# show mls qos maps dscp-to-cos</pre>	Verifies your entries.
Step 5	copy running-config startup-config Example: <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring the DSCP-to-DSCP-Mutation Map

If two QoS domains have different DSCP definitions, use the DSCP-to-DSCP-mutation map to translate one set of DSCP values to match the definition of another domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a QoS administrative domain.

With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS applies the new value to the packet. The switch sends the packet out the port with the new DSCP value.

You can configure multiple DSCP-to-DSCP-mutation maps on an ingress port. The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

Beginning in privileged EXEC mode, follow these steps to modify the DSCP-to-DSCP-mutation map. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos map dscp-mutation** *dscp-mutation-name* **in-dscp to out-dscp**
3. **interface** *interface-id*
4. **mls qos trust dscp**
5. **mls qos dscp-mutation** *dscp-mutation-name*
6. **end**
7. **show mls qos maps dscp-mutation**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.
Step 2	<p>mls qos map dscp-mutation <i>dscp-mutation-name</i> in-dscp to out-dscp</p> <p>Example:</p> <pre>Switch(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 0</pre>	<p>Modifies the DSCP-to-DSCP-mutation map.</p> <ul style="list-style-type: none"> For <i>dscp-mutation-name</i>, enter the mutation map name. You can create more than one map by specifying a new name. For <i>in-dscp</i>, enter up to eight DSCP values separated by spaces. Then enter the to keyword. For <i>out-dscp</i>, enter a single DSCP value. <p>The DSCP range is 0 to 63.</p> <p>Note To return to the default map, use the no mls qos dscp-mutation <i>dscp-mutation-name</i> global configuration command.</p>
Step 3	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config)# interface gigabitethernet1/0/1</pre>	<p>Specifies the port to which to attach the map, and enters interface configuration mode.</p> <p>Valid interfaces include physical ports.</p>
Step 4	<p>mls qos trust dscp</p> <p>Example:</p> <pre>Switch(config-if)# mls qos trust dscp</pre>	Configures the ingress port as a DSCP-trusted port. By default, the port is not trusted.
Step 5	<p>mls qos dscp-mutation <i>dscp-mutation-name</i></p> <p>Example:</p> <pre>Switch(config-if)# mls qos dscp-mutation mutation1</pre>	<p>Applies the map to the specified ingress DSCP-trusted port.</p> <p>For <i>dscp-mutation-name</i>, enter the mutation map name specified in Step 2.</p>
Step 6	<p>end</p> <p>Example:</p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 7	show mls qos maps dscp-mutation Example: Switch# <code>show mls qos maps dscp-mutation</code>	Verifies your entries.
Step 8	copy running-config startup-config Example: Switch# <code>copy-running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

[Examples: Configuring DSCP Maps, on page 109](#)

Configuring Egress Queue Characteristics

Depending on the complexity of your network and your QoS solution, you might need to perform all of the tasks in the following modules. You need to make decisions about these characteristics:

- Which packets are mapped by DSCP or CoS value to each queue and threshold ID?
- What drop percentage thresholds apply to the queue-set (four egress queues per port), and how much reserved and maximum memory is needed for the traffic type?
- How much of the fixed buffer space is allocated to the queue-set?
- Does the bandwidth of the port need to be rate limited?
- How often should the egress queues be serviced and which technique (shaped, shared, or both) should be used?

Configuration Guidelines

Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:

- If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.
- If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.
- If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services this queue in shared mode.

Allocating Buffer Space to and Setting WTD Thresholds for an Egress Queue Set

You can guarantee the availability of buffers, set WTD thresholds, and configure the maximum allocation for a queue set by using the **mls qos queue-set output *qset-id* threshold *queue-id* drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold** global configuration command.

Each threshold value is a percentage of the queue's allocated buffers, which you specify by using the **mls qos queue-set output *qset-id* buffers *allocation1* ... *allocation4*** global configuration command. The queues use WTD to support distinct drop percentages for different traffic classes.

Note

The switch supports 4 egress queues by default, although there is an option to enable a total of 8 egress queues. Use the **mls qos srr-queue output queues 8** global configuration command to enable all 8 egress queues. Once 8 egress queues are enabled, you are able to configure thresholds, buffers, bandwidth share weights, and bandwidth shape weights for all 8 queues. The 8 egress queue configuration is only supported on a standalone switch.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to configure the memory allocation and to drop thresholds for a queue set. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos srr-queue output queues 8**
3. **mls qos queue-set output *qset-id* buffers *allocation1* ... *allocation8***
4. **mls qos queue-set output *qset-id* threshold *queue-id* drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold**
5. **interface *interface-id***
6. **queue-set *qset-id***
7. **end**
8. **show mls qos interface [*interface-id*] buffers**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.

	Command or Action	Purpose
Step 2	<p>mls qos srr-queue output queues 8</p> <p>Example:</p> <pre>Switch(config)# mls qos srr-queue output queues 8</pre>	<p>(Optional) The switch supports 4 egress queues by default, although you can enable a total of 8 egress queues. Use the optional mls qos srr-queue output queues 8 command to enable the additional 4 egress queues.</p> <p>Once 8 queue support is enabled, you can then proceed to configure the additional 4 queues. Any existing egress queue configuration commands are then modified to support the additional queue parameters.</p> <p>Note The option to enable 8 queues is only available on a standalone switch. If the switch is within a stack, then only an additional 2 queues can be enabled for a total of 6 egress queues.</p>
Step 3	<p>mls qos queue-set output qset-id buffers allocation1 ... allocation8</p> <p>Example:</p> <pre>Switch(config)# mls qos queue-set output 2 buffers 40 20 20 20 10 10 10 10</pre>	<p>Allocates buffers to a queue set.</p> <p>By default, all allocation values are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of the buffer space. When eight egress queues are configured, then by default 30 percent of the total buffer space is allocated to queue 2 and 10 percent (each) to queues 1,3,4,5,6,7, and 8.</p> <p>If you enabled 8 egress queues as described in Step 2 above, then the following applies:</p> <ul style="list-style-type: none"> • For <i>qset-id</i>, enter the ID of the queue set. The range is 1 to 2. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port. • For <i>allocation1 ... allocation8</i>, specify eight percentages, one for each queue in the queue set. For <i>allocation1</i>, <i>allocation3</i>, and <i>allocation4</i> to <i>allocation8</i>, the range is 0 to 99. For <i>allocation2</i>, the range is 1 to 100 (including the CPU buffer). <p>Allocate buffers according to the importance of the traffic; for example, give a large percentage of the buffer to the queue with the highest-priority traffic.</p> <p>Note To return to the default setting, use the no mls qos queue-set output qset-id buffers global configuration command.</p>
Step 4	<p>mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold</p> <p>Example:</p> <pre>Switch(config)# mls qos queue-set output 2 threshold 2 40 60 80 200</pre>	<p>Configures the WTD thresholds, guarantee the availability of buffers, and configures the maximum memory allocation for the queue set (four egress queues per port).</p> <p>By default, the WTD thresholds for queues 1, 3, and 4 are set to 100 percent. The thresholds for queue 2 are set to 200 percent. The reserved thresholds for queues 1, 2, 3, and 4 are set to 50 percent. The maximum thresholds for all queues are set to 400 percent by default.</p> <p>If you enabled 8 egress queues as described in Step 2 above, then the following applies:</p> <ul style="list-style-type: none"> • For <i>qset-id</i>, enter the ID of the queue set specified in Step 3. The range is 1 to 2. • For <i>queue-id</i>, enter the specific queue in the queue set on which the command is performed. The queue-id range is 1-4 by default and 1-8 when 8 queues are enabled.

