<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode.  |
| configure terminal|         |
| Example:          |         |
| Device# configure terminal | |

| **Step 3**        | Specifies the interface to be configured, and enter interface configuration mode. |
| interface interface-id |         |
| Example:            |         |
### Enabling and Configuring Port Security

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# interface gigabitethernet1/0/1</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

**switchport mode {access | trunk}**

**Example:**

`Device(config-if)# switchport mode access`

Sets the interface switchport mode as access or trunk; an interface in the default mode (dynamic auto) cannot be configured as a secure port.

**Step 5**

**switchport voice vlan vlan-id**

**Example:**

`Device(config-if)# switchport voice vlan 22`

Enables voice VLAN on a port.

*vlan-id—Specifies the VLAN to be used for voice traffic.*

**Step 6**

**switchport port-security**

**Example:**

`Device(config-if)# switchport port-security`

Enable port security on the interface.

**Note**

Under certain conditions, when port security is enabled on the member ports in a switch stack, the DHCP and ARP packets would be dropped. To resolve this, configure a shut and no shut on the interface.

**Step 7**

**switchport port-security [maximum value [vlan {vlan-list | {access | voice}]}]]**

**Example:**

`Device(config-if)# switchport port-security maximum 20`

(Optional) Sets the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is set by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

(Optional) **vlan**—sets a per-VLAN maximum value

Enter one of these options after you enter the `vlan` keyword:

- **vlan-list**—On a trunk port, you can set a per-VLAN maximum value on a range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.
- **access**—On an access port, specifies the VLAN as an access VLAN.
- **voice**—On an access port, specifies the VLAN as a voice VLAN.
The `voice` keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.

**Step 8**

`switchport port-security violation {protect | restrict | shutdown | shutdown vlan}`

**Example:**

```
Device(config-if)# switchport port-security violation restrict
```

(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:

- **protect**—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

  **Note** We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- **restrict**—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown**—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown vlan**—Use to set the security violation mode per VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

Note

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.
Traffic Patterns

Figure 133: Broadcast Storm Control Example

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

Note
Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the storm-control interface configuration commands to set the threshold value for each traffic type.

How to Configure Storm Control

Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

Note
Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.
Follow these steps to storm control and threshold levels:

**Before you begin**

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `storm-control {broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps pps [pps-low]}`
5. `storm-control action {shutdown | trap}`
6. `end`
7. `show storm-control [interface-id] [broadcast | multicast | unicast]`
8. `copy running-config startup-config`

</tbody>
</table>
### Configuring Storm Control and Threshold Levels

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) For <strong>level-low</strong>, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00. If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.</td>
<td></td>
</tr>
<tr>
<td>• For <strong>bps bps</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <strong>bps-low</strong>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</td>
<td></td>
</tr>
<tr>
<td>• For <strong>pps pps</strong>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <strong>pps-low</strong>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</td>
<td></td>
</tr>
</tbody>
</table>

For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.

| Step 5 | **storm-control action {shutdown | trap}** |
|--------|------------------------------------------|
| Example: | Device(config-if)# storm-control action trap |

**Specifies the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.**

- Select the **shutdown** keyword to error-disable the port during a storm.
- Select the **trap** keyword to generate an SNMP trap when a storm is detected.

<table>
<thead>
<tr>
<th>Step 6</th>
<th><strong>end</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Command or Action

| Step 7 | `show storm-control [interface-id] [broadcast | multicast | unicast]` |

**Example:**

```
Device# show storm-control gigabitethernet1/0/1 unicast
```

### Purpose

Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, details for all traffic types (broadcast, multicast, and unicast) are displayed.

| Step 8 | `copy running-config startup-config` |

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Information About Protected Ports

#### Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

### Default Protected Port Configuration

The default is to have no protected ports defined.
## Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

## How to Configure Protected Ports

### Configuring a Protected Port

**Before you begin**

Protected ports are not pre-defined. This is the task to configure one.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport protected`
5. `end`
6. `show interfaces interface-id switchport`
7. `show running-config`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Port Blocking

Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown
unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

**Note** With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

### How to Configure Port Blocking

#### Blocking Flooded Traffic on an Interface

**Before you begin**

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface interface-id**
4. **switchport block multicast**
5. **switchport block unicast**
6. **end**
7. **show interfaces interface-id switchport**
8. **show running-config**
9. **copy running-config startup-config**

**DETAILED STEPS**

Table 162: Commands for Displaying Port Security Status and Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show port-security [interface interface-id]</code></td>
<td>Displays port security settings for the switch or for the specified interface, including the maximum allowed number of secure MAC addresses for each interface, the number of secure MAC addresses on the interface, the number of security violations that have occurred, and the violation mode.</td>
</tr>
<tr>
<td><code>show port-security [interface interface-id] address</code></td>
<td>Displays all secure MAC addresses configured on all switch interfaces or on a specified interface with aging information for each address.</td>
</tr>
<tr>
<td><code>show port-security interface interface-id vlan</code></td>
<td>Displays the number of secure MAC addresses configured per VLAN on the specified interface.</td>
</tr>
</tbody>
</table>

Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.
This example shows how to configure a static secure MAC address on VLAN 3 on a port:

```
Device(config)# interface gigabitethernet 1/0/2
Device(config-if)# switchport mode trunk
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3
```

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

```
Device(config)# interface tengigabitethernet 1/0/1
Device(config-if)# switchport access vlan 21
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan 22
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 20
Device(config-if)# switchport port-security violation restrict
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address sticky 0000.0000.0002
Device(config-if)# switchport port-security mac-address 0000.0000.0003
Device(config-if)# switchport port-security mac-address sticky 0000.0000.0001 vlan voice
Device(config-if)# switchport port-security mac-address 0000.0000.0004 vlan voice
Device(config-if)# switchport port-security maximum 10 vlan access
Device(config-if)# switchport port-security maximum 10 vlan voice
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for First Hop Security in IPv6

- You have configured the necessary IPv6 enabled SDM template.
- You should be familiar with the IPv6 neighbor discovery feature.
Restrictions for First Hop Security in IPv6

- The following restrictions apply when applying FHS policies to EtherChannel interfaces (Port Channels):
  - A physical port with an FHS policy attached cannot join an EtherChannel group.
  - An FHS policy cannot be attached to an physical port when it is a member of an EtherChannel group.

- By default, a snooping policy has a security-level of guard. When such a snooping policy is configured on an access switch, external IPv6 Router Advertisement (RA) or Dynamic Host Configuration Protocol server packets are blocked, even though the uplink port facing the router or DHCP server/relay is configured as a trusted port. To allow IPv6 RA or DHCPv6 server messages, do the following:
  - Apply an IPv6 RA-guard policy (for RA) or IPv6 DHCP-guard policy (for DHCP server messages) on the uplink port.
  - Configure a snooping policy with a lower security-level, for example glean or inspect. However; configuring a lower security level is not recommended with such a snooping policy, because benefits of First Hop security features are not effective.

Information about First Hop Security in IPv6

First Hop Security in IPv6 (FHS IPv6) is a set of IPv6 security features, the policies of which can be attached to a physical interface, or a VLAN. An IPv6 software policy database service stores and accesses these policies. When a policy is configured or modified, the attributes of the policy are stored or updated in the software policy database, then applied as was specified. The following IPv6 policies are currently supported:

- IPv6 FHS Binding Table Content—A database table of IPv6 neighbors connected to the switch is created from information sources such as Neighbor Discovery (ND) protocol snooping. This database, or binding, table is used by various IPv6 guard features (such as IPv6 ND Inspection) to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.

- IPv6 Neighbor Discovery Inspection—IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database and IPv6 neighbor discovery messages that do not conform are dropped. An ND message is considered trustworthy if its IPv6-to-Media Access Control (MAC) mapping is verifiable.

  This feature mitigates some of the inherent vulnerabilities of the ND mechanism, such as attacks on DAD, address resolution, router discovery, and the neighbor cache.
Effective Cisco IOS XE Release 16.3.1, ND Inspection functionality, IPv6 Snooping Policy, and IPv6 FHS Binding Table Content are supported through Switch Integrated Security Feature (SISF)-based Device Tracking. For more information, see Configuring SISF based device tracking section of the Software Configuration Guide.

• IPv6 Router Advertisement Guard—The IPv6 Router Advertisement (RA) guard feature enables the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network switch platform. RAs are used by routers to announce themselves on the link. The RA Guard feature analyzes the RAs and filters out bogus RAs sent by unauthorized routers. In host mode, all router advertisement and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. Once the Layer 2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

• IPv6 DHCP Guard—The IPv6 DHCP Guard feature blocks reply and advertisement messages that come from unauthorized DHCPv6 servers and relay agents. IPv6 DHCP guard can prevent forged messages from being entered in the binding table and block DHCPv6 server messages when they are received on ports that are not explicitly configured as facing a DHCPv6 server or DHCP relay. To use this feature, configure a policy and attach it to an interface or a VLAN. To debug DHCP guard packets, use the `debug ipv6 snooping dhcp-guard` privileged EXEC command.

• IPv6 Prefix Guard—The IPv6 prefix guard feature works within the IPv6 source guard feature, to enable the device to deny traffic originated from non-topologically correct addresses. IPv6 prefix guard is often used when IPv6 prefixes are delegated to devices (for example, home gateways) using DHCPv6 prefix delegation. The feature discovers ranges of addresses assigned to the link and blocks any traffic sourced with an address outside this range.

For more information on IPv6 Prefix Guard, see the IPv6 Prefix Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

• IPv6 Destination Guard—The IPv6 destination guard feature works with IPv6 neighbor discovery to ensure that the device performs address resolution only for those addresses that are known to be active on the link. It relies on the address glean functionality to populate all destinations active on the link into the binding table and then blocks resolutions before they happen when the destination is not found in the binding table.

IPv6 Destination Guard is recommended to apply on Layer 2 VLAN with an SVI configured

For more information about IPv6 Destination Guard, see the IPv6 Destination Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.
How to Configure an IPv6 Snooping Policy

The IPv6 Snooping Policy feature is deprecated starting from Cisco IOS XE Denali 16.3.1. Although the commands are visible on the CLI and you can configure them, we recommend that you use the Switch Integrated Security Feature (SISF)-based Device Tracking feature instead.

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Snooping Policy:

### SUMMARY STEPS

1. `configure terminal`
2. `ipv6 snooping policy policy-name`
3. `{ [default ] | [device-role {node | switch}] | [limit address-count value] | [no] | [protocol { dhcp | ndp}] | [security-level {glean | guard | inspect}] | [tracking {disable {stale-lifetime {seconds | infinite}} | enable [reachable-lifetime {seconds | infinite}]}] | [trusted-port] }
4. `end`
5. `show ipv6 snooping policy policy-name`

### DETAILED STEPS

## How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an EtherChannel interface or VLAN:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

Device# configure terminal

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface range Interface_name</td>
<td>Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

Device(config)# interface range Po1

**Tip**

Enter the `do show interfaces summary` command for quick reference to interface names and types.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6 snooping [attach-policy policy_name [ vlan {vlan_ids</td>
<td>add vlan_ids</td>
<td>except vlan_ids</td>
</tr>
</tbody>
</table>

**Example:**

Device(config-if-range)# ipv6 snooping attach-policy example_policy

or

Device(config-if-range)# ipv6 snooping attach-policy example_policy vlan 222,223,224

or

Device(config-if-range)# ipv6 snooping vlan 222,223,224
### How to Attach an IPv6 Snooping Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping Policy to VLANs across multiple interfaces:

#### SUMMARY STEPS

1. `configure terminal`
2. `vlan configuration vlan_list`
3. `ipv6 snooping [attach-policy policy_name]`
4. `do show running-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>Device(config)# configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>vlan configuration vlan_list</code></td>
<td>Specifies the VLANs to which the IPv6 Snooping policy will be attached; enters the VLAN interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>Device(config)# vlan configuration 333</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ipv6 snooping [attach-policy policy_name]</code></td>
<td>Attaches the IPv6 Snooping policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <code>attach-policy</code> option is not used. The default policy is, security-level <code>guard</code>, device-role <code>node</code>, protocol <code>ndp</code> and <code>dhcp</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>Device(config-vlan-config)#ipv6 snooping attach-policy example_policy</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>do show running-config</code></td>
<td>Verifies that the policy is attached to the specified VLANs without exiting the interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>Device#(config-if)# do show running-config</code></td>
</tr>
</tbody>
</table>
How to Configure the IPv6 Binding Table Content

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

SUMMARY STEPS

1. configure terminal
2. [no] ipv6 neighbor binding [vlan vlan-id {ipv6-address interface interface_type stack/module/port hw_address [reachable-lifetimevalue [seconds | default | infinite] | [tracking { [default | disable] [reachable-lifetimevalue [seconds | default | infinite] | [enable [reachable-lifetimevalue [seconds | default | infinite] | [retry-interval {seconds | default [reachable-lifetimevalue [seconds | default | infinite] } ] ]}]}
3. [no] ipv6 neighbor binding max-entries number [mac-limit number | port-limit number [mac-limit number] | vlan-limit number [ [mac-limit number] | [port-limit number [mac-limit number] ] ] ]
4. ipv6 neighbor binding logging
5. exit
6. show ipv6 neighbor binding

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 2** [no] ipv6 neighbor binding [vlan vlan-id {ipv6-address interface interface_type stack/module/port hw_address [reachable-lifetimevalue [seconds | default | infinite] | [tracking { [default | disable] [reachable-lifetimevalue [seconds | default | infinite] | [enable [reachable-lifetimevalue [seconds | default | infinite] | [retry-interval {seconds | default [reachable-lifetimevalue [seconds | default | infinite] } ] ]}]
| **Example:** Device(config)# ipv6 neighbor binding | Adds a static entry to the binding table database. |
| **Note** Switch adds small variance to configured reachable-time value to improve system stability during timer expiry of binding entries. | |
| **Step 3** [no] ipv6 neighbor binding max-entries number [mac-limit number | port-limit number [mac-limit number] | vlan-limit number [ [mac-limit number] | [port-limit number [mac-limit number] ] ] ]
| **Example:** Device(config)# ipv6 neighbor binding max-entries 30000 | Specifies the maximum number of entries that are allowed to be inserted in the binding table cache. |
| **Step 4** ipv6 neighbor binding logging | Enables the logging of binding table main events. |
| **Example:** Device(config)# ipv6 neighbor binding logging | |
How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exits global configuration mode, and places the router in privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)#</td>
<td>exit</td>
</tr>
<tr>
<td><strong>Step 6</strong> show ipv6 neighbor binding</td>
<td>Displays contents of a binding table.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device#</td>
<td>show ipv6 neighbor binding</td>
</tr>
</tbody>
</table>

How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

**SUMMARY STEPS**

1. configure terminal
2. [no]ipv6 nd inspection policy policy-name
3. device-role {host | switch}
4. limit address-count value
5. tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}]}
6. trusted-port
7. validate source-mac
8. no {device-role | limit address-count | tracking | trusted-port | validate source-mac}
9. default {device-role | limit address-count | tracking | trusted-port | validate source-mac}
10. do show ipv6 nd inspection policy policy_name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> [no]ipv6 nd inspection policy policy-name</td>
<td>Specifies the ND inspection policy name and enters ND Inspection Policy configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ipv6 nd inspection policy example_policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> device-role {host</td>
<td>switch}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-nd-inspection)# device-role switch</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> limit address-count value</td>
<td>Enter 1–10,000.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Device(config-nd-inspection)# limit address-count 1000**

**Step 5**

**tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}]}}**

**Example:**

*Device(config-nd-inspection)# tracking disable stale-lifetime infinite*

Overrides the default tracking policy on a port.

**Step 6**

**trusted-port**

**Example:**

*Device(config-nd-inspection)# trusted-port*

Configures a port to become a trusted port.

**Step 7**

**validate source-mac**

**Example:**

*Device(config-nd-inspection)# validate source-mac*

Checks the source media access control (MAC) address against the link-layer address.

**Step 8**

**no {device-role | limit address-count | tracking | trusted-port | validate source-mac}**

**Example:**

*Device(config-nd-inspection)# no validate source-mac*

Remove the current configuration of a parameter with the **no** form of the command.

**Step 9**

**default {device-role | limit address-count | tracking | trusted-port | validate source-mac}**

**Example:**

*Device(config-nd-inspection)# default limit address-count*

Restores configuration to the default values.

**Step 10**

**do show ipv6 nd inspection policy policy_name**

**Example:**

*Device(config-nd-inspection)# do show ipv6 nd inspection policy example_policy*

Verifies the ND Inspection Configuration without exiting ND inspection configuration mode.

---

### How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to an interface or VLANs on an interface:

**SUMMARY STEPS**

1. **configure terminal**
2. **interface Interface_type stack/module/port**
3. **ipv6 nd inspection {attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none } | remove vlan_ids | all }] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } ]**
4. **do show running-config**
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** interface Interface_type stack/module/port | Specifies an interface type and identifier; enters the interface configuration mode. |
| **Example:** Device(config)# interface gigabitethernet 1/1/4 | |

| **Step 3** ipv6 nd inspection [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | Attaches the Neighbor Discovery Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the attach-policy option is not used. |
| [vlan] [ {vlan_ids | add vlan_ids | except vlan_ids | all} ] | |
| [vlan] [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | |
| **Example:** Device(config-if)# ipv6 nd inspection attach-policy example_policy | |
| or | |
| Device(config-if)# ipv6 nd inspection attach-policy example_policy vlan 222,223,224 | |
| or | |
| Device(config-if)# ipv6 nd inspection vlan 222,223,224 | |

| **Step 4** do show running-config | Verifies that the policy is attached to the specified interface without exiting the interface configuration mode. |
| **Example:** Device#(config-if)# do show running-config | |

### How to Attach an IPv6 Neighbor Discovery Inspection Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Neighbor Discovery Inspection policy on an EtherChannel interface or VLAN:

**SUMMARY STEPS**

1. configure terminal
2. interface range Interface_name
3. ipv6 nd inspection [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | vlan] [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]
4. `do show running-config interfaceportchannel_interface_name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode. |
| interface range Interface_name | |
| **Example:**      | Enter the `do show interfaces summary` command for quick reference to interface names and types. |
| Device(config)# interface Po11 | |

| **Step 3** | Attaches the ND Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the `attach-policy` option is not used. |
| ipv6 nd inspection [attach-policy policy_name [vlan vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all] | vlan [vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all] | |
| **Example:** | |
| Device(config-if-range)# ipv6 nd inspection attach-policy example_policy | |
| or | |
| Device(config-if-range)# ipv6 nd inspection attach-policy example_policy vlan 222,223,224 | |
| or | |
| Device(config-if-range)#ipv6 nd inspection vlan 222, 223,224 | |

| **Step 4** | Confirms that the policy is attached to the specified interface without exiting the configuration mode. |
| do show running-config interfaceportchannel_interface_name | |
| **Example:** | |
| Device#(config-if-range)# do show running-config int poll | |

### How to Attach an IPv6 Neighbor Discovery Inspection Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to VLANs across multiple interfaces:

### SUMMARY STEPS

1. `configure terminal`
2. `vlan configuration vlan_list`
3. `ipv6 nd inspection [attach-policy policy_name]`
4. `do show running-config`

**DETAILED STEPS**

How to Configure an IPv6 DHCP Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 DHCP (DHCPv6) Guard policy:
### SUMMARY STEPS

1. `configure terminal`
2. `[no]ipv6 dhcp guard policy policy-name`
3. `[no]device-role {client | server}`
4. `[no] match server access-list ipv6-access-list-name`
5. `[no] match reply prefix-list ipv6-prefix-list-name`
6. `[no] preference { max limit | min limit }
7. `[no] trusted-port`
8. default {device-role | trusted-port}
9. `do show ipv6 dhcp guard policy policy_name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example: Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the DHCPv6 Guard policy name and enters DHCPv6 Guard Policy configuration mode.</td>
</tr>
<tr>
<td><code>[no]ipv6 dhcp guard policy policy-name</code></td>
<td></td>
</tr>
<tr>
<td>Example: Device(config)# <code>ipv6 dhcp guard policy example_policy</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Filters out DHCPv6 replies and DHCPv6 advertisements on the port that are not from a device of the specified role. Default is <code>client</code>.</td>
</tr>
<tr>
<td>`[no]device-role {client</td>
<td>server}`</td>
</tr>
<tr>
<td>Example: Device(config-dhcp-guard)# <code>device-role server</code></td>
<td></td>
</tr>
<tr>
<td>• <code>client</code>—Default value, specifies that the attached device is a client. Server messages are dropped on this port.</td>
<td></td>
</tr>
<tr>
<td>• <code>server</code>—Specifies that the attached device is a DHCPv6 server. Server messages are allowed on this port.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional). Enables verification that the advertised DHCPv6 server or relay address is from an authorized server access list (The destination address in the access list is 'any'). If not configured, this check will be bypassed. An empty access list is treated as a permit all.</td>
</tr>
<tr>
<td><code>[no] match server access-list ipv6-access-list-name</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>;;Assume a preconfigured IPv6 Access List as follows: Device(config)# ipv6 access-list my_acls Device(config-ipv6-acl)# permit host FE80::A8BB:CCFF:FE01:F700 any</code></td>
<td></td>

How to Configure IPv6 Source Guard

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `[no] ipv6 source-guard policy policy_name`
4. `[deny global-autoconf] [permit link-local] [default{...}] [exit] [no{...}]`
5. `end`
6. `show ipv6 source-guard policy policy_name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
  * Enter your password if prompted. |
| Example: | Device> enable | |
| **Step 2** | configure terminal | Enters the global configuration mode. |
| Example: | Device# configure terminal | |
| **Step 3** | `[no] ipv6 source-guard policy policy_name` | Specifies the IPv6 Source Guard policy name and enters IPv6 Source Guard policy configuration mode. |
| Example: | Device(config)# ipv6 source-guard policy example_policy | |
| **Step 4** | `[deny global-autoconf] [permit link-local] [default{...}] [exit] [no{...}]` | (Optional) Defines the IPv6 Source Guard policy.  
  * deny global-autoconf—Denies data traffic from auto-configured global addresses. This is useful when all global addresses on a link are DHCP-assigned and the administrator wants to block hosts with self-configured addresses to send traffic.  
  * permit link-local—Allows all data traffic that is sourced by a link-local address.  
  **Note** Trusted option under source guard policy is not supported. |
| Example: | Device(config-sisf-sourceguard)# deny global-autoconf | |

### Configuration Examples for IPv6 First Hop Security

#### Examples: How to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface

The following example shows how to attach an IPv6 Source Guard Policy to a Layer 2 EtherChannel Interface:

```
Switch# configure terminal
Switch(config)# ipv6 source-guard policy POL
Switch(config-sisf-sourceguard)# validate address
switch(config-sisf-sourceguard)# exit
Switch(config)# interface Po4
Switch(config)# ipv6 snooping
Switch(config-if)# ipv6 source-guard attach-policy POL
Switch(config-if)# exit
switch(config)#
```

#### Examples: How to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface

The following example shows how to attach an IPv6 Prefix Guard Policy to a Layer 2 EtherChannel Interface:

```
Switch# configure terminal
Switch(config)# ipv6 source-guard policy POL
Switch(config-sisf-sourceguard)# no validate address
Switch(config-sisf-sourceguard)# validate prefix
Switch(config)# interface Po4
Switch(config-if)# ipv6 snooping
Switch(config-if)# ipv6 source-guard attach-policy POL
```

CHAPTER 103

Configuring SISF-Based Device Tracking

• Information About SISF-Based Device Tracking, on page 2137
• How to Configure SISF-Based Device Tracking, on page 2143
• Configuration Examples for SISF-Based Device Tracking, on page 2151
• Feature History and Information for SISF-Based Device Tracking, on page 2154

Information About SISF-Based Device Tracking

Overview of SISF-Based Device Tracking

The Switch Integrated Security Features based (SISF-based) device tracking feature is part of the suite of first-hop security features.

The main role of the feature is to track the presence, location, and movement of end-nodes in the network. SISF snoops traffic received by the switch, extracts device identity (MAC and IP address), and stores them in a binding table. Many features, such as, IEEE 802.1X, web authentication, Cisco TrustSec and LISP etc., depend on the accuracy of this information to operate properly.

SISF-based device tracking supports both IPv4 and IPv6.

Even with the introduction of SISF-based device tracking, the legacy device tracking CLI (IP Device Tracking (IPDT) and IPv6 Snooping CLI) continues to be available. When you bootup the switch, the set of commands that is available depends on existing configuration, and only one of the following is available:

• SISF-based device tracking CLI, or

• IPDT and IPv6 Snooping CLI

Note

The IPDT and IPv6 Snooping commands are deprecated, but continue to be available. We recommend that you upgrade to SISF-based device tracking.

If you are using the IPDT and IPv6 Snooping CLI and want to migrate to SISF-based device tracking, see Migrating from legacy IPDT and IPv6 Snooping to SISF-Based Device Tracking, for more information.

SISF-based device tracking can be enabled manually (by using device-tracking commands), or programmatically (which is the case when providing device tracking services to other features).
Options to Enable SISF-Based Device Tracking

SISF-Based device tracking is disabled by default.

You can enable it by defining a device tracking policy and attaching the policy to a specific target.

Note
The target could be an interface or a VLAN.

Manually Enabling SISF-Based Device Tracking

- **Option 1**: Apply the default device tracking policy to a target.

  Enter the `device-tracking` command in the interface configuration mode or in the VLAN configuration mode. The system then attaches the default policy to the interface or VLAN.

  Note
  The default policy is a built-in policy with default settings; you cannot change any of the attributes of the default policy. In order to be able to configure device tracking policy attributes you must create a custom policy. See **Option 2**: Create a custom policy with custom settings.

- **Option 2**: Create a custom policy with custom settings.

  Enter the device-tracking policy command in global configuration mode and enter a custom policy name. The system creates a policy with the name you specify. You can then configure the available settings, in the device tracking configuration mode (config-device-tracking), and attach the policy to a specified target.

Programmatically Enabling SISF-Based Device Tracking

Some features rely on device tracking and utilize the trusted database of binding entries that SISF-based device tracking builds and maintains. These features, also called device tracking clients, enable device tracking programmatically (create and attach the device tracking policy).

Note
The exceptions here are IEEE 802.1X, web authentication, Cisco TrustSec, and IP Source Guard (IPSG) - they also rely on device tracking, but they do not enable it. For these device tracking clients, you must enter the `ip dhcp snooping vlan vlan` command, to programmatically enable device tracking on a particular target.

Note the following about programmatically enabling SISF-based device tracking:

- A device tracking client requires device tracking to be enabled.
  
  There are several device tracking clients, therefore, multiple programmatic policies could be created. The settings of each policy differ depending on the device tracking client that creates the policy.

- The policy that is created, and its settings, are system-defined.
Configurable policy attributes are available in the device tracking configuration mode (config-device-tracking) and vary from one release to another. If you try to modify an attribute that is not configurable, the configuration change is rejected and an error message is displayed.

For release-specific information about programmatically created policies, see Programmatically Enabling SISF-Based Device Tracking in Cisco IOS XE <release name> <release number> in the required version of the document.

Migrating from Legacy Commands to SISF-Based Device-Tracking Commands

Migrating from Legacy IPDT and IPv6 Snooping to SISF-Based Device Tracking

Starting with Cisco IOS XE Denali 16.1.1, the existing IPv6 snooping and IP Device Tracking (IPDT) commands have corresponding SISF-based device-tracking commands that allow you to apply your configuration to both IPv4 and IPv6 address families.

After you have upgraded from a Cisco IOS XE 3.x.x release to a Cisco IOS XE 16.x.x release, enter the device-tracking upgrade-cli to convert legacy IPDT and IPv6 Snooping commands to SISF-based device tracking commands. After you run the command, only the new device-tracking commands are available on your device and the legacy commands are not supported.

Based on the legacy configuration that exists on your device, the device-tracking upgrade-cli command upgrades your CLI differently. Consider the following configuration scenarios and the corresponding migration results before you migrate your existing configuration.

**Note**

You cannot configure a mix of the old IPDT and IPv6 snooping CLI with the new SISF-based device-tracking CLI.

**Only IPDT Configuration Exists**

If your device has only IPDT configuration, running the device-tracking upgrade-cli command converts the configuration to use the new SISF policy that is created and attached to the interface. You can then update this SISF policy.

If you continue to use the legacy commands, this restricts you to operate in a legacy mode where only the legacy IPDT and IPv6 snooping commands are available on the device.

**Only IPv6 Snooping Configuration Exists**

On a device with existing IPv6 snooping configuration, the old IPv6 Snooping commands are available for further configuration. The following options are available:

- (Recommended) Use the device-tracking upgrade-cli command to convert all your legacy configuration to the new SISF-based device tracking commands. After conversion, only the new device tracking commands will work on your device.

- Use the legacy IPv6 Snooping commands for your future configuration and do not run the device-tracking upgrade-cli command. With this option, only the legacy IPv6 Snooping commands are available on your device, and you cannot use the new SISF-based device tracking CLI commands.
Both IPDT and IPv6 Snooping Configuration Exist

On a device that has both legacy IPDT configuration and IPv6 snooping configuration, you can convert legacy commands to the SISF-based device tracking CLI commands. However, note that only one snooping policy can be attached to an interface, and the IPv6 snooping policy parameters override the IPDT settings.

If you do not migrate to the new SISF-based commands and continue to use the legacy IPv6 snooping or IPDT commands, your IPv4 device tracking configuration information may be displayed in the IPv6 snooping commands, as the SISF-based device tracking feature handles both IPv4 and IPv6 configuration. To avoid this, we recommend that you convert your legacy configuration to SISF-based device tracking commands.

No IPDT or IPv6 Snooping Configuration Exists

If your device has no legacy IP Device Tracking or IPv6 Snooping configurations, you can use only the new SISF-based device tracking commands for all your future configuration. The legacy IPDT commands and IPv6 snooping commands are not available.

Starting from Cisco IOS XE Denali 16.3.1, the `ip dhcp snooping vlan vlan` command creates a device tracking policy programmatically, to support the IEEE 802.1X, web authentication, Cisco TrustSec and IPSG features. The programmatically created policy tracks both IPv4 and IPv6 clients. Ensure that this command is configured, if you are using any of the aforementioned features.

**IPDT, IPv6 Snooping, and SISF-Based Device Tracking CLI Compatibility**

Table Table 163: IPDT → IPv6 Snooping Commands, on page 2140 displays legacy IPDT and the IPv6 snooping commands they are converted to. (The commands listed here are applicable if you have not upgraded to SISF-based device-tracking).

Table Table 164: IPDT → SISF Commands, on page 2141 displays legacy IPDT and the SISF-based device-tracking commands. (The commands listed here are applicable if you have upgraded to SISF-based device-tracking, with the `device-tracking upgrade-cli` command.)

28 Until Cisco IOS XE Denali 16.3.6 and in Cisco IOS XE Everest 16.5.x, the system incorrectly converts the `ip device tracking probe delay` command to `device-tracking binding reachable-lifetime`. Starting from Cisco IOS XE Denali 16.3.7 (except in Cisco IOS XE Everest 16.5.x), this is corrected to be set to the default value and cannot be changed.

29 Until Cisco IOS XE Denali 16.3.6 and in Cisco IOS XE Everest 16.5.x, the system incorrectly converts the `ip device tracking probe interval` command to `device-tracking tracking retry-interval`. Starting from Cisco IOS XE Denali 16.3.7 (except in Cisco IOS XE Everest 16.5.x), this is correctly converted to `device-tracking binding reachable-lifetime`. 
How to Configure SISF-Based Device Tracking

Manually Enabling SISF-Based Device Tracking

Applying the Default Device Tracking Policy to a Target

Beginning in privileged EXEC mode, follow these steps to apply the default device tracking policy to an interface or VLAN:

**SUMMARY STEPS**

1. `configure terminal`
2. Specify an interface or a VLAN
   - `interface interface`
   - `vlan configuration vlan_list`
3. `device-tracking`
4. `exit`
5. `show device-tracking policy policy-name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the interface and enters the interface configuration mode. The device tracking policy will be attached to the specified interface.</td>
</tr>
</tbody>
</table>
| Specify an interface or a VLAN
  - `interface interface`
  - `vlan configuration vlan_list` | |
| **Example:** Device(config)# interface gigabitethernet 1/1/4 OR Device(config)# vlan configuration 333 | |
| **Step 3** | Enables SISF-based device tracking and attaches the default policy to the interface or VLAN. The default policy is a built-in policy with default settings; none of the attributes of the default policy can be changed. |
| `device-tracking` | |
| **Example:** Device(config-if)# device-tracking OR Device(config-vlan-config)# device-tracking | |
| **Step 4** | Exits configuration mode. |
| `exit` | |
Creating a Custom Device Tracking Policy with Custom Settings

Beginning in privileged EXEC mode, follow these steps to create and configure a device tracking policy:

SUMMARY STEPS

1. `configure terminal`
2. `[no] device-tracking policy policy-name`
3. `[data-glean | default | destination-glean | device-role | distribution-switch | exit | limit | no | prefix-glean | protocol | security-level | tracking | trusted-port | vpc]`
4. `end`
5. `show device-tracking policy policy-name`

</tbody>
</table>

### Exits configuration mode.

#### Step 4

**Example:**
```
Device(config-device-tracking)# exit
```

### Displays the device-tracking policy configuration.

#### Step 5

**Example:**
```
Device# show device-tracking policy example_policy
```

### What to do next

Attach the policy to an interface or VLAN.

**Attaching a Device Tracking Policy to an Interface**

Beginning in privileged EXEC mode, follow these steps to attach a device tracking policy to an interface:

#### SUMMARY STEPS

1. configure terminal
2. interface interface
3. [no] device-tracking attach-policy policy name
4. end
5. show device-tracking policies [interface interface]

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 interface interface</td>
<td>Specifies an interface and enters the interface configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet 1/1/4</td>
<td></td>
</tr>
<tr>
<td>Step 3 [no] device-tracking attach-policy policy name</td>
<td>Attaches the device tracking policy to the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Attaching a Device Tracking Policy to a VLAN

Beginning in privileged EXEC mode, follow these steps to attach a device-tracking policy to VLANs across multiple interfaces:

**SUMMARY STEPS**

1. configure terminal
2. vlan configuration `vlan_list`
3. [no] device-tracking attach-policy `policy_name`
4. do show device-tracking policies vlan `vlan-ID`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal
Example:
Device# configure terminal | Enters the global configuration mode. |
| **Step 2**
vlan configuration `vlan_list`
Example:
Device(config)# vlan configuration 333 | Specifies the VLANs to which the device tracking policy will be attached; enters the VLAN interface configuration mode. |
| **Step 3**
[no] device-tracking attach-policy `policy_name`
Example: | Attaches the device tracking policy to the specified VLANs across all switch interfaces. |

**Note**

SISF based device-tracking policies can be disabled only if they are custom policies. Programmatically created policies can be removed only if the corresponding device-tracking client feature configuration is removed.

**Example:**

**Step 4**

end

Example:
Device# end

**Step 5**

show device-tracking policies [interface `interface`]

Example:
Device# show device-tracking policies interface gigabitethernet 1/1/4

**Purpose**

Displays policies that match the specified interface type and number.
Programmatically Enabling SISF-Based Device Tracking in Cisco IOS XE Denali 16.3.x

Table 165: Programmatically Enabling SISF-Based Device Tracking in Cisco IOS XE Denali 16.3.x

<table>
<thead>
<tr>
<th>Device tracking client features that can enable SISF-based device tracking</th>
<th>In this release, you can programmatically enable SISF-based device tracking for these features: IEEE 802.1X, web authentication, Cisco TrustSec, wireless, and IPSG features: enter the <code>ip dhcp snooping vlan</code> <code>vlan</code> command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Name</td>
<td>WL_DEVICE_TRACKING_DHCP ((automatically attached to the VLAN))</td>
</tr>
<tr>
<td>User Options</td>
<td>• Policy settings cannot be modified. • The programmatically created policy cannot be replaced by another policy • Only one device-tracking policy can be attached to the same interface or VLAN • The policy cannot be removed unless the device tracking client feature configuration is removed. • When a device-tracking policy is attached to an interface under a VLAN, the policy settings on the interface take precedence over those on its VLAN; exceptions here are the values for <code>limit address-count for IPv4 per mac</code> and <code>limit address-count for IPv6 per mac</code>, which are aggregated from the policy on both the interface and VLAN.</td>
</tr>
</tbody>
</table>

Step 4

```
do show device-tracking policies vlan 333
```

Verifies that the policy is attached to the specified VLAN, without exiting the VLAN interface configuration mode.

Programmatically Enabling SISF-Based Device Tracking in Cisco IOS XE Denali 16.3.x

Configuring a Multi-Switch Network to Stop Creating Binding Entries from a Trunk Port

In a multi-switch network, SISF-based device tracking provides the capability to distribute binding table entries between switches running the feature. Binding entries are only created on the switches where the host
appears on an access port. No entry is created for a host that appears over a trunk port. This is achieved by configuring a policy with the trusted-port and device-role switch options, and attaching it to the trunk port.

Important
Both, the trusted-port, and device-role switch options, must be configured in the policy.

Further, we recommended that you apply such a policy on a port facing a device, which also has SISF-based device tracking enabled.

Complete the following steps:

SUMMARY STEPS

1. configure terminal
2. device-tracking policy policy-name
3. device-role switch
4. trusted-port
5. end
6. interface interface
7. device-tracking attach-policy policy-name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</table>
### Configuration Examples for SISF-Based Device Tracking

These examples show sample device-tracking configuration and other recommended or related configuration for certain situations.

#### Example: Programmaticallly Enabling SISF-Based Device Tracking in Cisco IOS XE Denali 16.3.x

**Device tracking clients: IEEE 802.1X, web authentication, Cisco TrustSec, wireless, and IPSG features**

The following example shows how to enable SISF-based device-tracking for IEEE 802.1X, web authentication, Cisco TrustSec, wireless, and IPSG features (enabling device-tracking is a prerequisite for these features).

---

**Note**

The IEEE 802.1X, web authentication, Cisco TrustSec, wireless, and IPSG features are registered to listen for device-tracking notifications; the wireless feature is the one that creates and applies the device-tracking policy WLDEVICE_TRACKING_DHCP.

---

```
Device# configure terminal
Device(config)# ip dhcp snooping vlan 10
Device(config)# end
Device# show device-tracking policy WLDEVICE_TRACKING_DHCP
Policy WLDEVICE_TRACKING_DHCP configuration:
  security-level glean (*)
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  tracking enable

Policy WLDEVICE_TRACKING_DHCP is applied on the following targets:
  Target Type Policy Feature Target range
  vlan 10 VLAN WLDEVICE_TRACKING_DHCP Device-tracking vlan all

note:
  Binding entry Down timer: 24 hours (*)
```
Example: Disabling IPv6 Device Tracking on a Target

By default, SISF-based device tracking supports both IPv4 and IPv6. The following configuration examples show how you can disable IPv6 device tracking if you have to:

Disabling IPv6 device tracking when the target is attached to a custom policy:

```
Device(config)# device-tracking policy example-policy
Device(config-device-tracking)# no protocol ndp
Device(config-device-tracking)# no protocol dhcpv6
Device(config-device-tracking)# end
```

Note: In the Cisco IOS XE Denali 16.3.x release, you cannot disable IPv6 device tracking for a programmatically created policy.

Example: Enabling IPv6 for SVI on VLAN (To Mitigate the Duplicate Address Problem)

When IPv6 is enabled in the network and a switched virtual interface (SVI) is configured on a VLAN, we recommend that you add the following to the SVI configuration. This enables the SVI to acquire a link-local address automatically; this address is used as the source IP address of the SISF probe, thus preventing the duplicate IP address issue.

```
Device(config)# interface vlan 10
Device(config-if)# ipv6 enable
Device(config-if)# end
```

Example: Mitigating the IPv4 Duplicate Address Problem

This example show how you can tackle the Duplicate IP Address 0.0.0.0 error message problem encountered by clients that run Microsoft Windows:

Configure the `device-tracking tracking auto-source` command. This command determines the source IP and MAC address used in the Address Resolution Packet (ARP) request sent by the switch to probe a client, in order to maintain its entry in the device-tracking table. The purpose, is to avoid using 0.0.0.0 as source IP address.

Note: Configure the `device-tracking tracking auto-source` command only when a switch virtual interface (SVI) is not configured. You do not have to configure it when a SVI is configured with an IPv4 address on the VLAN.
<table>
<thead>
<tr>
<th>Command</th>
<th>Action (In order to select source IP and MAC address for device tracking ARP probe)</th>
<th>Notes</th>
</tr>
</thead>
</table>
| device-tracking tracking auto-source | • Set source to VLAN SVI if present.  
• Look for IP and MAC binding in device-tracking table from same subnet.  
• Use 0.0.0.0 | We recommend that you disable device-tracking on all trunk ports to avoid MAC flapping. |
| device-tracking tracking auto-source override | • Set source to VLAN SVI if present  
• Use 0.0.0.0 | Not recommended when there is no SVI. |
| device-tracking tracking auto-source fallback 0.0.0.X 255.255.255.0 | • Set source to VLAN SVI if present  
• Look for IP and MAC binding in device-tracking table from same subnet.  
• Compute source IP from client IP using host bit and mask provided. Source MAC is taken from the MAC address of the switchport facing the client*. | We recommend that you disable device-tracking on all trunk ports to avoid MAC flapping.  
The computed IPv4 address must not be assigned to any client or network device. |
| device-tracking tracking auto-source fallback 0.0.0.X 255.255.255.0 override | • Set source to VLAN SVI if present.  
Compute source IP from client IP using host bit and mask provided*. Source MAC is taken from the MAC address of the switchport facing the client*. | * Depending on the client IP address, an IPv4 address has to be reserved for the source IP.  
A reserved source IPv4 address = (client-ip and mask) | host-ip  
• Client IP = 192.0.2.25  
• Source IP = (192.0.2.25 and 255.255.255.0) | (0.0.0.1) = 192.0.2.1 |

IP address 192.0.2.1 should not be assigned to any client or network device.
Example: Avoiding a Short Device-Tracking Binding Reachable Time

When migrating from an older release, the following configuration may be present:

```
device-tracking binding reachable-time 10
```

Remove this by entering the `no` version of the command.

Feature History and Information for SISF-Based Device Tracking

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Denali</td>
<td>This feature was introduced.</td>
</tr>
<tr>
<td>16.1.1</td>
<td></td>
</tr>
<tr>
<td>Cisco IOS XE Denali</td>
<td>Correction in the system conversion of IPv6 snooping commands and SISF-based</td>
</tr>
<tr>
<td>16.3.7</td>
<td>device-tracking commands.</td>
</tr>
</tbody>
</table>

**IPDT → IPv6 Snooping conversion corrections:**

- Until Cisco IOS XE Denali 16.3.6, the system incorrectly converts the `ip device tracking probe delay` command to `ipv6 neighbor tracking retry-interval`. Starting from Cisco IOS XE Denali 16.3.7, this is set to the default value and cannot be changed.

- Until Cisco IOS XE Denali 16.3.6, the system incorrectly converts the `ip device tracking probe interval` command to `ipv6 neighbor tracking retry-interval`. Starting from Cisco IOS XE Denali 16.3.7, this is correctly converted to `ipv6 snooping tracking retry-interval`.

**IPDT → SISF conversion corrections:**

- Until Cisco IOS XE Denali 16.3.6 the system incorrectly converts the `ip device tracking probe delay` command to `device-tracking binding reachable-lifetime`. In the specified releases, you can still use this command, but to only configure the reachable-lifetime of an entry. Starting from Cisco IOS XE Denali 16.3.7, this is set to the default value and cannot be changed.

- Until Cisco IOS XE Denali 16.3.6, the system incorrectly converts the `ip device tracking probe interval` command to `device-tracking tracking retry-interval`. Starting from Cisco IOS XE Denali 16.3.7, this is correctly converted to `device-tracking binding reachable-lifetime`. 
CHAPTER 104

Configuring Cisco TrustSec

- Information about Cisco TrustSec, on page 2155
- Finding Feature Information, on page 2156
- Cisco TrustSec Features, on page 2156
- Feature Information for Cisco TrustSec, on page 2158

Information about Cisco TrustSec

Cisco TrustSec provides security improvements to Cisco network devices based on the capability to strongly identify users, hosts, and network devices within a network. TrustSec provides topology-independent and scalable access controls by uniquely classifying data traffic for a particular role. TrustSec ensures data confidentiality and integrity by establishing trust among authenticated peers and encrypting links with those peers.

The key component of Cisco TrustSec is the Cisco Identity Services Engine (ISE). Cisco ISE can provision switches with TrustSec Identities and Security Group ACLs (SGACLs), though these may be configured manually on the switch.

MTU Guidelines

CTS tagged packets greater than 1518 bytes may get dropped on the Cisco vWLC controller. This is due to a restriction on the size of incoming packets on the UCS server, which is hosting vWLC instances. The UCS server have a default MTU of 1500 thereby allowing packets of 1518 bytes only. Here, the additional 18 bytes includes 4 bytes of 802.1Q and 14 bytes of Ethernet header.

An Ethernet link configured for CTS tagging imposes a 8-byte encapsulation called Cisco metadata. As a result, the total size of the Ethernet packet is increased by 8 bytes to 1526 bytes (1518+8 = 1526). Hence, the MTU of the receiving interface has to be increased by 8-bytes to accommodate the additional 8 bytes in the Ethernet.

While CTS interfaces on the routers and switches (for example, Cisco ASR 1000 Series Routers, Cisco 4000 Series Integrated Services Routers, Cisco Catalyst 3000 Series Switches, Cisco Catalyst 9000 Series Switches) auto-adjusts MTU to 1508 bytes to accommodate additional 8-byte. However, other devices like UCS servers requires manual update to increase the MTU to 1508. For information on how to configure jumbo MTU on UCS, see the following link:

Finding Feature Information

To configure Cisco Trustsec on the switch, see the Cisco TrustSec Switch Configuration Guide at the following URL:

Release notes for Cisco TrustSec General Availability releases are at the following URL:

For restrictions and limitations on Catalyst 3850 and 3650, see the notes available at the following URL:

Additional information about the Cisco TrustSec solution, including overviews, datasheets, features by platform matrix, and case studies, is available at the following URL:

Cisco TrustSec Features

The table below lists the TrustSec features to be eventually implemented on TrustSec-enabled Cisco switches. Successive general availability releases of TrustSec will expand the number of switches supported and the number of TrustSec features supported per switch.

<table>
<thead>
<tr>
<th>Cisco TrustSec Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1AE Tagging (MACsec)</td>
<td>Protocol for IEEE 802.1AE-based wire-rate hop-to-hop Layer 2 encryption.</td>
</tr>
<tr>
<td></td>
<td>Between MACsec-capable devices, packets are encrypted on egress from the transmitting device, decrypted on ingress to the receiving device, and in the clear within the devices.</td>
</tr>
<tr>
<td></td>
<td>This feature is only available between TrustSec hardware-capable devices.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This feature is not supported on Catalyst 3850 and Catalyst 3650 switches with Cisco IOS XE Denali 16.1.1</td>
</tr>
<tr>
<td>Endpoint Admission Control (EAC)</td>
<td>EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).</td>
</tr>
<tr>
<td>Cisco TrustSec Feature</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Network Device Admission Control (NDAC)</td>
<td>NDAC is an authentication process where each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC utilizes an authentication framework based on IEEE 802.1X port-based authentication and uses EAP-FAST as its EAP method. Successful authentication and authorization in NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.</td>
</tr>
<tr>
<td>Security Group Access Control List (SGACL)</td>
<td>A Security Group Access Control List (SGACL) associates a Security Group Tag with a policy. The policy is enforced upon SGT-tagged traffic egressing the TrustSec domain.</td>
</tr>
<tr>
<td>Cisco TrustSec SGACL High Availability</td>
<td>Cisco TrustSec Security Group access control lists (SGACLs) support the high availability functionality on switches that support the Cisco StackWise technology. Cisco StackWise technology provides stateful redundancy and allows the switch stack to enforce and process access control entries. There is no Cisco TrustSec-specific configuration to enable this functionality. This feature is supported only on Catalyst 3850 and 3650 Series Switches from Cisco IOS XE Release Denali 16.2.1 and higher.</td>
</tr>
<tr>
<td>Security Association Protocol (SAP)</td>
<td>After NDAC authentication, the Security Association Protocol (SAP) automatically negotiates keys and the cipher suite for subsequent MACSec link encryption between TrustSec peers. SAP is defined in IEEE 802.11i.</td>
</tr>
<tr>
<td>Security Group Tag (SGT)</td>
<td>An SGT is a 16-bit single label indicating the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet.</td>
</tr>
<tr>
<td>SGT Exchange Protocol (SXP)</td>
<td>Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a sourceIP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.</td>
</tr>
</tbody>
</table>
When both ends of a link support 802.1AE MACsec, SAP negotiation occurs. An EAPOL-key exchange occurs between the supplicant and the authenticator to negotiate a cipher suite, exchange security parameters, and manage keys. Successful completion of these tasks results in the establishment of a security association (SA).

Depending on your software version and licensing and link hardware support, SAP negotiation can use one of these modes of operation:

- Galois Counter Mode (GCM)—authentication and encryption
- GCM authentication (GMAC)—GCM authentication, no encryption
- No Encapsulation—no encapsulation (clear text)
- Null—encapsulation, no authentication or encryption

### Feature Information for Cisco TrustSec

Restrictions for CoPP

Restrictions for control plane policing (CoPP) include the following:

- Only ingress CoPP is supported. The system-cpp-policy policy-map is available on the control plane interface, and only in the ingress direction.
- Only the system-cpp-policy policy-map can be installed on the control plane interface.
- The system-cpp-policy policy-map and the system-defined classes cannot be modified or deleted.
- Only the police action is allowed under the system-cpp-policy policy-map. The police rate for system-defined classes must be configured only in packets per second (pps); for user-defined class maps this must be configured only in bits per second (bps).
- One or more CPU queues are part of each class-map. Where multiple CPU queues belong to one class-map, changing the policer rate of a class-map affects all CPU queues that belong to that class-map. Similarly, disabling the policer in a class-map disables all queues that belong to that class-map. See Table 167: System-Defined Values for CoPP, on page 2161 for information about which CPU queues belong to each class-map.

- The show run command does not display information about classes configured under system-cpp-policy, when they are left at default values. Use the show policy-map system-cpp-policy or the show policy-map control-plane commands instead.

You can continue use the show run command to display information about custom policies.

- Disabling a CPU Queue, on page 2166
- Setting the Default Policer Rates for All CPU Queues, on page 2167
Information About Control Plane Policing

This chapter describes how control plane policing (CoPP) works on your device and how to configure it.

CoPP Overview

The CoPP feature improves security on your device protecting the CPU from unnecessary traffic and DoS attacks. It can also protect control and management traffic from traffic drops caused by high volumes of other, lower priority traffic.

Your device is typically segmented into three planes of operation, each with its own objective:

• The data plane, to forward data packets.
• The control plane, to route data correctly.
• The management plane, to manage network elements.

You can use CoPP to protect most of the CPU-bound traffic and ensure routing stability, reachability, and packet delivery. Most importantly, you can use CoPP to protect the CPU from a DoS attack.

CoPP uses the modular QoS command-line interface (MQC) and CPU queues to achieve these objectives. Different types of control plane traffic are grouped together based on certain criteria, and assigned to a CPU queue. You can manage these CPU queues by configuring dedicated policers in hardware. For example, you can modify the policer rate for certain CPU queues (traffic-type), or you can disable the policer for a certain type of traffic.

Although the policers are configured in hardware, CoPP does not affect CPU performance or the performance of the data plane. But since it limits the number of packets going to CPU, the CPU load is controlled. This means that services waiting for packets from hardware may see a more controlled rate of incoming packets (the rate being user-configurable).

System-Defined Aspects of CoPP

When you power-up the device for the first time, the system automatically performs the following tasks:

• Looks for policy-map system-cpp-policy. If not found, the system creates and installs it on the control-plane.

• Creates eighteen class-maps under system-cpp-policy.

The next time you power-up the device, the system detects the policy and class maps that have already been created.

• Enables all CPU queues by default, with their respective default rate. The default rates are indicated in the table System-Defined Values for CoPP.

The following table lists the class-maps that the system creates when you load the device. It lists the policer that corresponds to each class-map and one or more CPU queues that are grouped under each class-map. There is a one-to-one mapping of class-maps to policers; and one or more CPU queues map to a class-map.

When you upgrade or downgrade the software version on your device, note the following:

- **When upgrading from one software release to another:**

  The upgrade could be from Cisco IOS XE Release 3.x.xE to a Cisco IOS XE 16.x.x release, or from one Cisco IOS XE 16.x.x release to another Cisco IOS XE 16.x.x release:

  - If the device did not have a system-cpp-policy policy map before upgrade, then on upgrade, a default policy is created.

  - If the device had a system-cpp-policy policy map before upgrade, then on upgrade, the policy is not re-generated. Enter the `cpp system-default` command in global configuration mode to get the default policy working.

- **Note:**

  We recommend that you to enter the `cpp system-default` command after any major upgrade to get the latest, default policier rates.

- **When downgrading from one software release to another:**

  The downgrade could be from a Cisco IOS XE 16.x.x release to a Cisco IOS XE Release 3.x.xE, or from one Cisco IOS XE 16.x.x release to another Cisco IOS XE 16.x.x release:

  - The system-cpp-policy policy map is retained on the device, but not installed on the control plane. You can delete the policy.

  - If you downgrade to an earlier release and then upgrade to a later release:

    For example, if you downgrade from Cisco IOS XE 16.x.x release to Cisco IOS XE Release 3.x.xE and then upgrading to a Cisco IOS XE 16.x.x release:

    - If you delete the policy after downgrading to Cisco IOS XE Release 3.x.xE and then upgrade to a Cisco IOS XE 16.x.x release, the policy is generated with defaults.
• If you do not delete the policy after downgrading to Cisco IOS XE Release 3.x.xE, then on upgrade to a Cisco IOS XE 16.x.x release, the policy is not regenerated.

Enter the `cpp system-default` command in global configuration mode to get the default policy working.

**User-Configurable Aspects of CoPP**

You can perform these tasks to manage control plane traffic:

**Note**

All `system-cpp-policy` configurations must be saved so they are retained after reboot.

**Enable or Disable a Policer for CPU Queues**

Enable a policer for a CPU queue, by configuring a policer action (in packets per second) under the corresponding class-map, within the `system-cpp-policy` policy-map.

Disable a policer for CPU queue, by removing the policer action under the corresponding class-map, within the `system-cpp-policy` policy-map.

**Note**

If a default policer is already present, carefully consider and control its removal; otherwise the system may see a CPU hog or other anomalies, such as control packet drops.

**Change the Policer Rate**

You can do this by configuring a policer rate action (in packets per second), under the corresponding class-map, within the `system-cpp-policy` policy-map.

**Set Policer Rates to Default**

Set the policer for CPU queues to their default values, by entering the `cpp system-default` command in global configuration mode.

**Create User-Defined Class Maps**

If a given traffic class does not have a designated class map, and you want to protect this traffic, you can create specific class maps (with filters) for such traffic packets and add these user-defined class maps to `system-cpp-policy`.

While `system-cpp-policy` is applied in the ingress direction, the forwarding engine driver (FED) changes policers on user-defined class maps to the egress. The filters and the policers in all user-defined classes must therefore be applied as egress classifications and actions, respectively. The policy map itself is unaffected by this change in the direction.

When you add a user-defined class map to `system-cpp-policy`, the system automatically installs it on all 32 CPU queues (in addition to the control plane), resulting in 33 instances of the policy. You can see this by entering the `show platform software fed switch { switch_number } qos policy target status` command in privileged EXEC mode.
The police rate on these class maps is controlled by the Active Queue Management (AQM) policer. AQM provides buffering control of traffic flows prior to queuing a packet into the transmit queue of a port, ensuring that certain flows do not hog the switch packet memory. If the AQM policer feature is enabled, any user-defined police rates exceeding the AQM policer limits are disregarded.

User defined class maps have normal QoS or ACL classification filters.

## How to Configure CoPP

### Enabling a CPU Queue or Changing the Policer Rate

The procedure to enable a CPU queue and change the policer rate of a CPU queue is the same. Follow these steps:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `policy-map policy-map-name`
4. `class class-name`
5. `policerate rate pps`
6. `exit`
7. `control-plane`
8. `service-policy input policy-name`
9. `end`
10. `show policy-map control-plane`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td><code>policy-map</code> <em>policy-map-name</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# <code>policy-map system-cpp-policy</code>&lt;br&gt;Device(config-pmap)#</td>
<td>Enters the policy map configuration mode.</td>
</tr>
<tr>
<td>4</td>
<td><code>class</code> <em>class-name</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config-pmap)# <code>class system-cpp-police-protocol-snooping</code>&lt;br&gt;Device(config-pmap-c)#</td>
<td>Enters the class action configuration mode. Enter the name of the class that corresponds to the CPU queue you want to enable. See table <em>System-Defined Values for CoPP</em>.</td>
</tr>
<tr>
<td>5</td>
<td><code>police rate</code> <em>rate</em> <em>pps</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config-pmap-c)# <code>police rate 100 pps</code>&lt;br&gt;Device(config-pmap-c-police)#</td>
<td>Specifies an upper limit on the number of incoming packets processed per second, for the specified traffic class.&lt;br&gt;&lt;br&gt;<strong>Note</strong> The rate you specify is applied to all CPU queues that belong to the class-map you have specified.</td>
</tr>
<tr>
<td>6</td>
<td><code>exit</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config-pmap-c-police)# <code>exit</code>&lt;br&gt;Device(config-pmap-c)# <code>exit</code>&lt;br&gt;Device(config-pmap)# <code>exit</code>&lt;br&gt;Device(config)# <code>exit</code></td>
<td>Returns to the global configuration mode.</td>
</tr>
<tr>
<td>7</td>
<td><code>control-plane</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# <code>control-plane</code>&lt;br&gt;Device(config-cp)#</td>

</tr>
</tbody>
</table>

### Purpose

- Enters the class action configuration mode. Enter the name of the class that corresponds to the CPU queue you want to disable. See the table, *System-Defined Values for CoPP*.
- Disables incoming packet processing for the specified traffic class.
  - **Note**: This disables all CPU queues that belong to the class-map you have specified.
- Returns to the privileged EXEC mode.
- Displays all the classes configured under `system-cpp policy` and the rates configured for the various traffic types and statistics.

### Setting the Default Policer Rates for All CPU Queues

Follow these steps to set the policer rates for all CPU queues to their default rates:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `cpp system-default`
4. `end`
Examples for Configuring CoPP

Example: Enabling a CPU Queue or Changing the Policer Rate of a CPU Queue

This example shows how to enable a CPU queue or to change the policer rate of a CPU queue. Here the class `system-cpp-police-protocol-snooping` CPU queue is enabled with the policer rate of 2000 pps.

```
Device> enable
Device# configure terminal
Device(config)# policy-map system-cpp-policy
```
Device(config-pmap)# class system-cpp-police-protocol-snooping
Device(config-pmap-c)# police rate 2000 pps
Device(config-pmap-c-police)# end

Device# show policy-map control-plane
Control Plane

Service-policy input: system-cpp-policy

<Class-map: system-cpp-police-dot1x-auth (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 1000 pps, burst 244 packets
    conformed 0 bytes; actions:
    transmit
    exceeded 0 bytes; actions:
    drop
</output truncated>

<Class-map: system-cpp-police-protocol-snooping (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 2000 pps, burst 488 packets
    conformed 0 bytes; actions:
    transmit
    exceeded 0 bytes; actions:
    drop
</output truncated>

<Class-map: class-default (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: any

Example: Setting the Default Policer Rates for All CPU Queues

This example shows how to set the policer rates for all CPU queues to their default and then verify the setting.

Device> enable
Device# configure terminal
Device(config)# cpp system-default
Defaulting CPP : Policer rate for all classes will be set to their defaults
Device(config)# end
### Example: Setting the Default Policer Rates for All CPU Queues

Device# `show platform hardware fed switch 1 qos queue stats internal cpu policer`

### Feature History and Information For CoPP

<table>
<thead>
<tr>
<th>Feature</th>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| Changes in system-defined values for CoPP | Cisco IOS XE Everest 16.6.1 | These new system-defined classes were introduced:  
• system-cpp-police-stackwise-virt-control  
• system-cpp-police-l2lvx-control  
These new CPU queues were added to the existing system-cpp-default class:  
• WK_CPU_Q_UNUSED (7)  
• WK_CPU_Q_EWLC_CONTROL (9)  
• WK_CPU_Q_EWLC_DATA (10)  
This new CPU queue was added to the existing system-cpp-police-sw-forward:  
WK_CPU_Q_L2_LVX_DATA_PACK (11)  
This CPU queue is no longer available:  
WK_CPU_Q_SGT_CACHE_FULL (27) |
| Changes in system-defined values for CoPP | Cisco IOS XE Fuji 16.8.1a | This new system-defined class was introduced:  
system-cpp-police-dhcp-snooping  
This new CPU queue was added to the existing system-cpp-default class:  
WK_CPU_Q_INTER_FED_TRAFFIC  
These CPU queues are no longer available:  
• WK_CPU_Q_SHOW_FORWARD  
• WK_CPU_Q_UNUSED  
The default policer rate (pps) for some CPU queues has changed:  
• The default rate for  
WK_CPU_Q_EXCEPTION (24) was changed to 100  
• The default rate for all the CPU queues under system-cpp-default was increased to 2000.  
• The default rate for all the CPU queues under system-cpp-police-forus was increased to 4000. |
Starting with this release, eighteen system-defined classes are created under `system-cpp-policy`.

These new system-defined classes were introduced:

- `system-cpp-police-high-rate-app`
- `system-cpp-police-system-critical`

This was added to class `system-cpp-police-sys-data`: CPU queue `WK_CPU_Q_OPENFLOW(13)`.

This CPU queue is no longer available: `WK_CPU_Q_LEARNING_CACHE_OVFL(13)`.

This system-defined class is no longer available: `system-cpp-police-control-low-priority`
Configuring Wireless Guest Access

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Guest Access

- All mobility peers should be configured for hierarchical mobility architecture.
- For Guest Controller Mobility Anchor configuration on WLAN is must on Mobility Agent and Guest Controller.
- Guest Access can be a 3 box solution or 2 box solution. The mobility tunnel link status should be up between:
  - Mobility Agent, Mobility Controller and Guest Controller.
  or
  - Mobility Agent/Mobility Controller and Guest Controller.
Restrictions for Guest Access

Information about Wireless Guest Access

Ideally, the implementation of a wireless guest network uses as much of an enterprise’s existing wireless and wired infrastructure as possible to avoid the cost and complexity of building a physical overlay network. Assuming this is the case, the following additional elements and functions are needed:

- A dedicated guest WLAN/SSID—Implemented throughout the campus wireless network wherever guest access is required. A guest WLAN is identified by a WLAN with mobility anchor (Guest Controller) configured.
- Guest traffic segregation—Requires implementing Layer 2 or Layer 3 techniques across the campus network to restrict where guests are allowed to go.
- Access control—Involves using imbedded access control functionality within the campus network or implementing an external platform to control guest access to the Internet from the enterprise network.
- Guest user credential management—A process by which a sponsor or lobby administrator can create temporary credentials in behalf of a guest. This function might be resident within an access control platform or it might be a component of AAA or some other management system.

Fast Secure Roaming

Fast secure roaming can be achieved by caching the Pairwise Master Key (PMK) information for Cisco Centralized Key Management (CCKM), and 802.11i clients. Cisco Centralized Key Management (CCKM) helps to improve roaming. Only the client can initiate the roaming process, which depends on factors such as:

- Overlap between APs
- Distance between APs
- Channel, signal strength, and load on the AP
- Data rates and output power

Whenever a fast-roaming client 802.11i, [CCKM]) roams to a new device, after fast-roaming the clients go through mobility "handoff" procedure. And new AAA attributes learned through mobility "handoff" procedure get re-applied.

Full L2 authentication must be avoided during roaming if the client uses the 802.11i WPA2, CCKM, to achieve the full requirements of fast secure roaming. The PMK cache (802.11i, CCKM) is used to authenticate and derive the keys for roaming clients to avoid full L2 authentication. This requires all Mobility Anchors (MA) and Mobility Controllers (MC) in the mobility group to have the same PMK cache values.

The session timeout defines when a PMK cache will expire. A PMK cache can also be deleted when a client fails to re-authenticate or when it is manually deleted from the CLI. The deletion on the original controller or switch shall be propagated to other controllers or switches in the same mobility group.
# How to Configure Guest Access

## Creating a Lobby Administrator Account

### SUMMARY STEPS

1. `configure terminal`
2. `user-name user-name`
3. `type lobby-admin`
4. `password 0 password`
5. `end`
6. `show running-config | section user-name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
Example: Device # configure terminal | Enters global configuration mode. |
| **Step 2** | user-name user-name  
Example: Device (config)# user-name lobby | Creates a user account. |
| **Step 3** | type lobby-admin  
Example: Device (config-user-name)# type lobby-admin | Specifies the account type as lobby admin. |
| **Step 4** | password 0 password  
Example: Device(config-user-name)# password 0 lobby | Creates a password for the lobby administrator account. |
| **Step 5** | end  
Example: Device (config-user-name)# end | Returns to privileged EXEC mode. |
| **Step 6** | show running-config | section user-name (or) show running-config | section configured lobby admin username  
Example: Device # show running-config | section lobby | Displays the configuration details. |
Configuring Guest User Accounts

SUMMARY STEPS

1. `configure terminal`
2. `user-name user-name`
3. `password unencrypted/hidden-password password`
4. `type network-user description description guest-user lifetime year 0-1 month 0-11 day 0-30 hour 0-23 minute 0-59 second 0-59`
5. `end`
6. `show aaa local netuser all`
7. `show running-config | section user-name`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device # configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>user-name user-name</code></td>
<td>Creates a username for the lobby ambassador account.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device (config)# user-name guest</code></td>
<td></td>

</tr>
<tr>
<td>6</td>
<td><code>show aaa local netuser all</code></td>
<td>Displays the configuration details. After the lifetime, the user-name with guest type will be deleted and the client</td>
</tr>
</tbody>
</table>
### Purpose

Command or Action: `Device # show aaa local netuser all`

**Purpose:**

associated with the guest user-name will be de-authenticated.

### Step 7

Example:

```
Device # show running-config | section user-name
```

**Purpose:**

Displays the configuration details.

---

### Example

#### Configuring Mobility Agent (MA)

**SUMMARY STEPS**

1. configure terminal
2. wireless mobility controller ip mc-ipaddress public-ip mc-publicipaddress
3. wlan wlan-name wlan-id ssid
4. client vlan id vlan-group name/vlan-id
5. no security wpa
6. mobility anchor ip address
7. aaa-override
8. no shutdown
9. end
10. show wireless mobility summary
11. show wlan name wlan-name/id

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Device # configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>wireless mobility controller ip mc-ipaddress public-ip mc-publicipaddress</td>
<td>Configures the Mobility Controller to which the MA will be associated.</td>
</tr>
<tr>
<td></td>
<td>Example: Device (config) # wireless mobility controller ip 27.0.0.1 public-ip 27.0.0.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>wlan wlan-name wlan-id ssid</td>
<td>• For wlan-name enter, enter the profile name. The range is 1-32 characters.</td>
</tr>
<tr>
<td></td>
<td>Example: Device (config) # wlan mywlan 34 mywlan-ssid</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For wlan-id, enter the WLAN ID. The range is 1-512.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• For <em>ssid</em>, enter the Service Set IDentifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</td>
</tr>
</tbody>
</table>

### Step 4

**client vlan id vlan-group name vlan-id**

**Example:**

Device (config-wlan) # client vlan VLAN0136

Configures the VLAN id or group of the WLAN.

### Step 5

**no security wpa**

**Example:**

Device (config-wlan) # no security wpa

The security configuration must be the same for the WLAN created on the GC. This example is for open authentication. For other security types such as open and webauth, appropriate command should be provided.

### Step 6

**mobility anchor ipaddress**

**Example:**

Device (config-wlan) # mobility anchor 9.3.32.2

Configures the Guest Controller as mobility anchor.

### Step 7

**aaa-override**

**Example:**

Device (config-wlan) # aaa-override

(Optional) Enables AAA override. AAA override is required for non open authentication in case AAA attributes are to be prioritized. It is required only in case guest user need to be deauthenticated after lifetime or have to give aaa-override attribute to the user.

### Step 8

**no shutdown**

**Example:**

Device (config-wlan) # no shutdown

Enables the WLAN.

### Step 9

**end**

**Example:**

Device (config) # end

Returns to privileged EXEC mode.

### Step 10

**show wireless mobility summary**

**Example:**

Device # show wireless mobility summary

Verifies the mobility controller IP address and mobility tunnel status.

### Step 11

**show wlan name wlan-name/id**

**Example:**

Device # show wlan name mywlan

Displays the configuration of mobility anchor.

### Example

**Configuring Mobility Controller**

Mobility Controller mode should be enabled using the **wireless mobility controller** command.
### SUMMARY STEPS

1. `configure terminal`
2. `wireless mobility group member ip ip-address public-ip ip-address group group-name`
3. `wireless mobility controller peer-group peer-group-name`
4. `wireless mobility controller peer-group peer-group-name member ip ipaddress public-ip ipaddress`
5. `end`
6. `show wireless mobility summary`

<td><em>Example:</em></td>
<td>Device (config)# wlan ramban</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
---|---
#### Step 3
**shutdown**
Example:  
Device (config-wlan)# shutdown
Disables WLAN.

#### Step 4
**mobility anchor ip-address1**
Example:  
Device (config-wlan) # mobility anchor 9.7.136.15
Configures a guest controller as mobility anchor.

#### Step 5
**mobility anchor ip-address2**
Example:  
Device (config-wlan) # mobility anchor 9.7.136.16
Configures a guest controller as mobility anchor.

#### Step 6
**no shutdown wlan**
Example:  
Device (config-wlan) # no shutdown wlan
Enables the WLAN.

#### Step 7
**end**
Example:  
Device (config-wlan) # end
Returns to privileged EXEC mode.

#### Step 8
**show running-config | section wlan-name**
Example:  
Device # show running-config | section ramban
Displays the configuration details.

### Configuring Preauthentication ACL

**SUMMARY STEPS**

1. configure terminal
2. wlan wlan-name
3. shutdown
4. ip access-group web preauthrule
5. no shutdown
6. end
7. show wlan name wlan-name

**DETAILED STEPS**

### Example

#### Configuration Examples for Guest Access

**Example: Creating a Lobby Ambassador Account**

This example shows how to configure a lobby ambassador account.

```
Device# configure terminal
Device(config)# user-name lobby
Device(config)# type lobby-admin
Device(config)# password 0 lobby
Device(config)# end
Device# show running-config | section lobby
user-name lobby
creation-time 1351118727
password 0 lobby
type lobby-admin
```

**Example: Obtaining Web Authentication Certificate**

This example shows how to obtain web authentication certificate.

```
Device# configure terminal
Device(config)# crypto pki import cert pkcs12 tftp://9.1.0.100/ldapserver-cert.p12 cisco
Device(config)# end
Device# show crypto pki trustpoints cert
```
Trustpoint cert:

Example: Configuring Guest User Accounts

This example shows how to configure a guest user account.

```
Device# configure terminal
Device(config)# user-name guest
Device(config-user-name)# password 0 guest
Device(config-user-name)# type network-user description guest guest-user lifetime year 1
month 10 day 3 hour 1 minute 5 second 30
Device(config-user-name)# end
Device# show aaa local netuser all
User-Name : guest
  Type : guest
  Password : guest
  Is_passwd_encrypted : No
  Description : guest
  Attribute-List : Not-Configured
  First-Login-Time : Not-Logged-In
```
Example: Configuring Mobility Controller

This example shows how to configure a mobility controller.

Device# configure terminal
Device(config)# wireless mobility group member ip 27.0.0.1 public-ip 23.0.0.1 group test
Device(config)# wireless mobility controller peer-group pg
Device(config)# wireless mobility controller peer-group pg member ip 9.7.136.10 public-ip 9.7.136.10
Device(config)# end
Device# show wireless mobility summary

Mobility Controller Summary:

Mobility Role : Mobility Controller
Mobility Protocol Port : 16666
Mobility Group Name : default
Mobility Oracle : Enabled

Example: Choosing the Default Web Authentication Login Page

This example shows how to choose a default web authentication login page.

Device# configure terminal
Device(config)# parameter-map type webauth test
This operation will permanently convert all relevant authentication commands to their CPL control-policy equivalents. As this conversion is irreversible and will disable the conversion CLI 'authentication display [legacy|new-style]', you are strongly advised to back up your current configuration before proceeding.

Do you wish to continue? [yes]: yes

Device(config)# wlan wlan50
Device(config-wlan)# shutdown
Device(config-wlan)# security web-auth authentication-list test
Device(config-wlan)# security web-auth parameter-map test
Device(config-wlan)# no shutdown
Device(config-wlan)# end

Device# show running-config | section wlan50
wlan wlan50 50 wlan50
security wpa akm cckm
security wpa wpa1
security wpa wpa1 ciphers aes
security wpa wpa1 ciphers tkip
security web-auth authentication-list test
security web-auth parameter-map test
session-timeout 1800
no shutdown

Device# show running-config | section parameter-map type webauth test
parameter-map type webauth test
type webauth

**Example: Choosing a Customized Web Authentication Login Page from an IPv4 External Web Server**

This example shows how to choose a customized web authentication login page from an IPv4 external web server.

Device# configure terminal
Device(config)# parameter-map type webauth global
Device(config-params-parameter-map)# virtual-ip ipv4 1.1.1.1
Device(config-params-parameter-map)# parameter-map type webauth test
type webauth
Device(config-params-parameter-map)# redirect for-login http://9.1.0.100/login.html
Device(config-params-parameter-map)# redirect portal ipv4 9.1.0.100
Device(config-params-parameter-map)# end
Device# show running-config | section parameter-map
parameter-map type webauth global
virtual-ip ipv4 1.1.1.1
parameter-map type webauth test
type webauth
redirect for-login http://9.1.0.100/login.html
redirect portal ipv4 9.1.0.100
security web-auth parameter-map rasagna-auth-map
security web-auth parameter-map test

**Example: Assigning Login, Login Failure, and Logout Pages per WLAN**

This example shows how to assign login, login failure and logout pages per WLAN.

Device# configure terminal
Device(config)# parameter-map type webauth test
Example: Configuring AAA-Override

This example shows how to configure aaa-override.

Device# configure terminal
Device(config)# wlan fff
Device(config-wlan)# aaa-override
Device(config-wlan)# end
Device# show running-config | section fff
wlan fff 44 fff
  aaa-override
  shutdown

Example: Configuring Client Load Balancing

This example shows how to configure client load balancing.

Device# configure terminal
Device(config)# wlan fff
Device(config-wlan)# shutdown
Device(config-wlan)# mobility anchor 9.7.136.15
Device(config-wlan)# mobility anchor 9.7.136.16
Device(config-wlan)# no shutdown wlan
Device(config-wlan)# end
Device# show running-config | section wlan
wlan fff 44 fff
  aaa-override
  shutdown

Example: Configuring Preauthentication ACL

This example shows how to configure preauthentication ACL.

Device# configure terminal
Device(config)# wlan fff
Device(config-wlan)# shutdown
Device(config-wlan)# ip access-group web preauthrule
Device(config-wlan)# no shutdown
Device(config-wlan)# end
Device# show wlan name fff

Example: Configuring AAA-Override

This example shows how to configure aaa-override.

Device(config-params-parameter-map)# custom-page login device flash:loginsantosh.html
Device(config-params-parameter-map)# custom-page login expired device flash:loginexpire.html
Device(config-params-parameter-map)# custom-page failure device flash:loginfail.html
Device(config-params-parameter-map)# custom-page success device flash:loginsucess.html
Device(config-params-parameter-map)# end
Device# show running-config | section parameter-map type webauth test
  parameter-map type webauth test
  redirect for-login http://9.1.0.100/login.html
  redirect portal ipv4 9.1.0.100
  custom-page login device flash:loginsantosh.html
  custom-page success device flash:loginsucess.html
  custom-page failure device flash:loginfail.html
  custom-page login expired device flash:loginexpire.html

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)
Example: Configuring IOS ACL Definition

This example shows how to configure IOS ACL definition.

```
Device# configure terminal
Device(config)# ip access-list extended 102
Device(config-ext-nacl)# permit udp any eq 8080 any
Device(config-ext-nacl)# end
Device# show access-lists 102
  Extended IP access list 102
    10 permit udp any eq 8080 any
```

Example: Configuring Webpassthrough

This example shows how to configure webpassthrough.

```
Device# configure terminal
Device(config)# parameter-map type webauth webparalocal
Device(config-params-parameter-map)# type consent
Device(config-params-parameter-map)# end
Device# show running-config | section parameter-map type webauth test
  parameter-map type webauth test
  type webauth
  redirect for-login http://9.1.0.100/login.html
  redirect portal ipv4 9.1.0.100
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Rogue Devices

Rogue access points can disrupt wireless LAN operations by hijacking legitimate clients and using plain-text or other denial-of-service or man-in-the-middle attacks. That is, a hacker can use a rogue access point to capture sensitive information, such as usernames and passwords. The hacker can then transmit a series of Clear to Send (CTS) frames. This action mimics an access point, informing a particular client to transmit, and instructing all the other clients to wait, which results in legitimate clients being unable to access network
resources. Wireless LAN service providers have a strong interest in banning rogue access points from the air space.

Because rogue access points are inexpensive and readily available, employees sometimes plug unauthorized rogue access points into existing LANs and build ad hoc wireless networks without their IT department's knowledge or consent. These rogue access points can be a serious breach of network security because they can be plugged into a network port behind the corporate firewall. Because employees generally do not enable any security settings on the rogue access point, it is easy for unauthorized users to use the access point to intercept network traffic and hijack client sessions. There is an increased chance of enterprise security breach when wireless users connect to access points in the enterprise network.

The following are some guidelines to manage rogue devices:

- The containment frames are sent immediately after the authorization and associations are detected. The enhanced containment algorithm provides more effective containment of ad hoc clients.

- The local mode access points are designed to serve associated clients. These access points spend relatively less time performing off-channel scanning: about 50 milliseconds on each channel. If you want to perform high rogue detection, a monitor mode access point must be used. Alternatively, you can reduce the scan intervals from 180 seconds to a lesser value, for example, 120 or 60 seconds, ensuring that the radio goes off-channel more frequently, which improves the chances of rogue detection. However, the access point continues to spend about 50 milliseconds on each channel.

- Rogue detection is disabled by default for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect many rogue devices.

- Client card implementations might mitigate the effectiveness of ad hoc containment.

- It is possible to classify and report rogue access points by using rogue states and user-defined classification rules that enable rogues to automatically move between states.

- Each controller limits the number of rogue containments to three per radio (or six per radio for access points in the monitor mode).

- Rogue Location Discovery Protocol (RLDP) detects rogue access points that are configured for open authentication.

- RLDP detects rogue access points that use a broadcast Basic Service Set Identifier (BSSID), that is, the access point broadcasts its Service Set Identifier in beacons.

- RLDP detects only those rogue access points that are on the same network. If an access list in the network prevents the sending of RLDP traffic from the rogue access point to the controller, RLDP does not work.

- RLDP does not work on 5-GHz Dynamic Frequency Selection (DFS) channels. However, RLDP works when the managed access point is in the monitor mode on a DFS channel.

- If RLDP is enabled on mesh APs, and the APs perform RLDP tasks, the mesh APs are dissociated from the controller. The workaround is to disable RLDP on mesh APs.

- If RLDP is enabled on non-monitor APs, client connectivity outages occur when RLDP is in process.

- If the rogue is manually contained, the rogue entry is retained even after the rogue expires.

- If the rogue is contained by any other means, such as auto, rule, and AwIPS preventions, the rogue entry is deleted when it expires.

- The controller requests to the AAA server for rogue client validation only once. As a result, if rogue client validation fails on the first attempt then the rogue client will not be detected as a threat any more.
To avoid this, add the valid client entries in the authentication server before enabling **Validate Rogue Clients Against AAA**.

- In the 7.4 and earlier releases, if a rogue that was already classified by a rule was not reclassified. In the 7.5 release, this behavior is enhanced to allow reclassification of rogues based on the priority of the rogue rule. The priority is determined by using the rogue report that is received by the controller.

- The rogue detector AP fails to co-relate and contain the wired rogue AP on a 5Mhz channel because the MAC address of the rogue AP for WLAN, LAN, 11a radio and 11bg radio are configured with a difference of +/-1 of the rogue BSSID. In the 8.0 release, this behavior is enhanced by increasing the range of MAC address, that the rogue detector AP co-relates the wired ARP MAC and rogue BSSID, by +/-3.

- The rogue access points with open authentication can be detected on wire. The NAT wired or rogue wired detection is not supported in by WLC (both RLDP and rogue detector AP). The non-adjacent MAC address is supported by rogue detector mode of AP and not by RLDP.

- In a High Availability scenario, if the rogue detection security level is set to either High or Critical, the rogue timer on the standby controller starts only after the rogue detection pending stabilization time, which is 300 seconds. Therefore, the active configurations on the standby controller are reflected only after 300 seconds.

- After an AP is moved from rogue detection mode to any other mode or after an AP is moved from sniffer mode to local or monitor mode, the rogue detection functionality is not retained on the AP. To enable rogue detection functionality on the AP, you have to explicitly move the AP to the rogue detection mode.

- Some rogue devices exhibit RSSI value of –128 dBm although the minimum RSSI has seen configured to a higher value. In some scenarios, APs show the RSSI value of 0 for some rogue devices. If the controller receives the RSSI value as 0, the controller invalidates the value and replaces it with –128 dBm so that rogue rules or policies are not applied to the rogue device.

---

**Note**

A rogue AP or client or adhoc containment configuration is not saved after the reload. You have to configure all the rogues again after the reload.

---

**Note**

No separate command exists for controlling rogue client traps. However, you can enable or disable rogue client traps using the `config trapflags rogueap {enable | disable}` command, which is also used for rouge APs. In GUI configuration also, you should use the rogue AP flag under `Management > SNMP > TrapControl > Security > Rogue AP` to control rogue clients.

**Restrictions on Rogue Detection**

- Rogue containment on DFS channels is not supported.

**Rogue Location Discovery Protocol**

Rogue Location Discovery Protocol (RLDP) is an active approach, which is used when rogue AP has no authentication (Open Authentication) configured. This mode, which is disabled by default, instructs an active AP to move to the rogue channel and connect to the rogue as a client. During this time, the active AP sends de-authentication messages to all connected clients and then shuts down the radio interface. Then, it associates
to the rogue AP as a client. The AP then tries to obtain an IP address from the rogue AP and forwards a User Datagram Protocol (UDP) packet (port 6352) that contains the local AP and rogue connection information to the controller through the rogue AP. If the controller receives this packet, the alarm is set to notify the network administrator that a rogue AP was discovered on the wired network with the RLDP feature.

RLDP has 100% accuracy in rogue AP detection. It detects Open APs and NAT APs.

**Note**

Use the `debug dot11 rldp enable` command in order to check if the Lightweight AP associates and receives a DHCP address from the rogue AP. This command also displays the UDP packet sent by the Lightweight AP to the controller.

A sample of a UDP (destination port 6352) packet sent by the Lightweight AP is shown here: 0020 0a 01 01 0d 0a 01 .......(*...... 0030 01 1e 00 07 85 92 78 01 00 00 00 00 00 00 00 00 .......x........ 0040 00 00 00 00 00 00 00 00

The first 5 bytes of the data contain the DHCP address given to the local mode AP by the rogue AP. The next 5 bytes are the IP address of the controller, followed by 6 bytes that represent the rogue AP MAC address. Then, there are 18 bytes of zeroes.

The following steps describe the functioning of RLDP:

1. Identify the closest Unified AP to the rogue using signal strength values.
2. The AP then connects to the rogue as a WLAN client, attempting three associations before timing out.
3. If association is successful, the AP then uses DHCP to obtain an IP address.
4. If an IP address was obtained, the AP (acting as a WLAN client) sends a UDP packet to each of the controller's IP addresses.
5. If the controller receives even one of the RLDP packets from the client, that rogue is marked as on-wire.

**Note**

The RLDP packets are unable to reach the controller if filtering rules are placed between the controller's network and the network where the rogue device is located.

Caveats of RLDP:

- RLDP only works with open rogue APs broadcasting their SSID with authentication and encryption disabled.
- RLDP requires that the Managed AP acting as a client is able to obtain an IP address via DHCP on the rogue network.
- Manual RLDP can be used to attempt an RLDP trace on a rogue multiple number of times.
- During RLDP process, the AP is unable to serve clients. This negatively impacts performance and connectivity for local mode APs. To avoid this case, RLDP can be selectively enabled for Monitor Mode AP only.
- RLDP does not attempt to connect to a rogue AP operating in a 5GHz DFS channel.
RLDP is not supported for use with Cisco autonomous rogue access points. These access points drop the DHCP Discover request sent by the RLDP client. Also, RLDP is not supported if the rogue access point channel requires dynamic frequency selection (DFS). If the automatic RLDP attempt does not detect the rogue (due to a noisy RF environment, for example), the controller does not retry. However, you can initiate RLDP manually on a rogue device.