	Command or Action	Purpose
		<ul style="list-style-type: none"> For <i>drop-threshold1</i> <i>drop-threshold2</i>, specify the two WTD thresholds expressed as a percentage of the queue's allocated memory. The range is 1 to 3200 percent. For <i>reserved-threshold</i>, enter the amount of memory to be guaranteed (reserved) for the queue expressed as a percentage of the allocated memory. The range is 1 to 100 percent. For <i>maximum-threshold</i>, enable a queue in the full condition to obtain more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped if the common pool is not empty. The range is 1 to 3200 percent. <p>Note To return to the default WTD threshold percentages, use the no mls qos queue-set output <i>qset-id</i> threshold [<i>queue-id</i>] global configuration command.</p>
Step 5	interface <i>interface-id</i> Example: <pre>Switch(config)# interface gigabitethernet1/0/1</pre>	Specifies the port of the outbound traffic, and enters interface configuration mode.
Step 6	queue-set <i>qset-id</i> Example: <pre>Switch(config-id)# queue-set 2</pre>	Maps the port to a queue set. For <i>qset-id</i> , enter the ID of the queue set specified in Step 2. The range is 1 to 2. The default is 1.
Step 7	end Example: <pre>Switch(config-id)# end</pre>	Returns to privileged EXEC mode.
Step 8	show mls qos interface [<i>interface-id</i>] buffers Example: <pre>Switch# show mls qos interface buffers</pre>	Verifies your entries.
Step 9	copy running-config startup-config Example: <pre>Switch# copy-running-config startup-config</pre>	(Optional) Saves your entries in the configuration file. To return to the default setting, use the no mls qos queue-set output <i>qset-id</i> buffers global configuration command. To return to the default WTD threshold percentages, use the no mls qos queue-set output <i>qset-id</i> threshold [<i>queue-id</i>] global configuration command.

Mapping DSCP or CoS Values to an Egress Queue and to a Threshold ID

You can prioritize traffic by placing packets with particular DSCPs or costs of service into certain queues and adjusting the queue thresholds so that packets with lower priorities are dropped.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to map DSCP or CoS values to an egress queue and to a threshold ID. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. Use one of the following:
 - **mls qos srr-queue output dscp-map queue** *queue-id* **threshold** *threshold-id* *dscp1...dscp8*
 - **mls qos srr-queue output cos-map queue** *queue-id* **threshold** *threshold-id* *cos1...cos8*
3. **end**
4. **show mls qos maps**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	Use one of the following: <ul style="list-style-type: none"> • mls qos srr-queue output dscp-map queue <i>queue-id</i> threshold <i>threshold-id</i> <i>dscp1...dscp8</i> • mls qos srr-queue output cos-map queue <i>queue-id</i> threshold <i>threshold-id</i> <i>cos1...cos8</i> 	Maps DSCP or CoS values to an egress queue and to a threshold ID. By default, DSCP values 0–15 are mapped to queue 2 and threshold 1. DSCP values 16–31 are mapped to queue 3 and threshold 1. DSCP values 32–39 and 48–63 are mapped to queue 4 and threshold 1. DSCP values 40–47 are mapped to queue 1 and threshold 1. By default, CoS values 0 and 1 are mapped to queue 2 and threshold 1. CoS values 2 and 3 are mapped to queue 3 and threshold 1. CoS values 4, 6, and 7 are mapped to queue 4 and threshold 1. CoS value 5 is mapped to queue 1 and threshold 1. <ul style="list-style-type: none"> • For <i>queue-id</i>, the range is 1 to 4.

	Command or Action	Purpose
	<p>Example:</p> <pre>Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 2 10 11</pre>	<p>Note If you enabled 8 egress queues using the mls qos srr-queue output queues 8 global configuration command, then the <i>queue-id</i> range would be from 1 to 8.</p> <ul style="list-style-type: none"> For <i>threshold-id</i>, the range is 1 to 3. The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. For <i>dscp1...dscp8</i>, enter up to eight values, and separate each value with a space. The range is 0 to 63. For <i>cos1...cos8</i>, enter up to eight values, and separate each value with a space. The range is 0 to 7. <p>Note To return to the default DSCP output queue threshold map or the default CoS output queue threshold map, use the no mls qos srr-queue output dscp-map or the no mls qos srr-queue output cos-map global configuration command.</p>
Step 3	<p>end</p> <p>Example:</p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	<p>show mls qos maps</p> <p>Example:</p> <pre>Switch# show mls qos maps</pre>	<p>Verifies your entries.</p> <p>The DSCP output queue threshold map appears as a matrix. The d1 column specifies the most-significant digit of the DSCP number; the d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID; for example, queue 2 and threshold 1 (02-01).</p> <p>The CoS output queue threshold map shows the CoS value in the top row and the corresponding queue ID and threshold ID in the second row; for example, queue 2 and threshold 2 (2-2).</p>
Step 5	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p> <p>To return to the default DSCP output queue threshold map or the default CoS output queue threshold map, use the no mls qos srr-queue output dscp-map or the no mls qos srr-queue output cos-map global configuration command.</p>

Configuring SRR Shaped Weights on Egress Queues

You can specify how much of the available bandwidth is allocated to each queue. The ratio of the weights is the ratio of frequency in which the SRR scheduler sends packets from each queue.

You can configure the egress queues for shaped or shared weights, or both. Use shaping to smooth bursty traffic or to provide a smoother output over time.

Beginning in privileged EXEC mode, follow these steps to assign the shaped weights and to enable bandwidth shaping on the four egress queues mapped to a port. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **srr-queue bandwidth shape** *weight1 weight2 weight3 weight4*
4. **end**
5. **show mls qos interface** *interface-id* **queueing**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	interface <i>interface-id</i> Example: Switch(config)# interface gigabitethernet2/0/1	Specifies the port of the outbound traffic, and enters interface configuration mode.
Step 3	srr-queue bandwidth shape <i>weight1 weight2 weight3 weight4</i> Example: Switch(config-if)# srr-queue bandwidth shape 8 0 0 0	<p>Assigns SRR weights to the egress queues. By default, <i>weight1</i> is set to 25; <i>weight2</i>, <i>weight3</i>, and <i>weight4</i> are set to 0, and these queues are in shared mode.</p> <p>For <i>weight1 weight2 weight3 weight4</i>, enter the weights to control the percentage of the port that is shaped. The inverse ratio (1/weight) controls the shaping bandwidth for this queue. Separate each value with a space. The range is 0 to 65535.</p> <p>If you configure a weight of 0, the corresponding queue operates in shared mode. The weight specified with the srr-queue bandwidth shape command is ignored, and the weights specified with the srr-queue bandwidth share interface configuration command for a queue come into effect. When</p>

	Command or Action	Purpose
		<p>configuring queues in the same queue-set for both shaping and sharing, make sure that you configure the lowest number queue for shaping.</p> <p>The shaped mode overrides the shared mode.</p> <p>To return to the default setting, use the no srr-queue bandwidth shape interface configuration command.</p> <p>Note If you enabled 8 egress queues using the mls qos srr-queue output queues 8 global configuration command, then you would be able to assign SRR weights to a total of 8 queues.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show mls qos interface <i>interface-id</i> queuing</p> <p>Example:</p> <pre>Switch# show mls qos interface interface-id queuing</pre>	Verifies your entries.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p> <p>To return to the default setting, use the no srr-queue bandwidth shape interface configuration command.</p>

Configuring SRR Shared Weights on Egress Queues

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue empties and does not require a share of the link, the remaining queues can expand into the unused bandwidth and share it among them. With sharing, the ratio of the weights controls the frequency of dequeuing; the absolute values are meaningless.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **srr-queue bandwidth share** *weight1 weight2 weight3 weight4*
4. **end**
5. **show mls qos interface** *interface-id* **queueing**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Switch(config)# interface gigabitethernet2/0/1	Specifies the port of the outbound traffic, and enters interface configuration mode.
Step 3	srr-queue bandwidth share <i>weight1 weight2 weight3 weight4</i> Example: Switch(config-id)# srr-queue bandwidth share 1 2 3 4	Assigns SRR weights to the egress queues. By default, all four weights are 25 (1/4 of the bandwidth is allocated to each queue). For <i>weight1 weight2 weight3 weight4</i> , enter the weights to control the ratio of the frequency in which the SRR scheduler sends packets. Separate each value with a space. The range is 1 to 255. To return to the default setting, use the no srr-queue bandwidth share interface configuration command. Note If you enabled 8 egress queues using the mls qos srr-queue output queues 8 global configuration command, then you would be able to assign SRR weights to a total of 8 queues.

	Command or Action	Purpose
Step 4	end Example: Switch(config-id)# end	Returns to privileged EXEC mode.
Step 5	show mls qos interface <i>interface-id</i> queuing Example: Switch# show mls qos interface interface_id queuing	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy-running-config startup-config	(Optional) Saves your entries in the configuration file. To return to the default setting, use the no srr-queue bandwidth share interface configuration command.