Detecting Rogue Devices

The controller continuously monitors all the nearby access points and automatically discovers and collects information on rogue access points and clients. When the controller discovers a rogue access point, it uses the Rogue Location Discovery Protocol (RLDP) and the rogue detector mode access point is connected to determine if the rogue is attached to your network.

Controller initiates RLDP on rogue devices that have open authenticated and configured. If RLDP uses FlexConnect or local mode access points, then clients are disconnected for that moment. After the RLDP cycle, the clients are reconnected to the access points. As and when rogue access points are seen (auto-configuration), the RLDP process is initiated.

You can configure the controller to use RLDP on all the access points or only on the access points configured for the monitor (listen-only) mode. The latter option facilitates automated rogue access point detection in a crowded radio frequency (RF) space, allowing monitoring without creating unnecessary interference and without affecting the regular data access point functionality. If you configure the controller to use RLDP on all the access points, the controller always chooses the monitor access point for RLDP operation if a monitor access point and a local (data) access point are both nearby. If RLDP determines that the rogue is on your network, you can choose to contain the detected rogue either manually or automatically.

RLDP detects on wire presence of the rogue access points that are configured with open authentication only once, which is the default retry configuration. Retries can be configured using the `config rogue ap rldp retries` command.

You can initiate or trigger RLDP from controller in three ways:

1. Enter the RLDP initiation command manually from the controller CLI. The equivalent GUI option for initiating RLDP is not supported.

```
config rogue ap rldp initiate mac-address
```

2. Schedule RLDP from the controller CLI. The equivalent GUI option for scheduling RLDP is not supported.

```
config rogue ap rldp schedule
```

3. Auto RLDP. You can configure auto RLDP on controller either from controller CLI or GUI but keep in mind the following guidelines:

   • The auto RLDP option can be configured only when the rogue detection security level is set to custom.
   • Either auto RLDP or schedule of RLDP can be enabled at a time.

A rogue access point is moved to a contained state either automatically or manually. The controller selects the best available access point for containment and pushes the information to the access point. The access point stores the list of containments per radio. For auto containment, you can configure the controller to use only the monitor mode access point. The containment operation occurs in the following two ways:
• The container access point goes through the list of containments periodically and sends unicast containment frames. For rogue access point containment, the frames are sent only if a rogue client is associated.

• Whenever a contained rogue activity is detected, containment frames are transmitted.

Individual rogue containment involves sending a sequence of unicast disassociation and deauthentication frames.

**Cisco Prime Infrastructure Interaction and Rogue Detection**

Cisco Prime Infrastructure supports rule-based classification and uses the classification rules configured on the controller. The controller sends traps to Cisco Prime Infrastructure after the following events:

• If an unknown access point moves to the Friendly state for the first time, the controller sends a trap to Cisco Prime Infrastructure only if the rogue state is Alert. It does not send a trap if the rogue state is Internal or External.

• If a rogue entry is removed after the timeout expires, the controller sends a trap to Cisco Prime Infrastructure for rogue access points that are categorized as Malicious (Alert, Threat) or Unclassified (Alert). The controller does not remove rogue entries with the following rogue states: Contained, Contained Pending, Internal, and External.

---

**How to Configure Rogue Detection**

**Configuring Rogue Detection (CLI)**

**SUMMARY STEPS**

1. `configure terminal`
2. `wireless wps rogue detection min-rssi rssi in dBm`
3. `wireless wps rogue detection min-transient-time time in seconds`
4. `wireless wps rogue client {aaa | mse}`
5. `wireless wps rogue ap valid-client auto-contain`
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| configure terminal  
Device# configure terminal | Enters global configuration mode. |

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| wireless wps rogue detection min-rssi rssi in dBm  
Device(config)# wireless wps rogue detection min-rssi 100 | Specify the minimum RSSI value that rogues should have for APs to detect and for rogue entry to be created in the device. 
Valid range for the rssi in dBm parameter is –128 dBm to -70 dBm, and the default value is -128 dBm. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> wireless wps rogue detection min-transient-time <em>time</em> in seconds</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# wireless wps rogue detection min-transient-time</td>
<td></td>
</tr>
<tr>
<td>Specify the time interval at which rogues have to be consistently scanned for by APs after the first time the rogues are scanned. Valid range for the time in sec parameter is 120 seconds to 1800 seconds, and the default value is 0.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> This feature is applicable to APs that are in monitor mode only. Using the transient interval values, you can control the time interval at which APs should scan for rogues. APs can also filter the rogues based on their transient interval values. This feature has the following advantages:</td>
<td></td>
</tr>
<tr>
<td>• Rogue reports from APs to the controller are shorter</td>
<td></td>
</tr>
<tr>
<td>• Transient rogue entries are avoided in the controller</td>
<td></td>
</tr>
<tr>
<td>• Unnecessary memory allocation for transient rogues are avoided</td>
<td></td>
</tr>
</tbody>
</table>

| Step 4 | wireless wps rogue client {aaa | mse}  |
| **Example:** Device(config)# wireless wps rogue client aaa  |
| Device(config)# wireless wps rogue client mse  |
| Set the AAA server or local database, or the MSE to validate if rogue clients are valid clients.  |

| Step 5 | wireless wps rogue ap valid-client auto-contain  |
| **Example:** Device(config)# wireless wps rogue ap valid-client auto-contain  |
| Specify to automatically contain a rogue access point to which trusted clients are associated.  |

| Step 6 | end  |
| **Example:** Device(config)# end  |
| Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.  |

**Note** This feature is applicable to all the AP modes. There can be many rogues with very weak RSSI values that do not provide any valuable information in rogue analysis. Therefore, you can use this option to filter rogues by specifying the minimum RSSI value at which APs should detect rogues.
Verifying Rogue Detection

This section describes the new command for rogue detection.

The following command can be used to verify rogue detection on the:

Table 168: Verifying Rogue Detection Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show wireless wps rogue ap summary</td>
<td>Displays a list of all rogue access points detected by the</td>
</tr>
<tr>
<td>show wireless wps rogue client detailed</td>
<td>Displays detailed information for a specific rogue client.</td>
</tr>
<tr>
<td>client-mac</td>
<td></td>
</tr>
<tr>
<td>show wireless wps rogue client summary</td>
<td>Displays a list of all rogue clients detected by the</td>
</tr>
<tr>
<td>show nmsp capability</td>
<td>Displays the NMSP capabilities.</td>
</tr>
</tbody>
</table>

Table 169: Verifying Rogue Auto-Containment Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show wireless wps rogue auto-contain</td>
<td>Displays the rogue auto-containment information.</td>
</tr>
</tbody>
</table>

Examples: Rogue Detection Configuration

This example shows how to configure the minimum RSSI that a detected rogue AP needs to be at, to have an entry created at the:

```
Device# configure terminal
Device(config)# wireless wps rogue detection min-rssi -100
Device(config)# end
Device# show wireless wps rogue client detailed/show wireless wps rogue ap summary
```

This example shows how to configure the classification interval:

```
Device# configure terminal
Device(config)# wireless wps rogue detection min-transient-time 500
Device(config)# end
Device# show wireless wps rogue client detailed/show wireless wps rogue ap summary
```

This example shows how to configure the MSE to validate if rogue clients are valid clients:

```
Device# configure terminal
Device(config)# wireless wps rogue client mse
Device(config)# end
Device# show wireless wps rogue client summary
```
This example shows how to automatically contain a rogue access point to which trusted clients are associated:

```
Device# configure terminal
Device(config)# wireless wps rogue ap valid-client auto-contain
Device(config)# end
Device# show wireless wps rogue ap summary
Device# show nmsp capability
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Rogue Devices

Rogue access points can disrupt wireless LAN operations by hijacking legitimate clients and using plain-text or other denial-of-service or man-in-the-middle attacks. That is, a hacker can use a rogue access point to capture sensitive information, such as usernames and passwords. The hacker can then transmit a series of Clear to Send (CTS) frames. This action mimics an access point, informing a particular client to transmit, and instructing all the other clients to wait, which results in legitimate clients being unable to access network resources. Wireless LAN service providers have a strong interest in banning rogue access points from the air space.

Because rogue access points are inexpensive and readily available, employees sometimes plug unauthorized rogue access points into existing LANs and build ad hoc wireless networks without their IT department's knowledge or consent. These rogue access points can be a serious breach of network security because they can be plugged into a network port behind the corporate firewall. Because employees generally do not enable any security settings on the rogue access point, it is easy for unauthorized users to use the access point to intercept network traffic and hijack client sessions. There is an increased chance of enterprise security breach when wireless users connect to access points in the enterprise network.

The following are some guidelines to manage rogue devices:

* The containment frames are sent immediately after the authorization and associations are detected. The enhanced containment algorithm provides more effective containment of ad hoc clients.

* The local mode access points are designed to serve associated clients. These access points spend relatively less time performing off-channel scanning: about 50 milliseconds on each channel. If you want to perform high rogue detection, a monitor mode access point must be used. Alternatively, you can reduce the scan intervals from 180 seconds to a lesser value, for example, 120 or 60 seconds, ensuring that the radio goes...
off-channel more frequently, which improves the chances of rogue detection. However, the access point continues to spend about 50 milliseconds on each channel.

- Rogue detection is disabled by default for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect many rogue devices.

- Client card implementations might mitigate the effectiveness of ad hoc containment.

- It is possible to classify and report rogue access points by using rogue states and user-defined classification rules that enable rogues to automatically move between states.

- Each controller limits the number of rogue containment to three per radio (or six per radio for access points in the monitor mode).

- Rogue Location Discovery Protocol (RLDP) detects rogue access points that are configured for open authentication.

- RLDP detects rogue access points that use a broadcast Basic Service Set Identifier (BSSID), that is, the access point broadcasts its Service Set Identifier in beacons.

- RLDP detects only those rogue access points that are on the same network. If an access list in the network prevents the sending of RLDP traffic from the rogue access point to the controller, RLDP does not work.

- RLDP does not work on 5-GHz Dynamic Frequency Selection (DFS) channels. However, RLDP works when the managed access point is in the monitor mode on a DFS channel.

- If RLDP is enabled on mesh APs, and the APs perform RLDP tasks, the mesh APs are dissociated from the controller. The workaround is to disable RLDP on mesh APs.

- If RLDP is enabled on non-monitor APs, client connectivity outages occur when RLDP is in process.

- If the rogue is manually contained, the rogue entry is retained even after the rogue expires.

- If the rogue is contained by any other means, such as auto, rule, and AwIPS prevention, the rogue entry is deleted when it expires.

- The controller requests to the AAA server for rogue client validation only once. As a result, if rogue client validation fails on the first attempt then the rogue client will not be detected as a threat any more. To avoid this, add the valid client entries in the authentication server before enabling Validate Rogue Clients Against AAA.

- In the 7.4 and earlier releases, if a rogue that was already classified by a rule was not reclassified. In the 7.5 release, this behavior is enhanced to allow reclassification of rogues based on the priority of the rogue rule. The priority is determined by using the rogue report that is received by the controller.

- The rogue detector AP fails to co-relate and contain the wired rogue AP on a 5Mhz channel because the MAC address of the rogue AP for WLAN, LAN, 11a radio and 11bg radio are configured with a difference of +/-1 of the rogue BSSID. In the 8.0 release, this behavior is enhanced by increasing the range of MAC address, that the rogue detector AP co-relates the wired ARP MAC and rogue BSSID, by +/-3.

- The rogue access points with open authentication can be detected on wire. The NAT wired or rogue wired detection is not supported in by WLC (both RLDP and rogue detector AP). The non-adjacent MAC address is supported by rogue detector mode of AP and not by RLDP.

- In a High Availability scenario, if the rogue detection security level is set to either High or Critical, the rogue timer on the standby controller starts only after the rogue detection pending stabilization time, which is 300 seconds. Therefore, the active configurations on the standby controller are reflected only after 300 seconds.
• After an AP is moved from rogue detection mode to any other mode or after an AP is moved from sniffer mode to local or monitor mode, the rogue detection functionality is not retained on the AP. To enable rogue detection functionality on the AP, you have to explicitly move the AP to the rogue detection mode.

• Some rogue devices exhibit RSSI value of –128 dBm although the minimum RSSI has seen configured to a higher value. In some scenarios, APs show the RSSI value of 0 for some rogue devices. If the controller receives the RSSI value as 0, the controller invalidates the value and replaces it with –128 dBm so that rogue rules or policies are not applied to the rogue device.

---

**Note**

A rogue AP or client or adhoc containment configuration is not saved after the reload. You have to configure all the rogues again after the reload.

---

**Note**

No separate command exists for controlling rogue client traps. However, you can enable or disable rogue client traps using the `config trapflags rogueap {enable | disable}` command, which is also used for rouge APs. In GUI configuration also, you should use the rogue AP flag under **Management > SNMP > TrapControl > Security > Rogue AP** to control rogue clients.

---

**Restrictions on Rogue Detection**

• Rogue containment on DFS channels is not supported.

---

**Rogue Location Discovery Protocol**

Rogue Location Discovery Protocol (RLDP) is an active approach, which is used when rogue AP has no authentication (Open Authentication) configured. This mode, which is disabled by default, instructs an active AP to move to the rogue channel and connect to the rogue as a client. During this time, the active AP sends de-authentication messages to all connected clients and then shuts down the radio interface. Then, it associates to the rogue AP as a client. The AP then tries to obtain an IP address from the rogue AP and forwards a User Datagram Protocol (UDP) packet (port 6352) that contains the local AP and rogue connection information to the controller through the rogue AP. If the controller receives this packet, the alarm is set to notify the network administrator that a rogue AP was discovered on the wired network with the RLDP feature.

RLDP has 100% accuracy in rogue AP detection. It detects Open APs and NAT APs.

---

**Note**

Use the `debug dot11 rldp enable` command in order to check if the Lightweight AP associates and receives a DHCP address from the rogue AP. This command also displays the UDP packet sent by the Lightweight AP to the controller.

A sample of a UDP (destination port 6352) packet sent by the Lightweight AP is shown here:

```
0020 0a 01 01 0d 0a 01 ......0 00 00 07 85 92 78 01 00 00 00 00 00 00 00 00 00 00 00 00 00 00
```

The first 5 bytes of the data contain the DHCP address given to the local mode AP by the rogue AP. The next 5 bytes are the IP address of the controller, followed by 6 bytes that represent the rogue AP MAC address. Then, there are 18 bytes of zeroes.
The following steps describe the functioning of RLDP:

1. Identify the closest Unified AP to the rogue using signal strength values.
2. The AP then connects to the rogue as a WLAN client, attempting three associations before timing out.
3. If association is successful, the AP then uses DHCP to obtain an IP address.
4. If an IP address was obtained, the AP (acting as a WLAN client) sends a UDP packet to each of the controller's IP addresses.
5. If the controller receives even one of the RLDP packets from the client, that rogue is marked as on-wire.

---

**Note**
The RLDP packets are unable to reach the controller if filtering rules are placed between the controller's network and the network where the rogue device is located.

**Caveats of RLDP:**

- RLDP only works with open rogue APs broadcasting their SSID with authentication and encryption disabled.
- RLDP requires that the Managed AP acting as a client is able to obtain an IP address via DHCP on the rogue network.
- Manual RLDP can be used to attempt an RLDP trace on a rogue multiple number of times.
- During RLDP process, the AP is unable to serve clients. This negatively impacts performance and connectivity for local mode APs. To avoid this case, RLDP can be selectively enabled for Monitor Mode AP only.
- RLDP does not attempt to connect to a rogue AP operating in a 5GHz DFS channel.

---

**Note**
RLDP is not supported for use with Cisco autonomous rogue access points. These access points drop the DHCP Discover request sent by the RLDP client. Also, RLDP is not supported if the rogue access point channel requires dynamic frequency selection (DFS). If the automatic RLDP attempt does not detect the rogue (due to a noisy RF environment, for example), the controller does not retry. However, you can initiate RLDP manually on a rogue device.

---

**Detecting Rogue Devices**

The controller continuously monitors all the nearby access points and automatically discovers and collects information on rogue access points and clients. When the controller discovers a rogue access point, it uses the Rogue Location Discovery Protocol (RLDP) and the rogue detector mode access point is connected to determine if the rogue is attached to your network.

Controller initiates RLDP on rogue devices that have open authenticated and configured. If RLDP uses FlexConnect or local mode access points, then clients are disconnected for that moment. After the RLDP cycle, the clients are reconnected to the access points. As and when rogue access points are seen (auto-configuration), the RLDP process is initiated.
You can configure the controller to use RLDP on all the access points or only on the access points configured for the monitor (listen-only) mode. The latter option facilitates automated rogue access point detection in a crowded radio frequency (RF) space, allowing monitoring without creating unnecessary interference and without affecting the regular data access point functionality. If you configure the controller to use RLDP on all the access points, the controller always chooses the monitor access point for RLDP operation if a monitor access point and a local (data) access point are both nearby. If RLDP determines that the rogue is on your network, you can choose to contain the detected rogue either manually or automatically.

RLDP detects on wire presence of the rogue access points that are configured with open authentication only once, which is the default retry configuration. Retries can be configured using the `config rogue ap rldp retries` command.

You can initiate or trigger RLDP from controller in three ways:

1. Enter the RLDP initiation command manually from the controller CLI. The equivalent GUI option for initiating RLDP is not supported.
   ```
   config rogue ap rldp initiate mac-address
   ```

2. Schedule RLDP from the controller CLI. The equivalent GUI option for scheduling RLDP is not supported.
   ```
   config rogue ap rldp schedule
   ```

3. Auto RLDP. You can configure auto RLDP on controller either from controller CLI or GUI but keep in mind the following guidelines:
   - The auto RLDP option can be configured only when the rogue detection security level is set to custom.
   - Either auto RLDP or schedule of RLDP can be enabled at a time.

A rogue access point is moved to a contained state either automatically or manually. The controller selects the best available access point for containment and pushes the information to the access point. The access point stores the list of containments per radio. For auto containment, you can configure the controller to use only the monitor mode access point. The containment operation occurs in the following two ways:

- The container access point goes through the list of containments periodically and sends unicast containment frames. For rogue access point containment, the frames are sent only if a rogue client is associated.
- Whenever a contained rogue activity is detected, containment frames are transmitted.

Individual rogue containment involves sending a sequence of unicast disassociation and deauthentication frames.

**Cisco Prime Infrastructure Interaction and Rogue Detection**

Cisco Prime Infrastructure supports rule-based classification and uses the classification rules configured on the controller. The controller sends traps to Cisco Prime Infrastructure after the following events:

- If an unknown access point moves to the Friendly state for the first time, the controller sends a trap to Cisco Prime Infrastructure only if the rogue state is Alert. It does not send a trap if the rogue state is Internal or External.

- If a rogue entry is removed after the timeout expires, the controller sends a trap to Cisco Prime Infrastructure for rogue access points that are categorized as Malicious (Alert, Threat) or Unclassified (Alert). The controller does not remove rogue entries with the following rogue states: Contained, Contained Pending, Internal, and External.
How to Configure Rogue Detection

Configuring Rogue Detection (CLI)

SUMMARY STEPS

1. configure terminal
2. wireless wps rogue detection min-rssi \textit{rssi in dBm}
3. wireless wps rogue detection min-transient-time \textit{time in seconds}
4. wireless wps rogue client \{aaa | mse\}
5. wireless wps rogue ap valid-client auto-contain
6. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>\textbf{Example:} Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specify the minimum RSSI value that rogues should have for APs to detect and for rogue entry to be created in the device.</td>
</tr>
<tr>
<td>wireless wps rogue detection min-rssi \textit{rssi in dBm}</td>
<td></td>
</tr>
<tr>
<td>\textbf{Example:} Device(config)# wireless wps rogue detection min-rssi 100</td>
<td>Valid range for the rssi in dBm parameter is –128 dBm to -70 dBm, and the default value is -128 dBm.</td>
</tr>
<tr>
<td>\textbf{Note}</td>
<td>This feature is applicable to all the AP modes. There can be many rogues with very weak RSSI values that do not provide any valuable information in rogue analysis. Therefore, you can use this option to filter rogues by specifying the minimum RSSI value at which APs should detect rogues.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specify the time interval at which rogues have to be consistently scanned for by APs after the first time the rogues are scanned.</td>
</tr>
<tr>
<td>wireless wps rogue detection min-transient-time \textit{time in seconds}</td>
<td></td>
</tr>
<tr>
<td>\textbf{Example:} Device(config)# wireless wps rogue detection min-transient-time</td>
<td>Valid range for the time in sec parameter is 120 seconds to 1800 seconds, and the default value is 0.</td>
</tr>
</tbody>
</table>
Verifying Rogue Detection

This section describes the new command for rogue detection.

The following command can be used to verify rogue detection on the .

<table>
<thead>
<tr>
<th>Table 170: Verifying Rogue Detection Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
</tr>
<tr>
<td>show wireless wps rogue ap summary</td>
</tr>
<tr>
<td>show wireless wps rogue client detailed client-mac</td>
</tr>
</tbody>
</table>
**Examples: Rogue Detection Configuration**

This example shows how to configure the minimum RSSI that a detected rogue AP needs to be at, to have an entry created at the:

```
Device# configure terminal
Device(config)# wireless wps rogue detection min-rssi -100
```

This example shows how to configure the classification interval:

```
Device# configure terminal
Device(config)# wireless wps rogue detection min-transient-time 500
```

This example shows how to configure the MSE to validate if rogue clients are valid clients:

```
Device# configure terminal
Device(config)# wireless wps rogue client mse
Device(config)# end
Device# show wireless wps rogue client summary
```

This example shows how to automatically contain a rogue access point to which trusted clients are associated:

```
Device# configure terminal
Device(config)# wireless wps rogue ap valid-client auto-contain
Device(config)# end
Device# show wireless wps rogue ap summary
Device# show nmsp capability
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Classifying Rogue Access Points

The controller software enables you to create rules that can organize and display rogue access points as Friendly, Malicious, or Unclassified.

By default, none of the classification rules are used. You need to enable them. Therefore, all unknown access points are categorized as Unclassified. When you create or change a rule, configure conditions, and enable it, all rogue access points are then reclassified. Whenever you change a rule, it is applied to all the access points (friendly, malicious, and unclassified) in the Alert state only.

If you move any rogue or ad hoc rogue manually to unclassified and Alert state, it means that the rogue is moved to the default state. Rogue rules apply to all the rogues that are manually moved to unclassified and Alert state.
• Rule-based rogue classification does not apply to ad hoc rogues and rogue clients.

• You can configure up to 64 rogue classification rules per controller.

When the controller receives a rogue report from one of its managed access points, it responds as follows:

• If the unknown access point is in the friendly MAC address list, the controller classifies the access point as Friendly.

• If the unknown access point is not in the friendly MAC address list, the controller starts applying the rogue classification rules to the access point.

• If the rogue is already classified as Malicious, Alert or Friendly, Internal or External, the controller does not reclassify it automatically. If the rogue is classified differently, the controller reclassifies it automatically only if the rogue is in the Alert state.

• If the rogue access point matches the configured rules criteria, the controller classifies the rogue based on the classification type configured for that rule.

• If the rogue access point does not match any of the configured rules, the rogue remains unclassified.

The controller repeats the previous steps for all the rogue access points.

• If the rogue access point is detected on the same wired network, the controller marks the rogue state as Threat and classifies it as Malicious automatically, even if there are no configured rules. You can then manually contain the rogue to change the rogue state to Contained. If the rogue access point is not available on the network, the controller marks the rogue state as Alert. You can then manually contain the rogue.

• If desired, you can manually move the access point to a different classification type and rogue state.

Table 172: Classification Mapping

<table>
<thead>
<tr>
<th>Rule-Based Classification Type</th>
<th>Rogue State</th>
</tr>
</thead>
</table>
| Friendly                       | • Internal—If the unknown access point is inside the network and poses no threat to WLAN security, you can manually configure it as Friendly, Internal. An example of this would be the access points in your lab network.
|                               | • External—If the unknown access point is outside the network and poses no threat to WLAN security, you can manually configure it as Friendly, External. An example of this would be the access point in your neighboring coffee shop.
<p>|                               | • Alert—The unknown access point is moved to Alert if it is not in the neighbor list or in the user-configured friendly MAC list. |</p>
<table>
<thead>
<tr>
<th>Rule-Based Classification Type</th>
<th>Rogue State</th>
</tr>
</thead>
</table>
| Malicious                     | • Alert—The unknown access point is moved to Alert if it is not in the neighbor list or in the user-configured friendly MAC list.  
• Threat—The unknown access point is found to be on the network and poses a threat to WLAN security.  
• Contained—The unknown access point is contained.  
• Contained Pending—The unknown access point is marked Contained, but the action is delayed due to unavailable resources. |
| Unclassified                  | • Pending—On first detection, the unknown access point is put in the Pending state for 3 minutes. During this time, the managed access points determine if the unknown access point is a neighbor access point.  
• Alert—The unknown access point is moved to Alert if it is not in the neighbor list or in the user-configured friendly MAC list.  
• Contained—The unknown access point is contained.  
• Contained Pending—The unknown access point is marked Contained, but the action is delayed due to unavailable resources. |

The classification and state of the rogue access points are configured as follows:

- From Known to Friendly, Internal
- From Acknowledged to Friendly, External
- From Contained to Malicious, Contained

As mentioned earlier, the controller can automatically change the classification type and rogue state of an unknown access point based on user-defined rules. Alternatively, you can manually move the unknown access point to a different classification type and rogue state.

**Table 173: Allowable Classification Type and Rogue State Transitions**

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Friendly (Internal, External, Alert)</td>
<td>Malicious (Alert)</td>
</tr>
<tr>
<td>Friendly (Internal, External, Alert)</td>
<td>Unclassified (Alert)</td>
</tr>
<tr>
<td>Friendly (Alert)</td>
<td>Friendly (Internal, External)</td>
</tr>
<tr>
<td>Malicious (Alert, Threat)</td>
<td>Friendly (Internal, External)</td>
</tr>
<tr>
<td>Malicious (Contained, Contained Pending)</td>
<td>Malicious (Alert)</td>
</tr>
<tr>
<td>Unclassified (Alert, Threat)</td>
<td>Friendly (Internal, External)</td>
</tr>
<tr>
<td>Unclassified (Contained, Contained Pending)</td>
<td>Unclassified (Alert)</td>
</tr>
<tr>
<td>Unclassified (Alert)</td>
<td>Malicious (Alert)</td>
</tr>
</tbody>
</table>
If the rogue state is Contained, you have to uncontain the rogue access point before you can change the classification type. If you want to move a rogue access point from Malicious to Unclassified, you must delete the access point and allow the controller to reclassify it.

**Restrictions on Classifying Rogue Access Points**

- Classifying Custom type rogues is tied to rogue rules. Therefore, it is not possible to manually classify a rogue as Custom. Custom class change can occur only when rogue rules are used.

- Some are sent for containment by rule and every 30 minutes for rogue classification change. For custom classification, the first trap does not contain the severity score because the trap has existed before the custom classification. The severity score is obtained from the subsequent trap that is generated after 30 minutes if the rogue is classified.

- Rogue rules are applied on every incoming new rogue report in the controller in the order of their priority.

- After a rogue satisfies a higher priority rule and is classified, it does not move down the priority list for the same report.

- Previously classified rogue gets re-classified on every new rogue report with the following restrictions:
  - Rogues which are classified as friendly by rule and whose state is set to ALERT, go through re-classification on receiving the new rogue report.
  - If a rogue is classified as friendly by the administrator manually, then the state is INTERNAL and it does not get re-classified on successive rogue reports.
  - If rogue is classified as malicious, irrespective of the state it does not get re-classified on subsequent rogue reports.

- Transition of the rogue's state from friendly to malicious is possible by multiple rogue rules if some attribute is missing in new rogue report.

- Transition of the rogue's state from malicious to any other classification is not possible by any rogue rule.

- If a rogue AP is classified as friendly, it means that the rogue AP exists in the vicinity, is a known AP, and need not be tracked. Therefore, all the rogue clients are either deleted or not tracked if they are associated with the friendly rogue AP.

- When service set identifiers (SSIDs) are defined as part of a rogue rule, and details of the rogue rule are displayed using the `show wireless wps rogue rule detailed` command, the output differs in Cisco IOS XE Release 3.7E and prior releases and Cisco IOS XE Denali 16.1.1 and later releases.

The following is sample output from the `show wireless wps rogue rule detailed` command in Cisco IOS XE Release 3.6E and prior releases:

```
Switch# show wireless wps rogue rule detailed test
Priority : 1
Rule Name : wpstest
State : Disabled
Type : Pending
Match Operation : Any
Hit Count : 0
Total Conditions : 1
Condition :
```

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)
How to Classify Rogue Access Points

Configuring Rogue Classification Rules (CLI)

### SUMMARY STEPS

1. configure terminal
2. wireless wps rogue rule rule-name priority priority
3. classify {friendly | malicious}
4. condition {client-count condition_value | duration | encryption | infrastructure | rssi | ssid}
5. match {all | any}
6. default
7. exit
8. shutdown
9. end
10. configure terminal
11. wireless wps rogue rule shutdown
12. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Step 2</th>
<th>wireless wps rogue rule rule-name priority priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# wireless wps rogue rule rule_3 priority 3</td>
</tr>
</tbody>
</table>

- Creates or enables a rule. While creating a rule, you must enter the priority for the rule.
- **Note**: After creating a rule, you can edit the rule and change the priority only for the rogue rules that are disabled. You cannot change the priority for the rogue rules that are enabled. While editing, changing the priority for a rogue rule is optional.

| Step 3 | classify {friendly | malicious} |
|---|---|
| Example: | Device(config)# wireless wps rogue rule rule_3 priority 3  
Device(config-rule)# classify friendly |

- Classifies a rule.

| Step 4 | condition {client-count condition_value | duration | encryption | infrastructure | rssi | ssid} |
|---|---|
| Example: | Device(config)# wireless wps rogue rule rule_3 priority 3  
Device(config-rule)# condition client-count 5 |

- Adds the following conditions to a rule, which the rogue access point must meet:
  - **client-count**—Requires that a minimum number of clients be associated to the rogue access point. For example, if the number of clients associated to the rogue access point is greater than or equal to the configured value, the access point could be classified as Malicious. If you choose this option, enter the minimum number of clients to be associated to the rogue access point for the `condition_value` parameter. The valid range is from 1 to 10 (inclusive), and the default value is 0.
  - **duration**—Requires that the rogue access point be detected for a minimum period of time. If you choose this option, enter a value for the minimum detection period for the `condition_value` parameter. The valid range is from 0 to 3600 seconds (inclusive), and the default value is 0 seconds.
  - **encryption**—Requires that the advertised WLAN does not have encryption enabled.
  - **infrastructure**—Requires the SSID to be known to the controller.
  - **rssi**—Requires that the rogue access point have a minimum RSSI value. For example, if the rogue access point has an RSSI that is greater than the configured value, then the access point could be classified as malicious. If you choose this option, enter the minimum RSSI value for the `condition_value parameter`. The valid range is from –95 to –50 dBm (inclusive), and the default value is 0 dBm.
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• ssid—Requires the rogue access point to have a specific SSID. You should an SSID that is not managed by the controller. If you choose this option, enter the SSID for the <code>condition_value</code> parameter. The SSID is added to the user-configured SSID list.</td>
</tr>
</tbody>
</table>

| Step 5 | `match {all | any}`  |
|--------|----------------------|
| Example: | `Device(config)# wireless wps rogue rule rule_3 priority 3`  |
|         | `Device(config-rule)# match all`  |

<table>
<thead>
<tr>
<th>Step 6</th>
<th><code>default</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# wireless wps rogue rule rule_3 priority 3</code></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-rule)# default</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th><code>exit</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# wireless wps rogue rule rule_3 priority 3</code></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-rule)# exit</code></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)#</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th><code>shutdown</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# wireless wps rogue rule rule_3 priority 3</code></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-rule)# shutdown</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th><code>end</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# end</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 10</th>
<th><code>configure terminal</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device# configure terminal</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 11</th>
<th><code>wireless wps rogue rule shutdown</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# wireless wps rogue rule shutdown</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 12</th>
<th><code>end</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)#</code></td>
</tr>
</tbody>
</table>
Examples: Classifying Rogue Access Points

This example shows how to create a rule that can organize and display rogue access points as Friendly:

```
Device# configure terminal
Device(config)# wireless wps rogue rule ap1 priority 1
Device(config-rule)# classify friendly
Device(config-rule)# end
```

This example shows how to apply a condition that a rogue access point must meet:

```
Device# configure terminal
Device(config)# wireless wps rogue rule ap1 priority 1
Device(config-rule)# condition client-count 5
Device(config-rule)# condition duration 1000
Device(config-rule)# end
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About wIPS

The Cisco Adaptive Wireless Intrusion Prevention System (wIPS) uses an advanced approach to wireless threat detection and performance management. It combines network traffic analysis, network device and topology information, signature-based techniques, and anomaly detection to deliver highly accurate and complete wireless threat prevention. With a fully infrastructure-integrated solution, you can continually monitor wireless traffic on both the wired and wireless networks and use that network intelligence to analyze attacks from many sources to accurately pinpoint and proactively prevent attacks, rather than wait until damage or exposure has occurred.

Cisco Adaptive wIPS is a part of the Cisco 3300 Series Mobility Services Engine (MSE), which centralizes the processing of intelligence collected by the continuous monitoring of Cisco Aironet APs. With Cisco Adaptive wIPS functionalities and Cisco Prime Infrastructure integration into the Cisco MSE, the wIPS can configure and monitor wIPS policies and alarms and report threats.
If your wIPS deployment consists of a Cisco WLC, access point, and Cisco MSE, you must set all the three entities to the UTC time zone.

Note

Cisco Adaptive wIPS is not configured on the Cisco WLC. Instead, the Cisco Prime Infrastructure forwards the profile configuration to the wIPS service, which forwards the profile to the Cisco WLC. The profile is stored in flash memory on the Cisco WLC and sent to APs when they join the Cisco WLC. When an access point disassociates and joins another Cisco WLC, it receives the wIPS profile from the new Cisco WLC.

Local-mode APs with a subset of wIPS capabilities are referred to as Enhanced Local Mode access point or ELM AP. You can configure an access point to work in the wIPS mode if the AP is in any of the following modes:

- Monitor
- Local

The regular local mode AP is extended with a subset of wIPS capabilities. This feature enables you to deploy your APs to provide protection without needing a separate overlay network.

wIPS ELM has the limited capability of detecting off-channel alarms. AN AP periodically goes off-channel, and monitors the nonserving channels for a short duration, and triggers alarms if any attack is detected on the channel. But off-channel alarm detection is best effort, and it takes a longer time to detect attacks and trigger alarms, which might cause the ELM AP to intermittently detect an alarm and clear it because it is not visible.

APs in any of the above modes can periodically send alarms based on the policy profile to the wIPS service through the Cisco WLC. The wIPS service stores and processes the alarms and generates SNMP traps. Cisco Prime Infrastructure configures its IP address as a trap destination to receive SNMP traps from the Cisco MSE.

This table lists all the SNMP trap controls and their respective traps. When a trap control is enabled, all the traps of that trap control are also enabled.

The Cisco WLC uses only SNMPv2 for SNMP trap transmission.

The following are the trap descriptions for the traps mentioned in the *SNMP Trap Controls and Their Respective Traps* table:

- **General Traps**
  - **SNMP Authentication**—The SNMPv2 entity has received a protocol message that is not properly authenticated.

  **Note** When a user who is configured in SNMP V3 mode tries to access the Cisco WLC with an incorrect password, the authentication fails and a failure message is displayed. However, no trap logs are generated for the authentication failure.

  - **Link (Port) Up/Down**—Link changes status from up or down.

  - **Link (Port) Up/Down**—Link changes status from up or down.

  - **Multiple Users**—Two users log in with the same ID.
• Rogue AP—Whenever a rogue access point is detected, this trap is sent with its MAC address; when a rogue access point that was detected earlier no longer exists, this trap is sent.

• Config Save—Notification that is sent when the Cisco WLC configuration is modified.

• Cisco AP Traps
  • AP Register—Notification sent when an access point associates or disassociates with the Cisco WLC.
  • AP Interface Up/Down—Notification sent when an access point interface (802.11X) status goes up or down.

• Client-Related Traps
  • 802.11 Association—Associate notification that is sent when a client sends an association frame.
  • 802.11 Disassociation—Disassociate notification that is sent when a client sends a disassociation frame.
  • 802.11 Deauthentication—Deauthenticate notification that is sent when a client sends a deauthentication frame.
  • 802.11 Failed Authentication—Authenticate failure notification that is sent when a client sends an authentication frame with a status code other than successful.
  • 802.11 Failed Association—Associate failure notification that is sent when the client sends an association frame with a status code other than successful.
  • Exclusion—Associate failure notification that is sent when a client is exclusion listed (blacklisted).

  Note The maximum number of static blacklist entries that the APs can have is 340.

• Authentication—Authentication notification that is sent when a client is successfully authenticated.

• Max Clients Limit Reached—Notification that is sent when the maximum number of clients, defined in the Threshold field, are associated with the Cisco WLC.

• NAC Alert—Alert that is sent when a client joins an SNMP NAC-enabled WLAN.

  This notification is generated when a client on NAC-enabled SSIDs completes Layer2 authentication to inform the NAC appliance about the client's presence. cldcClientWlanProfileName represents the profile name of the WLAN that the 802.11 wireless client is connected to, cldcClientIPAddress represents the unique IP address of the client, cldcApMacAddress represents the MAC address of the AP to which the client is associated. cldcClientQuarantineVLAN represents the quarantine VLAN for the client. cldcClientAccessVLAN represents the access VLAN for the client.

• Association with Stats—Associate notification that is sent with data statistics when a client is associated with the Cisco WLC, or roams. Data statistics include transmitted and received bytes and packets.

• Disassociation with Stats—Disassociate notification that is sent with data statistics when a client disassociates from the Cisco WLC. Data statistics include transmitted and received bytes and packets, SSID, and session ID.
When you downgrade to Release 7.4 from a later release, if a trap that was not supported in Release 7.4 (for example, NAC Alert trap) is enabled before the downgrade, all traps are disabled. After the downgrade, you must enable all the traps that were enabled before the downgrade. We recommend that you disable the new traps before the downgrade so that all the other traps are not disabled.

**Note**

When a user who is configured in SNMP V3 mode tries to access the Cisco WLC with an incorrect password, authentication fails and a failure message is displayed. However, no trap logs are generated for the authentication failure.

- **Security Traps**
  - User Auth Failure—This trap informs that a client RADIUS Authentication failure has occurred.
  - RADIUS Server No Response—This trap is to indicate that no RADIUS servers are responding to authentication requests sent by the RADIUS client.
  - WEP Decrypt Error—Notification sent when the Cisco WLC detects a WEP decrypting error.
  - Rogue AP—Whenever a rogue access point is detected, this trap is sent with its MAC address; when a rogue access point that was detected earlier no longer exists, this trap is sent.
  - SNMP Authentication—The SNMPv2 entity has received a protocol message that is not properly authenticated.

- **SNMP Authentication**
  - Load Profile—Notification sent when the Load Profile state changes between PASS and FAIL.
  - Noise Profile—Notification sent when the Noise Profile state changes between PASS and FAIL.
  - Interference Profile—Notification sent when the Interference Profile state changes between PASS and FAIL.
  - Coverage Profile—Notification sent when the Coverage Profile state changes between PASS and FAIL.

- **Auto RF Profile Traps**
  - Load Profile—Notification sent when the Load Profile state changes between PASS and FAIL.
  - Noise Profile—Notification sent when the Noise Profile state changes between PASS and FAIL.
  - Interference Profile—Notification sent when the Interference Profile state changes between PASS and FAIL.
  - Coverage Profile—Notification sent when the Coverage Profile state changes between PASS and FAIL.
• Auto RF Update Traps
  • Channel Update—Notification sent when the access point dynamic channel algorithm is updated.
  • Tx Power Update—Notification sent when the access point dynamic transmit power algorithm is updated.

• Mesh Traps
  • Child Excluded Parent—Notification that is sent when a defined number of failed association to the Cisco WLC occurs through a parent mesh node.
  • Notification sent when a child mesh node exceeds the threshold limit of the number of discovery response timeouts. The child mesh node does not try to associate an excluded parent mesh node for the interval defined. The child mesh node remembers the excluded parent MAC address when it joins the network, and informs the Cisco WLC.
  • Parent Change—Notification is sent by the agent when a child mesh node changes its parent. The child mesh node remembers previous parent and informs the Cisco WLC about the change of parent when it rejoins the network.
  • Child Moved—Notification sent when a parent mesh node loses connection with its child mesh node.
  • Excessive Parent Change—Notification sent when the child mesh node changes its parent frequently. Each mesh node keeps a count of the number of parent changes in a fixed time. If it exceeds the defined threshold, the child mesh node informs the Cisco WLC.
  • Excessive Children—Notification sent when the child count exceeds for a RAP and a MAP.
  • Poor SNR—Notification sent when the child mesh node detects a lower SNR on a backhaul link. For the other trap, a notification is sent to clear a notification when the child mesh node detects an SNR on a backhaul link that is higher than the object defined by 'clMeshSNRThresholdAbate'.
  • Console Login—Notification is sent by the agent when a login on a MAP console is either successful or fail after three attempts.
  • Default Bridge Group Name—Notification sent when the MAP mesh node joins its parent using the default bridge group name.

---

**Note**
The remaining traps do not have trap controls. These traps are not generated too frequently and do not require any trap control. Any other trap that is generated by the Cisco WLC cannot be turned off.

**Note**
In all of the above cases, the Cisco WLC functions solely as a forwarding device.
How to Configure wIPS on an Access Point

Configuring wIPS on an Access Point (CLI)

SUMMARY STEPS

1. `ap name name mode submode wips`
2. `end`
3. `show wireless wps wips summary`
4. `show wireless wps wips statistics`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Configure an access point for local or monitor mode and then set the submode to wIPS.</td>
</tr>
<tr>
<td><code>ap name name mode submode wips</code></td>
<td>Example: <code>Device# ap name ap1 mode local wips</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <code>Ctrl-Z</code> to exit global configuration mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Example: <code>Device(config)# end</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>View the wIPS configuration on the access point.</td>
</tr>
<tr>
<td><code>show wireless wps wips summary</code></td>
<td>Example: <code>Device# show wireless wps wips summary</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>View the current state of wIPS configuration.</td>
</tr>
<tr>
<td><code>show wireless wps wips statistics</code></td>
<td>Example: <code>Device# show wireless wps wips statistics</code></td>
</tr>
</tbody>
</table>

Monitoring wIPS Information

This section describes the new command for wIPS.

The following command can be used to monitor wIPS configured on the access point.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless wps wips summary</code></td>
<td>Displays the wIPS configuration on the access point.</td>
</tr>
<tr>
<td><code>show wireless wps wips statistics</code></td>
<td>Displays the current state of wIPS configuration.</td>
</tr>
</tbody>
</table>
Examples: wIPS Configuration

This example shows how to configure wIPS on AP1:

```
Device# ap name ap1 mode local submode wips
Device# end
Device# show wireless wps wips summary
```

</table>
CHAPTER 110

Configuring Intrusion Detection System

- Finding Feature Information, on page 2239
- Information About Intrusion Detection System, on page 2239
- How to Configure Intrusion Detection System, on page 2240
- Monitoring Intrusion Detection System, on page 2241

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the <TBD>

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Intrusion Detection System

The Cisco Intrusion Detection System/Intrusion Prevention System (CIDS/CIPS) instructs devices to block certain clients from accessing the wireless network when attacks involving these clients are detected at Layer 3 through Layer 7. This system offers significant network protection by helping to detect, classify, and stop threats including worms, spyware/adware, network viruses, and application abuse. Two methods are available to detect potential attacks:

- IDS sensors
- IDS signatures

IDS sensors can be configured to detect various types of IP-level attacks in the network. When the sensors identify an attack, they can alert the device to shun the offending client. When a new IDS sensor is added, the IDS sensor should be registered with the device so that the device can query the sensor to get the list of shunned clients.

When an IDS sensor detects a suspicious client, it alerts the device to shun this client. The shun entry is distributed to all devices within the same mobility group. If the client to be shunned is currently joined to a device in this mobility group, the anchor device adds this client to the dynamic exclusion list, and the foreign
device removes the client. The next time that the client tries to connect to a device, the anchor device rejects the handoff and informs the foreign device that the client is being excluded.

# How to Configure Intrusion Detection System

## Configuring IDS Sensors

### SUMMARY STEPS

1. configure terminal
2. wireless wps cids-sensor index [ip-address ip-addr username username password
   password_type password]
3. wireless wps cids-sensor index
4. [default exit fingerprint interval no port shutdown]
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 2** | wireless wps cids-sensor index [ip-address ip-addr username username password
   password_type password] | Configures the IDS sensors that holds and internal index number. The index parameter determines the sequence in which the controller consults the IDS sensors. The controller supports up to five IDS sensors. |
| **Example:** | Device(config)# wireless wps cids-sensor 2 231.1.1.1 admin pwd123 | |
| **Step 3** | wireless wps cids-sensor index | Enters the IDS configuration submode. |
| **Example:** | Device(config)# wireless wps cids-sensor 1 | |
| **Step 4** | [default exit fingerprint interval no port shutdown] | Configures various IDS parameters. |
| **Example:** | Device(config-cids-index)# default | |
| | | • default– [optional] Sets a command to its default. |
| | | • exit– [optional] Exits the submode. |
### Monitoring Intrusion Detection System

**Table 176: Commands for Monitoring Wireless Multicast**

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless wps cids-sensor index</code></td>
<td>Displays the IDS configuration of the IDS sensor with the mentioned index value.</td>
</tr>
<tr>
<td><code>show wireless wps cids-sensor summary</code></td>
<td>Displays the list of all the configured IDS with their respective values like index, ip-address, port number, interval value, status and last query.</td>
</tr>
<tr>
<td><code>show wireless wps shun-list</code></td>
<td>Displays the list of the IDS shun list.</td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Switch Stacks

All the switches in the switch stack need to be running the same license level as the active switch. For information about license levels, see the System Management Configuration Guide (Catalyst 3650 Switches).

All switches in the switch stack need to be running compatible software versions.

A StackWise adapter must be installed in the stacking port to enable stacking. For switch stack hardware considerations, see the Catalyst 3650 Switch Hardware Installation Guide.

Restrictions for Switch Stacks

The following are restrictions for your switch stack configuration:
Switch stacks running the LAN Base license level do not support Layer 3 features.

A switch stack can have up to nine stacking-capable switches connected through their StackWise-160 ports.

You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

You cannot have a switch stack containing a mix of different license levels.

Information About Switch Stacks

Switch Stack Overview

A switch stack can have up to nine stacking-capable switches connected through their StackWise-160 ports. The stack members work together as a unified system. Layer 2 and Layer 3 protocols present the entire switch stack as a single entity to the network.

A switch stack always has one active switch and one standby switch. If the active switch becomes unavailable, the standby switch assumes the role of the active switch, and continues to keep the stack operational.

The active switch controls the operation of the switch stack, and is the single point of stack-wide management. From the active switch, you configure:

- System-level (global) features that apply to all stack members
- Interface-level features for each stack member

The active switch contains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level settings for each stack member. Each stack member has a current copy of these files for back-up purposes.

Supported Features in a Switch Stack

The system-level features supported on the active switch are supported on the entire switch stack.

Encryption Features

If the active switch is running the cryptographic universal software image (supports encryption), the encryption features are available on the switch stack.

StackWise-160

The stack members use the StackWise-160 technology to work together as a unified system. Layer 2 and Layer 3 protocols support the entire switch stack as a single entity in the network.

Note

Switch stacks running the LAN Base image do not support Layer 3 features.

StackWise-160 has a stack bandwidth of 160 Gbps, and uses stateful switchover (SSO) to provide resiliency within the stack. The stack behaves as a single switching unit that is managed by an active switch elected by the member switches. The active switch automatically elects a standby switch within the stack. The active switch creates and updates all the switching, routing and wireless information and constantly synchronizes.
that information with the standby switch. Access points continue to remain connected during an active-to-standby switchover unless the access point is directly connected to the active switch. In this case the access point will lose power and reboot. A working stack can accept new members or delete old ones without service interruption.

**Switch Stack Membership**

A standalone device is a device stack with one stack member that also operates as the active switch. You can connect one standalone device to another to create a device stack containing two stack members, with one of them as the active switch. You can connect standalone devicees to an existing device stack to increase the stack membership.

Hello messages are sent and received by all stack members.

- If a stack member does not respond, that member is removed from the stack.
- If the standby device does not respond, a new standby device is elected.
- If the active device does not respond, the standby device becomes the active device.

In addition, keepalive messages are sent and received between the active and standby devicees.

- If the standby device does not respond, a new standby device is elected.
- If the active device does not respond, the standby device becomes the active device.

**Changes to Switch Stack Membership**

If you replace a stack member with an identical model, the new switch functions with exactly the same configuration as the replaced switch, assuming that the new switch (referred to as the provisioned switch) is using the same member number as the replaced switch.

The operation of the switch stack continues uninterrupted during membership changes unless you remove the active switch or you add powered-on standalone switches or switch stacks.

- Adding powered-on switches (merging) causes all switches to reload and elect a new active switch from among themselves. The newly elected active switch retains its role and configuration. All other switches retain their stack member numbers and use the stack configuration of the newly elected active switch.

| Note | In Cisco IOS XE 3.6.4E and later versions, when a new switch is powered-on as a standalone switch before it is added as part of the switch stack, only this switch is reloaded and not the whole switch stack. |

- Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. This can cause:
  - An IP address conflict in your network. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks.
  - A MAC address conflict between two members in the stack. You can use the `stack-mac update force` command to resolve the conflict.
If a newly created switch stack does not have an active switch or standby switch, the switch stack will reload and elect a new active switch.

---

**Note**

Make sure that you power off the switches that you add to or remove from the switch stack.

After adding or removing stack members, make sure that the switch stack is operating at full bandwidth (160 Gbps). Press the Mode button on a stack member until the Stack mode LED is on. The last two right port LEDs on all switches in the stack should be green. Depending on the switch model, the last two right ports are 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports (10/100/1000 ports). If one or both of these LEDs are not green on any of the switches, the stack is not operating at full bandwidth.

If you remove powered-on members but do not want to partition the stack:

- Power off the switches in the newly created switch stacks.
- Reconnect them to the original switch stack through their stack ports.
- Power on the switches.

For cabling and power considerations that affect switch stacks, see the *Catalyst 3650 Switch Hardware Installation Guide*.

---

### Stack Member Numbers

The stack member number (1 to 9) identifies each member in the stack. The member number also determines the interface-level configuration that a stack member uses. You can display the stack member number by using the `show switch` EXEC command.

A new, out-of-the-box (one that has not joined a stack or has not been manually assigned a stack member number) ships with a default stack member number of 1. When it joins a stack, its default stack member number changes to the lowest available member number in the stack.

Stack members in the same stack cannot have the same stack member number. Every stack member, including a standalone, retains its member number until you manually change the number or unless the number is already being used by another member in the stack.

- If you manually change the stack member number by using the `switch current-stack-member-number renumber new-stack-member-number` command, the new number goes into effect after that stack member resets (or after you use the `reload slot stack-member-number` privileged EXEC command) and only if that number is not already assigned to any other members in the stack. Another way to change the stack member number is by changing the _NUMBER environment variable.

If the number is being used by another member in the stack, the selects the lowest available number in the stack.

If you manually change the number of a stack member and no interface-level configuration is associated with that new member number, that stack member resets to its default configuration.

You cannot use the `switch current-stack-member-number renumber new-stack-member-number` command on a provisioned . If you do, the command is rejected.

- If you move a stack member to a different stack, the stack member retains its number only if the number is not being used by another member in the stack. If it is being used, the selects the lowest available number in the stack.
• If you merge stacks, the stack of a new active switch select the lowest available numbers in the stack.

As described in the hardware installation guide, you can use the port LEDs in Stack mode to visually determine the stack member number of each stack member.

In the default mode Stack LED will blink in green color only on the stack master. However, when we scroll the Mode button to Stack option - Stack LED will glow green on all the stack members.

When mode button is scrolled to Stack option, the switch number of each stack member will be displayed as LEDs on the first five ports of that switch. The switch number is displayed in binary format for all stack members. On the switch, the amber LED indicates value 0 and green LED indicates value 1.

Example for switch number 5 (Binary - 00101):

First five LEDs glow as follows on stack member with switch number 5.

• Port-1 : Amber
• Port-2 : Amber
• Port-3 : Green
• Port-4 : Amber
• Port-5 : Green

Similarly, the first five LEDs glow amber or green, depending on the switch number on all stack members.

---

**Note**

• If you connect a Horizontal stack port to a normal network port on other end, stack port transmission/reception will be disabled within 30 seconds if no SDP packets are received from the other end.

• Stack port will not go down but only transmission/reception will be disabled. The log message shown below will be displayed on the console. Once the peer end network port is converted to stack port, transmission/reception on this stack port will be enabled.

```
%STACKMGR-4-HSTACK_LINK_CONFIG: Verify peer stack port setting for hstack
StackPort-1 switch 5 (hostname-switchnumber)
```

---

**Stack Member Priority Values**

A higher priority value for a stack member increases the probability of it being elected active switch and retaining its stack member number. The priority value can be 1 to 15. The default priority value is 1. You can display the stack member priority value by using the `show switch` EXEC command.

---

**Note**

We recommend assigning the highest priority value to the device that you prefer to be the active switch. This ensures that the device is reelected as the active switch if a reelection occurs.

To change the priority value for a stack member, use the `switch stack-member-number priority` `new priority-value` command. For more information, see the “Setting the Stack Member Priority Value” section.
The new priority value takes effect immediately but does not affect the current active switch. The new priority value helps determine which stack member is elected as the new active switch when the current active switch or the switch stack resets.

**Switch Stack Bridge ID and MAC Address**

A switch stack is identified in the network by its bridge ID and, if it is operating as a Layer 3 device, its router MAC address. The bridge ID and router MAC address are determined by the MAC address of the active switch.

If the active switch changes, the MAC address of the new active switch determines the new bridge ID and router MAC address.

If the entire switch stack reloads, the switch stack uses the MAC address of the active switch.

**Persistent MAC Address on the Switch Stack**

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes. During this time period, if the previous active switch rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not an active switch. If the previous active switch does not rejoin the stack during this period, the switch stack takes the MAC address of the new active switch as the stack MAC address. By default, the stack MAC address will be the MAC address of the first active switch, even if a new active switch takes over.

You can also configure stack MAC persistency so that the stack MAC address never changes to the new active switch MAC address.

**Active and Standby Switch Election and Reelection**

All stack members are eligible to be the active switch or the standby switch. If the active switch becomes unavailable, the standby switch becomes the active switch.

An active switch retains its role unless one of these events occurs:

- The switch stack is reset.
- The active switch is removed from the switch stack.
- The active switch is reset or powered off.
- The active switch fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.

The active switch is elected or reelected based on one of these factors and in the order listed:

1. The switch that is currently the active switch.
2. The switch with the highest stack member priority value.

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the active switch. This ensures that the switch is reelected as active switch if a reelection occurs.
3. The switch with the shortest start-up time.
4. The switch with the lowest MAC address.

The factors for electing or reelecting a new standby switch are same as those for the active switch election or reelection, and are applied to all participating switches except the active switch.

After election, the new active switch becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new active switch election and reset.

When the previous active switch becomes available, it does not resume its role as the active switch.

If you power on or reset an entire switch stack, some stack members might not participate in the active switch election. Stack members that are powered on within the same 2-minute timeframe participate in the active switch election and have a chance to become the active switch. Stack members that are powered on after the 120-second timeframe do not participate in this initial election and become stack members. For powering considerations that affect active-switch elections, see the switch hardware installation guide.

As described in the hardware installation guide, you can use the ACTV LED on the switch to see if the switch is the active switch.

**Switch Stack Configuration Files**

The active switch has the saved and running configuration file for the switch stack. The standby switch automatically receives the synchronized running configuration file. Stack members receive synchronized copies when the running configuration file is saved into the startup configuration file. If the active switch becomes unavailable, the standby switch takes over with the current running configuration.

The configuration files record these settings:

- System-level (global) configuration settings such as IP, STP, VLAN, and SNMP settings that apply to all stack members
- Stack member interface-specific configuration settings that are specific for each stack member

**Note**

The interface-specific settings of the active switch are saved if the active switch is replaced without saving the running configuration to the startup configuration.

A new, out-of-box device joining a switch stack uses the system-level settings of that switch stack. If a device is moved to a different switch stack before it is powered on, that device loses its saved configuration file and uses the system-level configuration of the new switch stack. If the device is powered on as a standalone device before it joins the new switch stack, the stack will reload. When the stack reloads, the new device may become the active switch, retain its configuration and overwrite the configuration files of the other stack members.

The interface-specific configuration of each stack member is associated with the stack member number. Stack members retain their numbers unless they are manually changed or they are already used by another member in the same switch stack. If the stack member number changes, the new number goes into effect after that stack member resets.
• If an interface-specific configuration does not exist for that member number, the stack member uses its default interface-specific configuration.

• If an interface-specific configuration exists for that member number, the stack member uses the interface-specific configuration associated with that member number.

If you replace a failed member with an identical model, the replacement member automatically uses the same interface-specific configuration as the failed device. You do not need to reconfigure the interface settings. The replacement device (referred to as the provisioned device) must have the same stack member number as the failed device.

You back up and restore the stack configuration in the same way as you would for a standalone device configuration.

**Offline Configuration to Provision a Stack Member**

You can use the offline configuration feature to provision (to supply a configuration to) a new switch before it joins the switch stack. You can configure the stack member number, the switch type, and the interfaces associated with a switch that is not currently part of the stack. The configuration that you create on the switch stack is called the *provisioned configuration*. The switch that is added to the switch stack and that receives this configuration is called the *provisioned switch*.

You manually create the provisioned configuration through the `switch stack-member-number provision type` global configuration command. You must change the `stack-member-number` on the provisioned switch before you add it to the stack, and it must match the stack member number that you created for the new switch on the switch stack. The switch type in the provisioned configuration must match the switch type of the newly added switch. The provisioned configuration is automatically created when a switch is added to a switch stack and when no provisioned configuration exists.

When you configure the interfaces associated with a provisioned switch, the switch stack accepts the configuration, and the information appears in the running configuration. However, as the switch is not active, any configuration on the interface is not operational and the interface associated with the provisioned switch does not appear in the display of the specific feature. For example, VLAN configuration information associated with a provisioned switch does not appear in the `show vlan` user EXEC command output on the switch stack.

The switch stack retains the provisioned configuration in the running configuration whether or not the provisioned switch is part of the stack. You can save the provisioned configuration to the startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. The startup configuration file ensures that the switch stack can reload and can use the saved information whether or not the provisioned switch is part of the switch stack.

**Effects of Adding a Provisioned Switch to a Switch Stack**

When you add a provisioned Device to the switch stack, the stack applies either the provisioned configuration or the default configuration. This table lists the events that occur when the switch stack compares the provisioned configuration with the provisioned switch.
### Table 177: Results of Comparing the Provisioned Configuration with the Provisioned Switch

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stack member numbers and the Device types match.</td>
<td>1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, and</td>
</tr>
<tr>
<td></td>
<td>2. If the Device type of the provisioned switch matches the Device type in the provisioned configuration on the stack.</td>
</tr>
<tr>
<td></td>
<td>The switch stack applies the provisioned configuration to the provisioned switch and adds it to the stack.</td>
</tr>
<tr>
<td>The stack member numbers match but the Device types do not match.</td>
<td>1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, but</td>
</tr>
<tr>
<td></td>
<td>2. The Device type of the provisioned switch does not match the Device type in the provisioned configuration on the stack.</td>
</tr>
<tr>
<td></td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</td>
</tr>
<tr>
<td></td>
<td>The provisioned configuration is changed to reflect the new information.</td>
</tr>
<tr>
<td>The stack member number is not found in the provisioned configuration.</td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</td>
</tr>
<tr>
<td></td>
<td>The provisioned configuration is changed to reflect the new information.</td>
</tr>
<tr>
<td>The stack member number of the provisioned switch is not found in the provisioned configuration.</td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</td>
</tr>
</tbody>
</table>

If you add a provisioned switch that is a different type than specified in the provisioned configuration to a powered-down switch stack and then apply power, the switch stack rejects the (now incorrect) `switch stack-member-number provision type` global configuration command in the startup configuration file. However, during stack initialization, the nondefault interface configuration information in the startup configuration file for the provisioned interfaces (potentially of the wrong type) is executed. Depending on the differences between the actual Device type and the previously provisioned switch type, some commands are rejected, and some commands are accepted.

**Note**

If the switch stack does not contain a provisioned configuration for a new Device, the Device joins the stack with the default interface configuration. The switch stack then adds to its running configuration with a `switch stack-member-number provision type` global configuration command that matches the new Device. For configuration information, see the Provisioning a New Member for a Switch Stack section.
Effects of Replacing a Provisioned Switch in a Switch Stack

When a provisioned switch in a switch stack fails, it is removed from the stack, and is replaced with another Device, the stack applies either the provisioned configuration or the default configuration to it. The events that occur when the switch stack compares the provisioned configuration with the provisioned switch are the same as those when you add a provisioned switch to a stack.

Effects of Removing a Provisioned Switch from a Switch Stack

If you remove a provisioned switch from the switch stack, the configuration associated with the removed stack member remains in the running configuration as provisioned information. To completely remove the configuration, use the `no switch stack-member-number provision` global configuration command.

Upgrading a Switch Running Incompatible Software

The auto-upgrade and auto-adviser features enable a switch with software packages that are incompatible with the switch stack to be upgraded to a compatible software version so that it can join the switch stack.

Auto-Upgrade

The purpose of the auto-upgrade feature is to allow a switch to be upgraded to a compatible software image, so that the switch can join the switch stack.

The switch with the higher version of software is made the active switch and all other switches that are to be upgraded are booted simultaneously. If you have new switches to add to the stack, first power them off, add them to the stack and then boot them simultaneously. You cannot add more members to a stack when an auto-upgrade is going on in the stack. You can add new members only after the on-going auto-upgrade process is completed.

When a new switch attempts to join a switch stack, each stack member performs compatibility checks with itself and the new switch. Each stack member sends the results of the compatibility checks to the active switch, which uses the results to determine whether the switch can join the switch stack. If the software on the new switch is incompatible with the switch stack, the new switch enters version-mismatch (VM) mode.

If the auto-upgrade feature is enabled on the existing switch stack, the active switch automatically upgrades the new switch with the same software image running on a compatible stack member. Auto-upgrade starts a few minutes after the mismatched software is detected before starting.

You can perform auto-upgrade on the newly added member of a stack only after the existing members of the stack are already auto-upgraded.

Auto-upgrade is disabled by default.

Note the following limitations before starting an auto-upgrade:

- Do not perform an auto-upgrade in bundle mode.
- Do not perform an auto-upgrade in half-ring stack.
- Do not perform stack merge of two active switches that have different version of images.
- Do not perform staggered boot of the switches to be upgraded.

Auto-upgrade includes an auto-copy process and an auto-extract process.
• Auto-copy automatically copies the software image running on any stack member to the new switch to automatically upgrade it. Auto-copy occurs if auto-upgrade is enabled, if there is enough flash memory in the new switch, and if the software image running on the switch stack is suitable for the new switch.

**Note** A switch in VM mode might not run all released software. For example, new switch hardware is not recognized in earlier versions of software.

• Automatic extraction (auto-extract) occurs when the auto-upgrade process cannot find the appropriate software in the stack to copy to the new switch. In that case, the auto-extract process searches all switches in the stack for the bin file needed to upgrade the switch stack or the new switch. The bin file can be in any flash file system in the switch stack or in the new switch. If a bin file suitable for the new switch is found on a stack member, the process extracts the file and automatically upgrades the new switch.

The auto-upgrade feature is not available in bundle mode. The switch stack must be running in installed mode. If the switch stack is in bundle mode, use the `software expand` privileged EXEC command to change to installed mode.

You can enable auto-upgrade by using the `software auto-upgrade enable` global configuration command on the new switch. You can check the status of auto-upgrade by using the `show running-config` privileged EXEC command and by checking the `Auto upgrade` line in the display.

You can configure auto-upgrade to upgrade the new switch with a specific software bundle by using the `software auto-upgrade source url` global configuration command. If the software bundle is invalid, the new switch is upgraded with the same software image running on a compatible stack member.

When the auto-upgrade process is complete, the new switch reloads and joins the stack as a fully functioning member. If you have both stack cables connected during the reload, network downtime does not occur because the switch stack operates on two rings.

For more information about upgrading a switch running incompatible software see the *Cisco IOS File System, Configuration Files, and Bundle Files Appendix, Cisco IOS XE Release 3SE (Catalyst 3650 Switches)*.

### Auto-Advise

The auto-advice feature is triggered when:

• The auto-upgrade feature is disabled.

• The new switch is in bundle mode and the stack is in installed mode. Auto-advice displays syslog messages about using the `software auto-upgrade` privileged EXEC command to change the new switch to installed mode.

• The stack is in bundle mode. Auto-advice displays syslog messages about booting the new switch in bundle mode so that it can join the stack.

• An auto-upgrade attempt fails because the new switch is running incompatible software. After the switch stack performs compatibility checks with the new switch, auto-advice displays syslog messages about whether the new switch can be auto-upgraded.

Auto-advice cannot be disabled. It does not give suggestions when the switch stack software and the software of the switch in version-mismatch (VM) mode do not contain the same license level.
Examples of Auto-Advise Messages

Auto-Upgrade Is Disabled and Incompatible Switch Attempting to Join: Example

This sample auto-advice output shows the system messages displayed when the auto-upgrade feature is disabled and an incompatible switch 1 tries to join the switch stack:

*Oct 18 08:36:19.379: %INSTALLER-6-AUTO_ADVISE_SW_INITIATED: 2 installer: Auto advise initiated for switch 1
*Oct 18 08:36:19.380: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: Searching stack for software to upgrade switch 1
*Oct 18 08:36:19.382: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: Switch 1 with incompatible software has been added to the stack. The software running on switch 1 was scanned and it has been determined that the 'software auto-upgrade' command can be used to install compatible software.

Auto-Upgrade is Disabled and New Switch is in Bundle Mode: Example

This sample auto-advice output shows the system messages displayed when auto-upgrade is disabled and a switch running in bundle mode tries to join the stack that is running in installed mode:

*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW_INITIATED: 2 installer: Auto advise initiated for switch 1
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: Switch 1 running bundled software has been added to the stack that is running installed software.
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: The 'software auto-upgrade' command can be used to convert switch 1 to the installed running mode by installing its running software.

Switch Stack Management Connectivity

You manage the switch stack and the stack member interfaces through the active switch. You can use the CLI, SNMP, and supported network management applications such as CiscoWorks. You cannot manage stack members on an individual Device basis.

Note: Use SNMP to manage network features across the stack that are defined by supported MIBs. The switch does not support MIBs to manage stacking-specific features such as stack membership and election.

Connectivity to the Switch Stack Through an IP Address

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the active switch or to any other stack member. You can still manage the stack through the same...
IP address even if you remove the active switch or any other stack member from the stack, provided there is IP connectivity.

**Note**

Stack members retain their IP addresses when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP addresses of any Device that you remove from the switch stack.

For related information about switch stack configurations, see the *Switch Stack Configuration Files* section.

**Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports**

You can connect to the active switch by using one of these methods:

- You can connect a terminal or a PC to the active switch through the console port of one or more stack members.

- You can connect a PC to the active switch through the Ethernet management ports of one or more stack members. For more information about connecting to the switch stack through Ethernet management ports, see the *Using the Ethernet Management Port* section.

You can connect to the active switch by connecting a terminal or a PC to the stack master through the console port of one or more stack members.

Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

We recommend using only one CLI session when managing the switch stack.

**How to Configure a Switch Stack**

**Enabling the Persistent MAC Address Feature**

**Note**

When you enter the command to configure this feature, a warning message appears with the consequences of your configuration. You should use this feature cautiously. Using the old active switch MAC address elsewhere in the same domain could result in lost traffic.

Follow these steps to enable persistent MAC address:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `stack-mac persistent timer [0 | time-value]`
4. `end`
5. `copy running-config startup-config`
## Enabling the Persistent MAC Address Feature

### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
Example:  
Device> enable |
| **Step 2** | configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
| **Step 3** | stack-mac persistent timer [0 | time-value] | Enables a time delay after an active-switch change before the stack MAC address changes to that of the new active switch. If the previous active switch rejoins the stack during this period, the stack uses that MAC address as the stack MAC address.  
Example:  
Device(config)# stack-mac persistent timer 7 |
| **Step 4** | end | Returns to privileged EXEC mode.  
Example:  
Device(config)# end |
| **Step 5** | copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
Example:  
Device# copy running-config startup-config |

### What to do next

Use the no stack-mac persistent timer global configuration command to disable the persistent MAC address feature.
Assigning a Stack Member Number

This optional task is available only from the active switch.

Follow these steps to assign a member number to a stack member:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `switch current-stack-member-number renumber new-stack-member-number`
4. `end`
5. `reload slot stack-member-number`
6. `show switch`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switch current-stack-member-number renumber new-stack-member-number</td>
<td>Specifies the current stack member number and the new stack member number for the stack member. The range is 1 to 9.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Specifies the current stack member number and the new member number for the stack member. The range is 1 to 2. You can display the current stack member number by using the <code>show switch</code> user EXEC command.</td>
</tr>
<tr>
<td>Device(config)# switch 3 renumber 4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> reload slot stack-member-number</td>
<td>Resets the stack member.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# reload slot 4</td>
<td></td>
</tr>
</tbody>
</table>
Setting the Stack Member Priority Value

This optional task is available only from the active switch.

Follow these steps to assign a priority value to a stack member:

**SUMMARY STEPS**

1. enable
2. switch stack-member-number priority new-priority-number
3. show switch stack-member-number
4. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> switch stack-member-number priority new-priority-number</td>
<td>Specifies the stack member number and the new priority for the stack member. The stack member number range is 1 to 9. The priority value range is 1 to 15.</td>
</tr>
<tr>
<td>Example: Device# switch 3 priority 2</td>
<td>You can display the current priority value by using the show switch user EXEC command. The new priority value takes effect immediately but does not affect the current active switch. The new priority value helps determine which stack member is elected as the new active switch when the current active switch or switch stack resets.</td>
</tr>
<tr>
<td><strong>Step 3</strong> show switch stack-member-number</td>
<td>Verify the stack member priority value.</td>
</tr>
<tr>
<td>Example: Device# show switch</td>
<td></td>
</tr>
</tbody>
</table>
Provisioning a New Member for a Switch Stack

This optional task is available only from the active switch.

SUMMARY STEPS

1. show switch
2. configure terminal
3. switch stack-member-number provision type
4. end
5. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>show switch</code></td>
<td>Displays summary information about the switch stack.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# show switch</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack-member-number provision type</code></td>
<td>Specifies the stack member number for the preconfigured switch. By default, no switches are provisioned.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# switch 3 provision WS-xxxx</code></td>
<td>For <code>stack-member-number</code>, the range is 1 to 9. Specify a stack member number that is not already used in the switch stack. See Step 1.</td>
</tr>
<tr>
<td></td>
<td>For <code>type</code>, enter the model number of a supported switch that is listed in the command-line help strings.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
Removing Provisioned Switch Information

Before you begin, you must remove the provisioned switch from the stack. This optional task is available only from the active switch.

**SUMMARY STEPS**

1. configure terminal
2. no switch stack-member-number provision
3. end
4. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> no switch stack-member-number provision</td>
<td>Removes the provisioning information for the specified member.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# no switch 3 provision</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

If you are removing a provisioned switch in a stack with this configuration:

- The stack has four members
- Stack member 1 is the active switch
- Stack member 3 is a provisioned switch
and want to remove the provisioned information and to avoid receiving an error message, you can remove power from stack member 3, disconnect the StackWise-160 cables between the stack member 3 and switches to which it is connected, reconnect the cables between the remaining stack members, and enter the `no switch stack-member-number provision` global configuration command.

### Displaying Incompatible Switches in the Switch Stack

**SUMMARY STEPS**

1. `show switch`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|        | show switch       | Displays any incompatible switches in the switch stack (indicated by a 'Current State' of 'V-Mismatch'). The V-Mismatch state identifies the switches with incompatible software. The output displays Lic-Mismatch for switches that are not running the same license level as the active switch. For information about managing license levels, see the `System Management Configuration Guide (Catalyst 3650 Switches)`.
|        | Example:          |         |
|        | `Device# show switch` |         |

### Upgrading an Incompatible Switch in the Switch Stack

**Before you begin**

- Ensure the switches are install booted.
- Ensure that the stack is connected in full ring mode.

**SUMMARY STEPS**

1. `software auto-upgrade`
2. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>software auto-upgrade</code></td>
<td>Upgrades incompatible switches in the switch stack, or changes switches in bundle mode to installed mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# software auto-upgrade</code></td>
<td></td>
</tr>
</tbody>
</table>
### Troubleshooting the Switch Stack

#### Temporarily Disabling a Stack Port

If a stack port is flapping and causing instability in the stack ring, to disable the port, enter the `switch stack-member-number stack port port-number disable` privileged EXEC command. To reenable the port, enter the `switch stack-member-number stack port port-number enable` command.

**Note**

Be careful when using the `switch stack-member-number stack port port-number disable` command. When you disable the stack port, the stack operates at half bandwidth.

A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state.

The stack is in the partial-ring state when the following occurs:

- All members are connected through their stack ports but some are not in the ready state.
- Some members are not connected through the stack ports.

### SUMMARY STEPS

1. `switch stack-member-number stack port port-number disable`
2. `switch stack-member-number stack port port-number enable`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack-member-number stack port port-number disable</code></td>
<td>Enables the specified stack port.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# switch 2 stack port 1 disable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack-member-number stack port port-number enable</code></td>
<td>Enables the stack port.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# switch 2 stack port 1 enable</td>
<td></td>
</tr>
</tbody>
</table>
When you disable a stack port and the stack is in the full-ring state, you can disable only one stack port. This message appears:

Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]

When you disable a stack port and the stack is in the partial-ring state, you cannot disable the port. This message appears:

Disabling stack port not allowed with current stack configuration.

### Reenabling a Stack Port While Another Member Starts

Stack Port 1 on Switch 1 is connected to Port 2 on Switch 4. If Port 1 is flapping, you can disable Port 1 with the `switch 1 stack port 1 disable` privileged EXEC command. While Port 1 on Switch 1 is disabled and Switch 1 is still powered on, follow these steps to reenable a stack port:

**Step 1** Disconnect the stack cable between Port 1 on Switch 1 and Port 2 on Switch 4.

**Step 2** Remove Switch 4 from the stack.

**Step 3** Add a switch to replace Switch 4 and assign it switch-number 4.

**Step 4** Reconnect the cable between Port 1 on Switch 1 and Port 2 on Switch 4 (the replacement switch).

**Step 5** Reenable the link between the switches. Enter the `switch 1 stack port 1 enable` privileged EXEC command to enable Port 1 on Switch 1.

**Step 6** Power on Switch 4.

---

**Caution**

Powering on Switch 4 before enabling the Port 1 on Switch 1 might cause one of the switches to reload. If Switch 4 is powered on first, you might need to enter the `switch 1 stack port 1 enable` and the `switch 4 stack port 2 enable` privileged EXEC commands to bring up the link.

### Monitoring the Device Stack

**Table 178: Commands for Displaying Stack Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show switch</code></td>
<td>Displays summary information about the stack, including the status of provisioned switches and switches in version-mismatch mode.</td>
</tr>
<tr>
<td><code>show switch</code></td>
<td>Displays information about a specific member.</td>
</tr>
<tr>
<td><code>show switch stack-member-number</code></td>
<td>Displays information about a specific member.</td>
</tr>
<tr>
<td><code>show switch detail</code></td>
<td>Displays detailed information about the stack.</td>
</tr>
<tr>
<td><code>show switch neighbors</code></td>
<td>Displays the stack neighbors.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>show switch stack-ports</strong> [summary]</td>
<td>Displays port information for the stack. Use the <strong>summary</strong> keyword to display the stack cable length, the stack link status, and the loopback status.</td>
</tr>
<tr>
<td><strong>show redundancy</strong></td>
<td>Displays the redundant system and the current processor information. The redundant system information includes the system uptime, standby failures, switchover reason, hardware, configured and operating redundancy mode. The current processor information displayed includes the active location, the software state, the uptime in the current state and so on.</td>
</tr>
<tr>
<td><strong>show redundancy state</strong></td>
<td>Displays all the redundancy states of the active and standby devices.</td>
</tr>
</tbody>
</table>

**Configuration Examples for Switch Stacks**

**Switch Stack Configuration Scenarios**

Most of these switch stack configuration scenarios assume that at least two device are connected through their StackWise-160 ports.

*Table 179: Configuration Scenarios*

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active switch election specifically determined by existing active switches</td>
<td>Connect two powered-on switch stacks through the StackWise-160 ports. Only one of the two active switches becomes the new active switch.</td>
</tr>
<tr>
<td>Active switch election specifically determined by the stack member priority value</td>
<td>1. Connect two switches through their StackWise-160 ports. The stack member with the higher priority value is elected active switch. 2. Use the <strong>switch</strong> stack-member-number <strong>priority</strong> new-priority-number global configuration command to set one stack member with a higher member priority value. 3. Restart both stack members at the same time.</td>
</tr>
<tr>
<td>Scenario</td>
<td>Result</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active switch election specifically determined by the configuration file</td>
<td>Assuming that both stack members have the same priority value:</td>
</tr>
<tr>
<td>1. Make sure that one stack member has a default configuration and that the other stack member has a saved (nondefault) configuration file.</td>
<td></td>
</tr>
<tr>
<td>2. Restart both stack members at the same time.</td>
<td>The stack member with the saved configuration file is elected active switch.</td>
</tr>
<tr>
<td>Active switch election specifically determined by the MAC address</td>
<td>Assuming that both stack members have the same priority value, configuration file, and feature set, restart both stack members at the same time.</td>
</tr>
<tr>
<td>Stack member number conflict</td>
<td>Assuming that one stack member has a higher priority value than the other stack member:</td>
</tr>
<tr>
<td>1. Ensure that both stack members have the same stack member number. If necessary, use the switch current-stack-member-number renumber new-stack-member-number global configuration command.</td>
<td></td>
</tr>
<tr>
<td>2. Restart both stack members at the same time.</td>
<td>The stack member with the higher priority value retains its stack member number. The other stack member has a new stack member number.</td>

</table>
Enabling the Persistent MAC Address Feature: Example

This example shows how to configure the persistent MAC address feature for a 7-minute time delay and to verify the configuration:

```
Device(config)# stack-mac persistent timer 7
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.
Device(config)# end
Device# show switch
Switch/Stack Mac Address : 0016.4727.a900
Mac persistency wait time: 7 mins
```

Provisioning a New Member for a Switch Stack: Example

This example shows how to provision a switch with a stack member number of 2 for the switch stack. The `show running-config` command output shows the interfaces associated with the provisioned switch:

```
Device(config)# switch 2 provision
Device(config)# end
Device# show running-config | include switch 2
! interface GigabitEthernet2/0/1
! interface GigabitEthernet2/0/2
! interface GigabitEthernet2/0/3
<output truncated>
```

show switch stack-ports summary Command Output: Example

Only Port 1 on stack member 2 is disabled.

```
Device# show switch stack-ports summary
Device#/ Stack Neighbor Cable Length Link Link Sync # In Changes To Link Loopback
Port# Status PORT Status OK OK OK To Link OK
-------- ----- ------ ------- ----- ---- -------- ------ ------ --------
1/1 OK     3      50 cm Yes Yes Yes 1 Yes 1 No
1/2 Down   None   3 m  Yes No Yes 1 No
2/1 Down   None   3 m  Yes No Yes 1 No
2/2 OK     3      50 cm Yes Yes Yes 1 Yes 1 No
3/1 OK     2      50 cm Yes Yes Yes 1 Yes 1 No
3/2 OK     1      50 cm Yes Yes Yes 1 Yes 1 No
```

</tbody>
</table>
Software Loopback with Connected Stack Cables: Examples

- On Port 1 on Switch 1, the port status is *Down*, and a cable is connected.
- On Port 2 on Switch 1, the port status is *Absent*, and no cable is connected.