Configuring the Egress Expedite Queue

You can ensure that certain packets have priority over all others by queuing them in the egress expedite queue. SRR services this queue until it is empty before servicing the other queues.

Beginning in privileged EXEC mode, follow these steps to enable the egress expedite queue. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **mls qos**
3. **interface *interface-id***
4. **priority-queue out**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 2	<p>mls qos</p> <p>Example:</p> <pre>Switch(config)# mls qos</pre>	Enables QoS on a switch.
Step 3	<p>interface <i>interface-id</i></p> <p>Example:</p> <pre>Switch(config)# interface gigabitethernet1/0/1</pre>	Specifies the egress port, and enters interface configuration mode.
Step 4	<p>priority-queue out</p> <p>Example:</p> <pre>Switch(config-if)# priority-queue out</pre>	<p>Enables the egress expedite queue, which is disabled by default.</p> <p>When you configure this command, the SRR weight and queue size ratios are affected because there is one fewer queue participating in SRR. This means that <i>weight1</i> in the srr-queue bandwidth shape or the srr-queue bandwidth share command is ignored (not used in the ratio calculation).</p> <p>Note To disable the egress expedite queue, use the no priority-queue out interface configuration command.</p>
Step 5	<p>end</p> <p>Example:</p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p>show running-config</p> <p>Example:</p> <pre>Switch# show running-config</pre>	Verifies your entries.
Step 7	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p> <p>To disable the egress expedite queue, use the no priority-queue out interface configuration command.</p>

Limiting the Bandwidth on an Egress Interface

You can limit the bandwidth on an egress port. For example, if a customer pays only for a small percentage of a high-speed link, you can limit the bandwidth to that amount.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

Beginning in privileged EXEC mode, follow these steps to limit the bandwidth on an egress port. This procedure is optional.

SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **srr-queue bandwidth limit** *weight1*
4. **end**
5. **show mls qos interface** [*interface-id*] **queueing**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Switch(config)# interface gigabitethernet2/0/1	Specifies the port to be rate-limited, and enters interface configuration mode.

	Command or Action	Purpose
Step 3	<p>srr-queue bandwidth limit <i>weight1</i></p> <p>Example:</p> <pre>Switch(config-if)# srr-queue bandwidth limit 80</pre>	<p>Specifies the percentage of the port speed to which the port should be limited. The range is 10 to 90.</p> <p>By default, the port is not rate-limited and is set to 100 percent.</p> <p>Note To return to the default setting, use the no srr-queue bandwidth limit interface configuration command.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show mls qos interface [<i>interface-id</i>] queueing</p> <p>Example:</p> <pre>Switch# show mls qos interface interface_id queueing</pre>	Verifies your entries.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy-running-config startup-config</pre>	<p>(Optional) Saves your entries in the configuration file.</p> <p>To return to the default setting, use the no srr-queue bandwidth limit interface configuration command.</p>

Monitoring Standard QoS

Table 16: Commands for Monitoring Standard QoS on the Switch

Command	Description
show class-map [<i>class-map-name</i>]	Displays QoS class maps, which define the match criteria to classify traffic.
show mls qos	Displays global QoS configuration information.
show mls qos aggregate-policer [<i>aggregate-policer-name</i>]	Displays the aggregate policer configuration.

Command	Description
show mls qos interface [<i>interface-id</i>] [buffers policers queueing statistics]	Displays QoS information at the port level, including the buffer allocation, which ports have configured policers, the queueing strategy, and the ingress and egress statistics.
show mls qos maps [cos-dscp cos-output-q dscp-cos dscp-mutation <i>dscp-mutation-name</i> dscp-output-q ip-prec-dscp policed-dscp]	Displays QoS mapping information.
show mls qos queue-set [<i>qset-id</i>]	Displays QoS settings for the egress queues.
show mls qos vlan <i>vlan-id</i>	Displays the policy maps attached to the specified SVI.
show policy-map [<i>policy-map-name</i> [class <i>class-map-name</i>]]	Displays QoS policy maps, which define classification criteria for incoming traffic. Do not use the show policy-map interface privileged EXEC command to display classification information for incoming traffic. The control-plane and interface keywords are not supported, and the statistics shown in the display should be ignored.
show running-config include rewrite	Displays the DSCP transparency setting.

Configuration Examples for QoS

Example: Configuring Port to the DSCP-Trusted State and Modifying the DSCP-to-DSCP-Mutation Map

This example shows how to configure a port to the DSCP-trusted state and to modify the DSCP-to-DSCP-mutation map (named *gi1/0/2-mutation*) so that incoming DSCP values 10 to 13 are mapped to DSCP 30:

```
Switch(config)# mls qos map dscp-mutation gigabitethernet1/0/2-mutation
10 11 12 13 to 30
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# mls qos trust dscp
Switch(config-if)# mls qos dscp-mutation gigabitethernet1/0/2-mutation
Switch(config-if)# end
```

Examples: Classifying Traffic by Using ACLs

This example shows how to allow access for only those hosts on the three specified networks. The wildcard bits apply to the host portions of the network addresses. Any host with a source address that does not match the access list statements is rejected.

```
Switch(config)# access-list 1 permit 192.5.255.0 0.0.0.255
Switch(config)# access-list 1 permit 128.88.0.0 0.0.255.255
Switch(config)# access-list 1 permit 36.0.0.0 0.0.0.255
! (Note: all other access implicitly denied)
```

This example shows how to create an ACL that permits IP traffic from any source to any destination that has the DSCP value set to 32:

```
Switch(config)# access-list 100 permit ip any any dscp 32
```

This example shows how to create an ACL that permits IP traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:

```
Switch(config)# access-list 100 permit ip host 10.1.1.1 host 10.1.1.2 precedence 5
```

This example shows how to create an ACL that permits PIM traffic from any source to a destination group address of 224.0.0.2 with a DSCP set to 32:

```
Switch(config)# access-list 102 permit pim any 224.0.0.2 dscp 32
```

This example shows how to create an ACL that permits IPv6 traffic from any source to any destination that has the DSCP value set to 32:

```
Switch(config)# ipv6 access-list 100 permit ip any any dscp 32
```

This example shows how to create an ACL that permits IPv6 traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:

```
Switch(config)# ipv6 access-list ipv6_Name_ACL permit ip host 10::1 host 10.1.1.2
precedence 5
```

This example shows how to create a Layer 2 MAC ACL with two permit statements. The first statement allows traffic from the host with MAC address 0001.0000.0001 to the host with MAC address 0002.0000.0001. The second statement allows only Ethertype XNS-IDP traffic from the host with MAC address 0001.0000.0002 to the host with MAC address 0002.0000.0002.

```
Switch(config)# mac access-list extended maclist1
Switch(config-ext-macl)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Switch(config-ext-macl)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
! (Note: all other access implicitly denied)
```

Examples: Classifying Traffic by Using Class Maps

This example shows how to configure the class map called *class1*. The *class1* has one match criterion, which is access list 103. It permits traffic from any host to any destination that matches a DSCP value of 10.

```
Switch(config)# access-list 103 permit ip any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# end
Switch#
```

This example shows how to create a class map called *class2*, which matches incoming traffic with DSCP values of 10, 11, and 12.