```
Device# show switch stack-ports summary

Sw#/Port# Port Neighbor Cable Link Link Sync #Changes In
Status Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
1/1 Down None 50 Cm No No No 1 No
1/2 Absent None No cable No No No 1 No
```

- In a *physical loopback*, a cable connects both stack ports on a switch. You can use this configuration to test:
  - Cables on a switch that is running properly
  - Stack ports with a cable that works properly

```
Device# show switch stack-ports summary

Sw#/Port# Port Neighbor Cable Link Link Sync #Changes In
Status Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
2/1 OK 2 50 cm Yes Yes Yes 1 No
2/2 OK 2 50 cm Yes Yes Yes 1 No
```

The port status shows that:
  - Switch 2 is a standalone switch.
  - The ports can send and receive traffic.

Software Loopback with no Connected Stack Cable: Example

```
Device# show switch stack-ports summary

Sw#/Port# Port Neighbor Cable Link Link Sync #Changes In
Status Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
1/1 Absent None No cable No No No 1 Yes
1/2 Absent None No cable No No No 1 Yes
```

Finding a Disconnected Stack Cable: Example

Stack cables connect all stack members. Port 2 on Switch 1 connects to Port 1 on Switch 2.

This is the port status for the members:

```
Device# show switch stack-ports summary

Sw#/Port# Port Neighbor Cable Link Link Sync #Changes In
Status Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
```
Fixing a Bad Connection Between Stack Ports: Example

Stack cables connect all members. Port 2 on Switch 1 connects to Port 1 on Switch 2.

This is the port status:

<table>
<thead>
<tr>
<th>Sw#/Port#</th>
<th>Status</th>
<th>Neighbor</th>
<th>Cable Length</th>
<th>Link OK</th>
<th>Link Active</th>
<th>Link Sync</th>
<th>#Changes</th>
<th>In Loopback</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>OK</td>
<td>2</td>
<td>50 cm</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>1</td>
<td>No</td>

<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>2</td>
<td>No</td>
</tr>
<tr>
<td>2/1</td>
<td>Down</td>
<td>None</td>
<td>50 cm</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>2</td>
<td>No</td>
</tr>
<tr>
<td>2/2</td>
<td>OK</td>
<td>1</td>
<td>50 cm</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>1</td>
<td>No</td>
</tr>
</tbody>
</table>

If you disconnect the cable from Port 2 on Switch 1, these messages appear:

%STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 2 has changed to state DOWN

%STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 1 has changed to state DOWN

This is now the port status:

Device# show switch stack-ports summary

<table>
<thead>
<tr>
<th>Sw#/Port#</th>
<th>Status</th>
<th>Neighbor</th>
<th>Cable Length</th>
<th>Link OK</th>
<th>Link Active</th>
<th>Link Sync</th>
<th>#Changes</th>
<th>In Loopback</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>OK</td>
<td>2</td>
<td>50 cm</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>1</td>
<td>No</td>
</tr>
<tr>
<td>1/2</td>
<td>Absent</td>
<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>2</td>
<td>No</td>
</tr>
<tr>
<td>2/1</td>
<td>Down</td>
<td>None</td>
<td>50 cm</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>2</td>
<td>No</td>
</tr>
<tr>
<td>2/2</td>
<td>OK</td>
<td>1</td>
<td>50 cm</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>1</td>
<td>No</td>
</tr>
</tbody>
</table>

Only one end of the cable connects to a stack port, Port 1 on Switch 2.

- The Stack Port Status value for Port 2 on Switch 1 is Absent, and the value for Port 1 on Switch 2 is Down.

- The Cable Length value is No cable.

Diagnosing the problem:

- Verify the cable connection for Port 2 on Switch 1.

- Port 2 on Switch 1 has a port or cable problem if
  - The In Loopback value is Yes.

  or

  - The Link OK, Link Active, or Sync OK value is No.
Diagnosing the problem:

- The Stack Port Status value is Down.
- Link OK, Link Active, and Sync OK values are No.
- The Cable Length value is 50 cm. The switch detects and correctly identifies the cable.

The connection between Port 2 on Switch 1 and Port 1 on Switch 2 is unreliable on at least one of the connector pins.

CHAPTER 112

Configuring Cisco NSF with SSO

• Finding Feature Information, on page 2275
• Prerequisites for NSF with SSO, on page 2275
• Restrictions for NSF with SSO, on page 2276
• Information About NSF with SSO, on page 2276
• How to Configure Cisco NSF with SSO, on page 2282

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for NSF with SSO

The following are prerequisites and considerations for configuring NSF with SSO.

• Use of the routing protocols requires the IP Services license level. EIGRP-stub and OSPF for routed access are supported on IP Base license level.

• BGP support in NSF requires that neighbor networking devices be NSF-aware; that is, the devices must have the graceful restart capability and advertise that capability in their OPEN message during session establishment. If an NSF-capable router discovers that a particular BGP neighbor does not have graceful restart capability, it does not establish an NSF-capable session with that neighbor. All other neighbors that have graceful restart capability continue to have NSF-capable sessions with this NSF-capable networking device.

• OSPF support in NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers that it has non-NSF-aware neighbors on a particular network segment, it disables NSF capabilities for that segment. Other network segments composed entirely of NSF-capable or NSF-aware routers continue to provide NSF capabilities.
Restrictions for NSF with SSO

The following are restrictions for configuring NSF with SSO:

- NSF capability is supported for IPv4 routing protocols only. NSF capability is not supported for IPv6 routing protocols.
- NSF does not support IP Multicast Routing, as it is not SSO-aware.
- NSF is not supported if the IOS-XE software is running in the LAN Base mode.
- For NSF operation, you must have SSO configured on the device.
- NSF with SSO supports IP Version 4 traffic and protocols only; NSF with SSO does not support IPv6 traffic.
- All Layer 3 neighboring devices must be NSF Helper or NSF-capable to support graceful restart capability.
- For IETF, all neighboring devices must be running an NSF-aware software image.

Information About NSF with SSO

Overview of NSF with SSO

The switch supports fault resistance by allowing a standby switch to take over if the active switch becomes unavailable. Cisco nonstop forwarding (NSF) works with stateful switchover (SSO) to minimize the amount of time a network is unavailable.

NSF provides these benefits:

- Improved network availability—NSF continues forwarding network traffic and application state information so that user session information is maintained after a switchover.
- Overall network stability—Network stability may be improved with the reduction in the number of route flaps, which were created when routers in the network failed and lost their routing tables.
- Neighboring routers do not detect a link flap—Because the interfaces remain up during a switchover, neighboring routers do not detect a link flap (the link does not go down and come back up).
- Prevents routing flaps—Because SSO continues forwarding network traffic during a switchover, routing flaps are avoided.
- Maintains user sessions established prior to the switchover.

Keepalive messages are sent and received between the active and standby switches.

- If the standby switch does not respond, a new standby switch is elected.
- If the active switch does not respond, the standby switch becomes the active switch.

In addition, hello messages are sent and received by all stack members.

- If a stack member does not respond, that member is removed from the stack.
• If the standby switch does not respond, a new standby switch is elected.
• If the active switch does not respond, the standby switch becomes the active switch.

**SSO Operation**

When a standby switch runs in SSO mode, the standby switch starts up in a fully-initialized state and synchronizes with the persistent configuration and the running configuration of the active switch. It subsequently maintains the state on the protocols listed below, and all changes in hardware and software states for features that support stateful switchover are kept in synchronization. Consequently, it offers minimum interruption to Layer 2 sessions in a redundant active switch configuration.

If the active switch fails, the standby switch becomes the active switch. This new active switch uses existing Layer 2 switching information to continue forwarding traffic. Layer 3 forwarding will be delayed until the routing tables have been repopulated in the newly active switch.

---

**Note**

SSO Layer 2 Only is supported if the IOS-XE software is running the LAN Base license level.

The state of these features is preserved between both the active and standby switches:

• 802.3
• 802.3u
• 802.3x (Flow Control)
• 802.3ab (GE)
• 802.3z (Gigabit Ethernet including CWDM)
• 802.3ad (LACP)
• 802.1p (Layer 2 QoS)
• 802.1q
• 802.1X (Authentication)
• 802.1D (Spanning Tree Protocol)
• 802.3af (Inline power)
• PAgP
• VTP
• Dynamic ARP Inspection
• DHCP
• DHCP snooping
• IP source guard
• IGMP snooping (versions 1 and 2)
SSO is compatible with the following list of features. However, the protocol database for these features is not synchronized between the standby and active switches:

- 802.1Q tunneling with Layer 2 Protocol Tunneling (L2PT)
- Baby giants
- Jumbo frame support
- CDP
- Flood blocking
- UDLD
- SPAN/RSPAN
- NetFlow

All Layer 3 protocols on a switch are learned on the standby switch if SSO is enabled.

**NSF Operation**

Cisco IOS Nonstop Forwarding (NSF) always runs with stateful switchover (SSO) and provides redundancy for Layer 3 traffic. NSF is supported by the BGP, OSPF, and EIGRP routing protocols and is supported by Cisco Express Forwarding (CEF) for forwarding. The routing protocols have been enhanced with NSF-capability and awareness, which means that routers running these protocols can detect a switchover and take the necessary actions to continue forwarding network traffic and to recover route information from the peer devices.

Each protocol depends on CEF to continue forwarding packets during switchover while the routing protocols rebuild the Routing Information Base (RIB) tables. After the routing protocols have converged, CEF updates the FIB table and removes stale route entries. CEF then updates the hardware with the new FIB information.

If the active switch is configured for BGP (with the **graceful-restart** command), OSPF, or EIGRP routing protocols, routing updates are automatically sent during the active switch election.
The switch supports NSF-awareness and NSF-capability for the BGP, OSPF, and EIGRP protocols in IP Services license level and NSF-awareness for the EIGRP-stub in IP Base license level.

NSF has two primary components:

- NSF-awareness

A networking device is NSF-aware if it is running NSF-compatible software. If neighboring router devices detect that an NSF router can still forward packets when an active switch election happens, this capability is referred to as NSF-awareness. Cisco IOS enhancements to the Layer 3 routing protocols (BGP, OSPF, and EIGRP) are designed to prevent route-flapping so that the CEF routing table does not time out or the NSF router does not drop routes. An NSF-aware router helps to send routing protocol information to the neighboring NSF router. NSF-awareness is enabled by default for EIGRP-stub, EIGRP, and OSPF protocols. NSF-awareness is disabled by default for BGP.

- NSF-capability

A device is NSF-capable if it has been configured to support NSF; it rebuilds routing information from NSF-aware or NSF-capable neighbors. NSF works with SSO to minimize the amount of time that a Layer 3 network is unavailable following an active switch election by continuing to forward IP packets. Reconvergence of Layer 3 routing protocols (BGP, OSPFv2, and EIGRP) is transparent to the user and happens automatically in the background. The routing protocols recover routing information from neighbor devices and rebuild the Cisco Express Forwarding (CEF) table.

**Cisco Express Forwarding**

A key element of Cisco IOS Nonstop Forwarding (NSF) is packet forwarding. In a Cisco networking device, packet forwarding is provided by Cisco Express Forwarding (CEF). CEF maintains the FIB and uses the FIB information that was current at the time of the switchover to continue forwarding packets during a switchover. This feature reduces traffic interruption during the switchover.

During normal NSF operation, CEF on the active supervisor switch synchronizes its current FIB and adjacency databases with the FIB and adjacency databases on the standby switch. Upon switchover, the standby switch initially has FIB and adjacency databases that are mirror images of those that were current on the active switch. CEF keeps the forwarding engine on the standby switch current with changes that are sent to it by CEF on the active switch. The forwarding engine can continue forwarding after a switchover as soon as the interfaces and a data path are available.

As the routing protocols start to repopulate the RIB on a prefix-by-prefix basis, the updates cause prefix-by-prefix updates to CEF, which it uses to update the FIB and adjacency databases. Existing and new entries receive the new version (“epoch”) number, indicating that they have been refreshed. The forwarding information is updated on the forwarding engine during convergence. The switch signals when the RIB has converged. The software removes all FIB and adjacency entries that have an epoch older than the current switchover epoch. The FIB now represents the newest routing protocol forwarding information.

**BGP Operation**

When an NSF-capable router begins a BGP session with a BGP peer, it sends an OPEN message to the peer. Included in the message is a statement that the NSF-capable device has “graceful” restart capability. Graceful restart is the mechanism by which BGP routing peers avoid a routing flap following a switchover. If the BGP peer has received this capability, it is aware that the device sending the message is NSF-capable. Both the NSF-capable router and its BGP peers need to exchange the graceful restart capability in their OPEN messages
at the time of session establishment. If both the peers do not exchange the graceful restart capability, the session will not be capable of a graceful restart.

If the BGP session is lost during the active switch switchover, the NSF-aware BGP peer marks all the routes associated with the NSF-capable router as stale; however, it continues to use these routes to make forwarding decisions for a set period of time. This functionality prevents packets from being lost while the newly active switch is waiting for convergence of the routing information with the BGP peers.

After an active switch switchover occurs, the NSF-capable router reestablishes the session with the BGP peer. In establishing the new session, it sends a new graceful restart message that identifies the NSF-capable router as having restarted.

At this point, the routing information is exchanged between the two BGP peers. After this exchange is complete, the NSF-capable device uses the routing information to update the RIB and the FIB with the new forwarding information. The NSF-aware device uses the network information to remove stale routes from its BGP table; the BGP protocol then is fully converged.

If a BGP peer does not support the graceful restart capability, it ignores the graceful restart capability in an OPEN message but establishes a BGP session with the NSF-capable device. This function allows interoperability with non-NSF-aware BGP peers (and without NSF functionality), but the BGP session with non-NSF-aware BGP peers is not capable of a graceful restart.

---

**Note**

BGP support in NSF requires that neighbor networking devices be NSF-aware; that is, the devices must have the graceful restart capability and advertise that capability in their OPEN message during session establishment. If an NSF-capable router discovers that a particular BGP neighbor does not have graceful restart capability, it does not establish an NSF-capable session with that neighbor. All other neighbors that have graceful restart capability continue to have NSF-capable sessions with this NSF-capable networking device.

---

**OSPF Operation**

When an OSPF NSF-capable router performs an active switch switchover, it must perform the following tasks in order to resynchronize its link state database with its OSPF neighbors:

- Relearn the available OSPF neighbors on the network without causing a reset of the neighbor relationship
- Reacquire the contents of the link state database for the network

As quickly as possible after an active switch switchover, the NSF-capable router sends an OSPF NSF signal to neighboring NSF-aware devices. Neighbor networking devices recognize this signal as an indicator that the neighbor relationship with this router should not be reset. As the NSF-capable router receives signals from other routers on the network, it can begin to rebuild its neighbor list.

After neighbor relationships are reestablished, the NSF-capable router begins to resynchronize its database with all of its NSF-aware neighbors. At this point, the routing information is exchanged between the OSPF neighbors. Once this exchange is complete, the NSF-capable device uses the routing information to remove stale routes, update the RIB, and update the FIB with the new forwarding information. The OSPF protocols are then fully converged.
OSPF support in NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers that it has non-NSF-aware neighbors on a particular network segment, it disables NSF capabilities for that segment. Other network segments composed entirely of NSF-capable or NSF-aware routers continue to provide NSF capabilities.

**EIGRP Operation**

When an EIGRP NSF-capable router initially re-boots after an NSF restart, it has no neighbor and its topology table is empty. The router is notified by the standby (now active) switch when it needs to bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables. The restarting router and its peers must accomplish these tasks without interrupting the data traffic directed toward the restarting router. EIGRP peer routers maintain the routes learned from the restarting router and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the restarting router uses a new Restart (RS) bit in the EIGRP packet header to indicate a restart. The RS bit is set in the hello packets and in the initial INIT update packets during the NSF restart period. The RS bit in the hello packets allows the neighbors to be quickly notified of the NSF restart. Without seeing the RS bit, the neighbor can only detect an adjacency reset by receiving an INIT update or by the expiration of the hello hold timer. Without the RS bit, a neighbor does not know if the adjacency reset should be handled using NSF or the normal startup method.

When the neighbor receives the restart indication, either by receiving the hello packet or the INIT packet, it recognizes the restarting peer in its peer list and maintains the adjacency with the restarting router. The neighbor then sends its topology table to the restarting router with the RS bit set in the first update packet indicating that it is NSF-aware and is helping out the restarting router. The neighbor does not set the RS bit in their hello packets, unless it is also a NSF restarting neighbor.

A router may be NSF-aware but may not be helping the NSF restarting neighbor because booting from a cold start.

If at least one of the peer routers is NSF-aware, the restarting router would then receive updates and rebuild its database. The restarting router must then find out if it had converged so that it can notify the routing information base (RIB). Each NSF-aware router is required to send an end of table (EOT) marker in the last update packet to indicate the end of the table content. The restarting router knows it has converged when it receives the EOT marker. The restarting router can then begin sending updates.

An NSF-aware peer would know when the restarting router had converged when it receives an EOT indication from the restarting router. The peer then scans its topology table to search for the routes with the restarted neighbor as the source. The peer compares the route timestamp with the restart event timestamp to determine if the route is still available. The peer then goes active to find alternate paths for the routes that are no longer available through the restarted router.

When the restarting router has received all EOT indications from its neighbors or when the NSF converge timer expires, EIGRP notifies the RIB of convergence. EIGRP waits for the RIB convergence signal and then floods its topology table to all awaiting NSF-aware peers.
How to Configure Cisco NSF with SSO

Configuring SSO

You must configure SSO in order to use NSF with any supported protocol.

SUMMARY STEPS

1. redundancy
2. mode sso
3. end
4. show running-config
5. show redundancy states

DETAILED STEPS

<table>
<thead>
<tr>

```
Configuring BGP for NSF

You must configure BGP graceful restart on all peer devices participating in BGP NSF.

SUMMARY STEPS

1. configure terminal
2. router bgp as-number
3. bgp graceful-restart

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>router bgp as-number</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# router bgp 300</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>bgp graceful-restart</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# bgp graceful-restart</td>
<td></td>
</tr>
</tbody>
</table>

Verifying BGP NSF

To verify BGP NSF, you must check that BGP graceful restart is configured on the SSO-enabled networking device and on the neighbor devices. To verify, follow these steps:

Step 1
Verify that “bgp graceful-restart” appears in the BGP configuration of the SSO-enabled switch by entering the `show running-config` command:

Example:

Device# show running-config
...```
Step 2  Repeat Step 1 on each of the BGP neighbors.

Step 3  On the SSO device and the neighbor device, verify that the graceful restart function is shown as both advertised and received, and confirm the address families that have the graceful restart capability. If no address families are listed, BGP NSF does not occur either:

Example:

```
Device# show ip bgp neighbors
BGP neighbor is 192.0.2.3, remote AS 1, internal link
BGP version 4, remote router ID 192.0.2.4
BGP state - Established, up for 00:02:38
Last read 00:00:38, last write 00:00:35, hold time is 180, keepalive interval is 60 seconds
Neighbor capabilities:
Route refresh: advertised and received(new)
Address family IPv4 Unicast: advertised and received
Message statistics:
InQ depth is 0
OutQ depth is 0
Sent Rcvd
Opens: 1 1
Notifications: 0 0
Updates: 0 0
Keepalives: 4 4
Route Refresh: 0 0
Total: 5 5
Default minimum time between advertisement runs is 0 seconds
```

Configuring OSPF NSF

All peer devices participating in OSPF NSF must be made OSPF NSF-aware, which happens automatically when you install an NSF software image on the device.

SUMMARY STEPS

1. configure terminal
2. router ospf processID
3. nsf

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# configure</td>
<td></td>
</tr>
<tr>
<td>terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 router ospf processID</td>
<td>Enables an OSPF routing process, which places the switch in router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# router ospf</td>
<td></td>
</tr>
<tr>
<td>processID</td>
<td></td>
</tr>
</tbody>
</table>
### Verifying OSPF NSF

#### Step 1
Verify that ‘nsf’ appears in the OSPF configuration of the SSO-enabled device by entering the show running-config command:

**Example:**
```
Device(config)# show running-config
route ospf 120
    log-adjacency-changes
    nsf
    network 192.0.2.0 192.0.2.255 area 0
    network 192.0.2.1 192.0.2.255 area 1
    network 192.0.2.2 192.0.2.255 area 2
```

#### Step 2
Enter the `show ip ospf` command to verify that NSF is enabled on the device:

**Example:**
```
Device# show ip ospf
Routing Process "ospf 1" with ID 192.0.2.1
Start time: 00:02:07.532, Time elapsed: 00:39:05.052
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
transit capable is 0
External flood list length 0
IETF Non-Stop Forwarding enabled
restart-interval limit: 120 sec
IETF NSF helper support enabled
Cisco NSF helper support enabled
Reference bandwidth unit is 100 mbps
Area BACKBONE(0)
Number of interfaces in this area is 3 (1 loopback)
Area has no authentication
SPF algorithm last executed 00:08:53.760 ago
SPF algorithm executed 2 times
Area ranges are
Number of LSA 3. Checksum Sum 0x025BE0
Number of opaque link LSA 0. Checksum Sum 0x000000
Number of DCbitless LSA 0
Number of indication LSA 0
Number of DoNotAge LSA 0
Flood list length 0
```
Configuring EIGRP NSF

SUMMARY STEPS

1. configure terminal
2. router eigrp as-number
3. nsf

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;Example:&lt;br&gt;Device configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>router eigrp as-number</strong>&lt;br&gt;Example:&lt;br&gt;Device(config)# router eigrp as-number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>nsf</strong>&lt;br&gt;Example:&lt;br&gt;Device(config-router)# nsf</td>
</tr>
</tbody>
</table>

Verifying EIGRP NSF

**Step 1**  Verify that “nsf” appears in the EIGRP configuration of the SSO-enabled device by entering the show **running-config** command:<br><br>Example:<br>Device show running-config<br>..<br>router eigrp 100<br>auto-summary<br>nsf<br>..

**Step 2**  Enter the **show ip protocols** command to verify that NSF is enabled on the device:<br><br>Example:<br>Device show ip protocols<br>*** IP Routing is NSF aware ***<br>Routing Protocol is "ospf 1"<br>Outgoing update filter list for all interfaces is not set<br>Incoming update filter list for all interfaces is not set<br>Router ID 192.0.2.3<br>Number of areas in this router is 1. 1 normal 0 stub 0 nssa<br>Maximum path: 1
Routing for Networks:

CHAPTER 113

Configuring Wireless High Availability

- Finding Feature Information, on page 2289
- Information about High Availability, on page 2289
- Information About Redundancy, on page 2290
- Information about Access Point Stateful Switch Over, on page 2292
- Initiating Graceful Switchover, on page 2292
- Configuring EtherChannels for High Availability, on page 2293
- Configuring LACP, on page 2293
- Troubleshooting High Availability, on page 2294

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about High Availability

The high availability feature is enabled by default when the devices are connected using the stack cable and the Cisco StackWise-160 technology is enabled. You cannot disable it; however, you can initiate a manual graceful-switchover using the command line interface to use the high availability feature enabled in the .

In Cisco Wireless LAN Controllers, high availability is achieved with redundancy.

In Cisco Wireless LAN Controllers, redundancy is achieved in two ways—n+1 and AP SSO redundancy.

Keepalive messages are sent and received between the active and standby controllers.

- If the standby controller does not respond, a new standby controller is elected.
- If the active controller does not respond, the standby controller becomes the active controller.

In addition, hello messages are sent and received by all stack members.

- If a stack member does not respond, that member is removed from the stack.
• If the standby controller does not respond, a new standby controller is elected.
• If the active controller does not respond, the standby controller becomes the active controller.

Information About Redundancy

In case of n+1 redundancy, access points are configured with primary, secondary, and tertiary controllers. When the primary controller fails, depending upon the number of access points managed by a controller, the access point fails over to the secondary controller. In case of AP SSO redundancy, once the primary controller is unavailable, the access points re-discovers the controller and reestablishes the CAPWAP tunnel with the secondary controller. However, all clients must disconnect and a re-authentication is performed to rejoin the controller.

You can configure primary, secondary, and tertiary controllers for a selected access point and a selected controller.

In an ideal high availability deployment, you can have access points connected to primary and secondary controllers and one controller can remain without connection to any access points. This way the controller that does not have any access points can take over when a failure occurs and resume services of active controller.

Configuring Redundancy in Access Points

You must use the commands explained in this section to configure primary, secondary, or tertiary controllers for a selected access point.

Before you begin

SUMMARY STEPS

1. conf t
2. ap capwap backup primary
3. ap capwap backup secondary
4. ap capwap backup tertiary

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>conf t</td>
<td>Configures the terminal</td>
</tr>
<tr>

<td>Controller # conf t</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>ap capwap backup primary</td>
<td>Configures the primary controller for the selected access point.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Controller # ap capwap backup primary WLAN-Controller-A</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ap capwap backup secondary</td>
<td>Configures the secondary controller for the selected access point.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controller # ap capwap backup secondary WLAN-Controller-B</td>
<td>Configure the tertiary controller for the selected access point.</td>
</tr>
</tbody>
</table>

#### Step 4

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap capwap backup tertiary</td>
<td>Configures the tertiary controller for the selected access point.</td>
</tr>
</tbody>
</table>

---

**What to do next**

Once you complete configuration of the primary, secondary, and tertiary controllers for a selected access point, you must verify the configuration using the `show ap name AP-NAME` command. For more details on, `show ap name AP-NAME` command, see the Lightweight Access Point Configuration Guide for Cisco Wireless LAN Controller.

---

### Configuring Heartbeat Messages

Heartbeat messages enable you to reduce the controller failure detection time. When a failure occurs, a switchover from active to hot standby happens after the controller waits for the heartbeat timer. If the controller does not function within the heartbeat time, then the standby takes over as then active controller. Ideally the access point generates three heartbeat messages within the time out value specified, and when the controller does not respond within the timeout value, the standby controller takes over as active. You can specify the timeout value depending on your network. Ideally the timer value is not a higher value as some chaos will occur while performing a switchover. This section explains on how to configure heartbeat interval between the controller and the access points using a timeout value to reduce the controller failure detection time.

#### Before you begin

**SUMMARY STEPS**

1. `conf t`
2. `ap capwap timers heartbeat-timeout`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configures the terminal.</td>
</tr>
<tr>
<td><code>conf t</code></td>
<td></td>

</tbody>
</table>
Information about Access Point Stateful Switch Over

An Access Point Stateful Switch Over (AP SSO) implies that all the access point sessions are switched over state-fully and the user session information is maintained during a switchover, and access points continue to operate in network with no loss of sessions, providing improved network availability. The active in the stack is equipped to perform all network functions, including IP functions and routing information exchange. The supports 1000 access points and 12000 clients.

However, all the clients are de-authenticated and need to be re-associated with the new active except for the locally switched clients in FlexConnect mode when a switchover occurs.

Once a redundancy pair is formed while in a stack, high availability is enabled, which includes that access points continue to remain connected during an active-to-standby switchover.

---

**Note**

You can not disable AP SSO while in a stack once the devices form a redundant pair.

---

**Note**

After switchover new standby gets reloaded during stack formation, this is due to bulk sync failure. This is seen after reload, 2nd attempt to form stack successfully. This happens when you execute the command `exception dump device second flash` which is used to enable, dump crashfile on flash when crashinfo directory is full. When crash occurs and if there is no space left in crashinfo, it proceeds to store the fullcore or crash files into flash.

---

Initiating Graceful Switchover

To perform a manual switchover and to use the high availability feature enabled in the, execute the `redundancy force-switchover` command. This command initiates a graceful switchover from the active to the standby.

```
Device# redundancy force-switchover
System configuration has been modified. Save ? [yes/no] : yes
Building configuration ...
Preparing for switchover ...
Compressed configuration from 14977 bytes to 6592 bytes[OK]This will reload the active unit and force switchover to standby[confirm] : y
```

---

**SUMMARY STEPS**

1. 

---

<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
</tbody>
</table>
Configuring EtherChannels for High Availability

The LAG, or an EtherChannel, bundles all the existing ports in both the standby and active units into a single logical port to provide an aggregate bandwidth of 60 Gbps. The creation of an EtherChannel enables protection against failures. The EtherChannels or LAGs created are used for link redundancy to ensure high availability of access points.

For more details on configuring EtherChannel, and Etherchannel modes, see the Layer 2 (Link Aggregation) Configuration Guide, Cisco IOS XE Release 3SE (Cisco WLC 5700 Series)

### Step 1
Connect two devices that are in powered down state using the stack cable.

### Step 2
Power up and perform a boot on both devices simultaneously or power and boot one.

The devices boot up successfully, and form a high availability pair.

### Step 3
Configure EtherChannel or LAG on the units.

### Step 4
Use the `show etherchannel summary` command to view the status of the configured EtherChannel.

On successful configuration, all the specified ports will be bundled in a single channel and listed in the command output of `show etherchannel summary`.

### Step 5
Execute the `show ap uptime` command to verify the connected access points.

---

Configuring LACP

**SUMMARY STEPS**

1. `configure terminal`
2. `interface port-channel number`
3. `lacp max-bundle number`
4. `lacp port-priority number`
5. `switchport backup interface po2`
6. `end`
7. `show etherchannel summary`
8. `show interfaces switchport backup`

**DETAILED STEPS**

### Before a Switchover

A switchover happens when the active fails; however, while performing a manual switchover, you can execute these commands to initiate a successful switchover:

### Summary Steps

1. show redundancy states
2. show switch detail
3. show platform ses states
4. show ap summary
5. show capwap detail
6. show dtls database-brief
7. show power inline
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show redundancy states</td>
<td>Displays the high availability role of the active and standby devices.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show redundancy states</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> show switch detail</td>
<td>Display physical property of the stack. Verify if the physical states of the stacks are &quot;Ready&quot; or &quot;Port&quot;.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show switch detail</td>

</tbody>
</table>

**Note** When a failover occurs, the standby controller must be in a standby-hot state and the redundant port in a terminal state in SSO for successful switchover to occur.

### After a Switchover

This section defines the steps that you must perform to ensure that successful switchover from the active to standby is performed. On successful switchover of the standby as active, all access points connected to the active need to re-join the standby (then active).

### Summary Steps

1. show ap uptime
2. show wireless summary
3. show wcdb database all
4. show power inline

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Administering the Device

System Time and Date Management

You can manage the system time and date on your device using automatic configuration methods (RTC and NTP), or manual configuration methods.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference on Cisco.com.
System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- NTP
- Manual configuration

The system clock can provide time to these services:

- User show commands
- Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a timesource considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative timesource, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative timesource. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The figure below shows a typical network example using NTP. Device A is the NTP master, with the Device B, C, and D configured in NTP server mode, in server association with Device A. Device E is configured as an NTP peer to the upstream and downstream Device, Device B and Device F, respectively.

Figure 134: Typical NTP Network Configuration

If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Stratum**

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.
NTP Associations

The communications between devices running NTP (known as *associations*) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

*Figure 135: Typical NTP Network Configuration*

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F.
If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

**NTP Version 4**

NTP version 4 is implemented on the device. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

For details about configuring NTPv4, see the Implementing NTPv4 in IPv6 chapter of the Cisco IOS IPv6 Configuration Guide, Release 12.4T.

**System Name and Prompt**

You configure the system name on the Device to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4 and the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4.

**Stack System Name and Prompt**

If you are accessing a stack member through the active switch, you must use the `session stack-member-number` privileged EXEC command. The stack member number range is . When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

**Default System Name and Prompt Configuration**

The default switch system name and prompt is Switch.
DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your device, you can substitute the hostname for the IP address with all IP commands, such as `ping`, `telnet`, `connect`, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a `com` domain name, so its domain name is `cisco.com`. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as `ftp.cisco.com`.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

Default DNS Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>

</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

Note

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4*.

Default Banner Configuration

The MOTD and login banners are not configured.

MAC Address Table

The MAC address table contains address information that the device uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the device learns and then ages when it is not in use.
• Static address—A manually entered unicast address that does not age and that is not lost when the device resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**Note**

For complete syntax and usage information for the commands used in this section, see the command reference for this release.

---

**MAC Address Table Creation**

With multiple MAC addresses supported on all ports, you can connect any port on the device to other network devices. The device provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the device updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the device maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The device sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the device forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The device always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

**MAC Addresses and VLANs**

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

**MAC Addresses and Device Stacks**

The MAC address tables on all stack members are synchronized. At any given time, each stack member has the same copy of the address tables for each VLAN. When an address ages out, the address is removed from the address tables on all stack members. When a Device joins a switch stack, that Device receives the addresses for each VLAN learned on the other stack members. When a stack member leaves the switch stack, the remaining stack members age out or remove all addresses learned by the former stack member.
Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

**Table 183: Default Settings for the MAC Address**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>

**ARP Table Management**

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.4 documentation on Cisco.com.

**How to Administer the Device**

**Configuring the Time and Date Manually**

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the device can synchronize, you do not need to manually set the system clock.

**Setting the System Clock**

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Follow these steps to set the system clock:

**SUMMARY STEPS**

1. `enable`
2. Use one of the following:
   - \texttt{clock set \textit{hh:mm:ss day month year}}
   - \texttt{clock set \textit{hh:mm:ss month day year}}

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>\texttt{enable}</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>\texttt{Example: Device&gt; enable}</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**  | Manually set the system clock using one of these formats: |
| Use one of the following: | • \textit{hh:mm:ss}—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured timezone. |
| \texttt{clock set \textit{hh:mm:ss day month year}} | • \textit{day}—Specifies the day by date in the month. |
| \texttt{clock set \textit{hh:mm:ss month day year}} | • \textit{month}—Specifies the month by name. |
| \texttt{Example: Device# clock set 13:32:00 23 March 2013} | • \textit{year}—Specifies the year (no abbreviation). |

**Configuring the Time Zone**

Follow these steps to manually configure the time zone:

**SUMMARY STEPS**

1. \texttt{enable}
2. \texttt{configure terminal}
3. \texttt{clock timezone zone hours-offset [minutes-offset]}
4. \texttt{end}
5. \texttt{show running-config}
6. \texttt{copy running-config startup-config}

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>\texttt{enable}</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>\texttt{Example: Device&gt; enable}</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**  | Enters global configuration mode. |
| \texttt{configure terminal} | |
| \texttt{Example:} | |
### Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

#### SUMMARY STEPS

1. enable
2. configure terminal
3. clock summer-time zone date date month year hh:mm date month year hh:mm [offset]
4. clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]
5. end
6. show running-config
7. copy running-config startup-config
# DETAILED STEPS

</tr>
<tr>
<td>Device(config)# clock summer-time PDT recurring 10 March 2013 2:00 3 November 2013 2:00</td>
<td></td>
</tr>
</tbody>
</table>

- **zone**—Specifies the name of the time zone (for example, PDT) to be displayed when summer time is in effect.
- (Optional) **week**—Specifies the week of the month (1 to 4, first, or last).
- (Optional) **day**—Specifies the day of the week (Sunday, Monday...).
- (Optional) **month**—Specifies the month (January, February...).
- (Optional) **hh:mm**—Specifies the time (24-hour format) in hours and minutes.
- (Optional) **offset**—Specifies the number of minutes to add during summer time. The default is 60.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

### SUMMARY STEPS

1. enable
2. configure terminal
3. clock summer-time zone date [month date year hh:mm month date year hh:mm [offset]] or clock summer-time zone date [date month year hh:mm date month year hh:mm [offset]]
4. end
5. show running-config
6. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring a System Name

Follow these steps to manually configure a system name:

### SUMMARY STEPS

1. enable
2. configure terminal

---

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 3 | **clock summer-time zone date [month date year hh:mm month date year hh:mm [offset]]** | Configures summer time to start on the first date and end on the second date. Summer time is disabled by default.  
   - For *zone*, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect.  
   - (Optional) For *week*, specify the week of the month (1 to 5 or last).  
   - (Optional) For *day*, specify the day of the week (Sunday, Monday...).  
   - (Optional) For *month*, specify the month (January, February...).  
   - (Optional) For *hh:mm*, specify the time (24-hour format) in hours and minutes.  
   - (Optional) For *offset*, specify the number of minutes to add during summer time. The default is 60. |
| 4 | **end** | Returns to privileged EXEC mode.  
   **Example:**  
   Device(config)# **end** |
| 5 | **show running-config** | Verifies your entries.  
   **Example:**  
   Device# **show running-config** |
| 6 | **copy running-config startup-config** | (Optional) Saves your entries in the configuration file.  
   **Example:**  
   Device# **copy running-config startup-config** |
3. `hostname name`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`          | Enables privileged EXEC mode.  
Example:  
Device> `enable`  
|      |                   | - Enter your password if prompted. |
| 2    | `configure terminal` | Enters global configuration mode.  
Example:  
Device# `configure terminal` |
| 3    | `hostname name`   | Configures a system name. When you set the system name, it is also used as the system prompt.  
The default setting is Switch.  
The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.  
Example:  
Device(config)# `hostname remote-users` |
| 4    | `end`             | Returns to privileged EXEC mode.  
Example:  
remote-users(config)# `end`  
remote-users# |
| 5    | `show running-config` | Verifies your entries.  
Example:  
Device# `show running-config` |
| 6    | `copy running-config startup-config` | (Optional) Saves your entries in the configuration file.  
Example:  
Device# `copy running-config startup-config` |
Setting Up DNS

If you use the device IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip domain-name name`
4. `ip name-server server-address1 [server-address2 ... server-address6]`
5. `ip domain-lookup [nsap | source-interface interface]`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device&gt; enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip domain-name name</code></td>
<td>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name).</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device(config)# ip domain-name Cisco.com</code></td>
<td>Do not include the initial period that separates an unqualified name from the domain name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>At boot time, no domain name is configured; however, if the device configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip name-server server-address1 [server-address2 ... server-address6]</code></td>
<td>Specifies the address of one or more name servers to use for name and address resolution.</td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

Device(config)# ip name-server 192.168.1.100
192.168.1.200 192.168.1.300

**Purpose:**
You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The device sends DNS queries to the primary server first. If that query fails, the backup servers are queried.

---

**Step 5** ip domain-lookup [nsap | source-interface interface]

**Example:**

Device(config)# ip domain-lookup

(Optional) Enables DNS-based hostname-to-address translation on your device. This feature is enabled by default.

If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).

---

**Step 6** end

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

---

**Step 7** show running-config

**Example:**

Device# show running-config

Verifies your entries.

---

**Step 8** copy running-config startup-config

**Example:**

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

### Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the device.

Follow these steps to configure a MOTD login banner:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. banner motd *message* c
4. end
5. show running-config
6. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> banner motd c message c</td>
<td>Specifies the message of the day.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# banner motd #</td>
<td>c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.</td>
</tr>
<tr>
<td>This is a secure site. Only</td>
<td>message—Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>
<tr>
<td>authorized users are allowed.</td>
<td></td>
</tr>
<tr>
<td>For access, contact technical</td>
<td></td>
</tr>
<tr>
<td>support.</td>
<td></td>
</tr>
<tr>
<td>#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Follow these steps to configure a login banner:
SUMMARY STEPS

1. enable
2. configure terminal
3. banner login c message c
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal     | Enters global configuration mode.                                      |
| Example:                          |                                                                         |
| Device# configure terminal       |                                                                         |

| **Step 3** banner login c message c | Specifies the login message.                                          |
| Example:                           |                                                                         |
| Device(config)# banner login $     | c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. |
| Access for authorized users only. | message—Enters a login message up to 255 characters. You cannot use the delimiting character in the message. |
| Please enter your username and password. $ |                                                                         |

| **Step 4** end                     | Returns to privileged EXEC mode.                                       |
| Example:                           |                                                                         |
| Device(config)# end                |                                                                         |

| **Step 5** show running-config    | Verifies your entries.                                                 |
| Example:                           |                                                                         |
| Device# show running-config       |                                                                         |

| **Step 6** copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example:                                    |                                                                         |
Managing the MAC Address Table

Changing the Address Aging Time

Follow these steps to configure the dynamic address table aging time:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. mac address-table aging-time [0 10-1000000] [routed-mac | vlan vlan-id]
4. end
5. show running-config
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> mac address-table aging-time [0 10-1000000] [routed-mac</td>
<td>vlan vlan-id]</td>
</tr>
<tr>
<td>Example: Device(config)# mac address-table aging-time 500 vlan 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Configuring MAC Address Change Notification Traps

Follow these steps to configure the switch to send MAC address change notification traps to an NMS host:

SUMMARY STEPS

1. enable
2. configure terminal
3. snmp-server host host-addr community-string notification-type { informs | traps } {version {1 | 2c | 3}} {vrf vrf instance name}
4. snmp-server enable traps mac-notification change
5. mac address-table notification change
6. mac address-table notification change [interval value] [history-size value]
7. interface interface-id
8. snmp trap mac-notification change {added | removed}
9. end
10. show running-config
11. copy running-config startup-config

DETAILLED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

### Configuring MAC Address Change Notification Traps

**Command or Action**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>`snmp-server host host-addr community-string notification-type { informs</td>
<td>traps } {version {1</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# snmp-server host 172.20.10.10 traps private mac-notification</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>snmp-server enable traps mac-notification change</code></td>
<td>Enables the device to send MAC address change notification traps to the NMS.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# snmp-server enable traps mac-notification change</code></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>mac address-table notification change</code></td>
<td>Enables the MAC address change notification feature.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# mac address-table notification change</code></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><code>mac address-table notification change [interval value] [history-size value]</code></td>
<td>Enters the trap interval time and the history table size.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# mac address-table notification change interval 123</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# mac address-table notification change history-size 100</code></td>
<td></td>
</tr>
</tbody>
</table>

- **host-addr**—Specifies the name or address of the NMS.
- **traps** (the default)—Sends SNMP traps to the host.
- **informs**—Sends SNMP informs to the host.
- **version**—Specifies the SNMP version to support. Version 1, the default, is not available with informs.
- **community-string**—Specifies the string to send with the notification operation. Though you can set this string by using the `snmp-server host` command, we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.
- **notification-type**—Uses the `mac-notification` keyword.
- **vrf vrf instance name**—Specifies the VPN routing/forwarding instance for this host.

- **interval value**—Specifies the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second.
- **history-size value**—Specifies the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1.
## Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Follow these steps to configure the device to send MAC address-move notification traps to an NMS host:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
4. `snmp-server enable traps mac-notification move`
5. `mac address-table notification mac-move`
6. `end`
7. `show running-config`

### Command or Action | Purpose
---|---
**Step 7** | enters interface configuration mode, and specifies the Layer 2 interface on which to enable the SNMP MAC address notification trap.
- `interface interface-id`
- **Example:**
  - `Device(config)# interface gigabitethernet 1/0/2`

**Step 8** | enables the MAC address change notification trap on the interface.
- `snmp trap mac-notification change {added | removed}`
- **Example:**
  - `Device(config-if)# snmp trap mac-notification change added`

**Step 9** | returns to privileged EXEC mode.
- `end`
- **Example:**
  - `Device(config)# end`

**Step 10** | verifies your entries.
- `show running-config`
- **Example:**
  - `Device# show running-config`

**Step 11** | (Optional) saves your entries in the configuration file.
- `copy running-config startup-config`
- **Example:**
  - `Device# copy running-config startup-config`
8. copy running-config startup-config

DETAILED STEPS

<table>

</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `snmp-server host host-addr {traps</td>
<td>informs} {version {1</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# snmp-server host 172.20.10.10 traps private mac-notification</td>
<td>• host-addr—Specifies the name or address of the NMS.</td>
</tr>
<tr>
<td></td>
<td>• traps (the default)—Sends SNMP traps to the host.</td>
</tr>
<tr>
<td></td>
<td>• informs—Sends SNMP informs to the host.</td>
</tr>
<tr>
<td></td>
<td>• version—Specifies the SNMP version to support. Version 1, the default, is not available with informs.</td>
</tr>
<tr>
<td></td>
<td>• community-string—Specifies the string to send with the notification operation. Though you can set this string by using the <code>snmp-server host</code> command, we recommend that you define this string by using the <code>snmp-server community</code> command before using the <code>snmp-server host</code> command.</td>
</tr>
<tr>
<td></td>
<td>• notification-type—Uses the mac-notification keyword.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>snmp-server enable traps mac-notification move</code></td>
<td>Enables the device to send MAC address move notification traps to the NMS.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# snmp-server enable traps mac-notification move</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>mac address-table notification mac-move</code></td>
<td>Enables the MAC address move notification feature.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# mac address-table notification mac-move</td>
<td></td>
</tr>
</tbody>
</table>
Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

Follow these steps to configure the switch to send MAC address table threshold notification traps to an NMS host:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type
4. snmp-server enable traps mac-notification threshold
5. mac address-table notification threshold
6. mac address-table notification threshold [limit percentage] | [interval time]
7. end
8. show running-config
9. copy running-config startup-config

What to do next

To disable MAC address-move notification traps, use the `no snmp-server enable traps mac-notification move` global configuration command. To disable the MAC address-move notification feature, use the `no mac address-table notification mac-move` global configuration command.

You can verify your settings by entering the `show mac address-table notification mac-move` privileged EXEC commands.
## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server host host-addr {traps</td>
<td>informs} {version [1</td>

</table>
### Adding and Removing Static Address Entries

Follow these steps to add a static address:

#### SUMMARY STEPS
1. **enable**
2. **configure terminal**
3. **mac address-table static** `mac-addr` `vlan` `vlan-id` `interface` `interface-id`
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <strong>Device&gt; enable</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

### Example:

**Step 7**

**Purpose**

Returns to privileged EXEC mode.

**End**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device(config)# end</strong></td>
<td>• Enteryourpasswordifprompted.</td>
</tr>
</tbody>
</table>

**Step 8**

**Purpose**

Verifies your entries.

**show running-config**

**Example:**

**Device# show running-config**

**Step 9**

**Purpose**

(Optional) Saves your entries in the configuration file.

**copy running-config startup-config**

**Example:**

**Device# copy running-config startup-config**
**Purpose**

**Command or Action** | **Purpose**
--- | ---
**Step 2** | configure terminal
Example: Device# configure terminal
Enters global configuration mode.

**Step 3** | mac address-table static mac-addr vlan vlan-id interface interface-id
Example:
Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/0/1
Adds a static address to the MAC address table.
- *mac-addr*—Specifies the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.
- *vlan-id*—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
- *interface-id*—Specifies the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. For static multicast addresses, you can enter multiple interface IDs. For static unicast addresses, you can enter only one interface at a time, but you can enter the command multiple times with the same MAC address and VLAN ID.

**Step 4** | end
Example:
Device(config)# end
Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

**Step 5** | show running-config
Example:
Device# show running-config
Verifies your entries.

**Step 6** | copy running-config startup-config
Example:
Device# copy running-config startup-config
(Optional) Saves your entries in the configuration file.

**Configuring Unicast MAC Address Filtering**

Follow these steps to configure the Device to drop a source or destination unicast static address:

**SUMMARY STEPS**

1. enable
Configuring Unicast MAC Address Filtering

2. configure terminal
3. mac address-table static mac-addr vlan vlan-id drop
4. end
5. show running-config
6. copy running-config startup-config

</tbody>
</table>
Configuration Examples for Device Administration

Example: Setting the System Clock

This example shows how to manually set the system clock:

Device# clock set 13:32:00 23 July 2013

Examples: Configuring Summer Time

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

Device(config)# clock summer-time PDT recurring PST date 10 March 2013 2:00 3 November 2013 2:00

This example shows how to set summer time start and end dates:

Device(config)# clock summer-time PST date 20 March 2013 2:00 20 November 2013 2:00

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

Device(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Device(config)#

This example shows the banner that appears from the previous configuration:

Unix> telnet 192.0.2.15
Trying 192.0.2.15...
Connected to 192.0.2.15.
Escape character is '^]'.
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
User Access Verification

Password:

Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

Device(config)# banner login $
Access for authorized users only. Please enter your username and password.
$

Device(config)#

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
Device(config)# snmp-server enable traps mac-notification change
Device(config)# mac address-table notification change
Device(config)# mac address-table notification change interval 123
Device(config)# mac address-table notification change history-size 100
Device(config)# interface gigabitethernet 1/2/1
Device(config-if)# snmp trap mac-notification change added

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

Device(config)# snmp-server host 172.20.10.10 traps private mac-notification
Device(config)# snmp-server enable traps mac-notification threshold
Device(config)# mac address-table notification threshold
Device(config)# mac address-table notification threshold interval 123
Device(config)# mac address-table notification threshold limit 78

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:
You cannot associate the same static MAC address to multiple interfaces. If the command is executed again with a different interface, the static MAC address is overwritten on the new interface.

```
Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/1/1
```

**Example: Configuring Unicast MAC Address Filtering**

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Device(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

**Feature History and Information for Device Administration**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.3SE</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>
**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Information About Boot Integrity Visibility**

Boot integrity visibility allows Cisco's platform identity and software integrity information to be visible and actionable. Platform identity provides the platform’s manufacturing installed identity, and software integrity exposes boot integrity measurements that can be used to assess whether the platform has booted trusted code. During the boot process, the software creates a checksum record of each stage of the boot loader activities.

You can retrieve this record and compare it with a Cisco-certified record to verify if your software image is genuine. If the checksum values do not match, you may be running a software image that is either not certified by Cisco or has been altered by an unauthorized party.

**Verifying the software image and hardware**

This task describes how to retrieve the checksum record that was created during switch bootup. Enter the following commands in privileged EXEC mode.
On executing the following commands, you might see the message **% Please Try After Few Seconds** displayed on the CLI. This does not indicate a CLI failure, but indicates setting up of underlying infrastructure required to get the required output. It is recommended to wait for few minutes and then try the command again.

The messages **% Error retrieving SUDI certificate** and **% Error retrieving integrity data** signify a real CLI failure.

### SUMMARY STEPS

1. show platform sudi certificate [sign [nonce nonce]]
2. show platform integrity [sign [nonce nonce]]

### DETAILED STEPS

</tr>
</tbody>
</table>

### Verifying Platform Identity and Software Integrity

#### Verifying Platform Identity

The following example displays the Secure Unique Device Identity (SUDI) chain in PEM format. The first certificate is the Cisco Root CA 2048 and the second is the Cisco subordinate CA (ACT2 SUDI CA). Both certificates can be verified to match those published on https://www.cisco.com/security/pki/. The third is the SUDI certificate.

```
Device# show platform sudi certificate sign nonce 123

-----BEGIN CERTIFICATE-----
MIIDQzCAوغAgIBAgIQ/h7KCUU1UgW1amlt/3ANBgghkL9G90BAQUFADA1
MRyjFAYDVQQKEw1DaXnjbyBTexN2Z1zMRswGQYDVQQDEAxDaXnjbyBSb290IENB
IDIwNQwHhcNMDQwMjAxNzEyMjkwNTE0MjAyNTQyWjA1MRyjFAYDVQQK
Ew1DaXnjbyBTexN2Z1zMRswGQYDVQQDEAxDaXnjbyBSb290IENBIDiwNDgwegEg
MA8Cgs8S1i3DQEBAkQUA4IBDQAwggElAoIBAQCwmrmp68Kd6f1cba0ZmKUeIHo
xm7nVEA8v8CRLQccda8bnuorpu0HISEdovyD0My5jQAmHAKeN8hF570YQXJ
FcfjFPC01YmUQ61EqDGYeJU5Tm8sUxJszRZtKYS7McQr/4Neb7Y9JHcJ6r8qqBq9
VvYqDxFU14F1pYXOWqCZe+36ufiYjXWLbdL76zEypzPEApkXStizivMW/VgpSdH
```
The optional RSA 2048 signature is across the three certificates, the signature version and the user-provided nonce.

```plaintext
RSA PKCS#1v1.5 Sign ( <Nonce (UINT64)> || <Signature Version (UINT32)> || <Cisco Root CA 2048 cert (DER)> || <Cisco subordinate CA (DER)> || <SUDI certificate (DER)> }
```

Cisco management solutions are equipped with the ability to interpret the above output. However, a simple script using OpenSSL commands can also be used to display the identity of the platform and to verify the signature, thereby ensuring its Cisco unique device identity.

```plaintext
[linux-host:~] openssl x509 -in sudicert.pem -subject -noout
subject= /serialNumber=PID:WS-C3650-12X48UQ SN:FDO1946BG05/O=Cisco/OU=ACT-2 Lite SUDI/CN=WS-C3650-12X48UQ

Verifying Software Integrity

The following example displays the checksum record for the boot stages. The hash measurements are displayed for each of the three stages of software successively booted. These hashes can be compared against Cisco-provided reference values. An option to sign the output gives a verifier the ability to ensure the output is genuine and is not altered. A nonce can be provided to protect against replay attacks.

```
Device # show platform integrity sign nonce 456
Platform: WS-C3650-12X48UQ
Boot Loader Version: CAT3K_CAA Boot Loader (CAT3K_CAA-HBOOT-M) Version 4.16, engineering software (D)
Boot Loader Hash: DB5A686E9F4CE358481DE3AF8B9C762F0A6D4E3B4764DF2A351F176E3D7
D3C60EB85C02906BD8CF2B28228D0CF2A899EC6FE6675D696E4ABAC0D687C0609EYE2
Boot 0 Version: F01062R15.05081905-09-15
Boot 0 Hash: 6EF15CD54D3C66A6B644194A67B7ED57044C82E6ECC69793E77FEC1F6DEAD
OS Version: 2016-10-18_10_57_mundra
OS Hash: 4C85AEC89DA49D40BBF65B1F17269F55C08D8DEFB4140F981923AA961140293E1
3B3E668CECF38ED7F596CD858ACD4DE8EEF6538F59C1E243C3513530266ECD
PCR0: 90214167AFF35C062AC79272596566E9AB72578FCDAD0B917466835AAA7B2B0
PCR8: FC2CE1BC397F970089363DF372A218BB16A79822288FF5A7B64EAA8018EDE5F
Signature version: 1
Signature:
632A724F1A864E6F6B9E8724D2052B3157F45B7E547763E224A848E807CD73760587FF68
2526A8FE354A116CC98EDEBD9C659B99234753642EE4295808436837D01B22A4849BB3C07B6EB
B6770685F6D6BC855CD04531E19A389FEB358894DF4BCF7C0FC6906AC9133B61099DF507F316C1
BP9527F99867C7878FF9935SD1CA95BD511B0BDDC0CA90982889FEBDF1884793032A8E30072D
F3D9D56880BAE89B777CFC0E301D35A167571FC2700E2F75911836D6551A85E154C5F52555
9165E6DF72DF73392F777AEB796BF9AC04C581ADEF19CA489A8620BB58A79B32DA8B3BFB1CF
8399468A096E2FC854883E35115EE3FE2C5ABDB5A029
```

The optional RSA 2048 signature is produced with the SUDI private key and can be verified with the SUDI public key contained in the SUDI certificate. The signature across PCR values, the signature version and the user-provided nonce is:

```plaintext
RSA PKCS#1 v1.5 Sign ( <Nonce (UINT64)> || <Signature Version (UINT32)> || <PCR0 (32 bytes)> || <PCR8 (32 bytes)> )
```
Cisco management solutions are equipped with the ability to interpret the above output, compare the results against published Cisco values, and to verify the signature.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Performing Device Setup Configuration

Review the sections in this module before performing your initial device configuration tasks that include IP address assignments and DHCP autoconfiguration.

Device Boot Process

To start your device, you need to follow the procedures in the hardware installation guide for installing and powering on the device and setting up the initial device configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The normal boot process involves the operation of the boot loader software and includes these activities:

- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
• Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
• Initializes the file systems on the system board.
• Loads a default operating system software image into memory and boots up the device.

The boot loader provides access to the file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door mechanism provides enough access to the system so that if it is necessary, you can reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.

Before you can assign device information, make sure you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match these of the device console port:

• Baud rate default is 9600.
• Data bits default is 8.

Note
If the data bits option is set to 8, set the parity option to none.

• Stop bits default is 2 (minor).
• Parity settings default is none.

Software Installer Features

The following software installer features are supported on your switch:

• Software bundle installation on a standalone switch, a switch stack, or a subset of switches in a stack. The default is installation on all the switches if a switch stack is configured.
• Software rollback to a previously installed package set.
• Emergency installation in the event that no valid installed packages reside on the boot flash.
• Auto-upgrade of a switch that joins the switch stack with incompatible software.
• Installation using packages on one switch as the source for installing packages on another switch in the switch stack.

Note
Software installation and rollback must be performed while running only in installed mode. You can use the request platform software package expand EXEC command to convert bundle boot mode to install mode.
Software Boot Modes

Your device supports two modes to boot the software packages:

- Installed mode
- Bundle mode

Related Topics

Examples: Displaying Software Bootup in Install Mode, on page 2371
Example: Emergency Installation, on page 2373

Installed Boot Mode

You can boot your device in installed mode by booting the software package provisioning file that resides in flash:

Switch: `boot flash:packages.conf`

The provisioning file contains a list of software packages to boot, mount, and run. The ISO filesystem in each installed package is mounted to the root file system directly from flash.

---

Note

The packages and provisioning file used to boot in installed mode must reside in flash. Booting in installed mode from usbflash0: or tftp: is not supported.

---

Related Topics

Examples: Displaying Software Bootup in Install Mode, on page 2371
Example: Emergency Installation, on page 2373

Bundle Boot Mode

You can boot your device in bundle boot mode by booting the bundle (.bin) file:

Switch: `boot flash:cat3850-universalk9.SSA.03.08.83.EMD.150-8.83.EMD.bin`

The provisioning file contained in a bundle is used to decide which packages to boot, mount, and run. Packages are extracted from the bundle and copied to RAM. The ISO file system in each package is mounted to the root file system.

Unlike install boot mode, additional memory that is equivalent to the size of the bundle is used when booting in bundle mode.

Unlike install boot mode, bundle boot mode is available from several locations:

- flash:
- usbflash0:
- tftp:

---

Note

Auto install and smart install functionality is not supported in bundle boot mode.
The AP image pre-download feature is not supported in bundle boot mode. For more information about the pre-download feature see the Cisco WLC 5700 Series Preloading an Image to Access Points chapter.

**Note**

### Boot Mode for a Switch Stack

All the switches in a stack must be running in installed mode or bundle boot mode. A mixed mode stack is not supported. If a new switch tries to join the stack in a different boot mode then the active switch, the new switch is given a V-mismatch state.

If a mixed mode switch stack is booted at the same time, then only those switches that boot up in a different mode than the active go to the V-mismatch state. If the boot mode does not support auto-upgrade, then the switch stack members must be re-booted in the same boot mode as the active switch.

If the stack is running in installed mode, the auto-upgrade feature can be used to automatically upgrade the new switch that is attempting to join the switch stack.

The auto-upgrade feature changes the boot mode of the new switch to installed mode. If the stack is running in bundle boot mode, the auto-upgrade feature is not available. You will be required to use the bundle mode to boot the new switch so that it can join the switch stack.

This is an example of the state of a switch that attempts to join the switch stack when the boot mode is not compatible with the active switch:

```
Device# show switch

Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
-----------------------------------------------
*2 Active 6400.f125.1100 1 V01 Ready
1 Member 6400.f125.1a00 1 0 V-Mismatch
```

### Devices Information Assignment

You can assign IP information through the device setup program, through a DHCP server, or manually.

Use the device setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.
If you are using DHCP, do not respond to any of the questions in the setup program until the device receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the device configuration steps, manually configure the device. Otherwise, use the setup program described in the Boot Process section.

## Default Switch Information

### DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The device can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your device (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your device. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

---

**Note**

We recommend a redundant connection between a switch stack and the DHCP, DNS, and TFTP servers. This is to help ensure that these servers remain accessible in case one of the connected stack members is removed from the switch stack.
The DHCP server for your device can be on the same LAN or on a different LAN than the device. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your device and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your device.

**DHCP Client Request Process**

When you boot up your device, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the device. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

*Figure 136: DHCP Client and Server Message Exchange*

The client, Device A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the device receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the device accepts replies from a BOOTP server and configures itself, the device broadcasts, instead of unicasts, TFTP requests to obtain the device configuration file.

The DHCP hostname option allows a group of devices to obtain hostnames and a standard configuration from the central management DHCP server. A client (device) includes in its DHCPDISCOVER message an option...
12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the `hostname name` global configuration command is not configured or the `no hostname` global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the `ip address dhcp` interface configuration command. In this case, if the client receives the DHCP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

**DHCP-based Autoconfiguration and Image Update**

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more devices in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new device added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

**Restrictions for DHCP-based Autoconfiguration**

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.
- The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the `write memory` or `copy running-configuration startup-configuration` privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

**DHCP Autoconfiguration**

DHCP autoconfiguration downloads a configuration file to one or more devices in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the device. It does not overwrite the bootup configuration saved in the flash, until you reload the device.

**DHCP Auto-Image Update**

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more devices in your network. The device (or devices) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

To enable a DHCP auto-image update on the device, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP
server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the device in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the device, and the new image is downloaded and installed on the device. When you reboot the device, the configuration is stored in the saved configuration on the device.

**DHCP Server Configuration Guidelines**

Follow these guidelines if you are configuring a device as a DHCP server:

- You should configure the DHCP server with reserved leases that are bound to each device by the device hardware address.

- If you want the device to receive IP address information, you must configure the DHCP server with these lease options:
  - IP address of the client (required)
  - Subnet mask of the client (required)
  - DNS server IP address (optional)
  - Router IP address (default gateway address to be used by the device) (required)

- If you want the device to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
  - TFTP server name (required)
  - Boot filename (the name of the configuration file that the client needs) (recommended)
  - Hostname (optional)

- Depending on the settings of the DHCP server, the device can receive IP address information, the configuration file, or both.

- If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the device is not configured. If the router IP address or the TFTP server name are not found, the device might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

- The device can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your device but are not configured. (These features are not operational.)

**Purpose of the TFTP Server**

Based on the DHCP server configuration, the device attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the device with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the device attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the device attempts to download a configuration file by using various combinations of filenames.
and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the device’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the device to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual device configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
- The router-config or the ciscortr.cfg file (These files contain commands common to all devices. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the device, or if it is to be accessed by the device through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.

### Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the device.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same LAN or on a different LAN from the device. If it is on a different LAN, the device must be able to access it through a router.

### How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the device obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the device and provided in the DHCP reply (one-file read method).

  The device receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

- The IP address and the configuration filename is reserved for the device, but the TFTP server address is not provided in the DHCP reply (one-file read method).

  The device receives its IP address, subnet mask, and the configuration filename from the DHCP server. The device sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the device and provided in the DHCP reply. The configuration filename is not provided (two-file read method).
The device receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The device sends a unicast message to the TFTP server to retrieve the network-config or ciscoconfdefault configuration file. (If the network-config file cannot be read, the device reads the ciscoconf file.)

The default configuration file contains the hostnames-to-IP-address mapping for the device. The device fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the device uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the device uses the default Switch as its hostname.

After obtaining its hostname from the default configuration file or the DHCP reply, the device reads the configuration file that has the same name as its hostname (hostname-config or hostname.cfg, depending on whether network-config or ciscoconf was read earlier) from the TFTP server. If the ciscoconf file is read, the filename of the host is truncated to eight characters.

If the device cannot read the network-config, ciscoconf, or the hostname file, it reads the router-config file. If the device cannot read the router-config file, it reads the ciscortr.cfg file.

---

**Note**
The device broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

---

**How to Control Environment Variables**

With a normally operating device, you enter the boot loader mode only through the console connection configured for 9600 bps. Unplug the device power cord, and press the Mode button while reconnecting the power cord. You can release the Mode button after all the amber system LEDs turn on and remain solid. The boot loader device prompt then appears.

The device boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader, or any other software running on the system, operates. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.
## Common Environment Variables

This table describes the function of the most common environment variables.

### Table 185: Common Environment Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Boot Loader Command</th>
<th>Cisco IOS Global Configuration Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOT</td>
<td>set BOOT filesystem :/file-url ...</td>
<td>booted system {filesystem :/file-url ...</td>
</tr>
<tr>
<td></td>
<td>A semicolon-separated list of executable files to try to load and execute when</td>
<td>Specifies the Cisco IOS image to load during the next boot cycle and the stack members on which the image is loaded. This command changes the setting of the BOOT environment variable. The package provisioning file, also referred to as the packages.conf file, is used by the system to determine which software packages to activate during boot up.</td>
</tr>
<tr>
<td></td>
<td>automatically booting.</td>
<td></td>
</tr>
<tr>
<td>MANUAL_BOOT</td>
<td>set MANUAL_BOOT yes</td>
<td>boot manual</td>
</tr>
<tr>
<td></td>
<td>Decides whether the switch automatically or manually boots.</td>
<td>Enables manually booting the switch during the next boot cycle and changes the setting of the MANUAL_BOOT environment variable. The next time you reboot the system, the switch is in boot loader mode. To boot up the system, use the boot flash: filesystem :/file-url boot loader command, and specify the name of the bootable image.</td>
</tr>
<tr>
<td></td>
<td>Valid values are 1, yes, 0, and no.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If it is set to no or 0, the boot loader attempts to automatically boot up the system.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If it is set to anything else, you must manually boot up the switch from the boot</td>
<td></td>
</tr>
<tr>
<td></td>
<td>loader mode.</td>
<td></td>
</tr>
</tbody>
</table>
### Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

| **Table 186: Environment Variables for TFTP** |

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_ADDR</td>
<td>Specifies the MAC address of the switch.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> We recommend that you do not modify this variable.</td>
</tr>
<tr>
<td></td>
<td>However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP. A reset is required for the new value to take effect.</td>
</tr>
<tr>
<td>IP_ADDRESS</td>
<td>Specifies the IP address and the subnet mask for the associated IP subnet of the switch.</td>
</tr>
</tbody>
</table>
### Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the device at a later time (for example, late at night or during the weekend when the device is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all devices in the network).

#### Note

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- **Reload of the software to take affect in the specified minutes or hours and minutes.** The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- **Reload of the software to take place at the specified time (using a 24-hour clock).** If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The `reload` command halts the system. If the system is not set to manually boot up, it reboots itself.

If your device is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the device from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the device prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the `CONFIG_FILE` environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.

### How to Perform Device Setup Configuration

Using DHCP to download a new image and a new configuration to a device requires that you configure at least two devices. One device acts as a DHCP and TFTP server and the second device (client) is configured to download either a new configuration file or a new configuration file and a new image file.

### Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing device in the network so that it can support the autoconfiguration of a new device.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_ROUTER</td>
<td>Specifies the IP address and subnet mask of the default gateway.</td>
</tr>
</tbody>
</table>
SUMMARY STEPS

1. configure terminal
2. ip dhcp pool poolname
3. boot filename
4. network network-number mask prefix-length
5. default-router address
6. option 150 address
7. exit
8. tftp-server flash:filename.text
9. interface interface-id
10. no switchport
11. ip address address mask
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip dhcp pool poolname</td>
<td>Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# ip dhcp pool pool</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> boot filename</td>
<td>Specifies the name of the configuration file that is used as a boot image.</td>
</tr>
<tr>
<td>Example: Device(dhcp-config)# boot config-boot.text</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> network network-number mask prefix-length</td>
<td>Specifies the subnet network number and mask of the DHCP address pool.</td>
</tr>
<tr>
<td>Example: Device(dhcp-config)# network 10.10.10.0 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> default-router address</td>
<td>Specifies the IP address of the default router for a DHCP client.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

Note: The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-router 10.10.10.1</td>
<td>Specifies the IP address of the TFTP server.</td>
</tr>
</tbody>
</table>

**Step 6**

```
Device(dhcp-config)# option 150 address
```

**Example:**

```
Device(dhcp-config)# option 150 10.10.10.1
```

**Step 7**

```
exit
```

**Example:**

```
Device(dhcp-config)# exit
```

**Step 8**

```
tftp-server flash:filename.text
```

**Example:**

```
Device(config)# tftp-server flash:config-boot.text
```

**Step 9**

```
interface interface-id
```

**Example:**

```
Device(config)# interface gigabitethernet 1/0/4
```

**Step 10**

```
no switchport
```

**Example:**

```
Device(config-if)# no switchport
```

**Step 11**

```
ip address address mask
```

**Example:**

```
Device(config-if)# ip address 10.10.10.1 255.255.255.0
```

**Step 12**

```
end
```

**Example:**

```
Device(config-if)# end
```

Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing device to support the installation of a new switch.

**Before you begin**

You must first create a text file (for example, autoinstall_dhcp) that will be uploaded to the device. In the text file, put the name of the image that you want to download (for example, c3750e-ipservices-mz.122-44.3.SE.tar, c3750x-ipservices-mz.122-53.3.SE2.tar). This image must be a tar and not a bin file.

**SUMMARY STEPS**

1. configure terminal
2. ip dhcp pool poolname
3. boot filename
4. network network-number mask prefix-length
5. default-router address
6. option 150 address
7. option 125 hex
8. copy tftp flash filename.txt
9. copy tftp flash imagename.bin
10. exit
11. tftp-server flash: config.text
12. tftp-server flash: imagename.bin
13. tftp-server flash: filename.txt
14. interface interface-id
15. no switchport
16. ip address address mask
17. end
18. copy running-config startup-config

**DETAILED STEPS**

### Configuring the Client to Download Files from DHCP Server

#### Note

You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.

#### SUMMARY STEPS

1. `configure terminal`
2. `boot host dhcp`
3. `boot host retry timeout timeout-value`
4. `banner config-save ^C warning-message ^C`
5. `end`
6. `show boot`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>  configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong>  boot host dhcp</td>
<td>Enables autoconfiguration with a saved configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(conf)# boot host dhcp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong>  boot host retry timeout</td>
<td>(Optional) Sets the amount of time the system tries to download a configuration file.</td>
</tr>
<tr>
<td>timeout-value</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(conf)# boot host retry timeout 300</td>
<td></td>
</tr>
</tbody>
</table>

Note: If you do not set a timeout, the system will try indefinitely to obtain an IP address from the DHCP server.

### Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

#### SUMMARY STEPS

1. configure terminal
2. interface vlan vlan-id
3. ip address ip-address subnet-mask
4. exit
5. ip default-gateway ip-address
6. end
7. show interfaces vlan vlan-id
8. show ip redirects

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# configure terminal
```
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface vlan vlan-id</code></td>
<td>Enters interface configuration mode, and enters the VLAN to which the IP information is assigned. The range is 1 to 4094.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>interface vlan 99</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>ip address ip-address subnet-mask</code></td>
<td>Enters the IP address and subnet mask.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-vlan)# <code>ip address 10.10.10.2 255.255.255.0</code></td>
<td></td>

<td>Device# <code>show interfaces vlan 99</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><code>show ip redirects</code></td>
<td>Verifies the configured default gateway.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Modifying the Device Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

Before you begin
Use a standalone device for this task.

SUMMARY STEPS

1. configure terminal
2. boot flash:/file-url
3. end
4. show boot
5. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>

<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>boot flash:/file-url</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# boot flash:config.text</td>
</tr>
<tr>
<td></td>
<td>Specifies the configuration file to load during the next boot cycle.</td>
</tr>
<tr>
<td></td>
<td>file-url—The path (directory) and the configuration filename.</td>
</tr>
<tr>
<td></td>
<td>Filenames and directory names are case-sensitive.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show boot</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The boot global configuration command changes the setting of the CONFIG_FILE environment variable.</td>
</tr>
</tbody>
</table>
**Manually Booting the Switch**

By default, the switch automatically boots up; however, you can configure it to manually boot up.

**Before you begin**

Use a standalone switch for this task.

**SUMMARY STEPS**

1. configure terminal
2. boot manual
3. end
4. show boot
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>boot manual</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# boot manual</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>show boot</strong></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Booting the Device in Installed Mode

**SUMMARY STEPS**

1. `cp source_file_path destination_file_path`
2. `request platform software package expand switch all file source_file_path to flash`
3. `reload`
4. `boot flash:packages.conf`
5. `show version`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>cp source_file_path destination_file_path</code></td>
<td>(Optional) Copies the bin file (image.bin) from the FTP or TFTP server to USB flash.</td>
</tr>
<tr>
<td>Example: <code>Switch# copy tftp://10.0.0.6/cat3k_caa-universalk9-SRP.03.12.02_EXP.150-12.02_EXP.150-12.02_EXP.bin flash:</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>request platform software package expand switch all file source_file_path to flash</code></td>
<td>Expands the bin file stored in flash, FTP, TFTP, HTTP, or HTTPS server on the booted device.</td>
</tr>
<tr>
<td>Example: Expanding the bin file from the TFTP server:</td>
<td>Note Ensure that the packages.conf file is available in the expanded list.</td>
</tr>
</tbody>
</table>
### Command or Action

```bash
Switch# request platform software package expand switch all file
tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin to flash:
```
```bash
Preparing expand operation ...

cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin
[1 2]: Copying package files
[1 2]: Package files copied
[1 2]: Finished expanding bundle
cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin
```

### Purpose

1. **Step 3**
   - **reload**
   - **Example:**
     ```bash
     Switch# reload
     ```
   - **Reloads the device.**
   - **Note**
     You can boot the device manually or automatically using the `packages.conf` file. If you are booting manually, you can proceed to Step 4. Otherwise, the device boots up automatically.

2. **Step 4**
   - **boot flash:packages.conf**
   - **Example:**
     ```bash
     Switch: boot flash:packages.conf
     ```
   - **Boots the device with the `packages.conf` file.**

3. **Step 5**
   - **show version**
   - **Example:**
     ```bash
     ```
   - **Verifies that the device is in the `INSTALL` mode.**
Booting the Device in Bundle Mode

There are several methods by which you can boot the device—either by copying the bin file from the TFTP server and then boot the device, or by booting the device straight from flash or USB flash using the commands `boot flash:<image.bin>` or `boot usbflash0:<image.bin>`.

The following procedure explains how to boot the device from the TFTP server in the bundle mode.

**SUMMARY STEPS**

1. `switch:BOOT=<source path of .bin file>`
2. `boot`
3. `show version`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Sets the boot parameters.</td>
</tr>
<tr>
<td>switch:BOOT=&lt;source path of .bin file&gt;</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>switch:BOOT=tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Boots the device.</td>
</tr>
<tr>
<td>boot</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>switch: boot</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Verifies that the device is in the BUNDLE mode.</td>
</tr>
<tr>
<td>show version</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>switch# show version</td>
</tr>
</tbody>
</table>

Booting a Specific Software Image On a Switch Stack

By default, the switch attempts to automatically boot up the system using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. However, you can specify a specific image to boot up.

**SUMMARY STEPS**

1. `configure terminal`
2. `boot system switch {number | all}`
3. `end`
4. `show boot system`
5. `copy running-config startup-config`
### DETAILED STEPS

Related Topics

Configuring DHCP Auto-Image Update (Configuration File and Image), on page 2358

Example: Configuring a Device to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

```plaintext
Device# configure terminal
Device(config)# boot host dhcp
Device(config)# boot host retry timeout 300
Device(config)# banner config-save "Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot"
Device(config)# vlan 99
Device(config-vlan)# interface vlan 99
Device(config-if)# no shutdown
Device(config-if)# end
Device# show boot
BOOT path-list:
  Config file: flash:/config.text
  Private Config file: flash:/private-config.text
  Enable Break: no
  Manual Boot: no
HELPER path-list:
  NVRAM/Config file
    buffer size: 32768
  Timeout for Config
```
Examples: Scheduling Software Image Reload

This example shows how to reload the software on the device on the current day at 7:30 p.m:

Device# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 2013 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]

This example shows how to reload the software on the device at a future time:

Device# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 2013 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]

## Installing WCM Sub-Package

This document explains the process to install wireless control module (WCM) sub-package in Cisco Catalyst 3850 and 3650 Series Switches.

The WCM sub-package, which consists of WCM module and AP images, upgrades features, supports new APs, and fixes known issues. It eliminates the need for a full image upgrade and the resulting network downtime by upgrading only the WCM portion of the image. For example, if the WCM fails to allow a new AP to join the network due to image version mis-match, you can upgrade only the WCM portion of the image to add
support for the new AP. When the WCM is upgraded, all the APs in the network are automatically upgraded to the newer image.

Benefits

- Fixes WCM bugs
- Supports new APs
- Updates features available in WCM

Prerequisites

- The controller must be booted in install mode.
- WCM sub-package should be available in any of the sources supported by installer. For example, flash or TFTP or USB.

Restrictions

- WCM sub-package can only be installed on previous minor versions of the 16.1 image (for example, WCM package from 16.01.YY(cat3k_caa-wcm.16.01.YY.SSA.pkg) can be installed on 16.01.01 to 16.01.YY super package (cat3k_caa-universalk9.16.01.[01-to-YY].SSA.bin).
- You should reboot the switch after an upgrade.

Installing WCM Sub-Package

**Step 1**
Upgrade controller WCM package.

```text
request platform software package install switch all file flash:wcm_sub_package.pkg auto-copy
```

**Step 2**
(Optional) Download and install the AP image. This procedure reduces network downtime by pre-downloading and pre-programming APs with new image. Otherwise, when the controller reloads there will be a version mis-match between controller and APs and the APs will start to upgrade themselves using the new AP image, which may lead to longer downtime on the network.

**Note**
After the download and install, wait for 30 seconds to ensure that the CLIs reach the AP.

a) Push the new image to all connected APs.

```text
ap image predownload
```

b) Monitor the progress of the download.

```text
show ap image
```

c) Point the boot variable of all APs to the new image.

```text
ap image swap
```

d) Reset the APs.

```text
ap image reset
```

**Step 3**
Reload the controller. After the reload, the controller reloads with new WCM package and APs reloads with new AP image and they will start joining the upgraded controller.
reload

Configuring Autonomic Networking

• Autonomic Networking, on page 2381

Autonomic Networking

Autonomic networking makes network devices intelligent by introducing self-management concepts that simplify network management for network operators.

Prerequisites for Autonomic Networking

• The Autonomic Networking Infrastructure feature supports only Ethernet ports and IPv6 addresses.
• All interfaces are up by default to exchange adjacency discovery messages if there is no startup configuration in the corresponding device.
• The Autonomic Control Plane is automatically built between two adjacent devices supporting the autonomic networking infrastructure. The Ethernet interfaces on both devices need to be up, and the device should either be unconfigured (greenfield rollout) or have autonomic networking configured explicitly.
• The Autonomic Control Plane can also be automatically built between two adjacent devices if there is an intervening nonautonomic layer 2 cloud such as a Metro ethernet service. This is achieved by the Channel Discovery protocol on the autonomic devices. This protocol probes for working VLAN encapsulations.
• To build the ACP across intervening nonautonomic L3 devices, you should explicitly configure a tunnel between the autonomic devices and enable autonomic adjacency discovery on this tunnel.
• Autonomic Registrar, commonly known as registrar, is required for the Autonomic Networking Infrastructure feature to work. At least one device in the network must be configured as a registrar to enroll new devices into the autonomic domain.
• In a network where all the required devices are already enrolled into the autonomic domain, a registrar is not required.
• Each registrar supports only one autonomic domain. The registrar is needed only when new autonomic devices join the domain.
• To contact the registrar for enrollment to the autonomic domain, all new devices must have L2 reachability to at least one device that is already enrolled to the domain. If there is no L2 reachability, user needs to configure the tunnel between the devices and configure autonomic adjacency discovery on them.
• A device can be enrolled only into one autonomic domain. Two devices enrolled into different domains will not build the autonomic control plane between each other.
• Autonomic intent can be configured only on the registrar and from there it is propagated to all the devices in the domain.
• For Zero Touch Bootstrap to take place, there must be no startup-config file present and the config-register must remain default which is 0x2102.

Restrictions for Autonomic Networking

• Autonomic networking supports only unique device identifier (UDI)-based devices.
• Autonomic networking and Zero Touch Provisioning (ZTP) are different zero touch solutions. We recommended that you do not test or use autonomic networking and ZTP at the same time.
• All the devices in an autonomic network should be contiguously autonomic. If there is no continuity, manual configuration is required to configure a tunnel through a nonautonomic network.
• In Cisco IOS XE Denali 16.3.1 Release, Cisco Catalyst 3850 and Cisco Catalyst 3650 switches support only untagged probes and channel.
• Devices running Cisco IOS XE Denali 16.3.x Release and later are not compatible with devices running releases earlier than IOS XE 3.18 or 15.6(01)T. To facilitate interwork between these devices, autonomic adjacency discovery should be configured on the interfaces.
• When autonomic networking is enabled, you must not disable IPv6 unicast routing manually.
• The autonomic Registrar functionality is not supported in Cisco Catalyst 3850 and Cisco Catalyst 3650 switches.

Information About Autonomic Networking

Overview of Autonomic Networking

The aim of autonomic networking is to create self-managing networks to overcome the rapidly growing complexity of the Internet and other networks to enable them to grow further. In a self-managing autonomic system, network management takes on a new role where, instead of controlling the network elements individually and directly, the administrator can define network-wide policies and rules to guide the self-management process.

The following figure provides a high-level architecture of an autonomic network.
Autonomic networking is controlled by a separate software entity running on top of traditional operating systems that include networking components, such as IP, Open Shortest Path First (OSPF), and so forth. Traditional networking components are unchanged and unaware of the presence of the autonomic process. The autonomic components use normal interfaces that are exposed by the traditional networking components and interact with different devices in the network. The autonomic components securely cooperate to add more intelligence to devices so that the devices in an autonomic network can autonomically configure, manage, protect, and heal themselves with minimal operator intervention. They can also securely consolidate their operations to present a simplified and abstracted view of the network to the operator.

**Autonomic Networking Infrastructure**

The Autonomic Networking Infrastructure feature simplifies the network bootstrap functionality by removing the need for any kind of prestaging, thereby allowing devices to join a domain securely, after which devices can be configured. The goal of the Autonomic Networking Infrastructure feature is to make new and unconfigured devices reachable by an operator or network management system, securely. This is carried as described here:

1. A device is defined and configured as the registrar. This registrar is the first autonomic domain device.
2. This step is optional. The network administrator collects a list of legitimate device identifiers of the devices to be added to the network. This list controls the devices that are added to the autonomic domain. Devices are identified by their unique device identifier (UDI). The list is compiled as a simple text file, one UDI per line. This step is optional because, in the absence of a whitelist, all the devices are allowed to join the domain. A whitelist is an approved list of entities that is provided a particular privilege, service, mobility, access, or recognition. Whitelisting means to grant access.
3. (Optional) The whitelist of known devices is uploaded to the registrar as part of its configuration.
4. Any new autonomic device that is directly connected to the registrar, or another enrolled domain device, will automatically receive a domain certificate from the registrar.
5. The autonomic control plane is automatically established across the autonomic domain to make new devices reachable.

The benefits of Autonomic Networking Infrastructure are as follows:

- Autonomic discovery of Layer 2 topology and connectivity by discovering how to reach autonomic neighbors.
- Secure and zero touch identity of new devices by using the device name and domain certificate.
- A virtual autonomic control plane that enables communications between autonomic nodes.
Autonomic behavior is enabled by default on new devices. To enable autonomic behavior on existing devices, use the `autonomic` command. To disable, use the `no` form of this command.

The components of autonomic networking are as follows:

- **Registrar**—A domain-specific registration authority in a given enterprise that validates new devices in the domain, provides them with domain-wide credentials, and makes policy decisions. Policy decisions can include a decision on whether a new device can join a given domain based on a preloaded whitelist. The registrar also has a database of devices that join a given domain and the device details.

- **Channel Discovery**—Used to discover reachability between autonomic nodes across nonautonomic Layer 2 networks.

- **Adjacency Discovery**—Used to discover autonomic neighbors. Adjacency discovery is performed on Layer 3. It is also possible to discover autonomic neighbors across pre-established Layer 3 Generic Routed Encapsulation (GRE) tunnels.

### New Device Joining the Autonomic Network

The following figure illustrates how a new device joins an autonomic network.

**Figure 138: New Device Joining the Autonomic Network**

1. The new device sends out a hello message to the neighbor. In this case, the neighbor is part of an autonomic network domain.
2. The hello message includes the unique device identifier (UDI) of the new device.
3. The autonomic device acts as a proxy and allows the new device to join this autonomic network domain. The autonomic network device advertises itself with the domain information to its Layer 3 neighbors.
4. On receiving the autonomic network hello message from the neighbor and detecting the UDI information, the new device is validated with the autonomic registrar.
5. The new device advertises its domain certificate in its hello message with all neighbors. The neighbor information is exchanged every 10 seconds.

---

**Note**

If the neighbor information changes, the entry is deleted and neighbor discovery is restarted. In the absence of a domain certificate and devices working with UDI, UDI is exchanged at a 10-second interval.

### Channel Discovery in Autonomic Networking

Channel Discovery occurs automatically on all the interfaces when Autonomic Networking is enabled on the device. Note that autonomic Networking is enabled by default on devices with no configuration (greenfield devices, and assuming they have AN functionality), but will be passive. They will only be able to receive and answer CD probes, which are L2 frames. Only a device with domain certificate or one that is already enrolled to a domain can send out CD probes on all of its Ethernet interfaces that are up. As a result of this, neighbors...
will be dynamically discovered. The probing will continue over time, so that newly added neighbors are discovered over time.

### Adjacency Discovery in Autonomic Networking

After a channel is established, the proxy will send ND Hello messages to the new device, that is the one that is already enrolled in the domain and can act as a proxy for a new device joining the domain. The new device will send AN Hello messages in response back to the proxy. The Hello messages consist of an identification for the new device (UDI). On receiving AN Hello messages from the new device and detecting the UDI information, the AN proxy will send the details to the Autonomic Networking Registrar (ANR) for validating this new device.

### Service Discovery in Autonomic Networking

Autonomic networking uses the multicast Domain Name System (mDNS) infrastructure to locate the various services required by the devices in the autonomic networking domain. A few of the services discovered by the network using the mDNS infrastructure are the AAA server, the configuration server, the syslog server, and the autonomic networking registrar. Autonomic networking listens to the mDNS advertisements on all the devices in the domain. From the devices hosting the services, autonomic networking initiates the mDNS advertisements.

### Autonomic Control Plane

When a new device in the domain receives a domain certificate, it exchanges the domain certificate in the Hello messages with its neighbors. This creates an autonomic control plane between two autonomic devices of the same domain. There are different types of autonomic control planes that can be created based on the different capabilities of the devices. The autonomic control plane is established by using the following mechanisms:

- Configuring a loopback interface.
- Dynamically assigning an IPv6 address to the loopback interface.
- Configuring autonomic VPN routing and forwarding (VRF).

### How to Configure Autonomic Networking

#### Configuring the Registrar

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `autonomic`
4. `autonomic registrar`
5. `domain-id domain-name`
6. `device-accept udi`
7. `whitelist filename`
8. `no shut`
9. `exit`
10. `exit`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1     | `enable`          | Enables privileged EXEC mode.  
  **Example:**  
  Device> enable |
| 2     | `configure terminal` | Enters global configuration mode.  
  **Example:**  
  Device# configure terminal |
| 3     | `autonomic`       | Enables autonomic networking.  
  **Example:**  
  Device# autonomic |
| 4     | `autonomic registrar` | Enables a device as a registrar and enters registrar configuration mode.  
  **Note:** In Cisco IOS XE Denali 16.3.1, autonomic registrar functionality is not supported for Cisco Catalyst 3850 switches and Cisco Catalyst 3650 switches.  
  **Example:**  
  Device(config)# autonomic registrar |
| 5     | `domain-id domain-name` | Represents a common group of all devices registered with the registrar.  
  **Example:**  
  Device(config-registrar)# domain-id abc.com |
| 6     | `device-accept udi` | (Optional) Specifies the UDI of a quarantined device to be accepted in the autonomic domain.  
  **Note:** This command is not required when configuring the registrar. It is required only after the registrar is enabled to accept previously quarantined devices.  
  **Example:**  
  Device(config-registrar)# device-accept  
  PID:A901-12C-FT-D SN:CAT1902U88Y |
| 7     | `whitelist filename` | (Optional) Allows loading a file on the local device that contains a list of devices to be accepted in a given domain.  
  The file must contain one UDI entry per line.  
  **Note:** If this command is not configured, all the devices are accepted into the domain.  
  **Example:**  
  Device(config-registrar)# whitelist  
  flash:whitelist.txt |
| 8     | `no shut`         | Enables the autonomic registrar.  
  **Example:**  
  Device(config-registrar)# no shut |
| 9     | `exit`            | Exits registrar configuration mode and returns to global configuration mode.  
  **Example:**  
  Device(config-registrar)# exit |
### Purpose

</table>
| **Step 8** clear autonomic {device | neighbor UDI | registrar accepted-device device UDI} | Clears or resets autonomic information.  
  - The **clear autonomic device** command clears or resets all the device-specific autonomic networking information, including the information obtained during the bootstrapping process.  
  - The **clear autonomic neighbor** command clears the neighbor-related information obtained during the neighbor discovery process. If no neighbor is specified, it clears the entire neighbor database.  
  - The **clear autonomic registrar accepted-device** command clears the public key stored for each device enrolled by the registrar. |
CHAPTER 118

Configuring Right-To-Use Licenses

• Finding Feature Information, on page 2389
• Restrictions for Configuring RTU Licenses, on page 2389
• Information About Configuring RTU Licenses, on page 2390
• How to Configure RTU Licenses, on page 2393
• Monitoring and Maintaining RTU Licenses, on page 2398
• Configuration Examples for RTU Licensing, on page 2399
• Additional References for RTU Licensing, on page 2403
• Feature History and Information for RTU Licensing, on page 2404

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring RTU Licenses

The following are the restrictions for configuring and using RTU licenses.

• AP count licenses can be ordered and pre-activated on your switch.

• Imaged based licenses can be upgraded. AP count licenses can be deactivated and moved between switches and controllers.

• To activate a license, you must reboot your switch after configuring the new license level. The AP-count license does not require a reboot to activate.

• An expired evaluation license can not be reactivated after reboot.

• Stack members of a switch stack must run the same license level. If the license level is different, the switch will not join the stack until it is changed and rebooted from the active switch of the stack.
Information About Configuring RTU Licenses

Right-To-Use Licensing

Right-to-use (RTU) licensing allows you to order and activate a specific license type and level, and then to manage license usage on your switch. The types of licenses available to order by duration are:

- Permanent licenses—For image-based licenses only. Purchased with a specific feature set with no expiration date.
- Term licenses—For add-on licenses only. Purchased with a feature set for a specific subscription period of 3, 5, or 7 years. The expiration date displays on Cisco Smart Software Manager (Cisco SSM).
- Evaluation licenses—Available with image-based and add-on licenses. Pre-installed on the switch and is valid for only a 90 day in-use period.

To activate a permanent or evaluation license, you are required to accept the End-User License Agreement (EULA).

A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.

Term license expiry information is available only on Cisco SSM. To get started, create a Smart Account. Go to software.cisco.com → Administration → Request Smart Account. For more information, see: http: www.cisco.com c en us buy smart-accounts software-licensing.html

If you activate the evaluation license, it will expire in 90 days. An evaluation license is a manufacturing image on your switch and is not transferable to another switch. Once activated, this type of license cannot be deactivated until it expires. After your evaluation period expires, at the next reload your switch image will return to its default license and network operations are not impacted.

Related Topics
- Activating an Image Based License, on page 2393
- Examples: Activating RTU Image Based Licenses, on page 2399

Right-To-Use Image-Based Licenses

Right-to-use image licenses support a set of features based on a specific image-based license:
• LAN Base—Layer 2 features.
• IP Base—Layer 2 and Layer 3 features.
• IP Services—Layer 2, Layer 3, and IPv6 features. (Applicable only to switches and not controllers.)

Right-To-Use License States

After you configure a specific license type and level, you can manage your licenses by monitoring the license state.

Table 187: RTU License States

<table>
<thead>
<tr>
<th>License State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active, In Use</td>
<td>EULA was accepted and the license is in use after device reboot.</td>
</tr>
<tr>
<td>Active, Not In Use</td>
<td>EULA was accepted and the switch is ready to use when the license is enabled.</td>
</tr>
<tr>
<td>Not Activated</td>
<td>EULA was not accepted.</td>
</tr>
</tbody>
</table>

Guidelines to follow when monitoring your image based license state:

• A purchased permanent license is set to **Active, In Use** state only after a switch reboot.

• If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the IP Services license is activated and not the LAN Base license.

• Remaining licenses purchased after switch reboot, stay in **Active, Not In Use** state.

---

**Note**

For the AP count license, to change the state to **Active, In Use**, you must first make sure that the evaluation AP count license is deactivated.

---

License Activation for Switch Stacks

Right-to-use licensing is supported on switch stacks. A switch is a set of up to nine stacking-capable switches connected through their StackWise-160 ports. One switch in the stack is identified as the active switch and the remaining switches are standby switches. The active switch is activated with an RTU license from its active console. The license level for the standby switches in the stack can be activated at the same time.

---

**Note**

A switch stack cannot contain mixed license levels. Also, the switches must be of the same platform.

To change the license level, you do not need to disconnected the new added stack member if the stack cables are connected. Use the active switch console to set the new member's license level same as active switch and reboot the new member to join the stack.
Mobility Controller Mode

AP-count licenses are used only when the switch is in Mobility Controller mode. The MC is the gatekeeper for tracking the AP-count licenses and allows an access point to join or not.

Management of AP-count licenses is performed by the in mobility controller mode configurable through the CLI.

Related Topics
Changing Mobility Mode, on page 2397

Right-To-Use AP-Count Licensing

Right-to-use licensing (RTU) allows you to order and activate a specific license type, and then to manage license usage on your device.

You can order your device with support for a specific number of adder access point count licenses, but the total number of licenses ordered should not exceed 25. You can also order your adder access point count licenses after receiving the device.

For example, if you have ordered 25 new adder licenses, you can add only those ordered adder licenses to the device. The licenses can be added in increments of 1, but the total number of licenses added for the device should not exceed 25.

You can configure your switch to manage the access point count licenses and view the number of access points currently in use from the CLI.

The following are two different types of access point licenses:

1. Permanent licenses for the access points
   - Adder access point count license—You can purchase the adder license to increase the device capacity at a later time. You can transfer the adder access point count license from one device to another.

2. Evaluation licenses for the access points
   - You can activate these licenses to evaluate more access points before purchasing the licenses.
   - The maximum number of access points that can be evaluated is 25.
   - The evaluation period for using the access point licenses is 90 days.
   - You can activate and deactivate the evaluation licenses from the CLI.

Related Topics
Activating an AP-Count License, on page 2395
Obtaining an Upgrade or Capacity Adder License, on page 2396
Rehosting a License, on page 2396

Right-to-Use AP-Count Evaluation Licenses

If you are considering upgrading to a license with a higher access point count, you can try an evaluation license before upgrading to a permanent version of the license. For example, if you are using a permanent license with a 50-access-point count and want to try an evaluation license with a 100-access-point count, you can try
out the evaluation license for 90 days. For example, if you are using a permanent license with a 10 access-point count and want to try an evaluation license with a 15-access-point count, you can try out the evaluation license for 90 days.

When an evaluation license is activated, the permanent AP-count licenses are ignored. The maximum supported licenses of 1000 access points are available for 90 days. The maximum supported licenses of 25 access points are available for 90 days.

To prevent disruptions in operation, the device does not change licenses when an evaluation license expires. A warning expiry message is displayed daily starting five days prior to the expiry date. After 90 days, the evaluation license expires with a warning message. You must disable the evaluation license and then purchase the permanent license.

When the device reboots after the evaluation license expiry, the license defaults to a permanent license.

Related Topics
Activating an AP-Count License, on page 2395
Obtaining an Upgrade or Capacity Adder License, on page 2396
Rehosting a License, on page 2396

Right-To-Use Adder AP-Count Rehosting Licenses
Revoking a license from one device and installing it on another is called rehosting. You might want to rehost a license to change the purpose of a device. For example, if you want to move your Office Extend or indoor access points to a different device, you could transfer the adder ap-count license from one device to another.

To rehost a license, you must deactivate the adder ap-count license from one device and activate the same license on another device.

Evaluation licenses cannot be rehosted.

How to Configure RTU Licenses

Activating an Image Based License
To activate image based licenses, complete the following task:

SUMMARY STEPS
1. license right-to-use activate {ipbase | ipservices | lanbase} [ all | evaluation | slotslot-number] [ acceptEULA ]
2. reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu ]
3. show license right-to-use usage [ slot slot-number ]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>license right-to-use activate {ipbase</td>
</tr>
</tbody>
</table>
### Purpose

**Example:** If you do not accept EULA, the modified configuration will not take effect after reload. The default license (or a license that was not deactivated) becomes active after reload.

**Note**

**Device**

```
reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]
```

**Example:**

```
Device# reload slot 1
```

When changing license level, you are not required to save the configuration. But, it is a good practice to ensure all the configuration is stored properly before reload. Changing from a higher license level to a lower license level on reboot will remove CLIs that are not applicable. Ensure that all features in the lower license level that are actively used are not removed.

### Step 3

**Example:**

```
Device# show license right-to-use usage
```

### Displays detailed usage information.

## Changing Mobility Mode

### SUMMARY STEPS

1. `wireless mobility controller`  
2. `write memory`  
3. `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`  
4. `no wireless mobility controller`  
5. `write memory`  
6. `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>wireless mobility controller</code></td>
<td>Changes a switch in Mobility Agent mode to Mobility Controller mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config)# wireless mobility controller  
% Mobility role changed to Mobility Controller. Please save config and reboot the whole stack.
```

**Step 2**

`write memory`

**Example:**

```
Device# write memory  
Building configuration...  
Compressed configuration from 13870 bytes to 5390 bytes[OK]  
Device#
```

**Step 3**

`reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`
### Purpose

**Command or Action**

**Example:**

Device# `reload slot 3`

Proceed with reload? [confirm]  

Step 4  

**no wireless mobility controller**

**Example:**

Device(config)# `no wireless mobility controller`  

Mobility role changed to Mobility Agent. Please save config and reboot the whole stack.  

Switch(config)#

Step 5  

**write memory**

**Example:**

Device# `write memory`

Building configuration...  

Compressed configuration from 13870 bytes to 5390 bytes[OK]

Device#

Step 6  

**reload**  

`[ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`

**Example:**

Device# `reload slot 3`

Proceed with reload? [confirm]  

Command or Action | Purpose |
--- | --- |
**Example:**

Device# `reload slot 3`

Proceed with reload? [confirm]  

Step 4  

**no wireless mobility controller**

**Example:**

Device(config)# `no wireless mobility controller`

Mobility role changed to Mobility Agent. Please save config and reboot the whole stack.  

Switch(config)#

Step 5  

**write memory**

**Example:**

Device# `write memory`

Building configuration...  

Compressed configuration from 13870 bytes to 5390 bytes[OK]

Device#

Step 6  

**reload**  

`[ LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`

**Example:**

Device# `reload slot 3`

Proceed with reload? [confirm]

### Monitoring and Maintaining RTU Licenses

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show license right-to-use default</code></td>
<td>Displays the default license information.</td>
</tr>
<tr>
<td><code>show license right-to-use detail</code></td>
<td>Displays detailed information of all the licenses in the switch stack.</td>
</tr>
<tr>
<td>`show license right-to-use eula {evaluation</td>
<td>permanent}`</td>
</tr>
<tr>
<td><code>show license right-to-use mismatch</code></td>
<td>Displays the license information that does not match.</td>
</tr>
</tbody>
</table>
### Configuration Examples for RTU Licensing

#### Examples: Activating RTU Image Based Licenses

This example shows how to activate an IP Services image license and accept the EULA for a specific slot:

```
Switch# license right-to-use activate ipservices slot 1 acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level
```

This example shows how to activate a license for evaluation:

```
Switch# license right-to-use activate ipservices evaluation acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level
```

#### Related Topics
- Activating an Image Based License, on page 2393

- Activating an AP-Count License, on page 2395

#### Examples: Displaying RTU Licensing Information

This example shows the consolidated RTU licensing information from the active switch on a switch stack. All of the members in the stack have the same license level.

```
Switch# show license right-to-use summary

License Name       Type       Period left
```

---

Command | Purpose
--- | ---
show license right-to-use slot `slot-number` | Displays the license information for a specific slot in a switch stack.
show license right-to-use summary | Displays a summary of the license information on the entire switch stack.
show license right-to-use usage `[ slot `slot-number` ]` | Displays detailed information about usage for all licenses in the switch stack.
show switch | Displays detailed information of every member in a switch stack including the state of the license.

- Restrictions for Configuring RTU Licenses, on page 2389
- Right-To-Use Licensing, on page 2390
- Monitoring and Maintaining RTU Licenses, on page 2398
This example shows a summary of permanent and adder licenses. The evaluation AP-count license is disabled displaying the total number of activated adder AP-count licenses in the switch stack. AP-count licenses in-use mean that they are connected.

**Switch#** show license right-to-use summary

<table>
<thead>
<tr>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
<th>Period left</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipservices</td>
<td>permanent</td>
<td>N/A</td>
<td>Lifetime</td>
</tr>
<tr>
<td>apcount</td>
<td>base</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>apcount</td>
<td>adder</td>
<td>25</td>
<td>Lifetime</td>
</tr>
</tbody>
</table>

This example shows the RTU default licenses. Default licenses are pre-installed and cannot be removed or transferred. If no license is activated the switch uses the default license, after a reboot.

**Switch#** show license right-to-use default

<table>
<thead>
<tr>
<th>Slot#</th>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ipservices</td>
<td>permanent</td>
<td>N/A</td>
</tr>
<tr>
<td>1</td>
<td>apcount</td>
<td>base</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>apcount</td>
<td>adder</td>
<td>10</td>
</tr>
</tbody>
</table>

This example shows the consolidated RTU licensing information of the controller. When the evaluation ap-count license is activated, the base and adder ap-count licenses are ignored. The maximum number of ap-count licenses are available when evaluation is enabled.

**controller#** show license right-to-use summary

<table>
<thead>
<tr>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
<th>Period left</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Example: Displaying RTU License Details

This example shows all the detailed information for the RTU licenses on slot 1:

Device# show license right-to-use detail slot 1

Index 1
License Name : ipservices
Period left : Lifetime
License Type : Permanent
License State : Active, In use
License Location: Slot 1

Index 2
License Name : ipservices
Period left : 90
License Type : Evaluation
License State : Not Activated
License Location: Slot 1

Index 3
License Name : ipbase
Period left : Lifetime
License Type : Permanent
License State : Active, Not In use
License Location: Slot 1

Index 4
License Name : ipbase
Period left : 90
License Type : Evaluation
License State : Not Activated
License Location: Slot 1

Index 5
License Name : lanbase
Period left : Lifetime
License Type : Permanent
License State : Active, Not In use
License Location: Slot 1

Controller# show license right-to-use detail slot 1
Index 6: License Name: apcount
Period left: Expired
License Type: evaluation
License State: Active, In use
Example: Displaying RTU License Mismatch

This example shows the license information of the switches in a stack and a mismatch state of a member switch. The member must match the active.

```
Switch# show switch

Switch/Stack Mac Address : 1c1d.8625.7700 - Local Mac Address
H/W Current
Switch# Role Mac Address Priority Version State
**************************************************************
*1 Active 1c1d.8625.7700 15 V02 Ready
2 Standby bc16.f55c.ab80 7 V04 Ready
3 Member 580a.2095.da00 1 V03 Lic-Mismatch
```

Note

To resolve the license mismatch, first check the RTU license summary:

```
Switch# show license right-to-use
```

Then change the license level of the mismatched switch so that it is the same license level of the active switch. This example shows that the IP Base license was activated for the member switch to match the active switch.

```
Switch# license right-to-use activate ipbase slot 3 acceptEULA
```
Example: Displaying RTU Licensing Usage

This example shows the detailed licensing usage on your switch stack. The IP Services license in Slot 1 is permanent and usage is one day. An AP-count license in Slot 2 is ready for evaluation. EULA was accepted and state shows in use, but after reboot the evaluation license will be deactivated.

Switch# `show license right-to-use usage`

<table>
<thead>
<tr>
<th>Slot#</th>
<th>License Name</th>
<th>Type</th>
<th>usage-duration(y:m:d)</th>
<th>In-Use</th>
<th>EULA</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ipservices</td>
<td>Permanent</td>
<td>0:10:27</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>1</td>
<td>ipservices</td>
<td>Evaluation</td>
<td>0:0:0</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>1</td>
<td>ipbase</td>
<td>Permanent</td>
<td>0:0:9</td>
<td>no</td>
<td>yes</td>
</tr>
<tr>
<td>1</td>
<td>ipbase</td>
<td>Evaluation</td>
<td>0:0:0</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>1</td>
<td>lanbase</td>
<td>Permanent</td>
<td>0:11:12</td>
<td>no</td>
<td>yes</td>
</tr>
</tbody>
</table>

Slot# License Name Type usage-duration(y:m:d) In-Use EULA
-------------------------------------------------------------------------------
2 ipservices Permanent 0:3:25 yes yes
2 ipservices Evaluation 0:0:0 no no
2 ipbase Permanent 0:0:0 no yes
2 ipbase Evaluation 0:0:0 no no
2 lanbase Permanent 0:7:2 no yes

Slot# License Name Type usage-duration(y:m:d) In-Use EULA
-------------------------------------------------------------------------------
3 ipservices Permanent 0:6:15 yes yes
3 ipservices Evaluation 0:0:0 no no
3 ipbase Permanent 0:0:0 no yes
3 ipbase Evaluation 0:0:0 no no
3 lanbase Permanent 0:8:11 no yes

This example shows the detailed licensing usage on your controller.

Controller# `show license right-to-use usage`

<table>

CHAPTER 119

Configuring Administrator Usernames and Passwords

• Finding Feature Information, on page 2405
• Information About Configuring Administrator Usernames and Passwords, on page 2405
• Configuring Administrator Usernames and Passwords, on page 2406
• Examples: Administrator Usernames and Passwords Configuration, on page 2408
• Additional References for Administrator Usernames and Passwords, on page 2409
• Feature History and Information For Performing Administrator Usernames and Passwords Configuration, on page 2409

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Administrator Usernames and Passwords

You can configure administrator usernames and passwords to prevent unauthorized users from reconfiguring the device and viewing configuration information. This section provides instructions for initial configuration and for password recovery.

You can also set administrator usernames and passwords to manage and configure one or more access points that are associated with the device.

Strong Passwords

You can set strong administrator passwords such as encrypted passwords with ASCII keys for the administrator user for managing access points.

Use the following guidelines while creating strong passwords:
- There should be at least three of the following categories—lowercase letters, uppercase letters, and digits, and special characters.

**Note** Special characters are not supported for username and password for GUI login.

- The new password should not be the same as that of the associated username and the username should not be reversed.

- The characters in the password should not be repeated more than three times consecutively.

- The password should not be cisco, ocsc, admin, nimda, or any variant obtained by changing the capitalization of letters therein, or by substituting "1" for "i" or "!" for i, and/or substituting "0" for "o", and/or substituting "$" for "s".

- The maximum number of characters accepted for the username and password is 32.

### Encrypted Passwords

You can set three types of keys for the password:

- Randomly generated key—This key is generated randomly and it is the most secure option. To export the configuration file from one system to another, the key should also be exported.

- Static key—The simplest option is to use a fixed (static) encryption key. By using a fixed key, no key management is required, but if the key is somehow discovered, the data can be decrypted by anyone with the knowledge of that key. This is not a secure option and it is called obfuscation in the CLI.

- User defined key—You can define the key by yourself. To export the configuration file from one system to another, both systems should have the same key configured.

**Note** When you configure the `ap mgmtuser username` and `ap dot1x username` commands, the system encrypts the password automatically when password encryption aes is enabled and the encryption key is configured with the `key config-key password-encrypt` command. If an already-encrypted password is entered (that is, type 8), then it must be one that has been encrypted with the currently stored key. If the key of the encrypted password does not match the currently stored key, the encrypted password is rejected. In such case, you can enter the password in plain text (that is, type 0) and allow the system to encrypt it automatically.

### Configuring Administrator Usernames and Passwords

#### SUMMARY STEPS

1. `configure terminal`
2. `wireless security strong-password`
3. `username admin-username password {0 unencrypted_password | 7 hidden_password | unencrypted_text}`
4. `username admin-username secret {0 unencrypted_secret_text | 4 SHA256 encrypted_secret_text | 5 MD5 encrypted_secret_text | LINE}`
5. `ap mgmtuser username username password {0 unencrypted password | 8 AES encrypted password} secret {0 unencrypted password | 8 AES encrypted password}`
6. `ap dot1x username username password {0 unencrypted password | 8 AES encrypted password}`
7. `end`
8. `ap name apname mgmtuser username password secret secret_text`
9. `ap name apname dot1x-user username password`
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# ap dot1x username cisco password 0 Qwci12@</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> end <strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> ap name apname mgmtuser username username password password secret secret_text</td>
<td>Configures the administrator username, password, and secret text for managing a specific access point that is configured to the device.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qne35! secret Nzep592$</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> ap name apname dot1x-user username password password</td>
<td>Configures the 802.1X username and password for a specific access point.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qne35!</td>
<td></td>
</tr>
</tbody>
</table>

### Examples: Administrator Usernames and Passwords Configuration

This example shows how to configure administrator usernames and passwords with the strong password policy in configuration mode:

```
Device# configure terminal  
Device(config)# wireless security strong-password  
Device(config)# username adminuser1 password 0 QZsek239@  
Device(config)# ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@!  
Device(config)# ap dot1x username cisco password 0 Qwci12@  
Device# end
```

This example shows how to configure administrator usernames and passwords for an access point in global EXEC mode:

```
Device# wireless security strong-password  
Device# ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qwci12@ secret Qwci14@  
Device# ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qwci12@  
Device# end
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on Band Selection, 802.11 Bands, and Parameters

- Band selection-enabled WLANs do not support time-sensitive applications such as voice and video because of roaming delays.
- Band selection can be used only with Cisco Aironet 1140, 1250, 1260, 1550, 1800, 2600, 2800, 3500, 3600, 3800 Series access points.
- Mid-RSSI is not supported on Cisco Aironet 1600 Series access points.
- Band selection is not supported in Cisco Aironet 1040, OEAP 600 Series access points.
- Band selection operates only on access points that are connected to a controller. A FlexConnect access point without a controller connection does not perform band selection after a reboot.
The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running.

You can enable both band selection and aggressive load balancing on the controller. They run independently and do not impact one another.

It is not possible to enable or disable band selection and client load balancing globally through the controller GUI or CLI. You can, however, enable or disable band selection and client load balancing for a particular WLAN. Band selection and client load balancing are enabled globally by default.

Information About Configuring Band Selection, 802.11 Bands, and Parameters

Band Selection

Band selection enables client radios that are capable of dual-band (2.4 and 5-GHz) operations to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of 3 nonoverlapping channels. To prevent these sources of interference and improve overall network performance, configure band selection on the device.

Band selection works by regulating probe responses to clients and it can be enabled on a per-WLAN basis. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels. In an access point, the band select table can be viewed by running the show dot11 band-select command. It can also be viewed by running the show cont d0/d1 | begin Lru command.

Note

The WMM default configuration is not shown in the show running-config command output.

Band Selection Algorithm

The band selection algorithm affects clients that use 2.4-GHz band. Initially, when a client sends a probe request to an access point, the corresponding client probe’s Active and Count values (as seen from the band select table) become 1. The algorithm functions based on the following scenarios:

- Scenario 1—Client RSSI (as seen from the show cont d0/d1 | begin RSSI command output) is greater than both Mid RSSI and Acceptable Client RSSI.
  - Dual-band clients—No 2.4-GHz probe responses are seen at any time; 5-GHz probe responses are seen for all 5-GHz probe requests.
  - Single-band (2.4-GHz) clients—2.4-GHz probe responses are seen only after the probe suppression cycle.
  - After the client’s probe count reaches the configured probe cycle count, the algorithm waits for the Age Out Suppression time and then marks the client probe’s Active value as 0. Then, the algorithm is restarted.
• Scenario 2—Client RSSI (as seen from `show cont d0/d1 begin RSSI`) lies between Mid-RSSI and Acceptable Client RSSI.
  • All 2.4-GHz and 5-GHz probe requests are responded to without any restrictions.
  • This scenario is similar to the band select disabled.

---

**Note**
The client RSSI value (as seen in the `sh cont d0 begin RSSI` command output) is the average of the client packets received, and the Mid RSSI feature is the instantaneous RSSI value of the probe packets. As a result, the client RSSI is seen as weaker than the configured Mid RSSI value (7-dB delta). The 802.11b probes from the client are suppressed to push the client to associate with the 802.11a band.

---

**802.11 Bands**

You can configure the 802.11b/g/n (2.4 GHz) and 802.11a/n (5 GHz) bands for the controller to comply with the regulatory requirements in your country. By default, both 802.11b/g/n and 802.11a/n are enabled.

When a controller is configured to allow only 802.11g traffic, 802.11b client devices are able to successfully connect to an access point, but cannot pass traffic. When you configure the controller only for 802.11g traffic, you must mark 11g rates as mandatory.

---

**Note**
The Block Acks in a Cisco 2800, 3800, 1560 APs are sent at configured mandatory data rates in Cisco WLC for 2.4 GHz radio.

---

**802.11n Parameters**

This section provides instructions for managing 802.11n access points on your network. The 802.11n devices support the 2.4 and 5-GHz bands and offer high throughput data rates.

The 802.11n high throughput rates are available on all the 802.11n access points for the WLANs using WMM with no Layer 2 encryption or with WPA2/AES encryption enabled.

---

**Note**
Some Cisco 802.11n APs may intermittently emit incorrect beacon frames, which can trigger false wIPS alarms. We recommend that you ignore these alarms. The issue is observed in the following Cisco 802.11n APs: 1140, 1250, 2600, 3500, and 3600.

---

**802.11h Parameters**

802.11h informs client devices about channel changes and can limit the transmit power of those client devices.
How to Configure 802.11 Bands and Parameters

Configuring Band Selection (CLI)

**SUMMARY STEPS**

1. `configure terminal`
2. `wireless client band-select cycle-count cycle_count`
3. `wireless client band-select cycle-threshold milliseconds`
4. `wireless client band-select expire suppression seconds`
5. `wireless client band-select expire dual-band seconds`
6. `wireless client band-select client-rssi client_rssi`
7. `end`
8. `wlan wlan_profile_name wlan_ID SSID_network_name band-select`
9. `end`

**DETAILED STEPS**

<table>

### Configuring the 802.11 Bands (CLI)

Follow the procedure given below to configure 802.11 bands and parameters:

#### SUMMARY STEPS

1. configure terminal
2. ap dot11 5ghz shutdown
3. ap dot11 24ghz shutdown
4. ap dot11 \{5ghz | 24ghz\} beaconperiod time_unit
5. ap dot11 \{5ghz | 24ghz\} fragmentation threshold
6. ap dot11 \{5ghz | 24ghz\} dtpc
7. wireless client association limit number interval milliseconds
8. ap dot11 \{5ghz | 24ghz\} rate rate \{disable | mandatory | supported\}
9. no ap dot11 5ghz shutdown
10. no ap dot11 24ghz shutdown
11. ap dot11 24ghz dot11g
12. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>

<th>Step 7</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan wlan_profile_name wlan_ID SSID_network_name band-select</td>
<td>Configures band selection on specific WLANs. Valid range is between 1 and 512. You can enter up to 32 alphanumerics for SSID_network_name parameter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 2    | `ap dot11 5ghz shutdown` | Disables the 802.11a band.  
**Example:**  
Device(config)# ap dot11 5ghz shutdown  
**Note**  
You must disable the 802.11a band before configuring the 802.11a network parameters. |
| 3    | `ap dot11 24ghz shutdown` | Disables the 802.11b band.  
**Example:**  
Device(config)# ap dot11 24ghz shutdown  
**Note**  
You must disable the 802.11b band before configuring the 802.11b network parameters. |
| 4    | `ap dot11 {5ghz | 24ghz} beaconperiod time_unit` | Specifies the rate at which the SSID is broadcast by the corresponding access point.  
**Example:**  
Device(config)# ap dot11 5ghz beaconperiod 500  
**Note**  
The beacon interval is measured in time units (TUs). One TU is 1024 microseconds. You can configure the access point to send a beacon every 20 to 1000 milliseconds. |
| 5    | `ap dot11 {5ghz | 24ghz} fragmentation threshold` | Specifies the size at which packets are fragmented.  
**Example:**  
Device(config)# ap dot11 5ghz fragmentation 300  
**Note**  
The threshold is a value between 256 and 2346 bytes (inclusive). Specify a low number for areas where communication is poor or where there is a great deal of radio interference. |
| 6    | `ap dot11 {5ghz | 24ghz} dtpc` | Enables access points to advertise their channels and transmit the power levels in beacons and probe responses.  
**Example:**  
Device(config)# ap dot11 5ghz dtpc  
Device(config)# no ap dot11 24ghz dtpc  
**Note**  
The default value is enabled. Client devices using dynamic transmit power control (DTPC) receive the channel-level and power-level information from the access points and adjust their settings automatically. For example, a client device used primarily in Japan can rely on DTPC to adjust its channel and power settings automatically when it travels to Italy and joins a network there.  
The **no** form of the command disables the 802.11a or 802.11b DTPC setting. |
| 7    | `wireless client association limit number interval milliseconds` | Specifies the maximum allowed clients that can be configured.  
**Example:**  
Device(config)# wireless client association limit 50 interval 1000  
**Note**  
You can configure the maximum number of association requests on a single access point slot at a given interval. The range of association limit that you can configure is from 1 to 100.  
The association request limit interval is measured between 100 to 10000 milliseconds. |
| 8    | `ap dot11 {5ghz | 24ghz} rate rate {disable | mandatory | supported}` | Specifies the rate at which data can be transmitted between the controller and the client.  
**Example:**  
Device(config)# ap dot11 5ghz rate 36 mandatory  
**Note**  
* disable—Defines that the clients specify the data rates used for communication. |
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• mandatory</td>
<td>Defines that the clients support this data rate in order to associate to an access point on the controller.</td>
</tr>
<tr>
<td>• supported</td>
<td>Any associated clients that support this data rate can communicate with the access point using that rate. However, the clients are not required to use this rate in order to associate.</td>
</tr>
<tr>
<td>• rate</td>
<td>Specifies the rate at which data is transmitted. For the 802.11a and 802.11b bands, the data is transmitted at the rate of 1, 2, 5.5, 6, 9, 11, 12, 18, 24, 36, 48, or 54 Mbps.</td>
</tr>
</tbody>
</table>

### Summary Steps

1. configure terminal
2. ap dot11 {5ghz | 24ghz} dot11n
3. ap dot11 {5ghz | 24ghz} dot11n mcs tx rtu
4. wlan wlan_profile_name wlan_ID SSID_network_name wmm require
5. ap dot11 {5ghz | 24ghz} shutdown
6. {ap | no ap} dot11 {5ghz | 24 ghz} dot11n a-mpdu tx priority {all | 0-7}
7. no ap dot11 {5ghz | 24ghz} shutdown
8. ap dot11 {5ghz | 24ghz} dot11n guard-interval {any | long}
9. ap dot11 {5ghz | 24ghz} dot11n rifs rx
10. end
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>

<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ap dot11 {5ghz</td>
<td>24ghz} dot11n</td>
</tr>
<tr>
<td>Example: Device(config)# ap dot11 5ghz dot11n</td>
<td>The no form of this command disables the 802.11n support on the network.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ap dot11 {5ghz</td>
<td>24ghz} dot11n mcs tx rtu</td>
</tr>
<tr>
<td>Example: Device(config)# ap dot11 5ghz dot11n mcs tx 20</td>
<td>rtu-The valid range is between 0 and 23.</td>
</tr>
<tr>
<td><strong>Step 4</strong> wlan wlan_profile_name wlan_ID SSID_network_name wmm require</td>
<td>Enables WMM on the WLAN and uses the 802.11n data rates that you configured.</td>
</tr>
<tr>
<td>Example: Device(config)# wlan wlan1 25 ssid12 Device(config-wlan)# wmm require</td>
<td>The require keyword requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ap dot11 {5ghz</td>
<td>24ghz} shutdown</td>
</tr>
<tr>
<td>Example: Device(config)# ap dot11 5ghz shutdown</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> {ap</td>
<td>no ap} dot11 {5ghz</td>
</tr>
<tr>
<td>Example: Device(config)# ap dot11 5ghz dot11n a-mpdu tx priority all</td>
<td>Aggregation is the process of grouping packet data frames together, rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). Both A-MPDU and A-MSDU are performed in the software.</td>
</tr>
<tr>
<td>You can specify the aggregation method for various types of traffic from the access point to the clients.</td>
<td>The list defines the priority levels (0-7) assigned per traffic type.</td>
</tr>
<tr>
<td>• 0—Best effort</td>
<td></td>
</tr>
<tr>
<td>• 1—Background</td>
<td></td>
</tr>
<tr>
<td>• 2—Spare</td>
<td></td>
</tr>
<tr>
<td>• 3—Excellent effort</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td>• 4—Controlled load</td>
<td></td>
</tr>
<tr>
<td>• 5—Video, less than 100-ms latency and jitter</td>
<td></td>
</tr>
<tr>
<td>• 6—Voice, less than 100-ms latency and jitter</td>
<td></td>
</tr>
<tr>
<td>• 7—Network control</td>
<td></td>
</tr>
</tbody>
</table>

You can configure each priority level independently, or you can use all the parameters to configure all the priority levels at once. You can configure priority levels so that the traffic uses either A-MPDU transmission or A-MSDU transmission.

- When you use the `ap` command along with the other options, the traffic associated with that priority level uses A-MPDU transmission.
- When you use the `no ap` command along with the other options, the traffic associated with that priority level uses A-MSDU transmission.

Configure the priority levels to match the aggregation method used by the clients. By default, A-MPDU is enabled for priority level 0, 4, and 5, and the rest are disabled. By default, A-MPDU is enabled for all priorities except 6 and 7.

---

**Step 7**

`no ap dot11 {5ghz | 24ghz} shutdown`

**Example:**

```
Device(config)# no ap dot11 5ghz shutdown
```

Re-enables the network.

**Step 8**

`ap dot11 {5ghz | 24ghz} dot11n guard-interval {any | long}`

**Example:**

```
Device(config)# ap dot11 5ghz dot11n guard-interval long
```

Configures the guard interval for the network.

**Step 9**

`ap dot11 {5ghz | 24ghz} dot11n rifs rx`

**Example:**

```
Device(config)# ap dot11 5ghz dot11n rifs rx
```

Configures the Reduced Interframe Space (RIFS) for the network.

**Step 10**

`end`

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-Z` to exit global configuration mode.
Configuring 802.11h Parameters (CLI)

Example: Viewing the status of 802.11h Parameters

```
Device# show wireless dot11h
Power Constraint: 0
Channel Switch: 0
Channel Switch Mode: 0
```

Example: Verifying the Band-Selection Settings

The following example displays a band-select configuration:

```
Device# show wireless band-select
Band Select Probe Response : per WLAN enabling
Cycle Count : 2
Cycle Threshold (millsec) : 200
Age Out Suppression (sec) : 20
Age Out Dual Band (sec) : 60
Client RSSI (dBm) : -80
Client Mid RSSI (dBm) : -80
```
Configuration Examples for Band Selection, 802.11 Bands, and Parameters

Examples: Band Selection Configuration

This example shows how to set the probe cycle count and time threshold for a new scanning cycle period for band select:

```
Device# configure terminal
Device(config)# wireless client band-select cycle-count 3
Device(config)# wireless client band-select cycle-threshold 5000
Device(config)# end
```

This example shows how to set the suppression expiry time to the band select:

```
Device# configure terminal
Device(config)# wireless client band-select expire suppression 100
Device(config)# end
```

This example shows how to set the dual-band expiry time for the band select:

```
Device# configure terminal
Device(config)# wireless client band-select expire dual-band 100
Device(config)# end
```

This example shows how to set the client RSSI threshold for the band select:

```
Device# configure terminal
Device(config)# wireless client band-select client-rssi 40
Device(config)# end
```

This example shows how to configure band selection on specific WLANs:

```
Device# configure terminal
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# band-select
Device(config)# end
```

Examples: 802.11 Bands Configuration

This example shows how to configure 802.11 bands using beacon interval, fragmentation, and dynamic transmit power control:

```
Device# configure terminal
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 24ghz shutdown
Device(config)# ap dot11 5ghz beaconsperiod 500
Device(config)# ap dot11 5ghz fragmentation 300
Device(config)# ap dot11 5ghz dtpc
Device(config)# wireless client association limit 50 interval 1000
```
Examples: 802.11n Configuration

This example shows how to configure 802.11n parameters for 5-GHz band using aggregation method:

Device(config)# ap dot11 5ghz rate 36 mandatory
Device(config)# no ap dot11 5ghz shutdown
Device(config)# no ap dot11 24ghz shutdown
Device(config)# ap dot11 24ghz dot11g
Device(config)# end

Examples: 802.11n Configuration

This example shows how to configure the guard interval for 5-GHz band:

Device# configure terminal
Device(config)# ap dot11 5ghz dot11n
Device(config)# ap dot11 5ghz dot11n mcs tx 20
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# wmm require
Device(config-wlan)# exit
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz dot11n a-mpdu tx priority all
Device(config)# no ap dot11 5ghz shutdown
Device(config)# exit

This example shows how to configure the RIFS for 5-GHz band:

Device# configure terminal
Device(config)# ap dot11 5ghz dot11n
Device(config)# ap dot11 5ghz dot11n mcs tx 20
Device(config)# wlan wlan1 25 ssid12
Device(config-wlan)# wmm require
Device(config-wlan)# exit
Device(config)# no ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz dot11n guard-interval long
Device(config)# end

Examples: 802.11h Configuration

This example shows how to configure the access point to announce when it is switching to a new channel using restriction transmission:

Device# configure terminal
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz channelswitch mode 0
Device(config)# no ap dot11 5ghz shutdown
Device(config)# end
This example shows how to configure the 802.11h power constraint for 5-GHz band:

```
Device# configure terminal
Device(config)# ap dot11 5ghz shutdown
Device(config)# ap dot11 5ghz power-constraint 200
Device(config)# no ap dot11 5ghz shutdown
Device(config)# end
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Aggressive Load Balancing

• You can configure aggressive load balancing only from the command-line interface.
• Aggressive load balancing is disabled by default, you must enable it manually.
• You can enable load balancing either separately or together with the band select configurations.
• When the band select is enabled on the dual-band clients, the load balancing parameter selects only the lowest load radio from 5-GHz radios. For the 2.4-GHz clients, there is no probe information of the client on 5 GHz and therefore the load balancing algorithm can only be selected between radio on 2.4 GHz.
• You can operate load balancing of clients between access points on the same device but not for the clients between access points on the different device.
• The load balancing uses an existing association denial mechanism based on the number of client on the radio and the band select is implemented by the distributed probe response suppression on the access point only.
Information for Configuring Aggressive Load Balancing Parameters

Aggressive Load Balancing

Enabling aggressive load balancing on the controller allows lightweight access points to load balance wireless clients across access points. You can enable aggressive load balancing using the controller.

When a wireless client attempts to associate to a lightweight access point, association response packets are sent to the client with an 802.11 response packet including status code 17. The code 17 indicates that the AP is busy. The AP does not respond with an association response bearing 'success' if the AP threshold is not met, and with code 17 (AP busy) if the AP utilization threshold is exceeded, and another less busy AP heard the client request.

For example, if the number of clients on AP1 is more than the number of clients on AP2 plus the load-balancing window, then AP1 is considered to be busier than AP2. When a client attempts to associate to AP1, it receives an 802.11 response packet with status code 17, indicating that the access point is busy, and the client attempts to associate to a different access point.

You can configure the controller to deny client associations up to 10 times (if a client attempted to associate 11 times, it would be allowed to associate on the 11th try). You can also enable or disable load balancing on a particular WLAN, which is useful if you want to disable load balancing for a select group of clients (such as time-sensitive voice clients).

Note

Voice Client does not authenticate when delay is configured more than 300 ms. To avoid this configure a Central-Auth, Local Switching WLAN with CCKM, configure a Pagent Router between AP and WLC with a delay of 600 ms (300 ms UP and 300 ms DOWN and try associating the voice client.

The maximum number of client associations that the access points can support is dependent upon the following factors:

- The maximum number of client associations differs for lightweight and autonomous Cisco IOS access points.
- There may be a limit per radio and an overall limit per AP.
- AP hardware (the 16-MB APs have a lower limit than the 32-MB and higher APs)

The Client Association Limits for Lightweight Access Points are as follows:

- For 16-MB APs, the limit is 128 clients per AP. This limit is applicable to 1100 and 1200 series APs.
- For 32-MB and higher APs, there is no per-AP limit.

The maximum Client Association Limits per-radio for all of the Cisco IOS APs is 200 associations.
With 32-MB and higher lightweight Cisco IOS APs, with two radios, up to \(200 + 200 = 400\) associations are supported.

The maximum Client Association Limits per Autonomous Cisco IOS access point is around 80 to 127 clients per AP. This number varies depending on the following factors:

- AP model (whether it is 16 MB or 32 MB or higher)
- Cisco IOS software release
- Hardware configuration (two radios use more memory than one)
- Enabled features (WDS functionality in particular)

The per-radio limit is about 200 associations. One association will likely hit the per-AP limit first. Unlike Cisco Unified Wireless Network, autonomous Cisco IOS supports per-SSID/per-AP association limits. This limit is configured using the max-associations CLI, under dot11 SSID. The maximum number is 255 associations (which is also the default number).

For a FlexConnect AP the association is locally handled. The load-balancing decisions are taken at the Cisco WLC. A FlexConnect AP initially responds to the client before knowing the result of calculations at the Cisco WLC. Load-balancing doesn't take effect when the FlexConnect AP is in standalone mode.

FlexConnect AP does not send (re)association response with status 17 for Load-Balancing as Local mode APs do; instead, it first sends (re)association with status 0 (success) and then deauth with reason 5.

### How to Configure Aggressive Load Balancing

#### Configuring Aggressive Load Balancing (CLI)

**SUMMARY STEPS**

1. Set the client window for aggressive load balancing by entering this command:
2. Set the denial count for load balancing by entering this command:
3. Save your changes by entering this command:
4. Enter WLAN configuration mode by entering this command:
5. Enable load balancing on the specific WLAN by entering this command:
6. Verify your settings by entering this command:
7. Save your changes by entering this command:

**DETAILED STEPS**

**Step 1** Set the client window for aggressive load balancing by entering this command:
**Monitoring Aggressive Load Balancing**

This section describes the new command for aggressive load balancing.

The following command can be used to monitor aggressive load balancing on the.

**Table 189: Monitoring Aggressive Load Balancing Command**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>

**Step 2**
Set the denial count for load balancing by entering this command:

**wireless load-balancing denial denial_count**

You can enter a value between 1 and 10 for the `denial_count` parameter.

**Step 3**
Save your changes by entering this command:

**write memory**

**Step 4**
Enter WLAN configuration mode by entering this command:

**wlan profile-name wlan_ID SSID**

You can enter a profile name with up to 32 alphanumeric characters for `profile-name`. You can enter a value between 1 and 512 for `wlan_ID` parameter. You can enter a network name of up to 32 alphanumeric characters for `SSID` parameter.

**Step 5**
Enable load balancing on the specific WLAN by entering this command:

**load-balance**

You can use no **load-balance** command to disable load balancing.

**Step 6**
Verify your settings by entering this command:

**show wireless load-balancing**

**Step 7**
Save your changes by entering this command:

**write memory**

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Client Roaming

The following are the restrictions that you should be aware while configuring client roaming:

- Cisco Compatible Extensions (CCX) support is enabled automatically for every WLAN on the device and cannot be disabled. The device stores the CCX version of the client in its client database and uses it to generate and respond to CCX frames appropriately. Clients must support CCXv4 or v5 (or CCXv2 for access point assisted roaming) to utilize these roaming enhancements.

- Client roaming between 600 Series Access points is not supported.

Information About Client Roaming

The controllers deliver high-end wireless services to the clients roaming across wireless network. Now, the wireless services are integrated with the switches, thus delivering a value-added Cisco unified new mobility
architecture. This unified architecture enables client-roaming services to both wireless and wired clients with seamless, fast- roaming services.

The new mobility architecture supports fast client roaming services using logical categorization of network into Mobility Domains (MDs), Mobility Groups (MGs), Mobility Subdomains (MSDs), and Switch Peer Groups (SPGs) using systems such as Mobility Oracle (MO), Mobility Controller (MC), and Mobility Agent (MA).

- **A Mobility Domain** is the entire domain across which client roaming is supported. It is a collection of mobility groups. For example, a campus network can be considered as a mobility domain.

- **A Mobility Group** is a collection of mobility subdomains across which fast roaming is supported. The mobility group can be one or more buildings within a campus across which frequent roaming is supported.

- **A Mobility Subdomain** is an autonomous portion of the mobility domain network. Each mobility subdomain contains one mobility controller (MC) and a collection of SPGs. A subdomain is equivalent to an 802.11r key domain.

- **A Switch Peer Group** is a collection of mobility agents.

- The **Mobility Oracle** acts as the point of contact for mobility events that occur across mobility subdomains. The mobility oracle also maintains a local database of each client in the entire mobility domain, their home and current subdomain. There is only one MO for an entire mobility domain. The Cisco WLC 5700 Series Controllers or Cisco Unified Wireless Networking Solution controller can act as MO.

- **The Mobility Controller** provides mobility management services for inter-SPG roaming events. The MC sends the configuration like SPG name and SPG peer member list to all of the mobility agents under its subdomain. The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.

- **The Mobility Agent** is the component that maintains client mobility state machine for a mobile client. All APs are connected to the mobility agent.

The New mobility architecture supports seamless roaming in the following scenarios:

- **Intra-switch roaming**—The client roaming between APs managed by same mobility agent.

- **Intra-SPG roaming**—The client roaming between mobility agents in the same SPG.

- **Inter-SPG, Intra-subdomain roaming**—The client roaming between mobility agents in different SPGs within the same subdomain.

- **Inter-subdomain roaming**—The client roaming between mobility agents across a subdomain.

**Fast Roaming**

New mobility architecture supports fast roaming when clients roam within a mobility group by eliminating the need for full authentication. Security policies should be same across the switches for fast roaming.

**Local, anchor, foreign MAs and MCs**

When a client joins an MA initially and its point of attachment has not changed, that MA is referred as local or associated MA. The MC to which this MA is associated is referred as local or associated MC.

When a client roams between two MAs, the MA to which the client was previously associated is the anchor MA (point of attachment) and the MA to which the client is currently associated is the foreign or associated...
MA (point of presence). The MCs to which these MAs are associated are referred as anchor, foreign, or associated MCs, respectively.

**Inter-Subnet Roaming**

Multiple-controller deployments support client roaming across access points managed by controllers in the same mobility group on different subnets. This roaming is transparent to the client because the session is sustained and a tunnel between the controllers allows the client to continue using the same DHCP-assigned or client-assigned IP address as long as the session remains active. The tunnel is torn down, and the client must reauthenticate when the client sends a DHCP Discover with a 0.0.0.0 client IP address or a 169.254.*.* client auto-IP address or when the operator-set user timeout is exceeded.

**Voice-over-IP Telephone Roaming**

802.11 voice-over-IP (VoIP) telephones actively seek out associations with the strongest RF signal to ensure the best quality of service (QoS) and the maximum throughput. The minimum VoIP telephone requirement of 20-millisecond or shorter latency time for the roaming handover is easily met by the Cisco Wireless solution, which has an average handover latency of 5 or fewer milliseconds when open authentication is used. This short latency period is controlled by controllers rather than allowing independent access points to negotiate roaming handovers.

The Cisco Wireless solution supports 802.11 VoIP telephone roaming across lightweight access points managed by controllers on different subnets, as long as the controllers are in the same mobility group. This roaming is transparent to the VoIP telephone because the session is sustained and a tunnel between controllers allows the VoIP telephone to continue using the same DHCP-assigned IP address as long as the session remains active. The tunnel is torn down, and the VoIP client must reauthenticate when the VoIP telephone sends a DHCP Discover with a 0.0.0.0 VoIP telephone IP address or a 169.254.*.* VoIP telephone auto-IP address or when the operator-set user timeout is exceeded.

**CCX Layer 2 Client Roaming**

The controller supports five CCX Layer 2 client roaming enhancements:

- **Access point assisted roaming**—This feature helps clients save scanning time. When a CCXv2 client associates to an access point, it sends an information packet to the new access point listing the characteristics of its previous access point. Roaming time decreases when the client recognizes and uses an access point list built by compiling all previous access points to which each client was associated and sent (unicast) to the client immediately after association. The access point list contains the channels, BSSIDs of neighbor access points that support the client’s current SSID(s), and time elapsed since disassociation.

- **Enhanced neighbor list**—This feature focuses on improving a CCXv4 client’s roam experience and network edge performance, especially when servicing voice applications. The access point provides its associated client information about its neighbors using a neighbor-list update unicast message.

- **Enhanced neighbor list request (E2E)**—The End-2-End specification is a Cisco and Intel joint program that defines new protocols and interfaces to improve the overall voice and roaming experience. It applies only to Intel clients in a CCX environment. Specifically, it enables Intel clients to request a neighbor list at will. When this occurs, the access point forwards the request to the controller. The controller receives the request and replies with the current CCX roaming sublist of neighbors for the access point to which the client is associated.
To see whether a particular client supports E2E, choose Wireless > Clients on the controller GUI, click the Detail link for the desired client, and look at the E2E Version text box in the Client Properties area.

- Roam reason report—This feature enables CCXv4 clients to report the reason why they roamed to a new access point. It also allows network administrators to build and monitor a roam history.
- Directed roam request—This feature enables the controller to send directed roam requests to the client in situations when the controller can better service the client on an access point different from the one to which it is associated. In this case, the controller sends the client a list of the best access points that it can join. The client can either honor or ignore the directed roam request. Non-CCX clients and clients running CCXv3 or below must not take any action. No configuration is required for this feature.

## How to Configure Layer 2 or Layer 3 Roaming

### Configuring Layer 2 or Layer 3 Roaming

#### Before you begin

To configure the mobility agent for Layer 2 or Layer 3 roaming, the following requisites should be considered:

- SSID and security polices should be same across MAs for Layer 2 and Layer 3 roaming.
- Client VLAN ID should be same for Layer 2 roaming and different for Layer 3 roaming.
- Bridge domain ID and client VLAN IDs should be same for Layer 2 roaming. Either one or both of the bridge domain ID and client VLAN ID should be different for Layer 3 roaming.

### SUMMARY STEPS

1. `configure terminal`
2. `wlan wlan_profile_name wlan_ID SSID_network_name`
3. `no mobility anchor sticky`
4. `end`

<tr>
<td>ap dot11 {5ghz</td>
<td>24ghz} l2roam rf-params {default</td>
</tr>
<tr>
<td>Example:</td>
<td>To fine-tune the RF parameters that affect client roaming, enter the <code>custom</code> option and then enter any one of the following options:</td>
</tr>
<tr>
<td>Device#ap dot11 5ghz l2roam rf-params custom -80</td>
<td>• Minimum RSSI—Indicates minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point.</td>
</tr>
<tr>
<td></td>
<td>If the client’s average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.</td>
</tr>
<tr>
<td></td>
<td>You can configure the minimum RSSI range from –50 through –90 dBm and the default value is –85 dBm.</td>
</tr>
<tr>
<td></td>
<td>• Hysteresis—Indicates how much greater the signal strength of a neighboring access point must be for the client to roam to it.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>PurposeCommand or Action</td>
<td>This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between two access points. You can configure the hysteresis range from 3 through 20 dB and the default is 3 dB.</td>
</tr>
<tr>
<td></td>
<td>• Scan Threshold—Indicates a minimum RSSI that is allowed before the client should roam to a better access point. When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold. You can configure the RSSI range from –50 through –90 dBm and the default value is –72 dBm.</td>
</tr>
<tr>
<td></td>
<td>• Transition Time—Indicates the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client’s associated access point is below the scan threshold. The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points. You can configure the time period in the range from 1 through 5 seconds and the default time is 5 seconds.</td>
</tr>
</tbody>
</table>

**Step 3**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

</tbody>
</table>
| 7    | `wireless mobility controller peer-group switch-peer-group-name bridge-domain-id id` | Configures the bridge domain ID for a switch peer group. The default is zero.  <br>**Note** The `no` form of command sets the bridge domain ID to the default value.  
**Example:**  
Device(config)# wireless mobility controller peer-group SPG bridge-domain-id 10.0.0.5 |
| 8    | `wireless mobility group member ip ip-address [public-ip public-ip-address] [group group-name]` | Adds a mobility group member.  
**Note** The `no` form of the command removes the member from the group. The default group name is the group name of MC.  
**Example:**  
Device(config)# wireless mobility group member ip 10.0.0.1 |
| 9    | `wireless mobility dscp value` | Sets the DSCP value for mobility control packet.  
You can configure the DSCP value in a range from 0 through 63. The default value is 46.  
**Example:**  
Device(config)# wireless mobility dscp 46 |
| 10   | `wireless mobility group keepalive {count | interval}` | Configures the wireless mobility group keepalive count which is the number of keepalive retries before a member status is deemed DOWN and keepalive interval which is interval between two keepalives.  
**Example:**  
Device(config)# wireless mobility group keepalive count |
| 11   | `wireless mobility group name name` | Specifies the case sensitive wireless mobility group name which can be ASCII printable string up to 31 characters.  
**Example:**  
Device(config)# wireless mobility group name group1 |
| 12   | `wireless mobility oracle ip mo-ip-address` | Configures the mobility oracle IP address.  
**Example:**  
Device(config)# wireless mobility oracle ip 10.0.0.5 |
| 13   | `wireless management interface interface-name` | Configures the wireless management interface.  
**Example:**  
Device(config)# wireless management interface Vlan21 |
| 14   | `end` | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.  
**Example:**  
Device(config)# end |
### Configuring Mobility Agent

#### SUMMARY STEPS

Configuring Application Visibility and Control in a Wired Network

Application Visibility and Control (AVC) is a solution for Cisco network devices that provides application-level classification, monitoring, and traffic control to improve business-critical application performance, facilitate capacity management and planning, and reduce network operating costs. The Cisco AVC solution is provided within the Branch and Aggregation routers, Cisco Switches, and Cisco Wireless Controllers and Access points.

For information about AVC on Cisco Switches, see Configuring Application Visibility and Control in a Wired Network.

For information about AVC on Cisco Wireless Controllers and Access points, see Configuring Application Visibility and Control.

- Information About Application Visibility and Control in a Wired Network, on page 2449

- Feature History and Information For Application Visibility and Control in a Wired Network, on page 2480

Information About Application Visibility and Control in a Wired Network

Application Visibility and Control (AVC) is a critical part of Cisco’s efforts to evolve its Branch and Campus solutions from being strictly packet and connection based to being application-aware and application-intelligent. Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition (NBAR2) engine. AVC can be configured on wired access ports for standalone switches as well as for a switch stack. NBAR2 can be activated either explicitly on the interface by enabling protocol-discovery or implicitly by attaching a QoS policy that contains match protocol classifier. Wired AVC Flexible NetFlow (FNF) can be configured on an interface to provide client, server and application statistics per interface. The record is similar to application-client-server-stats traffic monitor which is

### Restrictions for Application Visibility and Control

- NBAR based QoS policy configuration is allowed only on wired physical ports. Policy configuration is not supported on virtual interfaces, for example, VLAN, Port-Channel and other logical interfaces.

- NBAR2 based match criteria **match protocol** will be allowed only with marking or policing actions. NBAR2 match criteria will not be allowed in a policy that has queuing features configured.

- ‘Match Protocol’: up to 255 concurrent different protocols in all policies (8 bits HW limitation).

- NBAR2 attributes based QOS is not supported (**match protocol** attribute).

- AVC is not supported on management port (Gig 0/0).

- IPv6 packet classification is not supported.

- Only IPv4 unicast(TCP/UDP) is supported.

- NBAR and NetFlow cannot be configured together at the same time on the same interface.

- Web UI: You can configure application visibility and perform application monitoring from the Web UI. Application Control can only be done using the CLI. It is not supported on the Web UI.

  To manage and check wired AVC traffic on the Web UI, you must first configure **ip http authentication local** and **ip nbar http-service** commands using the CLI.

- NBAR and ACL logging cannot be configured together on the same switch.

- Protocol-discovery, application-based QoS, and wired AVC FNF cannot be configured together at the same time on the same interface with the non-application-based FNF. However, these wired AVC features
How to Configure Application Visibility and Control

Configuring Application Visibility and Control in a Wired Network

To configure application visibility and control on wired ports, follow these steps:

**Configuring Visibility:**

- Activate NBAR2 engine by enabling protocol-discovery on the interface using the `ip nbar protocol-discovery` command in the interface configuration mode. See the *Enabling Application Recognition on an Interface* section.

**Configuring Control:** Configure QoS policies based on application by

1. Creating an AVC QoS policy.
2. Applying AVC QoS policy to the interface.

**Configuring application-based Flexible Netflow:**

- Create a flow record by specifying key and non-key fields to the flow.
- Create a flow exporter to export the flow record.
- Create a flow monitor based on the flow record and the flow exporter.
- Attach the flow monitor to the interface.

Protocol-Discovery, application-based QoS and application-based FNF are all independent features. They can be configured independently or together on the same interface at the same time.

Enabling Application Recognition on an interface

To enable application recognition on an interface, follow these steps:
SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. ip nbar protocol-discovery
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the interface for which you are enabling</td>
</tr>

<td>protocol-discovery and enters interface configuration</td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
<td>mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip nbar protocol-discovery</td>
<td>Enables application recognition on the interface by</td>
</tr>
<tr>
<td>Example:</td>
<td>activating NBAR2 engine.</td>
</tr>
<tr>
<td>Device(config-if)# ip nbar protocol-discovery</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

Creating AVC QoS Policy

To create AVC QoS policy, perform these general steps:

1. Create a class map with match protocol filters.
2. Create a policy map.
3. Apply the policy map to the interface.

Creating a Class Map

You need to create a class map before configuring any match protocol filter. The QoS actions such as marking and policing can be applied to the traffic. The AVC match protocol filters are applied to the wired access ports. For more information about the protocols that are supported, see http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html.
### Creating a Policy Map

#### SUMMARY STEPS

1. `configure terminal`
2. `class-map class-map-name`
3. `match protocol application-name`
4. `end`

#### DETAILED STEPS

<table>

</tbody>
</table>

---

### Creating a Policy Map

#### SUMMARY STEPS

1. `configure terminal`
2. `policy-map policy-map-name`
3. `class [class-map-name | class-default]`
4. `police rate-bps burst-byte`
5. `set {dscp new-dscp | cos cos-value}`
6. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 2    | `policy-map policy-map-name` | Creates a policy map by entering the policy map name, and enters policy-map configuration mode.  
  Example:  
  `Device(config)# policy-map webex-policy`  
  By default, no policy maps are defined.  
  The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.  
  **Note** To delete an existing policy map, use the `no policy-map policy-map-name` global configuration command. |
| 3    | `class [class-map-name | class-default]` | Defines a traffic classification, and enters policy-map class configuration mode.  
  Example:  
  `Device(config-pmap)# class webex-class`  
  By default, no policy map and class maps are defined.  
  If a traffic class has already been defined by using the `class-map` global configuration command, specify its name for `class-map-name` in this command.  
  A `class-default` traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map.  
  With an implied `match any` is included in the `class-default` class, all packets that have not already matched the other traffic classes will match `class-default`.  
  **Note** To delete an existing class map, use the `no class class-map-name` policy-map configuration command. |
| 4    | `police rate-bps burst-byte` | Defines a policer for the classified traffic.  
  Example:  
  `Device(config-pmap-c)# police 100000 80000`  
  By default, no policer is defined.  
  • For `rate-bps`, specify an average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.  
  • For `burst-byte`, specify the normal burst size in bytes. The range is 8000 to 1000000. |
| 5    | `set {dscp new-dscp | cos cos-value}` | Classifies IP traffic by setting a new value in the packet.  
  Example:  
  `Device(config-pmap-c)# set dscp 45`  
  • For `dscp new-dscp`, enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63. |
| 6    | `end` | Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.  
  Example:  
  `Device(config)# end`  
  (Note: End command is not shown in the example, but it is included in the steps for completeness.)
Applying a QoS Policy to the switch port

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. service-policy input policymapname
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>

Configuring Wired AVC Flexible Netflow

Creating a Flow Record

A single flow record can be configured and associated with a flow monitor.

SUMMARY STEPS

1. configure terminal
2. flow record flow_record_name
3. description description
4. match ipv4 version
5. match ipv4 protocol
6. match application name
7. match connection client ipv4 address
8. match connection server ipv4 address
9. match connection server transport port
10. match flow observation point
11. collect flow direction
12. collect connection initiator
13. collect connection client counter packets long
14. collect connection client counter bytes network long
15. collect connection server counter packets long
16. collect connection server counter bytes network long
17. collect timestamp absolute first
18. collect timestamp absolute last
19. collect connection new-connections
20. end
21. show flow record

<tr>
<td>7</td>
<td>match connection client ipv4 address</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Device (config-flow-record)# match connection client ipv4 address</td>
</tr>
</tbody>
</table>

Purpose

- Enters global configuration mode.
- Enters flow record configuration mode.
- (Optional) Creates a description for the flow record.
- Specifies a match to the IP version from the IPv4 header.
- Specifies a match to the IPv4 protocol.
- Specifies a match to the application name.
- Specifies a match to the IPv4 address of the client (flow initiator).

Note

This action is mandatory for AVC support, as this allows the flow to be matched against the application.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong> match connection server ipv4 address</td>
<td>Specifies a match to the IPv4 address of the server (flow responder).</td>
</tr>
<tr>
<td><strong>Example:</strong> Device (config-flow-record)# match connection server ipv4 address</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> match connection server transport port</td>
<td>Specifies a match to the transport port of the server.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device (config-flow-record)# match connection server transport port</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> match flow observation point</td>
<td>Specifies a match to the observation point ID for flow observation metrics.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device (config-flow-record)# match flow observation point</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 11** collect flow direction | Specifies to collect the direction — Ingress or Egress — of the relevant side — Initiator or Responder — of the bi-directional flow that is specified by the `initiator` keyword in the `collect connection initiator` command in the step below. Depending on the value specified by the `initiator` keyword, the `flow direction` keyword takes the following values:

- • 0x01 = Ingress Flow
- • 0x02 = Egress Flow

When the `initiator` keyword is set to initiator, the flow direction is specified from the initiator side of the flow. When the initiator keyword is set to responder, the flow direction is specified from the responder side of the flow. For wired AVC, the `initiator` keyword is always set to initiator. |
| **Example:** Device (config-flow-record)# collect flow direction |
| **Step 12** collect connection initiator | Specifies to collect the side of the flow — Initiator or Responder — relevant to the direction of the flow specified by the `collect flow direction` command. The `initiator` keyword provides the following information about the direction of the flow:

- • 0x01 = Initiator - the flow source is the initiator of the connection

For wired AVC, the `initiator` keyword is always set to initiator. |
<p>| <strong>Example:</strong> Device (config-flow-record)# collect connection initiator |
| <strong>Step 13</strong> collect connection client counter packets long | Specifies to collect the number of packets sent by the client. |
| <strong>Example:</strong> Device (config-flow-record)# collect connection client counter packets long |</p>

<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device # show flow monitor flow-monitor-1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Displays statistics for wired AVC flow monitor.</td>
<td></td>
</tr>
<tr>
<td>show flow monitor flow-monitor-name statistics</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device# show flow monitor flow-monitor-1 statistics</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Clears the statistics of the specified flow monitor. Use the show flow monitor flow-monitor-name statistics command after using the clear flow monitor flow-monitor-name statistics to verify that all the statistics have been reset.</td>
<td></td>
</tr>
<tr>
<td>clear flow monitor flow-monitor-name statistics</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device# clear flow monitor flow-monitor-1 statistics</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Displays flow cache contents in a tabular format.</td>
<td></td>
</tr>
<tr>
<td>show flow monitor flow-monitor-name cache format table</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device# show flow monitor flow-monitor-1 cache format table</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>Displays flow cache contents in similar format as the flow record.</td>
<td></td>
</tr>
<tr>
<td>show flow monitor flow-monitor-name cache format record</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device# show flow monitor flow-monitor-1 cache format record</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

Command or Action | Purpose
--- | ---
**Step 14** | Displays flow cache contents in CSV format.

**Example:**

```
Device# show flow monitor flow-monitor-1 cache format csv
```

### Associating Flow Monitor to an Interface

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. ip flow monitor monitor-name { input | output }
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters the interface configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td></td>
</tr>
<tr>
<td>Example: Device(config)# interface Gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Associates a flow monitor to the interface for input and/or output packets.</td>
</tr>
<tr>
<td>ip flow monitor monitor-name { input</td>
<td>output }</td>
</tr>
<tr>
<td>Example: Device(config-if)# ip flow monitor flow-monitor-1 input</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### NBAR2 Custom Applications

NBAR2 supports the use of custom protocols to identify custom applications. Custom protocols support protocols and applications that NBAR2 does not currently support.

In every deployment, there are local and specific applications which are not covered by the NBAR2 protocol pack provided by Cisco. Local applications are mainly categorized as:

- Specific applications to an organization
Applications specific to a geography

NBAR2 provides a way to manually customize such local applications. You can manually customize applications using the command `ip nbar custom myappname` in global configuration mode. Custom applications take precedence over built-in protocols. For each custom protocol, user can define a selector ID that can be used for reporting purposes.

There are various types of application customization:

**Generic protocol customization**

- HTTP
- SSL
- DNS

**Composite**: Customization based on multiple underlying protocols – `server-name`

**Layer3/Layer4 customization**

- IPv4 address
- DSCP values
- TCP/UDP ports
- Flow source or destination direction

**Byte Offset**: Customization based on specific byte values in the payload

**HTTP Customization**

HTTP customization could be based on a combination of HTTP fields from:

- `cookie` - HTTP Cookie
- `host` - Host name of Origin Server containing resource
- `method` - HTTP method
- `referer` - Address the resource request was obtained from
- `url` - Uniform Resource Locator path
- `user-agent` - Software used by agent sending the request
- `version` - HTTP version
- `via` - HTTP via field

**HTTP Customization**

Custom application called MYHTTP using the HTTP host "*mydomain.com" with Selector ID 10.

```
Device# configure terminal
Device(config)# ip nbar custom MYHTTP http host *mydomain.com id 10
```
SSL Customization

Customization can be done for SSL encrypted traffic using information extracted from the SSL Server Name Indication (SNI) or Common Name (CN).

SSL Customization

Custom application called MYSSL using SSL unique-name “mydomain.com” with selector ID 11.

Device# configure terminal
Device(config)#ip nbar custom MYSSL ssl unique-name *mydomain.com id 11

DNS Customization

NBAR2 examines DNS request and response traffic, and can correlate the DNS response to an application. The IP address returned from the DNS response is cached and used for later packet flows associated with that specific application.

The command `ip nbar custom application-name dns domain-name id application-id` is used for DNS customization. To extend an existing application, use the command `ip nbar custom application-name dns domain-name domain-name extends existing-application`.

DNS Customization

Custom application called MYDNS using the DNS domain name “mydomain.com” with selector ID 12.

Device# configure terminal
Device(config)# ip nbar custom MYDNS dns domain-name *mydomain.com id 12

Composite Customization

NBAR2 provides a way to customize applications based on domain names appearing in HTTP, SSL or DNS.

Composite Customization

Custom application called MYDOMAIN using HTTP, SSL or DNS domain name “mydomain.com” with selector ID 13.

Device# configure terminal
Device(config)# ip nbar custom MYDOMAIN composite server-name *mydomain.com id 13

L3/L4 Customization

Layer3/Layer4 customization is based on the packet tuple and is always matched on the first packet of a flow.

L3/L4 Customization

Custom application called LAYER4CUSTOM matching IP addresses 10.56.1.10 and 10.56.1.11, TCP and DSCP ef with selector ID 14.
Device# configure terminal
Device(config)# ip nbar custom LAYER4CUSTOM transport tcp id 14
Device(config-custom)# ip address 10.56.1.10 10.56.1.11
Device(config-custom)# dscp ef

Examples: Monitoring Custom Applications

Show Commands for Monitoring Custom Applications
show ip nbar protocol-id | inc Custom

| LAYER4CUSTOM    | 14    | Custom|
| MYDNS           | 12    | Custom|
| MYDOMAIN        | 13    | Custom|
| MYHTTP          | 10    | Custom|
| MYSSL           | 11    | Custom|

show ip nbar protocol-discovery protocol CUSTOM_APP

WSW-157# show ip nbar protocol-id MYSSL
Protocol Name  id  type
------------------
MYSSL 11  Custom

NBAR2 Dynamic Hitless Protocol Pack Upgrade

Protocol packs are software packages that update the NBAR2 protocol support on a device without replacing the Cisco software on the device. A protocol pack contains information on applications officially supported by NBAR2 which are compiled and packed together. For each application, the protocol-pack includes information on application signatures and application attributes. Each software release has a built-in protocol-pack bundled with it.

Protocol packs provide the following features:

• They are easy and fast to load.

• They are easy to upgrade to a higher version protocol pack or revert to a lower version protocol pack.

• They do not require the switch to be reloaded.

NBAR2 protocol packs are available for download on Cisco Software Center from this URL: https://software.cisco.com/download/navigator.html.

Prerequisites for the NBAR2 Protocol Pack

Before loading a new protocol pack, you must copy the protocol pack to the flash on all the switch members.

To load a protocol pack, see Examples: Loading the NBAR2 Protocol Pack, on page 2467.

Loading the NBAR2 Protocol Pack

SUMMARY STEPS

1. enable
2. `configure terminal`
3. `ip nbar protocol-pack protocol-pack [force]`
4. `exit`
5. `show ip nbar protocol-pack {protocol-pack | active} [detail]`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  **Example:**  
  Device> enable |
| **Step 2** `configure terminal` | Enters global configuration mode.  
  **Example:**  
  Device# configure terminal |
| **Step 3** `ip nbar protocol-pack protocol-pack [force]` | Loads the protocol pack.  
  **Example:**  
  Device(config)# ip nbar protocol-pack flash:defProtoPack  
  **Example:**  
  Device(config)# default ip nbar protocol-pack |
| **Step 4** `exit` | Returns to privileged EXEC mode.  
  **Example:**  
  Device(config)# exit |
| **Step 5** `show ip nbar protocol-pack {protocol-pack | active} [detail]` | Displays the protocol pack information.  
  **Example:**  
  Device# show ip nbar protocol-pack active |

#### Examples: Loading the NBAR2 Protocol Pack

The following example shows how to load a new protocol pack:
Monitoring Application Visibility and Control

Monitoring Application Visibility and Control (CLI)

This section describes the new commands for application visibility.

The following commands can be used to monitor application visibility on the and access ports.

### Table 195: Monitoring Application Visibility Commands on the

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ip nbar protocol-discovery [interface interface-type interface-number] [stats {byte-count</td>
<td>bit-rate</td>
</tr>
<tr>
<td></td>
<td><em>(Optional) Enter keywords and arguments to fine-tune the statistics displayed. For more information on each of the keywords, refer to the <code>show ip nbar protocol-discovery</code> command in Cisco IOS Quality of Service Solutions Command Reference.</em></td>
</tr>
<tr>
<td><code>show policy-map interface interface-type interface-number</code></td>
<td>Displays information about policy map applied to the interface.</td>
</tr>
<tr>
<td><code>show platform software fed switch switch id wdavc flows</code></td>
<td>Displays statistics about all flows on the specified switch.</td>
</tr>
</tbody>
</table>

Examples: Application Visibility and Control

Examples: Application Visibility and Control Configuration

This example shows how to create class maps with apply match protocol filters for application name:
Device# configure terminal
Device(config)# class-map match-any NBAR-VOICE
Device(config-cmap)# match protocol ms-lync-audio
Device(config-cmap)# end

This example shows how to create policy maps and define existing class maps for egress QoS:

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 150000
Device(config-pmap-c)# set dscp 12
Device(config-pmap-c)# end

This example shows how to create policy maps and define existing class maps for ingress QoS:

Device# configure terminal
Device(config)# policy-map test-avc-down
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 200000
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# end

This example shows how to apply policy maps to a switch port:

Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# switchport mode access
Device(config-if)# switchport access vlan 20
Device(config-if)# service-policy input POLICING_IN
Device(config-if)# end

Show Commands for Viewing the Configuration

show ip nbar protocol-discovery

Displays a report of the Protocol Discovery statistics per interface.

The following is a sample output for the statistics per interface:

Deviceqos-cat9k-reg2-r1# show ip nbar protocol-discovery int GigabitEthernet1/0/1

GigabitEthernet1/0/1
Last clearing of "show ip nbar protocol-discovery" counters 00:03:16

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Packet Count</th>
<th>Byte Count</th>
<th>30sec Bit Rate (bps)</th>
<th>30sec Max Bit Rate (bps)</th>
</tr>
</thead>
</table>
| ms-lync    |              |            |                      |                          | 60580
show policy-map interface

Displays the QoS statistics and the configured policy maps on all interfaces.

The following is a sample output for the policy-maps configured on all the interfaces:

Device# show policy-map int

GigabitEthernet1/0/1
Service-policy input: MARKING-IN

Class-map: NBAR-VOICE (match-any)
718 packets
Match: protocol ms-lync-audio
0 packets, 0 bytes
30 second rate 0 bps
QoS Set
dscp ef

Class-map: NBAR-MM_CONFERENCING (match-any)
6451 packets
Match: protocol ms-lync
0 packets, 0 bytes
30 second rate 0 bps
Match: protocol ms-lync-video
0 packets, 0 bytes
30 second rate 0 bps
QoS Set
dscp af41

Class-map: class-default (match-any)
34 packets
Match: any

Show Commands for Viewing Flow Monitor Configuration

show flow monitor wdavc
Displays information about the specified wired AVC flow monitor.

Device # show flow monitor wdavc

Flow Monitor wdavc:
Description: User defined
Flow Record: wdavc
Flow Exporter: wdavc-exp (inactive)
Cache:
  Type: normal (Platform cache)
  Status: not allocated
  Size: 12000 entries
  Inactive Timeout: 15 secs
  Active Timeout: 1800 secs

show flow monitor wdavc statistics
Displays statistics for wired AVC flow monitor.

Device# show flow monitor wdavc statistics

Cache type: Normal (Platform cache)
Cache size: 12000
Current entries: 13
Flows added: 26
Flows aged: 13
  - Active timeout ( 1800 secs) 1
  - Inactive timeout ( 15 secs) 12

clear flow monitor wdavc statistics
Clears the statistics of the specified flow monitor. Use the show flow monitor wdavc statistics command after using the clear flow monitor wdavc statistics command to verify that all the statistics have been reset. The following is a sample output of the show flow monitor wdavc statistics command after clearing flow monitor statistics.

Device# show flow monitor wdavc statistics

Cache type: Normal (Platform cache)
Cache size: 12000
Current entries: 0
Flows added: 0
Flows aged: 0

Show Commands for Viewing Cache Contents

show flow monitor wdavc cache format table
Displays flow cache contents in a tabular format.

Device# show flow monitor wdavc cache format table

Cache type: Normal (Platform cache)
Cache size: 12000
Current entries: 13
Flows added: 26
Flows aged: 13
  - Active timeout ( 1800 secs) 1
- Inactive timeout ( 15 secs) 12

Basic Troubleshooting(Questions and Answers)

Following are the basic questions and answers for troubleshooting wired Application Visibility and Control:

1. **Question:** My IPv6 traffic is not being classified.
   **Answer:** Currently only IPv4 traffic is supported.

2. **Question:** My multicast traffic is not being classified
   **Answer:** Currently only unicast traffic is supported

3. **Question:** I send ping but I don’t see them being classified
   **Answer:** Only TCP/UDP protocols are supported

4. **Question:** Why can’t I attach NBAR to an SVI?
   **Answer:** NBAR is only supported on physical interfaces.

5. **Question:** I see that most of my traffic is CAPWAP traffic, why?
   **Answer:** Make sure that you have enabled NBAR on an access port that is not connected to a wireless access port. All traffic coming from APs will be classified as capwap. Actual classification in this case happens either on the AP or WLC.

6. **Question:** In protocol-discovery, I see traffic only on one side. Along with that, there are a lot of unknown traffic.
   **Answer:** This usually indicates that NBAR sees asymmetric traffic: one side of the traffic is classified in one switch member and the other on a different member. The recommendation is to attach NBAR only on access ports where we see both sides of the traffic. If you have multiple uplinks, you can’t attach NBAR on them due to this issue. Similar issue happens if you configure NBAR on an interface that is part of a port channel.
7. **Question:** With protocol-discovery, I see an aggregate view of all application. How can I see traffic distribution over time?

   **Answer:** WebUI will give you view of traffic over time for the last 48 hours.

8. **Question:** I can't configure queue-based egress policy with `match protocol protocol-name` command.

   **Answer:** Only `shape` and `set DSCP` are supported in a policy with NBAR2 based classifiers. Common practice is to set DSCP on ingress and perform shaping on egress based on DSCP.

9. **Question:** I don’t have NBAR2 attached to any interface but I still see that NBAR2 is activated.

   **Answer:** If you have any class-map with `match protocol protocol-name`, NBAR will be globally activated on the stack but no traffic will be subjected to NBAR classification. This is an expected behavior and it does not consume any resources.

10. **Question:** I see some traffic under the default QOS queue. Why?

    **Answer:** For each new flow, it takes a few packets to classify it and install the result in the hardware. During this time, the classification would be 'unknown' and traffic will fall under the default queue.

CHAPTER 124

Configuring Application Visibility and Control in a Wireless Network

Application Visibility and Control (AVC) is a solution for Cisco network devices that provides application-level classification, monitoring, and traffic control to improve business-critical application performance, facilitate capacity management and planning, and reduce network operating costs. The Cisco AVC solution is provided within the Branch and Aggregation routers, Cisco Switches, and Cisco Wireless Controllers and Access points.

For information about AVC on Cisco Switches, see Configuring Application Visibility and Control in a Wired Network.

For information about AVC on Cisco Wireless Controllers and Access points, see Configuring Application Visibility and Control in a Wireless Network.

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.
Information About Application Visibility and Control

Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition engine, and provides application-level visibility and control (QoS) in wireless networks. After the applications are recognized, the AVC feature enables you to either drop, mark, or police the data traffic.

AVC is configured by defining a class map in a QoS client policy to match a protocol.

Using AVC, we can detect more than 1000 applications. AVC enables you to perform real-time analysis and create policies to reduce network congestion, costly network link usage, and infrastructure upgrades.

You can view list of 30 applications in Top Applications in Monitor Summary section of the UI.

Traffic flows are analyzed and recognized using the NBAR2 engine at the access point. For more information about the NBAR2 Protocol Library, see http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html. The specific flow is marked with the recognized protocol or application, such as WebEx. This per-flow information can be used for application visibility using Flexible NetFlow (FNF).

AVC QoS actions are applied with AVC filters in both upstream and downstream directions. The QoS actions supported for upstream flow are drop, mark, and police, and for downstream flow are mark and police. AVC QoS is applicable only when the application is classified correctly and matched with the class map filter in the policy map. For example, if the policy has a filter based on an application name, and the traffic has also been classified to the same application name, then the action specified for this match in the policy will be applied.

When you downgrade the controller from 8.0 to any earlier version, the AVC rate limit rules display the action as drop. This action is expected since the AVC rate limit rule is introduced in the controller version 8.0.

Application Visibility and Control Protocol Packs

Protocol packs are a means to distribute protocol updates outside the switch software release trains, and can be loaded on the switch without replacing the switch software.
The Application Visibility and Control Protocol Pack (AVC Protocol Pack) is a single compressed file that contains multiple Protocol Description Language (PDL) files and a manifest file. A set of required protocols can be loaded, which helps AVC to recognize additional protocols for classification on your network. The manifest file gives information about the protocol pack, such as the protocol pack name, version, and some information about the available PDLs in the protocol pack.

The AVC Protocol Packs are released to specific AVC engine versions. You can load a protocol pack if the engine version on the switch platform is the same or higher than the version required by the protocol pack.

## Supported AVC Class Map and Policy Map Formats

### Supported AVC Class Map Format

<table>
<thead>
<tr>
<th>Class Map Format</th>
<th>Class Map Example</th>
<th>Direction</th>
</tr>
</thead>
<tbody>
<tr>
<td>match protocol</td>
<td>protocol name</td>
<td>Both upstream and downstream</td>
</tr>
<tr>
<td>class-map match-any webex-class match protocol webex-media</td>
<td></td>
<td></td>
</tr>
<tr>
<td>match protocol attribute category category-name</td>
<td>class-map match-any IM match protocol attribute category instant-messaging</td>
<td>Both upstream and downstream</td>
</tr>
<tr>
<td>match protocol attribute sub-category sub-category-name</td>
<td>class-map match-any realtimeconferencing match protocol attribute sub-category voice-video-chat-collaboration</td>
<td>Both upstream and downstream</td>
</tr>
<tr>
<td>match protocol attribute application-group application-group-name</td>
<td>class-map match-any skype match protocol attribute application-group skype-group</td>
<td>Both upstream and downstream</td>
</tr>
<tr>
<td>Combination filters</td>
<td>class-map match-any webex-class match protocol webex match dscp 45 match wlan user-priority 6</td>
<td>Upstream only</td>
</tr>
</tbody>
</table>

### Supported AVC Policy Format

<table>
<thead>
<tr>
<th>Policy Format</th>
<th>QoS Action</th>

</table>
### Prerequisites for Application Visibility and Control

- The access points should be AVC capable.
- For the control part of AVC (QoS) to work, the application visibility feature with FNF has to be configured.

### Guidelines for Inter-Device Roaming with Application Visibility and Control

Follow these guidelines to prevent clients from getting excluded due to malformed QoS policies:

- When a new QoS policy is added to the device, a QoS policy with the same name should be added to other device within the same roam or mobility domain.

- When a device is loaded with a software image of a later release, the new policy formats are supported. If you have upgraded the software image from an earlier release to a later release, you should save the configuration separately. When an earlier release image is loaded, some QoS policies might show as not supported, and you should restore those QoS policies to supported policy formats.

### Restrictions for Application Visibility and Control

- AVC is supported only on the following access points:
  - Cisco Aironet 1260 Series Access Points
  - Cisco Aironet 1600 Series Access Points
  - Cisco Aironet 2600 Series Access Point
  - Cisco Aironet 2600 Series Wireless Access Points
  - Cisco Aironet 2700 Series Access Point
  - Cisco Aironet 3500 Series Access Points

---

<table>
<thead>
<tr>
<th>AVC Policy Format</th>
<th>AVC Policy Example</th>
<th>Direction</th>
</tr>
</thead>
</table>
| Drop action       | Any of the above examples apply to this format with this additional example:  
|                   | policy-map webex-policy  
|                   | class webex-class  
|                   | drop  
|                   | class netflix  
|                   | set dscp ef //or set up,cos  
|                   | police 6000000  
|                   | class class-default  
|                   | set dscp <> | Upstream only |
- Cisco Aironet 3600 Series Access Points

- AVC is not supported on Cisco Aironet 702W, 702I (128 M memory), and 1530 Series Access Points.
- Dropping or marking of the data traffic (control part) is not supported for software Release 3.3.
- Dropping or marking of the data traffic (control part) is supported in software Release 3E.
- Only the applications that are recognized with application visibility can be used for applying QoS control.
- Multicast traffic classification is not supported.
- Only the applications that are recognized with App visibility can be used for applying QoS control.
- IPv6 including ICMPv6 traffic classifications are not supported.
- Datalink is not supported for NetFlow fields for AVC.
- The following commands are not supported for AVC flow records:
  - `collect flow username`
  - `collect interface { input | output }
  - `collect wireless client ipv4 address`
  - `match interface { input | output }
  - `match transport igmp type`

- The template timeout cannot be modified on exporters configured with AVC. Even if the template timeout value is configured to a different value, only the default value of 600 seconds is used.
- For the username information in the AVC-based record templates, ensure that you configure the options `records` to get the user MAC address to username mapping.
- When there is a mix of AVC-enabled APs such as 3600, and non-AVC-enabled APs such as 1140, and the chosen policy for the client is AVC-enabled, the policy will not be sent to the APs that cannot support AVC.
- Only ingress AVC statistics are supported. The frequency of statistics updates depends on the number of clients loaded at the AP at that time. Statistics are not supported for very large policy format sizes.
- The total number of flows for which downstream AVC QoS supported per client is 1000.
- The maximum number of flows supported for Catalyst 3850 Series Switch is 48 K.
- These are some class map and policy map-related restrictions. For supported policy formats, see Supported AVC Class Map and Policy Map Formats, on page 2483.

  - AVC and non-AVC classes cannot be defined together in a policy in a downstream direction. For example, when you have a class map with match protocol, you cannot use any other type of match filter in the policy map in the downstream direction.
  - Drop action is not applicable for the downstream AVC QoS policy.
  - Match protocol is not supported in ingress or egress for SSID policy.
- Google shares resources among several of their services because of which for some of the traffic it is not possible to say it is unique to one application. Therefore we added google-services for traffic that cannot be distinguished. The behavior you experience is expected.

- AVC is not supported on management port (Gig 0/0).

- NBAR based QoS policy configuration is allowed only on wired physical ports. Policy configuration is not supported on virtual interfaces, for example, VLAN, Port-Channel and other logical interfaces.

- NBAR and NetFlow cannot be configured together at the same time on the same interface.

How to Configure Application Visibility and Control

Configuring Application Visibility and Control (CLI)

To configure Application Visibility, follow these general steps:

1. Create a flow record by specifying keys and non-key fields to the flow.
2. Create an optional flow exporter by specifying the flow record as an option.
3. Create a flow monitor based on the flow record and flow exporter.
4. Configure WLAN to apply flow monitor in IPv4 input or output direction.

To configure Application Control, follow these general steps:

1. Create an AVC QoS policy.
2. Attach AVC QoS policy to the client in one of three ways: configuring WLAN, using ACS or ISE, or adding local policies.

To enable application recognition on an interface, see Enabling Application Recognition on an interface.

Creating a Flow Record

By default, wireless avc basic (flow record) is available. When you click Apply from the GUI, then the record is mapped to the flow monitor.

Default flow record cannot be edited or deleted. If you require a new flow record, you need to create one and map it to the flow monitor from CLI.

SUMMARY STEPS

1. configure terminal
2. flow record flow_record_name
3. description string
4. match ipv4 protocol
5. match ipv4 source address
6. match ipv4 destination address
7. match transport source-port
8. match transport destination-port
9. match flow direction
10. match application name
11. match wireless ssid  
12. collect counter bytes long  
13. collect counter packets long  
14. collect wireless ap mac address  
15. collect wireless client mac address  
16. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
|      | **Example:**  
|      | Device# configure terminal | |
| 2    | flow record *flow_record_name* | Enters flow record configuration mode. |
|      | **Example:**  
|      | Device(config)# flow record record1  
|      | Device (config-flow-record)# | |
| 3    | description *string* | (Optional) Describes the flow record as a maximum 63-character string. |
|      | **Example:**  
|      | Device(config-flow-record)# description IPv4flow | |
| 4    | match ipv4 protocol | Specifies a match to the IPv4 protocol. |
|      | **Example:**  
|      | Device (config-flow-record)# match ipv4 protocol | |
| 5    | match ipv4 source address | Specifies a match to the IPv4 source address-based field. |
|      | **Example:**  
|      | Device (config-flow-record)# match ipv4 source address | |
| 6    | match ipv4 destination address | Specifies a match to the IPv4 destination address-based field. |
|      | **Example:**  
|      | Device (config-flow-record)# match ipv4 destination address | |
| 7    | match transport source-port | Specifies a match to the transport layer source-port field. |
|      | **Example:**  
|      | Device (config-flow-record)# match transport source-port | |
| 8    | match transport destination-port | Specifies a match to the transport layer destination-port field. |
|      | **Example:**  
|      | Device (config-flow-record)# match transport destination-port | |
| Step 9 | match flow direction  
**Example:**  
Device (config-flow-record)# match flow direction | Specifies a match to the direction the flow was monitored in. |
|---|---|
| Step 10 | match application name  
**Example:**  
Device (config-flow-record)# match application name | Specifies a match to the application name.  
**Note** This action is mandatory for AVC support, as this allows the flow to be matched against the application. |
| Step 11 | match wireless ssid  
**Example:**  
Device (config-flow-record)# match wireless ssid | Specifies a match to the SSID name identifying the wireless network. |
| Step 12 | collect counter bytes long  
**Example:**  
Device (config-flow-record)# collect counter bytes long | Specifies to collect counter fields total bytes. |
| Step 13 | collect counter packets long  
**Example:**  
Device (config-flow-record)# collect counter bytes long | Specifies to collect counter fields total packets. |
| Step 14 | collect wireless ap mac address  
**Example:**  
Device (config-flow-record)# collect wireless ap mac address | Specifies to collect the BSSID with MAC addresses of the access points that the wireless client is associated with. |
| Step 15 | collect wireless client mac address  
**Example:**  
Device (config-flow-record)# collect wireless client mac address | Specifies to collect MAC address of the client on the wireless network.  
**Note** The collect wireless client mac address is mandatory configuration for wireless AVC. |
| Step 16 | end  
**Example:**  
Device(config)# end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |

**Creating a Flow Exporter (Optional)**

You can create a flow export to define the export parameters for a flow. This is an optional procedure for configuring flow parameters.

**SUMMARY STEPS**

1. configure terminal
2. `flow exporter flow_exporter_name`
3. `description string`
4. `destination {hostname | ip-address}`
5. `transport udp port-value`
6. `option application-table timeout seconds (optional)`
7. `option usermac-table timeout seconds (optional)`
8. `end`
9. `show flow exporter`
10. `end`

</table>
## Creating a Flow Monitor

You can create a flow monitor and associate it with a flow record and a flow exporter.

### SUMMARY STEPS

1. `configure terminal`
2. `flow monitor monitor-name`
3. `description description`
4. `record record-name`
5. `exporter exporter-name`
6. `cache timeout {active | inactive}` (Optional)
7. `end`
8. `show flow monitor`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><code>show flow exporter</code></td>
<td>Verifies your configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Device # show flow exporter</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
### Creating AVC QoS Policy

To create AVC QoS policy, perform these general steps:

1. Create a class map with match protocol filters.
2. Create a policy map.
3. Apply a policy map to the client in one of the following ways:
   1. Apply a policy map over WLAN either from the CLI or GUI.
   2. Apply a policy map through the AAA server (ACS server or ISE) from the CLI.
      
      For more information, refer to the Cisco Identity Services Engine User Guide and Cisco Secure Access Control System User Guide.
   3. Apply local policies either from the CLI or GUI.

### Creating a Class Map

You need to create a class map before configuring any match protocol filter. The QoS actions such as marking, policing, and dropping can be applied to the traffic. The AVC match protocol filters are applied only for the wireless clients. For more information about the protocols that are supported, see [http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html](http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html).
SUMMARY STEPS

1. configure terminal
2. class-map class-map-name
3. match protocol \{application-name | attribute category category-name | attribute sub-category sub-category-name | attribute application-group application-group-name\}
4. end

</tr>
</tbody>
</table>

Creating a Policy Map

SUMMARY STEPS

1. configure terminal
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** policy-map policy-map-name                  | Creates a policy map by entering the policy map name, and enters policy-map configuration mode. By default, no policy maps are defined. The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed. |
| **Example:**                                           |                                                                         |
| Device(config)# policy-map webex-policy                |                                                                         |
| Device(config-pmap)#                                   |                                                                         |

**Note** To delete an existing policy map, use the `no policy-map policy-map-name` global configuration command.

| **Step 3** class [class-map-name | class-default] | Defines a traffic classification, and enters policy-map class configuration mode. By default, no policy map and class maps are defined. If a traffic class has already been defined by using the `class-map` global configuration command, specify its name for `class-map-name` in this command. A `class-default` traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied `match any` is included in the `class-default` class, all packets that have not already matched the other traffic classes will match `class-default`. |
| **Example:**                                           |                                                                         |
| Device(config-pmap)# class-map webex-class             |                                                                         |
| Device(config-pmap-c)#                                 |                                                                         |

**Note** To delete an existing class map, use the `no class class-map-name` policy-map configuration command.

| **Step 4** police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}] | Defines a policer for the classified traffic. By default, no policer is defined. |
| **Example:**                                                                    |                                                                         |
| Device(config-pmap-c)# police 100000 80000 drop                                |                                                                         |

- For `rate-bps`, specify an average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.
- For `burst-byte`, specify the normal burst size in bytes. The range is 8000 to 1000000.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) Specifies the action to take when the rates are exceeded. Use the <code>exceed-action drop</code> keywords to drop the packet. Use the <code>exceed-action policed-dscp-transmit</code> keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Step 6</strong></td>
</tr>
<tr>
<td>set `{dscp new-dscp</td>
<td>cos cos-value}`</td>
</tr>
<tr>
<td>Example:</td>
<td>Example:</td>
</tr>
<tr>
<td>Device(config-pmap-c)# set dscp 45</td>
<td>Device(config)# end</td>
</tr>
</tbody>
</table>

**What to do next**

After creating your policy maps, attach the traffic policy or polices to an interface using the `service-policy` command.

**Configuring Local Policies (CLI)**

To configure local policies, complete these procedures:

1. Create a service template.
2. Create an interface template.
3. Create a parameter map.
4. Create a policy map.
5. Apply a local policy on a WLAN.

**Creating a Service Template (CLI)**

**SUMMARY STEPS**

1. `configure terminal`
2. `service-template service-template-name`
3. `access-group acl_list`
4. `vlan vlan_id`
5. `absolute-timer seconds`
6. `service-policy qos (input | output)`
7. `end`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> service-template service-template-name</td>
<td>Enters service template configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# service-template</td>
<td></td>
</tr>
<tr>
<td>cisco-phone-template</td>
<td></td>
</tr>
<tr>
<td>Device(config-service-template)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> access-group acl_list</td>
<td>Specifies the access list to be applied.</td>
</tr>
<tr>
<td>Example: Device(config-service-template)#</td>
<td></td>
</tr>
<tr>
<td>access-group foo-acl</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> vlan vlan_id</td>
<td>Specifies VLAN ID. You can specify a value from 1 to 4094.</td>
</tr>
<tr>
<td>Example: Device(config-service-template)#</td>
<td></td>
</tr>
<tr>
<td>vlan 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> absolute-timer seconds</td>
<td>Specifies session timeout value for service template. You can specify a value from 1 to 65535.</td>
</tr>
<tr>
<td>Example: Device(config-service-template)#</td>
<td></td>
</tr>
<tr>
<td>absolute-timer 20</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> service-policy qos {input</td>
<td>output}</td>
</tr>
<tr>
<td>Example: Device(config-service-template)#</td>
<td></td>
</tr>
<tr>
<td>service-policy foo-qos</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Creating a Parameter Map (CLI)

Parameter map is preferred to use than class map.

### SUMMARY STEPS

1. configure terminal
2. parameter-map type subscriber attribute-to-service parameter-map-name
3. `map-index map { device-type | mac-address | oui | user-role | username } { eq | not-eq | regex filter-name }
4. `interface-template interface-template-name
5. `end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>parameter-map type subscriber attribute-to-service</code> <code>parameter-map-name</code></td>
<td>Specifies the parameter map type and name.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# parameter-map type subscriber attribute-to-service Aironet-Policy-para</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`map-index map { device-type</td>
<td>mac-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-parameter-map-filter)# 10 map device-type eq &quot;WindowsXP-Workstation&quot;</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>interface-template interface-template-name</code></td>
<td>Enters service template configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-parameter-map-filter-submode)# interface-template cisco-phone-template Device(config-parameter-map-filter-submode)#</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <code>Ctrl-Z</code> to exit global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Creating a Policy Map (CLI)**

**SUMMARY STEPS**

1. `configure terminal`
2. `policy-map type control subscriber policy-map-name`
3. `event identity-update {match-all | match-first}`
4. `class_number class {class_map_name | always } {do-all | do-until-failure | do-until-success}`
5. `action-index map attribute-to-service table parameter-map-name`
6. `end`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>policy-map type control subscriber policy-map-name</td>
<td>Specifies the policy map type.</td>
</tr>
<tr>
<td>Example: Device(config)# policy-map type control subscriber Aironet-Policy</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>event identity-update {match-all</td>
<td>match-first}</td>
</tr>
<tr>
<td>Example: Device(config-policy-map)# event identity-update match-all</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Step 4 | class_number class {class_map_name | always } {do-all | do-until-failure | do-until-success} | Configures the local profiling policy class map number and specifies how to perform the action. The class map configuration mode includes the following command options:  
  - **always**—Executes without doing any matching but returns success.  
  - **do-all**—Executes all the actions.  
  - **do-until-failure**—Executes all the actions until any match failure is encountered. This is the default value.  
  - **do-until-success**—Executes all the actions until any match success happens. |
| Example: Device(config-class-control-policymap)# 1 class local_policy1_class do-until-success | | |
| Step 5 | action-index map attribute-to-service table parameter-map-name | Specifies parameter map table to be used. |
| Example: Device(config-policy-map)# 10 map attribute-to-service table Aironet-Policy-para | | |
| Step 6 | end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |
| Example: Device(config)# end | | |

#### Applying a Local Policy for a Device on a WLAN (CLI)

**Before you begin**

If the service policy contains any device type-based rules in the parameter map, ensure that the device classifier is already enabled.
You should use the **device classification** command to classify the device for it to be displayed correctly on the show command output.

### SUMMARY STEPS

1. configure terminal
2. wlan wlan-name
3. service-policy type control subscriber policymapname
4. profiling local http (optional)
5. profiling radius http (optional)
6. no shutdown
7. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters WLAN configuration mode.</td>
</tr>
<tr>
<td>wlan wlan-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# wlan wlan1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Applies local policy to WLAN.</td>
</tr>
<tr>
<td>service-policy type control subscriber policymapname</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-wlan)# service-policy type control subscriber Aironet-Policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables only profiling of devices based on HTTP protocol (optional).</td>
</tr>
<tr>
<td>profiling local http (optional)</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-wlan)# profiling local http</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Enables profiling of devices on ISE (optional).</td>
</tr>
<tr>
<td>profiling radius http (optional)</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-wlan)# profiling radius http</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Specifies not to shut down the WLAN.</td>
</tr>
<tr>
<td>no shutdown</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-wlan)# no shutdown</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <strong>Ctrl-Z</strong> to exit global configuration mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>

### Configuring WLAN to Apply Flow Monitor in IPV4 Input/Output Direction

#### SUMMARY STEPS

1. `configure terminal`
2. `wlan wlan-id`
3. `ip flow monitor monitor-name {input | output}`
4. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>wlan wlan-id</td>
</tr>
<tr>
<td>Example:</td>
<td>Enters WLAN configuration submode. For wlan-id, enter the WLAN ID. The range is 1 to 64.</td>
</tr>
<tr>
<td>Device (config) # wlan 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ip flow monitor monitor-name {input</td>
</tr>
<tr>
<td>Example:</td>
<td>Associates a flow monitor to the WLAN for input or output packets.</td>
</tr>
<tr>
<td>Device (config-wlan) # ip flow monitor flow-monitor-1 input</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td>Example:</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### AP Downstream QoS

#### Information About AP downstream QoS

AP downstream QoS is the process of marking traffic from the controller to the AP. This is achieved by using the flow information from AP on the downstream traffic.

Polaris-based controllers do not support NBAR and the NBAR resides in the AP. When an AP is connected to the WLC (in local-mode with AVC-enabled) the AP performs the application visibility in the upstream and helps the controller to classify traffic (AP assist) in the downstream direction.
In the upstream direction, the control of the classified applications is done by the AP. In the downstream direction, after inspecting the first packet from the WLC, the AP informs the controller about the traffic session and the controller marks the traffic accordingly.

Note: AP assist is done only for application-based marking.

Configuring Class-map for Downstream QoS

Follow the procedure given below to configure class-map for downstream QoS:

**SUMMARY STEPS**

1. `configure terminal`
2. `class-map match-any class-map-name`
3. `match protocol ftp`
4. `match protocol ftp-data`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures a matching class-name under this classmap.</td>
</tr>
<tr>
<td>class-map match-any class-map-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# class-map match-any class1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures FTP as the match protocol.</td>
</tr>
<tr>
<td>match protocol ftp</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-cmap)# match protocol ftp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures FTP as the match protocol for data part only.</td>
</tr>
<tr>
<td>match protocol ftp-data</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-cmap)# match protocol ftp-data</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Policy with Policing for Downstream QoS

Follow the procedure given below to configure policing for downstream QoS:

**SUMMARY STEPS**

1. `configure terminal`
2. `policy-map policy-map-name`
3. `class class-map-name`
4. `police cir bit-rate bc burst-rate`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal  &lt;br&gt; Example: &lt;br&gt; Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>policy-map policy-map-name  &lt;br&gt; Example: &lt;br&gt; Device(config)# policy-map policy1</td>
<td>Creates a policy map by entering the policy map name.</td>
</tr>
<tr>
<td>Step 3</td>
<td>class class-map-name  &lt;br&gt; Example: &lt;br&gt; Device(config-pmap)#class class1</td>
<td>Specifies the name of the class whose policy you want to create.</td>
</tr>
<tr>
<td>Step 4</td>
<td>police cir bit-rate bc burst-rate  &lt;br&gt; Example: &lt;br&gt; Device(config-pmap-c)# police cir 10000 bc 1500</td>
<td>Configures the policer with committed information rate bit rate and burst rates.</td>
</tr>
<tr>
<td>Step 5</td>
<td>conform-action transmit  &lt;br&gt; Example: &lt;br&gt; Device(config-pmap-c-police)# conform-action transmit</td>
<td>Transmits all the packets.</td>
</tr>
<tr>
<td>Step 6</td>
<td>exceed-action drop  &lt;br&gt; Example: &lt;br&gt; Device(config-pmap-c-police)# exceed-action drop</td>
<td>Drops all the packets.</td>
</tr>
</tbody>
</table>

### Configuring Policy-map for Downstream QoS (set-dscp)

Follow the procedure given below to configure policy-map for downstream QoS (set-dscp):

**SUMMARY STEPS**

1. configure terminal
2. policy-map policy-map-name
3. class class-map-name
4. set dscp
### Configuring Policy-map for Downstream QoS (drop)

Follow the procedure given below to configure policy-map for downstream QoS (drop):

#### SUMMARY STEPS

1. `configure terminal`
2. `policy-map policy-map-name`
3. `class class-map-name`
4. `drop`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>

<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>policy-map policy-map-name</code></td>
<td>Configures a matching policy-name under this policymap.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# policy-map policy1</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>class class-map-name</code></td>
<td>Specifies the name of the class whose policy you want to create.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-pmap)#class class1</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>set dscp</code></td>
<td>Matches packets with AF41 dscp.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-pmap-c)# set dscp af41</code></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Policy-map for Downstream QoS on the WLAN

Follow the procedure given below to configure policy-map for downstream QoS on the WLAN:

**Before you begin**

The following options are not supported for match app in the downstream direction on the WLAN:

- set dscp
- drop
- policing

### SUMMARY STEPS

1. configure terminal
2. wlan profile-name wlan-id ssid
3. client vlan vlan-id
4. ip flow monitor flow-monitor input
5. ip flow monitor flow-monitor output
6. service-policy client input policy-map-name
7. session-timeout session-duration
8. shutdown

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

</table>
### Monitoring Application Visibility and Control

#### Monitoring Application Visibility and Control (CLI)

This section describes the new commands for application visibility.

The following commands can be used to monitor application visibility on the switch and access points.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show avc client client-mac top n application [aggregate</td>
<td>upstream</td>
</tr>
<tr>
<td>`show avc wlan ssid top n application [aggregate</td>
<td>upstream</td>
</tr>
<tr>
<td>`avc top user[enable</td>
<td>disable]`</td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td><code>ip flow monitor flow-monitor output</code></td>
<td>Assigns the flow monitor that is created to the egress interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-wlan)# ip flow monitor monitor1 output</code></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><code>service-policy client input policy-map-name</code></td>
<td>Assigns policy-map to all clients in WLAN.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-wlan)# service-policy client input policy1</code></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td><code>session-timeout session-duration</code></td>
<td>Sets the session timeout duration.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-wlan)# session-timeout 10000</code></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td><code>shutdown</code></td>
<td>Disables the WLAN.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config-wlan)# shutdown</code></td>
<td></td>
</tr>
</tbody>
</table>
show avc wlan wlan-id application app name topN [aggregate | upstream | downstream]

Displays to know network usage information on a per user basis within an application.

**Note** On Catalyst 4500E Supervisor Engine 8-E, in the information about top N users that is displayed, the client's MAC address and username are not displayed. This issue occurs only within 90 seconds after the client is disconnected.

show wlan id wlan-id

Displays information whether AVC is enabled or disabled on a particular WLAN.

show flow monitor flow_monitor_name cache

Displays information about flow monitors.

show wireless client mac-address mac-address service-policy { input | output }

Displays information about policy mapped to the wireless clients.

show ip nbar protocol-discovery [interface interface-type interface-number] [stats {byte-count | bit-rate | packet-count | max-bit-rate}] [protocol protocol-name | top-n number]

Displays the statistics gathered by the NBAR Protocol Discovery feature.

- (Optional) Enter keywords and arguments to fine-tune the statistics displayed. For more information on each of the keywords, refer to the show ip nbar protocol-discovery command in Cisco IOS Quality of Service Solutions Command Reference.

**Note** When you configure NBAR, you must enable Protocol Discovery on the interface.

show policy-map target

show policy-map

show policy-map policy-name

show policy-map interface interface-type interface-number

Displays information about policy map.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear avc client mac stats</td>
<td>Clears the statistics per client.</td>
</tr>
<tr>
<td>clear avc wlan wlan-name stats</td>
<td>Clears the statistics per WLAN.</td>
</tr>
</tbody>
</table>
Examples: Application Visibility and Control

Examples: Application Visibility Configuration

This example shows how to create a flow record, create a flow monitor, apply the flow record to the flow monitor, and apply the flow monitor on a WLAN:

```
Device# configure terminal
Device(config)# flow record fr_v4
Device(config-flow-record)# match ipv4 protocol
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# match transport destination-port
Device(config-flow-record)# match flow direction
Device(config-flow-record)# match application name
Device(config-flow-record)# match wireless ssid
Device(config-flow-record)# collect counter bytes long
Device(config-flow-record)# collect counter packets long
Device(config-flow-record)# collect wireless ap mac address
Device(config-flow-record)# collect wireless client mac address
Device(config)# end
```

```
Device# configure terminal
Device(config)# flow monitor fm_v4
Device(config-flow-monitor)# record fr_v4
Device(config-flow-monitor)# cache timeout active 1800
Device(config)# end
```

```
Device(config)# wlan wlan1
Device(config-wlan)# ip flow monitor fm_v4 input
Device(config-wlan)# ip flow mon fm-v4 output
Device(config)# end
```

Examples: Application Visibility and Control QoS Configuration

This example shows how to create class maps with apply match protocol filters for application name, category, and subcategory:

```
Device# configure terminal
Device(config)# class-map cat-browsing
Device(config-cmap)# match protocol attribute category browsing
Device(config-cmap)# end
```

```
Device# configure terminal
Device(config)# class-map cat-fileshare
Device(config-cmap)# match protocol attribute category file-sharing
Device(config-cmap)# end
```

```
Device# configure terminal
Device(config)# class-map match-any subcat-terminal
Device(config-cmap)# match protocol attribute sub-category terminal
Device(config-cmap)# end
```
Device# configure terminal
Device(config)## class-map match-any webex-meeting
Device(config-cmap)## match protocol webex-meeting
Device(config-cmap)# end

This example shows how to create policy maps and define existing class maps for upstream QoS:

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 150000
Device(config-pmap-c)# set dscp 12
Device(config-pmap-c)# end

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-fileshare
Device(config-pmap-c)# police 1000000
Device(config-pmap-c)# set dscp 20
Device(config-pmap-c)# end

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class subcat-terminal
Device(config-pmap-c)# police 120000
Device(config-pmap-c)# set dscp 15
Device(config-pmap-c)# end

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class webex-meeting
Device(config-pmap-c)# police 50000000
Device(config-pmap-c)# set dscp 21
Device(config-pmap-c)# end

This example shows how to create policy maps and define existing class maps for downstream QoS:

Device# configure terminal
Device(config)# policy-map test-avc-down
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 200000
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# end

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-fileshare
Device(config-pmap-c)# police 300000
Device(config-pmap-c)# set wlan user-priority 2
Device(config-pmap-c)# set dscp 20
Device(config-pmap-c)# end

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class subcat-terminal
Device(config-pmap-c)# police 100000
Device(config-pmap-c)#
Device(config-pmap-c) # set dscp 25
Device(config-pmap-c) # end

Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class webex-meeting
Device(config-pmap-c)# polici 60000000
Device(config-pmap-c)# set dscp 41
Device(config-pmap-c)# end

This example shows how to apply defined QoS policy on a WLAN:

Device# configure terminal
Device(config)# wlan alpha
Device(config-wlan)# shut
Device(config-wlan)# end
Device(config-wlan)# service-policy client input test-avc-up
Device(config-wlan)# service-policy client output test-avc-down
Device(config-wlan)# no shut
Device(config-wlan)# end

Example: Configuring QoS Attribute for Local Profiling Policy

The following example shows how to configure QoS attribute for a local profiling policy:

Device(config)# class-map type control subscriber match-all local_policy1_class
Device(config-filter-control-classmap)# match device-type android
Device(config)# service-template local_policy1_template
Device(config-service-template)# vlan 40
Device(config-service-template)# service-policy qos output local_policy1
Device(config)# policy-map type control subscriber local_policy1
Device(config-event-control-policymap)# event identity-update match-all
Device(config-class-control-policymap)# 1 class local_policy1_class do-until-success
Device(config-action-control-policymap)# 1 activate service-template local_policy1_template
Device(config)# wlan open_auth 9
Device(config-wlan)# client vlan VLAN40
Device(config-wlan)# service-policy type control subscriber local_policy1

Information About Campus Fabric

Campus Fabric provides the basic infrastructure for building virtual networks based on policy-based segmentation constructs. This module describes how to configure Campus Fabric on your device.

Campus Fabric Overview

Campus Fabric Overlay provisioning consists of three main components:

• Control-Plane
• Data-Plane
• Policy-Plane

Understanding Fabric Domain Elements

Figure 139: Elements of a Fabric Domain displays the elements that make up the fabric domain.
Figure 139: Elements of a Fabric Domain

The following is a description of the fabric domain elements illustrated in the Figure 139: Elements of a Fabric Domain.

- **Fabric Edge Devices**—Provide connectivity to users and devices that connect to the fabric domain. Fabric edge devices identify and authenticate end points, and register end-point ID information in the fabric host-tracking database. These devices encapsulate at ingress and decapsulate at egress, to forward traffic to and from the end points connected to the fabric domain.

- **Fabric Control-Plane Devices**—Provide overlay reachability information and end points-to-routing locator mapping, in the host-tracking database. A control-plane device receives registrations from fabric edge devices having local end points, and resolves requests from edge devices to locate remote end points. You can configure up to three control-plane devices internally (a fabric border device) and externally (a designated control-plane device, such as Cisco CSR1000v), to allow redundancy in your network.

- **Fabric Border Devices**—Connect traditional Layer 3 networks or different fabric domains to the local domain, and translate reachability and policy information, such as virtual routing and forwarding (VRF) and SGT information, from one domain to another.

- **Virtual Contexts**—Provide virtualization at the device level, using VRF to create multiple instances of Layer 3 routing tables. Contexts or VRFs provide segmentation across IP addresses, allowing for overlapped address space and traffic separation. You can configure up to 32 contexts in the fabric domain.

- **Host-Pools**—Group end points that are present in the fabric domain into IP pools, and identify them with a VLAN ID and an IP subnet.

### Campus Fabric Configuration Guidelines

Consider the following guidelines and limitations when configuring campus fabric elements:

- Configure no more than 3 control-plane devices in each fabric domain.

- Each fabric edge device supports up to 2000 hosts.

- Each control-plane device supports up to 5000 fabric edge device registrations.
• Configure no more than 32 virtual contexts in each fabric domain.

How to Configure Fabric Overlay

Configuring Fabric Edge Devices

Follow these steps to configure fabric edge devices:

Before you begin

Configure a loopback0 IP address for each edge device to ensure that the device is reachable. Ensure that you run the `ip lisp source-locator loopback0` command on the uplink interface.

SUMMARY STEPS

1. enable
2. configure terminal
3. fabric auto
4. domain {default | name fabric domain name}
5. control-plane ipv4 address auth_key key
6. border ipv4 address
7. context name name id ID
8. host-pool name name
9. host-vlan ID
10. context name name
11. gateway IP address/mask
12. use-dhcp IP address
13. exit
14. show fabric domain

<tr>
<td>Device(config-fabric-auto-domain)#host-pool name VOICE_DOMAIN</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> host-vlan ID</td>
<td>Configures a VLAN ID to associate with the host-pool.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-fabric-auto-domain-host-pool)#host-vlan 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> context name name</td>
<td>(Optional) Associates a context or a VRF with the host-pool. You can configure up to 32 contexts in your fabric domain.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-fabric-auto-domain-host-pool)#context name eg-context</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> gateway IP address/mask</td>
<td>Configures the routing gateway IP address and the subnet mask for the host-pool. This address and subnet mask are</td>
</tr>
</tbody>
</table>
Purpose
Command or Action | Purpose
--- | ---
Device(config-fabric-auto-domain-host-pool)# gateway 192.168.1.254/24 | used to map the endpoint to the uplink interface connecting to the underlay.

Step 12

**use-dhcp IP address**

Example:

Device(config-fabric-auto-domain-host-pool)# use-dhcp 172.10.1.1

Configures a DHCP server address for the host-pool. You can configure multiple DHCP addresses for your host-pool. To delete a DHCP server address, use the **no use-dhcp IP address** command.

Step 13

**exit**

Example:

Device(config-fabric-auto-domain)# exit

Displays your fabric domain configuration. As part of this configuration, additional CLI commands are generated automatically. For more information, see Auto-Configured Commands on Fabric Edge Devices

### Auto-Configured Commands on Fabric Edge Devices

As a part of Fabric Overlay provisioning, some LISP-based configuration, SGT (security group tag) configuration and EID to RLOC mapping configuration is auto-generated, and is displayed in your running configuration.

For example, consider this configuration scenario for an edge device (loopback address 2.1.1.1/32):

```
device(config)# fabric auto
device(config-fabric-auto)# domain default
device(config-fabric-auto)# control-plane 192.168.1.4 auth-key example-key1
device(config-fabric-auto)# control-plane 192.168.1.5 auth-key example-key2
device(config-fabric-auto)# border 192.168.1.6
device(config-fabric-auto)# context name example-context id 10
device(config-fabric-auto)# host-pool name VOICE_DOMAIN
device(config-fabric-auto-domain-host-pool)# vlan 10
device(config-fabric-auto-domain-host-pool)# context example-context
device(config-fabric-auto-domain-host-pool)# gateway 192.168.1.254/24
device(config-fabric-auto-domain-host-pool)# use-dhcp 209.165.201.6
```

This is sample output for your fabric edge configuration:

```
device# show running-config
router lisp
encapsulation vxlan
locator-set default.RLOC
IPV4-interface Loopback0 priority 10 weight 10
exit
!
eid-table default instance-id 0
exit
!
eid-table vrf example-context instance-id 10
dynamic-eid example-context.EID.VOICE_DOMAIN
database-mapping 192.168.1.0/24 locator-set default.RLOC
exit
```
Configuring Fabric Control-Plane Devices

Follow these steps to configure your control-plane device.

**Before you begin**
Configure a loopback0 IP address for each edge device to ensure that the device is reachable. Ensure that you run the `ip lisp source-locator loopback0` command on the uplink interface.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. fabric auto
4. domain { default | name fabric domain name }
5. control-plane self auth_key key
6. host-prefix prefix context name name id ID
7. exit
8. show fabric domain

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>

</tbody>
</table>
| **Step 3** fabric auto | Enables automatic fabric provisioning and enters automatic fabric configuration mode.  
Example:  
Device(config)#fabric auto |
| **Step 4** domain { default | name fabric domain name} | Configures the default fabric domain and enters domain configuration mode. The name keyword allows you to add a new fabric domain.  
Example:  
Device(config-fabric-auto)#domain default  
Device(config-fabric-auto)#domain name exampledomain |
| **Step 5** control-plane self auth_key key | Enables the control-plane service with the authentication key, for the configured host-prefix.  
Example:  
Device(config-fabric-auto-domain)#control-plane self auth_key example-key1 |
| **Step 6** host-prefix prefix context name name id ID | Creates a new context or a VRF and assigns an ID to it. If you don't specify a context, the default context is used.  
Example:  
Device(config-fabric-auto-domain)#host-prefix 192.168.1.0/24 context name example-context id 10 |
| **Step 7** exit | |
| **Step 8** show fabric domain | Displays your control-plane device configuration. As part of this configuration, additional CLI commands are automatically generated.  
Example:  
Device# show fabric domain |

**Configuring Fabric Border Devices**

Follow these steps to configure your device as a fabric border device.

**Before you begin**

Configure a loopback0 IP address for each edge device to ensure that the device is reachable. Ensure that you run the `ip lisp source-locator loopback0` command on the uplink interface.

**SUMMARY STEPS**

1. enable  
2. configure terminal  
3. fabric auto  
4. domain { default | name fabric domain name}  
5. control-plane ipv4 address auth_key key  
6. border self
### DETAILED STEPS

<tbody>
<tr>
<td>Device(config-fabric-auto-domain)# host-prefix 192.168.1.0/24</td>
<td></td>
</tr>
<tr>
<td>context name eg-context</td>
<td></td>
</tr>
</tbody>
</table>

**Step 9**

exit

**Example:**

Device(config-fabric-auto-domain)# exit

**Step 10**

show fabric domain

**Example:**

Device# show fabric domain

Displays your fabric border device configuration.

---

### Security Group Tags and Policy Enforcement in Campus Fabric

Campus Fabric overlay propagates source group tags (SGTs) across devices in the fabric domain. Packets are encapsulated using virtual extensible LAN (VXLAN) and carry the SGT information in the header. When you configure an edge device, the `ipv4 sgt` command is auto-generated. The SGT mapped to the IP address of the edge device is carried within the encapsulated packet and propagated to the destination device, where the packet is decapsulated and the Source Group Access Control List (SGACL) policy is enforced.

For more information on Cisco TrustSec and Source Group Tags, see the [Cisco TrustSec Switch Configuration Guide](#).

### Multicast Using Campus Fabric Overlay

You can use Campus Fabric overlay to carry multicast traffic over core networks that do not have native multicast capabilities. Campus Fabric overlay allows unicast transport of multicast traffic with head-end replication in the edge device.

---

**Note**

Only Protocol Independent Multicast (PIM) Sparse Mode and PIM Source Specific Multicast (SSM) are supported in Campus Fabric; dense mode is not supported.

---

### Configuring Multicast PIM Sparse Mode in Campus Fabric

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip multicast-routing
4. ip pim rp-address rp address
5. interface LISP interface number
6. ip pim sparse-mode
7. exit
8. interface interface type interface number

---
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 3** | `ip multicast-routing`  
*Example:*  
Device(config)#ip multicast-routing | Enables IP multicast routing. |
| **Step 4** | `ip pim ssm {default | range } { access-list-number | access-list-name}`  
*Example:*  
Device(config)#ip pim ssm default | Defines the Source Specific Multicast (SSM) range of IP multicast addresses. |
| **Step 5** | `interface LISP interface number`  
*Example:*  
Device(config)#interface LISP 0 | Specifies the LISP interface and the subinterface on which to enable Protocol Independent Multicast (PIM) sparse mode. |
| **Step 6** | `ip pim sparse-mode`  
*Example:*  
Device(config-if)#ip pim sparse-mode | Enables Protocol Independent Multicast (PIM) on the specified interface for sparse-mode operation. |
| **Step 7** | `exit`  
*Example:*  
Device(config-if)#exit | Exits interface configuration mode and enters global configuration mode. |
| **Step 8** | `interface interface type interface number`  
*Example:*  
Device(config)#interface GigabitEthernet0/0/0 | Configures the interface facing the endpoint, and enters interface configuration mode. |
| **Step 9** | `ip pim sparse-mode`  
*Example:*  
Device(config-if)#ip pim sparse-mode | Enables Protocol Independent Multicast (PIM) on interface facing the fabric domain for sparse-mode operation. |
| **Step 10** | `ip igmp version 3`  
*Example:*  
Device(config-if)#ip igmp version 3 | Configures IGMP version 3 on the interface. |
| **Step 11** | `end` | Ends the current configuration session and returns to privileged EXEC mode. |
| **Step 12** | `show ip mroute multicast ip-address` | Verifies the multicast routes on the device. |
| **Step 13** | `ping multicast ip-address` | Verifies basic multicast connectivity by pinging the multicast address. |
| **Step 14** | `show ip mfib` | Displays the forwarding entries and interfaces in the IPv4 Multicast Forwarding Information Base (MFIB) |
**Data Plane Security in Campus Fabric**

Campus Fabric Data Plane Security ensures that only traffic from within a fabric domain can be decapsulated, by an edge device at the destination. Edge and border devices in the fabric domain validate that the source Routing Locator (RLOC), or the uplink interface address, carried by the data packet is a member of the fabric domain.

Data Plane Security ensures that the edge device source addresses in the encapsulated data packets cannot be spoofed. Packets from outside the fabric domain carry invalid source RLOCs that are blocked during decapsulation by edge and border devices.

**Configuring Data Plane Security on Edge Devices**

**Before you begin**

- Configure a loopback0 IP address for each edge device to ensure that the device is reachable.
  
  Ensure that you apply the `ip lisp source-locator loopback0` command to the uplink interface.

- Ensure that your underlay configuration is set up.

- Ensure that you have configured edge, control-plane, and border devices.

**SUMMARY STEPS**

1. `configure terminal`
2. `router lisp`
3. `decapsulation filter rloc source member`
4. `exit`
5. `show lisp [session [established] | vrf [vrf-name [session [peer-address]]]]`
6. `show lisp decapsulation filter [IPv4-rloc-address | IPv6-rloc-address] [eid-table eid-table-vrf | instance-id iid]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **configure terminal**  
Example:  
Device# `configure terminal`  
Enters global configuration mode. |
| **Step 2** | `router lisp`  
Example:  
Device(config)# `router lisp`  
Enters LISP configuration mode. |
| **Step 3** | `decapsulation filter rloc source member`  
Example:  
Device(config-router-lisp)# `decapsulation filter rloc source member`  
Enables the validation of the source RLOC (uplink interface) addresses of encapsulated packets in the fabric domain. |
### Configuring Data Plane Security on Control Plane Devices

#### Before you begin

- Configure a loopback0 IP address for each control plane device to ensure that the device is reachable. Ensure that you apply the `ip lisp source-locator loopback0` command to the uplink interface.
- Ensure that your underlay configuration is set up.
- Ensure that you have configured edge, control-plane, and border devices.

#### Procedure

<table>

### Configuring Data Plane Security on Border Devices

**Before you begin**

- Configure a loopback0 IP address for each border device to ensure that the device is reachable. Ensure that you apply the `ip lisp source-locator loopback0` command to the uplink interface.

- Ensure that your underlay configuration is set up.

- Ensure that you have configured edge, control-plane, and border devices.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. router lisp
4. decapsulation filter rloc source member
5. exit
6. show lisp [session [established] | vrf [vrf-name [session [peer-address]]]]
7. show lisp decapsulation filter [IPv4-rloc-address | IPv6-rloc-address] [eid-table eid-table-vrf | instance-id iid]
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted.  
  **Example:** Device> enable |
| **Step 2** configure terminal | Enters global configuration mode.  
  **Example:** Device# configure terminal |
| **Step 3** router lisp | Enters LISP configuration mode.  
  **Example:** Device(config)# router lisp |
| **Step 4** decapsulation filter rloc source member | Enables the validation of the source RLOC (uplink interface) addresses of encapsulated packets in the fabric domain.  
  **Example:** Device(config-router-lisp)# decapsulation filter rloc source member |
| **Step 5** exit | Exits LISP configuration mode and returns to global configuration mode.  
  **Example:** Device(config-router-lisp)# exit |
| **Step 6** show lisp [session [established] | Displays reliable transport session information. If there is more than one transport session, the corresponding information is displayed.  
  [vrf [vrf-name [session [peer-address]]]]]  
  **Example:** Device# show lisp session |
| **Step 7** show lisp decapsulation filter [IPv4-rloc-address | Displays RLOC address configuration details (manually configured or discovered).  
  IPv6-rloc-address] [eid-table eid-table-vrf |  
  instance-id iid]  
  **Example:** Device# show lisp decapsulation filter instance-id 0 |

### Campus Fabric Configuration Examples

This is sample output for the `show running-configuration` command for an edge configuration:
```
device#show running-config
fabric auto
! domain default
```
This is sample output for the **show running-configuration** command for a control-plane configuration:

```plaintext

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice and Video Parameters

You can confirm the following points before configuring voice and video parameters:

• Ensure that the device has access points connected to it.
• Configure SSID.

Restrictions for Voice and Video Parameters

The following are the restrictions that you should keep in mind while configuring voice and video parameters:

• SIP CAC can be used for the 9971 Cisco phones that support TSPEC-based admission control. You can also use the phones that support Status code 17.
• SIP snooping is supported for providing voice priority to the non-TSPEC SIP phones.

• TSPEC for video CAC is not supported.

• Cisco 792x IP phones that are admitted as non-WMM devices with 11K enabled will experience audio problems with the phones.

Note

Disable 11K for voice WLAN for all 792x Cisco IP phones that are admitted as non-WMM devices with 11K enabled. Upgrade the firmware on Cisco Unified Call Manager to 1.4.5 to resolve this issue. Refer to the Cisco Unified Call Manager configuration guide for more information.

Information About Configuring Voice and Video Parameters

Three parameters on the device affect voice and/or video quality:

• Call Admission Control

• Expedited bandwidth requests

• Unscheduled automatic power save delivery

Call Admission Control (CAC) and UAPSD are supported on Cisco Compatible Extensions (CCX) v4 and v5; however, these parameters are also supported even without CCX but on any device implementing WMM (that supports 802.1e). Expedited bandwidth requests are supported only on CCXv5.

Traffic stream metrics (TSM) can be used to monitor and report issues with voice quality.

Call Admission Control

Call Admission Control (CAC) enables an access point to maintain controlled quality of service (QoS) when the wireless LAN is experiencing congestion. The WMM protocol deployed in CCXv4 maintains QoS under differing network loads.

Two types of Over The Air (OTA) CAC are available: static-based CAC and load-based CAC.

The device supports the following QoS policies:

• User-defined policies: You can define your own QoS policies. You can have more control over these policies than the existing metal policies.

• System-defined precious metal policies: To support backward compatibility.
  • Platinum: Used for VoIP clients.
  • Gold: Used for video clients.
  • Silver: Used for best effort traffic.
  • Bronze: Used for NRT traffic.
### Static-Based CAC

Voice over WLAN applications supporting WMM and TSPEC can specify how much bandwidth or shared medium time is required to initiate a call. Bandwidth-based, or static, CAC enables the access point to determine whether it is capable of accommodating a particular call. The access point rejects the call if necessary in order to maintain the maximum allowed number of calls with acceptable quality.

The QoS setting for a WLAN determines the level of bandwidth-based CAC support. To use bandwidth-based CAC with voice applications, the WLAN must be configured for Platinum QoS. With bandwidth-based CAC, the access point bandwidth availability is determined based on the amount of bandwidth currently used by the access point clients, to which the bandwidth requested by the Voice over WLAN applications is added. If this total exceeds a configured bandwidth threshold, the new call is rejected.

---

**Note**

You must enable admission control (ACM) for CCXv4 clients that have WMM enabled. Otherwise, bandwidth-based CAC does not operate properly for these CCXv4 clients.

### Load-Based CAC

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types (including that from clients), cochannel access point loads, and coallocated channel interference, for voice and video applications. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point continuously measures and updates the utilization of the RF channel (that is, the mean time of bandwidth that has been exhausted), channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents oversubscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

---

**Note**

If you disable load-based CAC, the access points start using bandwidth-based CAC.

### IOSd Call Admission Control

IOSd Call Admission Control (CAC) controls bandwidth availability from device to access point.

You can configure class-based, unconditional packet marking features on your switch for CAC.

CAC is a concept that applies to voice and video traffic only—not data traffic. If an influx of data traffic oversubscribes a particular link in the network, queueing, buffering, and packet drop decisions resolve the congestion. The extra traffic is simply delayed until the interface becomes available to send the traffic, or, if traffic is dropped, the protocol or the end user initiates a timeout and requests a retransmission of the information.

Network congestion cannot be resolved in this manner when real-time traffic, sensitive to both latency and packet loss, is present, without jeopardizing the quality of service (QoS) expected by the users of that traffic. For real-time delay-sensitive traffic such as voice, it is better to deny network access under congestion conditions than to allow traffic onto the network to be dropped and delayed, causing intermittent impaired QoS and resulting in customer dissatisfaction.
CAC is therefore a deterministic and informed decision that is made before a voice call is established and is based on whether the required network resources are available to provide suitable QoS for the new call.

Based on the admit CAC CLI configuration in addition to the existing CAC algorithm, device allows either voice or video with TSPEC or SIP snooping. The **admit cac** CLI is mandatory for the voice call to pass through.

If the BSSID policer is configured for the voice or video traffic, then additional checks are performed on the packets.

### Expedited Bandwidth Requests

The expedited bandwidth request feature enables CCXv5 clients to indicate the urgency of a WMM traffic specifications (TSPEC) request (for example, an e911 call) to the WLAN. When the controller receives this request, it attempts to facilitate the urgency of the call in any way possible without potentially altering the quality of other TSPEC calls that are in progress.

You can apply expedited bandwidth requests to both bandwidth-based and load-based CAC. Expedited bandwidth requests are disabled by default. When this feature is disabled, the controller ignores all expedited requests and processes TSPEC requests as normal TSPEC requests.

The following table lists examples of TSPEC request handling for normal TSPEC requests and expedited bandwidth requests.

#### Table 198: TSPEC Request Handling Examples

<table>
<thead>
<tr>
<th>CAC Mode</th>
<th>Reserved bandwidth for voice calls</th>
<th>Usage</th>
<th>Normal TSPEC Request</th>
<th>TSPEC with Expedited Bandwidth Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth-based CAC</td>
<td>75% (default setting)</td>
<td>Less than 75%</td>
<td>Admitted</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Between 75% and 90% (reserved bandwidth for voice calls exhausted)</td>
<td>Rejected</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>More than 90%</td>
<td>Rejected</td>
<td>Rejected</td>
</tr>
<tr>
<td>Load-based CAC</td>
<td></td>
<td>Less than 75%</td>
<td>Admitted</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Between 75% and 85% (reserved bandwidth for voice calls exhausted)</td>
<td>Rejected</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>More than 85%</td>
<td>Rejected</td>
<td>Rejected</td>
</tr>
</tbody>
</table>

30 For bandwidth-based CAC, the voice call bandwidth usage is per access point radio and does not take into account cochannel access points. For load-based CAC, the voice call bandwidth usage is measured for the entire channel.

31 Bandwidth-based CAC (consumed voice and video bandwidth) or load-based CAC (channel utilization [Pb]).
Admission control for TSPEC G711-20ms and G711-40 ms codec types are supported.

**U-APSD**

Unscheduled automatic power save delivery (U-APSD) is a QoS facility defined in IEEE 802.11e that extends the battery life of mobile clients. In addition to extending battery life, this feature reduces the latency of traffic flow delivered over the wireless media. Because U-APSD does not require the client to poll each individual packet buffered at the access point, it allows delivery of multiple downlink packets by sending a single uplink trigger packet. U-APSD is enabled automatically when WMM is enabled.

**Traffic Stream Metrics**

In a voice-over-wireless LAN (VoWLAN) deployment, traffic stream metrics (TSM) can be used to monitor voice-related metrics on the client-access point air interface. It reports both packet latency and packet loss. You can isolate poor voice quality issues by studying these reports.

The metrics consist of a collection of uplink (client side) and downlink (access point side) statistics between an access point and a client device that supports CCX v4 or later releases. If the client is not CCX v4 or CCXv5 compliant, only downlink statistics are captured. The client and access point measure these metrics. The access point also collects the measurements every 5 seconds, prepares 90-second reports, and then sends the reports to the controller. The controller organizes the uplink measurements on a client basis and the downlink measurements on an access point basis and maintains an hour’s worth of historical data. To store this data, the controller requires 32 MB of additional memory for uplink metrics and 4.8 MB for downlink metrics.

TSM can be configured through either the GUI or the CLI on a per radio-band basis (for example, all 802.11a radios). The controller saves the configuration in flash memory so that it persists across reboots. After an access point receives the configuration from the controller, it enables TSM on the specified radio band.

This table shows the upper limit for TSM entries in different controller series.

<table>
<thead>
<tr>
<th>TSM Entries</th>
<th>5700</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX AP TSM entries</td>
<td>100</td>
</tr>
<tr>
<td>MAX Client TSM entries</td>
<td>250</td>
</tr>
<tr>
<td>MAX TSM entries</td>
<td>100*250=2500</td>
</tr>
</tbody>
</table>

Once the upper limit is reached, additional TSM entries cannot be stored and sent to WCS or NCS. If client TSM entries are full and AP TSM entries are available, then only the AP entries are stored, and vice versa. This leads to partial output. TSM cleanup occurs every one hour. Entries are removed only for those APs and clients that are not in the system.
Information About Configuring Voice Prioritization Using Preferred Call Numbers

You can configure a device to provide support for SIP calls from VoWLAN clients that do not support TSPEC-based calls. This feature is known as SIP CAC support. If bandwidth is available in the configured voice pool, the SIP call uses the normal flow and the device allocates the bandwidth to those calls.

You can also prioritize up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the device does not check the configured maximum voice bandwidth. The device allocates the bandwidth needed for the call, even if it exceeds the maximum bandwidth for voice configured for voice CAC. The preferred call will be rejected if bandwidth allocation exceeds 85% of the radio bandwidth. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.

You must configure the following parameters before configuring voice prioritization:

- Set WLAN QoS to allow voice calls to pass through.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

Information About Enhanced Distributed Channel Access Parameters

Enhanced Distributed Channel Access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality of service (QoS) traffic.

How to Configure Voice and Video Parameters

Configuring Voice Parameters (CLI)

Before you begin

Ensure that you have configured SIP-based CAC.

You should have created a class map for CAC before beginning this procedure.

SUMMARY STEPS

1. show wlan summary
2. show wlan wlan_id
3. configure terminal
4. policy-map policy-map name
5. class {class-name | class-default}
6. admit cac wmm-tspec
7. service-policy policy-map name
8. end
9. wlan wlan_profile_name wlan_ID SSID_network_name wlan shutdown
10. `wlan wlan_profile_name wlan_ID SSID_network_name`
11. `wlan wlan_name call-snoop`
12. `wlan wlan_name service-policy input input_policy_name`
13. `wlan wlan_name service-policy output output_policy_name`
14. `wlan wlan_name service-policy input ingress_policy_name`
15. `wlan wlan_name service-policy output egress_policy_name`
16. `ap dot11 {5ghz | 24ghz} shutdown`
17. `ap dot11 {5ghz | 24ghz} cac voice sip`
18. `ap dot11 {5ghz | 24ghz} cac voice acm`
19. `ap dot11 {5ghz | 24ghz} cac voice max-bandwidth bandwidth`
20. `ap dot11 {5ghz | 24ghz} cac voice roam-bandwidth bandwidth`
21. `no wlan shutdown`
22. `no ap dot11 {5ghz | 24ghz} shutdown`
23. `end`

</tr>
<tr>
<td>Step 13</td>
<td><strong>wlan wlan_name service-policy output output_policy_name</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# wlan wlan1&lt;br&gt;Device(config-wlan)# service-policy output platinum</td>
</tr>
<tr>
<td>Step 14</td>
<td><strong>wlan wlan_name service-policy input ingress_policy_name</strong></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Example:**  
Device(config)# wlan wlan1  
Device(config-wlan)# service-policy input policy1 | Configures egress SSID policy on a particular WLAN as user-defined policy. |
| **Step 15**  
wlan wlan_name service-policy output  
egress_policy_name | |
| **Example:**  
Device(config)# wlan wlan1  
Device(config-wlan)# service-policy output policy2 | |
| **Step 16**  
ap dot11 {5ghz | 24ghz} shutdown | Disables the radio network.  
**Example:**  
Device(config)# ap dot11 5ghz shutdown |
| **Step 17**  
ap dot11 {5ghz | 24ghz} cac voice sip | Enables or disables SIP IOSd CAC for the 802.11a or 802.11b/g network.  
**Example:**  
Device(config)# ap dot11 5ghz cac voice sip |
| **Step 18**  
ap dot11 {5ghz | 24ghz} cac voice acm | Enables or disables bandwidth-based voice CAC for the 802.11a or 802.11b/g network.  
**Example:**  
Device(config)# ap dot11 5ghz cac voice acm |
| **Step 19**  
ap dot11 {5ghz | 24ghz} cac voice max-bandwidth bandwidth | Sets the percentage of maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network.  
The bandwidth range is 5 to 85%, and the default value is 75%. Once the client reaches the value specified, the access point rejects new videos on this network.  
**Example:**  
Device(config)# ap dot11 5ghz cac voice max-bandwidth 85 |
| **Step 20**  
ap dot11 {5ghz | 24ghz} cac voice roam-bandwidth bandwidth | Sets the percentage of maximum allocated bandwidth reserved for roaming voice clients.  
The bandwidth range is 0 to 25%, and the default value is 6%. The device reserves this much bandwidth from the maximum allocated bandwidth for roaming voice clients.  
**Example:**  
Device(config)# ap dot11 5ghz cac voice roam-bandwidth 10 |
| **Step 21**  
no wlan shutdown | Reenables all WLANs with WMM enabled.  
**Example:**  
Device(config-wlan)# no wlan shutdown |
| **Step 22**  
no ap dot11 {5ghz | 24ghz} shutdown | Reenables the radio network.  
**Example:**  
Device(config)# no ap dot11 5ghz shutdown |
| **Step 23**  
end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.  
**Example:**  
Device(config)# end |
Configuring Video Parameters (CLI)

SUMMARY STEPS

1. show wlan summary
2. show wlan wlan_id
3. configure terminal

<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ap dot11 5ghz cac video acm</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Configures the load-based CAC method. If you do not enter this command, then the default static CAC is applied.</td>
<td></td>
</tr>
<tr>
<td>`ap dot11 {5ghz</td>
<td>24ghz} cac video load-based`</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ap dot11 5ghz cac video load-based</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 13**  
`ap dot11 {5ghz | 24ghz} cac video max-bandwidth bandwidth`  
**Example:**  
Device(config)# `ap dot11 5ghz cac video max-bandwidth 20`

Sets the percentage of maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network.

The bandwidth range is 5 to 85%, and the default value is 75%. The default value is 0, which means no bandwidth request control. The sum of the voice bandwidth and video bandwidth should not exceed 85% or configured maximum media bandwidth.

**Step 14**  
`ap dot11 {5ghz | 24ghz} cac video roam-bandwidth bandwidth`  
**Example:**  
Device(config)# `ap dot11 5ghz cac video roam-bandwidth 9`

Sets the percentage of maximum allocated bandwidth reserved for roaming clients for video.

The bandwidth range is 0 to 25%, and the default value is 0%.

**Step 15**  
`no wlan shutdown wlan_id`  
**Example:**  
Device(config-wlan)# `no wlan shutdown 25`

Reenables all WLANs with WMM enabled.

**Step 16**  
`no ap dot11 {5ghz | 24ghz} shutdown`  
**Example:**  
Device(config)# `no ap dot11 5ghz shutdown`

Reenables the radio network.

**Step 17**  
`end`  
**Example:**  
Device(config)# `end`

Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

### Example

**Configuring SIP-Based CAC (CLI)**

SIP CAC controls the total number of SIP calls that can be made.

**SUMMARY STEPS**

1. configure terminal  
2. wlan wlan-name  
3. call-snoop  
4. service-policy [client] input policy-map name  
5. service-policy [client] output policy-map name  
6. end  
7. show wlan {wlan-id | wlan-name}  
8. configure terminal  
9. ap dot11 {5ghz | 24ghz} cac {voice | video} acm

</tbody>
</table>
### Configuring a Preferred Call Number (CLI)

#### Before you begin

You must set the following parameters before configuring a preferred call number.

- Set WLAN QoS to voice.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.
- Enable SIP-based CAC.

#### SUMMARY STEPS

1. `configure terminal`
2. `wlan wlan-name qos platinum`
3. `ap dot11 {5ghz | 24ghz} cac {voice | video} acm`
4. `wlan wlan-name`
5. `wireless sip preferred-call-no call_index call_number`
6. `no wireless sip preferred-call-no call_index`
7. `end`

### Configuring EDCA Parameters (CLI)

**SUMMARY STEPS**

1. configure terminal
2. ap dot11 {5ghz | 24ghz} shutdown
3. ap dot11 {5ghz | 24ghz} edca-parameters {custom-voice | fastlane | optimized-video-voice | optimized-voice | svp-voice | wmm-default}
4. no ap dot11 {5ghz | 24ghz} shutdown
5. end
6. show ap dot11 {5ghz | 24ghz} network

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td><strong>Purpose</strong></td>
</tr>
</tbody>
</table>

**Step 2**

*ap dot11 {5ghz | 24ghz} shutdown*

**Example:**

Device(config)# ap dot11 5ghz shutdown

Disables the radio network.

**Step 3**

*ap dot11 {5ghz | 24ghz} edca-parameters {custom-voice | fastlane | optimized-video-voice | optimized-voice |svp-voice | wmm-default}*

**Example:**

Device(config)# ap dot11 5ghz edca-parameters optimized-voice

Enables specific EDCA parameters for the 802.11a or 802.11b/g network.

- **custom-voice**—Enables custom voice parameters for the 802.11a or 802.11b/g network.
- **fastlane**—Enables the fastlane parameters for the 802.11a or 802.11b/g network.
- **optimized-video-voice**—Enables EDCA voice-optimized and video-optimized parameters for the 802.11a or 802.11b/g network. Choose this option when both voice and video services are deployed on your network.
- **optimized-voice**—Enables non-SpectraLink voice-optimized profile parameters for the 802.11a or 802.11b/g network. Choose this option when voice services other than SpectraLink are deployed on your network.
- **svp-voice**—Enables SpectraLink voice-priority parameters for the 802.11a or 802.11b/g network. Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls.
- **wmm-default**—Enables the Wi-Fi Multimedia (WMM) default parameters for the 802.11a or 802.11b/g network. This is the default option. Choose this option when voice or video services are not deployed on your network.

**Step 4**

*no ap dot11 {5ghz | 24ghz} shutdown*

**Example:**

Device(config)# no ap dot11 5ghz shutdown

Re-enables the radio network.

**Step 5**

**end**

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

**Step 6**

*show ap dot11 {5ghz | 24ghz} network*

**Example:**

Device# show ap dot11 5ghz network

Displays the current status of MAC optimization for voice.

## Monitoring Voice and Video Parameters

This section describes the new commands for the voice and video parameters. The following commands can be used to monitor voice and video parameters.

**Table 199: Monitoring Voice Parameters Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ap dot11 {5ghz</td>
<td>24ghz} network`</td>
</tr>
<tr>
<td><code>show ap name ap_name dot11 24ghz tsm all</code></td>
<td>Displays the TSM voice metrics and current status of MAC optimization for voice.</td>
</tr>
<tr>
<td><code>show ap name apname cac voice</code></td>
<td>Displays the information about CAC for a particular access point.</td>
</tr>
<tr>
<td><code>show client detail client_mac</code></td>
<td>Displays the U-APSD status for a particular client.</td>
</tr>
<tr>
<td><code>show policy-map interface wireless client</code></td>
<td>Displays the video client policy details.</td>
</tr>
<tr>
<td><code>show access-list</code></td>
<td>Displays the video client dynamic access-list from the device.</td>
</tr>
<tr>
<td><code>show wireless client voice diag status</code></td>
<td>Displays information about whether voice diagnostics are enabled or disabled. If enabled, this also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call. <strong>Note</strong> To work on voice diagnostics CLIs, you need to enter the following command: <code>debug voice-diagnostic mac-addr client_mac_01 client_mac_02</code></td>
</tr>
<tr>
<td><code>show wireless client voice diag tspec</code></td>
<td>Displays the TSPEC information sent from the clients that are enabled for voice diagnostics.</td>
</tr>
<tr>
<td><code>show wireless client voice diag qos-map</code></td>
<td>Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.</td>
</tr>
<tr>
<td><code>show wireless client voice diag rssi</code></td>
<td>Display the client’s RSSI values in the last 5 seconds when voice diagnostics is enabled.</td>
</tr>
<tr>
<td><code>show client voice-diag roam-history</code></td>
<td>Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, reason for roaming-failure.</td>
</tr>
<tr>
<td><code>show policy-map interface wireless mac mac-address</code></td>
<td>Displays information about the voice and video data packet statistics.</td>
</tr>
<tr>
<td><code>show wireless media-stream client summary</code></td>
<td>Displays a summary of the media stream and video client information.</td>
</tr>
</tbody>
</table>
show controllers d0 | b queue Displays which queue the packets are going through on an access point.

show platform qos queue stats interface Displays which queue packets are going through from the device.

You can monitor the video parameters using the following commands.

**Table 200: Monitoring Video Parameters Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ap join stats summary <strong>ap_mac</strong></td>
<td>Displays the last join error detail for a specific access point.</td>
</tr>
<tr>
<td>show ip igmp snooping wireless mgid</td>
<td>Displays the TSM voice metrics and current status of MAC optimization for voice.</td>
</tr>
<tr>
<td>show wireless media-stream multicast-direct state</td>
<td>Displays the media stream multicast-direct parameters.</td>
</tr>
<tr>
<td>show wireless media-stream group summary</td>
<td>Displays the summary of the media stream and client information.</td>
</tr>
<tr>
<td>show wireless media-stream group detail <strong>group_name</strong></td>
<td>Displays the details of a specific media-stream group.</td>
</tr>
<tr>
<td>show wireless media-stream client summary</td>
<td>Displays the details for a set of media-stream clients.</td>
</tr>
<tr>
<td>show wireless media-stream client detail <strong>group_name</strong></td>
<td>Displays the details for a set of media-stream clients.</td>
</tr>
<tr>
<td>show ap dot11 {5ghz</td>
<td>24ghz} media-stream rrc</td>
</tr>
<tr>
<td>show wireless media-stream message details</td>
<td>Displays information about the message configuration.</td>
</tr>
<tr>
<td>show ap name <strong>ap-name</strong> auto-rf dot11 5ghz</td>
<td>Displays the details of channel utilization.</td>
</tr>
<tr>
<td><strong>i Util</strong></td>
<td></td>
</tr>
<tr>
<td>show controllers d0</td>
<td>b queue</td>
</tr>
<tr>
<td>show controllers d1</td>
<td>b queue</td>
</tr>
<tr>
<td>show cont d1</td>
<td>b Media</td>
</tr>
<tr>
<td>show capwap mcast mgid all</td>
<td>Displays information about all of the multicast groups and their corresponding multicast group identifications (MGIDs) associated to the access point.</td>
</tr>
<tr>
<td>show capwap mcast mgid id <strong>id</strong></td>
<td>Displays information about all of the video clients joined to the multicast group in a specific MGID.</td>
</tr>
</tbody>
</table>
Configuration Examples for Voice and Video Parameters

Example: Configuring Voice and Video

**Configuring Egress SSID Policy for Voice and Video**

The following example shows how to create and configure an egress SSID policy for voice and video:

```conf
table-map egress_ssid_tb
    map from 24 to 24
    map from 34 to 34
    map from 46 to 46
    default copy

class-map match-any voice
    match dscp ef

class-map match-any video
    match dscp af41

policy-map ssid-cac
    class class-default
        shape average 25000000
        set dscp dscp table egress_ssid_tb
        queue-buffers ratio 0
        service-policy ssid-child-cac

policy-map ssid-child-cac
    class voice
        priority level 1
        police 5000000
            conform-action transmit
            exceed-action drop
        admit cac wmm-tspec
            rate 1000
        wlan-up 6 7

    class video
        priority level 2
        police 10000000
            conform-action transmit
            exceed-action drop
        admit cac wmm-tspec
            rate 3000
        wlan-up 4 5
```

**Configuring Ingress SSID Policy for Voice and Video**

The following example shows how to create and configure an ingress SSID policy for voice and video:

```conf
table-map up_to_dscp
    map from 0 to 0
    map from 1 to 8
    map from 2 to 8
    map from 3 to 0
    map from 4 to 34
    map from 5 to 34
    map from 6 to 46
    map from 7 to 48
    default copy
```
policy-map ingress_ssid
class class-default
  set dscp wlan user-priority table up_to_dscp

Configuring Egress Port Policy Voice and Video

The following example shows how to create and configure an egress port policy for voice and video:

policy-map port_child_policy
class non-client-nrt-class
  bandwidth remaining ratio 10

  class voice
  priority level 1
  police rate 3000000

  class video
  priority level 2
  police rate 4000000

Applying Ingress and Egress SSID policies for Voice and Video on a WLAN

The following example shows how to apply ingress and egress SSID policies for voice and video on a WLAN:

wlan voice_video 1 voice_video
  service-policy input ingress_ssid
  service-policy output ssid-cac

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring RFID Tag Tracking

The device enables you to configure radio-frequency identification (RFID) tag tracking. RFID tags are small wireless devices that are affixed to assets for real-time location tracking. They operate by advertising their location using special 802.11 packets, which are processed by access points, the controller, and the location appliance.

How to Configure RFID Tag Tracking

Configuring RFID Tag Tracking (CLI)

SUMMARY STEPS

1. location rfid status
2. (Optional) no location rfid status
### 3. `location rfid timeout seconds`

### 4. `location rfid mobility vendor-name name`

### 5. (Optional) `no location rfid mobility name`

---

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>location rfid status</code></td>
<td>Enables RFID tag tracking.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>location rfid status</code></td>
<td>By default, RFID tag tracking is enabled.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><em>(Optional)</em> <code>no location rfid status</code></td>
<td>Disables RFID tag tracking.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>no location rfid status</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>location rfid timeout seconds</code></td>
<td>Specifies a static timeout value (between 60 and 7200 seconds).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>location rfid timeout 1500</code></td>
<td>The static timeout value is the amount of time that the device maintains tags before expiring them. For example, if a tag is configured to beacon every 30 seconds, we recommend that you set the timeout value to 90 seconds (approximately three times the beacon value). The default value is 1200 seconds.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>location rfid mobility vendor-name name</code></td>
<td>Enables RFID tag mobility for specific tags. When you enter the <code>location rfid mobility vendor-name</code> command, tags are unable to obtain a DHCP address for client mode when attempting to select and/or download a configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>location rfid mobility vendor-name Aerosct</code></td>
<td>These commands can be used only for Pango tags. Therefore, the only valid entry for <code>vendor-name</code> is “pango” in all lowercase letters.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><em>(Optional)</em> <code>no location rfid mobility name</code></td>
<td>Disables RFID tag mobility for specific tags. When you enter the <code>no location rfid mobility</code> command, tags can obtain a DHCP address. If a tag roams from one subnet to another, it obtains a new address rather than retaining the anchor state.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>no location rfid mobility test</code></td>
<td></td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Location Settings

The device determines the location of client devices by gathering Received Signal Strength Indication (RSSI) measurements from access points all around the client of interest. The device can obtain location reports from up to 16 access points for clients, RFID tags, and rogue access points.

You can configure the path loss measurement (S60) request for normal clients or calibrating clients to improve location accuracy.
How to Configure Location Settings

Configuring Location Settings (CLI)

SUMMARY STEPS

1. configure terminal
2. location plm {calibrating [multiband | uniband] | client} burst_interval
3. location rssi-half-life {calibrating-client | client | rogue-aps | tags} seconds
4. location expiry {calibrating-client | client | rogue-aps | tags} timeout
5. location algorithm {rssi-average | simple}
6. location admin-tag string
7. location civic-location identifier {identifier | host}
8. location custom-location identifier {identifier | host}
9. location geo-location identifier {identifier | host}
10. location prefer {cdp | lldp-med | static} weight priority_value
11. location rfid {status | timeout | vendor-name}
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>location plm {calibrating [multiband</td>
<td>uniband]</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# location plm client 100</td>
<td></td>
</tr>
</tbody>
</table>

The path loss measurement request improves the location accuracy. You can configure the burst_interval parameter for the normal, noncalibrating client from zero through 3600 seconds, and the default value is 60 seconds.

You can configure the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio or on the associated 802.11a/b/g radio.

If a client does not send probes often or sends them only on a few channels, its location cannot be updated or cannot be updated accurately. The location plm command forces clients to send more packets on all channels. When a CCXv4 (or higher) client associates, the Device sends it a path loss measurement request, which instructs the client to transmit on the bands and channels that the access points are on (typically, channels 1, 6, and 11 for 2.4-GHz-only...
### Purpose

Configure the RSSI half-life for the clients, calibrating clients, RFID tags, and rogue access points.

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>location rssi-half-life</strong> {calibrating-client</td>
<td>client</td>
</tr>
<tr>
<td><strong>location expiry</strong> {calibrating-client</td>
<td>client</td>
</tr>
<tr>
<td><strong>location algorithm</strong> {rssi-average</td>
<td>simple}</td>
</tr>
</tbody>
</table>

### Step 3

**location rssi-half-life**

Example:

```
Device(config)# location rssi-half-life calibrating-client 60
```

Configures the RSSI half-life for the clients, calibrating clients, RFID tags, and rogue access points.

You can enter the `location rssi-half-life` parameter value for the clients, calibrating clients, RFID tags, and rogue access points as 0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, or 300 seconds, and the default value is 0 seconds.

Some client devices transmit at reduced power immediately after changing channels, and RF is variable, so RSSI values might vary considerably from packet to packet. The `location rssi-half-life` command increases accuracy by averaging nonuniformly arriving data using a configurable forget period (or half life).

**Note**

We recommend that you do not use or modify the `location rssi-half-life` command.

### Step 4

**location expiry**

Example:

```
Device(config)# location expiry calibrating-client 50
```

Configures the RSSI timeout value for the clients, calibrating clients, RFID tags, and rogue access points.

You can enter the RSSI timeout value for the clients, RFID tags, and rogue access points from 5 through 3600 seconds, and the default value is 5 seconds.

For the calibrating clients, you can enter the RSSI timeout value from 0 through 3600 seconds, and the default value is 5 seconds.

Ensuring that recent, strong RSSIs are retained by the CPU is critical to location accuracy. The `location expiry` command enables you to specify the length of time after which old RSSI averages expire.

**Note**

We recommend that you do not use or modify the `location expiry` command.

### Step 5

**location algorithm**

Example:

```
Device(config)# location algorithm rssi-average
```

Configures the algorithm used to average RSSI and signal-to-noise ratio (SNR) values.

You can enter the `location algorithm rssi-average` command to specify a more accurate algorithm but requires more CPU overhead or the `location algorithm simple` command to specify a faster algorithm that requires low CPU overhead but provides less accuracy.

**Note**

We recommend that you do not use or modify the `location algorithm` command.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 6</td>
<td><code>location admin-tag string</code></td>
<td>Sets administrative tag or site information for the location of client devices.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>location admin-tag</code></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>`location civic-location identifier {identifier</td>
<td>host}`</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>location civic-location identifier host</code></td>
<td>You can set the civic location identifier either as a string or host.</td>
</tr>
<tr>
<td>Step 8</td>
<td>`location custom-location identifier {identifier</td>
<td>host}`</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>location custom-location identifier host</code></td>
<td>You can set the custom location identifier either as a string or host.</td>
</tr>
<tr>
<td>Step 9</td>
<td>`location geo-location identifier {identifier</td>
<td>host}`</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>location geo-location identifier host</code></td>
<td>You can set the location identifier either as a string or host.</td>
</tr>
<tr>
<td>Step 10</td>
<td>`location prefer {cdp</td>
<td>lldp-med</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>location prefer weight cdp 50</code></td>
<td></td>
</tr>
<tr>
<td>Step 11</td>
<td>`location rfid {status</td>
<td>timeout</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>location rfid timeout 100</code></td>
<td></td>
</tr>
<tr>
<td>Step 12</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example**

**Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues**

NMSP manages communication between the Cisco Mobility Services Engine (Cisco MSE) and the controller for incoming and outgoing traffic. If your application requires more frequent location updates, you can modify the NMSP notification interval (to a value between 1 and 180 seconds) for clients, active RFID tags, and rogue access points and clients.
The TCP port (16113) that the controller and Cisco MSE communicate over must be open (not blocked) on any firewall that exists between the controller and the Cisco MSE for NMSP to function.

**SUMMARY STEPS**

1. configure terminal
2. nmsp notification interval {attachment seconds | location seconds | rssi [clients interval | rfid interval | rogues [ap | client ] interval]}
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>

<td>location seconds</td>
</tr>
<tr>
<td>Example: Device(config)# nmsp notification interval rssi rfid 50</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Modifying the NMSP Notification Threshold for Clients, RFID Tags, and Rogues**

**SUMMARY STEPS**

1. configure terminal
2. location notify-threshold {clients | rogues ap | tags } threshold
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Command or Action

| Step 2 | location notify-threshold \{clients | rogues ap | tags \} threshold
| Step 3 | end

Example:

Device(config)# location notify-threshold clients 5

Example:

Device(config)# end

Purpose

Configures the NMSP notification threshold for clients, RFID tags, rogue clients, and access points.
threshold- RSSI threshold value in db. Valid range is from 0 to 10.

Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Monitoring Location Settings and NMSP Settings

Monitoring Location Settings (CLI)

This section describes the new commands for location settings.
The following commands can be used to monitor location settings on the.

Table 202: Monitoring Location Settings Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>

<tr>
<td>show nmsp notification interval</td>
<td>Displays the NMSP notification intervals.</td>
</tr>
<tr>
<td>show nmsp statistics connection</td>
<td>Displays the connection-specific NMSP counters.</td>
</tr>
<tr>
<td>show nmsp statistics summary</td>
<td>Displays the common NMSP counters.</td>
</tr>
</tbody>
</table>
### Examples: Location Settings Configuration

This example shows how to configure the path loss measurement (S60) request for calibrating client on the associated 802.11a or 802.11b/g radio:

```
Device# configure terminal
Device(config)# location plm calibrating uniband
Device(config)# end
Device# show location summary
```

This example shows how to configure the RSSI half life for a rogue access point:

```
Device# configure terminal
Device(config)# location rssi-half-life rogue-aps 20
Device(config)# end
Device# show location summary
```

### Examples: NMSP Settings Configuration

This example shows how to configure the NMSP notification interval for RFID tags:

```
Device# configure terminal
Device(config)# nmsp notification interval rssi rfid 50
Device(config)# end
Device# show nmsp notification interval
```

This example shows how to configure the NMSP notification interval for clients:

```
Device# configure terminal
Device(config)# nmsp notification interval rssi clients 180
Device(config)# end
Device# show nmsp notification interval
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on Cisco Hyperlocation

- FlexConnect mode is not supported.
- Only IPv4 addresses are supported for the NTP server.
- It is not possible to disable Cisco Hyperlocation on individual APs.

Information About Cisco Hyperlocation

Cisco Hyperlocation is an ultraprecise location solution that allows you to track the location of wireless clients with the accuracy of one meter. This is possible thanks to the Cisco Hyperlocation radio module that is part of Cisco Aironet 3600 and 3700 Series Access Points. This powerful module combines Wi-Fi and Bluetooth Low Energy (BLE) technologies to allow pinpointing beacons, inventory and personal mobile devices.

The Cisco Hyperlocation radio module provides the following:

- WSM radio module functions that are extended to:
• 802.11ac
• Wi-Fi Transmit
• WSM and RRM channel scanning that is extended to 20-MHz, 40-MHz, and 80-MHz channel bandwidth.

• Expanded location functionality:
  • Low latency location optimized channel scanning
  • 32-antenna angle of arrival (AoA)

Cisco Hyperlocation works in conjunction with Cisco Connected Mobile eXperience (CMX). Combining the Cisco Hyperlocation feature on the Cisco Catalyst 3850 or 3650 Series Switch with a CMX device allows to achieve better location accuracy, which can result in delivering more targeted content to users. When you use CMX with Cisco CleanAir frequency scanning, it is simple to locate failed, lost, and even rogue beacons.

Enhancements in Cisco IOS XE Denali 16.3.1 Release

• The Cisco Hyperlocation radio module with Integrated BLE Radio allows to transmit Bluetooth Low Energy (BLE) broadcast messages by using up to 5 BLE transmitters. The Cisco Catalyst 3850/3650 Switch is used to configure the transmission parameters such as interval for the beacons, UUID, and transmission power, per beacon globally for all the access points. Also, the Cisco Catalyst 3850/3650 Switch can configure major, minor, and transmission power value of each access point, thus providing more beacon granularity. This feature works in conjunction with Cisco Hyperlocation radio module and Hyperlocation feature.

Note
Cisco Hyperlocation feature must be enabled on the APs for Hyperlocation BLE to work.

• The Cisco Hyperlocation feature is enhanced such that the location performance via data packets RSSI is reported through Local Mode radios through CPU cycle stealing when Cisco Hyperlocation radio module is not installed on an AP. This enhancement is available on the following APs:
  • Cisco Aironet 700 Series APs
  • Cisco Aironet 1700 Series APs
  • Cisco Aironet 2600 Series APs
  • Cisco Aironet 2700 Series APs
  • Cisco Aironet 3600 Series APs
  • Cisco Aironet 3700 Series APs

• You can configure Cisco Hyperlocation for an AP group. Previously, Cisco Hyperlocation configuration was applicable to all APs globally.

Additional References

For more information about Cisco Hyperlocation, refer to the following documents:
Configuring Cisco Hyperlocation - Global Configuration (CLI)

**Procedure**

- **configure terminal**
  
  *Example:*
  
  ```
  Device# configure terminal
  ```
  
  Enters global configuration mode.

- **[no]** ap hyperlocation
  
  *Example:*
  
  ```
  Device(config)# [no] ap hyperlocation
  ```
  
  Enables or disables Hyperlocation on all the APs.

- **[no]** ap hyperlocation threshold detection `value-in-dBm`
  
  *Example:*
  
  ```
  Device(config)# [no] ap hyperlocation threshold detection -100
  ```
  
  Sets threshold to filter out packets with low RSSI. The `[no]` form of the command resets the threshold to its default value.

- **[no]** ap hyperlocation threshold reset `value-btw-0-99`
  
  *Example:*
  
  ```
  Device(config)# [no] ap hyperlocation threshold reset 8
  ```
  
  Resets value in scan cycles after trigger. The `[no]` form of the command resets the threshold to its default value.

- **[no]** ap hyperlocation threshold trigger `value-btw-1-100`
  
  *Example:*
  
  ```
  Device(config)# [no] ap hyperlocation threshold trigger 10
  ```
  
  Sets the number of scan cycles before sending a BAR to clients. The `[no]` form of the command resets the threshold to its default value.

- **[no]** ap ntp ip `ipv4-address-of-ntp-server`
  
  *Example:*
  
  ```
  Device(config)# [no] ap ntp ip 9.0.0.4
  ```
Sets the IPv4 address of the NTP server, directly reachable by the access points. The `no` form of the command resets the NTP value to 0.0.0.0.

- **show ap hyperlocation summary**

  **Example:**

  ```
  Device# show ap hyperlocation summary
  Site Name: default-group
  Site Description: 
  Hyperlocation operational status: Up
  Reason: N/A
  Hyperlocation NTP server currently used: 9.0.0.4
  Hyperlocation admin status: Enabled
  Hyperlocation detection threshold: -100 dBm
  Hyperlocation trigger threshold: 10
  Hyperlocation reset threshold: 8
  ```

  Shows the overall configuration values and operational status and parameters for default AP group.

- **show ap hyperlocation detail**

  **Example:**