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# end
Switch#
```

This example shows how to create a class map called *class3*, which matches incoming traffic with IP-precedence values of 5, 6, and 7:

```
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# end
Switch#
```

This example shows how to configure a class map to match IP DSCP and IPv6:

```
Switch(config)# Class-map cm-1
Switch(config-cmap)# match ip dscp 10
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch(config)# Class-map cm-2
Switch(config-cmap)# match ip dscp 20
Switch(config-cmap)# match protocol ip
Switch(config-cmap)# exit
Switch(config)# Policy-map pm1
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-2
Switch(config-pmap-c)# set dscp 6
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface G1/0/1
Switch(config-if)# service-policy input pm1
```

This example shows how to configure a class map that applies to both IPv4 and IPv6 traffic:

```
Switch(config)# ip access-list 101 permit ip any any
Switch(config)# ipv6 access-list ipv6-any permit ip any any
Switch(config)# Class-map cm-1
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# class-map cm-2
Switch(config-cmap)# match access-group name ipv6-any
Switch(config-cmap)# exit
Switch(config)# Policy-map pm1
Switch(config-pmap)# class cm-1
```

```
Switch(config-pmap-c) # set dscp 4
Switch(config-pmap-c) # exit
Switch(config-pmap) # class cm-2
Switch(config-pmap-c) # set dscp 6
Switch(config-pmap-c) # exit
Switch(config-pmap) # exit
Switch(config) # interface G0/1
Switch(config-if) # switch mode access
Switch(config-if) # service-policy input pml
```

[Classification Based on Class Maps and Policy Maps, on page 23](#)

Examples: Classifying, Policing, and Marking Traffic on Physical Ports Using Policy Maps

This example shows how to create a policy map and attach it to an ingress port. In the configuration, the IP standard ACL permits traffic from network 10.1.0.0. For traffic matching this classification, the DSCP value in the incoming packet is trusted. If the matched traffic exceeds an average traffic rate of 48000 b/s and a normal burst size of 8000 bytes, its DSCP is marked down (based on the policed-DSCP map) and sent:

```
Switch(config) # access-list 1 permit 10.1.0.0 0.0.255.255
Switch(config) # class-map ipclass1
Switch(config-cmap) # match access-group 1
Switch(config-cmap) # exit
Switch(config) # policy-map flow1t
Switch(config-pmap) # class ipclass1
Switch(config-pmap-c) # trust dscp
Switch(config-pmap-c) # police 1000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c) # exit
Switch(config-pmap) # exit
Switch(config) # interface gigabitethernet2/0/1
Switch(config-if) # service-policy input flow1t
```

This example shows how to create a Layer 2 MAC ACL with two permit statements and attach it to an ingress port. The first permit statement allows traffic from the host with MAC address 0001.0000.0001 destined for the host with MAC address 0002.0000.0001. The second permit statement allows only Ethertype XNS-IDP traffic from the host with MAC address 0001.0000.0002 destined for the host with MAC address 0002.0000.0002.

```
Switch(config) # mac access-list extended maclist1
Switch(config-ext-mac) # permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Switch(config-ext-mac) # permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
Switch(config-ext-mac) # exit
Switch(config) # mac access-list extended maclist2
Switch(config-ext-mac) # permit 0001.0000.0003 0.0.0 0002.0000.0003 0.0.0
Switch(config-ext-mac) # permit 0001.0000.0004 0.0.0 0002.0000.0004 0.0.0 aarp
Switch(config-ext-mac) # exit
Switch(config) # class-map macclass1
Switch(config-cmap) # match access-group maclist1
Switch(config-cmap) # exit
Switch(config) # policy-map macpolicy1
Switch(config-pmap) # class macclass1
Switch(config-pmap-c) # set dscp 63
Switch(config-pmap-c) # exit
Switch(config-pmap) # class macclass2 maclist2
```

```
Switch(config-pmap-c)# set dscp 45
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# service-policy input macpolicy1
```

This example shows how to create a class map that applies to both IPv4 and IPv6 traffic with the default class applied to unclassified traffic:

```
Switch(config)# ip access-list 101 permit ip any any
Switch(config)# ipv6 access-list ipv6-any permit ip any any
Switch(config)# class-map cm-1
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# class-map cm-2
Switch(config-cmap)# match access-group name ipv6-any
Switch(config-cmap)# exit
Switch(config)# policy-map pm1
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-2
Switch(config-pmap-c)# set dscp 6
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface G0/1
Switch(config-if)# switch mode access
Switch(config-if)# service-policy input pm1
```

[Physical Port Policing](#), on page 25

Examples: Classifying, Policing, and Marking Traffic on SVIs by Using Hierarchical Policy Maps

This example shows how to create a hierarchical policy map:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list 101 permit ip any any
Switch(config)# class-map cm-1
Switch(config-cmap)# match access 101
Switch(config-cmap)# exit
Switch(config)# exit
Switch#
Switch#
```

This example shows how to attach the new map to an SVI:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map cm-interface-1
Switch(config-cmap)# match input gigabitethernet3/0/1 - gigabitethernet3/0/2
Switch(config-cmap)# exit
```

```

Switch(config)# policy-map port-plcmap
Switch(config-pmap)# class cm-interface-1
Switch(config-pmap-c)# police 900000 9000 exc policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map vlan-plcmap
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy port-plcmap-1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-2
Switch(config-pmap-c)# service-policy port-plcmap-1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap)# exit
Switch(config-pmap)# class cm-3
Switch(config-pmap-c)# service-policy port-plcmap-2
Switch(config-pmap-c)# set dscp 20
Switch(config-pmap)# exit
Switch(config-pmap)# class cm-4
Switch(config-pmap-c)# trust dscp
Switch(config-pmap)# exit
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input vlan-plcmap
Switch(config-if)# exit
Switch(config)# exit
Switch#

```

This example shows that when a child-level policy map is attached below a class, an action must be specified for the class:

```

Switch(config)# policy-map vlan-plcmap
Switch(config-pmap)# class cm-5
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy port-plcmap-1

```

This example shows how to configure a class map to match IP DSCP and IPv6:

```

Switch(config)# class-map cm-1
Switch(config-cmap)# match ip dscp 10
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch(config)# class-map cm-2
Switch(config-cmap)# match ip dscp 20
Switch(config-cmap)# match protocol ip
Switch(config-cmap)# exit
Switch(config)# policy-map pm1
Switch(config-pmap)# class cm-1
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-2
Switch(config-pmap-c)# set dscp 6
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface G1/0/1
Switch(config-if)# service-policy input pm1

```

This example shows how to configure default traffic class to a policy map:

```

Switch# configure terminal
Switch(config)# class-map cm-3
Switch(config-cmap)# match ip dscp 30
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch(config)# class-map cm-4
Switch(config-cmap)# match ip dscp 40
Switch(config-cmap)# match protocol ip
Switch(config-cmap)# exit

```

```
Switch(config)# policy-map pm3
Switch(config-pmap)# class class-default
Switch(config-pmap)# set dscp 10
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-3
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-4
Switch(config-pmap-c)# trust cos
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
```

This example shows how the default traffic class is automatically placed at the end of policy-map pm3 even though class-default was configured first:

```
Switch# show policy-map pm3
Policy Map pm3
Class cm-3
  set dscp 4
Class cm-4
  trust cos
Class class-default
  police 8000 80000 exceed-action drop
Switch#
```

Examples: Classifying, Policing, and Marking Traffic by Using Aggregate Policers

This example shows how to create an aggregate policer and attach it to multiple classes within a policy map. In the configuration, the IP ACLs permit traffic from network 10.1.0.0 and from host 11.3.1.1. For traffic coming from network 10.1.0.0, the DSCP in the incoming packets is trusted. For traffic coming from host 11.3.1.1, the DSCP in the packet is changed to 56. The traffic rate from the 10.1.0.0 network and from host 11.3.1.1 is policed. If the traffic exceeds an average rate of 48000 b/s and a normal burst size of 8000 bytes, its DSCP is marked down (based on the policed-DSCP map) and sent. The policy map is attached to an ingress port.