  ```
  Device# show ap hyperlocation detail
  Site Name: default-group
  Site Description: 
  Hyperlocation operational status: Up
  Reason: N/A
  Hyperlocation NTP server currently used: 9.0.0.4
  Hyperlocation admin status: Enabled
  Hyperlocation detection threshold: -100 dBm
  Hyperlocation trigger threshold: 10
  Hyperlocation reset threshold: 8
  ```

  Values for APs in all AP Groups:

<table>
<thead>
<tr>
<th>AP Name</th>
<th>Radio MAC</th>
<th>Method</th>
<th>Hyperlocation</th>
</tr>
</thead>
<tbody>
<tr>
<td>APf07f.0635.2d40</td>
<td>f07f.0676.3b89</td>
<td>WSM</td>
<td>Enabled</td>
</tr>
<tr>
<td>APf4cf.e272.4ed0</td>
<td>f4cf.e223.ba31</td>
<td>Local</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

  Shows both overall and per-AP configuration values and operational status. The Method column of the AP rows shows “Local” for APs on Local Mode FastLocate. The values shown for Hyperlocation status and parameters reflect the values for default AP group.

- **set platform software trace wireless switch active R0 hyperlocation {debug | emergency | error | info | noise | notice | verbose | warning}**

  Tracing commands that are specific to Cisco Hyperlocation:

  - **debug**—Debug messages
  - **emergency**—Emergency possible message
  - **error**—Error messages
  - **info**—Informational messages
  - **noise**—Maximum possible message
• **notice**—Notice messages
• **verbose**—Verbose debug messages
• **warning**—Warning messages

### Configuring Cisco Hyperlocation for an AP Group (CLI)

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal`  
Example: `Device# configure terminal` | Enters global configuration mode. |
| **Step 2** | `ap group ap-group-name`  
Example: `Device(config)# ap group my-ap-group` | Creates an access point group. |
| **Step 3** | `[no] hyperlocation`  
Example: `Device(config-apgroup)# [no] hyperlocation` | Enables or disables Hyperlocation for the AP group *my-ap-group*. |
| **Step 4** | `[no] hyperlocation threshold detection value-in-dBm`  
Example: `Device(config-apgroup)# [no] hyperlocation threshold detection -100` | Sets threshold to filter out packets with low RSSI. The [no] form of the command resets the threshold to its default value. |
| **Step 5** | `[no] hyperlocation threshold reset value-btwn-0-99`  
Example: `Device(config-apgroup)# [no] hyperlocation threshold reset 8` | Resets value in scan cycles after trigger. The [no] form of the command resets the threshold to its default value. |
| **Step 6** | `[no] hyperlocation threshold trigger value-btwn-1-100`  
Example: `Device(config-apgroup)# [no] hyperlocation threshold trigger 10` | Sets the number of scan cycles before sending a BAR to clients. The [no] form of the command resets the threshold to its default value. |
| **Step 7** | `[no] ntp ip ipv4-address-of-ntp-server`  
Example: `Device(config-apgroup)# [no] ntp ip 9.0.0.4` | Sets the IPv4 address of the NTP server, directly reachable by the APs of an AP group. The [no] form of the command resets the NTP value to 0.0.0.0. |

Configuring Hyperlocation BLE Beacon Parameters

To configure hyperlocation BLE beacon parameters, use the procedure given below:

### Step 1
configure terminal

**Example:**
```
Controller# configure terminal
```
Enters the global configuration mode.

### Step 2
**ap hyperlocation ble-beacon** *(beacon-id | interval interval-value)*

**Example:**
```
Controller(config)# ap hyperlocation ble-beacon 3
```
Specifies the BLE beacon parameters and enters the BLE configuration mode.

### Step 3
**config-ble** *(default enable txpwr uuid) | enable exit no (enable txpwr uuid) | txpwr att-value uuid uuid-name)*

**Example:**
```
Controller(config-ble)# enable
```
Configures the BLE beacon values.

### Step 4
**show ap hyperlocation ble-beacon**

**Example:**
```
Controller# show ap hyperlocation ble-beacon
```
BLE Beacon interval (Hertz): 1

Monitoring Flow Control

- Finding Feature Information, on page 2571
- Information About Flow Control, on page 2571
- Monitoring Flow Control, on page 2571
- Examples: Monitoring Flow Control, on page 2572
- Additional References for Monitoring Flow Control, on page 2573
- Feature History and Information For Monitoring Flow Control, on page 2573

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Flow Control

Flow control is enabled by default on the device.

Flow control provides shim layers between WCM and Cisco IOS for a reliable IPC. Every component in WCM has a dedicated channel. Few of the components in WCM have leveraged flow control in that. There is no configuration of flow control from CLI. You can monitor the flow control for any channel.

Monitoring Flow Control

This section describes the new commands for flow control.

The following commands can be used to monitor flow control on the device.

Table 204: Monitoring Flow Control

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
show wireless flow-control channel-id

Displays information about flow control on a particular channel.

show wireless flow-control channel-id statistics

Displays statistical information about flow control on a particular channel.

Examples: Monitoring Flow Control

This example shows how to view information pertaining to any channel:

Device# show wireless flow-control 3
Device#

Channel Name : CAPWAP
FC State : Disabled
Remote Server State : Enabled
Pass-thru Mode : Disabled
EnQ Disabled : Disabled
Queue Depth : 2048
Max Retries : 5
Min Retry Gap (mSec): 3

This example shows how to view flow control for a particular channel:

Device# show wireless flow-control 3
Device#

Channel Name : CAPWAP
# of times channel went into FC : 0
# of times channel came out of FC : 0
Total msg count received by the FC Infra : 1
Pass-thru msgs send count : 0
Pass-thru msgs fail count : 0
# of msgs successfully queued : 0
# of msgs for which queuing failed : 0
# of msgs sent thru after queuing : 0
# of msgs sent w/o queuing : 1
# of msgs for which send failed : 0
# of invalid EAGAINs received : 0
Highest watermark reached : 0
# of times Q hit max capacity : 0
Avg time channel stays in FC (mSec) : 0

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring SDM Templates

SDM Templates

You can use SDM templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

These templates are supported on your device:

• Advanced—The advanced template is available on all supported images for this release. It maximizes system resources for features like netflow, multicast groups, security ACEs, QoS ACEs, and so on.

• VLAN—The VLAN template is available only on the LAN Base license. The VLAN template disables routing and supports the maximum number of unicast MAC addresses. It would typically be selected for a Layer 2 device.
After you change the template and the system reboots, you can use the `show sdm prefer` privileged EXEC command to verify the new template configuration. If you enter the `show sdm prefer` command before you enter the `reload` privileged EXEC command, the `show sdm prefer` command shows the template currently in use and the template that will become active after a reload.

The default is the advanced template.

**Table 205: Approximate Number of Feature Resources Allowed by Templates**

<td>4 K</td>
<td>4 K</td>
</tr>
<tr>
<td>SGT/DGT Overflow entries:</td>
<td>0</td>
<td>512</td>
</tr>
</tbody>
</table>

**Note**

When the switch is used as a Wireless Mobility Agent, the only template allowed is the advanced template.
SDM templates do not create VLANs. You must create the VLANs before adding commands to the SDM templates.

The tables represent approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

SDM Templates and Switch Stacks

In a switch stack, all stack members must use the same SDM template that is stored on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.

You can use the `show switch` privileged EXEC command to see if any stack members are in SDM mismatch mode.

How to Configure SDM Templates

Configuring SDM Templates

Configuring the Switch SDM Template

Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `sdm prefer { advanced | vlan }`
4. `end`
5. `reload`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Monitoring and Maintaining SDM Templates

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show sdm prefer</td>
<td>Displays the SDM template in use.</td>
</tr>
<tr>
<td>reload</td>
<td>Reloads the switch to activate the newly configured SDM template.</td>
</tr>
<tr>
<td>no sdm prefer</td>
<td>Sets the default SDM template.</td>
</tr>
</tbody>
</table>

---

Note: The SDM templates contain only those commands that are defined as part of the templates. If a template enables another related command that is not defined in the template, then this other command will be visible when the `show running config` command is entered. For example, if the SDM template enables the `switchport voice vlan` command, then the `spanning-tree portfast edge` command may also be enabled (although it is not defined on the SDM template).

If the SDM template is removed, then other such related commands are also removed and have to be reconfigured explicitly.
Configuration Examples for SDM Templates

Examples: Configuring SDM Templates

Examples: Displaying SDM Templates

This is an example output showing the advanced template information:

Device# show sdm prefer

Showing SDM Template Info

This is the Advanced template.
Number of VLANs: 4094
Unicast MAC addresses: 32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups: 8192
Overflow IGMP and Multicast groups: 512
Directly connected routes: 32768
Indirect routes: 8192
Security Access Control Entries: 3072
QoS Access Control Entries: 2816
Policy Based Routing ACEs: 1024
Netflow ACEs: 1024
Input Microflow policer ACEs: 256
Output Microflow policer ACEs: 256
Flow SPAN ACEs: 256
Tunnels: 256
Control Plane Entries: 512
Input Netflow flows: 8192
Output Netflow flows: 16384

These numbers are typical for L2 and IPv4 features. Some features such as IPv6, use up double the entry size; so only half as many entries can be created.

This is an example output showing the VLAN template information:

Device# show sdm prefer vlan

Showing SDM Template Info

This is the VLAN template for a typical Layer 2 network.
Number of VLANs: 4094
Unicast MAC addresses: 32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups: 8192
Overflow IGMP and Multicast groups: 512
Directly connected routes: 32768
Indirect routes: 8192
Security Access Control Entries: 3072
QoS Access Control Entries: 3072
Policy Based Routing ACEs: 0
Netflow ACEs: 1024
Input Microflow policer ACEs: 0
Output Microflow policer ACEs: 0
Flow SPAN ACEs: 256
Tunnels: 0
Control Plane Entries: 512
Input Netflow flows: 16384
Output Netflow flows: 8192

These numbers are typical for L2 and IPv4 features. Some features such as IPv6, use up double the entry size; so only half as many entries can be created.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time...
debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch. If a standalone switch, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port.

---

**Note**

The syslog format is compatible with 4.3 BSD UNIX.

---

**System Log Message Format**

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- `seq no:timestamp: %facility-severity-MNEMONIC: description (hostname-n)`
- `seq no:timestamp: %facility-severity-MNEMONIC: description`

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- `service sequence-numbers`
- `service timestamps log datetime`
- `service timestamps log datetime [localtime] [msec] [show-timezone]`
- `service timestamps log uptime`

---

Table 206: System Log Message Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seq no:</code></td>
<td>Stamps log messages with a sequence number only if the <code>service sequence-numbers</code> global configuration command is configured.</td>

<td>Local7</td>
</tr>
<tr>
<td>Server severity</td>
<td>Informational.</td>
</tr>
</tbody>
</table>

32 For Cisco IOS XE 3.6E release, the default logging buffer size is 16384 bytes.

Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the `snmp-server enable trap` global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level `warning` and numerically lower levels are stored in the history table even if syslog traps are not enabled.
When the history table is full (it contains the maximum number of message entries specified with the `logging history size` global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, `emergencies` equal 1, not 0, and `critical` equals 3, not 2.

## How to Configure System Message Logs

### Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `logging buffered [size]`
3. `logging host`
4. `logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]`
5. `end`
6. `terminal monitor`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>config terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>logging buffered [size]</td>
</tr>
<tr>
<td>Example:</td>
<td>Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the active switch. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes.</td>
</tr>
<tr>
<td>Device(config)# logging buffered 8192</td>
<td>If a standalone switch or the active switch fails, the log file is lost unless you previously saved it to flash memory. See Step 4.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the <code>show memory</code> privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.</td>
</tr>
</tbody>
</table>
### Command or Action

**Step 3**

**logging host**

Example:

Device(config)# logging 125.1.1.100

Purpose: Logs messages to a UNIX syslog server host.

*host* specifies the name or IP address of the host to be used as the syslog server.

To build a list of syslog servers that receive logging messages, enter this command more than once.

**Step 4**

**logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]**

Example:

Device(config)# logging file flash: log_msg.txt 40960 4096 3

Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the active switch.

- **filename**—Enters the log message filename.
- **(Optional) max-file-size** — Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.
- **(Optional) min-file-size** — Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.
- **(Optional) severity-level-number | type**—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.

**Step 5**

**end**

Example:

Device(config)# end

Purpose: Returns to privileged EXEC mode.

**Step 6**

**terminal monitor**

Example:

Device# terminal monitor

Logs messages to a nonconsole terminal during the current session.

Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.

---

**Synchronizing Log Messages**

You can synchronize unsolicited messages and `debug` privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and `debug` command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and `debug` command output appear on the console after the prompt for user input is returned. Therefore, unsolicited messages and `debug` command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.
This task is optional.

SUMMARY STEPS

1. configure terminal
2. line [console | vty] line-number [ending-line-number]
3. logging synchronous [level [severity-level | all] | limit number-of-buffers]
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 line [console</td>
<td>vty] line-number [ending-line-number]</td>
</tr>
<tr>
<td>Example: Device(config)# line console</td>
<td>• console — Specifies configurations that occur through the switch console port or the Ethernet management port.</td>
</tr>
<tr>
<td></td>
<td>• line vty line-number — Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15.</td>
</tr>
<tr>
<td></td>
<td>You can change the setting of all 16 vty lines at once by entering:</td>
</tr>
<tr>
<td></td>
<td>line vty 0 15</td>
</tr>
<tr>
<td></td>
<td>You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:</td>
</tr>
<tr>
<td></td>
<td>line vty 2</td>
</tr>
<tr>
<td></td>
<td>When you enter this command, the mode changes to line configuration.</td>
</tr>
<tr>
<td>Example: Device(config)# logging synchronous level 3 limit 1000</td>
<td>• (Optional) level severity-level — Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.</td>
</tr>
</tbody>
</table>
Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The `logging synchronous` global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return.

To reenable message logging after it has been disabled, use the `logging on` global configuration command. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. no logging console
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 no logging console</td>
<td>Disables message logging.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.
This task is optional.

SUMMARY STEPS

1.  configure terminal
2.  Use one of these commands:
    •  service timestamps log uptime
    •  service timestamps log datetime[msec | localtime | show-timezone]
3.  end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. service sequence-numbers
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** service sequence-numbers | Enables sequence numbers.                 |
| Example:                       |                                        |
| Device(config)# service sequence-numbers |                                        |

| **Step 3** end | Returns to privileged EXEC mode.       |
| Example:       |                                        |
| Device(config)# end |                                        |

Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. logging console level
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>logging console level</code></td>
<td>Limits messages logged to the console. By default, the console receives debugging messages and numerically lower levels.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>logging console 3</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>logging monitor level</code></td>
<td>Limits messages logged to the terminal lines. By default, the terminal receives debugging messages and numerically lower levels.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>logging monitor 3</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>logging trap level</code></td>
<td>Limits messages logged to the syslog servers. By default, syslog servers receive informational messages and numerically lower levels.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>logging trap 3</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>

### Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.

This task is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `logging history level`
3. `logging history size number`
4. `end`
### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>logging history level</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# logging history 3</td>
</tr>
<tr>
<td></td>
<td>Changes the default level of syslog messages stored in the history file and sent to the SNMP server. By default, <strong>warnings</strong>, <strong>errors</strong>, <strong>critical</strong>, <strong>alerts</strong>, and <strong>emergencies</strong> messages are sent.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>logging history size number</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# logging history size 200</td>
</tr>
<tr>
<td></td>
<td>Specifies the number of syslog messages that can be stored in the history table. The default is to store one message. The range is 0 to 500 messages.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

---

**Logging Messages to a UNIX Syslog Daemon**

This task is optional.

---

**Note**

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX **man syslogd** command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

---

**Before you begin**

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

---

**Summary Steps**

1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** Add a line to the file `/etc/syslog.conf`.  
Example: `local7.debug /usr/adm/logs/cisco.log` | • `local7`—Specifies the logging facility.  
• `debug`—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it. |
| **Step 2** Enter these commands at the UNIX shell prompt.  
Example: `$ touch /var/log/cisco.log
$ chmod 666 /var/log/cisco.log` | Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file. |
| **Step 3** Make sure the syslog daemon reads the new changes.  
Example: `$ kill -HUP `cat /etc/syslog.pid` | For more information, see the `man syslog.conf` and `man syslogd` commands on your UNIX system. |

Monitoring and Maintaining System Message Logs

Monitoring Configuration Archive Logs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Device while the Device is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints
Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Device is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Device or switch stack and the diagnostic tests that have already run.

## How to Configure Online Diagnostics

### Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the Device, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing:

### SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | complete | minimal | non-disruptive | per-port}`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Starts the diagnostic tests.</td>
</tr>
<tr>
<td>diagnostic start switch number test {name</td>
<td>test-id</td>
</tr>
</tbody>
</table>

You can specify the tests by using one of these options:

- `name` — Enters the name of the test.
- `test-id` — Enters the ID number of the test.
- `test-id-range` — Enters the range of test IDs by using integers separated by a comma and a hyphen.
- `all` — Starts all of the tests.
- `basic` — Starts the basic test suite.
- `complete` — Starts the complete test suite.
- `minimal` — Starts the minimal bootup test suite.
- `non-disruptive` — Starts the non-disruptive test suite.
- `per-port` — Starts the per-port test suite.
## Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

## Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a Device. Use the `no` form of this command to remove the scheduling.

### SUMMARY STEPS

1. `configure terminal`
2. `diagnostic schedule switch number test {name | test-id | test-id-range | all | basic | complete | minimal | non-disruptive | per-port} {daily | on mm dd yyyy hh:mm | port inter-port-number port-number-list | weekly day-of-week hh:mm}`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>`diagnostic schedule switch number test {name</td>
<td>test-id</td>
</tr>
</tbody>
</table>

The `switch number` keyword is supported only on stacking switches. The range is from 1 to 4.

When specifying the tests to be scheduled, use these options:

- `name`—Name of the test that appears in the `show diagnostic content` command output.
- `test-id`—ID number of the test that appears in the `show diagnostic content` command output.
- `test-id-range`—ID numbers of the tests that appear in the `show diagnostic content` command output.
- `all`—All test IDs.
- `basic`—Starts the basic on-demand diagnostic tests.
- `complete`—Starts the complete test suite.
- `minimal`—Starts the minimal bootup test suite.
- `non-disruptive`—Starts the non-disruptive test suite.
- `per-port`—Starts the per-port test suite.
You can schedule the tests as follows:

- Daily—Use the `daily hh:mm` parameter.
- Specific day and time—Use the `on mm dd yyyy hh:mm` parameter.
- Weekly—Use the `weekly day-of-week hh:mm` parameter.

## Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a Device while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Device to generate a syslog message because of a test failure, and enable a specific test.

Use the `no` form of this command to disable testing.

By default, health monitoring is disabled, but the Device generates a syslog message when a test fails.

Follow these steps to configure and enable the health-monitoring diagnostic tests:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day`
4. `diagnostic monitor syslog`
5. `diagnostic monitor threshold switch number number test {name | test-id | test-id-range | all} failure count count`
6. `diagnostic monitor switch number test {name | test-id | test-id-range | all}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Eneter global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Device# configure terminal</strong></td>
<td>Configures the health-monitoring interval of the specified tests.</td>
</tr>
</tbody>
</table>

**Step 3**

`diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day`

**Example:**

```
Device(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5
```

When specifying the tests, use one of these parameters:

- *name*—Name of the test that appears in the `show diagnostic content` command output.
- *test-id*—ID number of the test that appears in the `show diagnostic content` command output.
- *test-id-range*—ID numbers of the tests that appear in the `show diagnostic content` command output.
- *all*—All of the diagnostic tests.

When specifying the interval, set these parameters:

- *hh:mm:ss*—Monitoring interval in hours, minutes, and seconds. The range for *hh* is 0 to 24, and the range for *mm* and *ss* is 0 to 60.
- *milliseconds*—Monitoring interval in milliseconds (ms). The range is from 0 to 999.
- *day*—Monitoring interval in the number of days. The range is from 0 to 20.

**Step 4**

`diagnostic monitor syslog`

**Example:**

```
Device(config)# diagnostic monitor syslog
```

(Optional) Configures the switch to generate a syslog message when a health-monitoring test fails.

**Step 5**

`diagnostic monitor threshold switch number number test {name | test-id | test-id-range | all} failure count count`

**Example:**

```
Device(config)# diagnostic monitor threshold switch 2 test 1 failure count 20
```

(Optional) Sets the failure threshold for the health-monitoring tests.

The *switch number* keyword is supported only on stacking switches. The range is from 1 to 9.

When specifying the tests, use one of these parameters:

- *name*—Name of the test that appears in the `show diagnostic content` command output.
- *test-id*—ID number of the test that appears in the `show diagnostic content` command output.
- *test-id-range*—ID numbers of the tests that appear in the `show diagnostic content` command output.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td>Enables the specified health-monitoring tests. The range for the failure threshold <code>count</code> is 0 to 99.</td>
</tr>
</tbody>
</table>
| **Step 6** diagnostic monitor switch number test {name | test-id | test-id-range | all} | Enables the specified health-monitoring tests. The switch number keyword is supported only on stacking switches. The range is from 1 to 9. When specifying the tests, use one of these parameters:  
  - `name`—Name of the test that appears in the `show diagnostic content` command output.  
  - `test-id`—ID number of the test that appears in the `show diagnostic content` command output.  
  - `test-id-range`—ID numbers of the tests that appear in the `show diagnostic content` command output.  
  - `all`—All of the diagnostic tests. |
| **Step 7** | Returns to privileged EXEC mode. |
| **Step 7** end | Returns to privileged EXEC mode. |
| **Step 8** show running-config | Verifies your entries. |
| **Step 8** | Verifies your entries. |
| **Step 9** copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| **Step 9** | (Optional) Saves your entries in the configuration file. |

**What to do next**

Use the `no diagnostic monitor interval test-id | test-id-range` global configuration command to change the interval to the default value or to zero. Use the `no diagnostic monitor syslog` command to disable generation of syslog messages when a health-monitoring test fails. Use the `diagnostic monitor threshold test-id | test-id-range` failure count command to remove the failure threshold.
Monitoring and Maintaining Online Diagnostics

Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Device or Device stack and check the test results by using the privileged EXEC `show` commands in this table:

**Table 208: Commands for Diagnostic Test Configuration and Results**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show diagnostic content switch [number</td>
<td>all]`</td>
</tr>
<tr>
<td><code>show diagnostic status</code></td>
<td>Displays the currently running diagnostic tests.</td>
</tr>
<tr>
<td>`show diagnostic result switch [number</td>
<td>all] [detail</td>
</tr>
<tr>
<td>`show diagnostic switch [number</td>
<td>all] [detail]`</td>
</tr>
<tr>
<td>`show diagnostic schedule switch [number</td>
<td>all]`</td>
</tr>
<tr>
<td><code>show diagnostic post</code></td>
<td>Displays the POST results. (The output is the same as the <code>show post</code> command output.)</td>
</tr>
</tbody>
</table>

Configuration Examples for Online Diagnostic Tests

Examples: Start Diagnostic Tests

This example shows how to start a diagnostic test by using the test name:

```
Device# diagnostic start switch 2 test TestInlinePwrCtlr
```

This example shows how to start all of the basic diagnostic tests:

```
Device# diagnostic start switch 1 test all
```

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Device(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Device(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```
Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
Device(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
Device(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```

Examples: Displaying Online Diagnostics

This example shows how to display on demand diagnostic settings:

```
Device# show diagnostic ondemand settings
Test iterations = 1
Action on test failure = continue
```

This example shows how to display diagnostic events for errors:

```
Device# show diagnostic events event-type error
Diagnostic events (storage for 500 events, 0 events recorded)
Number of events matching above criteria = 0
No diagnostic log entry exists.
```

This example shows how to display the description for a diagnostic test:

```
Device# show diagnostic description switch 1 test all
DiagGoldPktTest :
    The GOLD packet Loopback test verifies the MAC level loopback functionality. In this test, a GOLD packet, for which doppler provides the support in hardware, is sent. The packet loops back at MAC level and is matched against the stored packet. It is a non-disruptive test.

DiagThermalTest :
    This test verifies the temperature reading from the sensor is below the yellow temperature threshold. It is a non-disruptive test and can be run as a health monitoring test.

DiagFanTest :
    This test verifies all fan modules have been inserted and working properly on the board
    It is a non-disruptive test and can be run as a health monitoring test.

DiagPhyLoopbackTest :
    The PHY Loopback test verifies the PHY level loopback functionality. In this test, a packet is sent which loops back at PHY level and is matched against the stored packet. It is a disruptive test and cannot be run as a health monitoring test.
```
DiagScratchRegisterTest:
The Scratch Register test monitors the health of application-specific integrated circuits (ASICs) by writing values into registers and reading back the values from these registers. It is a non-disruptive test and can be run as a health monitoring test.

DiagPoETest:
This test checks the PoE controller functionality. This is a disruptive test and should not be performed during normal switch operation.

DiagStackCableTest:
This test verifies the stack ring loopback functionality in the stacking environment. It is a disruptive test and cannot be run as a health monitoring test.

DiagMemoryTest:
This test runs the exhaustive ASIC memory test during normal switch operation. NG3K utilizes mbist for this test. Memory test is very disruptive in nature and requires switch reboot after the test.

Device#

This example shows how to display the boot up level:

Device# show diagnostic bootup level
Current bootup diagnostic level: minimal
Device#

Managing Configuration Files

Prerequisites for Managing Configuration Files

- You should have at least a basic familiarity with the Cisco IOS environment and the command-line interface.

- You should have at least a minimal configuration running on your system. You can create a basic configuration file using the `setup` command.

Restrictions for Managing Configuration Files

- Many of the Cisco IOS commands described in this document are available and function only in certain configuration modes on the device.

- Some of the Cisco IOS configuration commands are only available on certain device platforms, and the command syntax may vary on different platforms.

Information About Managing Configuration Files

Types of Configuration Files

Configuration files contain the Cisco IOS software commands used to customize the functionality of your Cisco device. Commands are parsed (translated and executed) by the Cisco IOS software when the system is booted (from the startup-config file) or when you enter commands at the CLI in a configuration mode.

Startup configuration files (startup-config) are used during system startup to configure the software. Running configuration files (running-config) contain the current configuration of the software. The two configuration
files can be different. For example, you may want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration using the configure terminal EXEC command but not save the configuration using the copy running-config startup-config EXEC command.

To change the running configuration, use the configure terminal command, as described in the Modifying the Configuration File (CLI) section. As you use the Cisco IOS configuration modes, commands generally are executed immediately and are saved to the running configuration file either immediately after you enter them or when you exit a configuration mode.

To change the startup configuration file, you can either save the running configuration file to the startup configuration using the copy running-config startup-config EXEC command or copy a configuration file from a file server to the startup configuration (see the Copying a Configuration File from a TFTP Server to the Device (CLI) section for more information).

**Configuration Mode and Selecting a Configuration Source**

To enter configuration mode on the device, enter the configure command at the privileged EXEC prompt. The Cisco IOS software responds with the following prompt asking you to specify the terminal, memory, or a file stored on a network server (network) as the source of configuration commands:

```
Configuring from terminal, memory, or network [terminal]?
```

Configuring from the terminal allows you to enter configuration commands at the command line, as described in the following section. See the Re-executing the Configuration Commands in the Startup Configuration File (CLI) section for more information.

Configuring from the network allows you to load and execute configuration commands over the network. See the Copying a Configuration File from a TFTP Server to the Device (CLI) section for more information.

**Configuration File Changes Using the CLI**

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are not stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the show running-config or more system:running-config EXEC command. Comments are not displayed when you list the startup configuration with the show startup-config or more nvram:startup-config EXEC mode command. Comments are stripped out of the configuration file when it is loaded onto the device. However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them.

**Location of Configuration Files**

Configuration files are stored in the following locations:

- The running configuration is stored in RAM.
- On all platforms except the Class A Flash file system platforms, the startup configuration is stored in nonvolatile random-access memory (NVRAM).
On Class A Flash file system platforms, the startup configuration is stored in the location specified by the CONFIG_FILE environment variable (see the Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI) section). The CONFIG_FILE variable defaults to NVRAM and can be a file in the following file systems:

- **nvram**: (NVRAM)
- **flash**: (internal flash memory)
- **usbflash0**: (external usbflash file system)

**Copy Configuration Files from a Network Server to the Device**

You can copy configuration files from a TFTP, rcp, or FTP server to the running configuration or startup configuration of the device. You may want to perform this function for one of the following reasons:

- To restore a backed-up configuration file.
- To use the configuration file for another device. For example, you may add another device to your network and want it to have a similar configuration to the original device. By copying the file to the new device, you can change the relevant parts rather than recreating the whole file.
- To load the same configuration commands on to all of the devices in your network so that all of the devices have similar configurations.

The `copy {ftp: | rcp: | tftp:system:running-config}` EXEC command loads the configuration files into the device as if you were typing the commands on the command line. The device does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration may not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, you need to copy the configuration file directly to the startup configuration (using the `copy ftp: | rcp: | tftp: nvram:startup-config` command) and reload the device.

To copy configuration files from a server to a device, perform the tasks described in the following sections.

The protocol that you use depends on which type of server you are using. The FTP and rcp transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because the FTP and rcp transport mechanisms are built on and use the TCP/IP stack, which is connection-oriented.

**Copying a Configuration File from the Device to a TFTP Server**

In some implementations of TFTP, you must create a dummy file on the TFTP server and give it read, write, and execute permissions before copying a file over it. Refer to your TFTP documentation for more information.

**Copying a Configuration File from the Device to an RCP Server**

You can copy a configuration file from the device to an RCP server.
One of the first attempts to use the network as a resource in the UNIX community resulted in the design and implementation of the remote shell protocol, which included the remote shell (rsh) and remote copy (rcp) functions. Rsh and rcp give users the ability to execute commands remotely and copy files to and from a file system residing on a remote host or server on the network. The Cisco implementation of rsh and rcp interoperates with standard implementations.

The rcp copy commands rely on the rsh server (or daemon) on the remote system. To copy files using rcp, you need not create a server for file distribution, as you do with TFTP. You need only to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, rcp creates it for you.

Although the Cisco rcp implementation emulates the functions of the UNIX rcp implementation—copying files among systems on the network—the Cisco command syntax differs from the UNIX rcp command syntax. The Cisco rcp support offers a set of copy commands that use rcp as the transport mechanism. These rcp copy commands are similar in style to the Cisco TFTP copy commands, but they offer an alternative that provides faster performance and reliable delivery of data. These improvements are possible because the rcp transport mechanism is built on and uses the TCP/IP stack, which is connection-oriented. You can use rcp commands to copy system images and configuration files from the device to a network server and vice versa.

You also can enable rcp support to allow users on remote systems to copy files to and from the device.

To configure the Cisco IOS software to allow remote users to copy files to and from the device, use the ip rcmd rcp-enable global configuration command.

Restrictions

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the device to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the copy EXEC command, if a username is specified.
2. The username set by the ip rcmd remote-username global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the device through Telnet and was authenticated through the username command, the device software sends the Telnet username as the remote username.
4. The device host name.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, you can specify that username as the remote username.

Use the ip rcmd remote-username command to specify a username for all copies. (Rcmd is a UNIX routine used at the super-user level to execute commands on a remote machine using an authentication scheme based on reserved port numbers. Rcmd stands for “remote command”). Include the username in the copy command if you want to specify a username for that copy operation only.

If you are writing to the server, the RCP server must be properly configured to accept the RCP write request from the user on the device. For UNIX systems, you must add an entry to the .hosts file for the remote user on the RCP server. For example, suppose the device contains the following configuration lines:
hostname Device1
ip rcmd remote-username User0

If the device IP address translates to device1.example.com, then the .rhosts file for User0 on the RCP server should contain the following line:

Device1.example.com Device1

### Requirements for the RCP Username

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the device to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the `copy EXEC` command, if a username is specified.
2. The username set by the `ip rcmd remote-username` global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the device through Telnet and is authenticated through the `username` command, the device software sends the Telnet username as the remote username.
4. The device host name.

For the RCP copy request to execute, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your RCP server for more information.

### Copying a Configuration File from the Device to an FTP Server

You can copy a configuration file from the device to an FTP server.

#### Understanding the FTP Username and Password

**Note**

The password must not contain the special character '@'. If the character '@' is used, the copy fails to parse the IP address of the server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the device to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the `copy EXEC` command, if a username is specified.
2. The username set by the `ip ftp username` global configuration command, if the command is configured.
3. Anonymous.

The device sends the first valid password it encounters in the following sequence:
1. The password specified in the `copy` command, if a password is specified.

2. The password set by the `ip ftp password` command, if the command is configured.

3. The device forms a password `username @devicename.domain`. The variable `username` is the username associated with the current session, `devicename` is the configured host name, and `domain` is the domain of the device.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the device.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more information.

Use the `ip ftp username` and `ip ftp password` global configuration commands to specify a username and password for all copies. Include the username in the `copy` EXEC command if you want to specify a username for that copy operation only.

### Copying files through a VRF

You can copy files through a VRF interface specified in the `copy` command. Specifying the VRF in the `copy` command is easier and more efficient as you can directly change the source interface without using a change request for the configuration.

#### Example

The following example shows how to copy files through a VRF, using the `copy` command:

```
Device# copy scp: flash-1: vrf test-vrf
Address or name of remote host [10.1.2.3]? 
Source username [ScpUser]? 
Source filename [/auto/tftp-server/ScpUser/vrf_test.txt]? 
Destination filename [vrf_test.txt]? 
Getting the vrf name as test-vrf 
Password: 
Sending file modes: C0644 10 vrf_test.txt
!
223 bytes copied in 22.740 secs (10 bytes/sec)
```

### Copy Configuration Files from a Switch to Another Switch

You can copy the configurations from one switch to another. This is a 2-step process - Copy the configurations from the switch to the TFTP server, and then from TFTP to another switch.

To copy your current configurations from the switch, run the command `copy startup-config tftp:` and follow the instructions. The configurations are copied onto the TFTP server.

Then, login to another switch and run the command `copy tftp: startup-config` and follow the instructions. The configurations are now copied onto the other switch.

After the configurations are copied, to save your configurations, use `write memory` command and then either reload the switch or run the `copy startup-config running-config` command.
Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, you should be aware of the information in the following sections.

Compressing the Configuration File

The `service compress-config` global configuration command specifies that the configuration file be stored compressed in NVRAM. Once the configuration file has been compressed, the device functions normally. When the system is booted, it recognizes that the configuration file is compressed, expands it, and proceeds normally. The `more nvram:startup-config` EXEC command expands the configuration before displaying it.

Before you compress configuration files, refer to the appropriate hardware installation and maintenance publication. Verify that your system’s ROMs support file compression. If not, you can install new ROMs that support file compression.

The size of the configuration must not exceed three times the NVRAM size. For a 128-KB size NVRAM, the largest expanded configuration file size is 384 KB.

The `service compress-config` global configuration command works only if you have Cisco IOS software Release 10.0 or later release boot ROMs. Installing new ROMs is a one-time operation and is necessary only if you do not already have Cisco IOS Release 10.0 in ROM. If the boot ROMs do not recognize a compressed configuration, the following message is displayed:

```
Boot ROMs do not support NVRAM compression Config NOT written to NVRAM
```

Storing the Configuration in Flash Memory on Class A Flash File Systems

On Class A Flash file system devices, you can store the startup configuration in flash memory by setting the `CONFIG_FILE` environment variable to a file in internal flash memory or flash memory in a PCMCIA slot.

See the Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI) section for more information.

Care must be taken when editing or changing a large configuration. Flash memory space is used every time a `copy system:running-config nvram:startup-config` EXEC command is issued. Because file management for flash memory (such as optimizing free space) is not done automatically, you must pay close attention to available flash memory. Use the `squeeze` command to reclaim used space. We recommend that you use a large-capacity Flash card of at least 20 MB.

Loading the Configuration Commands from the Network

You can also store large configurations on FTP, RCP, or TFTP servers and download them at system startup. To use a network server to store large configurations, see the Copying a Configuration File from the Device to a TFTP Server (CLI) and Configuring the Device to Download Configuration Files sections for more information on these commands.

Configuring the Device to Download Configuration Files

You can configure the device to load one or two configuration files at system startup. The configuration files are loaded into memory and read in as if you were typing the commands at the command line. Thus, the
configuration for the device is a mixture of the original startup configuration and the one or two downloaded configuration files.

**Network Versus Host Configuration Files**

For historical reasons, the first file the device downloads is called the network configuration file. The second file the device downloads is called the host configuration file. Two configuration files can be used when all of the devices on a network use many of the same commands. The network configuration file contains the standard commands used to configure all of the devices. The host configuration files contain the commands specific to one particular host. If you are loading two configuration files, the host configuration file should be the configuration file you want to have precedence over the other file. Both the network and host configuration files must reside on a network server reachable via TFTP, RCP, or FTP, and must be readable.

**How to Manage Configuration File Information**

**Displaying Configuration File Information (CLI)**

To display information about configuration files, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `show boot`
3. `more file-url`
4. `show running-config`
5. `show startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Lists the contents of the BOOT environment variable (if set), the name of the configuration file pointed to by the CONFIG_FILE environment variable, and the contents of the BOOTLDR environment variable.</td>
</tr>
<tr>
<td><code>show boot</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# show boot</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Displays the contents of a specified file.</td>
</tr>
<tr>
<td><code>more file-url</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# more 10.1.1.1</code></td>
<td></td>
</tr>
</tbody>
</table>
Step 4: show running-config

Example:
Device# show running-config

Purpose: Displays the contents of the running configuration file. (Command alias for the `more system:running-config` command.)

Step 5: show startup-config

Example:
Device# show startup-config

Purpose: Displays the contents of the startup configuration file. (Command alias for the `more nvram:startup-config` command.)

On all platforms except the Class A Flash file system platforms, the default startup-config file usually is stored in NVRAM.

On the Class A Flash file system platforms, the `CONFIG_FILE` environment variable points to the default startup-config file.

The `CONFIG_FILE` variable defaults to NVRAM.

**Modifying the Configuration File (CLI)**

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are not stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the `show running-config` or `more system:running-config` EXEC commands. Comments do not display when you list the startup configuration with the `show startup-config` or `more nvram:startup-config` EXEC mode commands. Comments are stripped out of the configuration file when it is loaded onto the device. However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them. To configure the software using the CLI, use the following commands in privileged EXEC mode:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. configuration command
4. Do one of the following:
   - end
   - ^Z
5. copy system:running-config nvram:startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enter the necessary configuration commands. The Cisco IOS documentation set describes configuration commands organized by technology.</td>
</tr>
<tr>
<td>configuration command</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# configuration command</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Ends the configuration session and exits to EXEC mode.</td>
</tr>
<tr>
<td>Do one of the following:</td>
<td></td>
</tr>
<tr>
<td>• end</td>
<td></td>
</tr>
<tr>
<td>• ^Z</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Saves the running configuration file as the startup configuration file.</td>
</tr>
<tr>
<td>copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

In the following example, the device prompt name of the device is configured. The comment line, indicated by the exclamation mark (!), does not execute any command. The **hostname** command is used to change the device name from device to new_name. By pressing Ctrl-Z (^Z) or entering the **end** command, the user quits configuration mode. The **copy system:running-config nvram:startup-config** command saves the current configuration to the startup configuration.

```
Device# configure terminal
Device(config)# !The following command provides the switch host name.
Device(config)# hostname new_name
new_name(config)# end
new_name# copy system:running-config nvram:startup-config
```
When the startup configuration is NVRAM, it stores the current configuration information in text format as configuration commands, recording only non-default settings. The memory is checksummed to guard against corrupted data.

Note

Some specific commands might not get saved to NVRAM. You need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a list of these settings so that you can quickly reconfigure your device after rebooting.

### Copying a Configuration File from the Device to a TFTP Server (CLI)

To copy configuration information on a TFTP network server, complete the tasks in this section:

**SUMMARY STEPS**

1. enable

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# <code>copy system:running-config tftp: //server1/topdir/file10</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# <code>copy nvram:startup-config tftp: //server1/1stdir/file10</code></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example copies a configuration file from a device to a TFTP server:

```
Device# `copy system:running-config tftp://172.16.2.155/tokyo-config`
```
Write file tokyo-config on host 172.16.2.155? [confirm] Y
Writing tokyo-config!!! [OK]

What to Do Next

After you have issued the `copy` command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Copying a Configuration File from the Device to an RCP Server (CLI)

To copy a startup configuration file or a running configuration file from the device to an RCP server, use the following commands beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip rcmd remote-username username`
4. `end`
5. Do one of the following:
   - `copy system:running-config rcp: [[[username@]location]/directory]/filename `
   - `copy nvram:startup-config rcp: [[[username@]location]/directory]/filename `

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip rcmd remote-username username</td>
<td>(Optional) Changes the default remote username.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip rcmd remote-username NetAdmin1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>(Optional) Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Step 5

Do one of the following:

- **copy system:running-config rcp:**
  
  ```
  [[[//username@]location ]directory ]filename ]
  ```

- **copy nvram:startup-config rcp:**
  
  ```
  [[[//username@]location ]directory ]filename ]
  ```

**Example:**

```
Device# copy system:running-config rcp://NetAdmin1@example.com/dir-files/file1
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do one of the following:</td>
<td>• Specifies that the device running configuration file is to be stored on an RCP server or • Specifies that the device startup configuration file is to be stored on an RCP server</td>
</tr>
</tbody>
</table>

**Examples**

**Storing a Running Configuration File on an RCP Server**

The following example copies the running configuration file named runfile2-confg to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
Device# copy system:running-config rcp://netadmin1@172.16.101.101/runfile2-confg
```

**Storing a Startup Configuration File on an RCP Server**

The following example shows how to store a startup configuration file on a server by using RCP to copy the file:

```
Device# configure terminal
Device(config)# ip rcmd remote-username netadmin2
Device(config)# end
Device# copy nvram:startup-config rcp:
Remote host[]? 172.16.101.101
Name of configuration file to write [start-confg]?
Write file start-confg on host 172.16.101.101?[confirm] ![OK]
```

**What to Do Next**

After you have issued the **copy** EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the **copy** command and the current setting of the **file prompt** global configuration command.
Copying a Configuration File from the Device to the FTP Server (CLI)

To copy a startup configuration file or a running configuration file from the device to an FTP server, complete the following tasks:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip ftp username username`
4. `ip ftp password password`
5. `end`
6. Do one of the following:
   - `copy system:running-config ftp: [[[username [:password ]@]location]/directory ]/filename ]`
   - `copy nvram:startup-config ftp: [[[username [:password ]@]location]/directory ]/filename ]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode. &lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode on the device.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>ip ftp username username</code></td>
<td>(Optional) Specifies the default remote username.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device(config)# ip ftp username NetAdmin1</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>ip ftp password password</code></td>
<td>(Optional) Specifies the default password.</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device(config)# ip ftp password adminpassword</code></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>end</code></td>
<td>(Optional) Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 2 and 3).</td>
</tr>
<tr>
<td></td>
<td>Example: <code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 6** Do one of the following:  
  - `copy system:running-config ftp://[[[username [:password [@]location]directory ]filename ] or  
  - `copy nvram:startup-config ftp://[[[username [:password [@]location]directory ]filename ]  
| Example:  
  Device# copy system:running-config ftp: | Copies the running configuration or startup configuration file to the specified location on the FTP server. |

**Examples**

**Storing a Running Configuration File on an FTP Server**

The following example copies the running configuration file named `runfile-confg` to the `netadmin1` directory on the remote host with an IP address of 172.16.101.101:

```
Device# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/runfile-confg
Write file runfile-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Device#
```

**Storing a Startup Configuration File on an FTP Server**

The following example shows how to store a startup configuration file on a server by using FTP to copy the file:

```
Device# configure terminal
Device(config)# ip ftp username netadmin2
Device(config)# ip ftp password mypass
Device(config)# end
Device# copy nvram:startup-config ftp:
Remote host[]? 172.16.101.101
Name of configuration file to write [start-confg]?
Write file start-confg on host 172.16.101.101?[confirm]
![OK]
```

**What to Do Next**

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.
Copying a Configuration File from a TFTP Server to the Device (CLI)

To copy a configuration file from a TFTP server to the device, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `copy tftp: [location]/directory/filename` system:running-config
3. `copy tftp: [location]/directory/filename` nvram:startup-config
4. `copy tftp: [location]/directory/filename` flash-[n]:/directory/startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Copies a configuration file from a TFTP server to the running configuration.</td>
</tr>
<tr>
<td><code>copy tftp: [location]/directory/filename</code> system:running-config</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy tftp://server1/dir10/datasource system:running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Copies a configuration file from a TFTP server to the startup configuration.</td>
</tr>
<tr>
<td><code>copy tftp: [location]/directory/filename</code> nvram:startup-config</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy tftp://server1/dir10/datasource nvram:startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Copies a configuration file from a TFTP server to the startup configuration.</td>
</tr>
<tr>
<td><code>copy tftp: [location]/directory/filename</code> flash-[n]:/directory/startup-config</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy tftp://server1/dir10/datasource flash:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the software is configured from the file named `tokyo-config` at IP address 172.16.2.155:

```
Device# copy tftp://172.16.2.155/tokyo-config system:running-config

Configure using tokyo-config from 172.16.2.155? [confirm] Y
```
What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Copying a Configuration File from the rcp Server to the Device (CLI)

To copy a configuration file from an rcp server to the running configuration or startup configuration, complete the following tasks:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip rcmd remote-username username`
4. `end`
5. Do one of the following:
   - `copy rcp://[username@]location/directory/[filename] system:running-config`
   - `copy rcp://[username@]location/directory/[filename] nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>configure terminal</code></td>
<td>(Optional) Enters configuration mode from the terminal. This step is required only if you override the default remote username (see Step 3).</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>ip rcmd remote-username username</code></td>
<td>(Optional) Specifies the remote username.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# ip rcmd remote-username NetAdmin1</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>end</code></td>
<td>(Optional) Exits global configuration mode. This step is required only if you override the default remote username (see Step 2).</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Purpose 
Command or Action

Step 5

Do one of the following:

- `copy 
  rcp://[username@[location]directory]filename system:running-config`
- `copy 
  rcp://[username@[location]directory]filename nvram:startup-config`

Example:

Device# copy 
rcp://[user1@example.com/dir10/fileone] 
nvram:startup-config

Examples

Copy RCP Running-Config

The following example copies a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the device:

Device# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
Device# %SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101

Copy RCP Startup-Config

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

Device# configure terminal
Device(config)# ip rcmd remote-username netadmin1
Device(config)# end
Device# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:![OK]
[OK]
Device# %SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101

What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the file prompt global configuration command.
## Copying a Configuration File from an FTP Server to the Device (CLI)

To copy a configuration file from an FTP server to the running configuration or startup configuration, complete the tasks in this section:

### SUMMARY STEPS

1. enable
2. configure terminal
3. ip ftp username *username*
4. ip ftp password *password*
5. end
6. Do one of the following:

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>(Optional) Allows you to enter global configuration mode. This step is required only if you want to override the default remote username or password (see Steps 3 and 4).</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip ftp username <em>username</em></td>
<td>(Optional) Specifies the default remote username.</td>
</tr>
<tr>
<td>Example: Device(config)# ip ftp username NetAdmin1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip ftp password <em>password</em></td>
<td>(Optional) Specifies the default password.</td>
</tr>
<tr>
<td>Example: Device(config)# ip ftp password adminpassword</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>(Optional) Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 3 and 4).</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> Do one of the following:</td>
<td>Using FTP copies the configuration file from a network server to running memory or the startup configuration.</td>
</tr>
</tbody>
</table>
Examples

Copy FTP Running-Config

The following example copies a host configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the device:

Device# copy ftp://netadmin1:mypass@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:!![OK]
Device# %SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101

Copy FTP Startup-Config

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

Device# configure terminal
Device(config)# ip ftp username netadmin1
Device(config)# ip ftp password mypass
Device(config)# end
Device# copy ftp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file(host1-config)? host2-config
Configure using host2-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:!![OK]
Device# %SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101

What to Do Next

After you have issued the copy EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.

Maintaining Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, perform the tasks described in the following sections:
Compressing the Configuration File (CLI)

To compress configuration files, complete the tasks in this section:

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `service compress-config`
4. `end`
5. Do one of the following:
   - Use FTP, RCP, or TFTP to copy the new configuration.
   - `configure terminal`
6. `copy system:running-config nvram:startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>

<td></td>
</tr>
<tr>
<td>Device(config)# copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example compresses a 129-KB configuration file to 11 KB:

```text
Device# configure terminal
Device(config)# service compress-config
Device(config)# end
Device# copy tftp://172.16.2.15/tokyo-confg system:running-config
Configure using tokyo-confg from 172.16.2.155? [confirm] y
Booting tokyo-confg from 172.16.2.155:!!! [OK - 874/16000 bytes]
Device# copy system:running-config nvram:startup-config
Building configuration...
Compressing configuration from 129648 bytes to 11077 bytes [OK]
```

**Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)**

To store the startup configuration in flash memory, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. copy nvram:startup-config flash-filesystem:filename
3. configure terminal
4. boot config flash-filesystem: filename
5. end
6. Do one of the following:
   - Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: “[buffer overflow - file-size / buffer-size bytes].”
   - configure terminal
7. copy system:running-config nvram:startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable            | Enables privileged EXEC mode.  
Example:                                     |
Device> enable |  
| 2    | copy nvram:startup-config flash-filesystem:filename | Copies the current startup configuration to the new location to create the configuration file.  
Example:                                     |
Device# copy nvram:startup-config  
usbflash0:switch-config |  
| 3    | configure terminal | Enters global configuration mode.  
Example:                                     |
Device# configure terminal |  
| 4    | boot config flash-filesystem: filename | Specifies that the startup configuration file be stored in flash memory by setting the CONFIG_FILE variable.  
Example:                                     |
Device(config)# boot config usbflash0:switch-config |  
| 5    | end               | Exits global configuration mode.  
Example:                                     |
Device(config)# end |  
| 6    | Do one of the following:  
  • Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: “[buffer overflow - file-size /buffer-size bytes].”  
  • configure terminal | Enters the new configuration.  
Example:                                     |
Device# configure terminal |  
| 7    | copy system:running-config nvram:startup-config | When you have finished changing the running-configuration, save the new configuration.  
Example:                                     |
Device(config)# copy system:running-config  
nvram:startup-config |
Examples
The following example stores the configuration file in usbflash0:

Device# copy nvram:startup-config usbflash0:switch-config
Device# configure terminal
Device(config)# boot config usbflash0:switch-config
Device(config)# end
Device# copy system:running-config nvram:startup-config

Loading the Configuration Commands from the Network (CLI)

To use a network server to store large configurations, complete the tasks in this section:

SUMMARY STEPS

1. enable
2. copy system:running-config {ftp: | rcp: | tftp:}
3. configure terminal
4. boot network {ftp://[username[:password]@]location/directory/filename } | rcp://[[username@]location/directory/filename ] | tftp://[[[location]/directory/filename ]}
5. service config
6. end
7. copy system:running-config nvram:startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2** copy system:running-config {ftp: | rcp: | tftp:} | Saves the running configuration to an FTP, RCP, or TFTP server. |
| **Example:** Device# copy system:running-config ftp: |

| **Step 3** configure terminal | Enters global configuration mode. |
| **Example:** Device# configure terminal |
### Purpose

**Command or Action**

- **Step 4**
  

  
  **Example:**
  
  `Device(config)# boot network ftp://user1:guessme@example.com/dir10/file1`

- **Step 5**
  
  `service config`

  **Example:**
  
  `Device(config)# service config`

- **Step 6**
  
  `end`

  **Example:**
  
  `Device(config)# end`

- **Step 7**
  
  `copy system:running-config nvram:startup-config`

  **Example:**
  
  `Device# copy system:running-config nvram:startup-config`

### Purpose Command or Action

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td>service config</td>
<td>Enables the switch to download configuration files at system startup.</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy system:running-config nvram:startup-config</td>
<td>Saves the configuration.</td>
</tr>
</tbody>
</table>

### Copying Configuration Files from Flash Memory to the Startup or Running Configuration (CLI)

To copy a configuration file from flash memory directly to your startup configuration in NVRAM or your running configuration, enter one of the commands in Step 2:

#### SUMMARY STEPS

1. **enable**
2. Do one of the following:
   - `copy filesystem: [partition-number]:[filename ] nvram:startup-config`
   - `copy filesystem: [partition-number]:[filename ] system:running-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

  - Enter your password if prompted.

  `Device> enable`
### Purpose

**Command or Action**

Do one of the following:

- **copy filesystem:** [partition-number:]filename
  - nvram:startup-config
- **copy filesystem:** [partition-number:]filename
  - system:running-config

**Example:**

Device# copy usbflash0:4:ios-upgrade-1
      nvram:startup-config

### Examples

The following example copies the file named ios-upgrade-1 from partition 4 of the flash memory PC Card in usbflash0 to the device startup configurations:

Device# copy usbflash0:4:ios-upgrade-1
      nvram:startup-config

Copy 'ios-upgrade-1' from flash device as 'startup-config'? [yes/no] yes

[OK]

### Copying Configuration Files Between Flash Memory File Systems (CLI)

On platforms with multiple flash memory file systems, you can copy files from one flash memory file system, such as internal flash memory to another flash memory file system. Copying files to different flash memory file systems lets you create backup copies of working configurations and duplicate configurations for other devices. To copy a configuration file between flash memory file systems, use the following commands in EXEC mode:

### SUMMARY STEPS

1. enable
2. show source-filesystem:
3. copy source-filesystem: [partition-number:]filename
dest-filesystem: [partition-number:]filename

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| **Example:**
  Device> enable | |

| **Step 2** show source-filesystem: | Displays the layout and contents of flash memory to verify the filename. |
| **Example:** | |
### Command or Action

<table>
<thead>
<tr>
<th>Device# show flash:</th>
</tr>
</thead>
</table>

### Purpose

Copies a configuration file between flash memory devices.

- The source device and the destination device cannot be the same. For example, the `copy usbflash0: usbflash0:` command is invalid.

### Step 3

**copy source-filesystem: [partition-number]:[filename ]
dest-filesystem:[partition-number]:[filename ]**

**Example:**

Device# copy flash: usbflash0: 

**Example**

The following example copies the file named running-config from partition 1 on internal flash memory to partition 1 of usbflash0 on a device. In this example, the source partition is not specified, so the device prompts for the partition number:

Device# copy flash: usbflash0: 

```
System flash
Partition Size Used Free Bank-Size State Copy Mode
1 4096K 3070K 1025K 4096K Read/Write Direct
2 16384K 1671K 14712K 8192K Read/Write Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1] 
System flash directory, partition 1:
File Length Name/status
1 3142748 dirt/network/mars-test/c3600-j-mz.latest
2 850 running-config

[3143728 bytes used, 1050576 available, 4194304 total]
usbflash0 flash directory:
File Length Name/status
1 1711088 dirt/gate/c3600-i-mz
2 850 running-config

[1712068 bytes used, 2482236 available, 4194304 total]
Source file name? running-config

Destination file name [running-config]?
Verifying checksum for 'running-config' (file # 2)... OK
Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]
Copy 'running-config' from flash: device
as 'running-config' into usbflash0: device WITH erase? [yes/no] yes

Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee...erased!

[OK - 850/4194304 bytes]
Flash device copy took 00:00:30 [hh:mm:ss]
Verifying checksum... OK (0x16)
```

### Copying a Configuration File from an FTP Server to Flash Memory Devices (CLI)

To copy a configuration file from an FTP server to a flash memory device, complete the task in this section:
SUMMARY STEPS

1. enable
2. configure terminal
3. ip ftp username username
4. ip ftp password password
5. end
6. copy ftp: [[//location]/directory]/bundle_name flash:

DETAIL STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>(Optional) Enters global configuration mode. This step is required only if you override the default remote username or password (see Steps 3 and 4).</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip ftp username username</td>
<td>(Optional) Specifies the remote username.</td>
</tr>
<tr>
<td>Example: Device(config)# ip ftp username Admin01</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip ftp password password</td>
<td>(Optional) Specifies the remote password.</td>
</tr>
<tr>
<td>Example: Device(config)# ip ftp password adminpassword</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>(Optional) Exits configuration mode. This step is required only if you override the default remote username (see Steps 3 and 4).</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy ftp: [[//location]/directory]/bundle_name flash:</td>
<td>Copies the configuration file from a network server to the flash memory device using FTP.</td>
</tr>
<tr>
<td>Example: Device&gt;copy ftp://cat3k_ccaa-universalk9.SSA.03.12.02&gt;EZP.+12.02.EZP.150+12.02.EZP.bin flash:</td>
<td></td>
</tr>
</tbody>
</table>

What to Do Next

After you have issued the copy EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.
Copying a Configuration File from an RCP Server to Flash Memory Devices (CLI)

To copy a configuration file from an RCP server to a flash memory device, complete the tasks in this section:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rcmd remote-username** *username*
4. **end**
5. **copy rcp:** [[[[username@]location ]directory] /bundle_name] flash:

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>

</tbody>
</table>
Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)

To copy a configuration file from a TFTP server to a flash memory device, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. copy tftp: [/[location ]/directory ]/bundle_name flash:

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> copy tftp: [/[location ]/directory ]/bundle_name flash:</td>
<td>Copies the file from a TFTP server to the flash memory device. Reply to any device prompts for additional information or confirmation. Prompting depends on how much information you provide in the copy command and the current setting of the file prompt command.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# copy tftp://cat3k_caa-universalk9.osp-12.02.EXP.150-12.02.EXP.150-12.02.EXP.bin flash:</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the copying of the configuration file named switch-config from a TFTP server to the flash memory card inserted in usbflash0. The copied file is renamed new-config.

Device# copy tftp:switch-config usbflash0:new-config

Re-executing the Configuration Commands in the Startup Configuration File (CLI)

To re-execute the commands located in the startup configuration file, complete the task in this section:

**SUMMARY STEPS**

1. enable
2. configure memory
Clearing the Startup Configuration (CLI)

You can clear the configuration information from the startup configuration. If you reboot the device with no startup configuration, the device enters the Setup command facility so that you can configure the device from scratch. To clear the contents of your startup configuration, complete the task in this section:

**SUMMARY STEPS**

1. enable
2. erase nvram

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure memory</td>
<td>Re-executes the configuration commands located in the startup configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure memory</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

For all platforms except the Class A Flash file system platforms, this command erases NVRAM. The startup configuration file cannot be restored once it has been deleted. On Class A Flash file system platforms, when you use the **erase startup-config** EXEC command, the device erases or deletes the configuration pointed to by the CONFIG_FILE environment variable. If this variable points to NVRAM, the device erases NVRAM. If the CONFIG_FILE environment variable specifies a flash memory device and configuration filename, the device deletes the configuration file. That is, the device marks the file as “deleted,” rather than erasing it. This feature allows you to recover a deleted file.
Deleting a Specified Configuration File (CLI)

To delete a specified configuration on a specific flash device, complete the task in this section:

**SUMMARY STEPS**

1. enable
2. delete flash-filesystem:filename

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  Example:  
  Device> enable |
| **Step 2** delete flash-filesystem:filename | Deletes the specified configuration file on the specified flash device.  
  Example:  
  Device# delete usbflash0:myconfig |

**Note** On Class A and B Flash file systems, when you delete a specific file in flash memory, the system marks the file as deleted, allowing you to later recover a deleted file using the `undelete` EXEC command. Erased files cannot be recovered. To permanently erase the configuration file, use the `squeeze` EXEC command. On Class C Flash file systems, you cannot recover a file that has been deleted. If you attempt to erase or delete the configuration file specified by the `CONFIG_FILE` environment variable, the system prompts you to confirm the deletion.

Specifying the `CONFIG_FILE` Environment Variable on Class A Flash File Systems (CLI)

On Class A flash file systems, you can configure the Cisco IOS software to load the startup configuration file specified by the `CONFIG_FILE` environment variable. The `CONFIG_FILE` variable defaults to NVRAM. To change the `CONFIG_FILE` environment variable, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
3. configure terminal
4. boot config dest-flash-url
5. end
6. copy system:running-config nvram:startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | **enable**<br>*Example:*<br>Device> enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Step 3 | **configure terminal**<br>*Example:*<br>Device# configure terminal |Enters global configuration mode. |
| Step 4 | **boot config dest-flash-url**<br>*Example:*<br>Device(config)# boot config 172.16.1.1 |Sets the CONFIG_FILE environment variable. This step modifies the runtime CONFIG_FILE environment variable. |
| Step 5 | **end**<br>*Example:*<br>Device(config)# end |Exits global configuration mode. |
| Step 6 | **copy system:running-config nvram:startup-config**<br>*Example:*<br>Device# copy system:running-config nvram:startup-config |Saves the configuration performed in Step 3 to the startup configuration. |
| Step 7 | **show boot**<br>*Example:*<br>Device# show boot |(Optional) Allows you to verify the contents of the CONFIG_FILE environment variable. |

### Examples

The following example copies the running configuration file to the device. This configuration is then used as the startup configuration when the system is restarted:
What to Do Next

After you specify a location for the startup configuration file, the `nvram:startup-config` command is aliased to the new location of the startup configuration file. The `more nvram:startup-config` EXEC command displays the startup configuration, regardless of its location. The `erase nvram:startup-config` EXEC command erases the contents of NVRAM and deletes the file pointed to by the `CONFIG_FILE` environment variable.

When you save the configuration using the `copy system:running-config nvram:startup-config` command, the device saves a complete version of the configuration file to the location specified by the `CONFIG_FILE` environment variable and a distilled version to NVRAM. A distilled version is one that does not contain access list information. If NVRAM contains a complete configuration file, the device prompts you to confirm your overwrite of the complete version with the distilled version. If NVRAM contains a distilled configuration, the device does not prompt you for confirmation and proceeds with overwriting the existing distilled configuration file in NVRAM.

Note

If you specify a file in a flash device as the `CONFIG_FILE` environment variable, every time you save your configuration file with the `copy system:running-config nvram:startup-config` command, the old configuration file is marked as “deleted,” and the new configuration file is saved to that device. Eventually, Flash memory fills up as the old configuration files still take up memory. Use the `squeeze` EXEC command to permanently delete the old configuration files and reclaim the space.

Configuring the Device to Download Configuration Files

You can specify an ordered list of network configuration and host configuration filenames. The Cisco IOS XE software scans this list until it loads the appropriate network or host configuration file.

To configure the device to download configuration files at system startup, perform at least one of the tasks described in the following sections:

- Configuring the Device to Download the Network Configuration File (CLI)
- Configuring the Device to Download the Host Configuration File (CLI)

If the device fails to load a configuration file during startup, it tries again every 10 minutes (the default setting) until a host provides the requested files. With each failed attempt, the device displays the following message on the console terminal:

Boot: host-config... [timed out]
If there are any problems with the startup configuration file, or if the configuration register is set to ignore NVRAM, the device enters the Setup command facility.

## Configuring the Device to Download the Network Configuration File (CLI)

To configure the Cisco IOS software to download a network configuration file from a server at startup, complete the tasks in this section:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
4. `service config`
5. `end`
6. `copy system:running-config nvram:startup-config`

</tbody>
</table>
Configuring the Device to Download the Host Configuration File (CLI)

To configure the Cisco IOS software to download a host configuration file from a server at startup, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
4. `service config`
5. `end`
6. `copy system:running-config nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
**Example:** Device(config)# boot host tftp:hostfile1 | Specifies the host configuration file to download at startup, and the protocol to be used (FTP, RCP, or TFTP):
- If you do not specify a host configuration filename, the device uses its own name to form a host configuration filename by converting the name to all lowercase letters, removing all domain information, and appending “-confg.” If no host name information |
is available, the software uses the default host configuration filename device-config. If you omit the address, the device uses the broadcast address.

- You can specify more than one host configuration file. The Cisco IOS software tries them in order entered until it loads one. This procedure can be useful for keeping files with different configuration information loaded on a network server.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>service config</td>
<td>Enables the system to automatically load the host file upon restart.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# service config</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>copy system:running-config nvram:startup-config</td>
<td>Saves the running configuration to the startup configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

In the following example, a device is configured to download the host configuration file named hostfile1 and the network configuration file named networkfile1. The device uses TFTP and the broadcast address to obtain the file:

```
Device# configure terminal
Device(config)# boot host tftp:hostfile1
Device(config)# boot network tftp:networkfile1
Device(config)# service config
Device(config)# end
Device# copy system:running-config nvram:startup-config
```

Prerequisites for Configuration Replace and Configuration Rollback

The format of the configuration files used as input by the Configuration Replace and Configuration Rollback feature must comply with standard Cisco software configuration file indentation rules as follows:

- Start all commands on a new line with no indentation, unless the command is within a configuration submode.
- Indent commands within a first-level configuration submode one space.
- Indent commands within a second-level configuration submode two spaces.
- Indent commands within subsequent submodes accordingly.

These indentation rules describe how the software creates configuration files for such commands as `show running-config` or `copy running-config destination-url`. Any configuration file generated on a Cisco device complies with these rules.

Free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration) is required.
Restrictions for Configuration Replace and Configuration Rollback

If the device does not have free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration), the configuration replace operation is not performed.

Certain Cisco configuration commands such as those pertaining to physical components of a networking device (for example, physical interfaces) cannot be added or removed from the running configuration. For example, a configuration replace operation cannot remove the interface ethernet 0 command line from the current running configuration if that interface is physically present on the device. Similarly, the Interface ethernet 1 command line cannot be added to the running configuration if no such interface is physically present on the device. A configuration replace operation that attempts to perform these types of changes results in error messages indicating that these specific command lines failed.

In very rare cases, certain Cisco configuration commands cannot be removed from the running configuration without reloading the device. A configuration replace operation that attempts to remove this type of command results in error messages indicating that these specific command lines failed.

Information About Configuration Replace and Configuration Rollback

Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the configure replace command. Before this feature was introduced, you could save copies of the running configuration using the copy running-config destination-url command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the configure replace command to revert to previous configuration states.

The archive config command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The show archive command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the configure replace command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.
Configuration Replace

The configure replace privileged EXEC command provides the capability to replace the current running configuration with any saved Cisco IOS configuration file. This functionality can be used to revert to a previous configuration state, effectively rolling back any configuration changes that were made since the previous configuration state was saved.

When using the configure replace command, you must specify a saved Cisco IOS configuration as the replacement configuration file for the current running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the copy running-config destination-url command), or, if generated externally, the replacement file must comply with the format of files generated by Cisco IOS devices. When the configure replace command is entered, the current running configuration is compared with the specified replacement configuration and a set of diffs is generated. The algorithm used to compare the two files is the same as that employed by the show archive config differences command. The resulting diffs are then applied by the Cisco IOS parser to achieve the replacement configuration state. Only the diffs are applied, avoiding potential service disruption from reapplying configuration commands that already exist in the current running configuration. This algorithm effectively handles configuration changes to order-dependent commands (such as access lists) through a multiple pass process. Under normal circumstances, no more than three passes are needed to complete a configuration replace operation, and a limit of five passes is performed to preclude any looping behavior.

The Cisco IOS copy source-url running-config privileged EXEC command is often used to copy a stored Cisco IOS configuration file to the running configuration. When using the copy source-url running-config command as an alternative to the configure replace target-url privileged EXEC command, the following major differences should be noted:

- The copy source-url running-config command is a merge operation and preserves all of the commands from both the source file and the current running configuration. This command does not remove commands from the current running configuration that are not present in the source file. In contrast, the configure replace target-url command removes commands from the current running configuration that are not present in the replacement file and adds commands to the current running configuration that need to be added.

- The copy source-url running-config command applies every command in the source file, whether or not the command is already present in the current running configuration. This algorithm is inefficient and, in some cases, can result in service outages. In contrast, the configure replace target-url command only applies the commands that need to be applied—no existing commands in the current running configuration are reapplied.

- A partial configuration file may be used as the source file for the copy source-url running-config command, whereas a complete Cisco IOS configuration file must be used as the replacement file for the configure replace target-url command.

A locking feature for the configuration replace operation was introduced. When the configure replace command is used, the running configuration file is locked by default for the duration of the configuration replace operation. This locking mechanism prevents other users from changing the running configuration while the replacement operation is taking place, which might otherwise cause the replacement operation to terminate unsuccessfully. You can disable the locking of the running configuration by using the no lock keyword when issuing the configure replace command.

The running configuration lock is automatically cleared at the end of the configuration replace operation. You can display any locks that may be currently applied to the running configuration using the show configuration lock command.
**Configuration Rollback**

The concept of rollback comes from the transactional processing model common to database operations. In a database transaction, you might make a set of changes to a given database table. You then must choose whether to commit the changes (apply the changes permanently) or to roll back the changes (discard the changes and revert to the previous state of the table). In this context, rollback means that a journal file containing a log of the changes is discarded, and no changes are applied. The result of the rollback operation is to revert to the previous state, before any changes were applied.

The `configure replace` command allows you to revert to a previous configuration state, effectively rolling back changes that were made since the previous configuration state was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the Cisco IOS configuration rollback capability uses the concept of reverting to a specific configuration state based on a saved Cisco IOS configuration file. This concept is similar to the database idea of saving a checkpoint (a saved version of the database) to preserve a specific state.

If the configuration rollback capability is desired, you must save the Cisco IOS running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes (using the `configure replace target-url` command). Furthermore, because you can specify any saved Cisco IOS configuration file as the replacement configuration, you are not limited to a fixed number of rollbacks, as is the case in some rollback models.

**Configuration Rollback Confirmed Change**

The Configuration Rollback Confirmed Change feature allows configuration changes to be performed with an optional requirement that they be confirmed. If this confirmation is not received, the configuration is returned to the state prior to the changes being applied. The mechanism provides a safeguard against inadvertent loss of connectivity between a network device and the user or management application due to configuration changes.

**Benefits of Configuration Replace and Configuration Rollback**

- Allows you to revert to a previous configuration state, effectively rolling back configuration changes.
- Allows you to replace the current running configuration file with the startup configuration file without having to reload the device or manually undo CLI changes to the running configuration file, therefore reducing system downtime.
- Allows you to revert to any saved Cisco IOS configuration state.
- Simplifies configuration changes by allowing you to apply a complete configuration file to the device, where only the commands that need to be added or removed are affected.
- When using the `configure replace` command as an alternative to the `copy source-url running-config` command, increases efficiency and prevents risk of service outages by not reapplying existing commands in the current running configuration.
How to Use Configuration Replace and Configuration Rollback

Creating a Configuration Archive (CLI)

No prerequisite configuration is needed to use the `configure replace` command. Using the `configure replace` command in conjunction with the Cisco IOS configuration archive and the `archive config` command is optional but offers significant benefit for configuration rollback scenarios. Before using the `archive config` command, the configuration archive must be configured. Perform this task to configure the characteristics of the configuration archive.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `archive`
4. `path url`
5. `maximum number`
6. `time-period minutes`
7. `end`
8. `archive config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>* Enter your password if prompted.</td>
</tr>
<tr>

<td>---------</td>
<td></td>
</tr>
<tr>
<td>Device(config-archive)# path flash:myconfiguration</td>
<td>If a directory is specified in the path instead of file, the directory name must be followed by a forward slash as follows: path flash:/directory/. The forward slash is not necessary after a filename; it is only necessary when specifying a directory.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

<table>
<thead>
<tr>
<th>maximum number</th>
<th>(Optional) Sets the maximum number of archive files of the running configuration to be saved in the Cisco IOS configuration archive.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-archive)# maximum 14</td>
</tr>
<tr>
<td></td>
<td>• The number argument is the maximum number of archive files of the running configuration to be saved in the Cisco IOS configuration archive. Valid values are from 1 to 14. The default is 10.</td>
</tr>
</tbody>
</table>

**Note** Before using this command, you must configure the **path** command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

**Step 6**

<table>
<thead>
<tr>
<th>time-period minutes</th>
<th>(Optional) Sets the time increment for automatically saving an archive file of the current running configuration in the Cisco IOS configuration archive.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-archive)# time-period 1440</td>
</tr>
<tr>
<td></td>
<td>• The minutes argument specifies how often, in minutes, to automatically save an archive file of the current running configuration in the Cisco IOS configuration archive.</td>
</tr>
</tbody>
</table>

**Note** Before using this command, you must configure the **path** command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

**Step 7**

<table>
<thead>
<tr>
<th>end</th>
<th>Exits to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-archive)# end</td>
</tr>
</tbody>
</table>

**Step 8**

<table>
<thead>
<tr>
<th>archive config</th>
<th>Saves the current running configuration file to the configuration archive.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# archive config</td>
</tr>
</tbody>
</table>

**Note** The **path** command must be configured before using this command.
Performing a Configuration Replace or Configuration Rollback Operation (CLI)

Perform this task to replace the current running configuration file with a saved Cisco IOS configuration file.

Note
You must create a configuration archive before performing this procedure. See Creating a Configuration Archive (CLI) for detailed steps. The following procedure details how to return to that archived configuration in the event of a problem with the current running configuration.

SUMMARY STEPS

1. enable
2. configure replace target-url [nolock] [list] [force] [ignore case] [revert trigger [error] [timer minutes] | time minutes]
3. configure revert { now | timer {minutes | idle minutes} }
4. configure confirm
5. exit

<tr>
<td></td>
<td>Specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the <code>configure replace</code> command).</td>
</tr>
<tr>
<td></td>
<td>• The <code>no lock</code> keyword disables the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replace operation.</td>
</tr>
<tr>
<td></td>
<td>• The <code>revert trigger</code> keywords set the following triggers for reverting to the original configuration:</td>
</tr>
<tr>
<td></td>
<td>• <code>error</code> — Reverts to the original configuration upon error.</td>
</tr>
<tr>
<td></td>
<td>• <code>timer minutes</code> — Reverts to the original configuration if specified time elapses.</td>
</tr>
<tr>
<td></td>
<td>• The <code>ignore case</code> keyword allows the configuration to ignore the case of the confirmation command.</td>
</tr>
</tbody>
</table>

**Step 3**

```bash
configure revert { now | timer (minutes | idle minutes ) }
```

**Example:**

```
Device# configure revert now
```

(Optional) To cancel the timed rollback and trigger the rollback immediately, or to reset parameters for the timed rollback, use the `configure revert` command in privileged EXEC mode.

• `now` — Triggers the rollback immediately.

• `timer` — Resets the configuration revert timer.

  • Use the `minutes` argument with the `timer` keyword to specify a new revert time in minutes.

  • Use the `idle` keyword along with a time in minutes to set the maximum allowable time period of no activity before reverting to the saved configuration.

**Step 4**

```bash
configure confirm
```

**Example:**

```
Device# configure confirm
```

(Optional) Confirms replacement of the current running configuration file with a saved Cisco IOS configuration file.

**Note**

Use this command only if the `time seconds` keyword and argument of the `configure replace` command are specified.

**Step 5**

```bash
exit
```

**Example:**

```
Device# exit
```

Exits to user EXEC mode.
Monitoring and Troubleshooting the Feature (CLI)

Perform this task to monitor and troubleshoot the Configuration Replace and Configuration Rollback feature.

SUMMARY STEPS

1. enable
2. show archive
3. debug archive versioning
4. debug archive config timestamp
5. exit

DETAILED STEPS

Step 1  enable

Use this command to enable privileged EXEC mode. Enter your password if prompted.

Example:

Device> enable
Device#

Step 2  show archive

Use this command to display information about the files saved in the Cisco IOS configuration archive.

Example:

Device# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
  Archive #  Name
    0
    1  flash:myconfiguration-1 <- Most Recent
    2
    3
    4
    5
    6
    7
    8
    9
   10
   11
   12
   13
   14

The following is sample output from the show archive command after several archive files of the running configuration have been saved. In this example, the maximum number of archive files to be saved is set to three.

Example:

Device# show archive
There are currently 3 archive configurations saved.
The next archive file will be named flash:myconfiguration-8
Step 3  debug archive versioning

Use this command to enable debugging of the Cisco IOS configuration archive activities to help monitor and troubleshoot configuration replace and rollback.

Example:

Device# debug archive versioning
Jan 9 06:46:28.419:backup_running_config
Jan 9 06:46:28.419:Current = 7
Jan 9 06:46:28.443:Writing backup file flash:myconfiguration-7
Jan 9 06:46:29.547: backup worked

Step 4  debug archive config timestamp

Use this command to enable debugging of the processing time for each integral step of a configuration replace operation and the size of the configuration files being handled.

Example:

Device# debug archive config timestamp
Device# configure replace flash:myconfiguration force
Timing Debug Statistics for IOS Config Replace operation:
    Time to read file usbflash0:sample_2.cfg = 0 msec (0 sec)
    Number of lines read:55
    Size of file :1054
Starting Pass 1
    Time to read file system:running-config = 0 msec (0 sec)
    Number of lines read:93
    Size of file :2539
    Time taken for positive rollback pass = 320 msec (0 sec)
    Time taken for negative rollback pass = 0 msec (0 sec)
    Time taken for negative incremental diffs pass = 59 msec (0 sec)
    Time taken by PI to apply changes = 0 msec (0 sec)
    Time taken for Pass 1 = 380 msec (0 sec)
Starting Pass 2
    Time to read file system:running-config = 0 msec (0 sec)
    Number of lines read:55
    Size of file :1054
    Time taken for positive rollback pass = 0 msec (0 sec)
    Time taken for negative rollback pass = 0 msec (0 sec)
    Time taken for Pass 2 = 0 msec (0 sec)
Total number of passes:1
Rollback Done

Step 5  exit
Use this command to exit to user EXEC mode.

**Example:**

```
Device# exit
Device>
```

## Configuration Examples for Configuration Replace and Configuration Rollback

### Creating a Configuration Archive

The following example shows how to perform the initial configuration of the Cisco IOS configuration archive. In this example, flash:myconfiguration is specified as the location and filename prefix for the files in the configuration archive and a value of 10 is set as the maximum number of archive files to be saved.

```
configure terminal
!
archive
    path flash:myconfiguration
    maximum 10
end
```

### Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File

The following example shows how to replace the current running configuration with a saved Cisco IOS configuration file named flash:myconfiguration. The `configure replace` command interactively prompts you to confirm the operation.

```
Device# configure replace flash:myconfiguration
This will apply all necessary additions and deletions to replace the current running configuration with the contents of the specified configuration file, which is assumed to be a complete configuration, not a partial configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
```

In the following example, the `list` keyword is specified in order to display the command lines that were applied during the configuration replace operation:

```
Device# configure replace flash:myconfiguration list
This will apply all necessary additions and deletions to replace the current running configuration with the contents of the specified configuration file, which is assumed to be a complete configuration, not a partial configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
```
Reverting to the Startup Configuration File

The following example shows how to revert to the Cisco IOS startup configuration file using the configure replace command. This example also shows the use of the optional force keyword to override the interactive user prompt:

```
Device# configure replace flash:startup-config force
Total number of passes: 1
Rollback Done
```

Performing a Configuration Replace Operation with the configure confirm Command

The following example shows the use of the configure replace command with the time minutes keyword and argument. You must enter the configure confirm command within the specified time limit to confirm replacement of the current running configuration file. If the configure confirm command is not entered within the specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the configure replace command).

```
Device# configure replace flash:startup-config time 120
This will apply all necessary additions and deletions to replace the current running configuration with the contents of the specified configuration file, which is assumed to be a complete configuration, not a partial configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
Device# configure confirm
```

The following example shows the use of the configure revert command with the timer keyword. You must enter the configure revert command to cancel the timed rollback and trigger the rollback immediately, or to reset parameters for the timed rollback.

```
Device# configure revert timer 100
```

Performing a Configuration Rollback Operation

The following example shows how to make changes to the current running configuration and then roll back the changes. As part of the configuration rollback operation, you must save the current running configuration before making changes to the file. In this example, the archive config command is used to save the current running configuration. The generated output of the configure replace command indicates that only one pass was performed to complete the rollback operation.
Before using the `archive config` command, you must configure the `path` command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

You first save the current running configuration in the configuration archive as follows:

```
archive config
```

You then enter configuration changes as shown in the following example:

```
configure terminal
!
user netops2 password rain
user netops3 password snow
exit
```

After having made changes to the running configuration file, assume you now want to roll back these changes and revert to the configuration that existed before the changes were made. The `show archive` command is used to verify the version of the configuration to be used as a replacement file. The `configure replace` command is then used to revert to the replacement configuration file as shown in the following example:

```
Device# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
Archive # Name
0
1  flash:myconfiguration-1 <- Most Recent
2
3
4
5
6
7
8
9
10
Device# configure replace flash:myconfiguration-1
Total number of passes: 1
Rollback Done
```

Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the device is named flash:.

As viewed from the active device, flash: refers to the local flash device, which is the device attached to the same device on which the file system is being viewed. In a device stack, each of the flash devices from the various stack members can be viewed from the active device. The names of these flash file systems include the corresponding device member numbers. For example, flash-3:, as viewed from the active device, refers to the same file system as does flash: on stack member 3. Use the `show file systems` privileged EXEC command to list all file systems, including the flash file systems in the device stack.

Only one user at a time can manage the software bundles and configuration files for a device stack.

Displaying Available File Systems

To display the available file systems on your device, use the `show file systems` privileged EXEC command as shown in this example for a standalone device:

```
Device# show file systems
File Systems:
+ Size(b) Free(b) Type Flags Prefixes
  * 15998976 5135872 flash rw flash:
  - - opaque rw bs:
  - - opaque rw vb:
```
This example shows a device stack. In this example, the active device is stack member 1; the file system on stack member 2 is displayed as flash-2; the file system on stack member 3 is displayed as flash-3; and so on up to stack member 9, displayed as flash-9: for a 9-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active device:

Device# show file systems

<table>
<thead>
<tr>
<th>Device# show file systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Systems:</td>
</tr>
<tr>
<td>Size(b)       Free(b) Type Flags        Prefixes</td>

<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size(b)</td>
<td>Amount of memory in the file system in bytes.</td>
</tr>
<tr>
<td>Free(b)</td>
<td>Amount of free memory in the file system in bytes.</td>
</tr>
</tbody>
</table>
| Type | Type of file system.  
  disk—The file system is for a flash memory device, USB flash, and crashinfo file.  
  network—The file system for network devices; for example, an FTP server or and HTTP server.  
  nvram—The file system is for a NVRAM device.  
  opaque—The file system is a locally generated pseudo file system (for example, the system) or a download interface, such as brimux.  
  unknown—The file system is an unknown type. |
| Flags | Permission for file system.  
  ro—read-only.  
  rw—read/write.  
  wo—write-only. |
### Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

### Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefixes</td>
<td>Alias for file system.</td>

<td></td>
<td><code>ymodem:</code>—Obtain the file from a network machine by using the Ymodem protocol.</td>
</tr>
</tbody>
</table>
Table 210: Commands for Displaying Information About Files

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir [/all] [filesystem:filename]</td>
<td>Displays a list of files on a file system.</td>
</tr>
<tr>
<td>show file systems</td>
<td>Displays more information about each of the files on a file system.</td>
</tr>
<tr>
<td>show file information file-url</td>
<td>Displays information about a specific file.</td>
</tr>
<tr>
<td>show file descriptors</td>
<td>Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

For example, to display a list of all files in a file system, use the `dir` privileged EXEC command:

```
device# dir flash:
Directory of flash:/
7386  -rwx  2097152 Jan 23 2013 14:06:49 +00:00 nvram_config
7378  drwx  4096 Jan 23 2013 09:35:11 +00:00 mnt
7385  -rw-  221775876 Jan 23 2013 14:15:13 +00:00 cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
7389  -rwx  556 Jan 21 2013 20:47:30 +00:00 vlan.dat
712413184 bytes total (445063168 bytes free)
device#
```

Changing Directories and Displaying the Working Directory (CLI)

Follow these steps to change directories and to display the working directory:

**SUMMARY STEPS**

1. `enable`
2. `dir filesystem:`
3. `cd directory_name`
4. `pwd`
5. `cd`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>* Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
</tbody>
</table>
## Creating Directories (CLI)

Beginning in privileged EXEC mode, follow these steps to create a directory:

### SUMMARY STEPS

1. `dir filesystem:
2. mkdir directory_name
3. dir filesystem:

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>dir filesystem:</code></td>
<td>Displays the directories on the specified file system.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>For <em>filesystem:</em>., use flash: for the system board flash device.</td>
</tr>
<tr>
<td><strong>Device# dir flash:</strong></td>
<td>To access flash partitions of device members in a stack, use flash-n where <em>n</em> is the stack member number. For example, flash-4.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>mkdir directory_name</code></td>
<td>Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td><strong>Device# cd</strong></td>
<td></td>
</tr>
</tbody>
</table>
Removing Directories

To remove a directory with all its files and subdirectories, use the `delete /force /recursive filesystem::file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

---

Caution

When directories are deleted, their contents cannot be recovered.

Copying Files

To copy a file from a source to a destination, use the `copy source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use `running-config` and `startup-config` keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (`xmodem:, ymodem:) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, tftp:, scp:, http:, and https: and have these syntaxes:

- FTP—ftp://username [:@password]@location/directory]/filename
- RCP—rcp://username@location/directory]/filename
- TFTP—tftp://location/directory]/filename
- SCP—scp://username [:@password]@location/directory]/filename
- HTTP—http://username [:@password]@location]/directory]/filename
- HTTPS—https://username [:@password]@location]/directory]/filename

---

Note

The password must not contain the special character '@'. If the character '@' is used, the copy fails to parse the IP address of the server.
Local writable file systems include flash:

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the `copy flash: flash:` command is invalid)

### Copying Files from One Device in a Stack to Another Device in the Same Stack

To copy a file from one device in a stack to another device in the same stack, use the `flash-X:` notation, where X is the device number.

To view all devicees in a stack, use the `show switch` command in privileged EXEC mode, as in the following example of a 9-member device stack:

```
Device# show switch
Switch/Stack Mac Address : 0006.f6b9.b580 - Local Mac Address Mac persistency wait time: Indefinite

Switch#  Role  Mac Address  Priority  Version  State
---------  ------  -----------  ---------  --------  ------
*1  Active  0006.f6b9.b580  15  P3B  Ready
2  Standby  0006.f6ba.0c80  14  P3B  Ready
3  Member  0006.f6ba.3300  7  P3B  Ready
4  Member  0006.f6b9.df80  6  P3B  Ready
5  Member  0006.f6ba.3880  13  P1A  Ready
6  Member  1ce6.c7b6.ef00  4  PF  Ready
7  Member  2037.06ce.2580  3  P2A  Ready
8  Member  2037.0653.7e00  2  P5A  Ready
9  Member  2037.0653.9280  1  P5B  Ready
```

To view all filesystems available to copy on a specific device, use the `copy` command as in the following example of a 5-member stack:

```
Device# copy flash: ?
crashinfo-1: Copy to crashinfo-1: file system
crashinfo-2: Copy to crashinfo-2: file system
crashinfo-3: Copy to crashinfo-3: file system
crashinfo-4: Copy to crashinfo-4: file system
crashinfo-5: Copy to crashinfo-5: file system
crashinfo: Copy to crashinfo: file system
flash-1: Copy to flash-1: file system
flash-2: Copy to flash-2: file system
flash-3: Copy to flash-3: file system
flash-4: Copy to flash-4: file system
flash-5: Copy to flash-5: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
revrcsf: Copy to revrcsf: file system
running-config Update (merge with) current system configuration
scp: Copy to scp: file system
```
This example shows how to copy a config file stored in the flash partition of device 2 to the flash partition of device 4. It assumes that device 2 and device 4 are in the same stack.

Device# copy flash-2:config.txt flash-4:config.txt

Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the delete [/force] [/recursive] [filesystem:]file-url privileged EXEC command.

Use the /recursive keyword for deleting a directory and all subdirectories and the files contained in it. Use the /force keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the /force and /recursive keywords for deleting old software images that were installed by using the archive download-sw command but are no longer needed.

If you omit the filesystem: option, the device uses the default device specified by the cd command. For file-url, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

Caution

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file myconfig from the default flash memory device:

Device# delete myconfig

Creating, Displaying and Extracting Files (CLI)

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:
### SUMMARY STEPS

1. `archive tar /create destination-url flash: /file-url`
2. `archive tar /table source-url`
3. `archive tar /xtract source-url flash:/file-url [dir/file...]`
4. `more [ /ascii | /binary | /ebcdic ] /file-url`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>device# archive tar /create</code></td>
<td>Creates a file and adds files to it.</td>
</tr>
<tr>
<td><code>tftp:172.20.10.30/saved. flash:/new-configs</code></td>
<td>For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</td>
</tr>
<tr>
<td></td>
<td>• Local flash file system syntax:</td>
</tr>
<tr>
<td></td>
<td><code>flash:</code></td>
</tr>
<tr>
<td></td>
<td>• FTP syntax:</td>
</tr>
<tr>
<td></td>
<td><code>ftp://[username:[password]@location]/directory/-filename</code>.</td>
</tr>
<tr>
<td></td>
<td>• RCP syntax:</td>
</tr>
<tr>
<td></td>
<td><code>rcp://[username@location]/directory/-filename</code>.</td>
</tr>
<tr>
<td></td>
<td>• TFTP syntax:</td>
</tr>
<tr>
<td></td>
<td><code>tftp://[location]/directory/-filename</code>.</td>
</tr>
<tr>
<td></td>
<td>For <code>flash:/file-url</code>, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</td>
</tr>
</tbody>
</table>

<p>| <strong>Step 2</strong>        |         |
| <strong>Example:</strong>      |         |
| <code>device# archive tar /table</code> | Displays the contents of a file. |
| <code>flash: /new_configs</code> | For <code>source-url</code>, specify the source URL alias for the local or network file system. The <code>-filename</code> is the file to display. These options are supported: |
|                   | • Local flash file system syntax: |
|                   |   <code>flash:</code> |
|                   |   • FTP syntax: |
|                   |     <code>ftp://[username:[password]@location]/directory/-filename</code>. |
|                   |   • RCP syntax: |
|                   |     <code>rcp://[username@location]/directory/-filename</code>. |
|                   |   • TFTP syntax: |
|                   |     <code>tftp://[location]/directory/-filename</code>. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 3

<table>
<thead>
<tr>
<th>archive tar /xtract source-url flash:/file-url [dir/file...]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extracts a file into a directory on the flash file system.</td>
</tr>
</tbody>
</table>

**Example:**

```
device# archive tar /xtract tftp:/172.20.10.30/saved. flash:/new-configs
```

For `source-url`, specify the source URL alias for the local file system. The `-filename` is the file from which to extract files. These options are supported:

- **Local flash file system syntax:**
  
  `flash:`

- **FTP syntax:**
  
  `ftp://username[@location][directory]-filename`

- **RCP syntax:**
  
  `rcp://username@location[/directory]-filename`

- **TFTP syntax:**
  
  `tftp://[location]/directory/-filename`

For `flash:/file-url [dir/file...]`, specify the location on the local flash file system from which the file is extracted. Use the `dir/file...` option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.

### Step 4

| more [ /ascii | /binary | /ebcdic ] /file-url |
|-------------------|
| Displays the contents of any readable file, including a file on a remote file system. |

**Example:**

```
device# more flash:/new-configs
```

---

Upgrading the Switch Software

• Upgrading the Switch Software, on page 2671

Upgrading the Switch Software

For information about upgrading the switch software from Cisco IOS XE Release 3.x.x to Cisco IOS XE Denali 16.1.x, see Release Notes for Cisco Catalyst 3650 Series Switch, Cisco IOS XE Denali 16.1.x.
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Introduction to Conditional Debugging

The Conditional Debugging feature allows you to selectively enable debugging and logging for specific features based on the set of conditions you define. This feature is useful in systems where a large number of features are supported.

Note

In Cisco IOS XE Denali 16.1.1, only Control Plane Tracing is supported.
The Conditional debug allows granular debugging in a network that is operating at a large scale with a large number of features. It allows you to observe detailed debugs for granular instances within the system. This is very useful when we need to debug only a particular session among thousands of sessions. It is also possible to specify multiple conditions.

A condition refers to a feature or identity, where identity could be an interface, IP Address, or a MAC address and so on.

**Note**

In Cisco IOS XE Denali 16.1.1, MAC address is the only supported condition. The support for other features will be introduced in the releases that follow.

This is in contrast to the general debug command, that produces its output without discriminating on the feature objects that are being processed. General debug command consumes a lot of system resources and impacts the system performance.

**Note**

To enable debug for wireless IPs, use the `debug platform condition feature wireless ip ip-address` command.

---

**Introduction to Radioactive Tracing**

Radioactive tracing provides the ability to stitch together a chain of execution for operations of interest across the system, at an increased verbosity level. This provides a way to conditionally print debug information (up to DEBUG Level or a specified level) across threads, processes and function calls.

**Note**

In Cisco IOS XE Denali 16.1.1 the default level is **DEBUG**. The users cannot change this to another level. The support for other levels will be introduced in the releases that follow.

**Note**

The radioactive tracing supports First-Hop Security (FHS).

For more information on First Hop Security features, see *System Management > Wireless Multicast > Information About Wireless Multicast > Information About IPv6 Snooping*.

---

**Conditional Debugging and Radioactive Tracing**

Radioactive Tracing when coupled with Conditional Debugging, enable us to have a single debug CLI to debug all execution contexts related to the condition. This can be done without being aware of the various control flow processes of the feature within the box and without having to issue debugs at these processes individually.
Location of Tracefiles

By default the tracefile logs will be generated for each process and saved into either the `/tmp/rp/trace` or `/tmp/fp/trace` directory. In this temp directory, the trace logs are written to files, which are of 1 MB size each. The directory can hold up to a maximum of 25 such files for a given process. When a tracefile in the `/tmp` directory reaches its 1MB limit or whatever size was configured for it during the boot time, it is rotated out to an archive location in the `/crashinfo` partition under `tracelogs` directory.

The `/tmp` directory holds only a single tracefile for a given process. Once the file reaches its file size limit it is rotated out to `/crashinfo/tracelogs`. In the archive directory, up to 25 files are accumulated, after which the oldest one is replaced by the newly rotated file from `/tmp`.

The tracefiles in the crashinfo directory are located in the following formats:

1. `Process-name_Process-ID_running-counter.timestamp.gz`
   - Example: IOSRP_R0-0.bin_0.14239.20151101234827.gz

2. `Process-name_pmanlog_Process-ID_running-counter.timestamp.bin.gz`
   - Example: wcm_pmanlog_R0-0.30360_0.20151028233007.bin.gz

Configuring Conditional Debugging

To configure conditional debugging, follow the steps given below:

**SUMMARY STEPS**

1. enable
2. debug platform condition mac `{mac-address}`
3. debug platform condition start
4. show platform condition OR show debug
5. debug platform condition stop
6. request platform software trace archive `{last {number} days} [target {crashinfo: | flashinfo:}]`
7. request platform software trace filter-binary `{wire | wireless} {context {mac-address} | level | module}
8. show platform software trace `[filter-binary | level | message]
9. clear platform condition all

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>-------------------</td>
</tr>
<tr>
<td>2</td>
<td><code>debug platform condition mac {mac-address}</code></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# debug platform condition mac bc16.6509.3314</td>
</tr>
<tr>
<td>3</td>
<td><code>debug platform condition start</code></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# debug platform condition start</td>
</tr>
<tr>
<td>4</td>
<td><code>show platform condition</code> OR <code>show debug</code></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# show platform condition Device# show debug</td>
</tr>
<tr>
<td>5</td>
<td><code>debug platform condition stop</code></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# debug platform condition stop</td>
</tr>
<tr>
<td>6</td>
<td>`request platform software trace archive [last {number}] days] [target {crashinfo:</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# request platform software trace archive last 2 days</td>
</tr>
<tr>
<td>7</td>
<td>`request platform software trace filter-binary {wire</td>
</tr>
<tr>
<td></td>
<td>level</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# request platform software trace filter-binary wireless context bc16.6509.3314</td>
</tr>
<tr>
<td>8</td>
<td>`show platform software trace [filter-binary</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Device# show platform software trace message</td>
</tr>
</tbody>
</table>

**Note**

In Cisco IOS XE Denali 16.1.1, from all the keywords available, the only keyword supported is wireless. This collects files from processes (ios, wcm, fman_rp, fman_fp, fed).
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear platform condition all</td>
<td>Clears all conditions.</td>
</tr>
</tbody>
</table>

**What to do next**

The commands `request platform software trace filter-binary` and `show platform software trace filter-binary` work in a similar way. The only difference is:

- `request platform software trace filter-binary` - Sources the data from historical logs.
- `show platform software trace filter-binary` - Sources the data from the flash Temp directory.

The command `request platform software trace filter-binary wireless {mac-address}` generates 3 flash files:

- `collated_log <.date..>`
- `mac_log <..date..>`
- `mac_database ..file`

Of these, `mac_log <..date..>` is the most important file, as it gives the messages for the MAC we are debugging. The command `show platform software trace filter-binary wireless` also generates the same flash files, and also prints the `mac_log` on the screen.

**Radioactive Tracing for L2 Multicast**

To identify a specific multicast receiver, specify the MAC address of the joiner or the receiver client, Group Multicast IP address and Snooping VLAN. Additionally, enable the trace level for the debug. The debug level will provide detailed traces and better visibility into the system.

```
debug platform condition feature multicast controlplane mac client MAC address ip Group IP address vlan id level debug level
```
Recommended Workflow for Trace files

The Recommended Workflow for Trace files is listed below:

1. To request the trace logs for a specific time period.
   
   EXAMPLE 1 day.
   
   Use the command:
   
   Device# request platform software trace archive last 1 day

2. The system generates a tar ball (.gz file) of the trace logs in the location /flash:

3. Copy the file off the switch. By copying the file, the trace logs can be used to work offline. For more details on copying files, see section below.

4. Delete the trace log file (.gz) file from /flash: location. This will ensure enough space on the switch for other operations.

Copying tracefiles off the box

An example of the tracefile is shown below:

Device# dir crashinfo:/tracelogs
Directory of crashinfo:/tracelogs/

50664 -rwx 760 Sep 22 2015 11:12:21 +00:00 plogd_F0-0.bin_0.gz
50603 -rwx 991 Sep 22 2015 11:12:08 +00:00 fed_pmanlog_F0-0.bin_0.9558.2015092211208.gz
50610 -rw- 11 Nov 2 2015 00:15:59 +00:00 timestamp
50611 -rwx 1443 Sep 22 2015 11:11:31 +00:00 auto_upgrade_client_sh_pmanlog_R0-.bin_0.3817.2015092211130.gz
50669 -rwx 589 Sep 30 2015 03:59:04 +00:00 cfgwr-8021_R0-0.bin_0.gz
50612 -rwx 1136 Sep 22 2015 11:11:46 +00:00 reflector_803_R0-0.bin_0.1312.2015092211116.gz
50794 -rwx 4239 Nov 2 2015 00:04:32 +00:00 IOSRP_R0-0.bin_0.14239.201511101234527.gz
50615 -rwx 131072 Sep 22 2015 11:11:46 +00:00 linux_iost_image_pmanlog_R0-0.bin_0

The trace files can be copied using one of the various options shown below:

Device# copy crashinfo:/tracelogs ?
  crashinfo: Copy to crashinfo: file system
  flash: Copy to flash: file system
  ftp: Copy to ftp: file system
  http: Copy to http: file system
  https: Copy to https: file system
  null: Copy to null: file system
  nvram: Copy to nvram: file system
  rcp: Copy to rcp: file system
  running-config Update (merge with) current system configuration
  scp: Copy to scp: file system
  startup-config Copy to startup configuration
  syslog: Copy to syslog: file system
  system: Copy to system: file system
  tftp: Copy to tftp: file system
  tmpsys: Copy to tmpsys: file system
The general syntax for copying onto a TFTP server is as follows:

Device# copy source: tftp:
Device# copy crashinfo:/tracelogs/IOSRP_R0-0.bin_0.14239.20151101234827.gz tftp:
Address or name of remote host []? 2.2.2.2
Destination filename [IOSRP_R0-0.bin_0.14239.20151101234827.gz]? 

It is important to clear the generated report or archive files off the switch in order to have flash space available for tracelog and other purposes.

Configuration Examples for Conditional Debugging

The following is an output example of the `show platform condition` command.

Device# show platform condition
Conditional Debug Global State: Stop
Conditions Direction
-----------------------------------------------|--------
MAC Address 0024.D7C7.0054 N/A
Feature Condition Type Value
-----------------------------------------------|--------
Device#

The following is an output example of the `show debug` command.

Device# show debug
IOSXE Conditional Debug Configs:
Conditional Debug Global State: Start
Conditions Direction
-----------------------------------------------|--------
MAC Address 0024.D7C7.0054 N/A
Feature Condition Type Value
-----------------------------------------------|--------
Packet Infra debugs:
Ip Address Port
-----------------------------------------------|--------
Device#

The following is a sample of the `debug platform condition stop` command.

Device# debug platform condition stop
Conditional Debug Global State: Stop

Monitoring Conditional Debugging

The table shown below lists the various commands that can be used to monitor conditional debugging.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>

</tr>
</thead>
<tbody>
<tr>
<td><code>request platform software trace filter-binary</code></td>
<td>Displays historical logs of merged tracefiles on the system.</td>
</tr>
</tbody>
</table>
CHAPTER 139

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

- Information About Troubleshooting the Software Configuration, on page 2681
- How to Troubleshoot the Software Configuration, on page 2689
- Verifying Troubleshooting of the Software Configuration, on page 2701
- Scenarios for Troubleshooting the Software Configuration, on page 2703
- Configuration Examples for Troubleshooting Software, on page 2705
- Additional References for Troubleshooting Software Configuration, on page 2707
- Feature History and Information for Troubleshooting Software Configuration, on page 2708

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Lost or Forgotten Password on a Device

The default configuration for the device allows an end user with physical access to the device to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the device.

Note

On these devices, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.
You cannot recover encryption password key, when Cisco WLC configuration is copied from one Cisco WLC to another (in case of an RMA).

### Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the *Interface and Hardware Component Configuration Guide (Catalyst 3650 Switches)*.

### Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Device port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the `shutdown` interface configuration command, and then enter the `no shutdown` interface command. You can also configure automatic recovery on the Device to recover from the error-disabled state.

On a Device, the `errdisable recovery cause loopback` and the `errdisable recovery interval seconds` global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

### Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the `power inline never` interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the `shutdown` and the `no shutdown` interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the `power inline never` command.

### Ping

The Device supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:
• Normal response—The normal response (*hostname* is alive) occurs in 1 to 10 seconds, depending on network traffic.

• Destination does not respond—if the host does not respond, a no-answer message is returned.

• Unknown host—if the host does not exist, an unknown host message is returned.

• Destination unreachable—if the default gateway cannot reach the specified network, a destination-unreachable message is returned.

• Network or host unreachable—if there is no entry in the route table for the host or network, a network or host unreachable message is returned.

**Layer 2 Traceroute**

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Device in the path. When the Device detects a device in the path that does not support Layer 2 traceroute, the Device continues to send Layer 2 trace queries and lets them time out.

The Device can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

**Layer 2 Traceroute Guidelines**

• Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.

  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

• A Device is reachable from another Device when you can test connectivity by using the ping privileged EXEC command. All Device in the physical path must be reachable from each other.

• The maximum number of hops identified in the path is ten.

• You can enter the traceroute mac or the traceroute mac ip privileged EXEC command on a Device that is not in the physical path from the source device to the destination device. All Device in the path must be reachable from this switch.

• The traceroute mac command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

• If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

• If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

• The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Device uses the Address
Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the Device uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the Device sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

- This feature is not supported in Token Ring VLANs.

- Layer 2 traceroute opens a listening socket on the User Datagram Protocol (UDP) port 2228 that can be accessed remotely with any IPv4 address, and does not require any authentication. This UDP socket allows to read VLAN information, links, presence of particular MAC addresses, and CDP neighbor information, from the device. This information can be used to eventually build a complete picture of the Layer 2 network topology.

- Layer 2 traceroute is enabled by default and can be disabled by running the no l2 traceroute command in global configuration mode. To re-enable Layer 2 traceroute, use the l2 traceroute command in global configuration mode.

**IP Traceroute**

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Device can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the Device is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate Device do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate Device is a multilayer Device that is routing a particular packet, this Device shows up as a hop in the traceroute output.

The traceroute privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP port-unreachable
error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

**Time Domain Reflector Guidelines**

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported on 10/100/1000 copper Ethernet ports and on Multigigabit Ethernet (10Gbps) ports. It is not supported on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

---

**Note**

When using the feature with Multigigabit Ethernet ports, the cable length is displayed only when an open or short condition is detected.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Device
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Device reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the Device does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
- The link is a 10-megabit or a 100-megabit link.
- The cable is a stranded cable.
- The link partner is a Cisco IP Phone.
- The link partner is not IEEE 802.3 compliant.
**Debug Commands**

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.

All `debug` commands are entered in privileged EXEC mode, and most `debug` commands take no arguments.

**System Report**

System reports or crashinfo files save information that helps Cisco technical support representatives to debug problems that caused the Cisco IOS image to fail (crash). It is necessary to quickly and reliably collect critical crash information with high fidelity and integrity. Further, it is necessary to collect this information and bundle it in a way that it can be associated or identified with a specific crash occurrence.

System reports are generated in these situations:

- **In case of a switch failure**—A system report is generated on the member that failed; reports are not generated on other members in the stack.
- **In case of a switchover**—System reports are generated only on high availability (HA) member switches. Reports are not generated for non-HA members.

The system does not generate reports in case of a reload.

During a process crash, the following is collected locally from the switch:

1. Full process core
2. Tracelogs
3. IOS syslogs (not guaranteed in case of non-active crashes)
4. System process information
5. Bootup logs
6. Reload logs
7. Certain types of `/proc` information

This information is stored in separate files which are then archived and compressed into one bundle. This makes it convenient to get a crash snapshot in one place, and can be then moved off the box for analysis. This report is generated before the switch goes down to rommon/bootloader.

Except for the full core and tracelogs, everything else is a text file.

**Crashinfo Files**

By default the system report file will be generated and saved into the `/crashinfo` directory. If it cannot be saved to the crashinfo partition for lack of space, then it will be saved to the `/flash` directory.
To display the files, enter the **dir crashinfo**: command. The following is sample output of a crashinfo directory:

```
Switch#dir crashinfo:
Directory of crashinfo:/
46553 drwx 1024 Jun 29 2015 14:52:09 +00:00 ap_crash
12 -rw- 0 Jan 1 1970 00:00:11 +00:00 koops.dat

23 -rw- 3425350 Sep 9 2015 09:28:47 +00:00 crashinfo_iosd_20150909-092728-UTC
24 -rw- 9535535 Sep 9 2015 09:28:47 +00:00 fullcore_iosd_20150909-092728-UTC
25 -rw- 459709 Sep 9 2015 09:29:28 +00:00 system-report_1_20150909-092728-UTC.gz
26 -rw- 0 Sep 22 2015 11:13:33 +00:00 tracelogs.J8C
50601 drwx 10240 Oct 28 2015 22:42:50 +00:00 tracelogs
```

System reports are located in the crashinfo directory in the following format:

```
system-report_[switch number]_[date]_[timestamp]-UTC.gz
```

After a switch crashes, check for a system report file. The name of the most recently generated system report file is stored in the *last_systemreport* file under the crashinfo directory. The system report and crashinfo files assist TAC while troubleshooting the issue.

The system report generated can be further copied using TFTP, HTTP and few other options.

```
Switch#copy crashinfo: ?
crashinfo: Copy to crashinfo: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
http: Copy to http: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
running-config Update (merge with) current system configuration
scp: Copy to scp: file system
startup-config Copy to startup configuration
syslog: Copy to syslog: file system
system: Copy to system: file system
tftp: Copy to tftp: file system
tmpsys: Copy to tmpsys: file system
```

The general syntax for copying onto TFTP server is as follows:

```
Switch#copy crashinfo: tftp: 
Source filename [system-report_1_20150909-092728-UTC.gz]?
Address or name of remote host []? 1.1.1.1
Destination filename [system-report_1_20150909-092728-UTC.gz]?
```

The tracelogs from all members in the stack can be collected by issuing a trace archive command. This command provides time period options. The command syntax is as follows:

```
Switch#request platform software trace archive ?
last Archive trace files of last x days
target Location and name for the archive file
```
The tracelogs stored in crashinfo: or flash: directory from within the last 3650 days can be collected.

```
Switch# request platform software trace archive last ?
<1-3650> Number of days (1-3650)
Switch# request platform software trace archive last 3650 days target ?
crashinfo: Archive file name and location
flash: Archive file name and location
```

**Note** It is important to clear the system reports or trace archives from flash or crashinfo directory once they are copied out, in order to have space available for tracelogs and other purposes.

---

### Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Device. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Device problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Device and small form-factor pluggable (SFP) modules. The Device stores this information in the flash memory:

- **CLI commands**—Record of the OBFL CLI commands that are entered on a standalone Device or a switch stack member.
- **Environment data**—Unique device identifier (UDI) information for a standalone Device or a switch stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- **Message**—Record of the hardware-related system messages generated by a standalone Device or a switch stack member.
- **Power over Ethernet (PoE)**—Record of the power consumption of PoE ports on a standalone Device or a switch stack member.
- **Temperature**—Temperature of a standalone Device or a switch stack member.
- **Uptime data**—Time when a standalone Device or a switch stack member starts, the reason the Device restarts, and the length of time the Device has been running since it last restarted.
- **Voltage**—System voltages of a standalone Device or a switch stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Device is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the Device fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Device is restarted, there is a 10-minute delay before logging of new data begins.

---

### Fan Failures

By default, the feature is disabled. When more than one of the fans fails in a field-replaceable unit (FRU) or in a power supply, the Device does not shut down, and this error message appears:
Multiple fan (FRU/PS) failure detected. System may get overheated. Change fan quickly.

The Device might overheat and shut down.

To enable the fan failures feature, enter the `system env fan-fail-action shut` privileged EXEC command. If more than one fan in the Device fails, the Device automatically shuts down, and this error message appears:

Faulty (FRU/PS) fans detected, shutting down system!

After the first fan shuts down, if the Device detects a second fan failure, the Device waits for 20 seconds before it shuts down.

To restart the Device, it must be power cycled.

### Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>You may see increased system memory usage when Cisco Catalyst 4500E Supervisor Engine 8-E is used in wireless mode.</td>
</tr>
</tbody>
</table>

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

### How to Troubleshoot the Software Configuration

#### Recovering from a Software Failure

**Before you begin**

This recovery procedure requires that you have physical access to the switch.

This procedure uses boot loader commands and TFTP to recover from a corrupted or incorrect image file.

**Step 1**  
From your PC, download the software image file *(image.bin)* from Cisco.com.

**Step 2**  
Load the software image to your TFTP server.
Step 3 Connect your PC to the switch Ethernet management port.

Step 4 Unplug the switch power cord.

Step 5 Press the Mode button, and at the same time, reconnect the power cord to the switch.

Step 6 From the bootloader (ROMMON) prompt, ensure that you can ping your TFTP server.

   a) Set the IP address switch: set IP_ADDRESS ip_address subnet_mask

   Example:
   switch: set IP_ADDRESS 192.0.2.123/255.255.255.0

   b) Set the default router IP address switch: set DEFAULT ROUTER ip_address

   Example:
   switch: set DEFAULT ROUTER 192.0.2.1

   c) Verify that you can ping the TFTP server switch: ping ip_address_of_TFTP_server

   Example:
   switch: ping 192.0.2.15
   ping 192.0.2.1 with 32 bytes of data...
   Host 192.0.2.1 is alive.
   switch:

Step 7 Verify that you have a recovery image in your recovery partition (sda9:).

This recovery image is required for recovery using the emergency-install feature.

Example:

switch: dir sda9:
Directory of sda9:/

 2 drwx 1024 .
 2 drwx 1024 ..
11 -rw- 18923068 c3850-recovery.bin

36939776 bytes available (20830208 bytes used)
switch:

Step 8 From the bootloader (ROMMON) prompt, initiate the emergency-install feature that assists you in recovering the software image on your switch.

WARNING: The emergency install command will erase your entire boot flash!

Example:

Switch# emergency-install
tftp://192.0.2.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin

The bootflash will be erased during install operation, continue (y/n)?y
Starting emergency recovery
(tftp://192.0.2.47/cat3k/cat3k_caa-universalk9.SPA.03.02.00.SE.150-1.EX.bin)...

Kernel Size : 0x318261/3244641
Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.
SUMMARY STEPS

1. Connect a terminal or PC to the switch.
2. Set the line speed on the emulation software to 9600 baud.
3. Power off the standalone switch or the entire switch stack.
4. Reconnect the power cord to the or the active switch. Within 15 seconds, press the Mode button while the System LED is still flashing green. Continue pressing the Mode button until a prompt is seen; then release the Mode button.
5. After recovering the password, reload the switch or the active switch.

DETAILED STEPS

**Step 1** Connect a terminal or PC to the switch.
- Connect a terminal or a PC with terminal-emulation software to the switch console port.
- Connect a PC to the Ethernet management port.

**Step 2** Set the line speed on the emulation software to 9600 baud.

**Step 3** Power off the standalone switch or the entire switch stack.

**Step 4** Reconnect the power cord to the or the active switch. Within 15 seconds, press the Mode button while the System LED is still flashing green. Continue pressing the Mode button until a prompt is seen; then release the Mode button.

---

Switch:
Xmodem file system is available.
Base ethernet MAC Address: 20:37:06:4d:e9:80
Verifying bootloader digital signature.

The system has been interrupted prior to loading the operating system software, console will be reset to 9600 baud rate.

Proceed to the Procedure with Password Recovery Enabled section, and follow the steps.

**Step 5** After recovering the password, reload the switch or the active switch.

On a switch:

```
Switch> reload
Proceed with reload? [confirm] y
```

---

**Procedure with Password Recovery Enabled**

If the password-recovery operation is enabled, this message appears:

**Step 1** Initialize the flash file system.
Switch: `flash_init`

**Step 2**
Ignore the startup configuration with the following command:

Switch: `SWITCH_IGNORE_STARTUP_CFG=1`

**Step 3**
Boot the switch with the `packages.conf` file from flash.

Switch: `boot flash:packages.conf`

**Step 4**
Terminate the initial configuration dialog by answering **No**.

Would you like to enter the initial configuration dialog? [yes/no]: **No**

**Step 5**
At the switch prompt, enter privileged EXEC mode.

Switch> `enable`
Switch#  

**Step 6**
Copy the startup configuration to running configuration.

Switch# `copy startup-config running-config` Destination filename [running-config]?  
Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

**Step 7**
Enter global configuration mode and change the **enable** password.

Switch# `configure terminal`
Switch(config)#

**Step 8**
Write the running configuration to the startup configuration file.

Switch(config)# `copy running-config startup-config`

**Step 9**
Confirm that manual boot mode is enabled.

Switch# `show boot`

BOOT variable = flash:packages.conf;  
Manual Boot = yes  
Enable Break = yes

**Step 10**
Reload the device.
Switch# reload

**Step 11**  
Return the Bootloader parameters (previously changed in Steps 2 and 3) to their original values.

```
switch: SWITCH_IGNORE_STARTUP_CFG=0
```

**Step 12**  
Boot the device with the `packages.conf` file from flash.

```
Switch: boot flash:packages.conf
```

**Step 13**  
After the device boots up, disable manual boot on the device.

```
Switch(config)# no boot manual
```

---

**Procedure with Password Recovery Disabled**

If the password-recovery mechanism is disabled, this message appears:

> The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

---

**Caution**

Returning the Device to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Device and VLAN configuration files.

- If you enter n (no), the normal boot process continues as if the **Mode** button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue........

- If you enter y (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

**Step 1**  
Choose to continue with password recovery and delete the existing configuration:
Would you like to reset the system back to the default configuration (y/n)? Y

**Step 2** Display the contents of flash memory:

Device: dir flash:

The Device file system appears.

```
Directory of flash:/
.
.
..i'
15494 drwx 4096 Jan 1 2000 00:20:20 +00:00 kirch
15508 -rw- 258065648 Sep 4 2013 14:19:03 +00:00 cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
162196684
```

**Step 3** Boot up the system:

Device: boot

You are prompted to start the setup program. To continue with password recovery, enter N at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 4** At the Device prompt, enter privileged EXEC mode:

Device> enable

**Step 5** Enter global configuration mode:

Device# configure terminal

**Step 6** Change the password:

Device(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 7** Return to privileged EXEC mode:

Device(config)# exit
Device#

**Note** Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized.

**Step 8** Write the running configuration to the startup configuration file:
Device# copy running-config startup-config

The new password is now in the startup configuration.

**Step 9**
You must now reconfigure the Device. If the system administrator has the backup Device and VLAN configuration files available, you should use those.

---

**Preventing Switch Stack Problems**

To prevent switch stack problems, you should do the following:

- Make sure that the Device that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.
- Press the **Mode** button on a stack member until the Stack mode LED is on. The last two port LEDs on the Device should be green. Depending on the Device model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.
- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.
- Manually assigning stack member numbers according to the placement of the Device in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the Device have manually assigned numbers if you add, remove, or rearrange Device later. Use the `switch current-stack-member-number renumber new-stack-member-number` global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new Device functions with the exact same configuration as the replaced Device. This is also assuming the new Device is using the same member number as the replaced Device.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.

For the commands that you can use to monitor the switch stack and its members, see the *Displaying Switch Stack Information* section.
Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Device settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Device performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

Note
If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Device, the Device software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

Note
The security error message references the GBIC_SECURITY facility. The Device supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the Device, and replace it with a Cisco module. After inserting a Cisco SFP module, use the `errdisable recovery cause gbic-invalid` global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Device brings the interface out of the error-disabled state and retries the operation. For more information about the `errdisable recovery` command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.
Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the `show interfaces transceiver` command in the command reference for this release.

Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Device.

Note

Though other protocol keywords are available with the `ping` command, they are not supported in this release.

Use this command to ping another device on the network from the Device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping ip host</td>
<td>address</td>
</tr>
<tr>
<td>Device# ping 172.20.52.3</td>
<td></td>
</tr>
</tbody>
</table>

Monitoring Temperature

The Device monitors the temperature conditions and uses the temperature information to control the fans.

Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Device (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.

Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>tracetroutemac [interface interface-id]</td>
<td>Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.</td>
</tr>
</tbody>
</table>
### Executing IP Traceroute

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tracert</code> <code>mac ip</code> `{source-ip-address</td>
<td>source-hostname}<code> </code>{destination-ip-address</td>
</tr>
</tbody>
</table>

**Purpose**

Though other protocol keywords are available with the `tracert` privileged EXEC command, they are not supported in this release.

### Running TDR and Displaying the Results

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command.

To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command.

### Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note**

Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see *Configuring System Message Logging*.

### Using the show platform forward Command

The output from the `show platform forward` privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the
parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the Device application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Using the show debug command

The `show debug` command is entered in privileged EXEC mode. This command displays all debug options available on the switch.

To view all conditional debug options run the command `show debug condition`. The commands can be listed by selecting either a condition identifier `<1-1000>` or `all` conditions.

To disable debugging, use the `no debug all` command.

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.

Configuring OBFL

Caution

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the `hw-switch switch switch-number logging onboard message` command in global configuration mode. On switches, the range for `switch-number` is from 1 to 9.

- To copy the OBFL data to the local network or a specific file system, use the `copy onboard switch switch-number url url-destination` privileged EXEC command.

- To disable OBFL, use the `no hw-switch switch switch-number logging onboard message` command in global configuration mode.

- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the `clear onboard switch switch-number` privileged EXEC command.

- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the `hw-switch switch switch-numberlogging onboard message` command in global configuration mode.

- You can enable or disable OBFL on a member switch from the active switch.
## Verifying Troubleshooting of the Software Configuration

### Displaying OBFL Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show onboard switch switch-number clilog</code></td>
<td>Displays the OBFL CLI commands that were entered on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 clilog</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number environment</code></td>
<td>Displays the UDI information for a standalone switch or the specified stack members and for all the connected FRU devices: the PID, the VID, and the serial number.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 environment</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number message</code></td>
<td>Displays the hardware-related messages generated by a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 message</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number counter</code></td>
<td>Displays the counter information on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 counter</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number temperature</code></td>
<td>Displays the temperature of a standalone switch or the specified switch stack members.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 temperature</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number uptime</code></td>
<td>Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch or specified stack members have been running since they last restarted.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 uptime</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number voltage</code></td>
<td>Displays the system voltages of a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 voltage</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number status</code></td>
<td>Displays the status of a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>device# show onboard switch 1 status</code></td>
<td></td>
</tr>
</tbody>
</table>
### Example: Verifying the Problem and Cause for High CPU Utilization

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```bash
Device# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRFC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

### Table 213: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.”</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts.</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”</td>
</tr>
</tbody>
</table>
Scenarios for Troubleshooting the Software Configuration

Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 214: Power over Ethernet Troubleshooting Scenarios

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
</table>
| Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports. | **Verify that the powered device works on another PoE port.**  
Use the `show run`, or `show interface status` user EXEC commands to verify that the port is not shut down or error-disabled.  
**Note** Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional.  
Verify that `power inline never` is not configured on that interface or port.  
Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host.  
**Note** Cisco powered device works only with straight cable and not with crossover one.  
Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters.  
Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on.  
If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the `show inline power` command to verify the amount of available power. |
<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>No PoE on all ports or a group of ports. Trouble is on all switch ports.</td>
<td>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch. If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch. Use the <code>show log</code> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes. If there are no alarms, use the <code>show interface status</code> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <code>shut</code> and <code>no shut</code> interface configuration commands to reenable the ports. Use the <code>show env power</code> and <code>show power inline</code> privileged EXEC commands to review the PoE status and power budget (available PoE). Review the running configuration to verify that <code>power inline never</code> is not configured on the ports. Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <code>shut</code> and <code>no shut</code> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected. Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port. Use the <code>show power inline</code> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on. If a powered device can power on when only one powered device is connected to the switch, enter the <code>shut</code> and <code>no shut</code> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <code>show interface status</code> and <code>show power inline</code> privileged EXEC commands to monitor inline power statistics and port status. If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</td>
</tr>
</tbody>
</table>
### Symptom or Problem

**Cisco pre-standard powered device disconnects or resets.**

After working normally, a Cisco phone intermittently reloads or disconnects from PoE.

**IEEE 802.3af-compliant or IEEE 802.3at-compliant powered devices do not work on Cisco PoE switch.**

A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.

### Possible Cause and Solution

Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads.

Verify that the cable length is not more than 100 meters from the switch port to the powered device.

Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs.

Notice whether any error messages appear at the same time a disconnect occurs. Use the `show log` privileged EXEC command to review error messages.

Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.)

Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.

Use the `show power inline` command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it.

Use the `show interface status` command to verify that the switch detects the connected powered device.

Use the `show log` command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or `inrush`) current that exceeds a current-limit threshold for the port.

### Configuration Examples for Troubleshooting Software

#### Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Device# ping 172.20.52.3
```

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:

```
!!!!!
```
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>
</tr>
<tr>
<td>C</td>
<td>A congestion experienced packet was received.</td>
</tr>
<tr>
<td>I</td>
<td>User interrupted test.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Packet lifetime exceeded.</td>
</tr>
</tbody>
</table>

To end a ping session, enter the escape sequence (Ctrl-^X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

**Example: Performing a Traceroute to an IP Host**

This example shows how to perform a `traceroute` to an IP host:

```
Device# traceroute ip 192.0.2.10
Type escape sequence to abort.
Tracing the route to 192.0.2.10
1 192.0.2.1 0 msec 0 msec 4 msec
2 192.0.2.203 12 msec 8 msec 0 msec
3 192.0.2.100 4 msec 0 msec 0 msec
4 192.0.2.10 0 msec 4 msec 0 msec
```

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>The probe timed out.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>A</td>
<td>Administratively unreachable. Usually, this output means that an access list is blocking traffic.</td>
</tr>
<tr>
<td>H</td>
<td>Host unreachable.</td>
</tr>
<tr>
<td>N</td>
<td>Network unreachable.</td>
</tr>
<tr>
<td>Character</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>----------------------</td>
</tr>
<tr>
<td>P</td>
<td>Protocol unreachable.</td>
</tr>
<tr>
<td>Q</td>
<td>Source quench.</td>
</tr>
<tr>
<td>U</td>
<td>Port unreachable.</td>
</tr>
</tbody>
</table>

To end a trace in progress, enter the escape sequence (Ctrl-^X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys and then press the X key.

### Example: Enabling All System Diagnostics

⚠️ **Caution**

Because debugging output takes priority over other network traffic, and because the `debug all` privileged EXEC command generates more output than any other `debug` command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific `debug` commands.

This command disables all-system diagnostics:

```
Device# debug all
```

The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about VideoStream

The IEEE 802.11 wireless multicast delivery mechanism does not provide a reliable way to acknowledge lost or corrupted packets. The multicast frame packets are sent at a predetermined rate irrespective of the wireless client optimal data rate. As a result, if any multicast packet is lost in the air, it is not sent again which may cause an IP multicast stream unviewable. Also if the packets are delivered faster, the packets get congested.

The VideoStream feature makes the delivery of the IP multicast stream reliable over air, by converting the multicast frame to a unicast frame over the air. Each VideoStream client acknowledges receiving a video IP multicast stream.

Prerequisites for VideoStream

- Make sure that the Multicast feature is enabled. We recommend that you configure IP multicast on the controller in multicast-multicast mode.
• Check for the IP address on the client machine. The machine should have an IP address from the respective VLAN.
• Verify that the access points have joined the controllers.

Restrictions for Configuring VideoStream

IGMP snooping is required to switch ON for this MC2UC feature to be functional.

How to Configure VideoStream

Configuring Multicast-Direct Globally for Media Stream

SUMMARY STEPS

1. configure terminal
2. wireless multicast
3. ip igmp snooping
4. ip igmp snooping querier
5. wireless media-stream multicast-direct
6. wireless media-stream message
7. wireless media-stream group name startIp endIp
8. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> wireless multicast</td>
<td>Enables multicast for wireless forwarding.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ip igmp snooping</td>
<td>Enables IGMP snooping on a per-VLAN basis. If the global setting is disabled, then all the VLANs are treated as disabled, whether they are enabled or not.</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip igmp snooping querier</td>
<td>Configures a snooping querier on an interface when there is no multicast router in the VLAN to generate queries.</td>
</tr>
<tr>
<td><strong>Step 5</strong> wireless media-stream multicast-direct</td>
<td>Configures the global multicast-direct on the controller.</td>
</tr>
<tr>
<td>Example: (config)#wireless media-stream multicast-direct</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Step 6**

**wireless media-stream message**

*Example:*

```plaintext
(config)# wireless media-stream message ?
  Email Configure Session Announcement Email
  Notes Configure Session Announcement notes
  URL Configure Session Announcement URL
  phone Configure Session Announcement Phone
```

Configures various message-configuration parameters such as phone, URL, email, and notes. That is, when a media stream is refused (due to bandwidth constraints), a message can be sent to the corresponding user. These parameters configure the messages that are to be sent to the IT support email address, notes (message be displayed explaining why the stream was refused), URL to which the user can be redirected, and the phone number that the user can call about the refused stream.

**Step 7**

**wireless media-stream group name startlp endlp**

*Example:*

```plaintext
(config)# wireless media-stream group grp1 231.1.1.1 239.1.1.3
```

Configures each media stream and its parameters such as expected multicast destination addresses, stream bandwidth consumption, and stream-priority parameters.

**Step 8**

**end**

*Example:*

```plaintext
Device(config)# end
```

Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VTP

Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more devices and have those changes automatically communicated to all the other devices in the network. Without VTP, you cannot send information about VLANs to other devices.

VTP is designed to work in an environment where updates are made on a single device and are sent through VTP to other devices in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on devices in the same domain, which would result in an inconsistency in the VLAN database.
The device supports a total of 4094 VLANs. However, the number of configured features affects the usage of the device hardware. If the device is notified by VTP of a new VLAN and the device is already using the maximum available hardware resources, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the `show vlan` user EXEC command shows the VLAN in a suspended state.

You can enable or disable VTP per port by entering the `[no] vtp` interface configuration command. When you disable VTP on trunking ports, all VTP instances for that port are disabled. You cannot set VTP to `off` for the MST database and `on` for the VLAN database on the same port.

When you globally set VTP mode to off, it applies to all the trunking ports in the system. However, you can specify on or off on a per-VTP instance basis. For example, you can configure the device as a VTP server for the VLAN database but with VTP `off` for the MST database.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the device or device stack and that this trunk port is connected to the trunk port of another device. Otherwise, the device cannot receive any VTP advertisements.

- Adding a VTP Client to a VTP Domain (CLI), on page 2740
- VTP Domain, on page 2723
- VTP Modes, on page 2724

**Restrictions for VTP**

The following are restrictions for a VTP:

- You cannot have a device stack containing a mix of and switches.

---

**Caution**

Before adding a VTP client device to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. If you add a device that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

**Information About VTP**

**VTP**

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP functionality is supported across the stack, and all devices in the stack maintain the same VLAN and VTP configuration inherited from the active device. When a device learns of a new VLAN through VTP
messages or when a new VLAN is configured by the user, the new VLAN information is communicated to all devices in the stack.

When a device joins the stack or when stacks merge, the new devices get VTP information from the active device.

**VTP Domain**

A VTP domain (also called a VLAN management domain) consists of one device or several interconnected devices or device stacks under the same administrative responsibility sharing the same VTP domain name. A device can be in only one VTP domain. You make global VLAN configuration changes for the domain.

By default, the device is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the device receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The device then ignores advertisements with a different domain name or an earlier configuration revision number.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all devices in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a device for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other devices in the domain, and they affect only the individual device. However, configuration changes made when the device is in this mode are saved in the device running configuration and can be saved to the device startup configuration file.

## VTP Modes

Table 218: VTP Modes

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
</table>
| VTP server | In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other devices in the same VTP domain and synchronize their VLAN configurations with other devices based on advertisements received over trunk links.  
  
  VTP server is the default mode.  
  
  In VTP server mode, VLAN configurations are saved in NVRAM. If the device detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the device cannot be returned to VTP server mode until the NVRAM is functioning. |
| VTP client | A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode.  
  
  In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode. |
VTP Mode | Description
--- | ---
VTP transparent | VTP transparent devices do not participate in VTP. A VTP transparent device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent devices do forward VTP advertisements that they receive from other devices through their trunk interfaces. You can create, modify, and delete VLANs on a device in VTP transparent mode. When the device is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other devices. In this mode, VTP mode and domain name are saved in the device running configuration, and you can save this information in the device startup configuration file by using the `copy running-config startup-config` privileged EXEC command.
In a device stack, the running configuration and the saved configuration are the same for all devices in a stack.

VTP off | A device in VTP off mode functions in the same manner as a VTP transparent device, except that it does not forward VTP advertisements on trunks.

Related Topics
- Prerequisites for VTP, on page 2721
- Configuring VTP Mode (CLI), on page 2731

VTP Advertisements

Each device in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring devices receive these advertisements and update their VTP and VLAN configurations as necessary.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
- Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:

- VLAN IDs (including IEEE 802.1Q)
In VTP version 3, VTP advertisements also include the primary server ID, an instance number, and a start index.

Related Topics
Prerequisites for VTP, on page 2721

VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:

- Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.
- Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the device is operating in VTP server mode.
- Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent device inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent device forwards a message only when the domain name matches.
- Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

Related Topics
Enabling the VTP Version (CLI), on page 2736

VTP Version 3

VTP version 3 supports these features that are not supported in version 1 or version 2:

- Enhanced authentication—You can configure the authentication as hidden or secret. When hidden, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format in the running configuration. You must reenter the password if you enter a takeover command in the domain. When you enter the secret keyword, you can directly configure the password secret key.
- Support for extended range VLAN (VLANs 1006 to 4094) database propagation—VTP versions 1 and 2 propagate only VLANs 1 to 1005.
VTP pruning still applies only to VLANs 1 to 1005, and VLANs 1002 to 1005 are still reserved and cannot be modified.

- Support for any database in a domain—In addition to propagating VTP information, version 3 can propagate Multiple Spanning Tree (MST) protocol database information. A separate instance of the VTP protocol runs for each application that uses VTP.

- VTP primary server and VTP secondary servers—A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to its NVRAM. By default, all devices come up as secondary servers. You can enter the vtp primary privileged EXEC command to specify a primary server. Primary server status is only needed for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers. Primary server status is lost if the device reloads or domain parameters change, even when a password is configured on the device.

- With VTP version 3 in server mode the VLAN configuration is saved into vlan.dat file. VLAN configuration is not saved in NVRAM as is the case in the transparent mode. While taking a backup of the switch configuration, you also have to take a backup of the vlan.dat file.

VTP versions 1 and 2 are capable of publishing only standard VLANs (VLANs 1 to 1001) and extended VLANs (VLANs 1006 to 4094) are stored locally in the flash drive or the running configuration. VTP version 3 is capable of publishing extended VLANs to the entire VTP domain and extended VLANs are not stored locally.

Related Topics
Enabling the VTP Version (CLI), on page 2736

VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a device floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving devices might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible device trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

Figure 140: Flooding Traffic without VTP Pruning

VTP pruning is disabled in the switched network. Port 1 on Device A and Port 2 on Device D are assigned to the Red VLAN. If a broadcast is sent from the host connected to Device A, Device A floods the broadcast and every device in the network receives it, even though Devices C, E, and F have no ports in the Red VLAN.
VTP pruning is enabled in the switched network. The broadcast traffic from Device A is not forwarded to Devices C, E, and F because traffic for the Red VLAN has been pruned on the links shown (Port 5 on Device B and Port 4 on Device D).

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each device in the domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all devices in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

**Related Topics**

- Enabling VTP Pruning (CLI), on page 2737

**VTP and Device Stacks**

VTP configuration is the same in all members of a device stack. When the device stack is in VTP server, client, or transparent mode, all devices in the stack carry the same VTP configuration.

- When a device joins the stack, it inherits the VTP and VLAN properties of the active switch.
- All VTP updates are carried across the stack.
When VTP mode is changed in a device in the stack, the other devices in the stack also change VTP mode, and the device VLAN database remains consistent.

VTP version 3 functions the same on a standalone device or a stack except when the device stack is the primary server for the VTP database. In this case, the MAC address of the active switch is used as the primary server ID. If the active device reloads or is powered off, a new active switch is elected.

- If you do not configure the persistent MAC address feature, when the new active device is elected, it sends a takeover message using the current stack MAC address.

**Note**
By default the persistent MAC address is on.

### VTP Configuration Guidelines

#### VTP Configuration Requirements
When you configure VTP, you must configure a trunk port so that the device can send and receive VTP advertisements to and from other devices in the domain.

#### VTP Settings
The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the device running configuration file, and you can save it in the device startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the device resets.

When you save VTP information in the device startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

#### Related Topics
- Configuring VTP on a Per-Port Basis (CLI), on page 2738
- Configuring a VTP Version 3 Primary Server (CLI), on page 2735

#### Domain Names for Configuring VTP
When configuring VTP for the first time, you must always assign a domain name. You must configure all devices in the VTP domain with the same domain name. Devices in VTP transparent mode do not exchange VTP messages with other devices, and you do not need to configure a VTP domain name for them.
If the NVRAM and DRAM storage is sufficient, all devices in a VTP domain should be in VTP server mode.

**Note**

Do not configure a VTP domain if all devices are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one device in the VTP domain for VTP server mode.

**Caution**

Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain devices must share the same password and you must configure the password on each device in the management domain. Devices without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a device that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the device accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new device to an existing network with VTP capability, the new device learns the domain name only after the applicable password has been configured on it.

**Caution**

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each device in the domain.

VTP Version

Follow these guidelines when deciding which VTP version to implement:

- All devices in a VTP domain must have the same domain name, but they do not need to run the same VTP version.

- A VTP version 2-capable device can operate in the same VTP domain as a device running VTP version 1 if version 2 is disabled on the version 2-capable device (version 2 is disabled by default).

- If a device running VTP version 1, but capable of running VTP version 2, receives VTP version 3 advertisements, it automatically moves to VTP version 2.

- If a device running VTP version 3 is connected to a device running VTP version 1, the VTP version 1 device moves to VTP version 2, and the VTP version 3 device sends scaled-down versions of the VTP packets so that the VTP version 2 device can update its database.

- A device running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.
• Do not enable VTP version 2 on a device unless all of the devices in the same VTP domain are version-2-capable. When you enable version 2 on a device, all of the version-2-capable devices in the domain enable version 2. If there is a version 1-only device, it does not exchange VTP information with devices that have version 2 enabled.

• Cisco recommends placing VTP version 1 and 2 devices at the edge of the network because they do not forward VTP version 3 advertisements.

• If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.

• When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.

• When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.

• A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.

• Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.

• Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.

How to Configure VTP

Configuring VTP Mode (CLI)

You can configure VTP mode as one of these:

• VTP server mode—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.

• VTP client mode—In VTP client mode, you cannot change its VLAN configuration. The client device receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.
• VTP transparent mode—In VTP transparent mode, VTP is disabled on the device. The device does not send VTP updates and does not act on VTP updates received from other device. However, a VTP transparent device running VTP version 2 does forward received VTP advertisements on its trunk links.

• VTP off mode—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a device to a different domain.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vtp domain domain-name`
4. `vtp mode {client | server | transparent | off} {vlan | mst | unknown}`
5. `vtp password password`
6. `end`
7. `show vtp status`
8. `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| `configure terminal` | |
| **Example:**      | |
| Device# `configure terminal` | |

| **Step 3**        | Configures the VTP administrative-domain name. The name can be 1 to 32 characters. All devices operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name. |
| `vtp domain domain-name` | |
| **Example:**      | This command is optional for modes other than server mode. VTP server mode requires a domain name. If the device has a trunk connection to a VTP domain, the device learns the domain name from the VTP server in the domain. You should configure the VTP domain before configuring other VTP parameters. |
| Device(config)# `vtp domain eng_group` | |
### Configuring a VTP Version 3 Password (CLI)

You can configure a VTP version 3 password on the device.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `vtp version 3`
4. `vtp password [hidden | secret] password`
5. `end`

#### Purpose

- **Configure the device for VTP mode (client, server, transparent, or off).**
  - *vlan*—The VLAN database is the default if none are configured.
  - *mst*—The multiple spanning tree (MST) database.
  - *unknown*—An unknown database type.

<td></td>
</tr>
<tr>
<td>Step 8</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves the configuration in the startup configuration file. Only VTP mode and domain name are saved in the device running configuration and can be copied to the startup configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable  
  Example: Device> enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** configure terminal  
  Example: Device# configure terminal | Enters global configuration mode. |
| **Step 3** vtp version 3  
  Example: Device(config)# vtp version 3 | Enables VTP version 3 on the device. The default is VTP version 1. |
| **Step 4** vtp password **password** [hidden | secret]  
  Example: Device(config)# vtp password mypassword hidden | (Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters.  
  - (Optional) **hidden**—Saves the secret key generated from the password string in the nvram: vlan.dat file. If you configure a takeover by configuring a VTP primary server, you are prompted to reenter the password.  
  - (Optional) **secret**—Directly configures the password. The secret password must contain 32 hexadecimal characters. |
| **Step 5** end  
  Example: Device(config)# end | Returns to privileged EXEC mode. |
| **Step 6** show vtp password  
  Example: Device# show vtp password | Verifies your entries. The output appears like this:  
  VTP password: 89914640C8D90868B6A0D8103847A733 |
### Configuring a VTP Version 3 Primary Server (CLI)

When you configure a VTP server as a VTP primary server, the takeover operation starts.

#### SUMMARY STEPS

1. `vtp version 3`
2. `vtp primary [vlan | mst] [force]`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `vtp version 3`  
Example:  
Device(config)# vtp version 3 | Enables VTP version 3 on the device. The default is VTP version 1. |
| Step 2 | `vtp primary [vlan | mst] [force]`  
Example:  
Device# vtp primary vlan force | Changes the operational state of a device from a secondary server (the default) to a primary server and advertises the configuration to the domain. If the device password is configured as `hidden`, you are prompted to reenter the password.  
- (Optional) `vlan`—Selects the VLAN database as the takeover feature. This is the default.  
- (Optional) `mst`—Selects the multiple spanning tree (MST) database as the takeover feature.  
- (Optional) `force`—Overwrites the configuration of any conflicting servers. If you do not enter `force`, you are prompted for confirmation before the takeover. |

Enabling the VTP Version (CLI)

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a device, every VTP version 2-capable device in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each device.

- With VTP versions 1 and 2, you can configure the version only on devices in VTP server or transparent mode. If a device is running VTP version 3, you can change to version 2 when the device is in client mode if no extended VLANs exist, and no hidden password was configured.

Caution

VTP version 1 and VTP version 2 are not interoperable on devices in the same VTP domain. Do not enable VTP version 2 unless every device in the VTP domain supports version 2.

- In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.

Caution

In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

SUMMARY STEPS

1. enable
2. configure terminal
3. vtp version {1 | 2 | 3}
4. end
5. show vtp status
6. copy running-config startup-config

### Enabling VTP Pruning (CLI)

#### Before you begin
VTP pruning is not designed to function in VTP transparent mode. If one or more devices in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the device upstream to the VTP transparent device pruning ineligible.

To configure VTP pruning on an interface, use the `switchport trunk pruning vlan` interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.
SUMMARY STEPS

1. enable
2. configure terminal
3. vtp pruning
4. end
5. show vtp status

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<td></td>
</tr>
</tbody>
</table>
Adding a VTP Client to a VTP Domain (CLI)

Follow these steps to verify and reset the VTP configuration revision number on a device before adding it to a VTP domain.

Before you begin

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other devices in the VTP domain. Devices in a VTP domain always use the VLAN configuration of the device with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a device that has a revision number higher than the revision number in the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the vtp mode transparent global configuration command to disable VTP on the device and then to change its VLAN information without affecting the other devices in the VTP domain.

SUMMARY STEPS

1. enable
2. show vtp status
3. configure terminal
4. vtp domain domain-name
5. end
6. show vtp status
7. configure terminal
8. vtp domain domain-name
9. end
10. show vtp status

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

Monitoring VTP

This section describes commands used to display and monitor the VTP configuration.

You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the device.

Table 219: VTP Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp counters</td>
<td>Displays counters about VTP messages that have been sent and received.</td>
</tr>
<tr>
<td>show vtp devices [conflict]</td>
<td>Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The show vtp devices command does not display information when the device is in transparent or off mode.</td>
</tr>
<tr>
<td>show vtp interface [interface-id]</td>
<td>Displays VTP status and configuration for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>show vtp password</td>
<td>Displays the VTP password. The form of the password displayed depends on whether or not the hidden keyword was entered and if encryption is enabled on the device.</td>
</tr>
<tr>
<td>show vtp status</td>
<td>Displays the VTP device configuration information.</td>
</tr>
</tbody>
</table>
Configuration Examples for VTP

Example: Configuring a Switch as the Primary Server

This example shows how to configure a device as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

Device# vtp primary vlan
Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain

VTP Database Conf Switch ID Primary Server Revision System Name
--- ---- ----------------- --------- ---------- ------------------
VLANDB Yes 00d0.00b8.1400-00d0.00b8.14001 stp7

Do you want to continue (y/n) [n]? y

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

• Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.

• If you plan to configure many VLANs on the device and to not enable routing, you can set the Switch Database Management (SDM) feature to the VLAN template, which configures system resources to support the maximum number of unicast MAC addresses.

• Devices running the LAN Base feature set support only static routing on SVIs.

• A VLAN should be present in the device to be able to add it to the VLAN group.
Restrictions for VLANs

The following are restrictions for VLANs:

- In the Cisco Catalyst 4500E Supervisor Engine, the number of device per-VLAN spanning-tree (PVST) or rapid PVST is based on the number of trunks on the switch multiplied by the number of active VLANs on the trunks, plus the number of non-trunking interfaces on the switch (trunks * VLANS + non-trunk ports). For MSTP, the maximum number of MST instances supported is 4094.

- The device supports IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.

- Configuring an interface VLAN router's MAC address is not supported. The interface VLAN already has an MAC address assigned by default.

- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

Information About VLANs

Logical Networks

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any device port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a device supporting fallback bridging. In a device stack, VLANs can be formed with ports across the stack. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the device is assigned manually on an interface-by-interface basis. When you assign device interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed.

The device can route traffic between VLANs by using device virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.

Supported VLANs

The device supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN 1 is the default VLAN and is created during system initialization. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs. All of the VLANs except 1002 to 1005 are available for user configuration.

There are 3 VTP versions: VTP version 1, version 2, and version 3. All VTP versions support both normal and extended range VLANs, but only with VTP version 3, does the device propagate extended range VLAN configuration information. When extended range VLANs are created in VTP versions 1 and 2, their
configuration information is not propagated. Even the local VTP database entries on the device are not updated, but the extended range VLANs configuration information is created and stored in the running configuration file.

You can configure up to 4049 VLANs on the device.

- Creating an Extended-Range VLAN (CLI), on page 2756
- Creating an Extended-Range VLAN with an Internal VLAN ID

**VLAN Port Membership Modes**

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the device learns and manages the addresses associated with the port on a per-VLAN basis.

**Table 220: Port Membership Modes and Characteristics**

<table>
<thead>
<tr>
<th>Membership Mode</th>

<td>A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.</td>
<td>VTP is not required; it has no effect on a voice VLAN.</td>
</tr>
</tbody>
</table>
VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the vlan.dat file (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The vlan.dat file is stored in flash memory. If the VTP mode is transparent, they are also saved in the device running configuration file.

In a device stack, the whole stack uses the same vlan.dat file and running configuration. On some devices, the vlan.dat file is stored in flash memory on the active device.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the device, the device configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.

- In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

Note

Ensure that you delete the vlan.dat file along with the configuration files before you reset the switch configuration using `write erase` command. This ensures that the switch reboots correctly on a reset.

Normal-Range VLAN Configuration Guidelines

Normal-range VLANs are VLANs with IDs from 1 to 1005.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

- Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.

- VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the device running configuration file.

- If the device is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)
• Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode.

• Before you can create a VLAN, the device must be in VTP server mode or VTP transparent mode. If the device is a VTP server, you must define a VTP domain or VTP will not function.

• The device does not support Token Ring or FDDI media. The device does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.

• The device supports 128 spanning tree instances. If a device has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs.

If you have already used all available spanning-tree instances on a device, adding another VLAN anywhere in the VTP domain creates a VLAN on that device that is not running spanning-tree. If you have the default allowed list on the trunk ports of that device (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent devices that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of devices that have used up their allocation of spanning-tree instances.

If the number of VLANs on the device exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your device to map multiple VLANs to a single spanning-tree instance.

• When a device in a stack learns a new VLAN or deletes or modifies an existing VLAN (either through VTP over network ports or through the CLI), the VLAN information is communicated to all stack members.

• When a device joins a stack or when stacks merge, VTP information (the vlan.dat file) on the new devices will be consistent with the active device.

Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

Follow these guidelines when creating extended-range VLANs:

• VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the device is running VTP version 3.

• You cannot include extended-range VLANs in the pruning eligible range.

• For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the device boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the device resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.
In a device stack, the whole stack uses the same running configuration and saved configuration, and extended-range VLAN information is shared across the stack.

## How to Configure VLANs

### How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type
  - Ethernet
  - Fiber Distributed Data Interface [FDDI]
  - FDDI network entity title [NET]
  - TrBRF or TrCRF
  - Token Ring
  - Token Ring-Net
- VLAN state (active or suspended)
- Security Association Identifier (SAID)
- Bridge identification number for TrBRF VLANs
- Ring number for FDDI and TrCRF VLANs
- Parent VLAN number for TrCRF VLANs
- Spanning Tree Protocol (STP) type for TrCRF VLANs
- VLAN number to use when translating from one VLAN type to another

You can cause inconsistency in the VLAN database if you attempt to manually delete the vlan.dat file. If you want to modify the VLAN configuration, follow the procedures in this section.
Creating or Modifying an Ethernet VLAN (CLI)

**Before you begin**

With VTP version 1 and 2, if the device is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

The device supports only Ethernet interfaces. Because FDDI and Token Ring VLANs are not locally supported, you only configure FDDI and Token Ring media-specific characteristics for VTP global advertisements to other devices.

Although the device does not support Token Ring connections, a remote device with Token Ring connections could be managed from one of the supported devices. Devices running VTP Version 2 advertise information about these Token Ring VLANs:

- Token Ring TrBRF VLANs
- Token Ring TrCRF VLANs

**SUMMARY STEPS**

1. `configure terminal`
2. `vlan vlan-id`
3. `name vlan-name`
4. `media { ethernet | fd-net | fddi | tokenring | trn-net }`
5. `remote-span`
6. `end`
7. `show vlan { name vlan-name | id vlan-id }`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code>&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;br&gt;Device# <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2 | `vlan vlan-id`<br><br>**Example:**<br><br>Device(config)# `vlan 20` | Enters a VLAN ID, and enters VLAN configuration mode.<br>Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN.  
**Note** The available VLAN ID range for this command is 1 to 4094. |
<p>| Step 3 | <code>name vlan-name</code>&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;br&gt;Device(config-vlan)# <code>name test20</code> | (Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the <code>vlan-id</code> value with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 4** media \{ ethernet | fd-net | fddi | tokenring | trn-net \} **Example:** Device(config-vlan)# media ethernet | Configures the VLAN media type. Command options include:  
  - **ethernet**—Sets the VLAN media type as Ethernet.  
  - **fd-net**—Sets the VLAN media type as FDDI net.  
  - **fddi**—Sets the VLAN media type as FDDI.  
  - **tokenring**—Sets the VLAN media type as Token Ring.  
  - **trn-net**—Sets the VLAN media type as Token Ring net. |
| **Step 5** remote-span **Example:** Device(config-vlan)# remote-span | (Optional) Configures the VLAN as the RSPAN VLAN for a remote SPAN session. For more information on remote SPAN, see the *Catalyst 3650 Network Management Configuration Guide*. |
| **Step 6** end **Example:** Device(config)# end | Returns to privileged EXEC mode. |
| **Step 7** show vlan \{name vlan-name | id vlan-id\} **Example:** Device# show vlan name test20 id 20 | Verifies your entries. |

**Deleting a VLAN (CLI)**

When you delete a VLAN from a device that is in VTP server mode, the VLAN is removed from the VLAN database for all devices in the VTP domain. When you delete a VLAN from a device that is in VTP transparent mode, the VLAN is deleted only on that specific device or a device stack.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

**Caution** When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no vlan vlan-id`
4. `end`
5. `show vlan brief`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device&gt; enable</td>
<td>Enables privileged EXEC mode.&lt;br&gt;• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>no vlan vlan-id</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# no vlan 4</td>
<td>Removes the VLAN by entering the VLAN ID.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show vlan brief</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# show vlan brief</td>
<td>Verifies the VLAN removal.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Assigning Static-Access Ports to a VLAN (CLI)

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

For the Cisco Catalyst 9500 Series Switches, if you are assigning a port on a cluster member device to a VLAN, first use the `rcommand` privileged EXEC command to log in to the cluster member switch.

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode access`
5. `switchport access vlan vlan-id`
6. `end`
7. `show running-config interface interface-id`
8. `show interfaces interface-id switchport`
9. `copy running-config startup-config`

**How to Configure Extended-Range VLANs**

Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any `switchport` commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the device running configuration file, and you can save
the configuration in the startup configuration file. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

You can change only the MTU size and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

Creating an Extended-Range VLAN (CLI)

SUMMARY STEPS

1. enable
2. configure terminal
3. vlan vlan-id
4. remote-span
5. exit
6. end
7. show vlan id vlan-id
8. copy running-config startup-config

### Command

```
show vlan [access-map name] [brief [dot1q {tag native}] [filter [access-map] vlan] [group [group-name name]] [id vlan-id] [ifindex] [mtu] [name name] [remote-span] [summary]]
```

### Purpose

Displays parameters for all VLANs or the specified VLAN on the device. The following command options are available:

- **access-map**—Displays the VLAN access-maps.
- **brief**—Displays VTP VLAN status in brief.
- **dot1q**—Displays the dot1q parameters.
- **filter**—Displays VLAN filter information.
- **group**—Displays the VLAN group with its name and the connected VLANs that are available.
- **id**—Displays VTP VLAN status by identification number.
- **ifindex**—Displays SNMP ifIndex.
- **mtu**—Displays VLAN MTU information.
- **name**—Displays the VTP VLAN information by specified name.
- **remote-span**—Displays the remote SPAN VLANs.
- **summary**—Displays a summary of VLAN information.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Groups

- A VLAN should be present in the device for it to be added to the VLAN group.

- For a VLAN group to function properly, in addition to enabling DHCP snooping globally, you must ensure that DHCP snooping is enabled in all the VLANs.

Restrictions for VLAN Groups

- The number of VLANs mapped to a VLAN group is not limited by Cisco IOS XE software release. However, if the number of VLANs in a VLAN group exceeds the recommended value of 32, the mobility functionality might not work as expected and in the VLAN group, L2 multicast breaks for some VLANs. Therefore, it is the responsibility of network administrators to configure feasible number of VLANs in
Information About VLAN Groups

Whenever a client connects to a wireless network (WLAN), the client is placed in a VLAN that is associated with the WLAN. In a large venue, such as an auditorium, a stadium, or a conference room where there are numerous wireless clients, having only a single WLAN to accommodate many clients might be a challenge.

The VLAN Groups feature uses a single WLAN that can support multiple VLANs. The clients can get assigned to one of the configured VLANs. This feature maps a WLAN to a single VLAN or multiple VLANs using the VLAN groups. When a wireless client associates to the WLAN, the VLAN is derived by an algorithm based on the MAC address of the wireless client. A VLAN is assigned to the client and the client gets the IP address from the assigned VLAN. This feature also extends the current AP group architecture and AAA override architecture, where the AP groups and AAA override can override a VLAN or a VLAN group to which the WLAN is mapped.

When a client associates with a WLAN and the WLAN is applied to a VLAN group, an index is calculated based on the MAC address of the client and the number of VLANs in the VLAN group using a hash algorithm. Based on this index, a VLAN is assigned to the client. If the index is "dirty," another index is generated in a round-robin manner and the VLAN is assigned to the client based on the newly generated index.

The system marks VLAN as Dirty for 30 minutes when the clients are unable to receive IP addresses using DHCP. The system might not clear the Dirty flag from the VLAN even after 30 minutes for a VLAN group. After 30 minutes, when the VLAN is marked non-dirty, new clients in the IP Learn state can get assigned with IP addresses from the VLAN if free IPs are available in the pool and DHCP scope is defined correctly. This is the expected behavior because the timestamp of each interface has to be checked to see if it is greater than 30 minutes, due to which there is a lag of 5 minutes for the global timer to expire.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco devices connected through IEEE 802.1Q trunks, the devices maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANS.

When you connect a Cisco device to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco device combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q device. However, spanning-tree information for each VLAN is maintained by Cisco devices separated by a cloud of non-Cisco IEEE 802.1Q devices. The non-Cisco IEEE 802.1Q cloud separating the Cisco devices is treated as a single trunk link between the devices.
• Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.

• Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

Restrictions for VLAN Trunks

The following are restrictions for VLAN trunks:

• A trunk port cannot be a secure port.

• Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
  • Allowed-VLAN list.
  • STP port priority for each VLAN.
  • STP Port Fast setting.
  • Trunk status:
    If one port in a port group ceases to be a trunk, all ports cease to be trunks.

• We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.

• If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

• A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

• Dynamic Trunking Protocol (DTP) is not supported on tunnel ports.

• The device does not support Layer 3 trunks; you cannot configure subinterfaces or use the encapsulation keyword on Layer 3 interfaces. The device does support Layer 2 trunks and Layer 3 VLAN interfaces, which provide equivalent capabilities.

• You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.
Information About VLAN Trunks

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet device interfaces and another networking device such as a router or a device. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

The following trunking encapsulations are available on all Ethernet interfaces:

- IEEE 802.1Q — Industry-standard trunking encapsulation.

Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the switchport trunk allowed setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting devices. To avoid loops, STP normally blocks all but one parallel link between devices. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same device. For load sharing using STP path costs, each load-sharing link can be connected to the same device or to two different devices.

Network Load Sharing Using STP Priorities

When two ports on the same device form a loop, the device uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.
Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

Feature Interactions

Trunking interacts with other features in these ways:

- A trunk port cannot be a secure port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the device propagates the setting that you entered to all ports in the group:
  - Allowed-VLAN list.
  - STP port priority for each VLAN.
  - STP Port Fast setting.
  - Trunk status:
    If one port in a port group ceases to be a trunk, all ports cease to be trunks.

- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

- A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

- If you do not intend to trunk across those links, use the `switchport mode access` interface configuration command to disable trunking.
To enable trunking to a device that does not support DTP, use the `switchport mode trunk` and `switchport nonegotiate` interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

### Configuring an Ethernet Interface as a Trunk Port

#### Configuring a Trunk Port (CLI)

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the device and that this trunk port is connected to the trunk port of a second device. Otherwise, the device cannot receive any VTP advertisements.

**Before you begin**

By default, an interface is in Layer 2 mode. The default mode for Layer 2 interfaces is `switchport mode dynamic auto`. If the neighboring interface supports trunking and is configured to allow trunking, the link is a Layer 2 trunk or, if the interface is in Layer 3 mode, it becomes a Layer 2 trunk when you enter the `switchport` interface configuration command.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport mode {dynamic {auto | desirable} | trunk}`
5. `switchport access vlan vlan-id`
6. `switchport trunk native vlan vlan-id`
7. `end`
8. `show interfaces interface-id switchport`
9. `show interfaces interface-id trunk`
10. `copy running-config startup-config`

**DETAILED STEPS**

</tbody>
</table>
Defining the Allowed VLANs on a Trunk (CLI)

VLAN 1 is the default VLAN on all trunk ports in all Cisco devices, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. switchport mode trunk
5. switchport trunk allowed vlan \{ word | add | all | except | none | remove\} vlan-list
6. end
7. show interfaces interface-id switchport
8. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the trunk configuration of the interface.</td>
<td>show interfaces interface-id trunk</td>
</tr>
<tr>
<td>(Optional) Saves your entries in the configuration file.</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Device# show interfaces gigabitethernet 1/0/2 trunk

Device# copy running-config startup-config
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Specifies the port to be configured, and enters interface configuration mode.</td>
</tr>
</tbody>
</table>

**Step 3**

interface interface-id  
Example:  
Device(config)# interface gigabitethernet 1/0/1  
Configures the interface as a VLAN trunk port.

**Step 4**

switchport mode trunk  
Example:  
Device(config-if)# switchport mode trunk

**Step 5**

switchport trunk allowed vlan { word | add | all | except | none | remove } vlan-list  
Example:  
Device(config-if)# switchport trunk allowed vlan remove 2
(Optional) Configures the list of VLANs allowed on the trunk.  
The `vlan-list` parameter is either a single VLAN number from 1 to 4094 or a range of VLANs described by two VLAN numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated VLAN parameters or in hyphen-specified ranges.  
All VLANs are allowed by default.

**Step 6**

end  
Example:  
Device(config)# end
Returns to privileged EXEC mode.

**Step 7**

show interfaces interface-id switchport  
Example:  
Device# show interfaces gigabitethernet 1/0/1 switchport
Verifies your entries in the *Trunking VLANs Enabled* field of the display.

**Step 8**

copy running-config startup-config  
Example:  
Device# copy running-config startup-config
(Optional) Saves your entries in the configuration file.

</tbody>
</table>
Configuring the Native VLAN for Untagged Traffic (CLI)

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the device forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the device sends the packet with a tag.

### SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport trunk native vlan vlan-id
5. end
6. show interfaces interface-id switchport
7. copy running-config startup-config

### Configuring Trunk Ports for Load Sharing

#### Configuring Load Sharing Using STP Port Priorities (CLI)

If your device is a member of a device stack, you must use the `spanning-tree [vlan vlan-id] cost cost` interface configuration command instead of the `spanning-tree [vlan vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

These steps describe how to configure a network with load sharing using STP port priorities.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2** | configure terminal  
Example: Device# configure terminal | Enters global configuration mode. |
| **Step 3** | interface interface-id  
Example: Device(config)# interface gigabitethernet 1/0/2 | Defines the interface that is configured as the IEEE 802.1Q trunk, and enters interface configuration mode. |
| **Step 4** | switchport trunk native vlan vlan-id  
Example: Device(config-if)# switchport trunk native vlan 12 | Configures the VLAN that is sending and receiving untagged traffic on the trunk port. For `vlan-id`, the range is 1 to 4094. |
| **Step 5** | end  
Example: Device(config-if)# end | Returns to privileged EXEC mode. |
| **Step 6** | show interfaces interface-id switchport  
Example: Device# show interfaces gigabitethernet 1/0/2 switchport | Verifies your entries in the Trunking Native Mode VLAN field. |
| **Step 7** | copy running-config startup-config  
Example: Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
SUMMARY STEPS

1. enable
2. configure terminal
3. vtp domain domain-name
4. vtp mode server
5. end
6. show vtp status
7. show vlan
8. configure terminal
9. interface interface-id
10. switchport mode trunk
11. end
12. show interfaces interface-id switchport
13. Repeat the above steps on Device A for a second port in the device or device stack.
14. Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A.
15. show vlan
16. configure terminal
17. interface interface-id
18. spanning-tree vlan vlan-range port-priority priority-value
19. exit
20. interface interface-id
21. spanning-tree vlan vlan-range port-priority priority-value
22. end
23. show running-config
24. copy running-config startup-config

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# vtp domain workdomain</td>
<td><strong>Configures Device A as the VTP server.</strong></td>
</tr>
</tbody>
</table>
| **Step 4** vtp mode server  
| **Example:**  
| Device(config)# vtp mode server | Returns to privileged EXEC mode. |
| **Step 5** end  
| **Example:**  
| Device(config)# end | **Verifies the VTP configuration on both Device A and Device B.**  
| | **In the display, check the *VTP Operating Mode* and the *VTP Domain Name* fields.** |
| **Step 6** show vtp status  
| **Example:**  
| Device# show vtp status | **Verifies that the VLANs exist in the database on Device A.** |
| **Step 7** show vlan  
| **Example:**  
| Device# show vlan | **Enters global configuration mode.** |
| **Step 8** configure terminal  
| **Example:**  
| Device# configure terminal | **Defines the interface to be configured as a trunk, and enters interface configuration mode.** |
| **Step 9** interface interface-id  
| **Example:**  
| Device(config)# interface gigabitethernet1/0/1 | **Configures the port as a trunk port.** |
| **Step 10** switchport mode trunk  
| **Example:**  
<p>| Device(config-if)# switchport mode trunk | <strong>Returns to privileged EXEC mode.</strong> |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config-if)# end</code></td>
<td></td>
</tr>
</tbody>
</table>
| **Step 12** | show interfaces interface-id switchport **Example:**
| `Device# show interfaces gigabitethernet 1/0/1 switchport` | Verifies the VLAN configuration. |
| **Step 13** | Repeat the above steps on Device A for a second port in the device or device stack. |
| **Step 14** | Repeat the above steps on Device B to configure the trunk ports that connect to the trunk ports configured on Device A. |
| **Step 15** | show vlan **Example:**
| `Device# show vlan` | When the trunk links come up, VTP passes the VTP and VLAN information to Device B. This command verifies that Device B has learned the VLAN configuration. |
| **Step 16** | configure terminal **Example:**
| `Device# configure terminal` | Enters global configuration mode on Device A. |
| **Step 17** | interface interface-id **Example:**
| `Device(config)# interface gigabitethernet 1/0/1` | Defines the interface to set the STP port priority, and enters interface configuration mode. |
| **Step 18** | spanning-tree vlan vlan-range port-priority priority-value **Example:**
| `Device(config-if)# spanning-tree vlan 8-10 port-priority 16` | Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16. |
| **Step 19** | exit **Example:**
| `Device(config-if)# exit` | Returns to global configuration mode. |
| **Step 20** | interface interface-id **Example:**
| | Defines the interface to set the STP port priority, and enters interface configuration mode. |
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# interface gigabitethernet 1/0/2</td>
</tr>
</tbody>
</table>

**Step 21**

**spanning-tree vlan vlan-range port-priority priority-value**

Assigns the port priority for the VLAN range specified. Enter a port priority value from 0 to 240. Port priority values increment by 16.

**Example:**

Device(config-if)# spanning-tree vlan 3-6 port-priority 16

**Step 22**

**end**

Returns to privileged EXEC mode.

**Example:**

Device(config-if)# end

**Step 23**

**show running-config**

Verifies your entries.

**Example:**

Device# show running-config

**Step 24**

**copy running-config startup-config**

(Optional) Saves your entries in the configuration file.

**Example:**

Device# copy running-config startup-config

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

• Voice VLAN configuration is only supported on device access ports; voice VLAN configuration is not supported on trunk ports.

Note

Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.
Before you enable voice VLAN, enable QoS on the device by entering the `trust device cisco-phone` interface configuration command. If you use the auto QoS feature, these settings are automatically configured.

You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all device interfaces.)

### Restrictions for Voice VLANs

You cannot configure static secure MAC addresses in the voice VLAN.

### Information About Voice VLAN

#### Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the device is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the device supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the device in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the device to trust or override the traffic priority assigned by a Cisco IP Phone.

*Figure 142: Cisco 7960 IP Phone Connected to a Device*

This network configuration is one way to connect a Cisco 7960 IP Phone.

The Cisco IP Phone contains an integrated three-port 10/100 device. The ports provide dedicated connections to these devices:

- Port 1 connects to the device or other voice-over-IP (VoIP) device.
- Port 2 is an internal 10/100 interface that carries the IP phone traffic.
- Port 3 (access port) connects to a PC or other device.
Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the device to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the device in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Related Topics
- Configuring Cisco IP Phone Voice Traffic (CLI), on page 2791
- Monitoring Voice VLAN, on page 2794

Cisco IP Phone Data Traffic

The device can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the device to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.
Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

**Related Topics**
- Configuring the Priority of Incoming Data Frames (CLI), on page 2793
- Monitoring Voice VLAN, on page 2794

**Voice VLAN Configuration Guidelines**

- Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the device to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.

- The voice VLAN should be present and active on the device for the IP phone to correctly communicate on the voice VLAN. Use the `show vlan` privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.

- The Power over Ethernet (PoE) devices are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.

- The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

- If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
  - They both use IEEE 802.1p or untagged frames.
  - The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
  - The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.
  - The Cisco IP Phone uses IEEE 802.1Q frames, and the voice VLAN is the same as the access VLAN.

- The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).

- Voice VLAN ports can also be these port types:
  - Dynamic access port.
  - IEEE 802.1x authenticated port.

- **Note** If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the device for up to 30 seconds.

- Protected port.

- A source or destination port for a SPAN or RSPAN session.
• Secure port.

Note When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.

How to Configure Voice VLAN

Configuring Cisco IP Phone Voice Traffic (CLI)

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. trust device cisco-phone
4. switchport voice vlan {vlan-id | dot1p | none | untagged}
5. end
6. Use one of the following:
   • show interfaces interface-id switchport
   • show running-config interface interface-id
7. copy running-config startup-config

DETAILED STEPS

<table>

</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>trust device cisco-phone</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config-if)# trust device cisco-phone</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>**switchport voice vlan {vlan-id</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config-if)# switchport voice vlan dot1p</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device(config-if)# end</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Use one of the following:</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Device# show interfaces gigabitethernet1/0/1 switchport</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Device# show running-config interface</strong></td>
</tr>
</tbody>
</table>

- **vlan-id**—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094.
- **dot1p**—Configures the device to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the device drops all voice and data traffic tagged with VLAN 0. If configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5.
- **none**—Allows the phone to use its own configuration to send untagged voice traffic.
- **untagged**—Configures the phone to send untagged voice traffic.
You can connect a PC or other data device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the device to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:

### SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport priority extend \{cos value | trust\}
5. end
6. show interfaces interface-id switchport
7. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>

### Command or Action

**Step 3**  
`interface interface-id`  
**Example:**  
Device(config)# interface gigabitethernet1/0/1  

### Purpose

Specifies the interface connected to the Cisco IP Phone, and enters interface configuration mode.

**Step 4**  
`switchport priority extend {cos value | trust}`  
**Example:**  
Device(config-if)# switchport priority extend trust  

### Purpose

Sets the priority of data traffic received from the Cisco IP Phone access port:
- **cos value**—Configures the phone to override the priority received from the PC or the attached device with the specified CoS value. The value is a number from 0 to 7, with 7 as the highest priority. The default priority is cos 0.
- **trust**—Configures the phone access port to trust the priority received from the PC or the attached device.

**Step 5**  
`end`  
**Example:**  
Device(config-if)# end  

### Purpose

Returns to privileged EXEC mode.

**Step 6**  
`show interfaces interface-id switchport`  
**Example:**  
Device# show interfaces gigabitethernet1/0/1 switchport  

### Purpose

Verifies your entries.

**Step 7**  
`copy running-config startup-config`  
**Example:**  
Device# copy running-config startup-config  

(Optional) Saves your entries in the configuration file.

## Monitoring Voice VLAN

To display voice VLAN configuration for an interface, use the `show interfaces interface-id switchport` privileged EXEC command.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Private VLANs

Private vlans are supported in transparent mode for VTP 1, 2 and 3. Private VLANS are also supported on server mode with VTP 3.

When configuring private VLANs on the device, always use the default Switch Database Management (SDM) template to balance system resources between unicast routes and Layer 2 entries. If another SDM template is configured, use the **sdm prefer default** global configuration command to set the default template.

Restrictions for Private VLANs

- Do not configure fallback bridging on devices with private VLANs.
• Do not configure a remote SPAN (RSPAN) VLAN as a private-VLAN primary or secondary VLAN.

• Do not configure private-VLAN ports on interfaces configured for these other features:
  • Dynamic-access port VLAN membership
  • Dynamic Trunking Protocol (DTP)
  • IPv6 Security Group (SG)
  • Port Aggregation Protocol (PAgP)
  • Link Aggregation Control Protocol (LACP)
  • Multicast VLAN Registration (MVR)
  • Voice VLAN
  • Web Cache Communication Protocol (WCCP)

• You can configure IEEE 802.1x port-based authentication on a private-VLAN port, but do not configure 802.1x with port security, voice VLAN, or per-user ACL on private-VLAN ports.

• A private-VLAN host or promiscuous port cannot be a SPAN destination port. If you configure a SPAN destination port as a private-VLAN port, the port becomes inactive.

• If you configure a static MAC address on a promiscuous port in the primary VLAN, you need not add the same static address to all associated secondary VLANs. Similarly, if you configure a static MAC address on a host port in a secondary VLAN, you need not add the same static MAC address to the associated primary VLAN. Also, when you delete a static MAC address from a private-VLAN port, you do not have to remove all instances of the configured MAC address from the private VLAN.

---

**Note**

Dynamic MAC addresses learned in Secondary VLAN of a private VLAN are replicated to the Primary VLANs. All mac entries are learnt on secondary VLANs, even if the traffic ingresses from primary VLAN. If a mac-address is dynamically learnt in the primary VLAN it will not get replicated in the associated secondary VLANs.

• Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs.

### Information About Private VLANs

#### Private VLAN Domains

The private VLAN feature addresses two problems that service providers face when using VLANs:

• When running the IP Base or IP Services image, the device supports up to 4094 active VLANs. If a service provider assigns one VLAN per customer, this limits the numbers of customers the service provider can support.
• To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

Figure 143: Private VLAN Domain

Using private VLANs addresses the scalability problem and provides IP address management benefits for service providers and Layer 2 security for customers. Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a primary VLAN and a secondary VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another.

Secondary VLANs

There are two types of secondary VLANs:

• Isolated VLANs—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.

• Community VLANs—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.

Related Topics

Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface, on page 2815
Example: Mapping Secondary VLANs to a Primary VLAN Interface, on page 2819

Private VLANs Ports

Private VLANs provide Layer 2 isolation between ports within the same private VLAN. Private VLAN ports are access ports that are one of these types:

• Promiscuous—A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports that belong to the secondary VLANs associated with the primary VLAN.
• Isolated—An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.

• Community—A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN.

Trunk ports carry traffic from regular VLANs and also from primary, isolated, and community VLANs.

Primary and secondary VLANs have these characteristics:

• Primary VLAN—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.

• Isolated VLAN—A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.

• Community VLAN—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the device through a promiscuous port. With a promiscuous port, you can connect a wide range of devices as access points to a private VLAN. For example, you can use a promiscuous port to monitor or back up all the private VLAN servers from an administration workstation.

Private VLANs in Networks

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

• Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.

• Configure interfaces connected to default gateways and selected end stations (for example, backup servers) as promiscuous ports to allow all end stations access to a default gateway.
You can extend private VLANs across multiple devices by trunking the primary, isolated, and community VLANs to other devices that support private VLANs. To maintain the security of your private VLAN configuration and to avoid other use of the VLANs configured as private VLANs on all intermediate devices, including devices that have no private VLAN ports.

**IP Addressing Scheme with Private VLANs**

Assigning a separate VLAN to each customer creates an inefficient IP addressing scheme:

- Assigning a block of addresses to a customer VLAN can result in unused IP addresses.
- If the number of devices in the VLAN increases, the number of assigned address might not be large enough to accommodate them.

These problems are reduced by using private VLANs, where all members in the private VLAN share a common address space, which is allocated to the primary VLAN. Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses allocated to the primary VLAN. Subsequent IP addresses can be assigned to customer devices in different secondary VLANs, but in the same primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses.

**Private VLANs Across Multiple Devices**

*Figure 144: Private VLANs Across Switches*

As with regular VLANs, private VLANs can span multiple devices. A trunk port carries the primary VLAN and secondary VLANs to a neighboring device. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple devices is that traffic from an isolated port in Device A does not reach an isolated port on Device B.

Private VLANs are supported in transparent mode for VTP 1, 2 and 3. Private vlan is also supported on server mode for VTP 3. If we have a server client setup using VTP 3, private vlans configured on the server should be reflected on the client.
Private-VLAN Interaction with Other Features

Private VLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of the these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private VLAN broadcast forwarding depends on the port sending the broadcast:

• An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
• A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
• A promiscuous port sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLAN multicast forwarding supports the following:

• Sender can be outside the VLAN and the Receivers can be inside the VLAN domain.
• Sender can be inside the VLAN and the Receivers can be outside the VLAN domain.
• Sender and Receiver can both be in the same community vlan.

Private VLANs and SVIs

In a Layer 3 device, a device virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

• If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
• If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.
Private VLANs and Device Stacks

Private VLANs can operate within the device stack, and private-VLAN ports can reside on different stack members. However, the following changes to the stack can impact private-VLAN operation:

- If a stack contains only one private-VLAN promiscuous port and the stack member that contains that port is removed from the stack, host ports in that private VLAN lose connectivity outside the private VLAN.

- If a stack master stack that contains the only private-VLAN promiscuous port in the stack fails or leaves the stack and a new stack master is elected, host ports in a private VLAN that had its promiscuous port on the old stack master lose connectivity outside of the private VLAN.

- If two stacks merge, private VLANs on the winning stack are not affected, but private-VLAN configuration on the losing device is lost when that device reboots.

Private VLAN with Dynamic Mac Address

The Mac addresses learnt in the secondary VLAN are replicated to the primary VLAN and not vice-versa. This saves the hardware l2 cam space. The primary VLAN is always used for forwarding lookups in both directions.

Dynamic MAC addresses learned in Primary VLAN of a private VLAN are then, if required, replicated in the secondary VLANs. For example, if a mac-address is dynamically received on the secondary VLAN, it will be learnt as part of primary VLAN. In case of isolated VLANs, a blocked entry for the same mac will be added to secondary VLAN in the mac address table. So, mac learnt on host ports in secondary domain are installed as blocked type entries. All mac entries are learnt on secondary VLANs, even if the traffic ingress from primary VLAN.

However, if a mac-address is dynamically learnt in the primary VLAN it will not get replicated in the associated secondary VLANs.

Private VLAN with Static Mac Address

Users are not required to replicate the Static Mac Address CLI for private VLAN hosts as compare to legacy model.

Example:

- In the legacy model, if the user configures a static mac address, they need to add same mac static mac-address in the associated VLAN too. For example, if mac-address A is user configured on port 1/0/1 in VLAN 101, where VLAN 101 is a secondary VLAN and VLAN 100 is a primary VLAN, then the user has to configure

  `mac-address static A vlan 101 interface G1/0/1`
  `mac-address static A vlan 100 interface G1/0/1`

- In this device, the user does not need to replicate the mac address to the associated VLAN. For the above example, user has to configure only

  `mac-address static A vlan 101 interface G1/0/1`

Private VLAN Interaction with VACL/QOS

Private VLANs are bidirectional in case of this device, as compared to “Unidirectional” in other platforms.
After layer-2 forward lookup, proper egress VLAN mapping happens and all the egress VLAN based feature processing happens in the egress VLAN context.

When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side. This is applicable to both bridged and routed traffic.

**Bridging:**

- For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.
- For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

**Routing**

If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

- The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port.
- The MAP of sec2 and L3 ACL of prim2 is applied in the egress port.

For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN’s VACL is applied in the ingress direction and primary VLAN’s VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

---

**Note**

2-way community VLAN is now not required as the private VLANS on this device are always bi-directional.

---

**Private VLANs and HA Support**

PVLAN will work seamlessly with High Availability (HA) feature. The Private VLAN existing on the master before switchover should be the same after switchover (new master should have similar PVLAN configuration both on IOS side and FED side as that of the old master).

**Private-VLAN Configuration Guidelines**

**Default Private-VLAN Configurations**

No private VLANs are configured.

**Secondary and Primary VLAN Configuration**

Follow these guidelines when configuring private VLANs:

- Private VLANs are supported in transparent mode for VTP 1, 2 and 3. If the device is running VTP version 1 or 2, you must set VTP to transparent mode. After you configure a private VLAN, you should not change the VTP mode to client or server. VTP version 3 supports private VLANs in all modes.
• With VTP version 1 or 2, after you have configured private VLANs, use the `copy running-config startup config` privileged EXEC command to save the VTP transparent mode configuration and private-VLAN configuration in the device startup configuration file. Otherwise, if the device resets, it defaults to VTP server mode, which does not support private VLANs. VTP version 3 does support private VLANs.

• VTP version 1 and 2 do not propagate private-VLAN configuration. You must configure private VLANs on each device where you want private-VLAN ports unless the devices are running VTP version 3, as VTP3 propagate private vlans.

• You cannot configure VLAN 1 or VLANs 1002 to 1005 as primary or secondary VLANs. Extended VLANs (VLAN IDs 1006 to 4094) can belong to private VLANs.

• A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it. An isolated or community VLAN can have only one primary VLAN associated with it.

• Although a private VLAN contains more than one VLAN, only one Spanning Tree Protocol (STP) instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

• When copying a PVLAN configuration from a tftp server and applying it on a running-config, the PVLAN association will not be formed. You will need to check and ensure that the primary VLAN is associated to all the secondary VLANs.