```
Switch(config)# access-list 1 permit 10.1.0.0 0.0.255.255
Switch(config)# access-list 2 permit 11.3.1.1
Switch(config)# mls qos aggregate-police transmit1 48000 8000 exceed-action
policed-dscp-transmit
Switch(config)# class-map ipclass1
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# class-map ipclass2
Switch(config-cmap)# match access-group 2
Switch(config-cmap)# exit
Switch(config)# policy-map aggflow1
Switch(config-pmap)# class ipclass1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police aggregate transmit1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class ipclass2
Switch(config-pmap-c)# set dscp 56
Switch(config-pmap-c)# police aggregate transmit1
Switch(config-pmap-c)# exit
```

```
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# service-policy input aggflow1
Switch(config-if)# exit
```

Examples: Configuring DSCP Maps

This example shows how to modify and display the CoS-to-DSCP map:

```
Switch(config)# mls qos map cos-dscp 10 15 20 25 30 35 40 45
Switch(config)# end
Switch# show mls qos maps cos-dscp

Cos-dscp map:
  cos:   0  1  2  3  4  5  6  7
-----
  dscp:  10 15 20 25 30 35 40 45
```

This example shows how to modify and display the IP-precedence-to-DSCP map:

```
Switch(config)# mls qos map ip-prec-dscp 10 15 20 25 30 35 40 45
Switch(config)# end
Switch# show mls qos maps ip-prec-dscp

IpPrecedence-dscp map:
  ipprec:  0  1  2  3  4  5  6  7
-----
  dscp:   10 15 20 25 30 35 40 45
```

This example shows how to map DSCP 50 to 57 to a marked-down DSCP value of 0:

```
Switch(config)# mls qos map policed-dscp 50 51 52 53 54 55 56 57 to 0
Switch(config)# end
Switch# show mls qos maps policed-dscp

Policed-dscp map:
  d1 :  d2 0  1  2  3  4  5  6  7  8  9
-----
  0 :   00 01 02 03 04 05 06 07 08 09
  1 :   10 11 12 13 14 15 16 17 18 19
  2 :   20 21 22 23 24 25 26 27 28 29
  3 :   30 31 32 33 34 35 36 37 38 39
  4 :   40 41 42 43 44 45 46 47 48 49
  5 :   00 00 00 00 00 00 00 00 58 59
  6 :   60 61 62 63
```

**Note**

In this policed-DSCP map, the marked-down DSCP values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the marked-down value. For example, an original DSCP value of 53 corresponds to a marked-down DSCP value of 0.

This example shows how to map DSCP values 0, 8, 16, 24, 32, 40, 48, and 50 to CoS value 0 and to display the map:

```
Switch(config)# mls qos map dscp-cos 0 8 16 24 32 40 48 50 to 0
Switch(config)# end
Switch# show mls qos maps dscp-cos
Dscp-cos map:
  d1 : d2 0  1  2  3  4  5  6  7  8  9
-----
  0 :    00 00 00 00 00 00 00 00 00 01
  1 :    01 01 01 01 01 01 00 02 02 02
  2 :    02 02 02 02 00 03 03 03 03 03
  3 :    03 03 00 04 04 04 04 04 04 04
  4 :    00 05 05 05 05 05 05 05 00 06
  5 :    00 06 06 06 06 06 06 07 07 07
  6 :    07 07 07 07
```

**Note**

In the above DSCP-to-CoS map, the CoS values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the DSCP; the d2 row specifies the least-significant digit of the DSCP. The intersection of the d1 and d2 values provides the CoS value. For example, in the DSCP-to-CoS map, a DSCP value of 08 corresponds to a CoS value of 0.

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remains as specified in the null map):

```
Switch(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 0
Switch(config)# mls qos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls qos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls qos map dscp-mutation mutation1 30 31 32 33 34 to 30
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mls qos trust dscp
Switch(config-if)# mls qos dscp-mutation mutation1
Switch(config-if)# end
Switch# show mls qos maps dscp-mutation mutation1
Dscp-dscp mutation map:
  mutation1:
  d1 : d2 0  1  2  3  4  5  6  7  8  9
-----
  0 :    00 00 00 00 00 00 00 00 10 10
  1 :    10 10 10 10 14 15 16 17 18 19
  2 :    20 20 20 23 24 25 26 27 28 29
  3 :    30 30 30 30 30 35 36 37 38 39
  4 :    40 41 42 43 44 45 46 47 48 49
  5 :    50 51 52 53 54 55 56 57 58 59
  6 :    60 61 62 63
```

**Note**

In the above DSCP-to-DSCP-mutation map, the mutated values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the mutated value. For example, a DSCP value of 12 corresponds to a mutated value of 10.

Examples: Configuring Egress Queue Characteristics

This example shows how to map a port to queue-set 2. It allocates 40 percent of the buffer space to egress queue 1 and 20 percent to egress queues 2, 3, and 4. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped:

```
Switch(config)# mls qos queue-set output 2 buffers 40 20 20 20
Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# queue-set 2
```

This example shows how to map DSCP values 10 and 11 to egress queue 1 and to threshold 2:

```
Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 2 10 11
```

This example shows how to configure bandwidth shaping on queue 1. Because the weight ratios for queues 2, 3, and 4 are set to 0, these queues operate in shared mode. The bandwidth weight for queue 1 is 1/8, which is 12.5 percent:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth shape 8 0 0 0
```

This example shows how to configure the weight ratio of the SRR scheduler running on an egress port. Four queues are used, and the bandwidth ratio allocated for each queue in shared mode is $1/(1+2+3+4)$, $2/(1+2+3+4)$, $3/(1+2+3+4)$, and $4/(1+2+3+4)$, which is 10 percent, 20 percent, 30 percent, and 40 percent for queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth of queue 1, twice the bandwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth share 1 2 3 4
```

This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# priority-queue out
Switch(config-if)# end
```

This example shows how to limit the bandwidth on a port to 80 percent:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth limit 80
```

When you configure this command to 80 percent, the port is idle 20 percent of the time. The line rate drops to 80 percent of the connected speed, which is 800 Mb/s. These values are not exact because the hardware adjusts the line rate in increments of six.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Auto-QoS

Before configuring standard QoS or auto-QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. Is the traffic bursty? Do you need to reserve bandwidth for voice and video streams?

- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.

Auto-QoS VoIP Considerations

Before configuring auto-QoS for VoIP, you should be aware of this information:

- Auto-QoS configures the switch for VoIP with Cisco IP Phones on nonrouted and routed ports. Auto-QoS also configures the switch for VoIP with devices running the Cisco SoftPhone application.

Note When a device running Cisco SoftPhone is connected to a nonrouted or routed port, the switch supports only one Cisco SoftPhone application per port.

- When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.
- This release supports only Cisco IP SoftPhone Version 1.3(3) or later.
- Connected devices must use Cisco Call Manager Version 4 or later.
- Auto-QoS VoIP uses the **priority-queue** interface configuration command for an egress interface. You can also configure a policy-map and trust device on the same interface for Cisco IP phones.

Auto-QoS Enhanced Considerations

Auto-QoS is enhanced to support video. Automatic configurations are generated that classify and trust traffic from Cisco TelePresence systems and Cisco IP cameras.

Before configuring auto-QoS enhanced, you should be aware of this information:

- The **auto qos srnd4** global configuration command is generated as a result of enhanced auto-QoS configuration.

Restrictions for Auto-QoS

The following are restrictions for automatic QoS (auto-QoS):

- After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use this new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map to the interface.
- To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. If necessary, you can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed.
- By default, the CDP is enabled on all ports. For auto-QoS to function properly, do not disable CDP.

- We recommend that you do **not** enable 8 egress queues by using the **mls qos srr-queue output queues 8** command, when running the following features in your configuration:
 - Auto-QoS
 - Auto SmartPort
 - EnergyWise

Running these features with 8 egress queue enabled in a single configuration is not supported on the switch.

**Note**

You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

Information About Configuring Auto-QoS

Auto-QoS Overview

You can use the auto-QoS feature to simplify the deployment of QoS features. Auto-QoS determines the network design and enables QoS configurations so that the switch can prioritize different traffic flows. It uses the egress queues instead of using the default (disabled) QoS behavior. The switch offers best-effort service to each packet, regardless of the packet contents or size, and sends it from a single queue.

When you enable auto-QoS, it automatically classifies traffic based on the traffic type and ingress packet label. The switch uses the classification results to choose the appropriate egress queue.

You can use auto-QoS commands to identify ports connected to the following Cisco devices:

- Cisco IP Phones
- Devices running the Cisco SoftPhone application
- Cisco TelePresence
- Cisco IP Camera
- Cisco digital media player

You also use the auto-QoS commands to identify ports that receive trusted traffic through an uplink. Auto-QoS then performs these functions:

- Detects the presence or absence of auto-QoS devices through conditional trusted interfaces.
- Configures QoS classification
- Configures egress queues

[Enabling Auto-QoS, on page 120](#)

[Examples: Global Auto-QoS Configuration, on page 124](#)

[Examples: Auto-QoS Generated Configuration for VoIP Devices, on page 128](#)

[Examples: Auto-QoS Generated Configuration For Enhanced Video, Trust, and Classify Devices, on page 129](#)

Auto-QoS Compact Overview

When you enter an auto-QoS command, the switch displays all the generated commands as if the commands were entered from the CLI. You can use the auto-QoS compact feature to hide the auto-QoS generated commands from the running configuration. This would make it easier to comprehend the running-configuration and also help to increase efficient usage of memory.

Generated Auto-QoS Configuration

By default, auto-QoS is disabled on all ports. Packets are not modified—the CoS, DSCP and IP precedence values in the packet are not changed.

When you enable the auto-QoS feature on the first port of the interface:

- Ingress packet label is used to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.
- QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are automatically generated. (See [Examples: Global Auto-QoS Configuration, on page 124](#)).
- Switch enables the trusted boundary feature and uses the Cisco Discovery Protocol (CDP) to detect the presence of a supported device.
- Policing is used to determine whether a packet is in or out of profile and specifies the action on the packet.

VoIP Device Specifics

The following actions occur when you issue these auto-QoS commands on a port:

- **auto qos voip cisco-phone**—When you enter this command on a port at the network edge connected to a Cisco IP Phone, the switch enables the trusted boundary feature. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. When there is no Cisco IP Phone, the ingress classification is set to not trust the QoS label in the packet. The policing is applied to the traffic matching the policy-map classification before the switch enables the trust boundary feature.
- **auto qos voip cisco-softphone** —When you enter this interface configuration command on a port at the network edge that is connected to a device running the Cisco SoftPhone, the switch uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0.
- **auto qos voip trust**—When you enter this interface configuration command on a port connected to the network interior, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices).

The switch configures egress queues on the port according to the settings in the following tables.

Table 17: Traffic Types, Packet Labels, and Queues

	VoIP Data Traffic	VoIP Control Traffic	Routing Protocol Traffic	STP BPDU Traffic	Real-Time Video Traffic	All Other Traffic	
DSCP value	46	24, 26	48	56	34	–	
CoS value	5	3	6	7	3	–	
CoS-to-Egress queue map	4, 5 (queue 1)	2, 3, 6, 7 (queue 2)			0 (queue 3)	2 (queue 3)	0, 1 (queue 4)

The following table shows the generated auto-QoS configuration for the egress queues.

Table 18: Auto-QoS Configuration for the Egress Queues

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority	1	4, 5	Up to 100 percent	25 percent	15 percent
SRR shared	2	2, 3, 6, 7	10 percent	25 percent	25 percent
SRR shared	3	0	60 percent	25 percent	40 percent
SRR shared	4	1	20 percent	25 percent	20 percent

- When you enable auto-QoS by using the **auto qos voip cisco-phone**, the **auto qos voip cisco-softphone**, or the **auto qos voip trust** interface configuration command, the switch automatically generates a QoS configuration based on the traffic type and ingress packet label and applies the commands listed in [Examples: Global Auto-QoS Configuration, on page 124](#) to the port.

Effects of Auto-QoS on Running Configuration

When auto-QoS is enabled, the **auto qos** interface configuration commands and the generated global configuration are added to the running configuration.

The switch applies the auto-QoS-generated commands as if the commands were entered from the CLI. An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions may occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch

without saving the current configuration to memory. If the generated commands are not applied, the previous running configuration is restored.

How to Configure Auto-QoS

Configuring Auto-QoS

Enabling Auto-QoS

For optimum QoS performance, enable auto-QoS on all the devices in your network.

SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. Use one of the following:
 - **auto qos voip {cisco-phone | cisco-softphone | trust}**
 - **auto qos video {cts | ip-camera | media-player}**
 - **auto qos classify [police]**
 - **auto qos trust {cos | dscp}**
4. **exit**
5. **interface *interface-id***
6. **auto qos trust**
7. **end**
8. **show auto qos interface *interface-id***

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i> Example: Switch(config)# interface gigabitethernet 3/0/1	Specifies the port that is connected to a video device or the uplink port that is connected to another trusted switch or router in the network interior, and enters interface configuration mode.

	Command or Action	Purpose
Step 3	<p>Use one of the following:</p> <ul style="list-style-type: none"> • auto qos voip {cisco-phone cisco-softphone trust} • auto qos video {cts ip-camera media-player} • auto qos classify [police] • auto qos trust {cos dscp} <p>Example: <pre>Switch(config-if)# auto qos trust dscp</pre></p>	<p>Enables auto-QoS for VoIP.</p> <ul style="list-style-type: none"> • cisco-phone—If the port is connected to a Cisco IP Phone, the QoS labels of incoming packets are trusted only when the telephone is detected. • cisco-softphone—The port is connected to device running the Cisco SoftPhone feature. • trust—The uplink port is connected to a trusted switch or router, and the VoIP traffic classification in the ingress packet is trusted. <p>Enables auto-QoS for a video device.</p> <ul style="list-style-type: none"> • cts—A port connected to a Cisco Telepresence system. • ip-camera—A port connected to a Cisco video surveillance camera. • media-player—A port connected to a CDP-capable Cisco digital media player. <p>QoS labels of incoming packets are trusted only when the system is detected.</p> <p>Enables auto-QoS for classification.</p> <ul style="list-style-type: none"> • police—Policing is set up by defining the QoS policy maps and applying them to ports (port-based QoS). <p>Enables auto-QoS for trusted interfaces.</p> <ul style="list-style-type: none"> • cos—Class of service. • dscp—Differentiated Services Code Point. • <cr>—Trust interface. <p>Note To view a list of commands that are automatically generated by issuing one of the auto-QoS commands listed here, you need to be in debug mode. Refer to the <i>Catalyst 2960-XR Switch QoS Command Reference Guide</i> for examples of how to run the appropriate debug command to view a list of these commands.</p>
Step 4	<p>exit</p> <p>Example: <pre>Switch(config-if)# exit</pre></p>	<p>Returns to global configuration mode.</p>
Step 5	<p>interface <i>interface-id</i></p> <p>Example: <pre>Switch(config)# interface</pre></p>	<p>Specifies the switch port identified as connected to a trusted switch or router, and enters interface configuration mode.</p>

	Command or Action	Purpose
	<code>gigabitethernet 2/0/1</code>	
Step 6	auto qos trust Example: Switch(config-if)# auto qos trust	Enables auto-QoS on the port, and specifies that the port is connected to a trusted router or switch.
Step 7	end Example: Switch(config-if)# end	Returns to privileged EXEC mode.
Step 8	show auto qos interface <i>interface-id</i> Example: Switch# show auto qos interface gigabitethernet 2/0/1	Verifies your entries. This command displays the auto-QoS command on the interface on which auto-QoS was enabled. You can use the show running-config privileged EXEC command to display the auto-QoS configuration and the user modifications.

Troubleshooting Auto-QoS

To display the QoS commands that are automatically generated when auto-QoS is enabled or disabled, enter the **debug auto qos** privileged EXEC command before you enable auto-QoS. For more information, see the **debug auto qos** command in the command reference for this release.

To disable auto-QoS on a port, use the **no** form of the **auto qos** command interface configuration command, such as **no auto qos voip**.

Note Auto-QoS generated global commands can also be removed manually if desired.

Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

You can use the **no mls qos** global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

Monitoring Auto-QoS

Table 19: Commands for Monitoring Auto-QoS

Command	Description
show auto qos [interface <i>[interface-type]</i>]	Displays the initial auto-QoS configuration. You can compare the show auto qos and the show running-config command output to identify the user-defined QoS settings.
show mls qos [aggregate policer interface maps queue-set stack-port stack-qset vlan]	Displays information about the QoS configuration that might be affected by auto-QoS.
show mls qos aggregate policer <i>policer_name</i>	Displays information about the QoS aggregate policer configuration that might be affected by auto-QoS.
show mls qos interface [<i>interface-type</i>] buffers policers queueing statistics]	Displays information about the QoS interface configuration that might be affected by auto-QoS.
show mls qos maps [cos-dscp cos-output-q dscp-cos dscp-mutation dscp-output-q ip-prec-dscp policed-dscp]	Displays information about the QoS maps configuration that might be affected by auto-QoS.
show mls qos queue-set <i>queue-set ID</i>	Displays information about the QoS queue-set configuration that might be affected by auto-QoS.
show mls qos stack-port buffers	Displays information about the QoS stack port buffer configuration that might be affected by auto-QoS.
show mls qos stack-qset	Displays information about the QoS stack queue set configuration that might be affected by auto-QoS.
show running-config	Displays information about the QoS configuration that might be affected by auto-QoS. You can compare the show auto qos and the show running-config command output to identify the user-defined QoS settings.

Configuration Examples for Auto-QoS

Examples: Global Auto-QoS Configuration

The following table describes the automatically generated commands for auto-QoS and enhanced auto-QoS by the switch.

Table 20: Generated Auto-QoS Configuration

Description	Automatically Generated Command {voip}	Enhanced Automatically Generated Command {Video Trust Classify}
<p>The switch automatically enables standard QoS and configures the CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value).</p>	<pre>Switch(config)# mls qos Switch(config)# mls qos map cos-dscp 0 8 16 26 32 46 48 56</pre>	<pre>Switch(config)# mls qos Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56</pre>
<p>The switch automatically maps CoS values to an egress queue and to a threshold ID.</p>	<pre>Switch(config)# no mls qos srr-queue output cos-map Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 3 5 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 3 3 6 7 Switch(config)# mls qos srr-queue output cos-map queue 3 threshold 3 2 4 Switch(config)# mls qos srr-queue output cos-map queue 4 threshold 2 1 Switch(config)# mls qos srr-queue output cos-map queue 4 threshold 3 0</pre>	<pre>Switch(config)# no mls qos srr-queue output cos-map Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 3 4 5 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 3 6 7 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 1 2 Switch(config)# mls qos srr-queue output cos-map queue 2 threshold 2 3 Switch(config)# mls qos srr-queue output cos-map queue 3 threshold 3 0 Switch(config)# mls qos srr-queue output cos-map queue 4 threshold 3 1</pre>
<p>The switch automatically maps DSCP values to an egress queue and to a threshold ID.</p>		

Description	Automatically Generated Command {voip}	Enhanced Automatically Generated Command {Video Trust Classify}
	<pre>Switch(config)# no mls qos srr-queue output dscp-map Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 3 40 41 42 43 44 45 46 47 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 24 25 26 27 28 29 30 31 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 56 57 58 59 60 61 62 63 Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 16 17 18 19 20 21 22 23 Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 32 33 34 35 36 37 38 39 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 2 9 10 11 12 13 14 15 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 3 0 1 2 3 4 5 6 7</pre>	<pre>Switch(config)# no mls qos srr-queue output dscp-map Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 3 32 33 40 41 42 43 44 45 46 47 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 1 16 17 18 19 20 21 22 23 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 1 26 27 28 29 30 31 34 35 36 37 38 39 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 2 24 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 56 Switch(config)# mls qos srr-queue output dscp-map queue 2 threshold 3 57 58 59 60 61 62 63 Switch(config)# mls qos srr-queue output dscp-map queue 3 threshold 3 0 1 2 3 4 5 6 7 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 1 8 9 11 13 15 Switch(config)# mls qos srr-queue output dscp-map queue 4 threshold 2 10 12 14</pre>

Description	Automatically Generated Command {voip}	Enhanced Automatically Generated Command {Video Trust Classify}
<p>The switch automatically configures the egress queue buffer sizes. It configures the bandwidth and the SRR mode (shaped or shared) on the egress queues mapped to the port.</p>	<pre>Switch(config)# mls qos queue-set output 1 threshold 1 138 138 92 138 Switch(config)# mls qos queue-set output 1 threshold 2 138 138 92 400 Switch(config)# mls qos queue-set output 1 threshold 3 36 77 100 318 Switch(config)# mls qos queue-set output 1 threshold 4 20 50 67 400 Switch(config)# mls qos queue-set output 2 threshold 1 149 149 100 149 Switch(config)# mls qos queue-set output 2 threshold 2 118 118 100 235 Switch(config)# mls qos queue-set output 2 threshold 3 41 68 100 272 Switch(config)# mls qos queue-set output 2 threshold 4 42 72 100 242 Switch(config)# mls qos queue-set output 1 buffers 10 10 26 54 Switch(config)# mls qos queue-set output 2 buffers 16 6 17 61 Switch(config-if)# priority-queue out Switch(config-if)# srr-queue bandwidth share 10 10 60 20</pre>	<pre>Switch(config)# mls qos queue-set output 1 threshold 2 100 100 50 200 Switch(config)# mls qos queue-set output 1 threshold 2 125 125 100 400 Switch(config)# mls qos queue-set output 1 threshold 3 100 100 100 400 Switch(config)# mls qos queue-set output 1 threshold 4 60 150 50 200 Switch(config)# mls qos queue-set output 1 buffers 15 25 40 20</pre>

[Auto-QoS Overview, on page 117](#)

Examples: Auto-QoS Generated Configuration for VoIP Devices

If you entered the **auto qos voip cisco-phone** command, the switch automatically enables the trusted boundary feature, which uses the CDP to detect the presence or absence of a Cisco IP Phone.