You can also use `configure replace flash:config_file force` instead of `copy flash:config_file running-config`.

• You can enable DHCP snooping on private VLANs. When you enable DHCP snooping on the primary VLAN, it is propagated to the secondary VLANs. If you configure DHCP on a secondary VLAN, the configuration does not take effect if the primary VLAN is already configured.

• When you enable IP source guard on private-VLAN ports, you must enable DHCP snooping on the primary VLAN.

• We recommend that you prune the private VLANs from the trunks on devices that carry no traffic in the private VLANs.

• You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs.

• Note the following considerations for sticky ARP:

  • Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out.

  • The `ip sticky-arp` global configuration command is supported only on SVIs belonging to private VLANs.

  • The `ip sticky-arp` interface configuration command is only supported on:

    • Layer 3 interfaces
    • SVIs belonging to normal VLANs
    • SVIs belonging to private VLANs

For more information about using the `ip sticky-arp global` configuration and the `ip sticky-arp interface` configuration commands, see the command reference for this release.
• You can configure VLAN maps on primary and secondary VLANs. However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.

• PVLANs are bidirectional. They can be applied at both the ingress and egress sides.

When a frame in Layer-2 is forwarded within a private VLAN, the VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side. Similarly, when the frame is routed from an external port to a Private VLAN, the private-VLAN is applied at the egress side.

Bridging

• For upstream traffic from secondary VLAN to primary VLAN, the MAP of the secondary VLAN is applied on the ingress side and the MAP of the primary VLAN is applied on the egress side.

• For downstream traffic from primary VLAN to secondary VLAN, the MAP of the primary VLAN is applied in the ingress direction and the MAP of the secondary VLAN is applied in the egress direction.

Routing

If we have two private VLAN domains - PV1 (sec1, prim1) and PV2 (sec2, prim2). For frames routed from PV1 to PV2:

• The MAP of sec1 and L3 ACL of prim1 is applied in the ingress port.

• The MAP of sec1 and L3 ACL of prim2 is applied in the egress port.

• For packets going upstream or downstream from isolated host port to promiscuous port, the isolated VLAN’s VACL is applied in the ingress direction and primary VLAN’S VACL is applied in the egress direction. This allows user to configure different VACL for different secondary VLAN in a same primary VLAN domain.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

• You can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.

• Although private VLANs provide host isolation at Layer 2, hosts can communicate with each other at Layer 3.

• Private VLANs support these Switched Port Analyzer (SPAN) features:

  • You can configure a private-VLAN port as a SPAN source port.

  • You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to separately monitor egress or ingress traffic.

**Private VLAN Port Configuration**

Follow these guidelines when configuring private VLAN ports:

• Use only the private VLAN configuration commands to assign ports to primary, isolated, or community VLANs. Layer 2 access ports assigned to the VLANs that you configure as primary, isolated, or community VLANs are inactive while the VLAN is part of the private VLAN configuration. Layer 2 trunk interfaces remain in the STP forwarding state.
• Do not configure ports that belong to a PAgP or LACP EtherChannel as private VLAN ports. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.

• Enable Port Fast and BPDU guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence. When enabled, STP applies the BPDU guard feature to all Port Fast-configured Layer 2 LAN ports. Do not enable Port Fast and BPDU guard on promiscuous ports.

• If you delete a VLAN used in the private VLAN configuration, the private VLAN ports associated with the VLAN become inactive.

• Private VLAN ports can be on different network devices if the devices are trunk-connected and the primary and secondary VLANs have not been removed from the trunk.

How to Configure Private VLANs

Configuring Private VLANs

To configure a private VLAN, perform these steps:

---

**Note**

Private vlans are supported in transparent mode for VTP 1, 2 and 3. Private VLANS are also supported on server mode with VTP 3.

---

**SUMMARY STEPS**

1. Set VTP mode to **transparent**.
2. Create the primary and secondary VLANs and associate them.
3. Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.
4. Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.
5. If inter-VLAN routing will be used, configure the primary SVI, and map secondary VLANs to the primary.
6. Verify private-VLAN configuration.

**DETAILED STEPS**

**Step 1**

Set VTP mode to **transparent**.

**Note**  
Note: For VTP3, you can set mode to either server or transparent mode.

**Step 2**

Create the primary and secondary VLANs and associate them.

See the Configuring and Associating VLANs in a Private VLAN, on page 2808

**Note**  
If the VLAN is not created already, the private-VLAN configuration process creates it.

**Step 3**

Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port.
See the Configuring a Layer 2 Interface as a Private VLAN Host Port, on page 2811

**Step 4** Configure interfaces as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair.

See the Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port, on page 2813

**Step 5** If inter-VLAN routing will be used, configure the primary SVI, and map secondary VLANs to the primary.

See the Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface, on page 2815

**Step 6** Verify private-VLAN configuration.

### Configuring and Associating VLANs in a Private VLAN

The `private-vlan` commands do not take effect until you exit VLAN configuration mode.

To configure and associate VLANs in a Private VLAN, perform these steps:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vtp mode transparent`
4. `vlan vlan-id`
5. `private-vlan primary`
6. `exit`
7. `vlan vlan-id`
8. `private-vlan isolated`
9. `exit`
10. `vlan vlan-id`
11. `private-vlan community`
12. `exit`
13. `vlan vlan-id`
14. `private-vlan community`
15. `exit`
16. `vlan vlan-id`
17. `private-vlan association [add | remove] secondary_vlan_list`
18. `end`
19. `show vlan private-vlan [type]` or `show interfaces status`
20. `copy running-config startup config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 2**

**Command or Action**

```
Device> enable
```

**Example:**

```
Device# configure terminal
```

**Step 3**

**Command or Action**

```
vtp mode transparent
```

**Example:**

```
Device(config)# vtp mode transparent
```

**Note**

For VTP3, you can set mode to either server or transparent mode.

**Step 4**

**Command or Action**

```
vlan vlan-id
```

**Example:**

```
Device(config)# vlan 20
```

**Step 5**

**Command or Action**

```
private-vlan primary
```

**Example:**

```
Device(config-vlan)# private-vlan primary
```

**Step 6**

**Command or Action**

```
exit
```

**Example:**

```
Device(config-vlan)# exit
```

**Step 7**

**Command or Action**

```
vlan vlan-id
```

**Example:**

```
Device(config)# vlan 501
```

(Optional) Enters VLAN configuration mode and designates or creates a VLAN that will be an isolated VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.

**Step 8**

**Command or Action**

```
private-vlan isolated
```

**Example:**

```
Device(config-vlan)# private-vlan isolated
```

**Step 9**

**Command or Action**

```
exit
```

**Example:**

```
Device(config-vlan)# exit
```

Returns to global configuration mode.
<table>

<tr>
<td>Example:</td>
<td>Device(config)# vlan 20</td>
</tr>
</tbody>
</table>

**Step 17**

<p>| <code>private-vlan association [add | remove] secondary_vlan_list</code> | Associates the secondary VLANs with the primary VLAN. It can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Example: | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Device(config-vlan)# private-vlan association 501-503`                         | • The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.  
  • The `secondary_vlan_list` parameter can contain multiple community VLAN IDs but only one isolated VLAN ID.  
  • Enter a `secondary_vlan_list`, or use the `add` keyword with a `secondary_vlan_list` to associate secondary VLANs with a primary VLAN.  
  • Use the `remove` keyword with a `secondary_vlan_list` to clear the association between secondary VLANs and a primary VLAN.  
  • The command does not take effect until you exit VLAN configuration mode.                        |

**Step 18**  
**Example:**  

Device(config)# end  

Returns to privileged EXEC mode.

**Step 19**  
**Example:**  

Device# show vlan private-vlan  

Verifies the configuration.

**Step 20**  
**Example:**  

Device# copy running-config startup-config  

Saves your entries in the device startup configuration file.

---

**Configuring a Layer 2 Interface as a Private VLAN Host Port**

Follow these steps to configure a Layer 2 interface as a private-VLAN host port and to associate it with primary and secondary VLANs:

---

**Note**  
Isolated and community VLANs are both secondary VLANs.
SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport mode private-vlan host
5. switchport private-vlan host-association primary_vlan_id secondary_vlan_id
6. end
7. show interfaces [interface-id] switchport
8. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 configure terminal | Enters global configuration mode. |
| Example:                  | |
| Device# configure terminal|         |

| Step 3 interface interface-id | Enters interface configuration mode for the Layer 2 interface to be configured. |
| Example:                      | |
| Device(config)# interface gigabitethernet1/0/22 | |

| Step 4 switchport mode private-vlan host | Configures the Layer 2 port as a private-VLAN host port. |
| Example:                                 | |
| Device(config-if)# switchport mode private-vlan host | |

| Step 5 switchport private-vlan host-association primary_vlan_id secondary_vlan_id | Associates the Layer 2 port with a private VLAN. |
| Example: | |
| Device(config-if)# switchport private-vlan host-association 20 501 | |

| Note | This is a required step to associate the PVLAN to a Layer 2 interface. |

| Step 6 end | Returns to privileged EXEC mode. |
| Example: | |

### Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port

Follow these steps to configure a Layer 2 interface as a private VLAN promiscuous port and map it to primary and secondary VLANs:

**Note**

Isolated and community VLANs are both secondary VLANs.

#### SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. switchport mode private-vlan promiscuous
5. switchport private-vlan mapping primary_vlan_id {add | remove} secondary_vlan_list
6. end
7. show interfaces [interface-id] switchport
8. copy running-config startup config

#### DETAILED STEPS

<table>
<thead>
<tr>

Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface

If the private VLAN will be used for inter-VLAN routing, you configure an SVI for the primary VLAN and map secondary VLANs to the SVI.

Note
Isolated and community VLANs are both secondary VLANs.

Follow these steps to map secondary VLANs to the SVI of a primary VLAN to allow Layer 3 switching of private VLAN traffic:

SUMMARY STEPS

1. enable
2. configure terminal
3. interface vlan primary_vlan_id
4. private-vlan mapping [add | remove] secondary_vlan_list
5. end
6. show interface private-vlan mapping
7. copy running-config startup config

Configuration Examples for Private VLANs

Example: Configuring and Associating VLANs in a Private VLAN

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, to associate them in a private VLAN, and to verify the configuration:

```plaintext
Device# configure terminal
Device(config)# vlan 20
Device(config-vlan)# private-vlan primary
Device(config-vlan)# exit
Device(config)# vlan 501
Device(config-vlan)# private-vlan isolated
Device(config-vlan)# exit
Device(config)# vlan 502
Device(config-vlan)# private-vlan community
Device(config-vlan)# exit
Device(config)# vlan 503
Device(config-vlan)# private-vlan community
Device(config-vlan)# exit
Device(config)# vlan 20
Device(config-vlan)# private-vlan association 501-503
Device(config-vlan)# end
Device# show vlan private-vlan
Primary Secondary Type
---------- --------------- -----------
20 501 isolated
20 502 community
```
Example: Configuring an Interface as a Host Port

This example shows how to configure an interface as a private VLAN host port, associate it with a private VLAN pair, and verify the configuration:

Device# configure terminal
Device(config)# interface gigabitethernet1/0/22
Device(config-if)# switchport mode private-vlan host
Device(config-if)# switchport private-vlan host-association 20 501
Device(config-if)# end
Device# show interfaces gigabitethernet1/0/22 switchport
Name: Gi1/0/22
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 {default}

- Configuring a Layer 2 Interface as a Private VLAN Promiscuous Port, on page 2813

Example: Configuring an Interface as a Private VLAN Promiscuous Port

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport mode private-vlan promiscuous
Device(config-if)# switchport private-vlan mapping 20 add 501-503
Device(config-if)# end
Use the `show vlan private-vlan` or the `show interface status` privileged EXEC command to display primary and secondary VLANs and private-VLAN ports on the Device.

## Example: Mapping Secondary VLANs to a Primary VLAN Interface

This example shows how to map the interfaces fo VLANs 501 and 502 to primary VLAN 10, which permits routing of secondary VLAN ingress traffic from private VLANs 501 and 502:

```plaintext
Device# configure terminal
Device(config)# interface vlan 20
Device(config-if)# private-vlan mapping 501-503
Device(config-if)# end
Device# show interfaces private-vlan mapping
--------- -------------- -----------------
vlans 501 isolated
vlans 502 community
vlans 503 community
```

**Related Topics**
- VTP Domain, on page 2723
- Secondary VLANs, on page 2799
- Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface, on page 2815

## Example: Monitoring Private VLANs

This example shows output from the `show vlan private-vlan` command:

```plaintext
Device# show vlan private-vlan
Primary Secondary Type Ports
--------- --------- ------------- ------------------------------------------
20 501 isolated Gi1/0/22, Gi1/0/2
20 502 community Gi1/0/2
20 503 community Gi1/0/2
```

## Where to Go Next

You can configure the following:

- VTP
- VLANs
- VLAN trunking
- Voice VLANs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About WLANs

This feature enables you to control up to 64 WLANs for lightweight access points. Each WLAN has a separate WLAN ID, a separate profile name, and a WLAN SSID. All devices publish up to 16 WLANs to each connected access point, but you can create up to the maximum number of WLANs supported and then selectively publish these WLANs (using access point groups) to different access points to better manage your wireless network.

You can configure WLANs with different SSIDs or with the same SSID. An SSID identifies the specific wireless network that you want the device to access.
Band Selection

Band selection enables client radios that are capable of dual-band (2.4 and 5-GHz) operations to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of 3 nonoverlapping channels. To prevent these sources of interference and improve overall network performance, configure band selection on the device.

Off-Channel Scanning Deferral

A lightweight access point, in normal operational conditions, periodically goes off channel and scans another channel. This is in order to perform RRM operations such as the following:

- Transmitting and receiving NDP packets with other APs.
- Detecting rogue APs and clients.
- Measuring noise and interference.

During the off channel period, which normally is about 70 milliseconds, the AP is unable to transmit or receive data on its serving channel. Therefore, there is a slight impact on its performance and some client transmissions might be dropped.

While the AP is sending and receiving important data, it is possible to configure off-channel scanning deferral so that the AP does not go off channel and its normal operation is not impacted. You can configure off-channel scanning deferral on a per-WLAN basis, per WMM UP class basis, with a specified time threshold in milliseconds. If the AP sends or receives, on a particular WLAN, a data frame marked with the given UP class within the specified threshold, the AP defers its next RRM off-channel scan. For example, by default, off-channel scanning deferral is enabled for UP classes 4, 5, and 6, with a time threshold of 100 milliseconds. Therefore, when RRM is about to perform an off-channel scan, a data frame marked with UP 4, 5, or 6 is received within the last 100 milliseconds, RRM defers going off-channel. If a voice call, which is sending and receiving audio samples, marked as UP 6, every 20 milliseconds is active, then the AP radio does not go off channel.

Off-channel scanning deferral does come with a tradeoff. Off-channel scanning can impact throughput by 2 percent or more, depending on the configuration, traffic patterns, and so on. Throughput can be slightly improved if you enable off-channel scanning deferral for all traffic classes and increase the time threshold. However, by not going off-channel, RRM can fail to identify AP neighbors and rogues, resulting in negative impact to security, DCA, TPC, and 802.11k messages.

We recommend that you do not change the default off-channel scanning deferral settings.

DTIM Period

In the 802.11 networks, lightweight access points broadcast a beacon at regular intervals, which coincides with the Delivery Traffic Indication Map (DTIM). After the access point broadcasts the beacon, it transmits
any buffered broadcast and multicast frames based on the value set for the DTIM period. This feature allows power-saving clients to wake up at the appropriate time if they are expecting broadcast or multicast data.

Typically, the DTIM value is set to 1 (to transmit broadcast and multicast frames after every beacon) or 2 (to transmit after every other beacon). For instance, if the beacon period of the 802.11 network is 100 ms and the DTIM value is set to 1, the access point transmits buffered broadcast and multicast frames 10 times per second. If the beacon period is 100 ms and the DTIM value is set to 2, the access point transmits buffered broadcast and multicast frames 5 times per second. Either of these settings are suitable for applications, including Voice Over IP (VoIP), that expect frequent broadcast and multicast data.

However, the DTIM value can be set as high as 255 (to transmit broadcast and multicast frames after every 255th beacon) if all 802.11 clients have power save enabled. Because the clients have to listen only when the DTIM period is reached, they can be set to listen for broadcasts and multicasts less frequently which results in a longer battery life. For example, if the beacon period is 100 ms and you set the DTIM value to 100, the access point transmits buffered broadcast and multicast frames once every 10 seconds. This rate allows the power-saving clients to sleep longer before they have to wake up and listen for broadcasts and multicasts, which results in a longer battery life.

Note

A beacon period, which is specified in milliseconds on the device, is converted internally by the software to 802.11 Time Units (TUs), where 1 TU = 1.024 milliseconds. On Cisco’s 802.11n access points, this value is rounded to the nearest multiple of 17 TUs. For example, a configured beacon period of 100 ms results in an actual beacon period of 104 ms.

Many applications cannot tolerate a long time between broadcast and multicast messages, which results in poor protocol and application performance. We recommend that you set a low DTIM value for 802.11 networks that support such clients.

Session Timeouts

You can configure a WLAN with a session timeout. The session timeout is the maximum time for a client session to remain active before requiring reauthorization.

Cisco Client Extensions

The Cisco Client Extensions (CCX) software is licensed to manufacturers and vendors of third-party client devices. The CCX code resident on these clients enables them to communicate wirelessly with Cisco access points and to support Cisco features that other client devices do not, including those features that are related to increased security, enhanced performance, fast roaming, and power management.

- The software supports CCX versions 1 through 5, which enables devices and their access points to communicate wirelessly with third-party client devices that support CCX. CCX support is enabled automatically for every WLAN on the device and cannot be disabled. However, you can configure Aironet information elements (IEs).

- If Aironet IE support is enabled, the access point sends an Aironet IE 0x85 (which contains the access point name, load, number of associated clients, and so on) in the beacon and probe responses of this WLAN, and the device sends Aironet IEs 0x85 and 0x95 (which contains the management IP address of the device and the IP address of the access point) in the reassociation response if it receives Aironet IE 0x85 in the reassociation request.
Peer-to-Peer Blocking

Peer-to-peer blocking is applied to individual WLANs, and each client inherits the peer-to-peer blocking setting of the WLAN to which it is associated. Peer-to-Peer enables you to have more control over how traffic is directed. For example, you can choose to have traffic bridged locally within the device, dropped by the device, or forwarded to the upstream VLAN.

Peer-to-peer blocking is supported for clients that are associated with the local switching WLAN.

Diagnostic Channel

You can choose a diagnostic channel to troubleshoot why the client is having communication problems with a WLAN. You can test the client and access points to identify the difficulties that the client is experiencing and allow corrective measures to be taken to make the client operational on the network. You can use the device GUI or CLI to enable the diagnostic channel, and you can use the device CLI to run the diagnostic tests.

Note

We recommend that you enable the diagnostic channel feature only for nonanchored SSIDs that use the management interface. CCX Diagnostic feature has been tested only with clients having Cisco ADU card.

Per-WLAN Radius Source Support

The device sources RADIUS traffic from the IP address of its management interface unless the configured RADIUS server exists on a VLAN accessible via one of the device Dynamic interfaces. If a RADIUS server is reachable via a device Dynamic interface, RADIUS requests to this specific RADIUS server will be sourced from the controller via the corresponding Dynamic interface.

By default, RADIUS packets sourced from the device will set the NAS-IP-Address attribute to that of the management interface's IP Address, regardless of the packet's source IP Address (Management or Dynamic, depending on topology).

When you enable per-WLAN RADIUS source support (Radius Server Overwrite interface) the NAS-IP-Address attribute is overwritten by the device to reflect the sourced interface. Also, RADIUS attributes are modified accordingly to match the identity. This feature virtualizes the device on the per-WLAN RADIUS traffic, where each WLAN can have a separate layer 3 identity. This feature is useful in deployments that integrate with ACS Network Access Restrictions and Network Access Profiles.
To filter WLANs, use the callStationID that is set by RFC 3580 to be in the APMAC:SSID format. You can also extend the filtering on the authentication server to be on a per-WLAN source interface by using the NAS-IP-Address attribute.

You can combine per-WLAN RADIUS source support with the normal RADIUS traffic source and some WLANs that use the management interface and others using the per-WLAN dynamic interface as the address source.

Prerequisites for WLANs

- You can associate up to 16 WLANs with each access point group and assign specific access points to each group. Each access point advertises only the enabled WLANs that belong to its access point group. The access point (AP) does not advertise disabled WLANs in its access point group or WLANs that belong to another group.

- We recommend that you assign one set of VLANs for WLANs and a different set of VLANs for management interfaces to ensure that devices properly route VLAN traffic.

- Enabling WLANs (CLI), on page 2834
- Disabling WLANs (CLI), on page 2835

Restrictions for WLANs

- When you change the WLAN profile name, then FlexConnect APs (using AP-specific VLAN mapping) will become WLAN-specific. If FlexConnect Groups are properly configured, the VLAN mapping will become Group-specific.

- Do not enable IEEE 802.1X Fast Transition on Flex Local Authentication enabled WLAN, as client association is not supported with Fast Transition 802.1X key management.

- Peer-to-peer blocking does not apply to multicast traffic.

- You can configure a maximum of up to 1000 clients.

- The WLAN name and SSID can have up to 32 characters.

- Special characters are not supported for the WLAN name.
Restrictions for WLANs

- WLAN name cannot be a keyword; for example, if you try to create a WLAN with the name as 's' by entering the `wlan s` command, it results in shutting down all WLANs because 's' is used as a keyword for shutdown.

- You cannot map a WLAN to VLAN0, and you cannot map VLANs 1002 to 1006.

- Dual stack clients with a static-IPv4 address is not supported.

- When creating a WLAN with the same SSID, you must create a unique profile name for each WLAN.

- When multiple WLANs with the same SSID get assigned to the same AP radio, you must have a unique Layer 2 security policy so that clients can safely select between them.

- When WLAN is local switching, associate the client to local-switching WLAN where AVC is enabled. Send some traffic from client, when you check the AVC stats after 90 sec. Cisco WLC shows stats under top-apps but does not show under client. There is timer issue so for the first slot Cisco WLC might not show stats for the clients. Earlier, only 1 sec stats for a client is seen if the timers at AP and at WLC are off by 89 seconds. Now, clearing of the stats is after 180 seconds so stats from 91 seconds to 179 seconds for a client is seen. This is done because two copies of the stats per client cannot be kept due to memory constraint in Cisco 5508 WLC.

- RADIUS Server Overwrite interface per wlan feature is not supported. However, you can achieve the same using the following configuration:
  - Configure a RADIUS Authentication Server
  - Configure a RADIUS Authentication Server Group
  - Create 802.1x WLAN
  - Configure Wireless Profile Policy and Attach it to the VLAN

  **Configure a RADIUS Authentication Server**
  - Device (config)# radius server server-name
  - Device (config-radius-server)# address ipv4 address auth-port auth_port_number acct-port acct_port_number
  - Device (config-radius-server)# key key

  **Configure a RADIUS Authentication Server Group**
  - Device(config)# aaa group server radius server-name
  - Device(config)# server name server-name
  - Device(config)# ip radius source-interface vlan vlan-name
  - Device(config)# aaa authentication dot1x dot1x_name group server-name

  **Create 802.1x WLAN**
  - Device(config)# wlan wlan-name id ssid
  - Device(config-wlan)# security dot1x authentication-list list-name
  - Device(config-wlan)# no shutdown
Configure Wireless Profile Policy and Attach it to VLAN

- Device(config)# wireless profile policy profile-name
- Device(config-wireless-policy)# vlan vlan-name
- Device(config-wireless-policy)# no shutdown

A sample configuration on the Cisco Wireless Controller is given below:

```plaintext
radius server RAD_EXT_3
   address ipv4 9.2.62.56 auth-port 1812 acct-port 1813
   key cisco

aaa group server radius AAA_EXT_3
   server name RAD_EXT_3
   ip radius source-interface vlan 50

aaa authentication dot1x test_ext group AAA_EXT_3
wlan test_wpa2_dot1x 2 test_wpa2_dot1x
   security dot1x authentication-list test_ext
   no shutdown

wireless profile policy pp-1
   vlan 50
   no shutdown

radius server RAD_EXT_3
   address ipv4 9.2.62.56 auth-port 1812 acct-port 1813
   key cisco

aaa group server radius AAA_EXT_2
   server name RAD_EXT_3
   ip radius source-interface vlan 51

aaa authentication dot1x test_ext_2 group AAA_EXT_2
wlan test_wpa2_2_dot1x 2 test_wpa2_2_dot1x
   security dot1x authentication-list test_ext_2
   no shutdown

wireless profile policy pp-1
   vlan 51
   no shutdown
```

Some clients might not be able to connect to WLANs properly if they detect the same SSID with multiple security policies. Use this feature with care.

How to Configure WLANs

Creating WLANs (CLI)

**SUMMARY STEPS**

1. `configure terminal`
2. `wlan profile-name wlan-id [ssid]`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Device#</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>wlan profile-name wlan-id [ssid]</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Device(config)# wlan mywlan 34 mywlan-ssid</code></td>
</tr>
<tr>
<td>Specifies the WLAN name and ID:</td>
<td></td>
</tr>
<tr>
<td>• For the <code>profile-name</code>, enter the profile name. The range is from 1 to 32 alphanumeric characters.</td>
<td></td>
</tr>
<tr>
<td>• For the <code>wlan-id</code>, enter the WLAN ID. The range is from 1 to 512.</td>
<td></td>
</tr>
<tr>
<td>• For the <code>ssid</code>, enter the Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>By default, the WLAN is disabled.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td>Example:</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <strong>Ctrl-Z</strong> to exit global configuration mode.</td>
</tr>
</tbody>
</table>
Deleting WLANs (CLI)

SUMMARY STEPS

1. **configure terminal**
2. **no wlan wlan-name wlan-id ssid**
3. **end**

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>no wlan wlan-name wlan-id ssid</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# no wlan test2</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# end</td>
</tr>
</tbody>
</table>

**Purpose**

- **Step 1**: Enters global configuration mode.
- **Step 2**: Deletes the WLAN. The arguments are as follows:
  - The **wlan-name** is the WLAN profile name.
  - The **wlan-id** is the WLAN ID.
  - The **ssid** is the WLAN SSID name configured for the WLAN.
  **Note**: If you delete a WLAN that is part of an AP group, the WLAN is removed from the AP group and from the AP’s radio.
- **Step 3**: Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Searching WLANs (CLI)

SUMMARY STEPS

1. show wlan summary

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show wlan summary</td>
<td>Displays the list of all WLANs configured on the device. You can search for the WLAN in the output.</td>
</tr>
</tbody>
</table>

Example

Device# show wlan summary
Number of WLANs: 4

<table>
<thead>
<tr>
<th>WLAN Profile Name</th>
<th>SSID</th>
<th>VLAN Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 test1</td>
<td>test1-ssid</td>
<td>137 UP</td>
</tr>
<tr>
<td>2 test2</td>
<td>test2-ssid</td>
<td>136 UP</td>
</tr>
<tr>
<td>3 test3</td>
<td>test3-ssid</td>
<td>1 UP</td>
</tr>
<tr>
<td>45 test4</td>
<td>test4-ssid</td>
<td>1 DOWN</td>
</tr>
</tbody>
</table>

You can also use wild cards to search WLANs. For example show wlan summary include variable. Where variable is any search string in the output.

Device# show wlan summary include test-wlan-ssid
1 test-wlan test-wlan-ssid 137 UP

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Remote-LAN

- The Remote-LAN feature is supported in Cisco IOS XE Denali 16.3.1 release and later. This feature is available on the Cisco Aironet 1810W Series AP, which offer compact, wall plate-mountable access point.

Restrictions for Remote-LAN

- Same profile names or IDs cannot be used for both WLANs and remote LANs.
- Only three clients can connect to a Cisco Aironet 1810W Series AP through local Gigabit Ethernet ports. Each port supports only one client.
Remote-LAN profiles can be mapped only to an AP group. Hence, an AP should be in an AP group to configure Remote-LAN profile in its local Gigabit Ethernet ports.

- The Default AP group cannot be configured for Remote-LAN.

### Information About Remote-LAN

Remote-LAN is similar to a WLAN, the only difference being that a WLAN is used for wireless connection, but a Remote-LAN is used for wired ports. Cisco Aironet 1810W Series AP come with three local Gigabit Ethernet ports, one uplink Gigabit Ethernet port, and one passive passthrough RJ-45 port. Configuring a Remote-LAN profile on a local Gigabit Ethernet port enables the traffic from wired devices to connect to the ports tunneled back to a wireless controller.

### Configuring Remote-LAN (CLI)

#### SUMMARY STEPS

1. `remote-lan profile-name id`
2. `session-timeout session-time`
3. `client vlan vlan-identifier`
4. `client association limit max-number-of-clients`
5. `ip access-group acl-name`
6. `security webauth parameter-map parameter-name`
7. `security dot1x`
8. `security dot1x authentication list-name`
9. `exclusionlist timeout time-sec`
10. `aaa-override`
11. `local-auth EAP-Profile`
12. `ip dhcp server ip-address`
13. `ip access-group web acl-name`
14. `accounting-list list-name`
15. `mac-filtering list-name`
16. `no shutdown`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>remote-lan profile-name id</code></td>
<td>Specifies the Remote-LAN profile name.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>remote-lan test-lan 3</code></td>
<td>• id—Unique number entered during configuration tasks. Range is from 1 to 64.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>session-timeout session-time</code></td>
<td>Sets the duration of session, in seconds. Range is from 0 to 86400.</td>
</tr>
</tbody>
</table>
| **Example:** | Device(config-remote-lan)# `session-timeout 50` | }
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 3    | client vlan `vlan-identifier` | Enables an interface group on the Remote-LAN.  
• `vlan-identifier`—Specifies the VLAN identifier. It can be the VLAN name, VLAN ID, or VLAN group name.  
**Example:**  
Device(config-remote-lan)# client vlan test-vlan |
| 4    | client association limit `max-number-of-clients` | Sets the maximum number of clients that can be connected to the Remote-LAN profile.  
**Example:**  
Device(config-remote-lan)# client association limit 200 |
| 5    | `ip access-group acl-name` | Configures the IPv4 ACL name or ID.  
**Example:**  
Device(config-remote-lan)# ip access-group acl-name |
| 6    | `security webauth parameter-map parameter-name` | Specifies the parameter map name.  
**Example:**  
Device(config-remote-lan)# security web-auth parameter-map parameter-22 |
| 7    | `security dot1x` | Specifies 802.1X security.  
**Example:**  
Device(config-remote-lan)# security dot1x |
| 8    | `security dot1x authentication list-name` | Sets the Authentication List name.  
**Example:**  
Device(config-remote-lan)# security dot1x authentication-list LIST1 |
| 9    | exclusionlist timeout `time-sec` | Sets time in seconds, after which a client is excluded. Range is from 0 to 2147483647. The value 0 stands for no timeout.  
**Example:**  
Device(config-remote-lan)# exclusionlist timeout 30 |
| 10   | `aaa-override` | Overrides the AAA policy.  
**Example:**  
Device(config-remote-lan)# aaa-override |
| 11   | local-auth EAP-Profile | Enables the EAP profile on a Remote-LAN.  
**Example:**  
Device(config-remote-lan)# local-auth EAP-Profile |
| 12   | `ip dhcp server ip-address` | Configures DHCP parameters for Remote-LAN.  
**Example:**  
Device(config-remote-lan)# |
### Configuration Examples for Remote-LAN

The following example shows a summary of all the Remote-LANs:

```
Device# show remote-lan summary
Number of Remote-LANs: 1

Remote-LAN Profile Name   VLAN Status
----------------------------
2    test                  1   DOWN
```

The following example shows a Remote-LAN configuration by ID:

```
Device# show remote-lan id 2
Remote-LAN Profile Name : test

Identifier : 2
Status : Disabled
Universal AP Admin : Disabled
Max Associated Clients per Remote-LAN : 0
AAA Policy Override : Enabled
Number of Active Clients : 0
Exclusionlist Timeout : 21474
Session Timeout : 864 seconds
Interface : default
Interface Status : Up
Remote-LAN ACL : testacl
DHCP Server : 10.5.7.9
DHCP Address Assignment Required : Disabled
Local EAP Authentication : testeapprofile
```
Mac Filter Authorization list name : testmaclist
Accounting list name : testlist
802.1x authentication list name : dotxauth
Security
  802.11 Authentication : Open System
  802.1X : Enabled
    Encryption : 104-bit WEP

The following example shows a Remote-LAN configuration by profile name:

Device# show remote-lan name test
Remote-LAN Profile Name : test
================================================
Identifier : 1
Status : Disabled
Universal AP Admin : Disabled
Max Associated Clients per Remote-LAN : 0
AAA Policy Override : Disabled
Number of Active Clients : 0
Exclusionlist Timeout : 60
Session Timeout : 1800 seconds
Interface : default
Interface Status : Up
Remote-LAN ACL : unconfigured
DHCP Server : 0.0.0.0
DHCP Address Assignment Required : Disabled
Local EAP Authentication : Disabled
Mac Filter Authorization list name : Disabled
Accounting list name : Disabled
802.1x authentication list name : Disabled
Security
  802.11 Authentication : Open System
  802.1X : Disabled
  Web Based Authentication : Disabled
  Conditional Web Redirect : Disabled
  Splash-Page Web Redirect : Disabled
  Webauth On-mac-filter Failure : Disabled
  Webauth Authentication List Name : Disabled
  Webauth Parameter Map : Disabled

The following example shows the Remote-LAN properties of all the configured Remote-LANs:

Device# show remote-lan all
Remote-LAN Profile Name : test
================================================
Identifier : 1
Status : Disabled
Universal AP Admin : Disabled
Max Associated Clients per Remote-LAN : 0
AAA Policy Override : Disabled
Number of Active Clients : 0
Exclusionlist Timeout : 60
Session Timeout : 1800 seconds
Interface : default
Interface Status : Up
Remote-LAN ACL : unconfigured
DHCP Server : 0.0.0.0
DHCP Address Assignment Required : Disabled
Local EAP Authentication : Disabled
Mac Filter Authorization list name : Disabled
Accounting list name : Disabled
The following examples show a Remote-LAN configuration:

```
Device# show running-config remote-lan test
remote-lan test 1
  aaa-override
  accounting-list test-all-list
  exclusion-list timeout 100
  ip access-group test-acl
  ip dhcp server 10.100.12.5
  mac-filtering test-mac-list
  security dot1x authentication-list test-dot1x-list
  session-timeout 100
  shutdown
```

The following examples show the details of the AP groups:

```
Device# show ap groups
Site Name: test-ap-group
Site Description: Hyperlocation Operational Status: Down

WLAN ID  WLAN Name  Interface
----------------------------------
LAN Status  PoE  Remote-LAN
----------------------------------
  1  Down  Disabled  None
  2  Down  None
  3  Down  None
```

The following examples show the details of a LAN port:

```
Device# show ap name AP00FE.C82D.E7B0 lan port 1
LAN Port status for AP AP00FE.C82D.E7B0
  LanOverride Enabled
  PortId Status VlanId PoE
  -----------------------------------
  LAN1 Enabled 0 Disabled
```

The following examples show the details of a LAN port summary:

```
Device# show ap name AP00FE.C82D.E7B0 lan port summary
LAN Port status for AP AP00FE.C82D.E7B0
  LanOverride Enabled
  Port ID Status Vlan ID PoE
  -----------------------------------
  LAN1 Enabled 0 Disable
Configuring AP Group-Specific CLIs

Use the following procedure to configure the LAN port parameters for an AP group:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>remote-lan remote-lan-name</td>
<td>Adds a Remote-LAN to an AP group.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-apgroup)# remote-lan test-lan</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>port port-id</td>
<td>Configures the port ID of an AP group.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-apgroup)# port 1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>poe</td>
<td>Enables a PoE on the port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-port-apgroup)# poe</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>PoE can be configured only for port 1.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>remote-lan remote-lan-name</td>
<td>Adds a Remote-LAN ID.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-port-apgroup)# remote-lan test-lan</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>no shutdown</td>
<td>Enables the LAN port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-port-apgroup)# no shutdown</td>
<td></td>
</tr>
</tbody>
</table>

Configuring PoE for a Port

The Cisco Aironet 1810W Series allows wired access via Power over Ethernet (PoE). This feature provides wired access with PoE for other devices, such as IP phones, security cameras, printers, and copiers. Only LAN Port 1 should be configured for the PoE to be enabled or disabled. By default, PoE is disabled for the port.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>ap name ap-name lan port-id port-id poe</td>
<td>Enables PoE for the LAN port of an AP.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# ap name AP00FE.C92D.DFB0 lan port-id 1 poe</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>PoE can be configured only for port 1.</td>
<td></td>
</tr>
</tbody>
</table>
Configuring LAN Override for an AP

LAN override can be enabled to override a LAN port configuration for a particular AP. Per-AP LAN port configurations work only when LAN override is enabled. By default, LAN override is disabled. With LAN override disabled, an AP uses AP group LAN port configurations.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>ap name ap-name lan override</code></td>
<td>Enables override for AP group LAN port configurations.</td>
</tr>
</tbody>
</table>

Example:

```
Device# ap name AP00FE.C82D.DFB0 lan override
```
DHCP for WLANs

- Feature Information for DHCP for WLANs, on page 2870

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About the Dynamic Host Configuration Protocol

You can configure WLANs to use the same or different Dynamic Host Configuration Protocol (DHCP) servers or no DHCP server. Two types of DHCP servers are available: internal and external.

Internal DHCP Servers

The devices contain an internal DHCP server. This server is typically used in branch offices that do not already have a DHCP server. The wireless network generally contains a maximum of 10 APs or less, with the APs on the same IP subnet as the device. The internal server provides DHCP addresses to wireless clients, direct-connect APs, and DHCP requests that are relayed from APs. Only lightweight access points are supported. When you want to use the internal DHCP server, you must set the management interface IP address of the device as the DHCP server IP address.
DHCP option 43 is not supported on the internal server. Therefore, the access point must use an alternative method to locate the management interface IP address of the device, such as local subnet broadcast, Domain Name System (DNS), or priming.

An internal DHCP server pool only serves the wireless clients of that device, not clients of other devices. Also, an internal DHCP server can serve only wireless clients, not wired clients.

When clients use the internal DHCP server of the device, IP addresses are not preserved across reboots. As a result, multiple clients can be assigned to the same IP address. To resolve any IP address conflicts, clients must release their existing IP address and request a new one. Wired guest clients are always on a Layer 2 network connected to a local or foreign device.

Note

- VRF is not supported in the internal DHCP servers.
- DHCPv6 is not supported in the internal DHCP servers.

General Guidelines

External DHCP Servers

The operating system is designed to appear as a DHCP Relay to the network and as a DHCP server to clients with industry-standard external DHCP servers that support DHCP Relay, which means that each device appears as a DHCP Relay agent to the DHCP server and as a DHCP server at the virtual IP address to wireless clients.

Because the device captures the client IP address that is obtained from a DHCP server, it maintains the same IP address for that client during intra device, inter device, and inter-subnet client roaming.

Note

External DHCP servers can support DHCPv6.

DHCP Assignments

You can configure DHCP on a per-interface or per-WLAN basis. We recommend that you use the primary DHCP server address that is assigned to a particular interface.

You can assign DHCP servers for individual interfaces. You can configure the management interface, AP-manager interface, and dynamic interface for a primary and secondary DHCP server, and you can configure the service-port interface to enable or disable DHCP servers. You can also define a DHCP server on a WLAN. In this case, the server overrides the DHCP server address on the interface assigned to the WLAN.

Security Considerations

For enhanced security, we recommend that you require all clients to obtain their IP addresses from a DHCP server. To enforce this requirement, you can configure all WLANs with a DHCP Addr. Assignment Required setting, which disallows client static IP addresses. If DHCP Addr. Assignment Required is selected, clients must obtain an IP address via DHCP. Any client with a static IP address is not allowed on the network. The device monitors DHCP traffic because it acts as a DHCP proxy for the clients.
WLANs that support management over wireless must allow management (device-servicing) clients to obtain an IP address from a DHCP server.

If slightly less security is tolerable, you can create WLANs with DHCP Addr. Assignment Required disabled. Clients then have the option of using a static IP address or obtaining an IP address from a designated DHCP server.

DHCP Addr. Assignment Required is not supported for wired guest LANs.

You can create separate WLANs with DHCP Addr. Assignment Required configured as disabled. This is applicable only if DHCP proxy is enabled for the device. You must not define the primary/secondary configuration DHCP server you should disable the DHCP proxy. These WLANs drop all DHCP requests and force clients to use a static IP address. These WLANs do not support management over wireless connections.

**Information About DHCP Option 82**

DHCP option 82 provides additional security when DHCP is used to allocate network addresses. It enables the device to act as a DHCP relay agent to prevent DHCP client requests from untrusted sources. You can configure the device to add option 82 information to DHCP requests from clients before forwarding the requests to the DHCP server.

*Figure 145: DHCP Option 82*

The access point forwards all DHCP requests from a client to the device. The device adds the DHCP option 82 payload and forwards the request to the DHCP server. The payload can contain the MAC address or the MAC address and SSID of the access point, depending on how you configure this option.

Any DHCP packets that already include a relay agent option are dropped at the device.

For DHCP option 82 to operate correctly, DHCP proxy must be enabled.
Configuring DHCP Scopes

Information About Internal DHCP Server

Devices have built-in DHCP relay agents. However, when you desire network segments that do not have a separate DHCP server, the devices can have built-in internal DHCP server that assign IP addresses and subnet masks to wireless clients. Typically, one device can have one or more internal DHCP server that each provide a range of IP addresses.

Internal DHCP server are needed for internal DHCP to work. Once DHCP is defined on the device, you can then point the primary DHCP server IP address on the management, AP-manager, and dynamic interfaces to the device’s management interface.

Note

The controller has the ability to provide internal DHCP server. This feature is very limited and considered as convenience that is often used simple demonstration or proof-of-concept, for example in a lab environment. The best practice is NOT to use this feature in an enterprise production network.

Prerequisites for Configuring DHCP for WLANs

• To be able to use the DHCP option 82, you must configure DHCP on Cisco IOS software. By default, DHCP option 82 is enabled for all clients. You can control the wireless client behavior using the WLAN suboptions.

• The Cisco converged access platforms support internal DHCP server functionality. However, as a general deployment guideline to build large enterprise-class networks, we recommend that you use external DHCP server to provide dynamic IP addressing to wireless clients. Such distributed function reduces processing and configuration load on network devices and allows them to operate efficiently in large scale deployments.

• DHCP Snooping Configuration—DHCP snooping configuration is the required best practices configuration on for rapid client join function. DHCP snooping needs to be enabled on each client VLAN including the override VLAN if override is applied on the WLAN.

Example of DHCP snooping configuration

1. Global DHCP snooping configuration:

   1. Device(config)#ip dhcp snooping
      Device(config)#ip dhcp snooping vlan 100

   2. Enable bootp-broadcast command. This is required for clients that send DHCP messages with broadcast addresses and broadcast bit is set in the DHCP message:

      Device(config)#ip dhcp snooping wireless bootp-broadcast enable

   3. To not append DHCP Option information, enter this command:

      Device(config)#no ip dhcp snooping information option
2. On the interface:

    Note  IP DHCP snooping trust is required on Port-Channel interface in addition to member link of the Port-Channel interface.

    Device(config)#interface range TenGigabitEthernet 1/0/1 - 2
    Device(config-if)#switchport mode trunk
    Device(config-if)#switchport trunk allowed vlan 100
    Device(config-if)#ip dhcp snooping trust

    Device(config)#interface port-channel 1
    Device(config-if)#switchport mode trunk
    Device(config-if)#switchport trunk allowed vlan 100
    Device(config-if)#ip dhcp snooping trust

    Note  DHCP snooping must be configured on the Guest Anchor for guest access similar to the Config above.

Restrictions for Configuring DHCP for WLANs

- If you override the DHCP server in a WLAN, you must ensure that you configure the underlying Cisco IOS configuration to make sure that the DHCP server is reachable.

- WLAN DHCP override works only if DHCP service is enabled on the device.

You can configure DHCP service in either of the following ways:

- Configuring the DHCP pool on the device.

- Configuring a DHCP relay agent on the SVI. Note: the VLAN of the SVI must be mapped to the WLAN where DHCP override is configured.

How to Configure DHCP for WLANs

Configuring DHCP for WLANs (CLI)

Use this procedure to configure the following DHCP parameters on a WLAN:

- DHCP Option 82 Payload
• DHCP Required
• DHCP Override

Before you begin
• You must have admin privileges for configuring the WLAN.
• To configure the DHCP override, you must have the IP address of the DHCP server.

SUMMARY STEPS
1. configure terminal
2. shutdown
3. wlan profile-name
4. ip dhcp opt82 \{ascii | format \{add-ssid | ap-ethmac\} | rid\}
5. ip dhcp required
6. ip dhcp server ip-address
7. no shutdown
8. end
9. show wlan wlan-name

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>*Example: * Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> shutdown</td>
<td>Shut down the WLAN.</td>
</tr>
<tr>
<td>*Example: * Device(config)# shutdown</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> wlan profile-name</td>
<td>Enters WLAN configuration submode. The profile-name is the profile name of the configured WLAN.</td>
</tr>
<tr>
<td>*Example: * Device# wlan test4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip dhcp opt82 {ascii</td>
<td>format {add-ssid</td>
</tr>
<tr>
<td>*Example: * Device(config)# ip dhcp opt82 format add-ssid</td>
<td>• ascii—Configures ASCII for DHCP Option 82. If this is not configured, the option 82 format is set to ASCII format.</td>
</tr>
<tr>
<td></td>
<td>• format—Specifies the DHCP option 82 format. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• add-ssid—Set RemoteID format that is the AP radio MAC address and SSID.</td>
</tr>
</tbody>
</table>
### Configuring DHCP Scopes (CLI)

**SUMMARY STEPS**

1. configure terminal  
2. ip dhcp pool pool-name  
3. network network-name mask-address  
4. dns-server hostname  
5. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

---

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>• ap-ethmac</strong> — Set RemoteID format that is the AP Ethernet MAC address.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> If the format option is not configured, only the AP radio MAC address is used.</td>
<td></td>
</tr>
<tr>
<td><strong>• rid</strong> — Adds the Cisco 2 byte RID for DHCP option 82.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5** `ip dhcp required`  
**Example:**  
Device(config-wlan)# ip dhcp required  
Makes it mandatory for clients to get their IP address from the DHCP server. Static clients are not allowed.

**Step 6** `ip dhcp server ip-address`  
**Example:**  
Device(config-wlan)# ip dhcp server 200.1.1.2  
Defines a DHCP server on the WLAN that overrides the DHCP server address on the interface assigned to the WLAN.

**Step 7** `no shutdown`  
**Example:**  
Device(config-wlan)# no shutdown  
Restarts the WLAN.

**Step 8** `end`  
**Example:**  
Device(config)# end  
Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

**Step 9** `show wlan wlan-name`  
**Example:**  
Device(config-wlan)# show wlan test-wlan  
Verifies the DHCP configuration.
### Configuring Internal DHCP Server

#### Configuring Internal DHCP Server Under Client VLAN SVI

**Before you begin**

- To use the internal DHCP server for both wireless and wired client VLAN, an IP address must be configured under the client VLAN switched virtual interfaces (SVI) interface.
- For wireless clients, the IP address of the internal DHCP server must be different from the address of the wireless client VLAN SVI interface (in DHCP helper address configuration).
- For wireless clients, the internal DHCP server can be configured under the client VLAN SVI interface or under the wireless policy profile.

**SUMMARY STEPS**

1. configure terminal
2. interface loopback interface-number
3. ip address ip-address
4. exit
5. interface vlan vlan-id
6. ip address ip-address
7. ip helper-address ip-address
8. no mop enabled

<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-if)# no mop enabled</code></td>
<td>Disables the Maintenance Operation Protocol (MOP) for an interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>no mop sysid</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-if)# no mop sysid</code></td>
<td>Disables the task of sending MOP periodic system ID messages.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>end</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-if)# exit</code></td>
<td>Exits the interface configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>ip dhcp excluded-address <strong>ip-address</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip dhcp excluded-address 192.168.32.1</code></td>
<td>Specifies the IP address that the DHCP server should not assign to DHCP clients.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>ip dhcp excluded-address <strong>ip-address</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip dhcp excluded-address 192.168.32.100</code></td>
<td>Specifies the IP addresses that the DHCP server should not assign to DHCP clients.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>ip dhcp pool <strong>pool-name</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip dhcp pool pool-vlan32</code></td>
<td>Configures the DHCP pool address.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td>network <strong>network-name</strong> mask-address</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(dhcp-config)# network 192.168.32.0 255.255.255.0</code></td>
<td>Specifies the network number in dotted-decimal notation, along with the mask address.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td>default-router <strong>ip-address</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(dhcp-config)# default-router 192.168.32.1</code></td>
<td>Specifies the IP address of the default router for a DHCP client.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 16</strong></td>
<td>exit</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(dhcp-config)# exit</code></td>
<td>Exits DHCP configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 17</strong></td>
<td>wireless profile policy <strong>profile-policy</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Configures the WLAN policy profile and enters the wireless policy configuration mode.</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# wireless profile policy default-policy-profile</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 18**

**central association**

*Example:*

```
Device(config-wireless-policy)# central association
```

Configures central association for locally switched clients.

**Step 19**

**central dhcp**

*Example:*

```
Device(config-wireless-policy)# central dhcp
```

Configures the central DHCP for locally switched clients.

**Step 20**

**central switching**

*Example:*

```
Device(config-wireless-policy)# central switching
```

Configures WLAN for central switching.

**Step 21**

**description policy-profile-name**

*Example:*

```
Device(config-wireless-policy)# description "default policy profile"
```

Adds a description for the policy profile.

**Step 22**

**vlan vlan-name**

*Example:*

```
Device(config-wireless-policy)# vlan 32
```

Assigns the profile policy to the VLAN.

**Step 23**

**no shutdown**

*Example:*

```
Device(config-wireless-policy)# no shutdown
```

Enables the profile policy.

---

### Configuring the Internal DHCP Server Under a Wireless Policy Profile

#### SUMMARY STEPS

1. configure terminal
2. interface loopback interface-number
3. ip address ip-address
4. exit
5. interface vlan vlan-id
6. ip address ip-address
7. no mop enabled
8. no mop sysid
9. exit
10. ip dhcp excluded-address ip-address
11. ip dhcp excluded-address ip-address
12. ip dhcp pool pool-name
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface loopback interface-number</td>
<td>Creates a loopback interface and enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface Loopback0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip address ip-address</td>
<td>Configures the IP address for the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# ip address 10.10.10.1 255.255.255.255</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> interface vlan vlan-id</td>
<td>Configures the VLAN ID.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>Device(config-wireless-policy)# no shutdown</td>
<td></td>
</tr>
</tbody>
</table>

**Verifying Internal DHCP Configuration**

To verify the client binding, use the following command:
Device# `show ip dhcp binding`

Bindings from all pools not associated with VRF:

<table>
<thead>
<tr>
<th>IP address</th>
<th>Client-ID/</th>
<th>Lease expiration</th>
<th>Type</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.32.3</td>
<td>0130.b49e.491a.53</td>
<td>Mar 23 2018 06:42 PM</td>
<td>Automatic</td>
<td>Active</td>
</tr>
</tbody>
</table>

To verify the DHCP relay statistics for wireless client, use the following command:

Device# `show wireless dhcp relay statistics`

DHCP Relay Statistics

**DHCP Server IP:** 10.10.10.1

<table>
<thead>
<tr>
<th>Message</th>
<th>Count</th>
</tr>
</thead>
<tbody>

CHAPTER 150

WLAN Security

- Finding Feature Information, on page 2871
- Prerequisites for Layer 2 Security, on page 2871
- Information About AAA Override, on page 2872
- How to Configure WLAN Security, on page 2872
- Additional References, on page 2877
- Feature Information about WLAN Layer 2 Security, on page 2878

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Layer 2 Security

WLANs with the same SSID must have unique Layer 2 security policies so that clients can make a WLAN selection based on the information advertised in beacon and probe responses. The available Layer 2 security policies are as follows:

- None (open WLAN)
- Static WEP or 802.1X

Note

- Because static WEP and 802.1X are both advertised by the same bit in beacon and probe responses, they cannot be differentiated by clients. Therefore, they cannot both be used by multiple WLANs with the same SSID.
- WLAN WEP is not supported in 1810w Access Point.
• WPA/WPA2

Note
• Although WPA and WPA2 cannot be used by multiple WLANs with the same SSID, you can configure two WLANs with the same SSID with WPA/Tkip with PSK and Wi-Fi Protected Access (WPA) Temporal Key Integrity Protocol (TKIP) with 802.1X, or with WPA/Tkip with 802.1X or WPA/AES with 802.1X.

• A WLAN configured with TKIP support will not be enabled on an RM3000AC module.

Related Topics
- Configuring Static WEP + 802.1X Layer 2 Security Parameters (CLI), on page 2872
- Configuring Static WEP Layer 2 Security Parameters (CLI), on page 2873

- Configuring 802.1X Layer 2 Security Parameters (CLI), on page 2876
- Configuring Advanced WLAN Properties (CLI), on page 2838
- Information About AAA Override, on page 2872

Information About AAA Override

The AAA Override option of a WLAN enables you to configure the WLAN for identity networking. It enables you to apply VLAN tagging, Quality of Service (QoS), and Access Control Lists (ACLs) to individual clients based on the returned RADIUS attributes from the AAA server.

Related Topics
- Configuring Advanced WLAN Properties (CLI), on page 2838

| 3.   | `security static-wep-key {authentication {open | sharedkey} | encryption {104 | 40} [ascii | hex] {0 | 8}} wep-key wep-key-index1-4` | Configures static WEP security on a WLAN. The keywords and arguments are as follows:  
  - **authentication**—Configures 802.11 authentication.  
  - **encryption**—Sets the static WEP keys and indices.  
  - **open**—Configures open system authentication.  
  - **sharedkey**—Configures shared key authentication.  
  - **104, 40**—Specifies the WEP key size.  
  - **hex, ascii**—Specifies the input format of the key.  
  - **wep-key-index, wep-key-index1-4**—Type of password that follows. A value of 0 indicates that an unencrypted password follows. A value of 8 indicates that an AES encrypted follows. |
|      | **Example:**  |  |
|      | Device(config-wlan)# `security static-wep-key encryption 40 hex 0 test 2` |  |
| 4.   | `end` | Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-Z` to exit global configuration mode. |
|      | **Example:**  |  |
|      | Device(config)# `end` |  |

Setting Client Count Per WLAN

• Finding Feature Information, on page 2879
• Restrictions for Setting Client Count for WLANs, on page 2879
• Information About Setting the Client Count per WLAN, on page 2880
• How to Configure Client Count Per WLAN, on page 2880
• Monitoring Client Connections (CLI), on page 2882
• Additional References for Client Connections, on page 2883
• Feature Information about Client Connections Per WLAN, on page 2884

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Setting Client Count for WLANs

• When a WLAN has reached the limit on the maximum number of clients connected to it or an AP radio and a new client tries to join the WLAN, the client cannot connect to the WLAN until an existing client gets disconnected.

• Roaming clients are considered as new clients. The new client can connect to a WLAN, which has reached the maximum limit on the number of connected clients, only when an existing client gets disconnected.

Note

For more information about the number of clients that are supported, see the product data sheet of your device.

Related Topics

Configuring Client Count per WLAN (CLI), on page 2880
Information About Setting the Client Count per WLAN

You can set a limit to the number of clients that can connect to a WLAN, which is useful in scenarios where you have a limited number of clients that can connect to a device. For example, consider a scenario where the device can serve up to 256 clients on a WLAN and these clients can be shared between enterprise users (employees) and guest users. You can set a limit on the number of guest clients that can access a given WLAN. The number of clients that you can configure for each WLAN depends on the platform that you are using.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for 802.11w

• To configure 802.11w feature for optional and mandatory, you must have WPA and AKM configured.

  Note
  The RNS (Robust Secure Network) IE must be enabled with an AES Cipher.

• To configure 802.11w as mandatory, you must enable PMF AKM in addition to WPA AKM.

Related Topics
  Configuring 802.11w (CLI), on page 2887

Restrictions for 802.11w

• 802.11w cannot be applied on an open WLAN, WEP-encrypted WLAN, or a TKIP-encrypted WLAN.

• The WLAN on which 802.11w is configured must have either WPA2-PSK or WPA2-802.1x security configured.

Related Topics
  Configuring 802.11w (CLI), on page 2887
  Disabling 802.11w (CLI), on page 2888
  Information About 802.11w, on page 2886

Information About 802.11w

Wi-Fi is a broadcast medium that enables any device to eavesdrop and participate either as a legitimate or rogue device. Control and management frames such as authentication/deauthentication, association/disassociation, beacons, and probes are used by wireless clients to select an AP and to initiate a session for network services.

Unlike data traffic which can be encrypted to provide a level of confidentiality, these frames must be heard and understood by all clients and therefore must be transmitted as open or unencrypted. While these frames cannot be encrypted, they must be protected from forgery to protect the wireless medium from attacks. For example, an attacker could spoof management frames from an AP to tear down a session between a client and AP.

The 802.11w protocol applies only to a set of robust management frames that are protected by the Management Frame Protection (PMF) service. These include Disassociation, Deauthentication, and Robust Action frames. Management frames that are considered as robust action and therefore protected are the following:

• Spectrum Management
• QoS
• Block Ack
• SA Query
• Vendor-specific Protected

When 802.11w is implemented in the wireless medium, the following occur:

• Client protection is added by the AP adding cryptographic protection (by including the MIC information element) to deauthentication and disassociation frames preventing them from being spoofed in a DOS attack.

• Infrastructure protection is added by adding a Security Association (SA) teardown protection mechanism consisting of an Association Comeback Time and an SA-Query procedure preventing spoofed association request from disconnecting an already connected client.
How to Configure 802.11w

Configuring 802.11w (CLI)

Before you begin

WPA and AKM must be configured.

SUMMARY STEPS

1. configure terminal
2. wlan profile-name
3. shutdown
4. security pmf {association-check association-comeback-time-in-seconds | mandatory | optional | saquery saquery-time-in-milliseconds}
5. no shutdown
6. end

| | | • `saquery`—Time interval identified in the association response to an already associated client before the association can be tried again. This time interval checks if the client is a real client and not a rogue client during the association comeback time. If the client does not respond within this time, the client association is deleted from the device.
| | | The range is from 100 to 500 ms. The value must be specified in multiples of 100 milliseconds. |
| **Example:** Device(config-wlan)# no security pmf | |
| **Step 5** no shutdown | Restart the WLAN for the changes to take effect. |
| **Example:** Device no shutdown | |
| **Step 6** end | Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-z` to exit global configuration mode. |
| **Example:** Device(config-wlan)# end | |

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for the Wi-Fi Direct Client Policy

• Wi-Fi Direct Client Policy is applicable to WLANs that have APs in local mode only.
• Cisco APs in FlexConnect mode (even in central authentication and central switching) is not supported.
• We do not recommend enabling this feature in a mixed AP mode deployment (some APs in FlexConnect mode and some APs in local mode). Such types of deployment is not supported or tested in FlexConnect mode.
• If WLAN applied client policy is invalid, the client is excluded with the exclusion reason being 'Client QoS Policy failure'.
Information About the Wi-Fi Direct Client Policy

Devices that are Wi-Fi Direct capable can connect directly to each other quickly and conveniently to do tasks such as printing, synchronization, and sharing of data. Wi-Fi Direct devices may associate with multiple peer-to-peer (P2P) devices and with infrastructure wireless LANs (WLANs) concurrently. You can use the device to configure the Wi-Fi Direct Client Policy, on a per WLAN basis, where you can allow or disallow association of Wi-Fi devices with infrastructure WLANs, or disable Wi-Fi Direct Client Policy altogether for WLANs.

<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Enters WLAN configuration submode. The profile-name is the profile name of the configured WLAN.</td>
</tr>
<tr>
<td>wlan profile-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# wlan test4</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Configures the Wi-Fi Direct client policy on the WLAN using one of the following:</td>
</tr>
<tr>
<td>wifidirect policy {permit</td>
<td>deny }</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-wlan)# wifidirect policy permit</td>
<td></td>
</tr>
</tbody>
</table>
association request to the device and these are based on the Wi-Fi capabilities of the device. These include:
  • Concurrent operation
  • Cross connection

Note The command no wifidirect policy ignores the client's Wi-Fi direct status. Additionally, the access point also does not advertise any beacons and probes. Effectively, the no form of the command disables the Wi-Fi direct feature on the WLAN.

If the Wi-Fi device supports either concurrent operations or cross connections or both, the client association is denied. The client can associate if the device does not support concurrent operations and cross connections.

<table>
<thead>
<tr>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for 802.11r Fast Transition

• EAP LEAP method is not supported.

• TSpec is not supported for 802.11r fast roaming. Therefore, RIC IE handling is not supported.

• If WAN link latency exists, fast roaming is also delayed. Voice or data maximum latency should be verified. The Cisco WLC handles 802.11r Fast Transition authentication request during roaming for both Over-the-Air and Over-the-DS methods.

• This feature is supported on open and WPA2 configured WLANs.

• Legacy clients cannot associate with a WLAN that has 802.11r enabled if the driver of the supplicant that is responsible for parsing the Robust Security Network Information Exchange (RSN IE) is old and not aware of the additional AKM suites in the IE. Due to this limitation, clients cannot send association requests to WLANs. These clients, however, can still associate with non-802.11r WLANs. Clients that are 802.11r capable can associate as 802.11i clients on WLANs that have both 802.11i and 802.11r Authentication Key Management Suites enabled.
The workaround is to enable or upgrade the driver of the legacy clients to work with the new 802.11r AKMs, after which the legacy clients can successfully associate with 802.11r enabled WLANs.

Another workaround is to have two SSIDs with the same name but with different security settings (FT and non-FT).

- Fast Transition resource request protocol is not supported because clients do not support this protocol. Also, the resource request protocol is an optional protocol.
- To avoid any Denial of Service (DoS) attack, each Cisco WLC allows a maximum of three Fast Transition handshakes with different APs.
- Non-802.11r capable devices will not be able to associate with FT-enabled WLAN.
- 802.11r FT + PMF is not recommended.
- 802.11r FT Over-the-Air roaming is recommended for FlexConnect deployments.
- In a default FlexGroup scenario, fast roaming is not supported.
- As part of a fix for CSCvk64674, Adaptive mode for 802.11r Fast Transition is not supported for open WLANs. That is, if you choose Layer 2 security as None for a WLAN, ensure that you disable the Adaptive mode for 802.11r Fast Transition; else, WLAN cannot be enabled.

Information About 802.11r Fast Transition

802.11r, which is the IEEE standard for fast roaming, introduces a new concept of roaming where the initial handshake with the new AP is done even before the client roams to the target AP, which is called Fast Transition (FT). The initial handshake allows the client and APs to do the Pairwise Transient Key (PTK) calculation in advance. These PTK keys are applied to the client and AP after the client does the reassociation request or response exchange with new target AP.

802.11r provides two methods of roaming:

- Over-the-Air
- Over-the-DS (Distribution System)

The FT key hierarchy is designed to allow clients to make fast BSS transitions between APs without requiring reauthentication at every AP. WLAN configuration contains a new Authenticated Key Management (AKM) type called FT (Fast Transition).

From Release 3E, you can create an 802.11r WLAN that is also an WPAv2 WLAN. In earlier releases, you had to create separate WLANs for 802.11r and for normal security. Non-802.11r clients can now join 802.11r-enabled WLANs as the 802.11r WLANs can accept non-802.11r associations. If clients do not support mixed mode or 802.11r join, they can join non-802.11r WLANS. When you configure FT PSK and later define PSK, clients that can join only PSK can now join the WLAN in mixed mode.
For a client to move from its current AP to a target AP using the FT protocols, the message exchanges are performed using one of the following two methods:

- **Over-the-Air**—The client communicates directly with the target AP using IEEE 802.11 authentication with the FT authentication algorithm.

- **Over-the-DS**—The client communicates with the target AP through the current AP. The communication between the client and the target AP is carried in FT action frames between the client and the current AP and is then sent through the device.

**Figure 146: Message Exchanges when Over the Air client roaming is configured**

This figure shows the sequence of message exchanges that occur when Over the Air client roaming is configured.
How to Configure 802.11r Fast Transition

Configuring 802.11r Fast Transition in an Open WLAN (CLI)

**SUMMARY STEPS**

1. configure terminal
2. **wlan** profile-name
3. client vlan vlan-id
4. no security wpa
5. no security wpa akm dot1x
6. no security wpa wpa2
7. no wpa wpa2 ciphers aes

**Monitoring 802.11r Fast Transition (GUI)**

You can view the Authentication Key Management details of a client.

Choose Monitor > Client. The Clients page appears. Click the corresponding client to view the client details. In the General tab, you can view the Authentication Key Management for the client such as FT, PSK, 802.1x, CCKM, 802.1x + CCKM. If the AKM is for 802.11r mixed mode, then FT-802.1x, FT-802.1x-CCKM, or FT-PSK appears.

**Monitoring 802.11r Fast Transition (CLI)**

The following command can be used to monitor 802.11r Fast Transition:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show wlan name <em>wlan-name</em></td>
<td>Displays a summary of the configured parameters on the WLAN.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>show wireless client mac-address mac-address</code></td>
<td>Displays the summary of the 802.11r authentication key management configuration on a client.</td>
</tr>
</tbody>
</table>

```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Assisted Roaming

The 802.11k standard allows clients to request neighbor reports containing information about known neighbor access points that are candidates for a service set transition. The use of the 802.11k neighbor list can limit the need for active and passive scanning.

The assisted roaming feature is based on an intelligent and client optimized neighbor list.

Unlike the Cisco Client Extension (CCX) neighbor list, the 802.11k neighbor list is generated dynamically on-demand and is not maintained on the device. The 802.11k neighbor list is based on the location of the clients without requiring the mobility services engine (MSE). Two clients on the same device but different APs can have different neighbor lists delivered depending on their individual relationship with the surrounding APs.

By default, the neighbor list contains only neighbors in the same band with which the client is associated. However, a switch exists that allows 802.11k to return neighbors in both bands.
Clients send requests for neighbor lists only after associating with the APs that adveritze the RRM (Radio Resource Management) capability information element (IE) in the beacon. The neighbor list includes information about BSSID, channel, and operation details of the neighboring radios.

**Assembling and Optimizing the Neighbor List**

When the device receives a request for an 802.11k neighbor list, the following occurs:

1. The device searches the RRM neighbor table for a list of neighbors on the same band as the AP with which the client is currently associated with.

2. The device checks the neighbors according to the RSSI (Received Signal Strength Indication) between the APs, the current location of the present AP, the floor information of the neighboring AP from Cisco Prime Infrastructure, and roaming history information on the device to reduce the list of neighbors to six per band. The list is optimized for APs on the same floor.

**Assisted Roaming for Non-802.11k Clients**

It is also possible to optimize roaming for non-802.11k clients. You can generate a prediction neighbor list for each client without the client requiring to send an 802.11k neighbor list request. When this is enabled on a WLAN, after each successful client association/reassociation, the same neighbor list optimization is applied on the non-802.11k client to generate the neighbor list and store the list in the mobile station software data structure. Clients at different locations have different lists because the client probes are seen with different RSSI values by different neighbors. Because clients usually probe before any association or reassociation, this list is constructed with the most updated probe data and predicts the next AP that the client is likely to roam to.

We discourage clients from roaming to those less desirable neighbors by denying association if the association request to an AP does not match the entries on the stored prediction neighbor list.

Similar to aggressive load balancing, there is a switch to turn on the assisted roaming feature both on a per-WLAN basis and globally. The following options are available:

- Denial count—Maximum number of times a client is refused association.
- Prediction threshold—Minimum number of entries required in the prediction list for the assisted roaming feature to be activated.

Because both load balancing and assisted roaming are designed to influence the AP that a client associates with, it is not possible to enable both the options at the same time on a WLAN.

**Restrictions for Assisted Roaming**

- The assisted roaming feature is supported across multiple devices.
- This feature is supported only on 802.11n capable indoor access points. For a single band configuration, a maximum of 6 neighbors are visible in a neighbor list. For dual band configuration, a maximum of 12 neighbors are visible.
- You can configure assisted roaming only using the device CLI.
How to Configure Assisted Roaming

Configuring Assisted Roaming (CLI)

SUMMARY STEPS

1. `configure terminal`
2. `wireless assisted-roaming floor-bias dBm`
3. `wlan wlan-id`
4. `assisted-roaming neighbor-list`
5. `assisted-roaming dual-list`
6. `assisted-roaming prediction`
7. `wireless assisted-roaming prediction-minimum count`
8. `wireless assisted-roaming denial-maximum count`
9. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>wireless assisted-roaming floor-bias dBm</code></td>
<td>Configures neighbor floor label bias. The valid range is from 5 to 25 dBm, and the default value is 15 dBm.</td>
</tr>
<tr>
<td></td>
<td>Example: Device(config)# wireless assisted-roaming floor-bias 20</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>wlan wlan-id</code></td>
<td>Enters the WLAN configuration submode. The <code>wlan-name</code> is the profile name of the configured WLAN.</td>
</tr>
<tr>
<td></td>
<td>Example: Device(config)# wlan wlan1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>assisted-roaming neighbor-list</code></td>
<td>Configures an 802.11k neighbor list for a WLAN. By default, assisted roaming is enabled on the neighbor list when you create a WLAN. The <code>no</code> form of the command disables assisted roaming neighbor list.</td>
</tr>
<tr>
<td></td>
<td>Example: Device(wlan)# assisted-roaming neighbor-list</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td><code>assisted-roaming dual-list</code></td>
<td>Configures a dual-band 802.11k dual list for a WLAN. By default, assisted roaming is enabled on the dual list when you create a WLAN. The <code>no</code> form of the command disables assisted roaming dual list.</td>
</tr>
<tr>
<td></td>
<td>Example: Device(wlan)# assisted-roaming dual-list</td>
<td></td>
</tr>
</tbody>
</table>
Verifying Assisted Roaming

The following command can be used to verify assisted roaming configured on a WLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wlan id wlan-id</code></td>
<td>Displays the WLAN parameters on the WLAN.</td>
</tr>
</tbody>
</table>

Configuration Examples for Assisted Roaming

This example shows how to configure the neighbor floor label bias:

```
Device# configure terminal
Device(config)# wireless assisted-roaming floor-bias 10
Device(config)# end
Device# show wlan id 23
```

This example shows how to disable neighbor list on a specific WLAN:

```
Device# configure terminal
```
Device(config)# wlan test1
Device(config (wlan)# no assisted-roaming neighbor-list
Device(config) (wlan)# end
Device# show wlan id 23

This example shows how to configure the prediction list on a specific WLAN:

Device# configure terminal
Device(config)# wlan test1
Device(config) (wlan)# assisted-roaming prediction
Device(config) (wlan)# end
Device# show wlan id 23

This example shows how to configure the prediction list based on assisted roaming prediction threshold and maximum denial count on a specific WLAN:

Device# configure terminal
Device(config)# wireless assisted-roaming prediction-minimum 4
Device(config)# wireless assisted-roaming denial-maximum 4
Device(config) (wlan)# end
Device# show wlan id 23

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring AP Groups

The following are the prerequisites for creating access point groups on a device:

- The required access control list (ACL) must be defined on the router that serves the VLAN or subnet.
- Multicast traffic is supported with access point group VLANs. However, if the client roams from one access point to another, the client might stop receiving multicast traffic, unless IGMP snooping is enabled.

Related Topics
- Information About Access Point Groups, on page 2918
- Restrictions on Configuring Access Point Groups, on page 2918
Restrictions on Configuring Access Point Groups

- Suppose that the interface mapping for a WLAN in the AP group table is the same as the WLAN interface. If the WLAN interface is changed, the interface mapping for the WLAN in the AP group table also changes to the new WLAN interface.

- Suppose that the interface mapping for a WLAN in the AP group table is different from the one defined for the WLAN. If the WLAN interface is changed, then the interface mapping for the WLAN in the AP group table does not change to the new WLAN interface.

- If you clear the configuration on the device, all of the access point groups disappear except for the default access point group “default-group,” which is created automatically.

- The default access point group can have up to 16 WLANs associated with it. The WLAN IDs for the default access point group must be less than or equal to 16. If a WLAN with an ID greater than 16 is created in the default access point group, the WLAN SSID will not be broadcasted. All WLAN IDs in the default access point group must have an ID that is less than or equal to 16. WLANs with IDs greater than 16 can be assigned to custom access point groups.

- We recommend that you configure all Flex+Bridge APs in a mesh tree (in the same sector) in the same AP group and the same FlexConnect group, to inherit the WLAN-VLAN mappings properly.

- Whenever you add a new WLAN to an AP group, radio reset occurs and if any client is in connected state, the client is deauthenticated and is required to reconnect. We recommend that you add or modify the WLAN configuration of an AP group only during maintenance windows to avoid outages.

- The number of AP groups that you can configure cannot be more than the number of ap-count licenses on Cisco WLC. For example, if your Cisco WLC has 5 ap-count licenses, the maximum number of AP groups that you can configure is 5, including the default AP group.

Related Topics
- Information About Access Point Groups, on page 2918
- Prerequisites for Configuring AP Groups, on page 2917

Information About Access Point Groups

After you create up to 512 WLANs on the device, you can selectively publish them (using access point groups) to different access points to better manage your wireless network. In a typical deployment, all users on a WLAN are mapped to a single interface on the device. Therefore, all users that are associated with that WLAN are on the same subnet or VLAN. However, you can choose to distribute the load among several interfaces or to a group of users based on specific criteria such as individual departments (such as Marketing) by creating access point groups. Additionally, these access point groups can be configured in separate VLANs to simplify network administration.

How to Configure Access Point Groups

Creating Access Point Groups

Before you begin
You must have administrator privileges to perform this operation.

SUMMARY STEPS

1. configure terminal
2. ap group ap-group-name
3. wlan wlan-name
4. (Optional) vlan vlan-name
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 2** | ap group ap-group-name |
| Example:  
Device(config)# ap group my-ap-group | Creates an access point group. |
| **Step 3** | wlan wlan-name |
| Example:  
Device(config-apgroup)# wlan wlan-name | Associates the AP group to a WLAN. |
| **Step 4** | (Optional) vlan vlan-name |
| Example:  
Device(config-apgroup)# vlan test-vlan | Assigns the access point group to a VLAN. |
| **Step 5** | end |
| Example:  
Device(config)# end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |

Example
This example shows how to create an AP group:
Device# configure terminal
Device(config-apgroup)# ap group test-ap-group-16
Device(config-wlan-apgroup)# wlan test-ap-group-16
Device(config-wlan-apgroup)# vlan VLAN1300

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Data Models

The NETCONF feature is not supported on a device running dual IOSd configuration or software redundancy.

Introduction to Data Models - Programmatic and Standards-Based Configuration

The traditional way of managing network devices is by using Command Line Interfaces (CLIs) for configurational (configuration commands) and operational data (show commands). For network management, Simple Network Management Protocol (SNMP) is widely used, especially for exchanging management information between various network devices. Although CLIs and SNMP are heavily used, they have several restrictions. CLIs are highly proprietary, and human intervention is required to understand and interpret their text-based specification. SNMP does not distinguish between configurational and operational data.
The solution lies in adopting a programmatic and standards-based way of writing configurations to any network device, replacing the process of manual configuration. Network devices running on Cisco IOS XE support the automation of configuration for multiple devices across the network using data models. Data models are developed in a standard, industry-defined language, that can define configuration and state information of a network.

Cisco IOS XE supports the Yet Another Next Generation (YANG) data modeling language. YANG can be used with the Network Configuration Protocol (NETCONF) to provide the desired solution of automated and programmable network operations. NETCONF (RFC 6241) is an XML-based protocol that client applications use to request information from and make configuration changes to the device. YANG is primarily used to model the configuration and state data used by NETCONF operations.

In Cisco IOS XE, model-based interfaces interoperate with existing device CLI, Syslog, and SNMP interfaces. These interfaces are optionally exposed northbound from network devices. YANG is used to model each protocol based on RFC 6020.

To access Cisco YANG models in a developer-friendly way, please clone the GitHub repository, and navigate to the vendor/cisco subdirectory. Models for various releases of IOS-XE, IOS-XR, and NX-OS platforms are available here.

NETCONF

NETCONF provides a simpler mechanism to install, manipulate, and delete the configuration of network devices.

It uses an Extensible Markup Language (XML)-based data encoding for the configuration data as well as the protocol messages.

NETCONF uses a simple RPC-based (Remote Procedure Call) mechanism to facilitate communication between a client and a server. The client can be a script or application typically running as part of a network manager. The server is typically a network device (switch or router). It uses Secure Shell (SSH) as the transport layer across network devices.

NETCONF also supports capability discovery and model downloads. Supported models are discovered using the ietf-netconf-monitoring model. Revision dates for each model are shown in the capabilities response. Data models are available for optional download from a device using the get-schema rpc. You can use these YANG models to understand or export the data model.

For more details, refer RFC 6241.

How to Configure Data Models

Configuring NETCONF

Before you begin

You must configure NETCONF-YANG as follows.
SUMMARY STEPS

1. enable
2. configure terminal
3. netconf-yang
4. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>netconf-yang</td>
<td>Enables the NETCONF interface on your network device.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device (config)# netconf-yang</td>
<td>Note: After the initial enablement through the CLI, network devices can be managed subsequently through a model based interface. The complete activation of model-based interface processes may require up to 90 seconds.</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device (config)# exit</td>
<td></td>
</tr>
</tbody>
</table>

Configuring NETCONF Options

Configuring SNMP

Enable the SNMP Server in IOS to enable NETCONF to access SNMP MIB data using YANG models generated from supported MIBs, and to enable supported SNMP traps in IOS to receive NETCONF notifications from the supported traps.

Perform the following steps:

SUMMARY STEPS

1. Enable SNMP features in IOS.
2. After NETCONF-YANG starts, enable SNMP Trap support by sending the following RPC <edit-config> message to the NETCONF-YANG port.
3. Send the following RPC message to the NETCONF-YANG port to save the running configuration to the startup configuration.
### DETAILED STEPS

#### Step 1
Enable SNMP features in IOS.

**Example:**
```
configure terminal
logging history debugging
logging snmp-trap emergencies
logging snmp-trap alerts
logging snmp-trap critical
logging snmp-trap errors
logging snmp-trap warnings
logging snmp-trap notifications
logging snmp-trap informational
logging snmp-trap debugging
!
snmp-server community public RW
snmp-server trap link ietf
snmp-server enable traps snmp authentication linkdown linkup snmp-server enable traps syslog
snmp-server manager
exit
```

#### Step 2
After NETCONF-YANG starts, enable SNMP Trap support by sending the following RPC `<edit-config>` message to the NETCONF-YANG port.

**Example:**
```
<?xml version="1.0" encoding="utf-8"?>
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="">
  <edit-config>
    <target>
      <running/>
    </target>
    <config>
      <netconf-yang xmlns="http://cisco.com/yang/cisco-self-mgmt">
        <cisco-ia xmlns="http://cisco.com/yang/cisco-ia">
          <snmp-trap-control>
            <trap-list>
              <trap-oid>1.3.6.1.4.1.9.9.41.2.0.1</trap-oid>
            </trap-list>
            <trap-list>
              <trap-oid>1.3.6.1.6.3.1.1.5.3</trap-oid>
            </trap-list>
            <trap-list>
              <trap-oid>1.3.6.1.6.3.1.1.5.4</trap-oid>
            </trap-list>
            </snmp-trap-control>
          </cisco-ia>
        </netconf-yang>
      </config>
    </edit-config>
  </rpc>
```

#### Step 3
Send the following RPC message to the NETCONF-YANG port to save the running configuration to the startup configuration.

**Example:**
```
<?xml version="1.0" encoding="utf-8"?>
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="">
```

Information About Programmability

iPXE Overview

Network bootloaders support booting from a network-based source. The bootloaders boot an image located on an HTTP, FTP, or TFTP server. A network boot source is detected automatically by using an iPXE-like solution.

iPXE enables network boot for a device that is offline. The following are the three types of iPXE boot modes:

- iPXE Timeout—Configures a timeout in seconds for iPXE network boot by using the IPXE_TIMEOUT rommon variable. When the timeout expires, device boot is activated.

- iPXE Forever—Boots through iPXE network boot. The device sends DHCP requests forever, when the `boot ipxe forever` command is configured. This is an iPXE-only boot (which means that the bootloader will not fall back to a device boot or a command prompt, because it will send DHCP requests forever until it receives a valid DHCP response.)

- Device—Boots using the local device BOOT line configured on it. When device boot is configured, the configured IPXE_TIMEOUT rommon variable is ignored. Device boot is the default boot mode.
Manual boot is another term used in this document. Manual boot is a flag that determines whether to do a rommon reload or not. When the device is in rommon mode, you have to manually issue the `boot` command. If manual boot is set to 1, the rommon or device prompt is activated. If manual boot is set to 0, the device is reloaded; but rommon mode is not activated.

The following section describes how an iPXE bootloader works:

**Figure 148: iPXE Bootloader Workflow**

1. Bootloader sends a DHCP request.
2. The DHCP response includes the IP address and boot file name. The boot file name indicates that the boot image is to be retrieved from a TFTP server (`tftp://server/filename`), FTP server (`ftp://userid:password@server/filename`), or an HTTP server (`http://server/filename`). Because the current iPXE implementation works only via the management port (GigabitEthernet0/0), DHCP requests sent through the front panel ports are not supported.
3. Bootloader downloads and boots the image from the network source.
4. If no DHCP response is received, the bootloader keeps sending DHCP requests forever or for a specified period of time, based on the boot mode configured. When a timeout occurs, the bootloader reverts to a device-based boot. The device sends DHCP requests forever only if the configured boot mode is `ipxe-forever`. If the `ipxe-timeout` boot mode command is configured, DHCP requests are sent for the specified amount of time, and when the timeout expires, device boot mode is activated.

When manual boot is disabled, the bootloader determines whether to execute a device boot or a network boot based on the configured value of the iPXE ROMMON variable. Irrespective of whether manual boot is enabled or disabled, the bootloader uses the BOOTMODE variable to determine whether to do a device boot or a network boot. Manual boot means that the user has to manually type the `boot manual switch` command to...
start the boot process. When manual boot is disabled, and when the device reloads, the boot process starts automatically.

When iPXE is disabled, the contents of the existing BOOT variable are used to determine how to boot the device. The BOOT variable may contain a network-based uniform resource identifier (URI) (for example, http://, ftp://, tftp://), and a network boot is initiated; however DHCP is not used to get the network image path. The device IP address is taken from the IP_ADDR variable. The BOOT variable may also contain a device-based path, in which case, a device-based boot is initiated.

To identify the device on a remote DHCP server for booting purposes, use the chassis serial number (available in DHCP option 61), the Product ID (PID) (available in DHCP Option 60), or the device MAC Address. The show inventory and show switch commands also display these values on the device.

The following is sample output from the show inventory command:

```
Device# show inventory
NAME:"c38xx Stack", DESCR:"c38xx Stack"  PID:WS-3850-12X-48U-L, VID:V01, SN:F0C1911V01A
NAME:"Switch 1", DESCR:"WS-C3850-12X48U-L"  PID:WS-C3850-12X48U-L, VID:V01, SN:F0C1911V01A
NAME:"Switch1 -Power Supply B", DESCR:"Switch1 -Power Supply B"  PID:PWR-C1-1100WAC, VID:V01, SN:LIT1847146Q
```

The following rommon variables should be configured for iPXE:

- BOOTMODE = ipxe-forever | ipxe-timeout | device
- IPXETIMEOUT = seconds

### Plug-N-Play Agent Overview

The Cisco Plug-N-Play (PnP) Agent works as a platform bootstrap agent. The device-based bootstrap agent interoperates with the identified bootstrap servers.

A platform bootstrap agent/PnP agent supports the following common requirements:

- **On-Premises, Out-of-Band Bootstrap**—Uses DHCP over management port.
- **Off-Premises, Out-of-Band Bootstrap**—Uses cloud-based connect over management port, for example, using DNS and Cisco PnP protocol.
- **Off-Premises, In-Band Bootstrap**—Uses cloud-based connect over data ports, for example using DNS and Cisco PnP protocol.
# How to Configure Programmability: Network Bootloader

## Configuring iPXE

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. 
   - `boot ipxe forever switch number`
   - `boot ipxe timeout seconds switch number`
4. `boot system {switch switch-number | all} {flash: | ftp: | http: | tftp:}`
5. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>boot ipxe forever switch number</code></td>

**Configuration Examples for Programmability: Network Bootloader**

**Example: iPXE Configuration**

The following example shows that iPXE is configured to send DHCP requests forever until the device boots with an image:
Device# configure terminal
Device(config)# boot ipxe forever switch 2
Device(config)# end

The following example shows how to configure the boot mode to ipxe-timeout. The configured timeout is 200 seconds. If an iPXE boot failure occurs after the configured timeout expires, the configured device boot is activated. In this example, the configured device boot is http://[2001:db8::1]/image-filename.

Device# configure terminal
Device(config)# boot ipxe timeout 200 switch 2
Device(config)# boot system http://[2001:db8::1]/image-filename
Device(config)# end