```
Switch(config-if)# mls qos trust device cisco-phone
```

If you entered the **auto qos voip cisco-softphone** command, the switch automatically creates class maps and policy maps.

```
Switch(config)# mls qos map policed-dscp 24 26 46 to 0
Switch(config)# class-map match-all AutoQoS-VoIP-RTP-Trust
Switch(config-cmap)# match ip dscp ef
Switch(config)# class-map match-all AutoQoS-VoIP-Control-Trust
Switch(config-cmap)# match ip dscp cs3 af31
Switch(config)# policy-map AutoQoS-Police-SoftPhone
Switch(config-pmap)# class AutoQoS-VoIP-RTP-Trust
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap)# class AutoQoS-VoIP-Control-Trust
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action policed-dscp-transmit
```

After creating the class maps and policy maps, the switch automatically applies the policy map called *AutoQoS-Police-SoftPhone* to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.

```
Switch(config-if)#service-policy input AutoQoS-Police-SoftPhone
```

If you entered the **auto qos voip cisco-phone** command, the switch automatically creates class maps and policy maps.

```
Switch(config-if)# mls qos trust device cisco-phone
```

If you entered the **auto qos voip cisco-softphone** command, the switch automatically creates class maps and policy maps.

```
Switch(config)# mls qos map policed-dscp 24 26 46 to 0
Switch(config)# class-map match-all AutoQoS-VoIP-RTP-Trust
Switch(config-cmap)# match ip dscp ef
Switch(config)# class-map match-all AutoQoS-VoIP-Control-Trust
Switch(config-cmap)# match ip dscp cs3 af31
Switch(config)# policy-map AutoQoS-Police-CiscoPhone
Switch(config-pmap)# class AutoQoS-VoIP-RTP-Trust
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# police 320000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap)# class AutoQoS-VoIP-Control-Trust
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action policed-dscp-transmit
```

After creating the class maps and policy maps, the switch automatically applies the policy map called *AutoQoS-Police-SoftPhone* to an ingress interface on which auto-QoS with the Cisco SoftPhone feature is enabled.

```
Switch(config-if)#service-policy input AutoQoS-Police-SoftPhone
```

Related Topics[Enabling Auto-QoS, on page 120](#)[Auto-QoS Overview, on page 117](#)

Examples: Auto-QoS Generated Configuration For Enhanced Video, Trust, and Classify Devices

If you entered the following enhanced auto-QoS commands, the switch configures a CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value):

- **auto qos video cts**
- **auto qos video ip-camera**
- **auto qos video media-player**
- **auto qos trust**
- **auto qos trust cos**
- **auto qos trust dscp**

The following command is initiated after entering one of the above auto-QoS commands:

```
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
```

Note No class maps and policy maps are configured.

If you entered the **auto qos classify** command, the switch automatically creates class maps and policy maps (as shown below).

```
Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_MULTIENTHANCED_CONF_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-MULTIENTHANCED-CONF
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Switch(config)# class-map match-all AUTOQOS_TRANSACTION_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-TRANSACTIONAL-DATA
Switch(config)# class-map match-all AUTOQOS_SIGNALING_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SIGNALING
Switch(config)# class-map match-all AUTOQOS_BULK_DATA_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-BULK-DATA
Switch(config)# class-map match-all AUTOQOS_SCAVANGER_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SCAVANGER
Switch(config)# policy-map AUTOQOS-SRND4-CLASSIFY-POLICY
Switch(config-pmap)# class AUTOQOS_MULTIENTHANCED_CONF_CLASS
Switch(config-pmap-c)# set dscp af41
Switch(config-pmap)# class AUTOQOS_BULK_DATA_CLASS
Switch(config-pmap-c)# set dscp af11
Switch(config-pmap)# class AUTOQOS_TRANSACTION_CLASS
Switch(config-pmap-c)# set dscp af21
Switch(config-pmap)# class AUTOQOS_SCAVANGER_CLASS
Switch(config-pmap-c)# set dscp cs1
Switch(config-pmap)# class AUTOQOS_SIGNALING_CLASS
Switch(config-pmap-c)# set dscp cs3
```

```
Switch(config-pmap)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
;
Switch(config-if)# service-policy input AUTOQOS-SRND4-CLASSIFY-POLICY
```

If you entered the `auto qos classify police` command, the switch automatically creates class maps and policy maps (as shown below).

```
Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_MULTIENTHANCED_CONF_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-MULTIENTHANCED-CONF
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Switch(config)# class-map match-all AUTOQOS_TRANSACTION_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-TRANSACTIONAL-DATA
Switch(config)# class-map match-all AUTOQOS_SIGNALING_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SIGNALING
Switch(config)# class-map match-all AUTOQOS_BULK_DATA_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-BULK-DATA
Switch(config)# class-map match-all AUTOQOS_SCAVANGER_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-SCAVANGER
Switch(config)# policy-map AUTOQOS-SRND4-CLASSIFY-POLICE-POLICY
Switch(config-pmap)# class AUTOQOS_MULTIENTHANCED_CONF_CLASS
Switch(config-pmap-c)# set dscp af41
Switch(config-pmap-c)# police 5000000 8000 exceed-action drop
Switch(config-pmap)# class AUTOQOS_BULK_DATA_CLASS
Switch(config-pmap-c)# set dscp af11
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap)# class AUTOQOS_TRANSACTION_CLASS
Switch(config-pmap-c)# set dscp af21
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap)# class AUTOQOS_SCAVANGER_CLASS
Switch(config-pmap-c)# set dscp cs1
Switch(config-pmap-c)# police 10000000 8000 exceed-action drop
Switch(config-pmap)# class AUTOQOS_SIGNALING_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action drop
Switch(config-pmap)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
;
Switch(config-if)# service-policy input AUTOQOS-SRND4-CLASSIFY-POLICE-POLICY
```

This is the enhanced configuration for the `auto qos voip cisco-phone` command:

```
Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_VOIP_DATA_CLASS
Switch(config-cmap)# match ip dscp ef
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-DEFAULT
Switch(config)# class-map match-all AUTOQOS_VOIP_SIGNAL_CLASS
Switch(config-cmap)# match ip dscp cs3
Switch(config)# policy-map AUTOQOS-SRND4-CISCOPHONE-POLICY
Switch(config-pmap)# class AUTOQOS_VOIP_DATA_CLASS
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# police 128000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap)# class AUTOQOS_VOIP_SIGNAL_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
Switch(config-pmap-c)# police 10000000 8000 exceed-action policed-dscp-transmit
;
Switch(config-if)# service-policy input AUTOQOS-SRND4-CISCOPHONE-POLICY
```

This is the enhanced configuration for the `auto qos voip cisco-softphone` command:

```
Switch(config)# mls qos map policed-dscp 0 10 18 24 26 46 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_MULTIENTHANCED_CONF_CLASS
Switch(config-cmap)# match access-group name AUTOQOS-ACL-MULTIENTHANCED-CONF
Switch(config)# class-map match-all AUTOQOS_VOIP_DATA_CLASS
Switch(config-cmap)# match ip dscp ef
Switch(config)# class-map match-all AUTOQOS_DEFAULT_CLASS

H

hierarchical policy maps **71**
 configuring **71**

I

IP ACLs **22**
 for QoS classification **22**
 IP phones **48**
 trusted boundary for QoS **48**
 IP precedence **17**
 IP-precedence-to-DSCP map for QoS **39, 83**

L

Layer 3 packets, classification methods **17**

M

mapping table **38**
 default configuration **38**
 mapping tables for QoS **28, 39, 40, 82, 83, 84, 87**
 configuring **39, 40, 82, 83, 84, 87**
 CoS-to-DSCP **39, 82**
 DSCP **82**
 DSCP-to-CoS **40**
 DSCP-to-DSCP-mutation **87**
 IP-precedence-to-DSCP **39, 83**
 policed-DSCP **84**
 described **28**
 marking **67, 79, 108, 109**
 action in policy map **67**
 action with aggregate policers **79, 108, 109**
 memory allocation **33**
 monitoring **101**

N

nonhierarchical policy maps **67**
 configuring **67**

P

packet modification, with QoS **34**
 policed-DSCP map for QoS **84**

policers **25, 79**
 configuring **79**
 for more than one traffic class **79**
 types of **25**
 policing **25, 26**
 hierarchical **26**
 See hierarchical policy maps **26**
 token-bucket algorithm **25**
 policy maps for QoS **67, 71**
 hierarchical on SVIs **71**
 configuring **71**
 nonhierarchical on physical ports **67**
 configuring **67**
 prerequisites **13, 115**
 auto-QoS **115**
 QoS **13**
 prioritization **16**

Q

QoS **18, 19, 20, 22, 23, 25, 28, 29, 33, 34, 35, 39, 40, 42, 44, 46, 50, 52, 54, 62, 65, 67, 70, 71, 79, 82, 83, 84, 86, 87, 89, 93, 94, 95, 96, 98, 100, 108, 109, 117, 118, 119, 120, 122**
 auto-QoS **118, 119, 122**
 categorizing traffic **118**
 disabling **122**
 effects on running configuration **119**
 basic model **18**
 class maps **62, 65**
 configuring **62, 65**
 classification **18, 19, 20, 22, 23, 50**
 DSCP transparency, described **50**
 forwarding treatment **18**
 IP ACLs, described **22, 23**
 MAC ACLs, described **19, 23**
 options for IP traffic **20**
 trusted CoS, described **19**
 configuring **44, 46, 52, 54, 67, 71, 79, 82, 89, 108, 109, 120**
 aggregate policers **79, 108, 109**
 auto-QoS **120**
 default port CoS value **46**
 DSCP maps **82**
 DSCP trust states bordering another domain **52**
 egress queue characteristics **89**
 IP standard ACLs **54**
 policy maps on physical ports **67**
 policy maps, hierarchical **71**
 port trust states within the domain **44**
 default auto configuration **118**
 default configuration **35**
 egress queues **33, 93, 94, 95, 96**
 configuring shaped weights for SRR **95**

QoS (continued)

egress queues (continued)

- configuring shared weights for SRR 96
- displaying the threshold map 94
- mapping DSCP or CoS values 93
- WTD, described 33

enabling globally 40

enabling VLAN-based on physical ports 42

implicit deny 23

IP phones 117

- automatic classification and queueing 117

limiting bandwidth on egress interface 100

mapping tables 28, 39, 40, 82, 83, 84, 86, 87

- CoS-to-DSCP 39, 82

- DSCP-CoS 86

- DSCP-to-CoS 40

- DSCP-to-DSCP-mutation 87

- IP-precedence-to-DSCP 39, 83

- policed-DSCP 84

- types of 28

marked-down actions 70

packet modification 34

policers 25, 70

- configuring 70

- types of 25

QoS 19

classification 19

- trust DSCP, described 19

- trust IP precedence, described 19

queues 29, 34, 98

- high priority (expedite) 34, 98

- location of 29

- WTD, described 29

rewrites 34

QoS policy 54

queueing 31

R

references 131

- auto-QoS 131

S

scheduling 31

shaped mode 34

shared mode 34

SRR 30

- described 30

- shaped mode 30

- shared mode 30

T

troubleshooting 122

- auto-QoS 122

trust states 43

trusted boundary for QoS 48

trusted port states 19

- classification options 19

W

WTD 90

- setting thresholds 90

- egress queue sets 90
